To restore farmland damaged by natural disasters and return it to productive agricultural use, the disaster and emergency title of the fiscal year 2001 appropriations act provided \$79.8 million for the Emergency Conservation Program (ECP). So far this fiscal year, just under \$40 million has been allocated to share the cost of repairing damage caused by drought, floods, tornadoes, and other disasters across the country. Claims are pending for damage from ice storms in a number of States, and additional claims are anticipated as a result of the recent flooding of the Mississippi River, as well as any other disasters that may occur. Most of the available funding is likely to be allocated by the end of the fiscal year.

The President's Budget requests no ECP funding for fiscal year 2002. However, the \$5.6 billion governmentwide National Emergency Reserve proposed in the President's Budget could provide for emergency conservation needs.

Dairy Indemnity Program

The Dairy Indemnity Program compensates dairy farmers and manufacturers who, through no fault of their own, suffer income losses on milk or milk products removed from commercial markets due to residues of certain chemicals or other toxic substances. Payees are required to reimburse the Government if they recover their losses through other sources such as litigation. The fiscal year 2002 appropriation request of \$100 thousand, together with carryover unobligated funds expected to be available at the end of fiscal year 2001, would cover a higher than normal but not catastrophic level of claims.

ADMINISTRATIVE SUPPORT

The costs of administering all FSA programs are funded by a consolidated Salaries and Expenses (S&E) account. The account is comprised of direct appropriation, transfers from program loan accounts under credit reform procedures, user fees, and advances and reimbursements from various sources.

The fiscal year 2002 Budget proposes funding of \$1.213 billion from appropriated sources, including credit reform transfers, for a net increase of about \$71 million over the fiscal year 2001 level. This net increase has two components: ADP activities and non-Federal county offices.

Our S&E request includes just over \$40 million for computer-related costs that formerly would have been funded by CCC. The 1996 Farm Bill imposed a cap of \$275 million for CCC-funded automated data processing (ADP) obligations for fiscal year 1997 through 2002. Subsequently, two separate legislative actions reduced the cap by a total of \$87 million to achieve budgetary offset savings in unrelated programs. The last of the funding under the resulting \$188 million cap was exhausted early in fiscal year 2001, making it necessary for FSA to draw upon S&E funding to support basic ADP maintenance and operating needs. The \$40 million requested for ADP under S&E for fiscal year 2002 would provide:

- \$26 million for basic operating costs, including hardware and software upgrades, licenses and renewals, contractor support for hardware and software, and maintenance of mission-critical systems essential for program delivery.
- \$7.8 million to begin the process of converting and migrating some of FSA's 50 legacy automated systems to the Common Computing Environment (CCE) to support the Service Center modernization effort. Transition to the CCE is necessary not only to improve customer service and administrative efficiencies, but also to meet the requirements of the Freedom to E-File Act and similar mandates.
- \$3.5 million for FSA's share of LAN/WAN/Voice installation and operation under the Department's Service Center modernization initiative, to provide a solid telecommunications infrastructure for the CCE, electronic access, and other ADP-related improvements.
- \$2.7 million for FSA's share of the Geographical Information System, which is at a critical point of implementation in providing digital geo-spatial data and the tools to make practical use of the information collected.

The remaining net increase of \$31 million for S&E reflects Federal office and non-Federal county office costs of pay raises, promotions, and within-grade increases, as well as other costs of maintaining permanent county office staffing at the 2001 level. Temporary non-Federal county office staffing needs are expected to decline modestly, by 461 staff years, as the expiration of ad hoc disaster and emergency legisla-

tion reduces the workload associated with crop and market loss assistance in fiscal year 2002. Since we cannot predict the programmatic impact of a new farm bill, or whether new emergency disaster assistance will be enacted, our estimates assume a continuation of ongoing workload activity. When a new farm bill is in place, or other legislation affecting workload is enacted, fiscal year 2002 staffing requirements may need to be reexamined.

Mr. Chairman, this concludes my statement. I will be happy to answer your questions and those of the other Subcommittee Members.

RELATED AGENCIES

FARM CREDIT ADMINISTRATION

PREPARED STATEMENT OF HONORABLE MICHAEL M. REYNA, CHAIRMAN AND CHIEF EXECUTIVE OFFICER

Mr. Chairman, Members of the Subcommittee, I am Michael Reyna, Chairman and Chief Executive Officer of the Farm Credit Administration (FCA or Agency). This is my second report to you as the Chairman of the FCA Board. As you know, the FCA Board is a three-member board. Ann Jorgensen, who also serves as the Chair of the Farm Credit System Insurance Corporation (FCSIC), joins me on the Board. The third position on the FCA Board is currently vacant.

I will highlight the FCA's accomplishments during the past year, report to you briefly on the condition of the Farm Credit System (FCS or System), and present our fiscal year 2002 budget request.

MISSION OF THE FARM CREDIT ADMINISTRATION

The mission of the FCA is to promote a safe and sound, competitive FCS so agriculture and rural America will continue to have a permanent, dependable, and affordable source of credit in both good and bad times. We are not involved in the daily management of System institutions. Instead, our responsibility is to ensure that the System complies with applicable statutes and regulations, and operates in accordance with safe and sound banking practices. We believe that the FCS will continue to play an important role in financing agriculture in the 21st century. We strive to maintain a regulatory environment that enables System institutions to remain financially strong and competitive so they can meet the changing demands of rural America for credit and other services. In doing so, our primary focus is to ensure the long-term safety and soundness of the FCS and develop rules and polices that respect market forces.

FISCAL YEAR 2002 BUDGET REQUEST

We are proud of our accomplishments as the safety and soundness regulator of the FCS and of our ability to contain costs while fulfilling our mission. I assure you that we will continue our commitment to effectiveness and cost-efficiency. We will regularly review how additional progress can be made in meeting these objectives. I am personally committed to a program of continuous improvement.

Before I present the budget request, I respectfully bring to the Committee's attention that the FCA's administrative expenses are paid for by the institutions that we examine. The FCA does not receive a Federal appropriation, but instead is funded through annual assessments of FCS institutions.

For fiscal year 2002, I propose a budget of \$38,736,000. While this is an increase of \$383,000, or 1 percent, above the \$38,353,000 for fiscal year 2001, I can assure you that we are cognizant of our responsibility to be good stewards of the System's resources. Most of this increase is due to adjustments in compensation and benefits for our workforce. The Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA) requires the FCA to keep the salaries of its employees comparable to those of other Federal financial institution regulators.

Our fiscal year 2002 budget request supports a staffing level of 293.6 full-time equivalents (FTEs). By comparison, our fiscal year 2001 budget supported a staffing level of 301.6 FTEs. Although our staffing level has declined by 8 FTEs from the previous fiscal year, I believe we can continue to maintain the right mix of positions and skills necessary to implement our Strategic Plan and accomplish our mission. The proposed budget that we formally submitted to the Committee provides details on the various expense categories and other highlights.

FISCAL YEAR 2000 ACCOMPLISHMENTS

I am proud of our many accomplishments during the past year. In fiscal year 2000, we continued our efforts to achieve the goals of our Strategic Plan through (1) effective risk identification and corrective action, and (2) sensible regulation and public policy.

We have worked hard to maintain the System's safety and soundness at a time when the agricultural economy is experiencing stress. At the same time, we are continually exploring options to reduce regulatory burden on the FCS and ensure it fulfills its public policy mission to provide constructive, competitive, and dependable credit and related services to agriculture and rural America.

Examination Programs

One of our highest priorities is the development and implementation of efficient and effective examination programs that meet the high standards and expectations of the Congress, investors in System debt obligations, the farmers, ranchers, and cooperatives that own System banks and associations, and the public at large. We conduct examinations according to risk-based examination principles, which means we set the scope and frequency of each examination based on the level of risk in the institution.

We continuously identify, evaluate, and proactively address these risks. We also use an examination cycle of up to 18 months for certain institutions, where appropriate, as permitted by the Farm Credit System Reform Act of 1996. We continually enhance our risk identification capabilities. Our Early Warning System identifies existing and prospective risk at FCS institutions. Each institution is reviewed quarterly to identify changes in its risk characteristics, and the Financial Institution Rating System (FIRS) rating is adjusted as needed. In addition, we use our forecasting model semiannually to identify and evaluate prospective risk in FCS institutions over the next 12 to 24 months under "most likely" and "worst case" scenarios, respectively. This includes monitoring trends in prices for various commodities. This proactive approach is intended to evaluate an institution's financial condition and performance under various scenarios to identify institutions with emerging risks and the potential for deterioration. This allows us to implement our differential supervision program to address and correct potential problems. We continue to enhance our modeling capabilities so that we can identify in a timely manner economic developments that may affect the financial condition of FCS institutions.

FIRS uses six components—Capital, Assets, Management, Earnings, Liquidity, and Sensitivity to interest rate risk (CAMELS)—to measure the performance of each FCS institution. The FCA assigns every institution a composite rating and a rating for each of the six individual rating components at least quarterly. The FIRS ratings reflect current risk and conditions throughout the System. In addition, our examiners provide continuous oversight of System institutions to ensure that risk in the System is adequately monitored and addressed.

I am especially pleased to report that for the first time in the System's history, more FCS institutions are rated "1", which is the highest FIRS category, than are rated "2". As of February 26, 2001, all rated System institutions, except one small association, achieved a composite rating in the two highest of the five FIRS categories. Currently, no System institution is under an enforcement action.

During fiscal year 2000, other Federal agencies used our expertise. Pursuant to an agreement with the Small Business Administration (SBA), the FCA conducted examinations of Small Business Lending Companies that are licensed to make SBA guaranteed loans. In fiscal year 2000, the FCA helped train examiners in the Office of Thrift Supervision (OTS) who now review an increasing number of agricultural loans made by savings associations. These arrangements help us to maintain the high quality skills of our examiners and defray some of the costs of our operations while providing valuable assistance and service to other Federal agencies.

Strategic Planning and Performance Plans

During fiscal year 2000, we focused on improving our methods for measuring the FCA's performance under the Strategic Plan. We refined the Annual Performance Plan covering Fiscal Years 2001 and 2002 in accordance with the Government Performance and Results Act of 1993. The Performance Plan lists our performance measures and goals, many of which link to strategic goals, objectives, and initiatives. These goals and objectives help us to deal effectively with rapid changes in agriculture and the System during both strong and weak economic conditions. We also use these performance measures and goals to assess our ultimate effectiveness in ensuring the safe and sound operation of the FCS.

Regulatory, Policy, and Philosophy Initiatives

Congress has given the FCA Board statutory authority to establish policy and prescribe regulations necessary to ensure that FCS institutions comply with the law and operate in a safe and sound manner. We strive to adopt sound and constructive policies and regulations, using a proactive and preventive approach that reflects the changing needs of agriculture. Our objective is to promulgate regulations that achieve safety and soundness goals while minimizing regulatory burden on System institutions.

During fiscal year 2000, we continued our efforts to remove geographic barriers within the FCS that limit the credit options of eligible farmers and ranchers and prevent System institutions, as single industry lenders, from diversifying concentrations in their loan portfolios. We repealed regulations that required an FCS bank or association to provide notice or obtain consent before it participated in loans that commercial banks and other non-System lenders made in the chartered territories of other System institutions. A Farm Credit bank and five of its affiliated associations opposed the final rule and subsequently filed suit in the United States District Court for the District of Columbia. Their suit asked the court for a declaratory judgment that the final rule is invalid and contrary to law. This action is currently pending.

The FCA is developing a new rule that would remove geographic lending barriers that have restricted the operations of FCS associations for decades. As a result, this rule would enable each direct lender association to apply for and obtain a charter that would authorize it to lend and offer related services to farmers, ranchers, and other eligible customers without geographic restrictions. The rule would require each association to comply with stringent business planning requirements and safety and soundness criteria. Each association must continue to serve, on a priority basis, the credit needs of farmers, ranchers, and other eligible borrowers in its local service area, which in most cases is the area it served before the removal of territorial boundaries. Expanded charters would not include territories of certain associations in four states that the FCA, by law, cannot overcharter unless the shareholders, in some cases the boards, and the funding banks of these associations consent. The FCA has proposed new regulations that would provide a process for the shareholders, boards, and the banks of the affected associations to vote on allowing other FCS associations to serve these areas.

During fiscal year 2000, the FCA adopted final rules concerning regulatory burden on FCS institutions, civil money penalties, standards of conduct, flood insurance, and disclosure to shareholders. Our proposed regulations addressed termination of FCS status, loans to designated parties, FCS funding of commercial banks and other financing institutions, loan purchases and sales, and issuance of stock in service corporations. The FCA Board issued two policy statements. One emphasized the obligation of FCS institutions to protect the privacy of personal information about their borrowers, while the other provided System institutions with more guidance about official and trade names.

Corporate Activities

During the past year, many FCS associations have merged or adopted new corporate structures that include wholly owned operating subsidiaries. These restructurings are expected to lower risk through diversification, reduce operating expenses, and enable associations to use their capital more efficiently while offering their customers a broader array of services on a one-stop basis. The FCA has devoted much time and energy in the past year to processing and approving these corporate applications. In fact, the number of corporate applications received by the FCA set a new record. In fiscal year 2000, we processed and approved 93 applications, which was double the 46 applications that we processed the previous year. We were able to handle the increased workload with our existing staff by reprioritizing other work and using creative and streamlined approaches for processing the applications. We met all 60-day review requirements of the Farm Credit Act of 1971, as amended (Act), unless waived by the applicants, and granted approval before the requested effective date in every case.

CONDITION OF THE FARM CREDIT SYSTEM

I am pleased to report that the FCS is a financially strong and reliable source of affordable credit to agriculture and rural America. The quality of loan assets, risk-bearing capacity, stable earnings, and capital levels collectively reflect a healthy System that has rebuilt its financial strength and improved its management systems. Despite various external factors affecting agriculture, such as reduced export demand, adverse weather conditions, and low commodity prices, the System's

strong financial position will help it weather adverse effects from potential deterioration in the agricultural economy.

Since 1994, the System has steadily earned \$1 billion or more each year. This has resulted in a large capital cushion that will enable the System to absorb losses and remain a viable lender to agriculture during downturns in the agricultural economy.

The quality of the System's loan portfolio has remained generally favorable despite continued adverse economic conditions in the agricultural sector and a slight deterioration in the performance of certain loans to cooperatives. Signs of deterioration have yet to materialize in the System's loan portfolio, and early warning indicators are much more positive than in the mid-1980s when the System last experienced serious asset quality problems.

Loan volume continues to grow, while the level of nonperforming loans, including nonaccrual loans,¹ consistently remains low. Delinquent loans also remain minimal at less than half of one percent of total loans.

The System continues to build capital through retained earnings. Total capital as a percentage of total assets has increased from 14.2 percent as of September 30, 1996, to 15.6 percent as of September 30, 2000. All institutions met their regulatory capital requirements, and most greatly exceeded them. Permanent capital ratios at System banks and associations ranged from a low of 9.94 percent to a high of 38.2 percent compared with the 7.0 percent minimum regulatory capital requirement.

Better management practices have resulted in stronger loan underwriting standards at most System institutions. Adherence to strong loan underwriting standards usually results in sound loans. Additionally, this helps insulate an institution's capital from excessive risk in a challenging operating environment. As a result of improving their management and internal controls, System institutions have been diligent in identifying and dealing with troubled loans early on. Also, improved asset/liability management practices have enabled System banks to effectively manage interest rate risk.

Economic stress in agriculture, however, is beginning to temper this good news. Prices for many agricultural commodities are low while farm production costs, particularly for energy, are increasing. As a result, the profit margins of many farmers are squeezed. Federal support for agriculture over the past several years has been necessary to help farmers repay their loans. Obviously, farmers, System institutions, and the FCA would much prefer that more favorable commodity prices would generate higher profits and better income for agriculture. In addition to strong capital and diligent management at System banks and associations, Federal assistance to farmers has also played an important role in helping the System maintain the quality of its loan portfolio.

Two indicators of profitability, net interest margins and net interest spreads, have been trending downward since 1995. Return on assets has also followed a declining trend for the past six years, although it increased in 2000. While these downward trends raise concerns, they also stress why retained earnings and strong capital are crucial to the continued financial strength of System institutions.

The allowance for loan losses continues to be adequate to cover risk in the loan portfolios. Since 1993, the System has steadily increased its allowance for loan losses to almost \$2 billion at the end of 2000. This increase is necessary to protect against the stress in the farm economy.

Perhaps the biggest challenge facing the System is the fact that it is a single-industry lender in a shrinking market. The number of farmers and ranchers has steadily declined ever since the System was founded in 1916. However, the System's mission is to finance agriculture in both good and bad economic times. The loan portfolios of System institutions, as single-industry lenders, are concentrated in agricultural commodities. As of September 30, 2000, there were 197 instances at 135 associations where loans to a single commodity exceeded capital. The System lends overwhelmingly to agriculture, which is the sector of the economy that is particularly vulnerable to changes in commodity prices, currency fluctuations, bad weather, diseases, pests, and other difficulties. The FCA will remain ever vigilant with regard to its safety and soundness mission in the face of the challenges confronting the System.

FEDERAL AGRICULTURAL MORTGAGE CORPORATION

The FCA has oversight and examination responsibility for the Federal Agricultural Mortgage Corporation, which is commonly known as Farmer Mac. Congress established Farmer Mac in 1988 to operate a secondary market for agricultural

¹ Nonperforming loans consist of nonaccrual loans, accruing restructured loans, and accruing loans 90 days or more past due.

mortgage and rural home loans. In this capacity, Farmer Mac creates and guarantees securities that are backed by mortgages on farms and rural homes. We monitor Farmer Mac's operations and financial condition and provide periodic and timely reports to Congress.

On February 21, 2001, we adopted a final risk-based capital regulation for Farmer Mac. The new regulation is designed to ensure that Farmer Mac has sufficient capital to meet its mission, especially during times of economic stress. The final rule establishes a risk-based capital stress test that will determine the minimum level of risk-based regulatory capital necessary for Farmer Mac to maintain positive capital during a 10-year period if stressful credit and interest rate conditions occur. The final rule requires Farmer Mac to run the risk-based capital stress test at least quarterly to determine the adequacy of its capital and to report the results to the FCA. The stress test is based on a statistical model used to project Farmer Mac's capital sufficiency over the 10-year stress period.

The FCA continues to monitor Farmer Mac's debt issuance and non-mortgage investment strategy. We also examine Farmer Mac's strategic and operational business planning. In 2000, Farmer Mac had \$10.4 million in net earnings, compared with \$6.9 million in 1999 and \$5.7 million in 1998. Farmer Mac's capital remains above the minimum prescribed by the Act and its total loan program activity continued to increase, reaching \$3.19 billion at December 31, 2000.

In conclusion, we are proud of our efforts and accomplishments in ensuring the safety and soundness of the Farm Credit System. We will continue to efficiently manage our resources while performing FCA's mission in the way Congress intended. Mr. Chairman, on behalf of my colleague on the Board, Ann Jorgensen, and myself, I thank you for the opportunity to share this information with you.

ADDITIONAL SUBMITTED QUESTIONS

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

DEPARTMENT OF AGRICULTURE

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

ADVANCED GENETIC TECHNOLOGIES, KENTUCKY

Question. Please provide a description of the research that has been funded under the Advanced Genetic Technologies, Kentucky grant.

Answer. This is a new special grant this year. The agency has requested the university to submit a grant proposal that has not yet been received. Preliminary communications with the principal researcher indicate that the project involves development of a high throughput deoxy-ribonucleic acid analysis facility. This will be used in genomics research projects on agricultural species aimed at (1) discovering genes and mechanisms to reduce the impact of diseases and pests on agricultural plants and animals, (2) metabolic engineering to produce novel commercial and pharmaceutical products from plants, and (3) enhancing crop and livestock productivity through genomics-facilitated breeding.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the principal researcher, the national need is that a fundamental understanding of crops and livestock, their symbionts and their pests can be gained far more rapidly and definitively by genomics tools and associated technologies. Information about whole genomes—such as very high density genetic maps or sequences of chromosomes—facilitates discovery of genes associated with metabolism, stress and parasite resistance, and yield. At the regional and local levels, the infrastructure generated through this grant will allow genomic analysis of local specialty crops and animals, a focus on their metabolites, pests and diseases, and an understanding of how plants and animals are or can be adapted to local environmental conditions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to increase the productivity of agricultural plants and animals by high-throughput genomic approaches. Similar research has been ongoing at this site, but at a much lower level than will be made possible by the research support technology to be funded by this award. Previous research included improvements of genetic maps of soybean, wheat, horses, and cattle; identification of plant genes for leaf senescence, organ development, stress tolerance, disease resistance, and secondary metabolism; and identifying genes in microorganisms that either enhance the productivity of plants and animals or contribute to the diseases of plants and animals.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated is \$473,955.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The present commitment of non-Federal funds and sources provided for this grant is approximately \$300,000 from State and Agricultural Experiment Station Funds and approximately \$25,000 for 0.3 full time equivalents in faculty time.

Question. Where is this work being carried out?

Answer. The research is conducted at the University of Kentucky, Lexington Campus, College of Agriculture/Kentucky Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is June 30, 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is the first year of the grant so a previous evaluation of the project has not been conducted. The agency will convene a merit review panel to evaluate the project when a proposal for fiscal year 2001 is received.

ADVANCED SPATIAL TECHNOLOGIES, MISSISSIPPI

Question. Please provide a description of the research that has been funded under the Advanced Spatial Technology, Mississippi grant.

Answer. This research will evaluate the use of site-specific technology and assess the economics of this application for site-specific precision farming. Cultural practices will be studied and integrated into a management system using site-specific technology to monitor yield and variable rate application. This project will expand on work conducted under the Spatial Technology Special Research Grant funded at \$350,000 in fiscal year 1997 and \$600,000 in 1998.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need for this research is to provide farmers with unbiased information on the application and economics of site-specific technologies for cotton, soybean, and rice production in the mid-south.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to evaluate site-specific technologies and develop recommendations for management decisions related to fertilization, pest control, and other cultural practices. Yield monitor and variable rate technology have been evaluated and are being adopted by farmers.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$350,000; for fiscal year 1998 it was \$600,000; for fiscal years 1999–2000 was \$1,000,000 per year; and for fiscal year 2001 is \$997,800 for total of \$3,947,800.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant are \$620,300 in 1998, \$942,000 in 1999, and \$974,000 in 2000. These funds are state appropriations that support the salaries of scientists and their support staff.

Question. Where is this work being carried out?

Answer. The research will be conducted on various Mississippi Agricultural Experiment Station facilities and farmer fields around the state.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Project Manager recognizes that it will take several years of field research to develop and demonstrate these technologies. Some objectives have been completed and results are being put into practice by farmers. Others are long term and will require multiple years to complete. Results from all experiments are evaluated at years end and used to fine tune remaining objectives as well as initiate priority new ones.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is subject to a thorough peer review in preparation of the grant proposal in addition to the year end assessment of progress for each experiment. A program update and field tour is held during the growing season for farmers, extension, and other researchers. Substantial improvements have been made in yield monitor for cotton harvesters and all program integration.

AFLATOXIN RESEARCH, ILLINOIS

Question. Please provide a description of the research that has been conducted under the Aflatoxin Research, Illinois grant.

Answer. This research is focused on development of strains of corn which will be highly resistant to infection with *Aspergillus flavus* and the production of aflatoxin

under field conditions. Transfer of genetic material from resistant strains to other usable, inbred strains of corn is underway, and these new strains are being field tested to determine level of resistance to fungal infection.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. There is continuing concern about the role of aflatoxins as carcinogens in the human population. The aflatoxin material is also toxic to animals and humans. The presence of the fungus in corn results in a lower value for the crop and the possible rejection of the corn. Aflatoxin contamination continues to be a serious problem in the southern and southeastern U.S., with additional outbreaks also occurring during severe drought conditions in the upper mid-west and other areas during the past few years.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was the reduction of infestation of corn with *Aspergillus flavus* and the consequent reduction of aflatoxin in the corn produced. The approach being used is to develop strains of corn which are genetically resistant to infestation with the fungus. The researchers have produced strains with resistance genes for both prevention of infection with *A. flavus* as well as the production of the aflatoxin itself. Field trials have been in progress to determine effectiveness of these resistance factors under normal growing conditions when exposed to the fungus. The work has now progressed to the stage where it seems likely that more than one gene will have to be transferred to produce strong resistance to the *Aspergillus* infection and production of aflatoxin.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$87,000; fiscal year 1991, \$131,000; fiscal years 1992–1993, \$134,000 per year; fiscal year 1994, \$126,000; fiscal years 1995 through 2000, \$113,000 per year; and for fiscal year 2001, \$130,712. A total of \$1,420,712 has been appropriated.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. The non-Federal funds have been from state appropriated dollars in the form of principal investigator and technical salaries, equipment usage, and experimental plot expenses. These have been at the level of \$130,000 for fiscal years 1997 and 1998 and \$24,747 for fiscal year 1999. In fiscal year 2000, \$65,000 in state and institutional funds were provided plus \$59,890 in related indirect costs not supported by the grant.

Question. Where is this work being performed?

Answer. The research is being performed in the Department of Crop Sciences at the University of Illinois.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was 1995, but the project was revised last year to continue into fiscal year 2002. The primary reason for the extension of the work is that there appears to be multiple resistance genes which are necessary to prevent both the infection with the fungus and the synthesis of the aflatoxin compound. The investigators are very optimistic about the future success of this approach. This work was discussed at a meeting of Multi-State Research Project NC-129 on January 25–26, 1999, in New Orleans, Louisiana, and the Principal Investigators are members of the Technical Committee of this project. This committee is very supportive of this line of research.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was evaluated in 1996 and again in March, 2000. The investigators have made good progress on this project. They have identified two genes which are required to have good protection against the fungus. They are testing several approaches to determine which will give them the best protection against the fungus. Unfortunately, the resistance to the *Aspergillus flavus* fungus which produces aflatoxin does not seem to carry over to other fungi such as *Fusarium moniliforme*, the origin of fumonisins. During the review it became apparent that a major impediment to more rapid progress is the lack of funds to permit larger scale field trials to test the transformed strains.

AGRICULTURAL DIVERSIFICATION AND SPECIALITY CROPS, HAWAII

Question. Please provide a description of the research that has been funded under the Agricultural Diversification and Specialty Crops, Hawaii grant.

Answer. A variety of research efforts are taking place, and they have outreach components that are adding value for clients. Work on the development of the most efficient post-harvest processing methodology for stevia, a natural sweetener, has begun and results are encouraging. Work on a production manual for fish in traditional Hawaiian fishponds on Molokai has also begun. This manual, written for the small entrepreneur, will include the results of production research. Work on food safety continues with a food safety survey sent out to 2,100 produce growers in December, 2000. This survey also had 20 frequently asked questions about food safety so that nearly all of Hawaii's produce growers have now become aware of the issue of food safety. Collaboration with the Hawaii Department of Agriculture has also led to the future establishment of a cadre of food safety auditors at the College of Tropical Agriculture and Human Resources, the Hawaii Department of Agriculture, and the private sector. Our website continues to be a major resource for information on food safety. Our "Profit Estimator" poster was available for clients in February 2000. This unique cost of production and profit estimation tool will allow any entrepreneur to calculate their costs and profit in five minutes without using a computer, software, or calculator. This project continues to advise the Hawaiian Commercial and Sugar Company on the possibility of starting a large-scale white taro production and processing operation in high pressure minimal processing for pineapple and other tropical fruits. The cause of premature fading of pineapple slices has been determined, and the temperature, pressure, and time relationship has been identified to achieve sterility. Plans are underway to work with the Hawaii Department of Agriculture and the Hawaii Agricultural Statistics Service to build a website where users can generate a graph of the prices of commodities found in the market place each day. The user can then define a time period and display the nature of price rises and declines. This information can help fine-tune production decisions.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Hawaii's economy continues to lag behind national averages where growth is concerned. The various projects under the umbrella of the Diversified Agriculture and Specialty Crop grant rely on research information to build decision-making tools. These tools help entrepreneurs make more informed decisions. When entrepreneurs make better decisions they have a higher chance of making a profit in business. The decisionmaking tools are being used in Hawaii, the Pacific, and on the mainland.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the original proposal was to screen potential food and non-food crops for commercial development in Hawaii and then make earnest attempts to work with willing and able entrepreneurs to move the results of research to the private sector. While the University of Hawaii continues to screen crops to help entrepreneurs pick the best ones for production and the market place, there are few decisionmaking tools that can help entrepreneurs take their products more successfully to market. Thus, there is an emphasis on information tools such as websites and the profit estimation/cost of the production poster. To help farmers prepare for increased food safety scrutiny, the University of Hawaii is working with Hawaii State agencies and other non-profits to reach out to farmers with critical information.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows, fiscal years 1988–1989, \$156,000 per year; fiscal years 1990–1993, \$154,000 per year; fiscal year 1994, \$145,000; fiscal years 1995–2001, \$131,000 per year; and fiscal year 2001, \$130,712. A total of \$1,989,712 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University of Hawaii provides in-kind support in the form of laboratory and office facilities, equipment and equipment maintenance, and administrative support services which was \$68,503 in fiscal year 1992; \$75,165 in fiscal year 1993; approximately \$75,000/year in fiscal years 1994–1996, and approximately \$20,000/year in fiscal years 1997–2000. Funds are also being leveraged from other private sector, state, and Federal sources for the development of nutraceuticals.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Hawaii's College of Tropical Agriculture and Human Resources on the island of Oahu, and other Hawaiian islands as necessary.

Question. What is the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date for additional or related objectives?

Answer. Profit/cost of the production poster will be available in February 2001. The Lei plant manual will be out in the first quarter of 2001. Work on Molokai fish production will conclude in December 2001. Work is just starting on transportation and food safety issues and will continue through 2002. Work on business related information tools will continue through 2002. Work continues on high pressure processing of tropical fruits and will continue through 2002. Work on nutraceuticals, particularly cultural practices and disease management of kava and stevia, is continuing through 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is progressing to reach the goals set forth in the proposal.

AGRICULTURAL DIVERSITY/RED RIVER, MINNESOTA AND NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Agricultural Diversity/Red River, Minnesota and North Dakota, grant.

Answer. This project has been an effective contributor to economic growth through a program of regional collaboration that helps to strengthen the region's competitive position in the global marketplace. A key and overarching goal of the project has been to bring together people and resources to enhance economic development for the region. This multi-year, multi-phase project will have six specific components. They are: (1) vegetable growing research—especially field and glasshouse related research, (2) vegetable collection and storage research and/or related storage or distribution business development, (3) development of processing industries for the fresh market or research related to the fresh products for market, (4) development of marketing and/or supply associations among vegetable producers, (5) development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products, and (6) development of processing industries for the frozen vegetable products market or research related to frozen products.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Initially the growing of vegetables in the region was driven by an opportunity to meet increasing consumer demands for fresh vegetables, and the northern plains states of Minnesota, North Dakota, and South Dakota have been identified as one area that could meet this need. The opportunity to add a high-value crop to the rotation cycle for northern Great Plains farmers can help to decrease their dependence upon program crops. The shift in cropping patterns can have a positive effect on farm income and lessen the need for outside or Federal financial assistance. Interest in the potential for adding higher value crop to the rotation cycle, including vegetables, has increased significantly in the past two years due to the poor farm economy. Research on the potential for adding new crops to the region's production base could help stabilize the farm economy in the region and lessen the need for outside financial assistance to farmers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original project goals include: (1) Conduct three replicated field trials on growing of carrots; (2) Continue study of vegetable growing techniques in Europe and continue negotiations with vegetable growing research facilities/laboratories in Europe to transfer growing knowledge to the region; (3) Review current and future market opportunities for further development of the industry and identify strategies and partners for pursuing these opportunities and take appropriate organizing steps; (4) Develop and maintain a web page for this vegetable industry project; (5) Conduct market research for establishment of a ready-to-eat delicatessen salad processing facility in the region; (6) Conduct market research for establishment of a ready-to-eat fresh-bagged salad processing facility in the region; (7) Continue business development planning for establishment of a ready-to-eat delicatessen salad processing facility in the region; and, (8) Continue business development planning for establishment of ready-to-eat and fresh-bagged salad processing facility in the region.

To date this grant has accomplished the economic incubation of a new deli-salad production system and industry for the region. Additional new regionally based in-

dustries that are being promoted, developed, and served by this grant include vegetable dehydration, greenhouse table vegetable production and alfalfa processing.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This work supported by this grant began in fiscal year 1998 with appropriations for fiscal years 1998 through 2000 of \$250,000 each year and \$374,175 in fiscal year 2001 for a total of \$1,124,175 appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Efforts have been made to secure non-Federal funding from individual states and commodity groups. To date the States of North Dakota and Minnesota have been a source of approximately \$65,000.

Question. Where is the work being carried out?

Answer. The work is being carried out in Minnesota, North Dakota, and South Dakota.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Progress is being made on the original objectives. It is expected that this will be a multi-year, multi-phase project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is evaluated by review of the proposal and the annual project reports. An on-site review was conducted during June of 2000. This project has been an effective contributor to economic growth through a program of regional collaboration that helps to strengthen the region's competitive position in the global marketplace. A key and overarching goal of the project has been to bring together people and resources to enhance economic development for the region. This project funding has facilitated the formation of a networking strategy that links manufacturing, financial, legal, transportation, trade services, and economic development sectors into a region-wide economic growth effort and to create a Red River region marketing program. The Red River Trade Council has become an important resource to the region in the development of grower driven alliances. The Red River Trade Council and its affiliate organization, The Northern Great Plains Initiative for Rural Development, currently serve as the staff for the FarmConnect effort in Minnesota, and they also serve as the resident agent for the U.S. Ag Producers Alliance. The project has had a strong presence on the world wide web and has facilitated entry of rural manufacturing business and agri-business into web-based e-business.

AG-BASED INDUSTRIAL LUBRICANTS RESEARCH PROGRAM, IOWA

Question. Please provide a description of the research that has been funded under the Agricultural-Based Industrial Lubricants Research Program, Iowa grant.

Answer. This project is a continuation of ten years of activity conducted to target specific applications, establish baseline performance data, develop formulations of additives and chemical modifications, administer laboratory and field tests, characterize, and build relationships for commercialization of industrial lubricants derived from U.S. grown vegetable-based oils. Baseline performance data will be compiled to establish fatty acid compositions, guide genetic modifications, additive development, establish standards relative to toxicity and biodegradability, and characterize compatibility with specific metallic and non-metallic components. The grant has been peer reviewed internally at the University of Northern Iowa.

Question. According to the research proposal, or the principal research, what is the national, regional, or local need for this research?

Answer. Primary local and regional need is related to expanding value-added applications of agricultural commodities in order to stimulate increased demand and raise crop prices paid to farmers. On a national level, pursuant to the Biomass Research and Development Act of 2000, Executive Orders 13101 and 13114, the need is to provide renewable, safer, more environmentally-sound alternatives to petroleum-based industrial lubricants. Furthermore, there is a belief that there are international possibilities for the use of genetically-modified soybean-based lubricants. Considering the controversy in Europe for genetically-modified food, premium quality lubricants made of genetically modified domestic crops present a potential for use in a more non-controversial area i.e., industrial lubricants.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the program was sponsored by non-Federal funding to develop a soybean-based hydraulic oil which was introduced to market in July

of 1997 as BioSOY hydraulic fluid. Field testing of two grease formulations and a dielectric transformer coolant are near completion, as well as development of a two-cycle engine lubricant, and bar and chain oil. A large volume of technical data has been compiled specific to crop-based oil and lubricants. This program has identified and has begun servicing a broad array of market development requirements, including demonstrating specific performance features, expanding awareness, and supporting government purchase initiatives. In September 1999, two new soybean-based lubricants were licensed to West Central Coop and are now commercial products. Those were a chain saw bar oil called SoyLINK and a fifth wheel grease called SoyTRUK. A new marketing arm spin-off from the University Foundation is planning to market 12 soybean oil-based lubricants developed through this program.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Federal funding for this project began with a 1998 appropriation of \$200,000. Fiscal years 1999 and 2000 appropriations are \$250,000 each year; and fiscal year 2001 is \$349,230, for a total of \$1,049,230 appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since 1992 this research program has received cash grants from the Iowa Soybean Promotion Board, Carver Scientific Research Initiatives, in addition to several in-kind donations from industry, to develop and coordinate commercialization of what has since become BioSOY hydraulic oil. Beginning in 1995, the state of Iowa began to support the program through its Wallace Technology Transfer Foundation. Beginning in 1996, state funding was provided by legislative appropriation through the Iowa Department of Economic Development. Additional funding has been provided by the Iowa Department of Agriculture and Land Stewardship. In fiscal year 2000 \$150,000 was appropriated through the Iowa Department of Economic Development, \$25,000 from the Iowa Soybean Promotion Board, \$25,000 from Iowa Department of Agriculture and Land Stewardship, \$32,500 from John Deere, and other awards and service revenues totaling approximately \$75,000. State funding for fiscal year 2001 in the amount of \$400,000 has been requested through direct appropriation to the university.

Question. Where is the work being carried out?

