TROPICAL WEATHER OUTLOOK
NWS NATIONAL HURRICANE CENTER MIAMI FL
800 PM EDT MON OCT 20 2014

For the North Atlantic...Caribbean Sea and the Gulf of Mexico:

Showers and thunderstorms associated with an area of low pressure located over the southwestern Bay of Campeche have changed little in organization since this afternoon. This system has the potential to become a tropical cyclone during the next couple of days while it moves slowly eastward across the southern Bay of Campeche. Later in the week, the low is forecast to interact and possibly merge with a frontal system over the southeastern Gulf of Mexico or northwestern Caribbean Sea. An Air Force Reserve reconnaissance aircraft is scheduled to investigate the disturbance tomorrow afternoon, if necessary. Interests in the Yucatan Peninsula should monitor the progress of this system.

- * Formation chance through 48 hours...medium...50 percent.
- * Formation chance through 5 days...medium...60 percent.

SPECIAL TROPICAL OUTLOOK

Significant or Unexpected Changes

NATIONAL HURRICANE CENTER
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

SPECIAL TROPICAL WEATHER OUTLOOK
NWS NATIONAL HURRICANE CENTER MIAMI FL
430 PM EDT MON JUN 30 2014

Special outlook issued to update discussion of the area of low pressure east of Florida.

Updated: An Air Force Reserve unit reconnaissance aircraft is investigating the area of low pressure centered about 110 miles east of Melbourne, Florida. While the low is well defined, the associated thunderstorm activity is just below the organizational threshold required to initiate tropical cyclone advisories. Environmental conditions continue to be favorable for development, and only a slight increase in the organization and persistence of the thunderstorm activity would result in the formation of a tropical depression.

Data from the reconnaissance aircraft indicate that peak sustained winds with the low are about 30-35 mph. The low is moving southwestward at around 5 mph, but is expected to turn westward tonight and northward by Wednesday when it will be near the east coast of Florida. If this system becomes a tropical cyclone, a tropical storm watch could be required for portions of the central or northern Atlantic coast of Florida. A turn toward the northeast near the southeastern U.S. coast is expected by Thursday.

* Formation chance through 48 hours...high...80 percent.
* Formation chance through 5 days...high...80 percent.

Why is it being issued?

DISCUSSION AND OUTLOOK

 At 1000 AM CDT, 1500 UTC, the center of Hurricane Isaac was located by NOAA Doppler weather radar near latitude 29.6 North, longitude 90.7 West, or very near Houma, Louisiana. Isaac is moving toward the northwest near 6 mph (9 km/h). This general motion is expected to continue through tonight, followed by a turn toward the north-northwest by Thursday night or early Friday. On the forecast track, the center of Isaac will move farther inland over Louisiana today and tomorrow, and over southern Arkansas by early Friday.

Maximum sustained winds have decreased to near 75 mph (120 km/h) with higher gusts. Isaac is a category one hurricane on the Saffir-Simpson Hurricane Wind Scale. Gradual weakening is forecast during the next 48 hours as the hurricane continues moving farther inland and Isaac is expected to weaken to a tropical storm later today.

Hurricane-force winds extend outward up to 45 miles (75 km) from the center, and tropical-storm-force winds extend outward up to 175 miles (280 km).

A gust to 74 mph was recently reported at the Mid Lake station in Lake Pontchartrain and a wind gust to 63 mph was reported at New Orleans International Airport.

PUBLIC ADVISORY

Location. Strength. Hazards. Warnings

NATIONAL HURRICANE CENTER
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters. The water could reach the following depths above ground if the peak surge occurs at the time of high tide...

- * MISSISSIPPI AND SOUTHEASTERN LOUISIANA...6 TO 12 FT
- * ALABAMA...3 TO 6 FT
- * SOUTH-CENTRAL LOUISIANA...3 TO 6 FT
- * FLORIDA PANHANDLE AND APALACHEE BAY...2 TO 4 FT

The deepest water will occur along the immediate coast in areas of onshore flow. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office. Near the coast, the surge will be accompanied by large and dangerous waves.

Storm surge values of near 8 feet have recently been reported at Shell Beach Louisiana and Waveland Mississippi.

WIND...Tropical storm conditions will continue across the warning area today, and hurricane conditions will continue to affect Portions of southeastern Louisiana and Mississippi in the hurricane Warning area into this afternoon.

How much storm surge is forecast?