Answer. Laboratory and literature studies are being carried out primarily at the Ag-based Industrial Lubricants Research Program facility in Waverly, Iowa, with minor portions of activity being conducted on the campus of the University of Northern Iowa in Cedar Falls, Iowa, and other labs. Field tests are being conducted at Sandia National Laboratories, U.S. Department of Army test sites, some municipalities, and in industrial equipment located throughout the nation. A short line Iowa-based railroad and a class I railroad have been testing soybean-based rail/flange grease with success. The rail systems in San Francisco—BART—and in Oregon—Tri-Met—now use soybean-based rail flange grease at their facilities. The Iowa Department of Transportation has begun conversion of most of its mobile equipment to the soybean-based hydraulic fluid developed under this program.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have been met, in part, with the optimization, demonstration, and commercialization of the soy-based hydraulic fluid, chain and bar lubricants, grease for semi-trucks, plus several other products that are being commercialized this year. Data collection, additive and modification research, characterization, and supplier development objectives of the last year are ongoing. Commercialization of the dielectric transformer coolant is an added objective and has been expedited through to field testing. Activities to expand public awareness and support government purchase initiatives have been added to the original objectives. Field testing of some products is expected to be completed within a year. Additional lubricants in the metalworking applications are targeted for development and field testing with commercialization expected in two years. The program has begun to identify price reduction strategies for the first generation lubricants to make final cost of these products competitive with conventional petroleum lubricants. The price of some soybean-based greases developed with genetically-modified soybeans are anticipated to approach prices of conventional oils by the conclusion of the current project period.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist reviews quarterly reports and has determined that this research is conducted in accordance with the mission of the agency.

AGRICULTURE TELECOMMUNICATIONS, NEW YORK

Question. Please provide a description of the research that has been funded under the Agriculture Telecommunications, New York grant.

Answer. This program encourages the development and utilization of an agricultural communications network to facilitate and strengthen agricultural extension, resident education, and research, and domestic and international marketing of U.S. commodities and products through a partnership between eligible institutions and the USDA.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. The following needs will be addressed by this program:

- Make optimal use of available resources for agricultural extension, resident education, and research by sharing resources between participating institutions;
- Improve the competitive position of U.S. agriculture in international markets by disseminating information to producers, processors, and researchers;
- Train students for careers in agriculture, natural resource management, environmental science, human sciences, and the food industries;
- Facilitate interaction among leading agricultural scientists;
- Identify new uses for farm commodities and increase the demand for U.S. agricultural products in both domestic and foreign markets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this program is to encourage the development and utilization of an agricultural communications network to facilitate and strengthen agricultural extension, resident education, and research, and domestic and international marketing of U.S. commodities and products through a partnership between eligible institutions and the USDA. Various educational, extension, and technology transfer projects have been funded through the program in fulfillment of this goal.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. The project began in fiscal year 2000. Appropriations for fiscal year 2000 was \$425,000 and for fiscal year 2001 is \$424,065 each year for a total of \$849,065. The project was previously funded under the Extension Activities account.

Question. What is the source and amount of non-Federal funds provided, by fiscal year?

Answer. Prior to fiscal year 2000, the project received a 100 percent match of funds from non-Federal sources. However, beginning in fiscal year 2000, it became a special research grant and does not require a match of funds from non-Federal sources.

Question. Where is this work being carried out?

Answer. Cornell University will award grants competitively throughout the U.S.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Individual projects being funded address ongoing needs for information dissemination and technology transfer. As each project is completed the results are evaluated to determine the success of meeting the program's objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The agency evaluated this project each year via a report from institutions funded. The following highlights the programs funded under this project:

The University of Minnesota, Washington State University, University of Arizona, and Virginia Tech will collaborate to develop and pilot a model for a national system for technology-enhanced pesticide applicator training and education. The model can be replicated in other national programs that require certification.

Oregon, Maryland, Vermont, Kentucky, Alabama, Wisconsin, Oklahoma, Kansas, California, Wyoming, Montana, Washington, and Arizona will collaborate to develop a comprehensive knowledge resource for alfalfa, the National Alfalfa Information System, providing an improved information resource for educational programs.

Florida, Kentucky, Georgia, Mississippi, and Texas have developed a national real-time Internet web-based radio network for agricultural, food, human and natural resource related information to present and promote new and existing educational information from land-grant universities and colleges providing the public with the latest up-to-date information.

Nebraska, South Dakota, Colorado, Minnesota, and Wisconsin established a library of Internet-based teaching modules in plant biotechnology that facilitate inter-

active learning to assemble programs that target the education needs of agricultural professionals.

Idaho, Colorado, Nevada, and California developed multiple courses for a national audience of persons related to mealtimes in child programs, including the USDA Child Care Food Program. The program provides research-based information via distance education to those who feed children in group settings and offers on-going accessible course work and in service training.

Pennsylvania, California, Texas, and Puerto Rico have developed web-based learning programs for food industry professionals designed to empower current and future food processing industry professionals to be effective product development team players, problem solvers, decision makers, and communicators with the ultimate goal of assisting companies in creating the expertise to develop and market new products.

Missouri and Colorado teaming with USDA's Meat Animal Research Center are using the world wide web and computing resources to deliver a sophisticated decision support tool to producers, educators, and researchers linking herd based, bio-economic simulation models related to cattle production systems.

Indiana and Kentucky with 33 other universities have designed a national interactive computer-based learning project for youth. This network is an integral component of curriculum developed by the National 4-H Cooperative Curriculum System for youth ages 8-19.

Nebraska, Iowa, Kansas, North Dakota, South Dakota, and Texas developed an inter-institutional program of studies leading to a Masters of Science in family financial planning through distance education. The program uses the expertise of several institutions to provide opportunities for pursuit of higher education and lowers barriers to inter-institutional collaboration.

AGRICULTURE WATER USAGE, GEORGIA

Question. Please provide a description of the research that has been funded under the Agriculture Water Usage, Georgia grant.

Answer. The project will determine agricultural water use in Georgia using a two percent statistical sample of water sources. Equipment has been purchased and personnel hired to conduct the project.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Water has become a major issue in the southeast. The tri-state water "issue" between Florida, Georgia, and Alabama involves allocating interstate waters in the primary river basins that begin in the Atlanta area. These allocation formulas are completed and ready for use. The salt water intrusion problem associated with coastal Georgia and South Carolina is also a major issue. Both of these problems suffer from a lack of data on agricultural water use across the state. This program seeks to develop a monitoring and modeling strategy to determine the quantity of water used by agricultural irrigation. The program is designed to begin in Georgia and allow expansion of the program into neighboring states for a better estimate of agricultural water use.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project hired strategic personnel for the monitoring program and development of the equipment and the database to be used for obtaining volunteers for the monitoring phase. This integrated project will involve the development of computer based models to take a monitoring sample and extrapolate that information for the entire state.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal years 1999 and 2000 was \$300,000 per year and for fiscal year 2001 is \$299,340 giving a total of \$899,340.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The State of Georgia through the Georgia Department of Natural Resources, Environmental Protection Division appropriated \$289,000 for fiscal years 1998-1999 and is expected to appropriate \$250,000 per year for an additional 4 years to help support this project.

Question. Where is the work being carried out?

Answer. Research will be conducted from the University of Georgia, College of Agricultural and Environmental Sciences. The primary coordination of the program will be centered in the Biological and Agricultural Engineering Unit at Tifton, Geor-

gia, but the program will involve input from personnel in Griffin and Athens and researchers outside the University of Georgia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project, within the overall agricultural water use program, is anticipated to be completed within the original 5-year time frame. Since this project is new, objectives have not been completed to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is new and has not been through an agency evaluation; however, the investigators prepare quarterly reports for the State. The procedures used to conduct the project have been peer reviewed, and publications developed by the project will be peer reviewed. One product has been produced, "Irrigation Conservation Practices for the Southeast U.S.", a 60-page report.

AGROECOLOGY, MARYLAND

Question. Please provide a description of the research that has been funded under the Agroecology, Maryland grant.

Answer. The agency has requested the university to submit a new grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to protect the largest estuary of the Chesapeake Bay in the U.S. that is fed by eight states. Maryland is trying to achieve its share of the 40 percent nutrient reductions required by the new Chesapeake 2000 Agreement while maintaining economically-viable agriculture and natural resources. Agriculture is the predominant land use and economic engine for Maryland. It requires the generation of additional science-based knowledge and policy guidance in the fields of biological, physical, and social sciences.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal is the generation of science-based policy decisions towards reaching the 40 percent reduction goals while maintaining viable agriculture and natural resource industries. Fiscal year 2001 is the first year for this project.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were \$285,000 state appropriations.

Question. Where will the research be carried out?

Answer. This is the first year for this grant, but the principal investigator envisions that work will be carried out at appropriate, well-equipped laboratories and field sites throughout the University of Maryland system and the state.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is still being clarified for the first year. The principal investigator anticipates that this project will play an ongoing role in assisting agriculture in achieving long-term nutrient reduction and other cooperative goals of the Chesapeake Bay Program.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since fiscal year 2001 is the first year of the project, no evaluation has yet been conducted.

ALLIANCE FOR FOOD PROTECTION, NEBRASKA AND GEORGIA

Question. Please provide a description of the research that has been funded under the Alliance for Food Protection, Nebraska and Georgia grant.

Answer. The fiscal year 2000 appropriation supports the continuation of a collaborative alliance between the University of Georgia Center for Food Safety and Quality Enhancement and the University of Nebraska Department of Food Science and Technology. Fiscal year 2000 funds supported research at the University of Nebraska on the detection, identification, and characterization of food allergens, the ef-

fects of processing on peanut allergens, and investigation of the efficacy of using various types of thermal processes to reduce or destroy the toxicity and mutagenicity of certain *Fusarium* metabolites in corn and corn products. Research at the University of Georgia was directed toward determining the foodborne significance of *Helicobacter pylori*, determining the effect of antimicrobials to eliminate *Arcobacter* from pork, determining the survival of *E. coli* O157:H7 at reduced water activity, and using extrusion cooking to destroy peanut allergens. Proposals from the University of Georgia and the University of Nebraska in support of the fiscal year 2001 appropriation have been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers believe the proposed research addresses emerging issues in food safety which have national, regional and local significance. Specifically, research will address bacterial pathogens that can cause ulcers, cancer, and diarrheal illness, toxic fungal metabolites in corn products, and allergens in foods that cause serious reactions, including death in sensitive people. These emerging issues affect consumers, the food industry, and food producers at all levels—national, state, and local.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of this research was to: (1) facilitate the development and modification of food processing and preservation technologies to enhance the microbiological and chemical safety of products as they reach the consumer, and (2) develop new rapid and sensitive techniques for detecting pathogens and their toxins as well as toxic chemicals and allergens in foods. The University of Nebraska developed assays for detection of peanut, milk, egg, almond, walnut, pecan, and hazelnut residues in processed foods; produced high-quality antibodies for these assays; identified and characterized a soybean allergen and two sunflower seed allergens; discovered clues as to the reason why Brazil nuts cause severe allergic reactions; discovered that certain types of *Fusarium* fungi do not produce mutagenic substances; developed a simple liquid chromatographic procedure for determination of moniliformin toxin; found that the corn flake manufacturing process can reduce levels of fungal toxins such as aflatoxin and fumonisins; also found that low levels of carcinogenic aflatoxins in corn grits might be reduced to less than regulatory actions levels by the corn flake manufacturing process; discovered that making corn flakes with sucrose did not help to reduce fumonisin levels, but that adding glucose, or toasting the flakes helped to reduce the fumonisin levels significantly; and created reagents that can be used to develop a rapid method to test corn for moniliformin toxin.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1996, and \$300,000 per year was appropriated in fiscal years 1996 through 2000, and \$299,340 in fiscal year 2001 for a total appropriation of \$1,799,340.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were \$117,000 state funds and \$250,000 industry and miscellaneous in fiscal year 1996 and were estimated to be a minimum of \$111,000 state funds and \$305,000 industry and miscellaneous in fiscal year 1997; \$70,000 state funds and \$295,000 industry and miscellaneous funds in fiscal year 1998; \$25,000 state funds and \$250,000 industry funds in fiscal year 1999; and are estimated to be a minimum of \$25,000 state funds and \$25,000 industry funds in fiscal year 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Georgia Center for Food Safety and Quality Enhancement in Griffin, Georgia, and at the University of Nebraska Department of Food Science and Technology in Lincoln, Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The original objectives have not yet been met. The researchers anticipate that work will be completed on the original objectives in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposals submitted in support of the appropriation on an annual basis. A review of the proposal from the University of Nebraska was conducted on May 4, 2000, and good progress was demonstrated on the objectives undertaken in 1998. A review of the

proposal from the University of Georgia was conducted on May 4, 2000, and good progress was demonstrated on the objectives undertaken in 1998.

ALTERNATIVE CROPS, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Alternative Crops, North Dakota program.

Answer. The alternative crops project has two main thrusts—development and utilization of alternative or specialty crops and novel or new utilization of traditional crops. The goals of the project are to diversify income at the farm gate, and reduce reliance on monoculture to help alleviate pest problems, while providing new agricultural and industrial products to society. Some of the new areas under investigation include feeding of co-products from value-added industry to livestock; development of white corn and white wheat as alternative crops; alternative crops for aquaculture diets; development of unique dry bean market classes; alternative legumes for crop rotations; and expanding utilization of dry peas and lentils. Previous work continues with oilseed crops such as crambe, rapeseed, and safflower as a renewable supply of industrial oil, products from food crops for novel new uses in paints, coatings, food ingredients, and the development of new biochemical and enzymatic processes to refine oils for industrial uses. The projects funded in this appropriation are evaluated by a peer-panel chosen by the Associate Dean of Research at North Dakota State University. The internal peer review was conducted on the following criteria: (1) development of novel uses for new and existing crops, (2) development of niche crops and diversified agriculture opportunities, (3) identification of identity-preserved products, (4) adaptation of alternative crops, (5) scientific merit, (6) feasibility and practicality, (7) interdisciplinary efforts, (8) private sector involvement, and (9) potential economic benefit.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Regionally, the temperate areas of the Midwest have the potential to grow a great number of different crops but are in need of publicly-sponsored research efforts to reveal the most practical, efficient, and economical crops and products to pursue.

Growers in surrounding states are currently utilizing the information generated by research conducted through this grant. The principal researcher believes that nationally developing new crops and new markets for agricultural products is critical for both environmental and economic reasons. Enhanced biodiversity that comes from the successful commercialization of new crops aids farmers in dealing with pests and reducing the dependency upon pesticides. New markets are needed to provide more economic stability for agricultural products, especially as Federal price supports are gradually withdrawn.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was and still is to introduce, evaluate, and test new crops which will broaden the economic diversity of crops grown in North Dakota. The primary emphasis continues to be the adaptation and development of new crops, utilization of new and existing crops, and creating value-added agricultural opportunities. A brief review of accomplishments includes: adaptation and expanded production of new crops including crambe, canola, field pea, lentil, lupin, chickpea, amaranth, and buckwheat; development of alternative crops and crop co-products for new markets in livestock and fish feeds; expanded knowledge on technical aspects of biochemical means of splitting oilseed fatty acids; deriving red dye and pectin from sunflower; creating new uses for various oilseeds; and developing improved nutritional profiles for selected food and feed crops. These efforts have forged a strong link with the private sector and successfully spawned several crops and products into profitable private sector businesses.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Appropriations by fiscal year are as follows: 1990, \$494,000; 1991, \$497,000; 1992 and 1993, \$700,000 per year; 1994, \$658,000; 1995, \$592,000; 1996 through 2000, \$550,000 per year; and 2001, \$623,625. A total of \$7,004,625 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1991, \$10,170 was provided by state appropriations. In fiscal year 1992, \$29,158 was also provided by state appropriations and self-generated funds. In fiscal year 1993, \$30,084 was provided by state appropriations. In fiscal year 1994, \$161,628 was provided by state funds, \$3,189 provided by industry, and

\$9,020 provided by other sources, totaling \$173,837. In fiscal year 1995, \$370,618 was provided by state appropriations, \$1,496 provided by self-generated funds, \$1,581 provided by industry, and \$5,970 was provided in other non-Federal funds totaling \$379,665 for fiscal year 1995. In fiscal year 1996, \$285,042 was provided by state appropriation, \$4,742 provided by industry, \$14,247 provided from other non-Federal funds totaling \$304,031 for 1996. In fiscal year 1997, \$462,012 was provided by state appropriations, \$8,080 was provided by self-generated funds, \$8,217 was provided by industry, and \$103,063 was provided from other non-Federal funds totaling \$581,372 for fiscal year 1997. In fiscal year 1999, \$984,251 was provided through state appropriations, \$40,198 provided through self-generated funds, \$13,010 provided by industry, and \$87,942 from other non-Federal sources for a total of \$1,125,401. In fiscal year 2000, \$368,664 in state appropriations, \$93,408 in other non-Federal funds, and \$31,886 in industry funds for a total of \$493,958 were provided for this grant

Question. Where is this work being carried out?

Answer. The work is conducted on the campus of North Dakota State University and at six different research extension centers in North Dakota. Work is also done in eastern Montana.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Fiscal year 2001 is the twelfth year of activity under this grant. The primary emphasis has been to find new crops with non-food uses and create value added products. The original objectives have been met, however, new opportunities have become known as previous research has identified new crop alternatives and innovative crop utilization ideas.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist annually reviews the project and has determined that the research is conducted in accordance with the mission of this agency.

ALTERNATIVE CROPS FOR ARID LANDS, TEXAS

Question. Please provide a description of the research that has been funded under the Alternative Crops for Arid Lands, Texas grant.

Answer. This grant is to develop the two most abundant plants in the southwestern U.S., i.e. mesquite and cactus, into commercial crops through a combination of applied research and market development. In Texas, New Mexico, Arizona and California these plants occupy 72 million acres. This grant is peer reviewed internally and external reviewers include a private sector cactus breeder, the Texas Agricultural Extension Service, and a specialist in wood products marketing.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this goal?

Answer. The semi-arid regions of the U.S. that border with Mexico in Texas, New Mexico, Arizona, and California have some of the highest unemployment rates, lowest economic returns per acre, and lowest incomes in the U.S. The two most abundant plant species in this region are prickly pear cactus and mesquite. By working with Mexican researchers, this grant will help to stabilize the economic situation of rural poor in Mexico and the U.S. There are few crops capable of being grown sustainably in these regions. Due to the nitrogen fixing capability, and thus soil improving properties of mesquite and high water use efficiency of cactus, these plants contribute to sustainable agriculture and will diversify southwestern agriculture. This research group is the only center in the U.S. developing these plants as crops.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to dramatically improve the economic returns and year-to-year economic stability in the southwestern United States from arid and semi-arid lands. For cactus, the goal has been to provide improved varieties that can be harvested and processed into food and forage. Over 50 hybridizations were conducted between the top producing fruit accessions of cactus. Reciprocal hybridizations for 14 different accessions were successfully harvested and viable seed recovered. Germination trials have yielded more than 100 seedlings from which selected hybrids will be transferred to the field in the spring of 2001. Plots planted in late summer of 1999 are growing well with few plant deaths. Data on pads and number of fruit have been analyzed and will be combined with data collected in the spring of 2001. Selected cuttings from different accessions have been planted and subjected to freezing temperatures to evaluate freeze damage. Long term storage of pollen is very important, and storage trials are underway to determine optimum conditions. For mes-

quite, the goal is to increase its value as a result of better tree form. Germination and survival rates for 20 sources for superior trees in Texas were evaluated. Seedling height prior to transplanting has been found to be an important factor that affects survival rate. A meeting was held with a ranch owner in Freer, Texas, to evaluate mesquite trees for possible inclusion in a mesquite productivity study. The Eighteenth Annual Los Amigos del Mesquite Conference, sponsored by the Wray Charitable Trust was planned and carried out in the fall of 2000. The conference topic was "The Mesquite Bean and Its Utilization". Subjects such as mesquite bean flour and cattle feed as well as mesquite tree management that fosters soil conservation, proper pruning procedures for mesquite trees, and long term development of mesquite products were presented. Ten mesquite-related companies were represented at the conference.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1994 and the appropriation for fiscal year 1994 was \$94,000. For fiscal years 1995 through 1997 the appropriation was \$85,000 per year; for fiscal years 1999 through 2000 was \$100,000 per year; and for fiscal year 2001 is \$99,780. A total of \$648,780 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1994, \$43,215 was provided by the Texas legislature.

Question. Where is the work being carried out?

Answer. The work is being conducted by Texas A&M University, Kingsville, Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. For cactus, the original objective of the project was to provide improved varieties of cactus for fruit and napolitos marketing. Researchers anticipate that improved varieties should be available in two to four years. Currently, a small Texas and California cactus industry exists, and more economic growth can be achieved with the introduction of new varieties. For mesquite, the objective to improve the economic return largely has been met, since markets for mesquite lumber, flooring, furniture, and barbecue work products continue to improve. Other related objectives such as growth and form, genetic screening, and breeding will take longer to complete.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

ALTERNATIVE NUTRIENT MANAGEMENT, VERMONT

Question. Please provide a description of the research that has been funded under the Alternative Nutrient Management, Vermont grant.

Answer. In January 2001, the agency requested the University of Vermont to submit a grant proposal which will be completed soon. The project will investigate the effectiveness of constructed wetlands to treat farm runoff and manure to protect adjacent water sources.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Developing more cost effective and efficient strategies to protect groundwater from pollution with farmyard waste is a local, regional, and national priority.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to use a constructed wetland comprised of different plant ecosystems to study how the plant biomass, the species or combination of plants, and the harvesting of plants and climatic conditions modify the effectiveness of nutrient removal from the farm effluent introduced into the system. The research is yet to commence although substantial planning and literature evaluation has been conducted.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 with an appropriation of \$189,582.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This project will be cooperative with colleagues across the University, in Natural Resource Conservation Service, and in the Vermont Department of Agriculture. We do not know the precise levels of non-Federal funds that will be expended over the course of the project. We expect there will be substantial additional investments of state and university funds in salaries, support costs, and equipment expenditures.

Question. Where is the work being carried out?

Answer. Research will be conducted at the University of Vermont's Paul Miller Research Center.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This will be a 1-year project completed at the end of 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since this is a new project, no agency evaluation has occurred.

ALTERNATIVE SALMON PRODUCTS, ALASKA

Question. Please provide a description of the research that has been funded under the Alternative Salmon Products, Alaska grant.

Answer. The overall goal of the Alternative Salmon Products Program for fiscal year 2000 was to develop market-desired salmon products using wild-caught salmon. The project assisted Alaska salmon producers in sustaining current and entering new markets. The main approach has been a competitive grant process for proposals on marketing of salmon products. In addition, an assessment of the Hong Kong smoked salmon trade was to be performed. According to the Principal Investigator, a call for proposals on the Marketing Mini-grants has been put out and the proposals will be judged. Proposals for fiscal year 2001 have been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Alaska salmon industry has lost considerable market share worldwide to farmed salmon production. In 1994, the farmed salmon market share surpassed Alaska's market share of the world's salmon supply and has continued to climb every year since. In 1997, Norwegian farmed salmon production exceeded Alaska wild stock harvests. Also in 1997, Chilean Coho salmon exports to Japan exceeded North American sockeye salmon exports to Japan. Japan has traditionally been Alaska's strongest and most lucrative export market. The Alaska salmon industry is a multi-state industry. Though the product is harvested in Alaska, the benefits are shared with fishermen residents in Washington State, Oregon, California, and throughout the nation.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The broad research goal of the Alternative Salmon Product Program is the development of market-desired salmon products using wild-caught salmon. In 1998 and continuing, researchers involved in the Pinbone Removal Machine Project are addressing the problem of deboning wild-caught fish in appropriate volumes, so that they can be marketed as frozen skinless, boneless fillet portions rather than simply as headed and gutted frozen fish or canned salmon. New products such as this would allow Alaskan wild caught salmon to compete more effectively with pen-reared salmon. The researchers have designed, built and tested four prototype pinbone removal machines, making sequential improvements in processing plants during the 2000 salmon season.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The initial funding for the Alternative Salmon Products program was \$400,000 per year on fiscal years 1998 and 1999; fiscal year 2000, \$552,500; and fiscal year 2001, \$643,581. A total of \$1,996,081 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Industry will contribute approximately \$50,000 based on estimated cost of \$50,000 per plant for commercial testing of beta prototype.

Question. Where is this work being carried out?

Answer. The work will be conducted at the University of Alaska, Fairbanks, the University of Alaska Fishery Industrial Technology Center in Kodiak Alaska, in Hong Kong, and in a variety of salmon product processing plants across Alaska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The Pinbone Machine Project under the Alternative Salmon Product Program, including original and related objectives, will be completed with fiscal year 2000 funding. Other projects, like the Alternative Salmon Management Program will take about two years to complete the objective.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal received in support of the fiscal year 2000 appropriation was reviewed for merit on September 14, 2000. The project's thrust is to assist Alaska Salmon producers to sustain market penetration by entering new markets with value added products. The main approach was to award competitive grant proposals on marketing Salmon products. Assessment of trade in Hong Kong smoked Salmon was also part of the proposal.

ANIMAL SCIENCE FOOD SAFETY CONSORTIUM

Question. Please provide a description of the research that has been funded under the Animal Science Food Safety Consortium program.

Answer. The Food Safety Consortium is focused on accomplishing six objectives: (1) to develop techniques for rapid detection of infectious agents and toxins in meat and poultry; (2) to develop a statistical approach for evaluating potential health risks; (3) to identify effective intervention points to control microbiological or chemical hazards; (4) to develop monitoring methodologies to detect these hazards in the distribution chain; (5) to develop technologies to complement the development of Hazard Analysis and Critical Control Point—HACCP—programs by USDA; and (6) to estimate costs and benefits associated with intervention alternatives.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. A safer meat product food supply would reduce the economic losses related to days away from work, medical treatment, and even human suffering and death as a result of foodborne illnesses. The costs are estimated at over \$5 billion a year. The Consortium's participation in technology transfer to health departments and trade associations are helping on a regional and local level to educate consumers and food handlers on safe handling procedures. Scientific-based testing that is being developed will help provide food that will be accepted in international markets and increase exports and sustainable rural economies at home. On a regional and local level, each of the institutions are involved in HACCP program training for industry and are holding seminars for industry to discuss food safety research findings. In addition, the University of Arkansas is teaching food safe programs to children in state elementary schools.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal was to bring together research and expertise of institutions in three states in order to best address the areas of poultry, beef, and pork meat production from the farm to the consumer's table. In coordination with each other, they seek to develop detection, monitoring, and prevention techniques to control or prevent the presence of infectious agents and chemical toxins in the food supply.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,400,000; fiscal year 1990, \$1,678,000; fiscal year 1991, \$1,845,000; fiscal years 1992–1993, \$1,942,000; fiscal year 1994, \$1,825,000; fiscal years 1995–1996, \$1,743,000 each year; fiscal year 1997, \$1,690,000; fiscal years 1998–2000, \$1,521,000 each year; and fiscal year 2001, \$1,631,403. A total of \$22,002,403 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$1,611,947 in 1991; \$1,639,050 in 1992; \$1,726,153 in 1993; \$2,304,223 in 1994; \$2,075,145 in 1995; \$2,796,097 in 1996; \$2,600,545 in 1997; \$1,850,899 in 1998; \$3,421,866 in 1999. Thus, from 1991 through 1999 a total of \$20,025,925 in non-Federal funds was provided.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University, Kansas State University, University of Arkansas at Fayetteville, University of Arkansas for Medical Sciences at Little Rock, and Arkansas Children's Hospital.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The research projects from the Consortium continue to evolve and build on the original objectives first set out in 1989. The principal investigators have developed patented tests that have significantly reduced the time necessary to detect pathogens in the processing plants.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. There has never been a formal evaluation of the Food Safety Consortium but instead an annual conference is organized at which a designated representative from CSREES attends. Along with other invited agency representatives, such as the Food Safety and Inspection Service, the Agricultural Research Service, and the Economic Research Service, CSREES participates in a steering committee meeting which critiques projects and discusses research priorities. Peer reviews are conducted by expert scientists who are not members of the Consortium, to determine those projects selected for funding.

APPLE FIRE BLIGHT, MICHIGAN AND NEW YORK

Question. Please provide a description of the research that has been funded under the Controlling Fire Blight Disease of Apple Trees, Michigan and New York grant.

Answer. This project studies fire blight in apple trees, which is a bacterial disease that can kill spurs, branches, and sometimes entire trees. The management of this disease is difficult because only one antibiotic treatment is available. The objectives of this research are to develop fire blight resistance varieties, evaluate biological and chemical control methodologies for disease management, and develop an education and extension component for disease management.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Fire blight is a destructive bacterial disease of apple trees throughout the U.S. that can kill the trees. In the northeast, the disease is more prevalent because of humid weather conditions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to develop transgenic apple trees through various molecular technologies, to develop new approaches to antibiotic treatments of disease, to develop an early screening technique for tree sensitivity to the disease, to evaluate biological and cultural controls, and to develop and improve education and extension components of disease management. The last objective involves using disease prediction models.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Fiscal year 1997 was the first year funds were appropriated for this grant at \$325,000. For fiscal years 1998 through 2000, \$500,000 per year, and \$498,900 in fiscal year 2001. A total of \$2,323,900 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds for 1997 were \$40,127 for Michigan and \$104,166 for New York. The funds for 1998 were \$40,071 from Michigan and \$104,166 from New York. The state appropriated funds for 1999 were \$49,771 for Michigan and \$106,689 from New York. The state appropriated funds for 2000 were \$43,200 for New York and \$46,178 for Michigan.

Question. Where is this work being carried out?

Answer. Research is being conducted at Michigan State University and Cornell University, New York Experiment Station.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated date of completion for the original objectives was 2000. The objectives have not been met. It is estimated by the researchers that three to five years are needed to complete this project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last merit review of this project was in January 1999. A site visit was made to Michigan State University in March 1999 and to Cornell University, Geneva and Ithaca, New York in April 1999. Both principal investigators were visited as well as the field sites. Surveys of established apple orchards and new planting in New York showed losses of up to 255 trees due to fire blight infections of rootstocks. Several new materials for control of fire blight on susceptible varieties gave promising results in field trails. Improved techniques to transfer genes into apples and to obtain flowering on the transgenic trees have been developed so that transgenic fruits can be examined within two years. In research in Michigan, a total of 50 phage isolated from fire blight were characterized with the potential of using these to control the disease. A new plant growth regulator that controls vegetative growth in apple appeared to make trees less susceptible to fire blight. A detailed study of the role of the *hrpA* gene in fire blight virulence has been completed with a better understanding of its involvement in virulence in the disease.

AQUACULTURE, ARKANSAS

Question. Please provide a description of the research that will be funded under the Aquaculture, Arkansas project.

Answer. CSREES has requested that the University of Arkansas at Pine Bluff submit a grant proposal for this new research activity that will focus on maximizing production efficiency of farm-raised catfish under changing market conditions and offshore competition.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This is a new project to be initiated in fiscal year 2001. The agency has requested the university submit a research proposal which has not been received to date. The principal researcher indicates that the U.S. farm-raised channel catfish industry is facing increased competition from imported catfish, increasing costs due to expansion of regulations, increasing labor costs, and changing market demands. Gains in productivity will be required for the industry to continue growing to provide employment opportunities and serve as a catalyst for economic growth in impoverished rural areas of the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new research grant to be funded in fiscal year 2001.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$237,476.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates that significant non-Federal funding will be provided in fiscal year 2001 primarily from state sources to cover the salaries of the principal investigators. A total of \$85,000 is anticipated for fiscal year 2001 consisting of \$46,600 from state appropriations, \$20,000 from the Arkansas Catfish Checkoff Fund, \$11,000 from private sector in-kind contributions, and \$7,400 from facility use.

Question. Where is this work being carried out?

Answer. The research will be conducted at the University of Arkansas at Pine Bluff.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is the first year of this project and the agency is currently awaiting submission of the research proposal.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this new project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to CSREES for funding. Since this is the first year of the program, CSREES will conduct an external peer review of the proposal. The 2001 CSREES review will be completed within three weeks of submission of the proposal. The researchers will be requested to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development.

AQUACULTURE, FLORIDA

Question. Please provide a description of the research that has been funded under the Aquaculture, Florida grant.

Answer. CSREES is in the process of reviewing the submitted proposal. The research will focus on developing procedures for hatchery seed production of two potential bivalve species applying dry tempering methods to increase the survival of Florida culture clams in refrigerated storage using molecular genetic techniques to examine hard clam stock diversity, determining the suitability of a freshwater clam for use in tertiary treatment of agricultural wastewater, and evaluating the efficacy of best management practices in pollutant reduction associated with food and baitfish farms.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This is the first year of this new grant proposal. The proposed research addresses critical local needs that have been identified by the Shellfish Aquaculture Advisory Committee and the Florida Food and Bait Aquaculture Advisory Committee. The research findings and results will also be of interest and applicable to other similar aquaculture operations and conditions in the southern region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to improve and strengthen aquaculture in Florida by enhancing the existing hard clam sector, developing new commercial species, and developing improved and practical pollutant reduction practices through interrelated research activities.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$445,019.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates that significant non-Federal funding will be provided in fiscal year 2001 primarily from state sources to cover the salaries of the principal investigators and operating expenses for the laboratory. As the program develops, additional non-Federal funding is expected.

Question. Where is this work being carried out?

Answer. The location of the work site(s) will be included in the new grant proposal when it is received by CSREES for processing to award the grant funds.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is a new research grant to be funded in fiscal year 2001. The agency has not received a grant proposal to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this new project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to CSREES for funding. Since this is the first year of the program, CSREES will conduct an external peer review of the proposal. The 2001 CSREES review will be completed within three weeks of submission of the proposal. The researchers will be requested to develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development.

AQUACULTURE, LOUISIANA

Question. Please provide a description of the research that has been funded under the Aquaculture, Louisiana grant.

Answer. The agency requested that the university submit a grant proposal that has not been received to date. Research under this program has addressed critical problems in the commercial aquaculture industry including crawfish, catfish, striped bass, and other emerging species. The university has completed studies in the area of fish nutrition, fish health, fish genetics, production management strategies, alternative species, seafood processing, product quality, product safety, and broodstock development.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator indicates that information generated from the funded research will have broad application for local, regional, and national aqua-

culture industries. The researchers indicate that there is a need to improve production efficiency for a number of important aquaculture species in order to enhance the profitability and sustainability of the aquaculture industry in the region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to provide science-based information through a basic and applied research base that specifically addressed the needs of the aquaculture industry in Louisiana and the southern region. Research funded by this program has led to improved feed formulations, production of fish vaccines, improved extraction and detection methods for off-flavor compounds, improved product quality and safety, procedures for the production of genetic maps for channel catfish, evaluation of growth hormones in channel catfish production, development of cryopreservation techniques for germplasm preservation, reduction of phosphorus in aquaculture effluents, improved forage-based systems for crawfish, as well as improved production, harvesting, and processing technologies for a number of important species. Research continues to be directed at important opportunities to enhance production efficiency and commercial viability of sustainable aquaculture systems in Louisiana and the southern region.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Research to be conducted under this program continues efforts initiated under the Aquaculture general program in fiscal years 1988 through 1991. The work supported by this specific program began in fiscal year 1992 and the appropriation for fiscal years 1992–1993 was \$390,000 per year, \$367,000 in fiscal year 1994, \$330,000 each year in fiscal years 1995–2000, and \$329,274 in fiscal year 2001 for a total of \$3,456,274.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates that non-Federal funding for this program is as follows: in fiscal year 1991, \$310,051; in fiscal year 1992, \$266,857; in fiscal year 1993, \$249,320; in fiscal year 1994, \$188,816; in fiscal year 1995, \$159,810; in fiscal year 1996, \$150,104; in fiscal year 1997, \$158,808; in fiscal years 1998 and 1999, \$110,101; and in fiscal year 2000, \$447,269. The primary source of this funding was from state sources and self-generated funds with minor contributions from industry and other non-Federal sources.

Question. Where is this work being carried out?

Answer. Research is being conducted at Louisiana State University.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific objectives were to be completed in 1990. These specific research objectives have been met, however, research required for long-term growth of the aquaculture industry in Louisiana and the southern region continues to be addressed. The specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Grants are awarded to scientists within the university on a competitive peer-review basis. The entire proposal is reviewed by agency Program Managers on an annual basis. The 2000 agency review determined that the proposal was well written with objectives clearly stated. The research approach, methodology, timetable, and experimental design were sound and addressed important opportunities for the commercial culture of catfish, crawfish, and tilapia in the southern region. The feasibility of attaining objectives during the life of the proposed research was excellent, and the research team was well-qualified. The proposed research built on work initiated in previous years, and progress on previous work was well documented. The proposed research is consistent with national goals and needs outlined in the National Science and Technology Councils—NSTC—Aquaculture Research and Development Strategic Plan.

AQUACULTURE RESEARCH, STONEVILLE, MISSISSIPPI

Question. Please provide a description of the research funded under the Aquaculture Research Stoneville, Mississippi grant.

Answer. The agency has requested that the university submit a grant proposal that has yet to be received. Research under this program has addressed the critical needs of the farm-raised channel catfish industry including practical feeding and nu-

trition strategies, fish health and water quality management, and acoustical in-pond monitoring technologies.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator indicates that results from this project continue to have a significant impact on the competitiveness of a significant segment of the domestic aquaculture industry, namely channel catfish. The farmed-raised channel catfish industry accounts for over 70 percent of total domestic aquaculture production. Research funded by this program is directed towards improving feeds and feeding strategies, enhancing aquatic animal health, and acoustical monitoring and inventory of catfish in pond production systems. These findings will have long-term impacts on the economic viability of the farm-raised channel catfish industries in the southern region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to address the research needs of the farm-raised channel catfish industry in the areas of water quality and nutrition. Results from this research have led to improved water quality management practices in commercial catfish ponds and improved diet formulation and feeding strategies that have been widely adopted by the industry. Research findings from this program have had a direct impact on reducing the cost of catfish feed without reducing performance and productivity. Researchers have demonstrated that fish meal levels can be significantly reduced in commercial catfish diets. Fish health monitoring efforts are also expected to enhance production efficiency. Additionally, sonar hardware and software technologies are being refined and evaluated for use in stock assessment in channel catfish ponds.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1980–1981, \$150,000 per year; fiscal year 1982, \$240,000; fiscal years 1983–1984, \$270,000 per year; fiscal year 1985, \$420,000; fiscal years 1986–87, \$400,000 per year; fiscal year 1988, \$500,000; fiscal year 1989, \$588,000; fiscal year 1990, \$581,000; fiscal year 1991, \$600,000; fiscal years 1992–1993, \$700,000 per year; fiscal year 1994, \$658,000; fiscal years 1995–1997, \$592,000 each year; fiscal year 1998, \$642,000; \$592,000 per year in fiscal years 1999 through 2000; and \$590,698 in fiscal year 2001. A total of \$10,819,698 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a total of \$2,101,508 in non-Federal funding to support this research for fiscal years 1991–1994; \$1,128,451 in fiscal year 1995; \$601,473 in fiscal year 1996; \$463,990 in fiscal year 1997; \$464,266 in year 1998; \$740,000 in fiscal year 1999; and \$770,000 in fiscal year 2000. Non-Federal funding is primarily provided by state funds. Additional funding is also provided from product sales, industry contributions, and other miscellaneous sources.

Question. Where is this work being carried out?

Answer. The grants have been awarded to the Mississippi State University Agricultural and Forestry Experiment Station. All nutrition research is conducted at the Delta Branch Experiment Station, Stoneville, Mississippi. The acoustical research is conducted in cooperation with the National Center for Physical Acoustics at the University of Mississippi.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the specific original research objectives was 1984. The original objectives have been met, however, projects funded by subsequent grants continue to address the critical research needs of the channel catfish industry. The specific research outlined in the current proposal will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency Program Managers and Program Specialist evaluate the progress of this project on an annual basis. The agency's fiscal year 2000 evaluation concluded that the proposal was well written, the objectives were clearly stated, and the experimental design and scientific approach were sound. The researchers were leading authorities in this area of research and were well aware of the complexity of the industry and the implications of their research. Significant progress had been reported on research objectives under this program, and a strong linkage between the researchers and the catfish industry has led to the accelerated adoption of re-

search findings within the industry. The research from this program continues to have a tremendous impact on the industry by improving production efficiency in commercial catfish ponds through improved feeds and feeding strategies. The proposed research is consistent with national goals and needs outlined in the National Science and Technology Councils—NSTC—Aquaculture Research and Development Strategic Plan.

AQUACULTURE, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Aquaculture, North Carolina grant.

Answer. The agency has requested that the university submit a grant proposal that has yet to be received. The researchers indicate that the funding will be used to support and expand research efforts in areas with species that are important to the aquaculture industry in North Carolina and the U.S. including hybrid striped bass, tilapia, flounder, and catfish.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator indicates that the proposed research will impact aquaculture production technology for several species of cultured finfish with regional and national implications that could significantly impact the economic viability of coastal and rural communities across the nation.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the project was targeted at resolving specific impediments to aquaculture efficiency, profitability, and growth in the Mid-Atlantic region. Research has led to improved vaccine administration methods for rainbow trout, improved broodstock maintenance methodologies for striped bass, and reduction of environmental impacts by improving system technologies and feeding strategies in hybrid striped bass production ponds. Under the fiscal year 2000 grant, research was initiated to improve technology for commercial production of the summer flounder. Studies have been initiated to enhance reproductive efficiency, to develop faster-growing all female populations, and to evaluate biochemical growth regulating factors in summer flounder.

Question. How long has the work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$150,000. The project was not funded in fiscal years 1998 and 1999. The fiscal year 2000 appropriation was \$255,000 and for fiscal year 2001, \$299,340 is appropriated. A total of \$704,340 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university reported a total of \$94,000 of non-Federal funding to support research carried out under this program for fiscal year 1997. The university estimates non-Federal funding of \$200,000 for fiscal year 2000, and \$221,000 for fiscal year 2001. The primary source of the non-Federal funding is from state sources.

Question. Where is the work being carried out?

Answer. Research is being conducted at North Carolina State University and their aquaculture research field station.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program was initiated in fiscal year 1997 and was funded for one year. The original objectives were completed. Funding was not appropriated in fiscal years 1998 and 1999. The anticipated completion date for the expanded objectives for the fiscal year 2000 proposal is July 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's fiscal year 2000 review indicated that the proposal was well written, objectives were clearly stated, and the methodology and experimental design were sound. The research team is well qualified and has the appropriate background. Facilities for the project are excellent. The research timetable presented was ambitious for a 12-month period. The proposed research is consistent with the goals and objectives of the National Science and Technology Council's—NSTC—Aquaculture Research and Development Strategic Plan.

AQUACULTURE, VIRGINIA

Question. Please provide a description of the research that has been funded under the Aquaculture, Virginia grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The proposed research will continue to evaluate culture methods and the economic viability of closed recirculating aquaculture systems. Fish culture technologies and waste management will be refined, off-flavors and product quality will be evaluated, and marketing strategies will developed for these systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The investigators indicate that there is a need to develop a highly-competitive, sustainable aquaculture industry that uses closed recirculating system technologies in order to meet consumer demand for cultivated aquatic foods that are of high quality, safe, competitively priced, nutritious, and are produced in an environmentally responsible manner. Research refining culture system technologies has the potential to significantly enhance domestic aquaculture production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify commercially-viable aquaculture species utilizing recirculating aquaculture system technology, verifying production and culture management protocols utilizing this technology, analyze production budgets providing information upon which to build business plans, investigate marketing development strategies, and prepare scientific, technical, and popular publications to disseminate the results of this research. Research was initiated in fiscal year 1999. Site selection and development has been completed and production trials are underway.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This was a new research initiative in fiscal year 1999 and \$100,000 per year was appropriated for fiscal years 1999 through 2000, and \$99,780 in fiscal year 2001. The total appropriation for this grant is \$299,780.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a minimum of \$90,000 of non-Federal funding in fiscal year 1999; \$34,853 in fiscal year 2000; and \$158,000 in fiscal year 2001. This support is provided primarily from state sources. In addition the university reports substantial in-kind support from research cooperators.

Question. Where is this work being carried out?

Answer. The research will be conducted through the Virginia Agricultural Experiment Station, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, and at the Southwest Virginia Aquaculture Center in collaboration with private aquaculture firms in Virginia.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This original proposal outlined a three year project. The fiscal year 1999 grant provided funding for the first year of the project and the fiscal year 2000 grant provided funding for the second year. The anticipated completion date for the fiscal year 2000 component of the project is 2001. It is anticipated that the fiscal year 2001 grant will provide funding for the third year of the proposed project with minor modifications.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The fiscal year 2000 agency evaluation concluded that objectives described in the proposal were relevant to state, regional, and national goals. The objectives, methodologies, and experimental design were sound. Personnel and facilities were appropriate for the stated objectives, and objectives should be attained within budgetary and time constraints. The proposed research is consistent with goals and needs of the National Science and Technology Council's—NSTC—Aquaculture Research and Development Strategic Plan.

AQUACULTURE, WASHINGTON

Question. Please provide a description of the research that has been funded under the Aquaculture, Washington grant.

Answer. The agency has requested that the university submit a grant proposal that has yet to be received. This is a new program that will be initiated in fiscal

year 2001. The university indicates that the research will address the critical needs of the trout farming industry in the U.S. including the hatchery sector of the industry which provides high quality trout eggs for international markets.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The researchers indicate that the project will focus on the current constraints to the expansion of the industry that include threats from foreign and domestic pathogens which could impact both foreign and domestic markets. Research efforts should lead to improved production efficiency and enhanced aquatic animal health management in the trout farming industry with regional and national implications. The researchers indicate that the research goals and objectives are consistent with those outlined in the National Science and Technology Council's—NSTC—Aquaculture Research and Development Strategic Plan.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The researchers indicate that original goals will be to improve and expand trout aquaculture at the regional and national level through improved animal health management, improved water quality and effluent management, and improved product quality and new product development.

Question. How long has the work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a total of \$148,323 non-Federal funding to support this project in fiscal year 2001 primarily from state sources. The university also reports significant in-kind support from the industry.

Question. Where is the work being carried out?

Answer. Research is being conducted at Washington State University in cooperation with industry.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project will be initiated in fiscal year 2001 with the anticipated completion date for the original objectives in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will conduct the initial review of this proposal when it is submitted for funding. The proposal may be externally peer reviewed as part of the evaluation.

AQUACULTURE PRODUCT AND MARKETING DEVELOPMENT, WEST VIRGINIA

Question. Please provide a description of the research that has been funded under the Aquaculture Product and Marketing Development, West Virginia, grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The research program is aimed at developing a viable and competitive aquaculture industry in West Virginia and the Appalachian region. The specific objectives of the project address state and regional needs by improving the short-term viability and long-term sustainability of aquaculture production and processing firms in West Virginia and similar areas of Appalachia. Specific research strategies include the development of marketing strategies for trout producers and processors, increasing the economic efficiency and profitability of trout-based enterprises, improving the consistency and quality of fresh trout fillets and value-added smoked trout products, utilization of impaired mine waters for aquaculture, and implementation of a technology transfer component to disseminate information generated by this project to the aquaculture industry in Appalachia.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The researchers indicate that there is a regional and national need to evaluate marketing and product development for small scale aquaculture systems in rural communities. In addition, there is a need to improve the efficiency of these systems and to evaluate the use of impaired mine waters for aquaculture.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop sound marketing strategies for aquaculture products, improve the economic efficiency of aquaculture pro-

duction systems, and improve the quality and variety of aquaculture products in West Virginia and the Appalachian region. Marketing surveys have been conducted for fee fishing operations and food fish production systems. Researchers have developed baseline information on the economics of production and processing relevant to small-scale facilities. Studies to evaluate the quality of aquaculture products from these small-scale systems have been implemented. Efforts to evaluate impaired mine waters for aquaculture production have recently been initiated.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. A grant has been awarded from funds appropriated as follows: fiscal year 1998, \$600,000; \$750,000 for each of fiscal years 1999 through 2000; and \$748,350 in fiscal year 2001. A total of \$2,848,350 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates total non-Federal funding available for this program at \$440,000 for fiscal years 1998 through 2001. The primary source of this funding is from state sources.

Question. Where is this work being carried out?

Answer. The research is being conducted at the University of West Virginia in Morgantown and at off campus sites with a variety of cooperators.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in fiscal year 1998. Research addressing the original objectives has essentially been completed and objectives have been met. Research initiated in fiscal years 1999 and 2000 is currently underway, and the anticipated completion date for these objectives is fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's fiscal year 2000 review indicated that the proposal was well written with objectives clearly stated. The research approach, methodology, timetable, and experimental design were sound. The research was relevant and addresses an important opportunity for the commercial aquaculture industry in West Virginia and throughout the Appalachian region. The feasibility of attaining objectives during the life of the proposed research was excellent. The research team was well qualified and has the appropriate background. Facilities are adequate to conduct the proposed research. The proposed research builds on work initiated in previous years and progress on previous work is well documented. The proposed research is consistent with national goals and needs outlined in the National Science and Technology Council's—NSTC—Aquaculture Research and Development Strategic Plan.

ASPARAGUS TECHNOLOGY AND PRODUCTION, WASHINGTON

Question. Please provide a description of the research that has been funded under the Asparagus Technology and Production, Washington grant.

Answer. This is a new grant and the University of Washington is preparing a proposal for submission.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. The asparagus industry in Washington and other states is suffering severe economic loss due to competition from countries where labor and other costs of production are lower. This has necessitated producing more asparagus for the fresh market, developing advanced technologies, and delivering this information to the producers. This research will enable Washington asparagus producers to remain domestically and internationally competitive.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this grant is to develop new technologies for harvesting and packaging fresh asparagus that will reduce labor inputs and allow asparagus growers from the U.S. to remain competitive.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$224,505.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1999, \$145,000 from an asparagus grower assessment was spent addressing these issues. In fiscal year 2000, \$123,000 from an asparagus

grower assessment and \$30,000 from the State of Washington was provided. In is anticipated that this level of non-Federal funding will continue throughout the life of the project.

Question. Where is this work being carried out?

Answer. The work is being carried out at Washington State University and Michigan State University.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. The anticipated completion date for the original objectives is the end of fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. A peer review of the project will be undertaken by the performing institution and reported on annually. CSREES will conduct a thorough evaluation of the proposal once it is received.

BABCOCK INSTITUTE FOR INTERNATIONAL DAIRY RESEARCH AND DEVELOPMENT

Question. Please provide a description of the research that has been funded under the Babcock Institute, Wisconsin grant.

Answer. The Babcock Institute for International Dairy Research and Development was established with participation of the University of Wisconsin-Madison College of Agriculture and Life Sciences, School of Veterinary Medicine, and the Cooperative Extension Division. The objective of the Babcock Institute is to link the U.S. dairy industry with the dairy industry in the rest of the world through degree training, continuing education, technology transfer, adaptive research, scientific collaboration, and market analysis.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the need is to strengthen dairy industries around the world, to enhance international commercial and scientific collaborative opportunities for the U.S. dairy industry, and to draw upon global perspectives to build insight into the strategic planning of the U.S. dairy industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Institute remains the linkage of the U.S. dairy industry with the rest of the world through training, continuing education and outreach, technology transfer, adaptive research, scientific collaboration, and market analysis. Initial efforts were focused on planning and staffing. An initial activity was, and continues to be, the development of multi-language extension materials about basic management techniques essential to optimize performance of U.S. dairy cattle overseas. This activity has grown to include manuals on Breeding and Genetics, Lactation and Milking, and Basic Dairy Farm Financial Management published in English, Spanish, French, Russian, and Chinese. Research on potential implications of the North American Free Trade Agreement—NAFTA—and the General Agreement on Tariffs and Trade—GATT—on the U.S. dairy industry was completed. A technical workshop on dairy grazing in New Zealand and the Midwest was organized and held in Madison, Wisconsin, during the fall of 1993. A technical workshop on Nutrient Management, Manure and the Dairy Industry—European Perspectives and Wisconsin's Challenges—was held in Madison, Wisconsin, during September 1994. A round table was held in January 1995 addressing "World Dairy Markets in the Post-GATT Era". Sponsored the Great Lakes Dairy Sheep Symposium in 1995 and 1996. Created a World Wide Web site in 1996 for distribution of Babcock Institute technical dairy fact sheets in four languages. The first International Dairy Short Course for a group of producers and technicians from Argentina has been organized on the University of Wisconsin Campus. Scientists' are being supported in collaborative research with New Zealand primarily to gain a better understanding of grazing systems as related to dairy management. An analysis of the impact of changes in European dairy policies has been completed. The Institute sponsored a Minnesota-Wisconsin Dairy Policy Conference to provide insights into current agricultural programs and policy issues in the dairy sector of the U.S. economy. During the past year more than 30 publications have appeared as a result of funding through the Babcock Institute. These report the results of research collaboration and scientific exchange, world market and trade analysis, or are for use in international education and training programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1992 and 1993, \$75,000 per year; fiscal year 1994, \$250,000; fiscal years 1995–1998, \$312,000 per year; fiscal year 1999, \$400,000; fiscal year 2000, \$510,000; and fiscal year 2001, \$598,680. A total of \$3,156,680 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. During fiscal year 1992, \$13,145 of State funds were used to support this program and \$19,745 of State funds in fiscal year 1993 for a total of \$32,890 during the first two years of this research. Information is not available for fiscal years 1994–2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Wisconsin-Madison College of Agriculture and Life Sciences.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Babcock Institute's overarching mission has been to link the U.S. dairy industry and its trade potential with overseas dairy industries and markets. The original objectives of this project have remained consistent over the years. However, each year specific objectives were proposed to further the mission of the Institute and to build on previous accomplishments. The Institute has accomplished specific objectives each year in a timely manner. The Babcock Institute has remained true to its original objective of linking Wisconsin and the U.S. to dairy industries around the world. This objective remains increasingly important with continued development of international markets for dairy products and technologies. The university researchers anticipate that work currently in progress will be completed by September 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Babcock Institute undergoes two independent review processes each year. The first is done by a committee of university and industry representatives who review the annual research proposal and amend it prior to submission to the agency. The annual proposal is reviewed by agency technical staff prior to approval for fund release. In addition, the institute was included in a comprehensive review of the programs of the Department of Dairy Science at the University of Wisconsin in May 1995. The agency project officer has conducted two onsite reviews of the institute since its formation in 1992. The most recent review has found that the approach proposed by the researchers is appropriate and that the researchers are well qualified to perform the objectives as stated. The objectives of the proposal are within the mission of USDA and CSREES.

BEEF TECHNOLOGY TRANSFER, MISSOURI

Question. Please provide a description of the research that has been funded under the Beef Technology Transfer, Missouri grant.

Answer. This is a new project starting in fiscal year 2001. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need for this research is for the adoption of technology to enhance vertically-aligned independent and corporate beef producers. Missouri is currently the second largest cow-calf producing state in the country. Accessing and the delivery of pre-harvest beef production technology is critical to the future success of beef producers in the state and region to optimize and improve beef quality and product value.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to enhance the information base available to beef producers involved in vertically-coordinated production systems to capture retail case value. Input from Missouri state commodity groups, implementation of beef advisory groups to the land-grant university representing producers throughout the state, and interaction with a new age producer cooperative that has begun with a business goal of marketing beef products and capturing retail case value are examples of recent, innovative accomplishments and university/producer interactions to date. Conceptually, this moves the paradigm from marketing of beef toward the concept of marketing specific and consumer-oriented beef products.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: approximately \$350,000 state appropriations for fiscal year 2001.

Question. Where is this work being carried out?

Answer. Research and/or outreach will be conducted at the University of Missouri-Columbia and Lincoln University, Columbia, Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for original, additional, and related objectives is January 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project, and no evaluation has been conducted.

BIOBASED TECHNOLOGY, MICHIGAN

Question. Please provide a description of the research that has been funded under the Biobased Technology, Michigan grant.

Answer. This is a new grant, and funds will be used to develop and demonstrate new biobased polymers derived from agricultural resources. Polymer technology allows a highly-customizable material to be developed, such as medical plastics that can resist blood clot formation and infections. Funds will be used to develop and optimize the reaction and recovery processes to produce succinic acid.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Biobased technologies offer environmentally-preferable products and processing technologies that expand agricultural markets, create job opportunities in rural America.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This grant is new in fiscal year 2001. Prior research to justify this new work includes the development and scale-up of a fermentation process to produce succinic acid. Polymer research has been successful in changing the surface characteristics of medical devices to optimize performance such as resisting blood clot formation.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since this is a new grant, and a proposal has not yet been received, the source and amount of non-Federal funds for this research is unknown.

Question. Where is this work being carried out?

Answer. This work will be carried out at Michigan State University.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Since this is a new grant, no evaluation has been conducted.

BIOINFORMATICS INITIATIVE, VIRGINIA

Question. Please provide a description of the research that has been funded under the Bioinformatics Initiative, Virginia grant.

Answer. This is a new special grant this year. The agency has requested the university to submit a grant proposal that has not yet been received. Preliminary communications with the principal researcher indicate that the project involves the development of software and database tools for comparative genomic analysis of model organisms such as Arabidopsis and Medicago relative to agriculturally-important crops such as tomato, potato, soybean, and others.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the principal researcher, the national need is that a considerable amount of Federal funding in plant genomics, with the exception of the rice genome, goes into model organisms of marginal agricultural importance such as *Arabidopsis thaliana* and *Medicago truncatula*. In order to make use of and leverage the Federal investment in the genomics of model organisms, the principal researcher states that it is necessary to build analytical information bridges between model genomes and agriculturally-important crops thereby enhancing technology transfer and economic development.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to advance critical information and communications technologies to support the analysis, manipulation, transmission, and end use of massive volumes of complex data being generated by contemporary genome research. The research is just getting started at the Virginia Polytechnic Institute and State University—VPISU.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated is \$473,955.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Commonwealth of Virginia is providing operational support of \$11.6 million for the 2000–2002 biennium for the Virginia Bioinformatics Institute. This amount is projected to increase to \$12 million per year thereafter. VPISU is raising additional funds from the private sector of currently indeterminate amount for the Virginia Bioinformatics Institute.

Question. Where is this work being carried out?

Answer. The research is conducted at the Virginia Bioinformatics Institute, Virginia Polytechnic Institute and State University, Blacksburg, Virginia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion of additional or related objectives?

Answer. The anticipated completion date for the original objectives is September 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new special grant so it has not been evaluated yet. The agency will convene a merit review panel to evaluate the project upon receipt of a proposal for fiscal year 2001.

BIOMASS-BASED ENERGY RESEARCH, OKLAHOMA AND MISSISSIPPI

Question. Please provide a description of the research that has been funded under the Biomass-Based Energy Research, Oklahoma and Mississippi, grant.

Answer. CSREES has requested Oklahoma State University to submit a grant proposal that has not yet been received. The research will address conversion of biomass to ethanol. Through the establishment of the Oklahoma State and Mississippi State University Consortium, both universities are continuing the development of an ethanol gasification-bioconversion process that utilizes all of the biomass, including the lignin. While making it more cost efficient than other methods of ethanol production, this process utilizes all portions of biomass/feedstock material: grasses, crop residues, processing plant byproducts, and animal wastes.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Gasification-bioconversion provides an additional method for the development of ethanol while developing an alternative source of income in rural America.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This grant is new and the research will build upon existing expertise for utilizing crop residues, grasses, byproducts, and animal wastes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$900,016.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since this is a new grant, and a proposal has not yet been received, the source and amount of non-Federal funds for this research is unknown.

Question. Where is this work being carried out?

Answer. This work will be carried out at Oklahoma State University and Mississippi State University.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Since this is a new grant, no evaluation has been conducted.

BIOTECHNOLOGY, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Biotechnology, North Carolina grant.

Answer. This is a new special grant this year. The agency has requested the university to submit a grant proposal that has not yet been received. Preliminary communications with the institutional research administrator indicate that the project involves integrated biotechnological and genetic systems for enhanced forest productivity and health. Three areas of focus are: (1) genetic control of wood quality; (2) understanding and managing invasive species threats to the Fraser fir Christmas tree industry; and (3) development of propagation and deployment systems for elite oak genotypes.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the institutional research administrator, the need for this research is to enhance the competitiveness of the southern region in the production of industrial wood through genetic manipulation, to combat invasive pathogens of various ornamental trees, and to develop advanced techniques to capture genetic quality and replicate elite genotypes of hardwood forest species more efficiently.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to improve the competitiveness of southern U.S. wood production, to better manage invasive pathogens of ornamental trees, and to increase the distribution of elite hardwood trees in natural forest settings. The research is just getting underway at North Carolina State University.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Existing research and extension resources at North Carolina State University will be used to complement the Federal funding to carry out the proposed research. The forest industry is also expected to provide in-kind support in the form of field work and laboratory analyses. The exact amount of these contributions is not known at the present time.

Question. Where is this work being carried out?

Answer. The research is conducted at North Carolina State University and various sites in the southern Appalachians and elsewhere in the southeast U.S.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion of additional or related objectives?

Answer. The anticipated completion date for the original objectives, according to the institutional research administrator, is five years from project inception or approximately September 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new special grant so it has not been evaluated yet. The agency will convene a merit review panel to evaluate the project upon receipt of a proposal for fiscal year 2001.

BLOCKING ANHYDROUS METHAMPHETAMINE PRODUCTION, IOWA

Question. Please provide a description of the research that has been done under the Blocking Anhydrous Methamphetamine Production, Iowa grant.

Answer. Since starting in fiscal year 2000, research under this grant has examined several possible ways to chemically treat anhydrous ammonia intended for use

as an agricultural fertilizer so that it cannot be used for making the illegal drug methamphetamine.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher has indicated that anhydrous ammonia, a commonly used agricultural fertilizer, can be used as an ingredient for making methamphetamine, an illegal and highly addictive drug which has posed a drug enforcement problem for Iowa and other Midwestern states in recent years.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to discover a chemical procedure that will render anhydrous ammonia ineffective in producing methamphetamine while keeping the anhydrous ammonia cost-efficient and effective as a fertilizer. Preliminary results suggest that certain metal salts in catalytic amounts can be effective at inactivating the drug-producing reaction.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This grant began in fiscal year 2000 with an appropriation of \$212,500. The appropriation for fiscal year 2001 is \$247,454 for a total of \$459,954 appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. State funds in an amount of less than \$5,000 were used to get the project started in fiscal year 1999. The state plans to cost-share the salaries of the principal investigator and a faculty collaborator in the amounts of \$20,000 and \$25,000 per year, respectively.

Question. Where is this work being carried out?

Answer. The research is being conducted in the Chemistry Department at Iowa State University, Ames, Iowa.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator anticipates completing the original objectives of the project in two or three years. Additional or related objectives have not been specifically identified at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was evaluated by a merit review panel convened by the agency on April 17, 2000. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received, and the agency is satisfied that the program is being administered in compliance with the purpose of the grant. A merit review panel will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2001.

BOVINE TUBERCULOSIS, MICHIGAN

Question. Please provide a description of the research that has been conducted under the Bovine Tuberculosis, Michigan grant.

Answer. Bovine tuberculosis has been discovered to be present in free-ranging white-tailed deer and other wild life in Michigan. Eradication of the organism/disease from the state's deer population has been mandated. To address this issue this project will work on three objectives: (1) Determine the spatial relationships in transmission of bovine tuberculosis relating to feeding habits and factors in the habitat; (2) Determine the survivability of *Mycobacterium bovis*—*M. bovis*—in the environment; and (3) Determine other wild or domestic hosts for *M. bovis* transmission through epidemiological studies of naturally-infected hosts.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The need for this research relates to the critical problem of bovine tuberculosis which has now been discovered to have spread into the white-tailed deer population in the state of Michigan. If information on the scope of this disease in deer and methodologies to monitor and reduce this problem is not available soon, it will present a serious threat to the largely tuberculosis-free national cattle herd.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research is to develop information about the spread of the bovine tuberculosis organism, *M. bovis*, within the deer population of

Michigan. Appropriate control programs cannot be devised until the epidemiologic information is available. The research team has reported that there is clear evidence that supplemental feeding of deer is associated with the prevalence of *M. bovis* in the deer population. The other component of the epidemiological study concerns the survival of the *M. bovis* organism in the environment. To date, all samples tested—approximately 190—from cattle farms, deer feeding sites, and captive cervid operations have been negative. Either oral or intratracheal inoculation of pigeons can result in shedding of the *M. bovis* organism in feces. However, only the intratracheal inoculation seems capable of producing active disease in the pigeons. The group has also initiated a literature search to identify relevant existing risk assessment models and initial work on a model has begun.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 with an appropriation of \$170,000 and \$324,285 in fiscal year 2001. The total amount appropriated is \$494,285.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. During fiscal year 2000, an additional \$650,000 were provided from institutional—Michigan State University—and state funds—Departments of Agriculture and Natural Resources.

Question. Where is this work being performed?

Answer. The research is being performed in the College of Veterinary Medicine, Michigan State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is 2002. The research team has made good progress in identifying potential risk factors for the occurrence of tuberculosis in the wild deer herds as well as the studies on the potential role of pigeon as either active or passive carriers of the organism.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was initiated in fiscal year 2000, and due to the short time interval since it was started, no formal, onsite evaluation has been done at this time. The CSREES representative has had regular contact with personnel at Michigan State University to monitor this research effort.

BRUCELLOSIS VACCINE, MONTANA

Question. Please provide a description of the research that has been conducted under the Brucellosis Vaccine, Montana grant.

Answer. This project will study the immune response of bison to *Brucella abortus* antigen which has been incorporated into an organism that can be given orally to the animals. The objective is to produce an oral vaccine that can be easily administered to the bison without subjecting them to intensive handling procedures.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The research project is intended to develop a strategy for vaccinating or immunizing cattle against brucellosis by incorporation of *Brucella abortus* genes into an orally-administered system. The need for this program relates to the problem associated with bison which are infected with *Brucella abortus*, the causative agent of brucellosis, within the Yellowstone bison herd.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the project was to accomplish incorporation of *Brucella* genes which code for specific antigens into *Salmonella* species of bacteria and test the efficacy of oral administration of this material in developing systemic immunity in bison. At this time, the research team has been successful in demonstrating that an immune response to a test organism does occur after oral exposure, and the antibodies do appear in secretions of the reproductive tract. They are currently testing the feasibility of intranasal vaccination as a possible alternative to the oral route and are also working on development of methods to permit incorporation of the lipopolysaccharide—LPS—from *B. abortus* into a potential vaccine product.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal year 1999 was \$150,000; for fiscal year 2000, \$425,000; and for fiscal year 2001, \$494,909 for a total of \$1,069,909.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. The source and amount of non-Federal funds for fiscal year 1999 was \$67,401 from state sources, and \$15,300 from state sources in fiscal year 2000. In addition, the university contributed unpaid overhead costs on the grant.

Question. Where is this work being performed?

Answer. The work is being performed in the Department of Veterinary and Molecular Biology at Montana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was May, 2002 or three years from the initiation of the project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project began in the summer of 1999 and there has been no formal onsite evaluation as yet.

CENTER FOR ANIMAL HEALTH AND PRODUCTIVITY, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Center for Animal Health and Productivity, Pennsylvania grant.

Answer. This research is designed to reduce nutrient transfer to the environment surrounding dairy farms in the Chesapeake Bay watershed. Progress to date includes the development of an individual dairy cow model which will predict absorbed amino acids and the loss of nitrogen in manure. This model has been developed into a user-friendly software so that trained farm advisors can evaluate herd nutrient management status while on a farm site. A whole farm model has been developed which integrates feeding and agronomic practices to predict utilization of nitrogen and farm surpluses. Using these tools, a survey of dairy farms in the region has been done to assess nitrogen status on dairy farms and potential management practices to reduce nitrogen excesses on dairy farms. Refinement of the model tools and research to refine estimates of the environmental fate of excess nitrogen from dairy farms is in progress. During the last two years, researchers have discovered that a significant fraction of total nitrogen in feed is lost from the animal housing facility in the form of ammonia volatilized to the atmosphere. Preliminary estimates indicate that as much as 50 percent of the nitrogen consumed by dairy cows is lost as ammonia to the atmosphere before waste ever reaches the manure storage and management system. Two on-site reviews of the program have been conducted by the CSREES Project Officer and a third is planned during 2001. The animal and farm models have been published in peer reviewed scientific journals. Scientists funded by the grant regularly participate in public meetings related to animal nutrient management systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that reducing non-point pollution of ground and surface water by nitrogen from intensive livestock production units are of concern nationally, and especially in sensitive ecosystems like the Chesapeake Bay. This research is designed to find alternative feeding, cropping, and management systems which will reduce net nutrient flux on Pennsylvania dairy farms to near zero.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research remains the development of whole farm management systems which will reduce nutrient losses from the farm to the environment external from the farm to near zero. To date the researchers have developed their own models to more accurately formulate rations for individual dairy cows which permit the comparison of alternative feeding programs based upon both maximal animal performance and minimal nutrient losses in animal waste. This model is being tested on select commercial dairy farms to evaluate the extent to which total nitrogen losses in manure can be reduced without impacting economic performance of the farm. At the same time, whole farm nutrient models have been developed to evaluate alternative cropping systems which will make maximum use of nutrients from animal waste and minimize nutrient flux from the total farm system. These tools are currently being used to survey the current status of nutrient balance on farms in the area and efforts to fine tune the tools are in progress. The

recent discovery of the quantitative significance of nitrogen loss as ammonia to the atmosphere and potential transport from the farm and redeposition to the earth's surface raises a whole new aspect of nutrient management.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. A grant has been awarded from funds appropriated in fiscal year 1993 for \$134,000 and in fiscal year 1994 for \$126,000. In fiscal years 1995–2000, \$113,000 per year was appropriated, and \$112,751 in fiscal year 2001. A total of \$1,050,751 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This information is not available at the present time.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Pennsylvania, College of Veterinary Medicine at New Bolton Center, Pennsylvania.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The University researchers anticipate that work currently underway will be completed by September 2001. This will complete the original objectives of the research. The principal researcher indicates that consideration has been given to the broadening of objectives to include additional nutrients in the model system, but this has been dropped because technical expertise required is currently not readily available.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Center for Animal Health and Productivity Project was last reviewed in June 1997. An onsite review by agency technical staff was conducted in June 1995. It was concluded that project objectives are within the goals of the program, are within the mission of both the USDA and CSREES, and the institution is well equipped and qualified to carry out the research project. The institution has made excellent progress toward the completion of the original goals of the project, but still must evaluate the effectiveness of the use of the new tools developed in reducing nutrient runoff from commercial dairy farms within the watershed of the Chesapeake Bay.

CENTER FOR RURAL STUDIES, VERMONT

Question. Please provide a description of the program that has been funded under the Center for Rural Studies, Vermont project.

Answer. The Center for Rural Studies project involves applied research focused on developing and refining social and economic indicators used to evaluate the impact of economic development programming and activities. The Center is perfecting a delivery format for technical assistance for community and small business development. A major component of current research relates to utilization of the world wide web as a delivery vehicle. Project proposal undergoes a merit review within the agency.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is an on-going project to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural development. The grant has addressed methodology and strategies for assessing rural development program impacts and perfecting planning tools to assist rural areas in land use and economic planning activities.

Question. What was the original goal of this research and what has been accomplished?

Answer. The original goal was to create a database and analytical capability for rural development programming in Vermont. Examples of past accomplishments include maps presented to target child hunger programs, targeted areas for other types of rural development program intervention, analytical reports to guide the development of retail shopping areas, an "Economic Handbook for Vermont Counties," and strategies for using the world wide web to disseminate information.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The grant was initiated in fiscal year 1992. Appropriated amounts are: fiscal year's 1992–1993, \$37,000 per year; fiscal year 1994, \$35,000; fiscal year's 1995–1998, \$32,000 per year; fiscal year 1999–2000, \$200,000 per year; and fiscal year 2001, \$199,560 for total appropriations of \$836,560.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Fiscal year 1991 included \$91,130 in state matching funds. Fiscal years 1993, \$143,124; fiscal years 1994–1996, \$3,547 state matching funds. Fiscal years 1997–1998 state dollars were \$2,931, plus researcher's salary. No non-Federal dollars were provided for fiscal years 1999–2001.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through the University of Vermont. Parts of the research and application were done in association with the Lamoille County Planning Commission and the Addison County Planning Commission.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1993. The original objectives of this research have been met. The additional objectives presented for fiscal year 2000 will be completed by June 30, 2001. The proposal for fiscal year 2001 has not been received to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes. A state level peer review was also performed for the Year 2000 project.

CHESAPEAKE BAY AGROECOLOGY, MARYLAND

Question. Please provide a description of the research that has been funded under the Chesapeake Bay Agroecology, Maryland grant.

Answer. The Chesapeake Bay Agroecology, Maryland project focuses on increasing our understanding of nutrient cycling, retention, and utilization by vital agricultural industries located within the vulnerable Chesapeake Bay watershed ecosystems that have been impacted by outbreaks of the toxic microorganisms *Pfiesteria*. There is a specific focus on Maryland's Eastern Shore. This research focus has been identified as a priority by the State of Maryland's Blue Ribbon *Pfiesteria* Action Commission Report of 1997 and by a Research, Education and Economics—REE—strategic plan emphasis, Greater Harmony Between Agriculture and the Environment, that calls for a better understanding of the linkages between agricultural production, water and soil quality range and forest land health, and habitat protection.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. The continued viability of Maryland's important coastal agricultural economy and the protection of the Chesapeake Bay's and Atlantic coastal aquatic and agricultural resources from future *Pfiesteria* outbreaks depends on our ability to prevent future toxic algal blooms by stemming the flow of nitrogen, phosphorus, and other agricultural nutrients into estuarine waterways.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The objective of this research is to increase our understanding of nutrient cycling, retention, and utilization by vital agricultural industries located in the coastal regions of the Chesapeake Bay and to develop new technologies and strategies that limit the loss of nutrients into waterways while preserving and enhancing vital agricultural industries. The project was initiated in 1999, and research results from 2000 are just becoming available.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001.

Answer. This project was initiated in fiscal year 1999. There were \$150,000 per year in fiscal years 1999 and 2000 and \$174,615 in fiscal year 2001. Total appropriations are \$474,615.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. The State of Maryland has pledged to match 100 percent of the Federal funds provided in fiscal year 2000 and in the future years of the Chesapeake Bay Agroecology project.

Question. Where is this work being carried out?