PUBLIC ADVISORY

Location. Strength. Hazards. Warnings

NATIONAL HURRICANE CENTER
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

HAZARDS AFFECTING LAND

WIND..Tropical storm conditions will continue across the warning area today, and hurricane conditions will continue to affect portions of southeastern Louisiana and Mississippi in the hurricane warning area into this afternoon.

Winds affecting the upper floors of high-rise buildings will be significantly stronger than those near ground level. At about the 30th story, winds would likely be one Saffir-Simpson category stronger than at the surface.

RAINFALL..Isaac is expected to produce total rainfall amounts of 7 to 14 inches, with possible isolated maximum amounts of 20 inches over much of Louisiana, southern Mississippi, and southwest Alabama through Friday morning. These rains could result in significant lowland flooding. Rains are expected to increase northward into Arkansas on Thursday, with amounts of 3 to 6 inches expected over southern Arkansas by Friday morning.

TORNADOES..Isolated tornadoes are possible along the central Gulf Coast region and parts of the lower Mississippi river valley through Thursday.

SURF..Dangerous surf and rip current conditions will continue to affect the west coast of Florida and the northern Gulf coast for the next day or so.

How much rain is forecast?

NATIONAL HURRICANE CENTER
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

HURRICANE JOAQUIN DISCUSSION NUMBER 15
 NWS NATIONAL HURRICANE CENTER MIAMI FL AL112015
 1100 AM EDT THU OCT 01 2015

An Air Force Reserve Hurricane Hunter aircraft reported 700-mb flight-level winds of 119 kt in the northwestern eyewall, with a 117 kt surface wind estimate from the Stepped Frequency Microwave Radiometer in the southwestern eyewall. The latest central pressure was 942 mb. Based on these data, the advisory intensity is increased to 110 kt. Satellite imagery indicates that an eye is trying to form in the central dense overcast, and that the cirrus outflow is good in all directions. Joaquin is expected to intensify a little more in the next 12 to 24 hours as it remains over very warm waters and in an environment of decreasing vertical shear. After that time, there could be some fluctuations in intensity due to eyewall replacement cycles. There is some uncertainty in the intensity forecast in the 48-96 hour period. The statistical models suggest that Joaquin should weaken due to increasing shear. However, several of the global models forecast the hurricane to move into an area of strong upper-level divergence and show a falling central pressure. The new forecast will continue to show weakening during this time, but it would not be a surprise if it is stronger than currently forecast. The initial motion is 220/5. Water vapor imagery shows a mid- to upper-level ridge north of the hurricane, with a developing deep-layer trough over the eastern and southeastern United States. The

FORECAST DISCUSSION

Confidence. Scenarios. Key Messages.

NATIONAL HURRICANE CENTER
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

KEY MESSAGES:

1. Preparations to protect life and property in the central Bahamas should be complete. The slow motion of Joaquin over the next day or so will bring a prolonged period of hurricane force winds, storm surge, and very heavy rainfall to those islands.
2. Confidence in the details of the forecast after 72 hours is still low, since there have been some large changes in the model guidance overnight and a large spread in the model solutions remains, with potential impacts from the Carolinas through New England. It is also possible that Joaquin will remain far from the U.S. east coast. A hurricane watch for the U.S. coast would likely not occur until at least Friday morning.
3. Efforts to provide the forecast models with as much data as possible continue, with twice daily NOAA G-IV jet missions in the storm environment, and extra NWS balloon launches.
4. It's too early to talk about specific wind, rain, or surge impacts from Joaquin in the United States. Regardless of Joaquin's track, strong onshore winds will create minor to moderate coastal flooding along the coasts of the mid-Atlantic and northeastern states through the weekend.
5. Many portions of the eastern U.S. are currently experiencing heavy rains and gusty winds associated with a frontal system.

FORECAST DISCUSSION

Confidence. Scenarios. Key Messages.

NATIONAL HURRICANE CENTER
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION

4. It's too early to talk about specific wind, rain, or surge impacts from Joaquin in the United States. Regardless of Joaquin's track, strong onshore winds will create minor to moderate coastal flooding along the coasts of the mid-Atlantic and northeastern states through the weekend.

5. Many portions of the eastern U.S. are currently experiencing heavy rains and gusty winds associated with a frontal system. These heavy rains are likely to continue for the next few days, even if the center of Joaquin stays offshore. The resulting inland flood potential could complicate preparations for Joaquin should it head toward the coast, and even more substantial inland flooding is possible if Joaquin later passes near or over these same areas.