Answer. This research will be conducted at the University System of Maryland institutions and field research stations located throughout Maryland.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. Major progress has been made towards meeting specific project goals, as well as regional objectives. However, the issues being addressed are complex, and solutions will require a long-term approach.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. The project has not yet been evaluated by the agency. However, the projects supported by this Special Grant are peer reviewed by an independent external scientific panel prior to awarding of funds.

CHESAPEAKE BAY AQUACULTURE, MARYLAND

Question. Please provide a description of the research funded under the Chesapeake Bay Aquaculture, Maryland grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The objective of the Chesapeake Bay Aquaculture project has focused on improving the culture of striped bass and its hybrids through genetic improvement, reproductive biology, nutrition, health management, waste management, and product quality. The research is aimed at enhancing production efficiency and product quality, and provides a good balance between basic and applied research. Recently, research efforts have expanded to include the evaluation of nutrient remediation capabilities of seaweed culture systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator indicates that the Mid-Atlantic region of the U.S. continues to play a significant role in the overall expansion of the domestic aquaculture industry. Research supported through this program will assist in enhancing the culture of striped bass and its hybrids in the U.S. Additionally, research supported through this program will address the management of aquaculture effluents by enhancing nutrient uptake with cultured aquatic plants.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original research goal was to generate new knowledge that can be utilized to address serious problems limiting the expansion of the aquaculture industry in Maryland and the Mid-Atlantic region. The program has focused on closing the life cycle, enhancing production efficiency, decreasing effluents, and improving product quality under aquaculture conditions of striped bass and its hybrids. Research has been conducted in the areas of growth, reproduction and development, nutrition, aquacultural systems, product quality, and aquatic animal health. Progress has been made in developing controlled artificial spawning techniques, cryopreservation of sperm, and refining the nutritional requirements. Efforts to evaluate nutrient remediation capabilities of seaweed culture systems have also been initiated.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported under this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$370,000. The appropriations for fiscal years 1991-1993 was \$437,000 per year; fiscal year 1994, \$411,000; fiscal years 1995-1998, \$370,000 each year, fiscal years 1999 and 2000, \$385,000 per year; and fiscal year 2001, \$391,138. A total of \$4,733,138 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates the amount of non-Federal funding for this program is as follows: in fiscal years 1991 and 1992, \$200,000; in fiscal years 1993 and 1994, \$175,000; in fiscal year 1995 \$400,000; in fiscal year 1996 \$536,000; in fiscal year 1997 approximately \$400,000; in fiscal year 1998, \$360,000; in fiscal year 1999, approximately \$360,000; and \$783,055 in fiscal year 2000. The university reports that these funds are from direct state appropriations and other non-Federal funding sources.

Question. Where is the work being carried out?

Answer. Research is being conducted at the University of Maryland.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific research objectives were to be completed in 1993. The original specific research objectives have been met, however, research funded through this grant continues to address problems faced by the hybrid-striped bass industry in Maryland and throughout the U.S. The specific research outlined in the current proposal will be completed in fiscal year 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES staff evaluate the progress of this project on an annual basis. The agency's fiscal year 2000 review of this project concluded that the research objectives were relevant and addressed important opportunities in the aquaculture industry. The feasibility of attaining the stated objectives during the life of the proposed research was considered good, the research team was well-qualified and has the appropriate background, facilities were adequate, the budget was appropriate for the proposed activities, and the proposed research addressed priority needs of the aquaculture industry at the state and regional levels. The proposed research is consistent with national goals and needs outlined in the National Science and Technology Councils—NSTC—Aquaculture Research and Development Strategic Plan.

CITRUS CANCKER, FLORIDA

Question. Please provide a description of the research that has been funded under the Citrus Canker, Florida grant.

Answer. This is a new grant at the University of Florida, Institute of Food and Agricultural Sciences. This project is engaged in short- and long-term research directed at the infection of commercial and residential citrus trees by the *Xanthomonas* bacterium which causes Citrus Canker disease. Priorities for the research are targeted at developing knowledge and technology in support of eradication of this invasive species in the short term, and in support of development of mechanisms in the long term for citrus to resist the infection process and disease development.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Citrus Canker is a devastating disease caused by an invasive bacterial pathogen. Fresh outbreaks of this disease threaten the viability of the important citrus industry in Florida and other states.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. A team of microbiologists, plant pathologists, geneticists, and horticulturists are working together on three major goals: (1) evaluate potential materials that can delay or interfere with the bacterial infection process on susceptible host material; (2) characterize aspects of canker biology, ecology, and epidemiology—disease development—that might be manipulated to reduce infection or to predict more effectively where infection has taken place; and (3) to develop mechanisms within the host plants that will increase their resistance to infection and disease development. Included are enhancing differences in susceptibility among citrus cultivars and the introduction of additional resistance mechanisms derived from the pathogen or from plants with resistance to other similar bacterial diseases. Educational objectives of this project focus on development and delivery of current information on the organism, the disease, and efforts to eliminate it. The targets of this educational effort are: (1) commercial citrus producers, harvesters, and those who work in contact with citrus trees which may be exposed to the disease; (2) homeowners with citrus planted in their yards; (3) the general public who seeks information on the eradication effort and its necessity; and (4) regulators and policy makers who are interested in science-based actions and policies.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$4,739,550.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds have been identified that have been provided for this research.

Question. Where is this work being carried out?

Answer. The work is being carried out within the Florida Agricultural Experiment Station, which is part of the Florida Institute of Food and Agricultural Sciences, and includes Research and Education Centers dealing with citrus at Lake Alfred, Bradenton, Immokalee, and Homestead.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. The anticipated completion date for the original objectives is the end of fiscal year 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. The University of Florida intends to operate this project as an internal competitive grants program. Submitted proposals will be reviewed by a peer panel. CSREES will annually review the request for proposals and will consult with the university on the development of the peer review process.

CITRUS TRISTEZA

Question. Please provide a description of the research that has been funded under the Citrus Tristeza research grant.

Answer. Seven projects were selected for funding through a CSREES competitive grants program. Some of the research included: survey information on distribution of the brown citrus aphid and Citrus Tristeza Virus in Louisiana and Texas; the development of resistant citrus varieties to the virus; better understanding of virus strains; and the disease complex and biological control efforts on the brown citrus aphid in Florida and California.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Citrus Tristeza virus is a problem in all citrus growing areas of the U.S. and Puerto Rico. The recent introduction of a new vector, the brown citrus aphid, into Florida has allowed for another pathotype of the virus to be introduced. The new pathotype is more destructive and causes greater damage than those pathotypes already established in the citrus producing areas.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to reduce citrus losses in citrus; characterize and detect citrus tristeza virus strains; understand the biology and control of the brown citrus aphid and the epidemiology of citrus tristeza virus; identify host plant resistance; assess crop loss caused by citrus tristeza virus; develop strains of citrus tristeza virus strains that induce cross-protection in citrus, and provide virus free budwood.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999 at the appropriation level of \$500,000. The appropriation for fiscal year 2000 was \$595,000 and for fiscal year 2001, \$740,368. A total of \$1,835,368 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. There are no non-Federal funds provided for this grant.

Question. Where is this work being carried out?

Answer. Research is being carried out at land grant universities and research centers in Florida, Louisiana, California, and Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is the second year of this funding. An anticipated completion date has not been determined as the original objectives have not been met at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. All projects underwent a peer review at the University level, a scientific peer review, and an agency merit review in August, 2000.

COMPETITIVENESS OF AGRICULTURE PRODUCTS, WASHINGTON

Question. Please provide a description of the research that has been done under the Competitiveness of Agriculture Products, Washington research grant?

Answer. This research identifies international marketing opportunities for Northwest firms in the forest products and food products sectors.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. Most food processing firms are small. Their export sales are made in many widely scattered markets with different languages, customs, institutions, and market structures. These markets have also been subjected to wrenching changes.

University researchers provide a central and stable core of knowledgeable experts who can guide small export businesses in navigating these markets successfully.

Forest products from the Pacific Northwest can be shipped to Asian markets for less than the cost of shipping them to the eastern population centers in the U.S. Research has opened Asian markets to U.S. light frame construction building technology, providing good opportunities to export higher-valued secondary-manufactured products to Japan and China. Research has also been focused on forest management alternatives that can better satisfy environmental goals with less negative impacts on timber-dependent communities. The Northwest agricultural economy is highly dependent upon being able to export given that food production in the region greatly exceeds food consumption.

Northwest wood products companies that could export are generally small and are not able to provide their own research. Construction technologies used in Asian markets are inferior to U.S. technology, yet there is a long history of use and cultural appreciation of traditional methods. Deregulation and change in these markets has required extensive research on comparability of alternative product and building standards, quality and service needs, training in the U.S. technology, and customization to foreign consumer values. The Pacific Northwest can grow more wood with higher quality using more advanced technologies while reducing the impact on timber-dependent communities from harvest constraints to protect certain species.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to provide the information on markets and product technologies that can open higher-valued international markets to U.S. exporters. Foreign purchasers need information on the advantages of U.S. products, and U.S. exporters need information on the substantially different quality and service requirements for serving foreign markets. If the U.S. can remain competitive and retain its presence in these markets in the face of a stronger dollar, exports should return to a high growth path once Asian economies recover. Evidence to date suggests this is indeed happening.

The food production research has focused on finding new market opportunities for Pacific Northwest producers, solving technical impediments to exports, and developing new products and new processes that will enhance exports. It has pinpointed emerging market opportunities in Southeast Asia, China, Japan, Taiwan, Korea, India, Mexico, and Latin America. It has improved the export quality of diverse products, such as asparagus, apples, grass-seed, cherries, pears, potatoes, onions, and wheat. It has helped commercialize high-value products such as Wagyu beef, azuki beans, wasabi radish, edamame, and burdock, and pioneered new food processing technologies that produce higher-quality, fresh-like, shelf-stable products and save energy and reduce waste.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work began in fiscal year 1992. The appropriation for fiscal years 1992–1993 was \$800,000 each year; fiscal year 1994, \$752,000; fiscal years 1995–1998, \$677,000 each year; \$680,000 in fiscal years 1999–2000; and \$678,504 in fiscal year 2001. A total of \$7,098,504 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$716,986 State appropriations, \$209,622 product sales, \$114,000 industry, and \$661,119 miscellaneous for a total of \$1,701,727 in 1991; \$727,345 State appropriations, \$114,810 product sales, \$299,000 industry, and \$347,425 miscellaneous for a total of \$1,488,580 in 1992; \$1,259,437 State appropriations, \$55,089 product sales, \$131,000 industry, and \$3,000 miscellaneous for a total of \$1,448,526 in 1993; \$801,000 State appropriations, \$1,055,000 product sales, \$1,040,000 industry, and \$244,000 miscellaneous for a total of \$3,140,000 in 1994; \$810,000 State appropriations, \$42,970 product sales, \$785,000 industry, and a \$2,000,000 gift of a ranch due to the International Marketing Program for Agricultural Commodities and Trade Center's research on Wagyu cattle for a total of \$3,637,970 in 1995; \$844,000 State appropriations, \$45,000 product sales \$900,000 industry, and \$45,000 miscellaneous for a total of \$1,834,000 in 1996; \$876,000 State appropriations and \$1,606,000 industry for a total of \$2,482,000 in 1997; \$1,180,000 State appropriations and \$604,000 industry for a total of \$1,784,000 in 1998; \$1,551,000 State appropriations, \$1,006,400 industry, \$62,000 product sales, and \$30,096 miscellaneous for a total of \$2,649,496 in 1999; \$673,152 State appropriations, \$488,000 industry, and \$13,900 miscellaneous for a total of \$1,175,052 in 2000.

Question. Where is the work being carried out?

Answer. The food research is being carried out by the International Marketing Program for Agricultural Commodities and Trade—IMPACT—at Washington State University, Pullman; and the forest products research is carried out at the Center for International Trade in Forest Products—CINTRAFOR—at the University of Washington, Seattle.

Question. What was the anticipated completion date of the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was projected for 3 years duration to be completed following fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide the summary of the last evaluation conducted?

Answer. Two evaluations of the Washington State University component of the project were conducted in 1992 by USDA. The State of Washington Legislative Budget Committee gave the Washington State Center exemplary marks for meeting its objectives. On-site reviews are conducted annually of the University of Washington component of the project through annual meetings of the project's Executive Board, attended by the agency's staff. Both components are reviewed annually by the agency. The project is meeting the key objective of trade expansion through innovative research. The University of Washington project was formally reviewed by the agency in 1991. State reviews were completed in 1992 and 1994. A formal review by the University was completed in 1997. A broad survey of constituents impacted by the research was completed, resulting in a very favorable review of the Center's activities and a recommendation to continue this research. In 1998, State of Washington legislation eliminated the requirement for state reviews of the Center, including one scheduled for 1999, based on hearings that focused on the other favorable reviews and the continuous oversight by the Executive Board.

COOL SEASON LEGUME RESEARCH, IDAHO

Question. Please provide a description of the research that has been funded under the Cool Season Legume Research, Idaho grant.

Answer. The Cool Season Legumes, peas, lentils, chickpeas, and fava bean are considered minor crops on the national scale but are major in importance across the northern tier of states where all U.S. production is located. In addition to providing for U.S. consumption, they represent important export commodities and are important rotational crops in areas where a limited number of crops can be grown. Production research is urgently needed to improve economics in order to remain competitive in a world economy. The multi-state multi-disciplinary research is divided toward crop improvement, crop protection crop management, product development, and human nutrition.

Question. According to the research proposal, or principal researcher, what is the national, regional, or local need for this research?

Answer. The project is multi-state involving 5–7 states each year and representing the majority of U.S. production. Therefore, the program is national in scope.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The principal researcher believes the original goal of this project was to improve efficiency and sustainability of cool season food legumes through an integrated collaborative research program. Research on genetic resistance to important virus diseases in peas and lentils, and evaluation studies of biocontrol agents for root disease organisms on peas are underway. Other studies are evaluating integration of genetic resistance and chemical control. Considerable progress has been made using biotechnology to facilitate gene identification and transfer. Management system studies have addressed tillage and weed control issues. Results of previous years' work is already in use by area farmers and are helping to sustain the industry facing increasing competition from abroad and increasing production cost at home.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991 with appropriations for fiscal year 1991 of \$375,000; fiscal year 1992 and 1993, \$387,000 per year; fiscal year 1994, \$364,000; fiscal year 1995, \$103,000; and fiscal years 1996 and 2000, \$329,000; and fiscal year 2001, \$328,276. A total of \$3,589,276 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant were as follows: 1991, \$304,761 state appropriations, \$14,000 industry, and \$18,071 other non-Federal; 1992, \$364,851 state appropriations, \$15,000 industry, and \$14,000 other non-Federal; 1993, \$400,191 state appropriations, \$19,725 industry, and \$10,063, other non-Federal; and 1994, \$147,607 non-Federal support. Non-Federal support for 1995 was \$150,607; for 1996 it was \$386,887; for 1997 \$384,628; for 1998 \$392,000; for 1999 \$557,000; and for 2000 \$443,000.

Question. Where is this work being carried out?

Answer. Research has been conducted at agricultural experiment stations in Idaho, Oregon, Washington, Wisconsin, Minnesota, New York, Montana, North Dakota, and New Hampshire. The funds have been awarded competitively among participating states and not all states receive funds each year.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The projected duration of the initial project was five years. Revised objectives are expected to be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation?

Answer. The project is evaluated annually by a university/industry advisory panel. Proposals are peer reviewed at the universities and by the agency National Program Leaders. This research has provided vital information which is already being used to improve production management. However, a number of critical issues related to insect and disease control as well as crop quality remain to be addressed. Breeding for insect and disease resistance is given the highest priority, while crop management alternatives to help reduce disease and insect pest problems will continue to be studied.

CRANBERRY AND BLUEBERRY, MASSACHUSETTS

Question. Please provide a description of the research that has been funded under the Cranberry/Blueberry, Massachusetts grant.

Answer. Molecular genetics is being used to develop a system that will allow farmers to predict when dodder will emerge in their fields. This will allow accurate timing of herbicide application which will enable farmers to use less herbicide. In addition, molecular genetics is being used in an attempt to induce natural defense mechanisms in cranberry plants that will reduce the need for fungicide applications to protection cranberry fruit from rotting organisms.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. The research is a new approach to managing pests associated with cranberries and blueberries in Massachusetts. The program is focusing on the use of molecular genetics to reduce pesticide dependency in cranberry production. The research will be applicable to all states where cranberries are produced.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to determine whether early emerging and late emerging dodder populations can be differentiated using molecular markers; to determine the relationships among several isolates of a fungus which might be used in biological control; to screen various plant pathogen fungi isolates for infectivity and virulence and determine the presence of genes in these isolates; and develop an in vitro assay system for root rot and induce resistance in cranberry plants caused by different isotypes of the fungus. To date, markers have been developed that differentiate between early and late emerging dodder populations. Strains of *Phytophthora cinnamomi* have been identified with potential to be used as elicitors of systemic acquired resistance.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999 and the appropriation for fiscal year 1999 and 2000 was \$150,000. The appropriation in fiscal year 2001 is \$174,615. A total of \$474,615 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds are provided for this grant.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Massachusetts Cranberry Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2005.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project underwent a merit review at the agency level in January 2001. It was determined that the investigators are making significant progress toward the achievement of their stated objectives. The remaining objectives should be attainable within a period of four years. The investigators are publicizing the results of their research, both in professional venues as well as to producers. The quality of this project was determined to be high.

CRANBERRY-BLUEBERRY DISEASE AND BREEDING, NEW JERSEY

Question. Please provide a description of the research that has been funded under the Cranberry-Blueberry Disease and Breeding, New Jersey grant.

Answer. The work has focused on identification and monitoring of insect pests on blueberries and cranberries; the identification, breeding, and incorporation of superior germplasm into horticulturally-desirable genotypes; identification and determination of several fungal fruit-rotting species; and identification of root-rot resistant cranberry genotypes. Overall, research has focused on the attainment of cultural management methods that are environmentally compatible, while reducing blueberry and cranberry crop losses.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. This project involves diseases having major impacts on New Jersey's cranberry and blueberry industries, but the findings here are being shared with experts in Wisconsin, Michigan, and New England.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was the development of cranberry and blueberry cultivars compatible with new disease and production management strategies. Over 75 blueberry selections with wild blueberry accessions resistant to secondary mummy berry infections have been moved into advanced testing identified. The biology and seasonal life history of spotted fireworm on cranberries has been determined. A pheromone trap-based monitoring system for cranberry fruitworm was developed and further refined for commercialization. Blueberry fruit volatiles attractive to blueberry maggots were identified and tested in the field. Researchers have planted over 4,500 cranberry progeny for evaluation. Seven major fruit-rotting fungal species were identified, and their incidence in 10 major cultivars of blueberry and cranberry were determined. It is likely that resistance to fruit rot is specific to fungal species.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal years 1986 and 1987, \$95,000 per year; fiscal years 1988 and 1989, \$260,000 per year; fiscal year 1990, \$275,000; fiscal years 1991 to 1993, \$260,000 per year; fiscal year 1994, \$244,000; fiscal years 1995 to 2000, \$220,000 each year; and fiscal year 2001, \$219,516. A total of \$3,648,516 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. State and non-Federal sources are providing funds in the amount of 250,000 each year.

Question. Where is this work being carried out?

Answer. This research is being conducted at the New Jersey Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original objectives was 1995. Those objectives have not been met. To complete the breeding, disease and insect management, and provision of new management guidelines for extension and crop consultants, it is estimated that an additional five to nine years will be required.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The last agency evaluation of this project occurred in January 1999. In summary, the evaluation stated that the effort has continued to be highly productive and resulted in improved management strategies, new plant materials, and environmentally-balanced pesticides being used by growers. Some specific accomplishments included continued evaluation of blueberry and cranberry germplasm for yield, color, fruit rot, and flavor; and development of an efficient plant regeneration system for cranberry for genetic transformation. Other research includes trap and lure development for monitoring the cranberry fruitworm and evaluation of several aphidicides in blueberries. The discovery of an anti-sporulant in a registered fungicide provide for a novel use patent for blueberry anthracnose control.

CRITICAL ISSUES

Question. Please provide a description of the research that has been funded under the Critical Issues grant.

Answer. These funds support research on critical issues related to new or emerging pests and diseases of animals and plants. The program is expected to initiate research in a short time period until other resources can be secured to address the issue. The program began in fiscal year 1996 when potato late blight and vesicular stomatitis in animals were the two targeted emerging problems chosen for funding. Funding for these two projects was continued with fiscal year 1997 funds to permit orderly conclusion of work leading to integrated pest management efforts for the potato late blight and for further surveys on wildlife reservoirs of the vesicular stomatitis virus. During fiscal year 1998, these funds were used for support of a project on a newly emerging corona virus strain that is a probable cause of severe outbreaks of shipping fever or pneumonia in transported beef cattle. For plant diseases, fiscal year 1998 funds were used to support two major research projects on a new disease of sorghum, Sorghum Ergot. The two projects were Epidemiology and Life History of Ergot and Development of Integrated Control of Sorghum Ergot. In fiscal year 1999, Johne's Disease of cattle was identified by both veterinary researchers and USDA's Animal and Plant Health Inspection Service—APHIS—animal disease control staff as a major issue. For plants in fiscal year 1999, research was supported on the insect-vectored disease, Tomato Yellow Leaf Curl virus. For fiscal year 2000, plant research was supported to address monitoring of Mexican rice borer movement into sugarcane in Texas and Louisiana, the rate and spread of *Cactoblastis* moth on U.S. cactus, and incidence of cucurbit yellow stunting disorder virus in U.S. cucurbits. The research on Johne's disease issues was continued in fiscal year 2000, with continued emphasis on the possible linkage between this disease in cattle and Crohn's disease in humans.

Question. What is the national, regional, or local need for this research?

Answer. Vesicular stomatitis was of national impact due to its similarity to foot and mouth disease and the negative effect on movement of horses, cattle and swine during an outbreak. Since 1992, new, highly virulent strains of the potato late blight fungus, *Phytophthora infestans*, caused severe losses in potato and tomato production throughout the U.S., resulting in what some experts term a national crisis. From 1993 to 1995, a series of meetings involving growers, consultants, industry, academia, and government assessed the growing problem, and participants concluded that extraordinary steps were needed to mobilize research efforts that would help address the problem in the near term. Bovine shipping fever causes heavy economic losses to the beef industry in cattle being shipped to feedlots, and vaccines for currently recognized viruses seem to be ineffective in certain settings in preventing outbreaks. The isolation of a probable new virus, bovine respiratory corona virus, represents an opportunity to contribute to the reduction of this disease complex in cattle. Sorghum Ergot is a serious disease of sorghum which was first detected in Texas in March, 1997. It rapidly spread to almost all sorghum growing regions of the U.S. by September 1997. Johne's Disease has been identified by several commodity and animal health organizations as the leading problem for dairy cattle owners and also a serious issue for beef producers. Decisions on specific research needs and focus of research projects is decided after consultation with a variety of commodity stakeholders, other USDA agencies, especially APHIS, scientists in the land grant system, and other public input. Tomato Yellow Leaf Curl virus is a newly introduced disease into Florida that has caused considerable crop loss and now has moved into Georgia. This disease is vectored by the silver leaf whitefly and affects tomatoes, beans, and other vegetables. The disease symptoms are severe stunting, distortion, and high rates of flower loss. Mexican rice borer, a pest of sugarcane in the Lower Rio Grande valley of Texas, is a new and emerging pest which threatens sugarcane production in Louisiana. The biocontrol agent, *Cactoblastis cactorum*, was accidentally introduced into Florida from the Caribbean Islands in

1989. Even though this species was introduced into the Caribbean basin as a biocontrol agent for cacti, it now threatens many native species of cacti in Florida and has the potential to spread to other cactus species in the United States. The Old World virus, cucurbit yellow stunting disorder virus, was first found in melons from Texas and northern Mexico in 1999. In other parts of the world it has become the most important virus in cucurbits. Determination of incidence and spread in the U.S. is important, particularly since the primary vector species *Bemisia argentifolii* is well established in Florida, other southern states, California, and Arizona.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research supported by this program is to focus on specific questions or issues which are considered to be most important in developing control or prevention programs for the disease agent under investigation, whether in plants or animals. Thus, for the animal studies, the focus has been on identifying natural reservoirs of the vesicular stomatitis virus and insects which are capable of transmitting the disease among animals; determining the precise significance of the apparent new corona virus in shipping fever pneumonia of beef cattle; and developing a sub-unit vaccine for Johne's Disease in cattle and determining the significance of a linkage between Johne's Disease and Crohn's disease of humans. In spite of a very large research effort, the natural reservoir for vesicular stomatitis virus is still unknown. The bovine respiratory disease work on the apparently new respiratory corona virus has validated the role of this virus in outbreaks of pneumonia in cattle vaccinated for other known causes of shipping fever. This virus has now been isolated from animals with pneumonia in other states. Research was initiated to provide growers with the knowledge and technologies they need to reduce economic losses resulting from potato late blight with less reliance on pesticides. Research initiated with fiscal year 1996 funds is making progress in developing modeling tools and management approaches that are an important step towards reducing the devastating effects of late blight. The National Late Blight Fungicide Trial provided important information on the efficacy of an array of fungicide programs. A World Wide Web site was established to provide growers, researchers, and industry with the latest information on management of potato late blight. The research projects on Sorghum Ergot were intended to develop information about the history and epidemiology of the disease which would lead to studies on development of integrated control programs for this fungus. Research on Tomato Yellow Leaf Curl Virus has aided in the understanding of which field crops other than tomato serve as a source of virus infection. Weed reservoirs were also studied as potential whitefly infection sites. These results will help in the development of field management strategies for this virus. Another research project tested transformed tomatoes that had been selected for resistance to Tomato Yellow Leaf Curl virus. This approach was successful in developing resistant tomatoes to another similar virus and is expected to produce highly resistant tomato varieties to Tomato Yellow Leaf Curl virus. Incidence and spread of cucurbit yellow stunting disorder virus, *Cactoblastis* moths, and the Mexican rice borer are all significant for agriculture and horticulture in the U.S.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. \$200,000 were appropriated in fiscal years 1996-2000 and \$199,560 in fiscal year 2001 for a total appropriation of \$1,199,560 to date.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This information is not currently available.

Question. Where is this work being carried out?

Answer. From 1996 to 1997, the vesicular stomatitis work was conducted at the University of Arizona and Colorado State University. The potato late blight work has been conducted at Washington State University, Oregon State University, University of Idaho, University of Wisconsin, the Pennsylvania State University, and North Carolina State University. In 1998, the bovine respiratory disease work was performed at Louisiana State University. The Sorghum Ergot work was done at the University of Nebraska and Texas A&M University. In fiscal years 1999 and 2000, the research on Johne's Disease was performed at Iowa State University and the University of Iowa. The research on Tomato Yellow Leaf Curl Virus was carried out at the Gulf Coast Research and Education Center, University of Florida, Bradenton, Florida, and the Tropical Research and Education Center, University of Florida, Homestead, Florida. The research on the Mexican rice borer is conducted in Texas and Louisiana, the research on *Cactoblastis* is being done in Florida and the incidence of cucurbit yellow stunting disorder virus is being done in regions where the primary vector, *Bemisia argentifolii*, is known to occur.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Critical Issues funds are intended to support the initiation of research on issues requiring immediate attention until other, longer-term resources are available. The objectives of the projects are short-term and are expected to be completed within a 1–2 year period. This has been true for the vesicular stomatitis and potato late blight work. These projects have been reviewed to ensure compliance with the original goals during fiscal year 1997. The subsequent project grants for potato blight in 1997 and for Sorghum Ergot and bovine respiratory disease in 1998 had short term goals and were completed by the end of their project years in late spring 1999. Similarly, the objectives of the research funded with fiscal year 1999 funds were completed by the summer of 2000. For the Johne's Disease work, the emphasis is on determining the likelihood of a link between this disease of cattle and Crohn's Disease in humans and also developing a vaccine to prevent further spread within the cattle population. For Tomato Yellow Leaf Curl Virus, the emphasis is on field management of the disease and the development of virus resistant varieties of tomato. For Mexican rice borer, *Cactoblastis*, and cucurbit yellow stunting disorder virus work the primary focus is on determination of incidence and spread.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. All projects were reviewed for scientific merit before funding decisions were made. Also, scientists being supported with these funds are in close contact with CSREES' National Program Leaders in these areas so that the agency is kept abreast of developments as they occur. Each investigator is required to submit a detailed report at the end of the funding period to document their accomplishments with these funds. In addition, site visits are arranged when convenient to include as part of other official travel to that state. The vesicular stomatitis research had a site visit review in early 1998 and was reviewed as a completed project in March 1999 during a program review at the University of Arizona. The final results of the bovine respiratory work were submitted to CSREES for review in early fall 1999. The plant related projects have received similar reviews as the projects have moved forward, and the results are being reported at regional and national meetings.

DAIRY AND MEAT GOAT RESEARCH, TEXAS

Question. Please provide a description of the research that has been funded under the Dairy and Meat Goat Research, Texas grant?

Answer. The program has addressed a range of issues associated with goat production. Research by scientists at the International Dairy Goat Center, Prairie View A&M University, focuses on problems affecting goat production in the U.S. Issues included are the study of nutritional requirements of goats, disease problems, methods to improve reproductive efficiency in the doe, the use of gene transfer to improve caprine genetics, and the evaluation of breeding schemes to improve meat and milk production. Currently, research is in progress to assess the economics of alternative breeding and rearing systems for goats in the southeastern region of the U.S., to study the incidence and impact of intestinal parasites, and to develop least-cost health management strategies for parasite control.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that nationally, most of the farm enterprises that include goats are diverse and maintain a relatively small number of animals. Responding to disease, nutrition, breeding, and management problems will improve efficiency of production and economic returns to the enterprise.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to conduct research that will lead to improvement in goat production among the many small producers in the U.S. Research has been conducted to develop and improve nutritional standards, improve genetic lines for meat and milk production and to define mechanisms that impede reproductive efficiency in goats. Current efforts focus on the development of enterprise budget management tools for goat producers in the Texas gulf coast region.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded through appropriated funds as follows: \$100,000 per year for fiscal years 1983–1985; \$95,000 per year for fiscal years 1986–1988; no funds were appropriated in fiscal year 1989; \$74,000 for fiscal year 1990;

\$75,000 per year for fiscal years 1991–1993; \$70,000 for fiscal year 1994; \$63,000 per year for fiscal years 1995–2000; and \$62,861 in fiscal year 2001. A total of \$1,394,861 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university reports no non-Federal funds expended on this program.

Question. Where is this work being carried out?

Answer. Research is being conducted at Prairie View A&M University in Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The overall objective of this research is to support the needs of small farms engaged in the production of meat and milk from goats along the Texas Gulf Coast. The university researchers continue to address those needs on an annual basis, and anticipate that work currently in progress will be completed by the end of fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Dairy/Meat Goat Research grant was reviewed last in June 1997. The project objectives are within the goals of the program, are within the mission of both USDA and CSREES, and the institution is well equipped and qualified to carry out the research project.

DAIRY FARM PROFITABILITY, PENNSYLVANIA

Bonilla. Please provide a description of the research that has been funded under the Dairy Farm Profitability, Pennsylvania grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. This is a new project that will be initiated in fiscal year 2001.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is national in scope. The dairy industry is undergoing significant structural change. Producers must adopt and improve practices that will enable them to remain profitable as these changes occur.

Question. What was the original goal for this research and what has been accomplished to date?

Answer. The goal of the research is to identify and develop improved dairy management practices that will help producers sustain and improve the profitability of their operations. Since the project is just now being implemented, there are no accomplishments to report at this time.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001. The appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Some preliminary related work has been conducted at the Pennsylvania State University. A proposal for this new project is just being developed so at this date, no non-Federal funds have been provided for this grant.

Question. Where is the work being carried out?

Answer. Research will be conducted at the Pennsylvania State University

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since the proposal has not yet been received, anticipated completion dates are not available at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since this is a new project, no evaluation has yet been conducted.

DELTA RURAL REVITALIZATION, MISSISSIPPI

Question. Please provide a description of the program that has been funded under the Delta Rural Revitalization, Mississippi project?

Answer. The Delta Rural Revitalization, Mississippi project involves applied research and outreach focused on creating new and expanded economic development opportunities for the Mississippi Delta region. The project has gone through several phases in the delineation of a strategy for long range development within the region.

Phase I was completed with the delivery of a baseline assessment of the economic, social, and political factors that enhance or impede the advancement of the region. Phase II of the project evaluated the potential for entrepreneurship and small business creation as mechanisms to improve economic conditions. Phase III is now focusing on technical assistance to Delta region manufacturing firms to strengthen their ability to provide employment and incomes and includes the development and refinement of data bases and development statistics. The proposals are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas and provide greater impact on targeted region.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to job and business development as a development strategy. The principal researcher believes that the databases, technical assistance, and analytical capability will increase the effectiveness of economic development and entrepreneurial activity in the region.

Question. What was the original goal of this research and what has been accomplished?

Answer. The applied research and outreach project was designed to increase ability to strategically guide economic development through target industry attraction. An analytical baseline for the Delta region has been developed to benchmark economic development progress and to profile potential arenas of opportunity. An entrepreneurial forum was established to help new business ventures with start-up advice and assistance. A venture capital association was formed to help both inventors and businessmen find capital resources to carry out development initiatives. The emphasis of the project is now shifted to technical assistance for existing industries. During the past budget year, activity of this project has been directed to expanding the use of information technology in economic development in the Mississippi Delta.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from appropriated funds in the following amounts per year: fiscal year 1989, \$175,000; fiscal year 1990, \$173,000; fiscal year's 1991-1993, \$175,000 per year; fiscal year 1994, \$164,000; fiscal year's 1995-2000, \$148,000 per year; and fiscal year 2001, \$204,549. A total of \$2,129,549 has been appropriated and awarded.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Total non-Federal funds directed to this project, as reported by Mississippi State University, are: fiscal year 1991, \$117,866; fiscal year 1992, \$84,402; fiscal year 1993, \$68,961; fiscal year 1998, \$57,404. Reports for other years indicate no non-Federal funds.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through Mississippi State University and sub-contractors.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1990. The original objectives of this research have been met. The additional objectives being presented for the current year should be completed by September 30, 2001. The current year proposal has not been submitted to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit periodic reports to the agency to document impact of the project. Significant suggestions have been offered to improve the relevance and impact of this project. An assessment of the project was conducted by the Social Science Research Center at Mississippi State University and a report compiled in November 1996. A site review was conducted in April 1999 to assess the merits of research efforts underway. A review and evaluation by an outside consultant is currently underway.

DESIGNING FOODS FOR HEALTH, TEXAS

Question. Please provide a description of the research that has been funded under the Designing Foods for Health, Texas grant.

Answer. Designing fruits and vegetables for improved health and nutrition will be the overall goal. Health scientists have documented that naturally-occurring compounds such as flavonoids, carotenoids, and antioxidants have health benefits to prevent heart disease, stroke, and some forms of cancer. The research objective is to develop fruits and vegetables that have uniform, high levels of these compounds so all consumers can prevent chronic diseases through their diet. The fiscal year 2000 grant supports research through September 2001. CSREES requested the university submit a grant proposal for fiscal year 2001 that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for continuing this research is to improve the quality of many different fruits and vegetables. Health scientists have documented that several fruits and vegetables have naturally-occurring compounds that promote health and prevent disease. The medical community advocates that preventing disease is more advantageous than trying to cure it. For example, a large effort of Texas health science centers is to develop improved diets that can aid in prevention of colon, esophagus, and prostate cancers. A wide range of improved fruits and vegetables for health will provide an enormous benefit for consumers worldwide, and will help people who may not know of the additional benefits of consuming the new varieties but like the texture and taste.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to design fruits and vegetables that assist in preventing diseases through diet. With plant breeders and medical scientists now working together, goals can be established to develop varieties that provide more nutrition and assist in preventing disease in children through the elderly. The most exciting accomplishment has been the development of the new carrot, BetaSweet. It was designed to be attractive, crisp in texture, have excellent sweet carrot flavor, and to contain a higher content of beta-carotene than most orange carrots in the marketplace. Beta-carotene is a major source of Vitamin A and is thought to play additional roles in preventing certain forms of cancer, especially oral cancer. This carrot also contains high levels of anthocyanins that are normally found in fruits such as grapes and blueberries. They are known to be excellent antioxidants that prevent blood clotting, aid in the prevention of some cancers, heart disease, and strokes. The researchers are also improving health promoting aspects of the BetaSweet carrot by adding lycopene, which is found in tomatoes. Lycopene is thought to play a role in the prevention of prostate cancer. All these improvements are being done using conventional breeding.

Question. How long has this work been underway and how much has been appropriated by fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999, and the appropriation for fiscal year 1999 was \$250,000; for fiscal year 2000 \$318,750; and for fiscal year 2001, \$561,761. A total of \$1,130,511 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were \$206,500 from university funds and \$165,000 from an endowment fund in 1999, and \$240,000 from university funds and \$180,600 from an endowment fund in 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Vegetable and Fruit Improvement Center and other research centers within the Texas Agricultural and Mechanical University System.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective of developing fruits and vegetables that contain high levels of naturally-occurring compounds that have health benefits continues to be addressed. The specific objective of improving the carrot by increasing the carotenoid and anthocyanin content while maintaining superior flavor and textural properties will be completed in 2001. Related objectives include increasing quercetin and anthocyanin levels in onions; carotene and anthocyanins in peaches; carotene in melons; carotene, quercetin, vitamin C, and lutein in peppers. Some of these objectives will be met by the end of 2003 and will include other crops such as tomatoes and citrus in the near future.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project director conducted a review by peer scientists at Texas Agricultural and Mechanical University prior to submitting the proposal for fiscal year 1999. The Vegetable and Fruit Improvement Center has a very active advisory board of industry professionals who review the Center's research programs annually.

DIAPREPES/ROOTWEEVIL, FLORIDA

Question. Please provide a description of the research that has been funded under the Diaprepes/Rootweevil, Florida grant.

Answer. The funds are requested to address objectives established by an inter-agency/industry task force. CSREES will request the university to submit a grant proposal for this award. Among the most critical priorities are: Assessment of the plant injury and economic damage caused by the root weevil on horticultural, agronomic, and ornamental plants in the affected area, and the potential for the pest to spread beyond its current range; Development and use of monitoring tools to evaluate population levels, regions infested, and to predict where economic damage is likely to occur; Development, field evaluation, and implementation of management tools that individually will assist in weevil management within existing pest management programs in citrus and other affected crops. Tools to be developed are chemical, biological, cultural and mechanical methods.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Diaprepes abbreviatus is a pest introduced into Florida from its native Caribbean Islands in the late 1960's, but remained very localized in few citrus groves until the late 1980's when the pest began to spread. Known as a serious pest of a wide range of plants, this pest has the potential to affect traditional agriculture and also native plants. The potential exists for enormous economic losses in the home landscape industry, a multi-billion dollar business in Florida and the Southeast. Further, movement could expand the impact of this pest to other areas of the U.S., and could invoke regulatory concerns between trading partners and commerce. Individual plants which are attacked are injured through root loss, underground stem damage, and in the case of citrus, plant death. Whole blocks of citrus are progressively being killed, and the area cannot be replanted to citrus or other susceptible crops. Present management needs involve the development and evaluation of methods to locate and reduce larval and adult populations by a combination of treatments that are effective, safe, and economical.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Research on this pest has concentrated in the past year on further development of management approaches for citrus, as well as development of information and management options for the pest on a wide range of other crops and native plants. Aspects of the biology of the weevil under investigation within this program include understanding the attraction cues that allow adult weevils to identify and locate host plants on which to feed and lay eggs. Leading from this research is the development of monitoring and trapping methods, which help us understand seasonal and spatial movement of the weevil populations. This in turn allows for the proper timing of applied controls. Field research is refining the use of selected pesticides for adult control on host plant foliage and use of short-residual pesticides for interference with young larvae as they fall from the canopy to infest roots. The evaluation of commercially-available parasitic nematodes to attack and kill root weevils and the testing of a native nematode are presently under investigation. Introduction and evaluation of parasitoid insects which attack and kill weevil eggs also is underway. Integration of these tools into a system which will reduce crop impact and slow weevil spread is the ultimate goal of this research effort. Establishment of cooperative research efforts in Texas are progressing following the finding of this pest in Texas in late 2000.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Fiscal year 2000 was the first year of the grant and \$297,500 was appropriated. For fiscal year 2001, \$394,131 is appropriated for a total of \$691,631.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Investment of state funds will continue to be made in this research. University of Florida has several programs that have focused their efforts on Diaprepes research, including the entomologists, pathologists, and plant improvement teams.

Internal funds, as well as effort, have been redirected to address this problem. The citrus growers of Florida have dedicated considerable grant dollars from a self-tax for research, and more recently, other commodity groups are contributing to fund research. In-kind support through cooperation, shared equipment, and other means are being provided to address the issue.

Question. Where is the work being carried out?

Answer. The work is being carried out at the University of Florida with cooperative field studies in the new infested area of Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion of some of the objectives will continue past the period of the current funding proposal, with evaluation and definition of new or modified objectives and priorities to be specified in a report which will accompany a new proposal.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project which will be evaluated as accomplishments are reported.

DROUGHT MITIGATION, NEBRASKA

Question. Please provide a description of the research that has been funded under the Drought Mitigation, Nebraska grant.

Answer. The National Drought Mitigation Center in the School of Natural Resource Sciences at the University of Nebraska has a comprehensive program aimed at lessening societal vulnerability to drought. Activities of the Center include: promoting and conducting research on drought mitigation and preparedness technologies, improving coordination of drought-related activities and actions within and between levels of government, and assisting in the development, dissemination, and implementation of appropriate mitigation and preparedness technologies in the public and private sectors.

Emphasis is directed toward research, outreach projects, and mitigation/management strategies that stress risk minimization.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Federal Emergency Management Agency has recently estimated that annual losses attributable to drought in the U.S. are between \$6–8 billion. Drought impacts are escalating in response to increasing demands for water and other natural resources, increasing and shifting population, new technologies, and social behavior. These impacts are diverse and affect the economic, environmental, and social sectors of society. This fact was reinforced dramatically in 1996 in the Southwestern U.S. Impacts of drought in Texas alone were estimated to be more than \$5 billion.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to create a National Drought Mitigation Center and develop a comprehensive program aimed at lessening societal water shortages and vulnerability to drought. The Center has created an information clearinghouse and is delivering information to a diverse audience of users through its web site. Over 50,000 users now access the Center's web site each month. The Center's award winning web site was used extensively by state and Federal agencies during the 1999 drought to assist in the evaluation and response process. This web site networks users of drought-related information in the U.S. and elsewhere with information that would otherwise be unavailable or inaccessible.

The National Drought Mitigation Center played an important role in the response of Federal and state government to the 1996 severe drought in the Southwest and southern Great Plains states. The Center provides timely and relevant information on drought severity and alternative response, mitigation, and planning measures. The Center participated in the Multi-state Drought Task Force workshop organized at the request of President Clinton and helped formulate long-term recommendations to improve the way this Nation prepares for and responds to drought. The Center is also a member of the Western Governors' Association Drought Task Force. This Task Force made recommendations to reduce the risks associated with drought in the western U.S.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant received an appropriation of \$200,000 in fiscal years 1995 through 2000 and \$199,560 in fiscal year 2001 for a total appropriation of \$1,399,560.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University of Nebraska contributed \$75,737 of non-Federal funds in support of this research in fiscal year 1995, \$58,977 in fiscal year 1996, and \$61,545 in fiscal year 1997. The University of Nebraska contributed \$67,819 in fiscal year 1998 and \$74,887 in fiscal year 1999.

Question. Where is this work being carried out?

Answer. The research will be conducted at the University of Nebraska-Lincoln.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research conducted under this project is being undertaken within a series of nine tasks. Significant progress on each of these tasks has been made, but these activities are ongoing. The information clearinghouse has been created, but new information and documents are continuously added to the web site in response to users' needs and requests. In addition, the drought watch section is updated monthly to assist users in evaluating current climate and water supply conditions. Research on new climatic indices to monitor drought and water supply conditions are being tested, and mitigation technologies and existing state drought plans are continuously evaluated. New activities are also being initiated in response to the growing interest and awareness in drought mitigation in the United States and elsewhere. The activities of the Western Drought Coordination Council provide the Center with a broadening range of research needs on an annual basis.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer-reviewed at the time the proposal was prepared in 1998. Each year, when the new proposal is prepared, the proposal is reviewed on the campus and again by agency representatives. The project is evaluated for progress toward completion of objectives, new activities proposed, and accomplishments.

ECOSYSTEMS, ALABAMA

Question. Please provide a description of the research that has been funded under the Ecosystems, Alabama grant.

Answer. In 1998, CSREES approved a proposal from Auburn University to support projects at two Community Colleges in Alabama—Faulkner State Community College and Alabama Southern Community College. The Faulkner State Community College's project is intended to: (1) fund the development of distance education classrooms for estuarine- and marine-related education, and (2) to establish an aquaculture-related veterinary technician education program. The Alabama Southern Community College project will purchase and install laboratory equipment to further the education capacity of the Center for Excellence in Forestry, Paper, and Chemical Technology.

Question. According to the research proposal, or the principal researcher, what is the local, regional, or national need for this project?

Answer. Faulkner State Community College asserts that their veterinary technician program will be the only such program in the country providing the first two years of the degree program leading to an A.A. degree at Faulkner State, and the second two years leading to a bachelor's degree at Auburn University. The distance education capacity is intended to better integrate marine and estuary research into education activities.

The Center for Excellence in Forestry, Paper, and Chemical Technology at Alabama Southern Community College is believed to be a unique educational opportunity in the Southeastern U.S. due to the merging of four individual technology training programs. These programs are: (1) Industrial Maintenance, (2) Electronics and Instrumentation, (3) Paper Process, and (4) Chemical Process training.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals for these projects include the development of a veterinary technician training program and integration of marine and estuary research into classrooms at Faulkner State Community College; and to establish a state-of-the-art wood paper process and chemical process laboratory at Southern Alabama Community College.

The fiscal year 1998 objectives for Faulkner State Community College were to establish a distance education web site to enhance integration of marine and estuarine environmental research and to establish a 2+2 veterinary technicians program with an emphasis on marine/aquaculture. The distance education web site is in place and

has been tested. In addition, classrooms have been tested and some faculty have been trained in the use of the media/hardware. After further assessment, it was decided that the proposed Veterinary Technician Program would not be cost effective. With the fiscal year 1999 proposal, Faulkner State Community College proposed instead to establish a 2 + 2 Environmental Science degree program.

The fiscal year 1998 objectives for Alabama Southern Community College was to have completed, tested, and placed into operation the chemical, pulp, and paper process laboratories in the areas of (1) Process Control, (2) Crystallization, (3) Batch Reactor, and (4) Digester by June 2000. The Process Controls, Crystallization, and Digester laboratories were completed. The Batch Reactor is currently being completed. The completion of the Batch Reactor was delayed because the original corporation designated to do the work on this project was unable to follow through. However, Auburn University took the responsibility of preparing the engineering specifications for the Batch Reactor, and the unit will be functional by the end of summer 2001.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Funds were appropriated for this grant beginning in fiscal year 1998. In fiscal years 1998 through 2000, \$500,000 was appropriated each year, and in fiscal year 2001, \$498,900 is appropriated. A total of \$1,998,900 has been appropriated.

Question. What is the source and amount of non-Federal funds provided to support this project?

Answer. No non-Federal funds have been identified to support this project.

Question. Where is this work being carried out?

Answer. The project is being conducted at the Faulkner State Community College Aquaculture Center in Alabama and at the Alabama Southern Community College Center for Forestry, Paper, and Chemical Technology.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Alabama Southern Community College project proposal indicates a two-year budget for project completion. The Faulkner State Community College proposal was for one year only. The objectives have not yet been met but are well underway.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project had a merit review before it began in fiscal year 1998. Subsequent projects were peer reviewed by the respective institutions for the fiscal year 1999 allocation.

EFFICIENT IRRIGATION, NEW MEXICO AND TEXAS

Question. Please provide a description of the research that has been funded under the Efficient Irrigation, New Mexico and Texas grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. It is anticipated that it will request funding for research to increase the efficiency of agriculture and urban landscape irrigation and encourage the development of efficient water markets in the Rio Grande Basin.

Question. According to the research proposal, or the principal researcher, what is the national, regional, and local need for this program?

Answer. Growing demand and drought have created critical water supply issues for much of the southwest. This project is designed to improve irrigation efficiency and water conservation in the Rio Grande basin in New Mexico, Texas, and Mexico. The crux of the problem is that a total water management system, which would assist agriculture and urban interests, does not exist. As a result, water is released on demand often resulting in inefficient management. Water problems will only increase as the population in this region grows and more industry is located to this region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Subject areas addressed will include irrigation district studies; irrigation system management; urban landscape and in-home water conservation; environment, ecology and water quality protection; saline and waste water management and water use; basin-wide hydrology, salinity modeling, and technology; and communications/oversight/biometric support/accountability.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$1,185,386.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. Sources of any non-Federal funds will be identified in the grant proposal.

Question. Where is the work being carried out?

Answer. This research will be carried out by Texas A&M University and New Mexico State University. Coordination will be provided through the Water Resources Institute at Texas A&M University.

Question. What was the anticipated completion date for the original objectives of this project? Have them objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. The anticipated completion date for the first phase is April 30, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the, last evaluation conducted.

Answer. This is a new project. An agency review will be conducted prior to awarding the grant.

ENVIRONMENTAL BIOTECHNOLOGY, RHODE ISLAND

Question. Please provide a description of the research that has been funded under the Environmental Biotechnology, Rhode Island grant.

Answer. This is a new special grant this year. The agency has requested the university to submit a grant proposal that has not yet been received. Preliminary communications with the institutional research administrator indicate that the project is part of an ongoing environmental biotechnology initiative approved by the Rhode Island Board of Governors for Higher Education in 1998. The goal of the initiative is to enhance the educational, training, and research capacities of the biological and environmental sciences of the university through development of state-of-the-art research and training facilities including core facilities for genomics, transgenics, imaging, and bioinformatics.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the institutional research administrator, this project will strengthen research and training programs in marine and environmental biology and ecology in response to public needs for research, for practical problem solving in government and industry, and for the public and private needs of scholars, technological experts, and future leaders.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to enhance the educational, training, and research capacities of biological and environmental sciences of the institution through development of state-of-the-art research and training facilities. Accomplishments in the first two years include receipt of four awards totaling \$600,000 from the Rhode Island Champlin Foundation to equip biotechnology teaching laboratories, receipt of a Federal challenge grant for a transgenics teaching facility and training, and commitment of \$2.1 million toward the Slater Center of Excellence in Biotechnology at the institution.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$189,582.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In addition to the non-Federal Champlin and Slater Center funds referred to earlier, the university has funded a significant amount of renovation in the laboratories equipped by the Champlin funds, and it has absorbed the cost of developing alternative space to free space for a turf-grass business incubator facility on-campus.

Question. Where is this work being carried out?

Answer. The research is conducted on the campus of the University of Rhode Island, Kingston, Rhode Island.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion of additional or related objectives?

Answer. Currently planned interim facilities that will house the equipment purchased under this special grant are intended to meet campus needs for the environmental biotechnology core facility until a new facility is completed in 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new special grant so it has not been evaluated yet. The agency will convene a merit review panel to evaluate the project upon receipt of a proposal for fiscal year 2001.

ENVIRONMENTAL HORTICULTURE, FLORIDA

Question. Please provide a description of the research that has been funded under the Environmental Horticulture, Florida grant.

Answer. This is a new grant, and the University of Florida is preparing a grant proposal for submission.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Agriculture in the six counties of north-central Florida has suffered economically with the decline in the tobacco industry. This is a rural area with very little industrial development and so the agricultural decline has been a hardship. The environmental horticulture industry offers hope for renewed economic growth in this area.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this grant is to establish the Green Industries Education Institute. This institute will identify and promote alternative horticultural crops that can be grown in north-central Florida. Appropriate cultural techniques will be developed for these crops. Courses will be developed that will re-train the growers in this area in these techniques. In addition, a curriculum will be developed that will train workers in the skills that will be required by this new industry.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001.

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$284,373.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. In fiscal year 2000, \$340,000 was appropriated by the state of Florida to develop this project.

Question. Where is this work being carried out?

Answer. The work is being carried out at the University of Florida, Florida A&M University, and the North Florida Community College.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. The anticipated completion date for the original objectives is the end of fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. A peer review of the project will be undertaken by the performing institution, and the agency will conduct a thorough evaluation of the proposal once it is received.

ENVIRONMENTAL RESEARCH, NEW YORK

Question. Please provide a description of the research that has been funded under the Environmental Research, New York grant.

Answer. This research has several major goals. These are: (1) to better understand the impacts of nutrient flows, principally nitrogen, from agriculture on non-agricultural ecosystems, forests, wetlands, and water resources in mixed ecosystem landscapes; (2) to improve knowledge of agricultural contributions to greenhouse gas emissions and effects of projected climate change on crop production; and (3) to develop innovative approaches and technologies for improving the efficiency of agricultural production. New thrusts include: (1) to improve understanding of the impacts of land application of biosolids on the sustainability of New York agriculture and on water quality, and to develop management practices and guidelines for sustainable use of biosolids in New York agriculture; and (2) to evaluate spatial and temporal variability of crop yields within fields and to develop management practices that increase productivity, increase the efficiency of use of inputs, and reduce environmental impacts of agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Programs supported by the special grant are multi-disciplinary in nature involving technical scientists from a range of disciplines, together with social scientists and economists. Due to the complexity of agriculture and environmental interactions at all levels, the needed research is complex and requires much time. Additionally, translation of knowledge from plot or field studies to larger scales, such as landscape to regional and global, is needed to provide information that is useful to policymakers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. One goal of the program is to identify impacts of nitrogen flows from agricultural lands on adjacent natural ecosystems, forests and wetlands, and water resources and to devise management strategies to minimize these impacts. Leaching of nitrogen from maize-based cropping systems has been shown to be higher when organic sources of nitrogen, manures, and plow-down alfalfa are used as nitrogen sources for crop growth compared to use of inorganic fertilizers. A computer-based nitrogen decision support system to improve recommendations for on-farm nitrogen management is being used in New York.

A second goal of the program is to investigate several interactions between agriculture and climate change. Studies of methane fluxes to/from soils showed that northern hardwood forests are both a source and a sink for this powerful greenhouse gas and overall may be a net source of methane. In contrast, upland agricultural systems were consistently found to be a sink for methane. Use of legume green manures to supply nitrogen in an organic production system increased methane emissions two-fold, creating a conflict between a sustainable agriculture practice and the environment.

No-tillage agriculture was shown to increase preservation of existing soil organic carbon, but accumulation of carbon derived from crop inputs was higher with conventional tillage. Inputs of carbon to soils from root exudates and residues were found to be more important to carbon sequestration in soils than were residues from the tops of plants.

Soil quality assessments at the Chesapeake farms sustainable agriculture project on Maryland's Eastern shore, where various cropping systems are being compared with the conventional corn-soybean rotation, have shown that soil quality improves as the cropping system becomes more complex, involves less tillage, and has more organic inputs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of \$297,000. The fiscal years 1992–1993 appropriation was \$575,000 per year; \$540,000 in fiscal year 1994; \$486,000 each year in fiscal years 1995 through 1999; \$400,000 each year for fiscal years 2000–2000; and \$399,120 for fiscal year 2001. A total of \$5,216,120 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1991, Cornell University provided \$27,893 and the State of New York provided \$118,014. In fiscal year 1992, Cornell University provided \$37,476, and the State of New York provided \$188,915. In fiscal year 1993, Cornell University provided \$13,650, and the State of New York provided \$243,251. In fiscal year 1994, the State of New York provided \$214,989. In fiscal year 1995, the State of New York provided \$233,085. In fiscal year 1996, the State of New York provided \$388,301. In fiscal year 1999, the State of New York provided in excess of \$400,000 to support this research and contributed approximately \$300,000 in 2000.

Question. Where is this work being carried out?

Answer. This research is being conducted at Cornell University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original estimate was for a 5-year program, and many of the initial objectives in the nitrogen and climate change areas have been met. New objectives evolved from the original work, and the program was also oriented to consider broader dimensions of environmental management, particularly strategies for community-based watershed management involving linkage of technical knowledge with social and local governmental perspectives and needs. Estimated completion items for the current program that started in 1999 are:

- Watershed science and management
- Effects of elevated carbon dioxide on crop yield potential
- Remington farms sustainable agriculture project—a 10-year project
- Carbon storage in soils

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed in 1997, 1998, and 1999. Overall, the project was rated very high. The agency conducted a merit review of the project in 2000 and is planning a more formal review of the project in the coming year.

ENVIRONMENTAL RISK FACTORS/CANCER, NEW YORK

Question. Please provide a description of the work that has been funded under the Environmental Risk Factors/Cancer, New York grant.

Answer. The agency has requested the University to submit a renewal grant proposal which has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, and local need for this research?

Answer. The American Cancer Society estimated that over 182,800 women in the U.S. will be newly diagnosed with breast cancer during 2000 and that 41,200 will die from this disease. The role of environmental risk factors, such as pesticides, is of concern to women, their families, the agricultural community, and policymakers. This project, emphasizing risk reduction information, will work at filling that void.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original and continuing goals of this research are:

1. To establish and expand the database of critical evaluations on the current scientific evidence of carcinogenicity for selected agricultural chemicals. This will include writing critical evaluations on the breast cancer risk of chemicals used in agricultural settings and the role of selected agrochemicals in childhood cancer.

2. To communicate effectively information in the database to a variety of audiences, including the scientific community, Federal agencies, public health professionals, the agricultural community, and the public using printed materials and electronic formats on the Internet.

3. To ensure that the public will have access to science-based information written in non-technical language about environmental factors and the risk of breast cancer and childhood cancers.

4. To increase the knowledge and use of practical strategies aimed at breast cancer risk reduction for residents in rural areas. Efforts to address this objective will include: a) simple, attractive, printed educational materials tailored for families in rural areas; b) videotape-based educational workshops for use with groups of rural women; and c) enhancement, adaptation, and continued use of the Breast Cancer Environmental Risk Factors—BCERF—interactive display.

5. To effectively incorporate breast cancer risk reduction messages into health care and health screening settings in rural areas with tailored printed materials and interactive display. Satellite video-conferencing and supporting web site will allow expanded efforts throughout the U.S.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1997, and in fiscal years 1997–1999, \$100,000 was appropriated per year; fiscal year 2000, \$170,000; and fiscal year 2001, \$226,501 was appropriated for a total of \$696,501.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$150,000 state appropriations for fiscal year 1996; \$250,000 per year in state funds were provided for fiscal years 1997 and 1998; \$350,000 state funds for fiscal years 1999 and 2000; and \$350,000 state funds were requested for fiscal year 2001 with two possible supplements of \$150,000 each also proposed.

Question. Where is this work being carried out?

Answer. This research and outreach is conducted at Cornell University, Ithaca, New York.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project began in April 1997. Because of the success of meeting the original objectives in New York State, BCERF efforts are being refined to address multiple community settings and tailored for regional efforts. The anticipated completion date is June 30, 2002.

Objectives met:

—The bibliographic database was established during year one and is updated and expanded each year. It currently has over 5,000 entries with over 400 added

each quarter. Also, it includes full bibliographies of all pesticide and dietary/lifestyle scientific critical reviews.

- Critical Evaluations: the breast cancer risk of nine pesticides—four in fiscal year 1997, three in fiscal year 1998, and two in fiscal year 1999—have been completed. The completion of two additional critical evaluations is anticipated by the end of the current fiscal year. One critical evaluation was published in a peer-reviewed journal and four other manuscripts submitted for publication.
- Science-based information material—fact sheets—have been developed for the nine pesticides and for multiple pesticide-related issues. Also, fact sheets were developed on diet/hormone/lifestyle breast cancer risk factors and general information on breast cancer. Seven additional fact sheets are to be developed in the current fiscal year.
- Two video teleconferences and an in-service have been held and evaluated. Follow-up telephone surveys of 1997 facilitators at BCERF satellite video conference downlink sites and participants at the June 1997 on-campus training program was completed. These results informed the design of the rural initiative and prepared the program for broader videoconferencing.
- The interactive computer Rural Exhibit was completed and evaluated in 1999. It was enhanced, refined, and used broadly this year.
- The BCERF web site was revamped and relaunched in 1997–1998. The number of browsers accessing the BCERF home page rose from approximately 400 hits per month during the summer of 1998 to over 1,000 hits in November 1998 and 3,490 hits in December 1998. Hits remain with an average of about 3,000 per month.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As a relatively new project, a complete evaluation has not been conducted, although the proposal is currently under review. Periodic progress reports have been made throughout the year. The project is moving towards achieving its desired goals. A final evaluation will be made after June 30, 2001. BCERF has evaluated most components of the program, with further evaluation planned. To date, BCERF has done an evaluation of the video teleconferences and in-service and has had the pesticide fact sheets reviewed by focus groups—breast cancer survivors and women not having breast cancer. The participants brought a variety of perspectives to the discussion, providing BCERF with a wealth of important feedback on our fact sheets and educational approach. Some of the conclusions drawn from this evaluation have already resulted in simple changes made in the preparation of current fact sheets. Other feedback from this evaluation will inform planning efforts for the education component in general.

Evaluation played a key role in the development of the interactive computer rural exhibit. To develop the exhibit, qualitative and quantitative information was gathered about the knowledge, attitudes, and beliefs of rural women regarding environmental risk factors and breast cancer. In addition, BCERF conducted brief surveys of rural women attending several rural conferences and events. The complete exhibit was tested at two farm shows and the New York State Fair in Fall 1999, partnering with professionals and organizations such as those providing mobile mammography. An adapted, more mobile version, was tested in four New York State counties. To evaluate the value of critical evaluations to scientists and Federal agency personnel, a fax-back survey was sent. The majority of respondents—82 percent—found the critical evaluations to be relevant to their work. This year 17 scientists have requested critical evaluations.

ENVIRONMENTALLY SAFE PRODUCTS, VERMONT

Question. Please provide a description of the research that has been funded under the Environmentally Safe Products, Vermont grant.

Answer. This research is designed to develop an environmentally-friendly wood finish coating formulation system by using whey proteins. Whey proteins are a cheese-making byproduct. If successful, the new natural and environmentally-friendly wood coating product will be used for wood painting and coating, such as furniture, toys, and other wooden crafts.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Almost all the wood finish/coating products available in the United States markets contain both environmentally-unfriendly and health hazardous ingredients, for example, methoxymethylethoxypropanol and butoxymethylethoxypropanol. Therefore, our country needs natural and environmentally-safe wood coating products in order to protect our environment and the health of people.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop and optimize an environmentally-friendly wood finish coating formulation system by using whey protein as a binding material. This research started in the second half of 2000. Five prototype wood coating mixes have been formulated. The chemical characteristics of the formulations have been analyzed. The coating materials have been applied on experimental wood samples. A workshop has been built which is designed for this project. The mechanical properties of the coating on wood samples will be studied.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000. The appropriation for fiscal year 2000 was \$170,000 and for fiscal year 2001 is \$245,459. The total amount appropriated is \$415,459.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. A total of \$4,000 was provided by Vermont Wood and Dairy Industries for preliminary studies.

Question. Where is this work being carried out?

Answer. This work is being carried out at the University of Vermont, Department of Nutrition and Food Sciences.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. The anticipated completion date for the original objectives of the project is October 2002. Some of the objectives have been met. Anticipated completion date of additional objectives is October 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

EXOTIC PEST DISEASES, CALIFORNIA

Question. Please provide a description of the research that has been funded under the Exotic Pest Diseases, California grant.

Answer. This is a new grant. CSREES has requested that the university submit a grant proposal that has not yet been received. The principal investigator has indicated that the grant will be awarded on a competitive basis to scientists at a number of universities.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Exotic and invasive pest species are a severe national, regional, and state problem. In California, recent invasive species include the glassy-winged sharpshooter that vectors Pierce's disease, Formosan subterranean termite, red imported fire ant, Africanized honey bee, giant Arundo, scotch broom, burrowing nematode, rice blast disease, Chinese mitten crab, and many others. Pierce's disease threatens the state's \$33 billion grape industry and has caused an estimated \$12-14 million loss in the Temecula grape-producing region over the last year.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new grant. The proposal has not yet been received and the work has not yet begun. The goal of this research is to fund research on exotic pest diseases affecting California agricultural, urban, and natural systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for the fiscal year is \$1,247,250.

Question. What is the source and the amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: California commodity boards fund approximately \$400,000 per year in research on invasive species; and the State of California funds approximately \$600,000 per year in fruit fly research. The total non-Federal funds and sources provided for this grant were as follows: \$600,000 state appropriations and \$400,000 miscellaneous in fiscal year 2001.

Question. Where will this work be carried out?

Answer. California will conduct this research through a competitive grants program with a majority of the research on endemic exotic species to be done in California. Some research may be done in Texas, Florida, or Hawaii by USDA co-investigators in cooperation with University of California scientists.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objective is the end of fiscal year 2005.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is the first year for this project, and it has not yet been reviewed.

EXPANDED WHEAT PASTURE, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Expanded Wheat Pasture, Oklahoma grant.

Answer. This project was designed to develop improved supplementation programs and new systems for technology delivery to reduce production risk of raising cattle on wheat pasture. The work involves evaluation of grazing termination date on grain and beef production, assess the impact of wheat cultural practices, and develop an economic model to evaluate alternative decisions on grain/beef production. Additional effort is directed toward development of cool season perennial forage grasses to complement wheat pasture.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that this work addresses the needs of wheat/cattle producers of Oklahoma as a primary focus. However, it would appear to have application regionally in adjacent wheat growing states.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop economically-viable management systems for use of wheat for supplemental pasture for beef cattle before the crop starts making grain. This work has already shown how the use of feed supplements can increase net profit from cattle grazing on wheat pasture. The study has identified management practices, e.g. date of planting, cultivar selection, grazing intensity, and date of cattle removal that produce the optimum grain yield and cattle gain. A Wheat/Stocker Management Model has been developed as a decision aid to help producers assess income risk in the operation. Work is underway on a Wheat Grazing Systems simulation model.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1989 and appropriations were as follows: fiscal year 1989, \$400,000; fiscal year 1990, \$148,000; fiscal year 1991, \$275,000; fiscal years 1992–1993, \$337,000 per year; fiscal year 1994, \$317,000; fiscal years 1995–2000, \$285,000 each year; and fiscal year 2001, \$292,355. A total of \$3,816,355 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$175,796 state appropriations in 1991; \$174,074 state appropriations in 1992; and \$236,584 state appropriations in 1993. The non-Federal support for 1994 was \$238,058 for state appropriations. Funds for fiscal year 1995 were \$275,426, for 1996 were \$120,000, for 1997 were \$190,510, for 1998 \$224,500, for 1999, \$222,650, and for 2000, \$234,000.

Question. Where is this work being carried out?

Answer. The research is being done at Oklahoma State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project started in 1989 with a projection of 10 years to complete the research objectives. Some objectives are nearing completion while others will require further study. A number of wheat cultivars have been identified which will tolerate grazing and still produce economic grain yields. The grazing cut off date for grain production has been established. However, year to year variation need additional study in order to develop a reliable decision support system. The revised projected completion date is 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This program is reviewed annually. Each year's funding cycle is peer reviewed internally and by CSREES National Program Leaders for scientific merit and relevance. Results from this project are currently being used by ranchers to help with management decisions concerning stocker cattle grazed on wheat that will be harvested for grain. Current work is designed to refine the current information and identify wheat cultivars and grazing management for optimum economic return.

EXPERT IPM DECISION SUPPORT SYSTEM

Question. Please provide a description of the research that has been funded under the Expert Integrated Pest Management Decision Support System grant.

Answer. A prototype information and decision support system was developed in collaboration with Purdue University and the U.S. Department of Energy's Argonne National Laboratory that integrates and manages information from multiple data sources. Development of this system now continues with the collaboration of the Office of Pest Management Policy—OPMP—and the National Science Foundation Center for Integrated Pest Management at North Carolina State University. Components of the Pest Management Information Decision Support System—PMIDSS—include information on the U.S. Environmental Protection Agency—EPA—review status of pesticides, crop losses caused by pests, status of minor use registrations, current research in progress, and priorities of integrated pest management implementation teams. PMIDSS data, along with OPMP and Pesticide Impact Assessment Program—PIAP—crop profiles, provide the background information that is critical to the development of commodity-specific Pest Management Strategies in response to Food Quality Protection Act-driven regulatory decisions.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. When fully operational, PMIDSS will serve national, regional, and local needs for research and extension activities. At the national level, the system supports the USDA and EPA Memorandum of Understanding to identify crop protection gaps and to find alternatives to pesticides either under Food Quality Protection Act regulatory review or those being lost due to pest resistance. The system will assist in the identification of priorities for the Pest Management Alternatives Program, Crops at Risk from Food Quality Protection Act—FQPA—Implementation and the Risk Avoidance and Mitigation Programs, and regional Integrated Pest Management—IPM—Special Grants and Special Projects. With the new implementation of the USDA Regional Pest Management Centers, PMIDSS technology is critical to the information needs of these Centers. It will provide a mechanism for decision transparency and for all stakeholders to interact with the priority setting process. The ultimate result will be to help insure that farmers have adequate alternatives for managing pests at the specific local level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of PMIDSS was to refine the process of identification for Integrated Pest Management needs of the USDA, EPA, and states. This goal reinforces the state and Federal partnerships to disseminate important pest management information for improved decision making and environmental quality, and to address future needs. In 1996 and 1997, the program addressed priority commodity pest management needs resulting from voluntary pesticide cancellations and regulatory cancellations, responding to the Memorandum of Understanding, and supplemental Memorandum of Understanding between the USDA and EPA. The supplemental Memorandum of Understanding was signed in April 1996, at which time there were 58 pesticides and 374 uses identified and prioritized. The process included information on cancellations furnished by EPA. Selected uses were sent to the states' Pesticide Impact Assessment Program and Integrated Pest Management networks. Impacts of cancellations affecting individual states were reported for inclusion in the decision support system. Twenty-five minor use crops on which 40 specific pests were identified in the 1997 Request For Proposals. Results were also used by the regional IPM grants program Request For Proposals. In 1999, information sources from PMIDSS were used as source material for the development of a number of Crop Profiles. In 2000, the Crop profile use continued and the pest management Strategic Plans also accessed components of PMIDSS for baseline information. PMIDSS had undergone a complete rewrite during this last 2 years. PMIDSS was originally begun prior to the initiation of the World Wide Web. It has now been rewritten, using Java and Cold Fusion Structured Query Language queries, with all data now stored on a Structured Query Language Windows NT server. This means

that no software other than the standard browser is required to access the information. All of the time-sensitive data has been updated and a searchable database of the new Pest Management Strategic Plans has been developed. Presently, user-customizable interfaces are being developed.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001.

Answer. This work began in 1994, with CSREES administrative funding. In fiscal year 1995, \$172,000 was appropriated. In fiscal year 1996, we expended \$177,000 in a cooperative agreement with Purdue University and Argonne National Laboratory from Pest Management Alternative Special Grant Funds, \$21,000 from Research, Extension, and Education Evaluation Funds, and \$40,000 from PIAP. In fiscal years 1997–1998, we expended \$165,425 and \$177,000 to Purdue University and Argonne National Laboratory. In fiscal years 1999 through 2000 we expended \$177,000 per year and in fiscal year 2001, \$176,611 was appropriated to go to North Carolina State University Center for IPM to make the system web-based and provide access to multiple databases.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds support the Pest Management Information Decision Support System.

Question. Where is this work being carried out?

Answer. Presently, the bulk of the work is carried out in Washington, D.C. and in Raleigh, North Carolina. CSREES has National Program Leaders in IPM, PIAP, and Inter-regional Project-4 program areas working on the PMIDSS. The Center for Integrated Pest Management at North Carolina State University manages the web server where the pest management information system is located and is developing the multiple concurrent database search and decision support capability. Interaction and information is provided by every state in our system. We are in the process of strengthening the role of Land Grant partners in this program, and additional database access is being developed through the Center for Integrated Pest Management, at North Carolina State University and through a sub-contract with George Mason University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated complex date of additional or related objectives?

Answer. Our original estimate was two to three years with adequate resources to complete the developmental work. However, the design considerations became more complex with the 1996 passage of FQPA. Program needs dictated an expansion and change in information bases. In addition, the web technology that was unavailable in 1994 is now a major and needed part of the program strategy. We feel we are reasonably addressing FQPA objectives with available resources and this effort may need to become an ongoing activity USDA.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. PMIDSS underwent a formal review in June 1997, and a major piece of the system, the Pest Management Alternatives Program WorkBench, was reviewed by regionally-selected land grant scientists and others in November 1997. In August 1998 a progress review evaluated the engineered software product and determined the need for a web accessible multiple database search and look-up function for the system. A concept review held in September 1998 demonstrated the functionality of a web-based decision support system. The June review recommendations included: focus the system on the needs of the Pest Management Alternatives Program, timely delivery of the software product to USDA, and development of a plan to sustain the system in a user-friendly, widely-available format. The November evaluation of the WorkBench brought the following comments and recommendations: the WorkBench provides good linkages to relevant databases and brings together essential information on pest management issues; the system should be placed on the World Wide Web for greater access and utility; tell potential users that it is available; and invest in high quality databases to support and enhance data integrity of the WorkBench. Development now focuses on the needs of the Pest Management Alternatives Program, Crops at Risk Program, Risk Avoidance and Mitigation Program, the requirements of FQPA and an easy-to-use interface for data search and access. Data access is focused on current and transparent databases to address critical FQPA needs.

FARM INJURIES AND ILLNESSES, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Farm Injuries and Illnesses, North Carolina grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. It is anticipated that it will request funding for research on health and safety issues in agriculture, forestry, and fisheries models for future interventions and outcomes evaluation. The initial research focus in this funding period would be heat exposure of field workers and supervisors and the resultant risk of heat exhaustion.

Question. According to the research proposal, or the principal researcher, what is the national, regional, and local need?

Answer. The dominant rural occupations in North Carolina are agriculture, forestry, and fisheries. North Carolina has the second largest number of farmers in the U.S. Agriculture employs 21 percent of the state's workforce. Agriculture, forestry, and fishing are three of the four most dangerous occupations in the U.S. Agriculture, forestry, and fisheries specific occupational illness and injury include: death due to trauma, heat stroke, amputations, musculoskeletal disorders, skin cancer, hearing loss, chronic respiratory problems, infectious disease, emotional stress, and toxic pesticide related illness. This population is often underserved medically because of geographic isolation, economic constraints, and sometimes lack of understanding about the need for health care. We have very little data about the health problems of this population. Current health statistics available in North Carolina do not identify occupation. Though individuals in these industries have many problems common to other rural citizens, they are exposed to unique occupational and environmental hazards that can lead to health problems not seen in others.

There is no hard data on the magnitude of heat stroke in field workers from surveys, emergency room visits, or death certificates. Reporting of heat stroke death in North Carolina is not mandatory unless there are five deaths from a single event. Under high heat index conditions, heat illness escalates from self-treatable to true medical emergency over a few hours. It is poorly understood and often mismanaged. There are numerous interactions with medications, alcohol, and drugs that exacerbate heat related illness. Older farmers and workers are at much higher risk. Since heat related illness is preventable, there is a real need to both increase awareness and determine instantaneous risk of heat illness in the field.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Preliminary planning is underway. The goals of the research are to: (1) evaluate the factors involved and the role each plays in heat related illness, (2) research existing methods and develop a comprehensive database for capturing data on heat exhaustion and other health problems unique to this population, and (3) develop a plan for intervention based on the outcome of the field research.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. Sources of any non-Federal funds will be identified in the grant proposal.

Question. Where is the work being carried out?

Answer. The field operations for this research project will be carried out on eastern North Carolina farms. The work will be done collaboratively by faculty and staff located at East Carolina University, North Carolina Agricultural and Technical University, and North Carolina State University.

Question. What was the anticipated completion date for the original objectives of this project? Have them objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. The anticipated completion date is one year from receipt of the award.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. An agency review will be conducted prior to awarding the grant.

FEED BARLEY FOR RANGELAND CATTLE, MONTANA

Question. Please provide a description of the research that has been funded under the Feed Barley for Rangeland Cattle, Montana grant.

Answer. This project supports research on the nutritional value of barley cultivars as feed for beef cattle. This research will assist the breeding and selection of superior barley types that can be more competitive with other feed grains and improve farmer income from barley crops grown in rotational systems in the Northern Great Plains. The project was subjected to a merit review.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Barley is grown extensively as a feed grain in the U.S. Based upon both chemical analysis and the experience of some cattle feeders, the principal investigator believes barley should have a feed value on a par with corn or wheat. Currently, barley is listed as inferior to both corn and wheat in feed hand books and is, therefore, discounted in the feed market. Comprehensive feeding studies of various barley types will be conducted to document the value as a feed grain for beef cattle.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research has examined the use of laboratory analysis of barley for predicting feeding quality for beef cattle. They have identified several characteristics, including particle size and starch content, which are important in feed quality. They have then used some of this information to select among barley strains for best feeding quality. They have now determined that marker-assisted selection of barley varieties will be a viable approach to incorporating feed quality into a barley breeding program.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1996 with an appropriation of \$250,000; for fiscal year 1997, \$500,000; for fiscal years 1998 and 1999, \$600,000 each year; for fiscal year 2000, \$637,500; and for fiscal year 2001, \$692,473. The total appropriation is \$3,279,973.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds for this project were \$160,000 in 1996, \$174,500 in 1997, and \$168,000 in 1998. No information is available for 1999, 2000, or 2001.

Question. Where is this work being carried out?

Answer. Research is being conducted at Montana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion of the original objectives is anticipated in fiscal year 2001. Integration of findings into management systems is expected by fiscal year 2005 with outreach and information dissemination completed by fiscal year 2010.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is evaluated annually. It undergoes a scientific merit review by two Department Heads and three peer faculty members. It is reviewed again by a CSREES National Program Leader upon submission to the agency.

FISH AND SHELLFISH TECHNOLOGIES, VIRGINIA

Question. Please provide a description of the research that has been funded under the Fish and Shellfish Technologies, Virginia grant.

Answer. The agency has requested that the university submit a grant proposal that has yet to be received. The project will be initiated in fiscal year 2001. The project will focus on minimizing effluents from commercial recirculating aquaculture systems, aiding commercial fish producers in intensifying their production capacity, and characterization of solid and liquid wastes from intensive aquaculture production systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The investigators indicate that there is a regional and national need to advance recirculating system technologies and to enhance waste management in these systems in order to develop environmentally-compatible aquaculture systems and management practices. In addition, intensification of aquaculture production systems will become increasingly important in areas with limited water supplies. This research could have significant impact on the future of domestic seafood production reducing dependence on foreign products. The researchers indicate that the research goals and objectives are consistent with those outlined in the National Science and Technology Council's—NSTC—Aquaculture Research and Development Strategic Plan.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to enhance the economic viability and environmental compatibility of intensive aquaculture production systems as alter-

native agricultural enterprises. To achieve these goals, researchers will characterize effluent discharges from commercial fish farms in Virginia, develop design criteria to enhance intensification of commercial fish farm with limited water supplies, and conduct studies to minimize waste production in commercial scale recirculating aquaculture systems. This project will be initiated in fiscal year 2001.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$473,955.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates in excess of \$50,000 of non-Federal funds will be made available in fiscal year 2001 coming primarily from state and other sources.

Question. Where is this work being carried out?

Answer. The research will be conducted through the Virginia Agricultural Experiment Station, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, and in collaboration with private aquaculture producers in Virginia.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the fiscal year 2001 grant is fiscal year 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the proposal once it is submitted.

FLORICULTURE, HAWAII

Question. Please provide a description of the research that has been funded under the Floriculture, Hawaii grant.

Answer. The research carried out with these funds involves wholesale and retail U.S. and Japan market research, development of new varieties for aesthetic values and pest resistance, and pest management strategies to meet quarantine needs and consumer expectations.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The researcher believes the tropical cut flower and foliage industry in Hawaii, which includes anthurium, orchids, flowering ginger, bird of paradise, heliconia, protea, and cut foliage is worth over \$50 million primarily in out-of-state sales. Development of disease resistant cultivars and quarantine pest management strategies that reduce pesticide usage are high priority issues at the national and international level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to develop superior Hawaii anthuriums, orchids, protea, and exotic tropical flower varieties with disease resistance, particularly to anthurium blight which devastated the Hawaii anthurium industry through the mid-1980's and reduced Hawaii's market share. Additionally, research focused on development of post-harvest handling practices and quarantine pest control. To date, a new anthurium cultivar has been patented and released. Additional blight resistant cultivars are being propagated and tested by the anthurium industry. Disease resistant protea germplasm has been obtained from South Africa and is being used in the protea breeding program. A post-harvest hot water dip treatment has been developed and is being used commercially on tolerant cut-flower species to meet quarantine requirements.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$300,000; fiscal years 1990-1993, \$296,000 per year; fiscal year 1994, \$278,000; fiscal years 1995-2000 \$250,000 each year; and fiscal year 2001, \$249,450. A total of \$3,511,450 has been appropriated since 1989.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: State appropriations of \$87,937 in 1995, \$56,680 in 1997, and \$62,600 in 1998 for a total of \$207,217 since 1995.

Question. Where is this work being carried out?

Answer. Research is being conducted by the University of Hawaii at Manoa and Hilo.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives in the original project were to maintain Hawaii floricultural industry competitiveness. This objective continues to be the principal direction for the projects. Because the industry and the markets are changing, pests are becoming resistant and newer strains are emerging. As quarantine requirements continually change, the need for new technologies continue, the objective remains valid and the need for this research continues.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The individual projects funded under this Special Research Grant are annually evaluated by a panel of peers prior to awards. Each project goes through a merit review within their own institution to ensure that good science is being used. In addition, the principal investigator and the Acting Dean and Director of the College of Agriculture in Hawaii met with the CSREES liaison to this project on April 17, 2000, in Washington, DC. The project accomplishments were reviewed and the research objectives and performance goals for fiscal year 2000 were presented, justified and discussed. Future research needs and related production issues were also discussed. The principal investigator demonstrated good progress, strong leadership and judicious use of project funds. The review also allowed the Federal partner to provide input to the direction of the project and for the state scientists and administrators to demonstrate the accomplishments, competency, and merit of this grant that they manage.

FOOD AND AGRICULTURE POLICY RESEARCH INSTITUTE, IOWA AND MISSOURI

Question. Please provide a description of the research that has been done at the Food and Agriculture Policy Research Institute, Iowa and Missouri program.

Answer. The Food and Agriculture Policy Research Institute—FAPRI—was established by Iowa State University and the University of Missouri, Columbia, in 1984. The purpose of the Institute is to conduct comprehensive analysis and disseminate results about the economic impacts of U.S. food, farm, and trade policies to agricultural producers, agribusinesses, and public policymakers. Iowa State conducts research on the economic interrelationships within and between domestic and foreign food and agricultural markets from the farm gate to market destinations; develops and maintains databases and analytical support systems to facilitate the analysis of agricultural and trade policy issues; and evaluates the impacts of U.S. and foreign commodity supply, demand, and public policy programs on agricultural trade. The University of Missouri maintains models of the domestic agricultural economy and directs its efforts primarily to the analysis of domestic policy issues. The two universities maintain linkages with a number of other universities who provide data and analytical support to the system.

The universities maintain a comprehensive analytical modeling system of the U.S. and international food and agricultural sectors to evaluate near and long-term economic implications of alternative farm policies for the basic commodities. Each year, and more often if conditions require, the system is used to provide economic information on potential impacts out to 10 years in the future of farm policies on farm prices, income, output, government program costs and means to enhance the management of farm programs at the national level.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The Nation's agricultural sector and its components are subject to numerous Federal policies and programs. FAPRI is the only publicly-supported, non-Federal organization with the analytical capability to assess and evaluate the numerous public policies and programs affecting the agricultural sector and report results to a broad constituency including farmers, agribusinesses, and Federal and State policymakers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to develop the analytical capability to assess and evaluate U.S. farm policies on the U.S. agricultural sector, and disseminate this information to farmers, farm and other agricultural organizations, and public policymakers. The mission has been expanded to include assessment of trade and environmental policy impacts and their interaction with the agricultural sector at national, regional, and farm levels. The models in place are also used to assess fiscal and

monetary policy implications and impacts of new technologies such as biotechnological innovations on the agricultural sector.

Both institutions maintain large econometric models and data sets which are regularly updated to analyze farm and trade policy alternatives and the impacts of various programs on the several sub sectors of the agricultural economy. This update was especially valuable for conducting analysis to assess policy options for the 1996 farm bill. During the past year, FAPRI completed 35–40 studies addressing policy issues such as assessments of the 1996 Farm Bill, alternative ethanol programs, USDA's proposed milk market order reform, U.S.-Canada agricultural trade, the importance of fast track to U.S. agriculture economic recession in the Middle East, and the economic meltdown in Russia. Numerous studies were completed addressing improvements made to the empirical modeling system to improve domestic and international policy capabilities. The FAPRI staff has made numerous public appearances throughout the U.S. to agricultural groups and Congressional committees and Executive branch groups addressing policy issues.

Question. How long has the work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1984–1985, \$450,000 per year; fiscal years 1986–1987, \$357,000 per year; fiscal year 1988, \$425,000; fiscal year 1989, \$463,000; fiscal year 1990, \$714,000; fiscal years 1991–1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal years 1995–1996, \$850,000 each year; fiscal years 1997–2000, \$800,000 per year; and fiscal year 2001, \$947,910. The total amount appropriated is \$12,018,910.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$260,355 State appropriations, \$113,565 industry, and \$37,913 miscellaneous for a total of \$411,833 in 1991; \$321,074 State appropriations, \$51,500 industry, and \$35,100 miscellaneous for a total of \$407,674 in 1992; \$234,796 State appropriations and \$70,378 industry for a total of \$305,174 in 1993; \$78,286 State appropriations, \$43,925 industry, and \$29,750 miscellaneous in 1994 for a total of \$151,961 in 1994; \$80,155 State appropriations, \$37,128 industry, and \$42,236 miscellaneous for a total of \$159,519 in 1995; \$124,123 in State appropriations with no other funding for 1996; \$79,000 in State appropriations, \$50,000 industry, and \$25,000 miscellaneous for a total of \$154,000 in 1997; and \$88,800 State appropriations, \$75,200 industry, and \$34,687 miscellaneous for a total of \$198,687 in 1998.

Question. Where is this work being carried out?

Answer. The program is carried out at the Center for Agriculture and Rural Development, Iowa State University and the Center for National Food and Agricultural Policy, University of Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is a continuing program of research and analysis for the purpose of assessing farm and related policy actions and proposed actions likely to affect the agricultural sector and its components.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The annual proposal is carefully reviewed by the CSREES program leader for adherence to stated objectives and progress before the special research grant is awarded. It is also peer reviewed prior to its submission. No formal evaluation of this program has been conducted.

FOOD IRRADIATION, IOWA

Question. Please provide a description of the research that has been funded under the Food Irradiation, Iowa grant.

Answer. Since the Linear Accelerator Facility was placed in operation in March 1993, studies on the effect of irradiation on shelf-life extension, safety and quality of ground beef, beef steaks, ham, pork chops from loins, chicken breasts, and turkey have been conducted. Studies combining irradiation with high hydrostatic pressure and cooking using whole chicken breasts, turkey, and ham, have been conducted to determine the combination of these treatments that will yield a shelf-stable product while maintaining high eating quality. Several studies were conducted to determine whether consumers can detect a difference between irradiated and non-irradiated ground beef patties. Experiments were also conducted to investigate consumer acceptance of pork products irradiated to prevent trichinosis. Test markets of irradiated chicken breasts were conducted to determine consumers' willingness to pay for

irradiated products. Studies on the effect of packaging materials on quality of irradiated meat have been completed. Quality changes in ready-to-eat meat and poultry products irradiated to control *Listeria* are under investigation. The fiscal year 2000 funds are supporting research from May 1, 2000 through June 30, 2001. A proposal in support of the fiscal year 2001 appropriation has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes consumers' attention and concern about the safety of fresh meat and poultry has increased with recent outbreaks of foodborne illness from *E. coli* O157:H7 and *Listeria monocytogenes* in the past decade. The meat industry has also expressed interest regarding the quality of irradiated products and how this process can be used to yield high quality fresh meats and ready-to-eat products that are free of pathogens. The massive recall of over 50 million pounds of frankfurters and luncheon meats due to illness caused by *Listeria monocytogenes* contamination has resulted in huge economic losses in years 2000 and 2001. With clearance of Food and Drug Administration and USDA of irradiation of red meat—December 23, 1999—research leading to commercialization of this technology has been enhanced. Additionally, researchers from eight other research institutes have used the irradiation facility for research projects. Thus, the principal researcher believes this research to be of national, regional, and local need.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of the research was to generate knowledge necessary to develop a research and technology transfer program leading to commercial use of irradiation of foods whereby consumers would be provided with food products with enhanced safety. The effectiveness of irradiation, using an electron beam accelerator, in destroying known pathogenic bacteria in pork and beef has been determined. Mathematical models have been developed to predict the growth of bacteria in low-dose irradiated ground pork. Demonstration of irradiation technology has been presented to some commercial firms, and plans are being developed for some large scale test markets.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991 when \$100,000 was appropriated for this project. The appropriations for fiscal years 1992 and 1993 were \$237,000 per year; fiscal year 1994, \$223,000; fiscal years 1995–1997, \$201,000 each year; fiscal years 1998–2000, \$200,000 per year; and fiscal year 2001, \$224,505. Total appropriated for are \$2,224,505.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. The project received \$1,037,270 in State of Iowa funds—\$1 million of which was for capital construction—in fiscal year 1991; \$37,942 in state funds and \$67,800 in industry grants in fiscal year 1992; \$68,897 in state funds, \$78,300 in industry grants, and \$9,666 in user fees in fiscal year 1993; \$70,652 in state funds, \$35,420 in industry grants, and \$47,788 in user fees in fiscal year 1994; \$72,772 in state funds, \$100,000 in industry grants, and \$55,211 in user fees in fiscal year 1995; \$81,540 in state funds, \$115,300 in industry grants, and \$50,963 in user fees in fiscal year 1996; \$77,963 in state funds, \$253,450 in industry grants, and \$46,550 in user fees in fiscal year 1997; and \$100,200 in state funds, \$205,900 in industry grants, and \$36,200 in user fees in fiscal year 1998; \$125,000 in state funds, \$213,800 in industry grants, and \$34,900 in user fees in fiscal year 1999; and \$109,000 in state funds, \$115,000 in industry grants, and \$48,300 in user fees in fiscal year 2000. Information for fiscal year 2001 is not available at this time.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal investigator anticipates that the project's original objectives will be met within a few years after the USDA final rules are issued for ready-to-eat meat and poultry products.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A review of the proposal supporting the fiscal year 2000 appropriation was conducted on May 23, 2000. Previous studies funded under this project have provided useful information toward understanding how irradiation can be useful in eliminating or reducing foodborne pathogens in meat products. It is anticipated that

the proposed research will continue to further the understanding of how irradiation can be used to improve shelf-life and enhance safety of meats and meat products.

FOOD MARKETING POLICY CENTER, CONNECTICUT

Question. Please provide a description of the research done under the Food Marketing Policy Center, Connecticut grant.

Answer. The Food Marketing Policy Center was established in 1988 at the University of Connecticut at Storrs. The Center seeks to improve the performance of the food production and marketing system by conducting research on food and agricultural marketing and related policy questions. The Center is primarily an economic research organization, but it conducts interdisciplinary research as appropriate and it communicates results to the public. Key users include farm and consumer organizations, agricultural business firms, public agencies, state legislatures, and the U.S. Congress. The research proposal was subject to an administrative review and a peer review by the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research addresses an ongoing national need to monitor the performance of the U.S. food system and to recommend policies that improve performance for the benefit of farmers, merchants, processors, and consumers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The ongoing research goal is to identify marketing problems and assess alternatives that improve economic performance of the U.S. agricultural and food marketing sector. The Center serves as a core research group for Multi-State Research Project NE-165, Private Strategies, Public Policies, and Food System Performance. The research agenda includes industrial organization, strategic marketing, economics of food safety, cooperatives, and public policy, including antitrust and regulation.

The Center is a prolific provider of high quality theoretical and empirical work, and makes significant scientific, management, and policy contributions. The Center has prepared over 50 working papers, 40 policy research reports, 20 policy issue papers, 8 books and numerous chapters, a number of MS and PhD theses, and has distributed scientifically-important research articles to researchers, industry, Federal and state legislators, and decision makers.

This grant supports research projects in two problem areas: impacts of changes in strategies, technologies, consumer behavior, and policies on the economic performance of the food system; and impacts of private and public strategies on improvements in food safety and quality. Recent accomplishments include: evidence that more concentrated retail markets have higher retail prices, brands with greater market share have greater ability to raise prices, residents in low income areas lack comparable access to retail stores. Forthcoming reports examine the impact of Walmart supercenters on local markets; milk pricing policies in the Northeast; the ability of firms to differentiate their products based on safety or process—e.g. animal welfare, ecological impact, organic—attributes; and the impact of sanitary/phyto-sanitary—SPS—and technical trade barriers on food quality/safety/price attributes available in the U.S. and other countries. Expert testimony before the Federal Trade Commission and state attorneys general has resulted in tougher antitrust enforcement, and has caused at least one firm to withdraw from a retail megamerger. The Center maintains an extensive database, including special tabulations of Census data and private data, that facilitates research by a large number of university-based researchers.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1988, \$150,000; fiscal year 1989, \$285,000; fiscal year 1990, \$373,000; fiscal years 1991–1993, \$393,000 per year; fiscal year 1994, \$369,000; fiscal years 1995–1998, \$332,000 per year; fiscal years 1999–2000, \$400,000 per year; and fiscal year 2001, \$493,911. A total of \$4,977,911 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are State appropriations as follows: \$234,259 in fiscal year 1991; \$231,741 in fiscal year 1992; \$201,288 in fiscal year 1993; \$234,557 in fiscal year 1994; \$219,380 in fiscal year 1995; \$134,399 in fiscal year 1996; \$135,490 in fiscal year 1997; \$164,772 in fiscal year 1998; \$163,895 in fiscal year 1999; and \$343,302 in fiscal year 2000.

Question. Where is the work being carried out?

Answer. The research is being carried out at the University of Connecticut and the University of Massachusetts.

Question. What was the anticipated completion date for the original objectives of the projects? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1987 was for 24 months. According to the principal researcher, the objective of conducting policy-oriented research on food manufacturing and distribution industries to assist state and Federal policy makers in improving the performance of the food system is still an ongoing public concern, given increasing levels of concentration in food processing. The current phase will be completed in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in April 2000, as it evaluated the 2000 project proposal. The review noted that: "The stated objectives, addressed through nine continuing projects and one new one, are scientifically valid, and the procedures specified for each are appropriate. The Principal Investigator and associated researchers are nationally and internationally recognized and are clearly competent to execute this project."

FOOD PROCESSING CENTER, NEBRASKA

Question. Please provide a description of the research that has been funded under the Food Processing Center, Nebraska grant.

Answer. The University of Nebraska Food Processing Center has been conducting short-term, highly-applied research projects to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Projects were selected based on the estimated economic impact of the technical assistance or the criticality of the technical assistance to the future of the firm or venture. Priorities were placed on projects relating to the safety of the food product or process and to the fulfillment of regulatory mandates such as nutrition labeling, use of approved and effective ingredients, and adherence to regulations imposed by foreign governments. In addition, several research projects were conducted to improve or assess the quality, extend the shelf-life, or assess or improve the processing efficiency of specialty food products which impacted several processors or used alternative agricultural products. A proposal in support of the fiscal year 2001 appropriation has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the primary impact of this project will be statewide. Small and mid-sized food processing companies and entrepreneurs have limited technological capabilities for addressing issues related to product development, process development, product and process evaluation, food safety, quality assurance, and regulatory mandates. The short-term research and technology transfer projects conducted as part of this overall project will aid these companies in appropriately addressing these oftentimes complicated issues.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Technological evaluations were conducted for 89 individuals or companies interested in developing new food processing businesses. These evaluations included formulations, processes, processing equipment, packaging, shelf-life, sensory, nutritional attributes, microbiological quality, regulatory considerations, and other factors. Additionally, microbiological analyses, shelf-life assessments, sanitation audits, and nutritional analyses were conducted for numerous Nebraska food companies.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1992. The appropriations were \$50,000 per year for fiscal years 1992-1993 ; \$47,000 for fiscal year 1994; \$42,000 per year for fiscal years 1995-2000; and \$41,908 for fiscal year 2001. A total of \$440,908 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. The Food Processing Center received \$402,389 in state funds and \$1,993,914 in food industry grants and miscellaneous sources from 1992 through 1999. Data for fiscal year 2000 are not available.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Because this project supports ongoing technical assistance to clients, the objectives are ongoing. The original objective of assisting entrepreneurs and small and mid-sized food processing companies to develop/improve products and/or processes have been successfully met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on May 24, 2000. Progress under previous grants for this project appears to be satisfactory, with numerous examples of assistance cited and summaries of short-term projects provided by the principal investigator.

FOOD QUALITY, ALASKA

Question. Please provide a description of the research that has been funded under the Food Quality, Alaska grant.

Answer. Research has been aimed at completing a number of smaller projects that have significance to seafood quality and safety in the Alaska Seafood Industry. To identify the most important projects, the investigators consulted with informed people from state and Federal agencies and from industry. The vetted projects mentioned address pertinent research needs in the area of improving seafood quality and safety. The subprojects are: (1) Bioprocessing of Marine Bacteriocins for Enhancing Seafood Safety; (2) Molecular Tracking of *Listeria monocytogenes* in Smoked Salmon Processing Plants for Eradication by Directed Sanitation; (3) Evaluation of Clostridium sporogenes as a Substitute for Botulism Testing of Low-Salt, Vacuum-Packaged Seafoods including smoked salmon and sujiko; and (4) Using an Electronic Nose to Improve Seafood Quality.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Seafood Industry is the largest employment sector in Alaska. Many of the small coastal communities in Alaska have a local fish packing plant that has been the major source of income in their economies. In 1998, Alaska harvested approximately two million metric tons of fish, all for human food. This is greater than 60 percent of the U.S. total for fish landings. Furthermore, if one focuses on fish harvested for human food, Alaska's share represents an even greater percentage because there are no reduction fisheries in Alaska and all harvested species are used, at least in part, for human food.

The salmon industry is regional, involving thousands of fishermen and processing workers from Washington, Oregon, California, and throughout the nation that come to Alaska to participate in the fishery. In recent years, the Alaska salmon industry has suffered economically from increased competition from international salmon farmers, mainly in Norway and Chile. They have made great inroads in many traditional markets, surpassed Alaska in salmon production, and now set the product standard in the marketplace. One key for American businesses to recapture and strengthen their salmon markets is to guarantee and promote the quality of wild Alaska salmon. This project will provide the industry with the research and information needed to accomplish this.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of this research was to ensure a consistent and predictable level of handling and quality for Alaska seafood. In doing so, the project will help Alaska seafood processors strengthen or maintain their place in domestic and international markets. The goals for each of the subproposals are listed as follows: (1) The long-range goal is to utilize novel, natural, and safe biopreservatives to eliminate potential bacterial pathogens in seafoods. Work is in progress on the isolation of broad- and narrow-spectrum bacteriocins from new producing strains and applied to inactivate *Listeria monocytogenes* in minimally-preserved seafood products stored under extended refrigeration. (2) Other goals include molecular typing of *L. monocytogenes* strains isolated from four smoked fish processing plants in Alaska; to determine if site-directed sanitation methods reduce the incidence of the organism; and to determine if growth of inoculated *C. sporogenes* can be used to indicate temperature-abuse of low-salt, vacuum-packaged seafoods. Work is in progress. (3) A final goal is to: determine specific compounds that are indicators of quality loss

in fresh and frozen seafoods; train a hand-held electronic nose to recognize these early indicators of quality loss in seafoods; compare the trained electronic nose with the traditional chemical, physical, and sensory techniques used to evaluate seafood quality under controlled conditions; and to evaluate the electronic nose in an operating seafood processing plant.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999 and the appropriation for fiscal years 1999 and 2000 was \$350,000 each year and \$349,230 for 2001 totaling \$1,049,230.

Question. What is the source and amount of non Federal funds provided by fiscal year?

Answer. The State of Alaska, the Alaska Seafood Marketing Institute, the University of Alaska, and the industry will contribute considerable personnel hours. We estimate the non-Federal contributions for the entire group of four subproposals is approximately \$25,000–\$30,000.

Question. Where is this work being carried out?

Answer. The work will be administered at the University of Alaska Fairbanks. Field work will be carried out in numerous Alaska fishing communities.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The anticipated completion of the full objectives of this research is one year from date of the award.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project application was reviewed for merit by a CSREES specialist on August 3, 2000. Progress for the previous grant is satisfactory. Research on the use of marine bacteriocins, molecular biology of *L. monocytogenes*, and using electronic nose to test seafood quality appeared satisfactory.

FOOD SAFETY, ALABAMA

Question. Please provide a description of the research that has been funded under the Food Safety, Alabama grant.

Answer. Auburn Research Centers Food Safety Program is developing a method of food inspection that involves the placement of a sensor chip on food items. The goal is for these chips to automatically inventory and assess the safety at any point from source to consumption of appropriate fresh food products sold in the U.S.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Most food-borne illness can be attributed to bacteria. The sensor chips developed at Auburn University will target detection of the bacteria that causes most of these illnesses. This technology could result in financial savings nationally, regionally, and locally through the prevention of food-borne illness and its related costs. Up to 33 million Americans become ill each year from food borne disease. Estimates indicate that as many as 9,000 of these individuals will die with another one million suffering permanent disabilities. The USDA estimates that foodborne illness costs the U.S. economy \$14.2 billion in lost productivity annually. This project will improve the safety of our food supply chain leading to an improved quality of life for every citizen and resident of the U.S. In addition to these costs to the public and the nation, the costs to industry of settling civil litigation due to foodborne disease can be immense. The 1993 Jack-in-the-Box hamburger incident, which infected 433 individuals, resulted in lawsuit settlements of \$126 million dollars. This research when implemented should greatly reduce the incidence of foodborne illness.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to reduce the incidence of food-borne illness through the use of a sensor chip that will assess the safety of food items as they move through the food chain. Already to date, the researchers have demonstrated a new method for the detection of *Salmonella* bacteria that has the potential to greatly reduce detection times. Current industrial methods require that a sample of suspect food be taken to the laboratory where tests require a minimum of 6 to 48 hours to determine a food is safe to eat. The new technology can identify harmful levels of *Salmonella* bacteria in a few minutes and will be packaged as a portable hand-held unit that may be used on the food production line. Additionally, Auburn University has demonstrated a working stamp-sized radio frequency identification sensor tag that can be used to automatically inventory and trace food within

seconds. This tag stores information from farm to its final destination and can be interrogated to rapidly provide information to identify the source of a contamination or food problem should it be detected at a latter date downstream.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in June 1999. The appropriation for fiscal year 1999 was \$300,000; for fiscal year 2000, \$446,250; and for fiscal year 2001, \$519,854. A total of \$1,266,104 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. Expenditures of non-Federal funds from state and corporations totaled \$577,350 in fiscal year 2000 and \$674,890 has been allocated for expenditure in fiscal year 2001. This will bring the total of non-Federal funds to \$1,252,240 for the first two years.

Question. Where is this work being carried out?

Answer. Research is being conducted at Auburn University through the Auburn Research Center for Detection and Food Safety.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The project is part of a 10-year program to develop and implement an entirely new sensing and information technology for the detection of foodborne pathogens. Annual objectives are set for each year. All objectives for year one were exceeded or met. Already the project has completed 50 percent of the second year objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The interim results of the project were reviewed during a meeting with the Project Investigator in October of 2000. The interim results of the research were found to be satisfactory.

FOOD SAFETY RESEARCH CONSORTIUM, NEW YORK

Question. Please provide a description of the research that has been funded under the Food Safety Research Consortium, New York grant.

Answer. This is a new project to be started in fiscal year 2001. Research related to food safety research will be supported by this grant. CSREES has requested the university to submit a proposal in support of fiscal year 2001 funds, which has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project will develop improved methods to help the food industry control contamination with the bacterium *Listeria monocytogenes*. This bacterium causes serious foodborne disease in humans and is responsible for an estimated 500 foodborne deaths annually in the U.S. The presence of this bacterium is also commonly responsible for costly food recalls, even though many contaminated food products may not cause human disease. There is a national need to develop tools that will help food processors to prevent contamination of their products with this bacterium and to understand which types of *Listeria monocytogenes* may cause disease when present in foods.

Question. What is the original goal of the research and what has been accomplished to date?

Answer. The goal of this research is to develop a collection of *Listeria monocytogenes* isolated from various food processing plants and from various sites within processing plants for characterization by DNA fingerprinting to elucidate the specific DNA subtypes of this organism associated with contamination. DNA fingerprints for these *Listeria monocytogenes*, as well as fingerprints for *Listeria monocytogenes* from humans, will be assembled into an electronic fingerprint database accessible to other researchers, public health officials, and industry. This database will provide the food industry with access to modern DNA fingerprinting tools and will help them to better control *Listeria monocytogenes* contamination.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This is a new project for fiscal year 2001. For fiscal year 2001 \$284,373 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. Funding in the amount of \$122,245 has been provided to the International Life Sciences Institute, North America.

Question. Where is this work being carried out?

Answer. The work will be carried out at the Department of Food Sciences at Cornell University, Ithaca, New York. Collaborators include ABC Research, Gainesville, Florida.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The original objectives of this project should be completed by September 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project beginning in fiscal year 2001. No evaluation has been conducted by USDA.

FOOD SYSTEMS RESEARCH GROUP, WISCONSIN

Question. Please provide a description of the research that has been done under the Food Systems Research Group, Wisconsin program.

Answer. The Group conducts research on contemporary issues affecting the organization and competitiveness of the U.S. food system in domestic and international markets. The issues include new technologies, market structure, firm behavior, and government policies and programs. Studies have been completed on pricing of cheddar cheese, fed cattle, and hogs; changes in private label product markets; causes of structural change in the flour milling, soybean oil milling, wet corn milling, cottonseed milling, beef packing, and broiler processing industries; competition in U.S. food markets; and the relationship between U.S. food market structure and the industry's performance in global markets. The research proposal was subject to an administrative review and a peer review by the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the U.S. food system is changing rapidly in response to a large number of global economic, social, and technological changes. Research is needed to determine the effects of these changes on the system's organization and performance, and to ascertain needed adjustments in public policies based upon sound research. There is a national need to assess and evaluate the organization and performance of the Nation's food industry to ensure that it continues to satisfy performance expectations of farmers and consumers and adheres to acceptable standards of conduct. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations like the Food Systems Research Group are providing research needed for public and private decision making.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal was to assess and evaluate the organization and performance of the U.S. food industry and provide recommendations for improvements. Recent research results include the following: (1) firm concentration trends in a number of food industry subsectors, such as dairy, have been analyzed as preparation for determining the impact of increasing consolidation on producers, consumer, and others; (2) models of arbitrage pricing were developed and used to estimate allocative efficiency in broiler, beef, and pork subsectors; allocative inefficiency appears in all three because participants do not adequately anticipate dynamic market changes; vertical integration in broilers has greatly improved production efficiency but not allocative efficiency; (3) resource allocation to an "office of technology transfer" seems to be the most important factor affecting diversity biotechnology patent production, strategic behavior of Wisconsin agribusiness firms was documented in three case studies: one firm operates in the mature artificial breeding industry, and the other two are involved in cheese production.

The project has completed numerous studies on economic structure and performance issues of the U.S. food manufacturing and distribution system. Basic research is conducted on market theories; effects of mergers, new technologies, and firm conduct on industry structure and organization; factors affecting industry prices, profits, efficiency and progressiveness; and impact of public policies and regulations on food system organization and performance.

Question. How long has this work been underway, and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1976–1981, \$150,000 per year; fiscal years 1982–1985, \$156,000 per year; fiscal years 1986–1989, \$148,000 per year; fiscal year 1990, \$219,000; fiscal years 1991–1993, \$261,000 per year; fiscal year 1994, \$245,000; fiscal years 1995–1998, \$221,000 per year; fiscal year 1999, \$225,000; fiscal year 2000, \$425,000; and fiscal year 2001, \$498,900. A total of \$5,395,900 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: State appropriations of \$120,304 in 1991; \$119,448 in 1992; \$85,188 in 1993; \$96,838 in 1994; \$59,435 in 1995; \$50,636 in 1996; \$56,421 in 1997; \$64,004 in 1998; \$75,115 in 1999; and \$40,218 in 2000.

Question. Where is the work being carried out?

Answer. The grant supports research at the University of Wisconsin, Madison.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1976 was for a period of 36 months. The current phase of the program will be completed in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in April 2000, as it evaluated the 2000 project proposal and concluded: The Food Systems Research Group at the University of Wisconsin is undergoing leadership changes. An Interim Director has been appointed while a new director is being sought. The Group continues to attract a number of respected researchers that do very good work.

FORAGES FOR ADVANCED LIVESTOCK PRODUCTION, KENTUCKY

Question. Please provide a description of the research that has been funded under the Forages for Advanced Livestock Production, Kentucky grant.

Answer. Forage-based livestock production in Kentucky and surrounding states depends primarily on tall fescue. There are more than 35 million acres of tall fescue in the region. The objective of this project is to use traditional plant breeding and molecular mapping of tall fescue and related species to develop cultivars with reduced endophyte toxicity and improve production and persistence.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The focus of this research will be in Kentucky; however the results will have extensive application in the surrounding states where tall fescue is the principle forage grass. Therefore this project is regional in nature.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop improved cool season forage cultivars from tall fescue and related species and improve the economics of forage-based livestock production in the region.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2000. The appropriation for fiscal year 2000 was \$212,500, and fiscal year 2001 is \$374,175 a total of \$586,675 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The principle investigator estimated non-Federal funds provided by the state in support of this work was \$130,000 in the year 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Kentucky Research Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The initial proposal was subjected to peer review and approval process at the initiating institution and received additional review by CSREES National Program Staff. Results from the first year will be used to refine objectives and approaches for year 2001 proposal.

FORESTRY RESEARCH, ARKANSAS

Question. Please provide a description of the research that has been done under the Forestry Research, Arkansas grant.

Answer. The Arkansas Forest Resources Center offers programs of research, education, and outreach to the landowners of Arkansas and the surrounding region. This has been accomplished through continuing education events for landowners, the development of a series of distance-learning tutorials, and the funding of 20 assistantships for the first two classes of graduate students in the new forest resources master's program. A partial list of workshops includes: Uneven-aged Silviculture of Loblolly and Shortleaf Pine Forest Types; Environmental Law & Policy; Timber Income Tax Update; Thinning Methods and Operations; Introduction to Arc View 3.0; Estate Planning; Forest Finance Applications: Basic Tools for Daily Practice; and Opportunities in Forest Regeneration. The educational thrust has combined Center and private dollars to establish one of only three of the country's Arc View Learning Centers for natural resources. To better provide the highly educated professionals needed in the natural resources professions, educational tutorials are being developed in dendrology—tree identification, plant morphology, silvics—that aid in the (1) transfer of students in community colleges to institutions with forest resources offerings, and (2) forest resources education of non-majors at institutions without forest resources faculty. Furthermore, the University of Arkansas activated a new Master of Science program in the Fall 1998.

Research projects address issues of species diversity, richness, redundancy, and the resilience of disturbed and undisturbed hardwood stands of the Mississippi River floodplain. Furthermore, research has indicated that neotropical migratory birds are indicators of ecosystem health. Factors influencing their breeding range include habitat destruction/alteration and forest fragmentation. Thus, issues of re-establishment and structure of hardwood stands are important for timber, non-timber values, and the quality of life enjoyed regionally, nationally, and internationally. Also, other projects are contributing to the development of (1) a biological control agent for the southern pine beetle, (2) alternative forest crops for the economically-depressed Delta region, and (3) technologies for enhanced fiber and wood production from nonindustrial and industrial lands. Newer projects include an important regional social science study of the resource ethical values held by people of the southern U.S. and a comprehensive study for forest growth and yield.

Question. According to the research proposal, or the principal researchers, what is the national, regional, and local need for this research?

Answer. With the reduced levels of production of wood products from the Northwest, southern forests are increasingly having to produce a major portion of wood products for the U.S. This increased demand and production make it critical that the forestry community understand the possible environment effects of forestry practice. Social implications of the conflicts between forest production and environmental quality will become more and more important. Collectively, the projects address the sustainable management of southern forests.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to develop alternative forest management strategies for achieving multi-resource objectives; i.e., production of timber, wildlife, recreation, and other values of the forest on private industrial and non-industrial forest lands and public lands. Significant progress has been made in several areas. Some examples include: developing intensive fiber farming systems as alternatives to soybeans for Mississippi Delta farmers, taking the first step toward biological control of the southern pine beetle by discovering the nutrient needs of predators of the beetle so predators can be grown and studied in artificial cultures. The first survey of nonindustrial landowners in Arkansas for 15 years has been conducted. The survey shows that because of the average age of landowners—60+ years—there will be a massive change in ownership in the next 10–20 years. Landowners continue to not be aware of assistance programs. The survey also indicated a concern about government programs and possible intervention on private land. This information will be useful in understanding future timber supply trends from private holdings and in the design of assistance and educational programs.

Ongoing projects include a broad array of topics competitively awarded within the Center. These include best management practices, ecological characteristics, effects of different forest management regimes, stream-sided buffer zone effectiveness, effects of winter logging, and secondary processing efficiency.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows:

| <i>Grant Year</i> | <i>Grant Received</i> |
|-------------------|-----------------------|
| 1994 | \$470,000 |
| 1995 | 523,000 |
| 1996 | 523,000 |
| 1997 | 523,000 |
| 1998 | 523,000 |
| 1999 | 523,000 |
| 2000 | 523,000 |
| 2001 | 521,849 |
| Total | 4,129,849 |

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funding and its source provided to this grant in 1994 was \$411,726 State appropriations and \$380,000 industry for a total of \$791,726; \$491,301 State appropriations and \$785,262 industry for a total of \$1,276,563 for 1995; a total of \$695,204 from State and industry sources for 1996; a total of \$1,115,341 from these sources in 1997; and an estimated total of \$1,000,000 for 1998. For 1999, the State legislature appropriated approximately \$850,000 above the 1998 level. For 2000, the state contributed \$1,607,000 to the project.

Question. Where is this work being carried out?

Answer. The Arkansas Forest Resources Center is administered from the School of Forest Resources on the campus of the University of Arkansas at Monticello. Individual studies are being conducted at the University of Arkansas at Fayetteville and several locations across the State.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Grants were received in 1994–2000 with funds distributed for use over the 3 to 5 years following the activation year. Projects are on schedule; work from 1994 and 1995 funding is nearing completion. Forestry research is long term. Center objectives and selected projects will be continued beyond the life of individual grants using the infrastructure and capacity developed with these Special Research Grants.

Question. When was the last agency evaluation of the project? Provide a summary of the last evaluation conducted.

Answer. In 1991, an agency team visited the University and reviewed faculty qualifications, supporting sources, and the feasibility of the proposal. The team exit report indicated the faculty was highly capable, the infrastructure needed strengthening, and the proposal concepts were feasible. Since 1991, there has not been a formal program review. A review planned for the year 2000 has been rescheduled for 2001 because of a change in forest resources leadership at the University.

FRUIT AND VEGETABLE MARKET ANALYSIS, ARIZONA AND MISSOURI

Question. Please provide a description of the research that has been funded under the Fruit and Vegetable Market Analysis, Arizona and Missouri program.

Answer. The purpose of this research is to provide timely knowledge and analysis of the impacts of trade, environmental, monetary, and other public policies and programs upon the Nation's fruit and vegetable industry to farmers, agribusinesses, and policymakers through a program of empirical assessment and evaluation.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The U.S. fruit and vegetable sector is experiencing increased growth from greater domestic and export demand. However, the growth of this sector depends upon its ability to compete domestically and internationally and to conform with the regulatory environment in which it operates. This program of research provides increasingly critical information to farmers and policymakers on the implications and impacts of various policies and programs such as environmental, trade, labor, and food safety. It is the only such program providing analysis of the total U.S. sector.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to develop the analytical capability to assess and evaluate public policies and programs impacting the U.S. fruit and vegetable industry and disseminate the results to policy makers, industry organizations, producers, and other users. Proposals have been submitted that outline long-range plans and specific projects for funding. Models have been developed for 18 major—as measured in production, consumption, and trade—United States fruits and vegetables representing 80 percent of the farm value of the U.S. fruit and vegetable industry.

Trade models for those commodities with a significant import and/or export sector will also be developed. These models feed in to a larger food and agricultural sector model to support analysis of cross commodity and policy effects.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This research program was initiated in fiscal year 1994. Grants have been awarded from funds appropriated as follows: fiscal year 1994, \$329,000; fiscal years 1995 through 1998, \$296,000 per year; fiscal years 1999 and 2000, \$320,000 per year; and fiscal year 2001, \$347,234. A total of \$2,500,234 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funding and its source provided to this grant in 1994 was \$50,073 State appropriations and \$11,000 industry for a total of \$61,073; \$21,876 State appropriations and \$36,624 industry for a total of \$58,500 for 1995; a total of \$62,400 from State and industry sources expected for 1996; and \$50,000 each year from these sources in 1997 and 1998.

Question. Where is the work being carried out?

Answer. The work is being carried out at Arizona State University and the University of Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The university researchers anticipate that this is an ongoing project to look at the impact of various public policy proposals on the U.S. fruit and vegetable industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation. However annual proposals are peer reviewed for scientific merit and relevance; also each annual budget proposal is carefully reviewed and work progress is compared with prior year's objectives. Informal discussions with congressional staff indicate that the analyses are extremely useful.

GENERIC COMMODITY PROMOTION, NEW YORK

Question. Please provide a description of the research that has been done under the Generic Commodity Promotion, New York program.

Answer. The grant supports, in part, the National Institute on Commodity Promotion Research and Evaluation which provides objective analyses of national and state commodity checkoff programs designed to enhance domestic and export demand for U.S. agricultural products. "Checkoff" programs collect funds from producers to pay for advertising and promotional programs. The overall project proposal was peer reviewed at the university level; a competitive peer review process is used to select specific research projects.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher states that producers are contributing about \$1 billion annually to commodity research and promotion funds designed to expand the domestic and export markets for their products. The number of commodity groups participating and the size of the funds available could continue to grow. The 1996 Federal Agriculture Improvement and Reform—FAIR—Act requires all Federally-constituted research and promotion boards to evaluate their programs at least every five years. Accurate evaluations require the development of sophisticated techniques that differentiate the impact of research and promotion expenditures from several other market influencing factors.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to determine the economic effectiveness of generic promotion programs designed to increase the sales of agricultural commodities in domestic and international markets. Accomplishments over the last five years include: (1) understanding key economic relationships in the advertising and promotion of milk and dairy products, beef, cotton, and eggs, and the exports of beef, pork, and wheat; (2) discovering that "pulsed" advertising is superior to uniform advertising; (3) understanding the factors affecting producer attitudes toward checkoff programs; (4) developing a comprehensive database of advertising expenditures for all food products; (5) developing new techniques using scanner data; (6) developing new methods of estimating the relationships among advertising, promotion, government support pro-

grams, and government policy; (7) developing new methods of measuring advertising "wearout;" (8) determining the sensitivity of results using various methods; (9) explaining the effect of socioeconomic and market factors on the impact of advertising; (10) estimating optimal allocation of advertising expenditures by type of media; and (11) comparing the relative returns from generic and brand advertising. The Institute has sponsored educational workshops and conferences for promotion board leaders and for elected and appointed public officials responsible for developing public policy and administering checkoff programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by the grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000; for fiscal years 1995–1999, \$212,000 per year; for fiscal year 2000, \$198,000 per year; and for fiscal year 2001, \$197,564. A total of \$1,690,564 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal matching funds and sources allocated to this grant by Cornell University are as follows: \$97,333 a year in State appropriations for 1994–1996; \$125,650 for 1997; \$130,430 each for 1998 and 1999; and \$130,000 for 2000. Collaborating institutions performing work under subcontracts also contribute non-Federal matching funds.

Question. Where is this work being carried out?

Answer. The work is being carried out at Cornell University in collaboration with eight other land-grant universities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 21 months, however, the need to evaluate the benefits of commodity promotion and research programs is a growing regional and national concern as producers take on greater responsibility for marketing their products. An increasing number of promotion and research programs are being evaluated. The current phase of the program will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in March 2000, as it evaluated the 2000 project proposal, and determined that: "The project has sound objectives and procedures that are helping private and public decision makers effectively expand markets for U.S. agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans. The proposal carefully documents the progress and results of several ongoing projects supported by the grant at a number of universities. The principal investigator, as well as other faculty and staff at Cornell University, is well-recognized for research in the economics of commodity promotion."

GLOBAL CHANGE

Question. Please provide a description of the research that has been funded under the Global Change, Colorado grant.

Answer. Radiation from the sun occurs in a spectrum of wavelengths with the majority of wavelengths being beneficial to humans and other living organisms. A small portion of the short wavelength radiation, what is known as the Ultraviolet, or UV-B Region of the spectrum, is harmful to many biological organisms. Fortunately, most of the UV-B radiation from the sun is absorbed by ozone located primarily in the stratosphere and does not reach the surface of the earth. The discovery of destruction of the stratospheric ozone layer and development of the ozone hole over polar regions has raised concern about the real potential for increased UV-B irradiance reaching the surface of the earth and the significant negative impact this could have on all biological systems including man, animals, and plants of agricultural importance. There is an urgent need to determine the amount of UV-B radiation reaching the earth's surface and to learn more about the effect of this changing environmental force. CSREES is in the process of establishing a network for monitoring surface UV-B radiation which will meet the needs of the science community of the U.S., and which will be compatible with similar networks being developed throughout the world. The fiscal year 2000 grant supports work through September 2001.

This grant is part of a government-wide initiative. The research is closely coordinated with other Federal agencies involved in the U.S. Global Change Research Program Inter-agency UV-Monitoring Network Plan.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes destruction of the stratospheric ozone layer, our shield from the full intensity of solar radiation, continues to increase. This creates a high priority need for information to document not only the levels of UV-B radiation reaching the earth's surface, but the climatology of that radiation. The U.S., and the rest of the world, needs to know the strength of the UV-B radiation reaching the earth and the potential impact on all forms of life, especially animal and plant life of agriculturally-important species. The principal researcher believes this research to be of national as well as regional and local importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The USDA UV-B Network is to provide accurate, geographically-dispersed data on UV-B radiation reaching the surface of the earth and to detect trends over time in this type of radiation. A primary problem which had to be overcome in order to reach this goal was the development of instrumentation adequate to make the measurements required for the monitoring network. A major advance occurred during 1996 with the availability to the network of a new multi-band instrument which will provide the spectral information needed to support both biological and atmospheric science research and to serve as ground-truth for satellite measurements. These instruments have been deployed and are currently in operation at 29 monitoring sites across the U.S., including Hawaii and Alaska. The researchers plan to have additional sites in Puerto Rico, Oregon, North Carolina, and Oklahoma, but these plans are on hold due to lack of funding to support their installation and operation.

Two grants to design and build six advanced spectroradiometers have been awarded under the CSREES National Research Initiative Competitive Grants Program. These instruments are to be used in a research network to make precise measurements of the total UV-B spectra at selected research sites. The first of these instruments failed to meet spectral performance standards when tested and calibrated by the National Institute of Science and Technology. An alternative design, which resulted in a much larger and more difficult instrument to deploy, has been developed. The first of the advanced instruments was deployed at a U.S. Department of Commerce research site at Table Mountain near Boulder, Colorado, during the fall of 1998. The second and third were installed at a Department of Energy solar radiation research site in Oklahoma and at an Agricultural Research Service Plant Stress site in Beltsville, Maryland, during 1999. Additional funding will be required to support the deployment of additional research instruments.

To gain experience in network operation, broadband instruments along with ancillary instruments were installed at ten sites and have been in operation for the last 72-84 months. These sites are now equipped with a full compliment of instruments including the new multi-band instrument. Sixteen additional sites developed since 1997 are similarly equipped with broadband and the new multi-band UV instrument. Data from each site is transmitted daily to Colorado State University for preliminary analysis, distribution, and archiving. These data are available, within 24 hours of collection, on the Internet via a World Wide Web Site located in the Natural Resources Research Laboratory at Colorado State University. USDA is also a participant in the development of a central calibration facility at the U.S. Department of Commerce facilities in Boulder, Colorado. The purpose of the central calibration facility is to ensure uniform and acceptable calibration and characterization of all instruments used in interagency UV-B monitoring programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1992, and the appropriation for fiscal years 1992-1993 was \$2,000,000 per year; fiscal year 1994 was \$1,175,000; fiscal year 1995 was \$1,625,000; fiscal year 1996 was \$1,615,000; fiscal year 1997 was \$1,657,000; fiscal years 1998 through 2000 were \$1,000,000 per year; and in fiscal year 2001, \$1,430,845. A total of \$14,502,845 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$162,000 state appropriations in 1993; \$183,106 state appropriations in 1994; and \$285,430 provided by Colorado State University in 1995.

Question. Where is this work being carried out?

Answer. Colorado State University is managing the operating network, which when completed will include all regions of the country. At least 30 sites are planned for the climatological network including sites in Hawaii, Alaska, and Puerto Rico in order to provide broad geographic coverage. Ten sites have been operational with broad band instruments for up to seven years, and 29 sites are now operational with new generation instruments. The research level network began with the first instrument installed at the Table Mountain, Colorado instrument intercomparison site and the second and third have been installed at the USDA Plant Stress Laboratory at Beltsville, Maryland, and the U.S. Department of Energy Solar Radiation site near Ponca City, Oklahoma, as part of the Atmospheric Radiation Measurements field network in 1999.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. As with other weather and climate observations, this network will be an ongoing need for the predictable future. These measurements will provide information on the nature and seriousness of UV-B radiation in the U.S. and will provide ground truth validation to other predictions of UV-B irradiance. The project has nearly met its first objective of the establishment of a climatological network to monitor UV-B radiation at the surface of the earth. Years of operation will be required to measure trends in UV-B radiation and to develop models to predict the climatology of UV-B radiation.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency has assigned two technical staff to continuously monitor activities in the global change research program. A team of three experts in UV-B radiation measurement technology reviewed specifications for the development of the advanced spectroradiometers in July 1996 prior to the procurement of major components of the instrument. A panel of radiation spectra scientists were brought in to review data derived from the new multi-band instruments in December 1996 to advise on the interpretation and analysis of data derived from these instruments. Agency staff is in contact with program management on a weekly basis and has visited the program headquarters six times during the last year. The annual plan of work has been reviewed by three scientists prior to approval by the agency. A review of the UV-B Monitoring Program by a panel of technical experts from outside the Department is planned for April 2001.

GRAIN SORGHUM, KANSAS

Question. Please provide a description of the research that has been funded under the Grain Sorghum, Kansas grant.

Answer. This project was designed to improve the yield improvement of grain sorghum cultivars by developing early maturing hybrids with a longer grain filling period. The research focuses on identification of sorghum germplasm, which have a longer grain filling period or earlier maturation date. These traits may be used to shift more of the production to grain and less to vegetative growth, thus enabling more efficient use of the limited water supply. These funds are awarded to scientists working on sorghum at Kansas State University.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The focus of this research is toward the non-irrigated lands of Kansas where sorghum can produce a grain crop under conditions that would not be possible with corn and is, therefore, very important in the rotation with wheat. While the research is directed toward Kansas conditions, it would also apply to adjoining states.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify germplasm and use it to develop grain sorghum cultivars that mature earlier and produce more grain. Initial studies have identified genetic characteristics controlling grain yield under a range of climatic conditions. Researchers have identified several sorghum lines, which have a grain-filling period as much as one-third longer than U.S. adapted parent lines. Analyses show that variability exists, the trait is genetically controlled, and incorporation into adapted germplasm can be accomplished. Simulation of expected production gains has been initiated.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal years 1997 through 2000 was \$106,000, and for fiscal year 2001 is \$105,767 for a total of \$529,767.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In 1998, Kansas State provided support via salaries and associated fringe benefits of \$31,852, associated indirect costs of \$14,652, and in-kind costs of \$45,580, for a total of \$92,084. In 1999, a total of \$95,700 was provided and for 2000, \$97,200 was provided.

Question. Where is this work being carried out?

Answer. The research will be conducted on Kansas State University research facilities.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of this project, which began in 1997, are to develop sorghum parental lines with genetically-longer grain fill duration and identify changes in management necessary to optimize grain production in these lines. Five years or more are required to accomplish the objectives. The first objective has been completed. The researchers expect to complete the next three original objectives by 2004 and subsequent objectives by 2006. Preliminary results have contributed toward the understanding of factors controlling grain yield and the development of higher yielding sorghum cultivars for Kansas.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is subjected to the institutional review and approval process, as well as review by CSREES National Program Staff. In addition, stakeholder input was obtained through formal and informal methods. The institutional review of the project confirmed that high priority issues of the sorghum industry in Kansas and other sorghum-producing states were being addressed.

GRASS SEED CROPPING SYSTEMS FOR SUSTAINABLE AGRICULTURE, ID, OR, & WA

Question. Please provide a description of the research that has been funded under the Grass Seed Cropping Systems for Sustainable Agriculture, Idaho, Oregon, and Washington grant.

Answer. This program was developed to provide management systems for sustainable grass seed production without field burning of the straw residue following harvest which results in adverse air quality problems. Grass seed yields are often significantly reduced the following season if the residue is not burned.

Funds from this grant are awarded competitively to scientists at Oregon State University, the University of Idaho, and Washington State University engaged in research on grass seed production. Each award has passed a merit review by peer scientist.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that according to information provided by technical committees representing researchers and the grass seed industry, the need for this research is to develop sustainable systems of seed production that do not depend on field burning of straw residue. Much of the grass seed for the U.S., including lawn grasses, is produced in the area. Field burning of straw residue creates unacceptable levels of air pollution, and yields of some cultivar decline without burning. This is a regional issue that impacts the national supply of grass seed.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal for this project is to develop grass seed production systems that do not depend on field burning of straw residue. To date joint planning by state experiment station administrators and researchers from the three states with industry input has developed an integrated regional research effort to solve the problem.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000; for fiscal years 1995–2000, \$423,000 each year; and for fiscal year 2001, \$422,069. A total of \$3,430,069 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal support for this project in fiscal year 1994 was \$266,055; \$298,052 for fiscal year 1995; \$282,053 in fiscal year 1996; \$301,650 in fiscal year 1997; \$310,700 in fiscal year 1998; \$346,500 in fiscal year 1999; and \$334,800 in fiscal year 2000.

Question. Where is this work being carried out?

Answer. The research will be conducted by the three state agricultural experiment stations in Idaho, Oregon, and Washington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion of the initial objectives was anticipated to take five years and, therefore, should be completed in 1999. Revised goals leading to application of new management systems have been developed and should be completed in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The entire project is reviewed annually by a steering committee for focus and relevance. The combined proposal is reviewed by CSREES before funds are awarded.

Considerable progress has been made toward identifying the consequences of phased out field burning of straw residue on grass seed production. Current and future efforts are directed toward development of sustainable systems without field burning. This program is subject to annual comprehensive evaluation by a team of peer scientists, industry representatives, and farmers. The results are used to guide research for the next year. Each proposal is subjected to the institution project approval process and reviewed by the CSREES National Program Leader.

HUMAN NUTRITION, IOWA

Question. Please provide a description of the work that has been funded under the Human Nutrition, Iowa grant.

Answer. This research aims to develop animal and plant foods with nutritionally-optimal fat content and to improve utilization of foods containing non-nutrient health protectants, components that may reduce health risks. The research includes food production and processing, human and animal nutrient utilization, consumer food choices, and economic impacts of designed food to support optimal nutrition. The fiscal year 2000 grant supports research efforts of 30 investigators from seven disciplines through June 2001.

CSREES requested that the university submit a grant proposal for fiscal year 2001, which is now under CSREES merit review.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. The research addresses food quality, nutrition, and optimal health. Much of the research focuses on improving the nutritional quality of foods important to the economy of the Midwest, while making those improvements economically feasible. Ongoing research focuses on increasing health protective lipids and plant chemicals in human foods. Such foods have recently been called functional foods, and the development of functional foods is of high priority to the food industry. In ongoing projects, novel strategies are being developed for the dietary reduction of heart disease risk. Recent studies have included genetic modification of plant foods for animal and human diets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Center for Designing Foods to Improve Nutrition, the administrative unit for this grant, is to improve human nutrition and health maintenance by determining how to improve animal and plant food fat content and how to increase availability of health-protectant factors in the human food supply.

The Center's research group on soybean health effects has built upon its international reputation for the soybean isoflavone database, by demonstrating the importance of isoflavones with soy proteins in lowering circulating cholesterol and in maintaining bone density. Scientists in the Center have also contributed to the development of strategies for dietary control of high cholesterol and heart disease risk. Pork was modified to contain high polyunsaturated fatty acids that were found to lower circulating cholesterol in human subjects.

Additional projects are aimed at genetically-modifying plants to enhance their human health benefit. One project is assessing the plant genes that control vitamin content with the aim of modifying vitamin content in the future. Another project focuses on controlling the genes that regulate carotenoid synthesis to provide a better utilized pro-vitamin A source for the developing world. A third project developed

strategies to improve the bioavailability of resveratrol, a cancer preventative agent, from genetically-modified alfalfa that accumulates this compound. Ongoing research is based on earlier studies that demonstrated improved carotenoid bioavailability in fats with high saturated fatty acid content. Shea butter is used for cooking in sub-Saharan Africa and has a high saturated fatty acid profile. This project will determine if using shea butter as a vehicle for vitamin A fortification will improve vitamin A status in compromised populations.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of \$300,000. The fiscal years 1992–1993 appropriation was \$500,000 per year; \$470,000 in fiscal year 1994; \$473,000 per year in fiscal years 1995 through 2000, and \$471,959 in fiscal year 2001. A total of \$5,079,959 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$293,000 university, \$312,869 industry, and \$14,000 miscellaneous in 1991; \$90,000 state appropriations, \$473,608 university, \$131,160 industry, and \$116,560 miscellaneous in 1992; \$307,500 state appropriations, \$472,081 university, and \$222,267 industry in 1993; \$486,000 university and \$254,000 private in 1994; \$210,000 university and \$200,000 private in 1995; \$613,770 university and \$207,811 private in 1996; \$690,736 university and \$458,000 private in 1997; \$502,124 university and \$700,000 private in 1998; \$363,000 university, \$3,109,000 private, and \$2,617,000 other Federal in 1999; and \$804,639 private and \$2,957,877 other Federal in 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the Center for Designing Foods to Improve Nutrition, Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective to design foods to improve nutrition is continuing to be addressed. A new set of related objectives will be initiated in 2001.

Bonilla. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant proposals for fiscal years 1998 through 2000 have undergone extensive scientific peer review by the grantee. Progress and objectives were further reviewed in May 1999 by the Center's newly formed External Advisory Council and in May 2000 by the Departmental and Center Review Committee, and their recommendations are being implemented. Space allocations for Center research activities have been clarified and a full time Director is being recruited.

HUMAN NUTRITION, LOUISIANA

Question. Please provide a description of the work that has been funded under the Human Nutrition, Louisiana grant.

Answer. Obesity remains a worldwide epidemic. The grant entitled "Dietary Fat and Obesity" examines three aspects of this problem. Will the surreptitious replacement of dietary fat reduce body weight? Will fluctuations in daily fat intake influence the ability to use fat? How do good and bad fatty acids produce their different health effects? The fiscal year 2000 grant supports research through September 2001. CSREES has requested that the university submit a grant proposal for fiscal year 2001.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. Obesity is the second leading cause of preventable death. If dietary fat plays a role in the epidemic of obesity, reducing fat intake might help alleviate its consequences. Identifying individual risk factors for susceptibility to obesity and its health consequences in the environment of a high fat diet will enable the targeting of these special populations for intervention.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal of this grant is to identify the basis for the susceptibility to obesity of people who eat high-fat diets and to understand how they differ from those people who are resistant to becoming obese when eating a high-fat diet. The principal finding of the past year has been the strong relationship of insulin and fitness to the ease with which people become obese. The best indicator of the risk

of storing fat is the level of insulin. The identification of these relationships opens up a new group of possible strategies for prevention of obesity.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991, and the appropriation for fiscal years 1991–1993 was \$800,000 per year; for fiscal years 1994–2000 was \$752,000 per year; and for fiscal year 2001, \$750,346. A total of \$8,414,346 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$523,100 state appropriations in 1991; \$515,100 state appropriations and \$2,216,606 private in 1992; \$536,100 state appropriations and \$940,000 private in 1993; \$627,000 state appropriations and \$3,775,000 private in 1994; \$546,100 state appropriations and \$3,100,000 private in 1995; \$1,471,000 state appropriations and \$2,488,000 private in 1996; \$1,998,000 state appropriations and \$2,104,000 private in 1997; \$987,000 state appropriations and \$1,892,000 private in 1998; \$1,004,000 state appropriations and \$3,136,000 private in 1999; and \$1,085,000 state appropriations and \$1,685,000 private in 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Pennington Biomedical Research Center, Louisiana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective was to identify the basis for the susceptibility to obesity of people who eat high fat diets and to understand how they differ from those people who are resistant to becoming obese when eating a high fat diet. It is anticipated that several specific objectives will be completed in 2001. On March 13, 2001, a site visit team will provide external peer review of the projects proposed for completion in 2001 and will also review research projects proposed for 2001 and 2002, which address the related objective of further characterization of the susceptibility to positive energy balance when exposed to a high dietary fat environment by evaluating a broader population, including men and women, African Americans, and Caucasians with varying fitness conditions.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In March 1999 an on-site panel of researchers evaluated the proposed objectives and experimental protocols. The critiques from this site visit were used to revise the final proposal. Another site visit is planned on March 13, 2001, to assess the progress and evaluate a new set of related objectives, as well as future research protocols. The site visit panel will include four imminent peer scientists, and the evaluation will be on the basis of originality and feasibility of the research plan, potential impact of the research results, and appropriateness of the research to the mission of USDA. The site visit team will produce a report of the review to be submitted to the Principal Investigator and to the responsible National Program Leader in CSREES. The research protocols will not be implemented until they have met acceptable standards by all review criteria.

HUMAN NUTRITION, NEW YORK

Question. Please provide a description of the work that has been funded under the Human Nutrition, New York grant.

Answer. This grant continues to bring together investigators who focus on issues that range from improving our understanding of key roles of nutrients at the molecular level to the development of improved strategies to enable consumers to adopt newly created knowledge easily and effectively. At the molecular end of the spectrum, emphasis is given to nutrient-gene interactions, and at the consumer end, emphasis is given to the role that a supportive environment plays in enabling consumers to make desired changes in their eating patterns. The fiscal year 2000 grant supports research through September 2001. This grant supports the second year activities for 14 research projects begun during the 1999 fiscal year. The focus of this program is to address the individualization of nutrient requirements from a broad multidisciplinary perspective. CSREES requested the university submit a grant proposal for fiscal year 2001 that has not yet been received.

Question. According to the principal researcher, what is the national, regional, or local need for this research?

Answer. In the past decade, and in particular the past five years, there has been an explosion of knowledge concerning individual differences in the genetic control of the metabolism which underlay disease processes and health maintenance. Because metabolism cannot exist without the provision of nutrients and because nutrients influence genetic control, an understanding of genomics is fundamental to the development of nutritional sciences, from the biological to the social. Further, knowledge of the individuality will become critical for the development of appropriate nutrition programs and policies, ranging from food system concerns, to the philosophy and design of dietary guidelines and guidance, to the implementation and evaluation of food assistance programs. For all of these applications there is a need for an integrated consideration of individual differences, not just in biology, but also in personal and cultural experience with food and other lifestyle and environmental exposures.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The 1990 Dietary Guidelines emphasize a reliance on plant-based foods. This emphasis was designed to control caloric consumption, reduce fat intake, modify the composition of ingested fats, enhance the consumption of foods associated with reduced cancer risk, and simultaneously insure that nutrient needs are met in the proportion that is recommended. The researchers continue to address information gaps that relate to these health goals and to the policy aims for their implementation and that limit the more effective enhancement of consumer practices. The recently released Dietary Guidelines continue this emphasis and are consistent with the programmatic direction that has become the hallmark of this project since its inception.

Selected highlights of research accomplishments include significant findings on the role of antioxidants found in foods that may protect from some cancers. One study has identified a biomarker for selenium in the blood that is suspected to play an important role in cancer-protective metabolites and serve as an end point measure of selenium status in cancer prevention trials. Other anti-cancer research involves retinoic acid, a metabolite of vitamin A. Research supported by this grant has helped understand the role of retinoic acid binding proteins in regulating the multiple functions of retinoic acid, especially in its role as an anticarcinogenic agent. We are exploring new avenues of nutrition research related to the interaction of genes and the nutritional environment. One study has successfully adapted methodologies used in the study of behavioral response of rats to iron and folate deficiencies to an experimental mouse model. Mice are the animal of choice in genetic studies, and this advance provides new opportunities for future research in functional genomics.

Epidemiologic research on the biological effect of folic acid deficiency on cardiovascular disease and certain cancers has shown that both dietary levels of this vitamin and a biomarker of folate acid status, homocysteine in the blood, are related to increased blood pressure in the third National Health and Nutrition Examination Survey. Other research has been examining food insecurity in Hispanic, black, and white elderly persons who live at home. This research has shown that neither the most commonly used definition of food insecurity nor the Federal measure used in the U.S. Census are sufficient in describing the problems among the elderly. As a result, food insecurity status of the elderly is misunderstood and underestimated in the U.S. We expect to propose new ways of measuring this problem to the USDA in Spring 2001.

Question. How long has this work been underway, and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal years 1990–1991, \$556,000 per year; fiscal years 1992–1993, \$735,000 per year; fiscal year 1994, \$691,000; fiscal years 1995 through 2000, \$622,000 each year; and fiscal year 2001, \$620,632. A total of \$8,075,632 has been appropriated.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$154,056 state appropriations and \$2,456 private in 1991; \$238,430 state appropriations and \$60,746 private in 1992; \$19,401 state appropriations and \$22,083 private in 1993; \$202,441 state appropriations and \$1,175 private in 1994; \$296,794 state appropriations in 1995; \$348,127 in state appropriations and \$39,593 private in 1996; \$133,162 state appropriations in 1997; \$8,185 university appropriations, \$166,752 state appropriations, and \$7,905 private in 1998; \$6,395 university appropriations, \$164,244 state appropriations, and \$7,414 private in 1999; and \$17,598

university appropriations, \$205,917 state appropriations, and \$16,717 private in 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at Cornell University, New York.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The university changed the focus of research funded by this grant complement, the university's initiative in mammalian genomics as well as the human and social science issues that relate to food and nutrition. Progress has been consistent with the proposed time lines. They anticipate completing the specific objectives in 2001 and plan to concentrate on an expanded nutritional genomics theme for the fiscal year 2001 proposal.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES made a site visit on May 27, 1999, to evaluate the change in focus. The grant proposal for fiscal years 1999 and 2000 was also subjected to independent peer review coordinated through the Cornell Agricultural Experiment Station. Two peer reviewers from a list of four submitted by the Project Director were selected by the Station Director. The reviewers were given the following eight criteria: scientific merit, clarity of objectives, appropriate methodology, feasibility of attaining objectives, accomplishment during preceding project period, research performance and competence of investigators, significance of anticipated results for agriculture, forestry or rural life, and relevance of the proposed work to regional and national goals. They gave the proposal an overall score of slightly below outstanding. The reviewers did report serious concerns with the objectives of two proposals that were subsequently not funded. Modifications were also made to experimental designs of other projects based on recommendations from the reviewers. The next peer review is scheduled to occur in Spring 2001 in conjunction with developing the next proposal.

HYDROPONIC TOMATO PRODUCTION, OHIO

Question. Please provide a description of the research that has been funded under the Hydroponic Tomato Production, Ohio grant.

Answer. This research is designed to develop and demonstrate state-of-the-art hydroponic vegetable production technology to achieve year-round high quality-tomato production. The project will develop and test decision support functions and distribute them through the Internet, and to develop and test automated control system. Results will be extended to other vegetable crops.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research is needed to develop and evaluate management protocols for economical production of green house tomatoes as an alternative crop.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of the research are to develop and test protocols for management systems for operation of year round green house tomato production as an alternative crop.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 1998 and the appropriation for fiscal year 1998 was \$140,000; for fiscal years 1999 and 2000 was \$200,000 each year; and for fiscal year 2001, \$99,780. A total of \$639,780 has been appropriated.

Question. What is the source and amount of non-Federal provided by fiscal year?

Answer. The non-Federal funds provided for support of the project are \$19,400 for fiscal year 1998; \$24,500 for fiscal year 1999; and \$30,000 for fiscal year 2000.

Question. Where is this work being carried out?

Answer. The research will be conducted by the Ohio State Agricultural Experiment Station at selected locations in Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator for this project anticipates completion of the original objectives in fiscal year 2002. Revised objectives are projected for completion in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was subjected to a peer review in the institution and again reviewed by CSREES National Program Staff.

ILLINOIS-MISSOURI ALLIANCE FOR BIOTECHNOLOGY

Question. Please provide a description of the research that has been funded under the Illinois-Missouri Alliance for Biotechnology grant.

Answer. The Illinois-Missouri Alliance has initiated a competitive grants program in agricultural biotechnology for research in targeted priority areas of need related to corn and soybeans. The scope of interest includes production, processing, marketing, utilization, inputs, and support services, along with economic, social, environmental, and natural resource concerns. The Alliance has solicited research project proposals from scientists at Illinois and Missouri and other midwestern institutions and has conducted peer reviews for science quality, commercial feasibility and potential economic impact to select the proposals that will be funded. In 2000 the Alliance awarded three new research grants at three institutions totaling \$900,703. In 1998 the Alliance started an on-line magazine called AgBioForum devoted to the economics and management of agricultural biotechnology. The purpose of AgBioForum is to provide unbiased, timely information and new ideas leading to socially-responsible and economically-efficient decisions in science, public policy, and private strategies pertaining to agricultural biotechnology. In its second year of operation, AgBioForum experienced over 135,000 hits from individuals in universities, industry, government, and international organizations.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal investigator has indicated that the goal of the Alliance is the pre-commercial development of emerging biotechnology discoveries for agriculture. The midwestern region produces more than half of the nation's output of corn and soybean crops and is critical to domestic food security and U.S. competitiveness in global agricultural markets. Alliance grants are awarded on a regional basis to advance corn and soybean production in the Midwest. The Alliance is implementing a research strategy that it hopes will generate important biotechnological developments that are rapidly adaptable to unique local soil, climatic, and socio-economic conditions of the region. Alliance grants are awarded to projects with a clearly defined marketable product or service derived from biotechnology research.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Fiscal year 2000 was the sixth year of funding for the Alliance. The research program focuses on the two major commodity crops, corn and soybeans, as produced, processed, and marketed in the midwest. The goal of this biotechnology program is to fund integrated research and development projects that will lead to specifically-defined practical technologies for commercialization. The projects funded in fiscal year 2000 include efforts to: (a) better understand consumer attitudes toward products that have been improved through biotechnology and the basis for those attitudes; (b) evaluate options and strategies for more effectively communicating the benefits and risks of biotechnology; and (c) develop new soybean varieties with added healthful constituents, with special emphasis on antioxidants.

Question. How long has this work been underway and how much has been appropriated by fiscal year through 2001?

Answer. The work supported by this grant began in fiscal year 1995. The appropriations for fiscal years 1995 and 1996 were \$1,357,000 each year; for fiscal year 1997, \$1,316,000; for fiscal years 1998 through 2000, \$1,184,000 per year; and for fiscal year 2001, \$1,239,268 bringing the total appropriations to date to \$8,821,268.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Alliance has not specified a required amount of matching funds, but it is expected that most projects will have commitments for significant direct and in-kind non-Federal support such as faculty salaries, graduate student stipends, and funding from industry and commodity groups. Since Alliance projects are still underway, the exact amount of the non-Federal contribution is still unknown. The non-Federal contribution is expected to be substantial, and a system for accounting for future non-Federal contributions is in place.

Question. Where is this work being carried out?

Answer. The research projects identified are being conducted at the University of Illinois, the University of Missouri, Iowa State University, Northwestern University, Southern Illinois University, and the USDA Agricultural Research Service.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Each project proposal for Alliance funding has a target date for completion. The four initial projects were three-year studies with anticipated completions at the end of fiscal year 1998. Most of the second and third rounds of projects are also three-year studies that were to be completed at the end of fiscal years 1999 and 2000, respectively.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Illinois-Missouri Biotechnology Alliance was evaluated for scientific merit by a review panel convened by the agency on April 17, 2000. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received, and we are satisfied that the program is being administered in compliance with the purpose of the grant. A merit review panel will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2001.

IMPROVED DAIRY MANAGEMENT PRACTICES, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Improved Dairy Management Practices, Pennsylvania grant.

Answer. The research focuses on developing methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. Individual research projects funded by the grant are determined by a competitive peer review process administered by the Institution using peers from Institutions located primarily in other states.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the local need is for the identification and implementation of profit-enhancing management strategies for Pennsylvania dairy farms in response to changing market conditions and emerging technologies. The current focus is to reduce cow losses due to salmonella infections, to evaluate an effective fiber index system for the formulation of rations fed to dairy cattle, and to evaluate induced lactation in dairy heifers as a method to increase profitability of Pennsylvania dairy farms.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research remains the same, which is the development of methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. A farm management survey is complete, and analysis of results is in progress. Farm financial models have been developed and are undergoing a field test on selected farms. Workshops to teach elements of business management to dairy farmers have been conducted, and survey instruments are in place to monitor effectiveness of workshops. Research is currently underway to develop improved models for nutrient management on northeastern dairy farms, to evaluate the potential role of intensive grazing systems to replace harvested forage, and to better understand how decisions are made by dairy farm families. Refinement of an expert computer-based system to assist dairy farmers in controlling the udder disease, mastitis, is underway. A study to evaluate the induction of lactation on dairy profitability is underway. An additional study to evaluate the impact of improved protein nutrition during late gestation on dairy cow performance has been initiated.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$335,000 per year. The fiscal year 1994 appropriation was \$329,000; \$296,000 each year in fiscal years 1995–2000; and \$397,124 in fiscal year 2001. A total of \$3,172,124 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. During fiscal year 1992, \$354,917 were from State funds, and \$16,000 from Industry, for a total of \$370,917. During fiscal year 1993, \$360,374 were from State funds and \$16,000 from Industry for a total of \$376,374. Information is not available for fiscal years 1994–2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the Pennsylvania State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal researcher anticipated completion of the original objectives by March 1994. The original objectives were met. Availability of continued funding has permitted the institution to develop a competitively-awarded grant program within the institution to address priority issues related to management of dairy farms. Proposals are reviewed and ranked by peers in other institutions prior to award. It is anticipated that awards from the fiscal year 2001 appropriation will be complete in September 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency accepts technical review of specific proposals funded by this grant on an annual basis. The overall proposal is reviewed by the agency on an annual basis. In addition, technical staff has conducted an onsite review of the program in 1993 and in 1995. The overall objective of the work funded by this grant has direct relationship to the development of Integrated Management Systems as well as to aspects of animal production systems for animal well-being and impact on the environment.

IMPROVED EARLY DETECTION OF CROP DISEASE, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Improved Early Detection of Crop Disease, North Carolina grant.

Answer. This project involves detecting pathogens on crops before symptoms appear. The project will examine several remote sensing systems to combine photonic instruments.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigator indicates that the project has potential of creating a universal remote sensing biosensor platform for early warning crop disease detection.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The goal of the research is to produce a crop-based biosensor with which to monitor the onset and spread of crop diseases for the purpose of early crop disease detection. They have made strides in the measurement of a green fluorescent protein in transgenic plants by using fluorescence spectrophotometer and laser-induced fluorescence imaging. These techniques are pivotal in gathering the induced plant photonic signal which will serve as an early indicator of plant diseases.

Question. How long has this work been underway and how much has been appropriated by fiscal year 2001.

Answer. The work supported by this grant began in fiscal year 2000. The appropriation for fiscal year 2000 was \$170,000 and for fiscal year 2001 is \$197,564. The total appropriation is \$367,564.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds are not provided for this grant.

Question. Where is the work being carried out?

Answer. Research will be conducted at the University of North Carolina-Greensboro.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This grant was issued in 2000. It is anticipated that significant progress can be made in the next four years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The overall grant is reviewed annually by CSREES' scientific staff.

IMPROVED FRUIT PRACTICES, MICHIGAN

Question. Please provide a description of the work that has been done under the Improved Fruit Practices, Michigan grant.

Answer. Funds from this grant will be awarded competitively to scientists at Michigan State University working with these crops. This research will involve a multidisciplinary approach to reduce chemical use on apple, blueberry, and sour cherry, three important Michigan fruit crops, and improve the management of dry

edible beans and sugar beets. Research will be conducted on crop management techniques and reduced chemical use.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes Michigan's need for this research is to develop and maintain/expand their tree fruit and small fruits industry. There is a need to improve the culture and management of dry edible beans and sugar beets in order for Michigan farmers to sustain production of these crops.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The planned objectives of the research are to reduce the chemical contamination of the environment from fruit production and improve production practices for beans and beets through multi-disciplinary research, including pesticides, and the development of new nonchemical production methods.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$494,000, for fiscal years 1995–2000, \$445,000 each year; and for fiscal year 2001, \$444,021. A total of \$3,608,021 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant in fiscal year 1994 were \$437,338 from state appropriations and \$135,000 from industry; for fiscal year 1995, \$574,494 were from state appropriations and \$127,000 from industry; and a total of \$908,969 for fiscal year 1996. The non-Federal funds for fiscal year 1997 totaled \$752,500, for fiscal year 1998, total \$729,145; for fiscal year 1999, total \$1,332,300; and for fiscal year 2000, total \$986,000.

Question. Where is this work being carried out?

Answer. Research will be conducted at Michigan State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Principal Investigators have reported significant progress toward improved cultural practices for these speciality crops which is expected to reduce the need for chemical pesticides. Some of the original objectives were completed by the end of fiscal year 1999. Long-term goals are expected to take an additional five years with a projected completion date of 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has been subjected to a comprehensive review with each funding cycle. The annual proposals, including all of its sub-projects, are subjected to peer review before submission to CSREES to be reviewed by National Program Staff. The project has progressed toward the objective of developing management practices and strategies for economical production of speciality crops in Michigan with reduced chemical pesticide use. At the end of each research cycle, priorities are adjusted for the next year's funding. The evaluation is performed by scientists at Michigan State University.

INFECTIOUS DISEASE RESEARCH, COLORADO

Question. Please provide a description of the research that has been conducted under the Infectious Disease Research, Colorado grant.

Answer. The purpose of this project is to establish a multidisciplinary research center to study infectious animal diseases which have a critical economic impact. The "Center for Economically Important Infectious Animal Diseases" will work collaboratively with universities and state and Federal agencies. The focus will be on the impact of diseases such as vesicular stomatitis, various *Mycobacterium* species—*M. bovis*, *M. tuberculosis*, *M. avium* subsp. *paratuberculosis*— and brucellosis, methods for risk analysis, antimicrobial resistance issues, and development of vaccines for some of these diseases.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The need for this research is to provide valid risk assessment models for diseases which affect both animal and public health and which can have a serious impact on international trade. Livestock producers and the industry need this type of information to enable them to make correct disease management decisions. The Center utilizes commodity advisory groups to prioritize specific disease problems

and will focus on those diseases with the greatest potential for economic impact. The Center currently has an Advisory Committee which comprises the private sector—commodity groups—academia, and Federal and state health officials. This group meets once or twice annually to review direction of the Center's programs and decide on critical priorities for the next year.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal was to establish a regional center that would foster interactive work on risk assessment, disease control, and minimize the economic impact of disease outbreaks in livestock. The Center has been successful in obtaining additional funding from a variety of sources to initiate studies on diseases such as vesicular stomatitis and tuberculosis. The coordinating structures have been established, and the Center has now reported several successes from their research program. They have been conducting long term surveillance for vesicular stomatitis on sentinel herds in the U.S. as well as in three other countries—Costa Rica, El Salvador, Mexico—south of the U.S. where this virus can be endemic in nature. Progress is also being made on newer, molecular technique-based diagnostic tests for Mycobacteria which are involved in tuberculosis or Johne's disease outbreaks.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999 with appropriations in fiscal year 1999 of \$250,000; in fiscal year 2000, \$255,000; and in fiscal year 2001, \$299,340, for a total of \$804,340.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. In fiscal year 1999, the project also received the following funds: other Federal agency grants, \$85,750; private foundation grants, \$39,488; and state funds, \$33,120 for a total of \$158,358. For fiscal year 2000, the Center received \$195,000 in other grants in support from private companies and foundations, \$7,000 from the UN-International Agency for Atomic Energy, and the university contributed \$119,276 in related indirect costs for a total non-Federal contribution of \$321,276.

Question. Where is this work being performed?

Answer. The research is being conducted at the College of Veterinary Medicine, Colorado State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date is 2003. The work is proceeding on the designated schedule, and it is expected that the objectives will be met in a timely manner.

Question. When was the last agency evaluation of this project? Provide a summary of it.

Answer. The project was initiated in fiscal year 1999, and no formal on-site evaluation has been done at this time. The CSREES representative has kept in close contact with the Center Director and will attend the meeting of the Center's Advisory Committee on March 2, 2001, at which time a detailed review of the programs and functions of the Center for Economically Important Infectious Animal Diseases will be done.

INSTITUTE FOR FOOD SCIENCE AND ENGINEERING, ARKANSAS

Question. Please provide a description of the research that has been funded under the Institute for Food Science and Engineering, Arkansas grant.

Answer. As the flagship center for the Institute of Food Science and Engineering, the Center for Food Processing and Engineering has as its objectives to facilitate and encourage value-added research and improve the processing of agricultural products. The Center for Food Safety and Quality, with a mission to conduct research on the safety and quality of foods relative to microbiological and chemical hazards, was activated on January 1, 1997. Researchers within the Center for Human Nutrition are focusing on identification and evaluation of important dietary phytochemicals present in fruits, vegetables, grains, and legumes grown in Arkansas and the Southern region, enhancement of phytochemical content through advanced breeding techniques, and the development of new value-added products with elevated levels of these health promoting compounds. A proposal in support of the fiscal year 2001 appropriation has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Institute will provide technical support and expertise to small and mid-sized food processors that usually do not possess adequate expertise in-house.

The economy of the southern region will be improved through the creation of new jobs and a high multiplier effect from the research.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to establish an Institute of Food Science and Engineering at the University of Arkansas-Fayetteville. The full implementation of research findings is estimated to have a potential economic impact for the food industry of over \$25 million annually.

The Institute staff has assisted national food processing companies in development and quality improvement of thermally-processed products as well as serving small commercial kitchens and start-up. The Institute's Food and Agricultural Organization—FAO—Center of Excellence has been involved with a number of training-related activities in Latin America and the Caribbean to promote good agricultural practices related in the production and handling of fresh produce for export to the U.S. This activity is vitally important to the U.S. consumer because approximately 40 percent of fresh fruits and vegetables are imported.

To date, 108 publications, two IMPACT reports and a newsletter have served to keep the industry and fellow scientists informed of research activities. The publication of two comprehensive manuals and six Extension fact sheets has supplemented several Hazard Analysis Critical Control Point—HACCP—and Better Process Control Schools as important technology transfer activities.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$750,000 each year; \$950,000 for fiscal year 1998; \$1,250,000 each year for fiscal years 1999 through 2000; and \$1,247,250 in fiscal year 2001. A total of \$6,197,250 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. The non-Federal funds and sources provided for this grant include \$184,700 in state funds and \$85,500 from industry in fiscal year 1996; \$146,023 in state funds and \$279,728 from industry in fiscal year 1997; \$57,584 in state funds and \$243,225 from industry in fiscal year 1998; \$62,479 in state funds and \$394,589 from industry in fiscal year 1999; \$63,564 in state funds and \$409,470 from industry in fiscal year fiscal year 2000; and \$65,344 in state funds and \$211,342 from industry. Including equipment donations of \$738,369 and training of the Descriptive Sensory Panel valued at \$200,000, industry has made a total contribution of \$3,141,917. Adding Food and Agricultural Organization contributions of \$88,000 and direct state contributions of \$663,094, non-Federal support totals \$3,893,011.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Arkansas at Fayetteville.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal researcher anticipates that work will be completed on the original goals in fiscal year 2002. The objectives related to research and service to industry, food entrepreneurs and the general public continue to be ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. In a review of the proposal on May 25, 2000, the assessment was that satisfactory progress was demonstrated in meeting the goals of the Institute.

INTEGRATED PEST MANAGEMENT

Question. Please provide a description of the research that has been funded under the Integrated Pest Management research grant.

Answer. The research supported by this grant develops new pest management tools to address critical pest problems identified by farmers in an agricultural production region. Funds are distributed through the Regional Integrated Pest Management—IPM—Grants Program using a competitive process which includes technical and merit review at the regional and national levels. Projects funded by the Regional Grants Program develop new pest management tactics to replace management tools lost as a result of regulatory action, pest resistance, and other factors. Alternative pest management tactics are identified and validated in a production

setting. Education and training programs are conducted to help producers implement new tactics.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber is dependant on access to safe, profitable, and reliable pest management systems. For a variety of reasons, including the Food Quality Protection Act—FQPA—of 1996 and pest resistance, many of the chemical control options farmers have relied on for many years are no longer available. The loss of these important tools is likely to continue at an accelerated rate over the next several years and will have significant impacts on pest management systems in the U.S. over the next decade. The minor use crops, high value crops grown on relatively few acres, will be particularly hard hit during this period. For these reasons and others, it is essential that farmers be provided with new pest management tools and better information so they can remain competitive in today's global marketplace. These research grant funds are an important part of the Department's plan to assist farmers in finding effective pest management alternatives so they can adjust to changes in pesticide availability resulting from implementation of the FQPA.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to provide farmers with new pest management options that allow them to reduce dependance on pesticides, improve profitability, and protect vital natural resources. The research supported by this research grant has made important contributions to increasing knowledge about new approaches to pest management. The following are some examples:

- In California, a resource and training program was developed in a CD-ROM format to help retail nursery personnel and Master Gardener volunteers solve garden and landscape problems using least toxic pest control methods. This program is now in use in every county in California.

- In Texas, a statistically-valid and user-friendly method was developed to monitor a variety of pests and natural enemies on a number of important crops. As a result, and together with the Texas Agricultural Experiment Station, the Texas Agricultural Extension Service and the Texas Integrated Pest Management Program, personnel are being hired throughout the state to implement IPM strategies for greenhouse and nursery crops.

- In New England, researchers have been investigating the possibility of establishing populations of a natural enemy to control red mite in apple orchards. Results show that this biological control method can probably be sustained in most northeastern orchards and may eradicate the need for chemical control throughout this apple growing area.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1982, \$1,500,000; fiscal years 1983 through 1985, \$3,091,000 per year; fiscal years 1986 through 1989, \$2,940,000 per year; fiscal year 1990, \$2,903,000; fiscal year 1991, \$4,000,000; fiscal years 1992 and 1993, \$4,457,000 per year; fiscal year 1994, \$3,034,000; fiscal years 1995 through 2000, \$2,731,000 each year; and fiscal year 2001, \$2,724,992. A total of \$60,494,992 has been appropriated since fiscal year 1981.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. A study of the source of non-Federal funds that contribute to this research effort was conducted in 1993–1994 with the following results: In fiscal year 1993, state appropriations, \$841,017, product sales, \$33,987, industry grants, \$17,081, and other, \$31,737; for fiscal year 1994, state appropriations, \$2,303,458, product sales, \$77,157, industry grants, \$210,110, and other, \$216,552. These studies, which have not been repeated since 1994, demonstrate a trend toward greater annual state investments in Integrated Pest Management programs.

Question. Where is the work being carried out?

Answer. Scientists in all states are eligible to compete for this funding on a competitive basis. In fiscal year 2000, grants were awarded to Colleges of Agriculture in 23 states.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Due to the passage of the FQPA in 1996, the economic and environmental pressures facing U.S. agriculture are at least as great today as they were

in 1981 when Federal funds were first appropriated for this research grant. It is important for government to address the needs of agricultural producers by supporting research and extension efforts to develop alternative pest management approaches. It is anticipated that the need for this work will only increase as new pests emerge, existing pests become resistant to current control methods, and as new pesticide regulations are implemented.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Projects funded by this research grant are awarded through a competitive process that evaluates relevance to stakeholder needs and technical merit. Progress reports are reviewed to evaluate accomplishments and special attention is given to studies involving new control strategies relating to at-risk sites with pest management usage patterns impacted by FQPA implementations.

INTEGRATED PRODUCTION SYSTEMS, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Integrated Production Systems, Oklahoma grant.

Answer. This grant focuses on the development of efficient management systems for production of watermelons and blackberries under intensively-managed conditions. The work will address biotic and abiotic production components under southeastern Oklahoma conditions for use in production guidelines. This will include planting densities, fertilizer studies, weed management and insect and disease control.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research.

Answer. The principal researcher believes the need for this research is focused on the local area of southeastern Oklahoma, an area that is economically depressed and in need of alternative crops to diversify the dominant cow/calf livestock production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop new and alternative crops to supplement and diversify the cow/calf livestock agriculture of southeastern Oklahoma with emphasis on horticultural crops. Work to date has shown promise for strawberries, blackberries, cabbage, melons, and blueberries. Research results to support an expert system will be developed for grower use.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Work supported by this grant started in fiscal year 1984 and the appropriations were: fiscal year 1984, \$200,000; fiscal year 1985, \$250,000; fiscal year 1986, \$238,000; fiscal years 1987–1989, \$188,000 per year; fiscal years 1990–1991, \$186,000 per year; fiscal year 1992, \$193,000; fiscal year 1993, \$190,000; fiscal year 1994, \$179,000; fiscal years 1995–1998, \$161,000 each year; fiscal years 1999–2001, \$180,000 per year; and fiscal year 2001, \$179,604. A total of \$3,369,604 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal

Answer. The non-Federal funds and sources provided for this grant were as follows: \$165,989 state appropriations in 1991; \$160,421 state appropriations in 1992; and \$164,278 state appropriations in 1993. Non-Federal support for 1994 was \$141,850 for state appropriations. Funds for fiscal year 1995 were \$129,552; for 1996, \$146,000; for 1997, \$152,000; for 1998, \$148,000; for 1999, \$151,000; and for 2000, \$137,000.

Question. Where is this work being carried out?

Answer. This research is being done at the West Watkins Agricultural Research and Extension Center at Lane, Oklahoma, a branch of the Oklahoma State Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of this project were to develop a production system for alternative crops with economic potential for southeastern Oklahoma. Each year's funding cycle has addressed specific crop and management objectives to be completed over two-years time. These short term objectives have been met for each of the completed two year projects. However, the original objective of developing alternative cropping systems is very long term and has not been completed. The current project is projected for completion in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each of the annual project proposals has been put through the institutions review and is reviewed by a CSREES scientist before approval. In addition to the annual review of individual proposals, a comprehensive review of the Lane Agricultural Center, where this research is conducted, was conducted in 1993. This review showed that work supported by this grant is central to the mission of that station and represents an important contribution to the agriculture of the area. This work has provided practical management information for farmers of southeastern Oklahoma that has improved their ability to economically-produce small fruit and vegetable crops. This project is evaluated internally at the end of each year in order to set priorities for the next year.

INTELLIGENT QUALITY SENSOR FOR FOOD SAFETY, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Intelligent Quality Sensor for Food Safety, North Dakota grant.

Answer. This is a new project starting in fiscal year 2001. The long-range goal of this project is to build portable intelligent quality sensors for detecting food borne pathogens and measuring food quality. The investigators at North Dakota State University have indicated that they start by reconfiguring and improving currently available sensors to detect the volatile compounds produced by stored meat and relate the volatile compounds to the type of food borne pathogen present in the meat.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need for this research is to develop rapid methods to detect contamination of food by pathogenic microorganisms. An online detection system will increase the speed with which food safety can be assured. Details will be known when the proposal is received from the principal investigator.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to improve the safety and quality of the food. The goal will be achieved by developing intelligent quality sensors to detect food quality and food borne pathogens. The investigators from North Dakota State University have indicated that they have conducted preliminary research on the development of sensors for detecting odors in meat. In this project, they also propose to reconfigure and improve these sensors to detect food borne pathogens. Accomplishments will be reported at the end of this project period.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$141,688.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university will show the matching resources in the proposal.

Question. Where is this work being carried out?

Answer. Research will be conducted at North Dakota State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives of this new project is August 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. There was no project last year and no evaluation was conducted.

INTERNATIONAL ARID LANDS CONSORTIUM, ARIZONA

Question. Please provide a description of the research that has been funded under the International Arid Lands Consortium, Arizona grant.

Answer. Fiscal year 2001 is the eighth year that CSREES has funded the International Arid Lands Consortium. The Forest Service supported the program during fiscal year 1993 to develop an ecological approach to multiple-use management and sustainable use of arid and semiarid lands. Projects that began in 1997-2000 will continue to be funded to address issues of land reclamation, land use, water resources development and conservation, water quality, inventory technology, and remote sensing. All proposals are peer reviewed and awarded competitively, whereby the principal investigator must be from a Consortium member institution.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the consortium is devoted to the development, management and reclamation of arid and semi-arid lands in the United States, Israel, and elsewhere in the world. The International Arid Lands Consortium will work to achieve research and development, educational and training initiatives, and demonstration projects. The current member institutions are the University of Arizona; the University of Illinois; Jewish National Fund; Jordan's Higher Council for Science and Technology; New Mexico State University; South Dakota State University; Texas A&M University, Kingsville; and Desert Research Institute, Nevada. Affiliate membership includes Egypt's Ministry of Agriculture and Land Reclamation Undersecretary for Afforestation. The USDA's Forest Service works very closely with The International Arid Lands Consortium through a service-wide memorandum of understanding.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Consortium was and continues to be acknowledged as the leading international organization supporting ecological sustainability of arid and semi-arid lands. To date, 74 projects have been funded, 51 of which are to conduct research and development, 14 for demonstration projects, and 9 for international workshops. Funds approximating \$6.2 million have been used to fund these projects.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The International Arid Lands Consortium was incorporated in 1991. Funds were appropriated to the Forest Service in 1993. Additional funds were received during each of the years that followed. \$329,000 per year has been appropriated for fiscal years 1994 through 1998; \$400,000 per year for fiscal years 1999 and 2000; and \$493,911 for fiscal year 2001. Total appropriations are \$2,938,911.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Members of the International Arid Lands Consortium have provided funds to support the Consortium office in Tucson, Arizona, and for printed materials as needed. Each member has provided travel and operations support for semi-annual meetings, teleconferences, and other related activities. In fiscal years 1993–1996, \$60,000 in state appropriations were provided. Industry provided \$84,083, \$100,000, and \$25,000 in fiscal years 1993, 1995, 1996, respectively. Additional funds of \$34,000 were received during 1996 from the Egyptian affiliate member to enhance future collaboration. Funds of \$50,000 from industry were received during 1998–2000.

Question. Where is this work being carried out?

Answer. Research is currently being conducted at the University of Arizona, South Dakota State University, Texas A&M University, Kingsville, New Mexico State University, University of Illinois, Nevada's Desert Research Institute, and several research and higher education institutions in Israel, Jordan and Egypt.

Question. What was the anticipated completion date for the original objectives of the projects? Have those objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. All research and demonstration projects that started in 1993 through 1996 have been completed. The projects started in 1997 and 1998 are expected to be completed within 12 months depending upon the nature of the project. Projects started in 1999 and 2000 will be completed within two years. Six international conferences and workshops were held during 1994 through 2000. The International Arid Lands Consortium is an organization with long-term goals.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist reviews the project semi-annually and has determined that the research is conducted in accordance with the mission of the agency.

IOWA BIOTECHNOLOGY CONSORTIUM

Question. Please provide a description of the work that has been funded under the Iowa Biotechnology Consortium grant.

Answer. This Consortium is engaged in jointly planned research activities between Iowa State University—ISU, the University of Iowa—UI, and the City of Cedar Rapids, Iowa. Both fundamental and applied research studies are being conducted to identify opportunities to convert agricultural processing wastes into value-

added products. These waste streams include harvesting residues as well as food processing wastes, the latter of which can place enormous burdens on municipal waste management systems. The overall project involves broad and coordinated research approaches for the cost-effective disposal of wastes along with efforts to recover and utilize byproduct materials generated by the biotechnology industries. Individual projects supported by these funds include various studies in the areas of analytical methodology, separation and recovery of waste components, value-added products from wastes, anaerobic digestion and waste disposal, animal feeding of waste products, and land applications of waste products. Annual funding decisions for individual studies to be included in the overall project are based on a competitive peer review process with panel evaluations.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The environmental burden associated with agriculture and the agricultural processing industries is recognized as a growing problem in the U.S. These researchers are interested in discovery investigations that will lead to technological breakthroughs allowing the recovery and recycling of energy, chemicals, and materials from agriculture-related processing wastes. While these investigators are working with wastes that are generated in the State of Iowa, similar waste streams are generated by agricultural industries across the U.S. Thus, the researchers believe that their studies encompass national, regional, and local needs because the potential technologies, which can be developed from their research, would have nationwide applications. In many respects, this ongoing research effort anticipates the rapidly expanding national interest in bio-based products and genetically modified plants and animals.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The primary goal of this project is to conduct fundamental and applied research aimed at enhancing the recovery and utilization of by-product materials from waste streams generated by new and emerging biotechnology industries, with emphasis on agribusiness. Early in the project, research emphasized characterization of waste streams from agricultural processing industries and developing anaerobic digestion technologies suitable for treating these streams. This early work has resulted in commercially-successful anaerobic digesters used in both Iowa and other states. Success in these endeavors has led to new research activities aimed at producing value-added products from the waste streams. For example, researchers at ISU are investigating ways to produce hydrogen instead of methane from anaerobic digesters; are testing a process to break down agricultural residues such as oat hulls and corn stover into compounds that can be converted to ethanol, lactic acid, polyols, and other industrial chemicals; and are culturing microorganisms that naturally appear in the vents and tanks at agricultural processing plants to see if they could be useful in recovering value-added products from waste streams from the plant. Researchers at UI have developed a biodegradable sugar-based plastic with extraordinary water-absorbant properties for use in personal care products, such as disposable diapers; are effecting bio-transformations of agriculturally-derived byproducts to generate antioxidant food products, vitamin-like growth factors and flavors, such as vanillin; and have demonstrated the value of constructed wetlands for the treatment of landfill leachates.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,225,000; fiscal year 1990, \$1,593,000; fiscal year 1991, \$1,756,000; fiscal year 1992, \$1,953,000; fiscal year 1993, \$2,000,000; fiscal year 1994, \$1,880,000; fiscal years 1995–1996 \$1,792,000 each year; fiscal year 1997, \$1,738,000; in fiscal years 1998 through 2000, \$1,564,000 each year; and in fiscal year 2001, \$1,560,559. A total of \$21,981,559 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds and sources provided for this grant were as follows: \$623,803 from the State of Iowa, \$42,813 from the city of Cedar Rapids in 1991; \$768,287 from the State of Iowa, and \$365,813 from the city of Cedar Rapids in 1992; \$858,113 from the State of Iowa, and \$170,000 from the city of Cedar Rapids in 1993; \$841,689 from the State of Iowa, and \$36,000 from the City of Cedar Rapids in 1994; \$1,016,505 from the State of Iowa, and \$36,000 from the city of Cedar Rapids in 1995; \$862,558 from the State of Iowa, and \$40,000 from the City of Cedar Rapids in 1996; \$1,044,864 from the State of Iowa, and \$50,000 from the City of Cedar Rapids in 1997; \$303,549 from the State of Iowa, and \$50,000 from the City of Cedar Rapids in 1998; and \$293,461 from the State of Iowa, and \$59,400

from the City of Cedar Rapids in 1999. In fiscal year 2000, \$377,410 was obtained from the State of Iowa.

In addition, leveraging of Federal grant monies has been obtained in the form of industrial matching funds or contracts for related projects. Some of the more noteworthy awards are as follows: \$20,000 from Archer Daniels Midland; \$342,720 from Ajinomoto; \$40,000 from BASF; \$18,000 from Bluestem Solid Waste Agency; \$1,748,975 from Cargill; \$177,200 from Heartland Lysine, Inc.; \$48,000 from Horizon Technology, Inc.; \$75,274 from Iowa Corn Promotion Board; \$65,200 from Iowa Energy Center; \$80,273 from National Corn Growers Association, \$25,000 from National Pork Producers Council; and \$11,500 from PathoGenesis Corporation.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University and the University of Iowa, in collaboration with the City of Cedar Rapids. In addition, field studies are being conducted at various sites throughout Iowa, including the facilities of participating industries located in Cedar Rapids and other Iowa communities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. No firm date was established to complete this research at the beginning of the project, and the nature and goals of the research have evolved over the life of the project. The Consortium was originally created as a partnership between the City of Cedar Rapids and the participating universities to assist the city in dealing with wastes associated with corn and oat processing and milling, involving bio-catalysis to produce high-fructose syrups and one of the largest fermentation facilities in the world. More recently, new agricultural biotechnology industries have been attracted to Cedar Rapids and have added greatly to the volume of industrial waste streams. The researchers continue to work closely with the City of Cedar Rapids and the industries generating these waste streams. While significant progress has been made in analyzing waste streams and in devising laboratory procedures for extracting useful products, commercialization is still needed. The City of Cedar Rapids is investing its funds in special waste treatment facilities to conduct large scale tests of new treatment methods. Several years will be required to complete these tests and to refine separation technologies.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Consortium conducts a call for pre-proposals, open to all researchers at ISU, UI, and Cedar Rapids. Projects received from this call are individually peer-reviewed by researchers outside the two universities, who submit written comments. At ISU, a three-member panel made up of individuals from agricultural processing industries is convened to rank the projects and revise budgets based on the written reviews. The decisions made by this panel are used to assemble an overall grant application. Once the completed grant application is submitted to CSREES, it is again evaluated for scientific merit by an agency biotechnology peer panel that makes recommendations regarding approval for the award. The Iowa Biotechnology Consortium proposal for fiscal year 2001 has not yet been received, but once it is available, a CSREES review panel will be convened to review and evaluate the proposed studies in the grant application and to make recommendations regarding overall approval of the project. In addition, the panel will assess progress during the past year as a part of the approval process and post-award management. Also, a site visit was made by a National Program Leader to the research facilities of Iowa State University during the past year.

IR-4 MINOR CROP MANAGEMENT

Question. Please provide a description of the research that has been funded under the IR-4 Minor Crop Management grant.

Answer. The IR-4 Minor Crop Management Program is a highly-effective effort between the State Agricultural Experiment Stations, CSREES, and the USDA Agricultural Research Service—ARS. The basic mission of IR-4 is to aid producers of minor food crops and ornamentals in obtaining needed crop protection products. IR-4 provides the national leadership, coordination, and focal point for obtaining data to support the regulatory clearance through the Environmental Protection Agency—EPA—for pesticides and biological control agents for specialty food crops such as fruits and vegetables as well as non-food crops like turf and ornamentals. In many cases, the agricultural chemical industry can not economically justify the time and expense required to conduct the necessary research for products with limited market potential. With assistance from IR-4, registration-related costs are manageable, and producers of a large number of small acreage crops such as vegetables, fruits, nuts,

herbs and other specialized crops have access to necessary pest control products. In order to accomplish the above, a four-step process has been developed. Step one involves research prioritization. Yearly workshops are conducted that involve growers, commodity organizations, university research and extension specialists, EPA staff, and industry representatives to determine which projects are the most critical to minor crop agriculture. Step two is research planning. Research protocols are written after careful review and comments from stakeholders. Step three is research implementation. A typical IR-4 program consists of both field and laboratory phases. For the field work, researchers apply the crop protection chemical to the target crop according to the experimental protocol. The crop is harvested and transferred to the laboratories where the chemical residues in the crop, if any, are determined. All field and laboratory research is conducted under EPA's Good Laboratory Practices. Step four is data submission and approval. The data are critically reviewed and formatted into a regulatory package and submitted to the EPA for their review. If appropriate, the EPA will approve the submission and grant a tolerance to use the chemical on the target minor crop.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This is a national effort which identifies needs by a network of users, commodity groups, and state university and Federal researchers. This research is highly significant to national and regional as well as local needs. The basic mission of IR-4 is to aid producers of minor food crops and ornamentals in obtaining needed crop protection products. IR-4 is the principal public effort supporting the registration of crop protection products and biological pest control agents for approximately \$40 billion minor crop industry, representing 40 percent of the total farm crop value in the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to obtain minor use pesticide registrations with a high priority placed on those pesticides classified as Reduced Risk, assist in the maintenance of current registrations, and to assist with the development and registration of biopesticides. For 2000, IR-4 submitted 115 data packages to EPA that supported 588 new minor food use clearances. During the past three years, over 1,183 new minor food use clearance requests were submitted to IR-4 from growers, state, and Federal scientists and extension specialists. The Food Use part of the IR-4 Program continues to have a high productivity which, according to EPA, supports 40 percent of all EPA pesticide registrations. Since the program's inception in 1963, IR-4 has been granted over 5,500 food use clearances.

For ornamental crops in 2000, IR-4 obtained 1,155 pesticide clearances which included 29 biopesticide uses on ornamental. Since 1977, IR-4 has assisted with the registration of over 8,800 crop protection chemicals and biological pest control agents on nursery stock, flowers, and turf grass. The ornamental industry accounts for over 25 percent or \$12 billion of the total minor crop value in the U.S. Biopesticides have been an important IR-4 thrust since 1982. EPA granted 56 IR-4-supported biopesticide food use clearances in 2000.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001.

Answer. Grants have been awarded from appropriated funds as follows: Program redirection in fiscal year 1975, \$250,000; fiscal year 1979, \$500,000; fiscal years 1976-1980, \$1,000,000 per year; fiscal year 1981, \$1,250,000; fiscal years 1982-1985, \$1,400,000 per year; fiscal years 1986-1989, \$1,369,000 per year; fiscal year 1990, \$1,975,000; fiscal year 1991, \$3,000,000; fiscal years 1992-1993, \$3,500,000; fiscal year 1994, \$6,345,000; fiscal year 1995 through 1997, \$5,711,000 per year; fiscal years 1998 through 2000, \$8,990,000 per year; and fiscal year 2001, \$8,970,222. A total of \$89,469,222 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$891,856 state appropriations and \$65,402 industry in 1991; \$1,002,834 state appropriations and \$104,292 industry in 1992; \$1,086,876 state appropriations and \$310,133 industry in 1993; \$550,160 state appropriations, \$408,600 industry, and \$924,169 miscellaneous in 1994; \$775,432 state appropriations, \$266,714 industry, and \$751,375 miscellaneous in 1995; and an estimated \$800,000 state appropriations, \$250,000 industry, and \$800,000 miscellaneous in each year of 1996 through 2000. This is a total of \$16,387,843 from fiscal year 1991 through 2000.

Question. Where is this work being carried out?

Answer. Field work is performed at the State and Territorial Experiment Stations. Laboratory analysis is conducted primarily at the California, New York, Flor-

ida, and Michigan Agricultural Experiment Stations with assistance by the Puerto Rico, Hawaii, North Dakota, North Carolina, Washington, Virginia, and Idaho Agricultural Experiment Stations. Field Research Centers located in Hawaii, Oregon, Washington, California, Wisconsin, Michigan, North Dakota, South Dakota, North Carolina, Florida, Tennessee, Texas, New Jersey, New York, Maryland, and New Hampshire conduct the field residue program. Protocol development, data assimilation, writing petitions and registration processing are coordinated through the New Jersey Agricultural Experiment Station. ARS is conducting minor use pesticide studies at field locations in California, Georgia, Ohio, South Carolina, Texas, and Washington. ARS laboratories in Georgia, Maryland, and Washington are cooperating with analyses.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. IR-4 is involved in research on biological systems that by their nature are ever changing and presenting new challenges to agriculture. The IR-4 workload is anticipated to be long term because of public sensitivities regarding food safety and the environment, and the eventual loss of a large number of conventional pesticide registrations for minor crops because of the 1996 Food Quality Protection Act—FQPA. FQPA presents a serious challenge to minor crop pest management. It is estimated that there will be significant loss of conventional pesticide registrations for minor crops. IR-4 has developed a strategy to minimize the impact of loss of the critical pest control tools needed by our domestic minor crop growers. The IR-4 strategy involves the following factors: (1) facilitating regulatory clearance of Reduced Risk pesticides for minor crops; (2) when appropriate, develop risk mitigation measures for existing minor use registrations; (3) assist with the registration of biologically-based pest control products for minor crops; and (4) register and maintain pesticides essential to integrated pest management systems.

With the implementation of the 1995 Strategy Plan, IR-4 has achieved significant accomplishments. Since FQPA requires that EPA review all of the nearly 10,000 tolerances by 2006, it is anticipated that the IR-4 program will have a significant challenge to help bring new crop protection solutions to minor crop growers well into this century.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the grant applications are peer reviewed and reviewed by CSREES senior scientific staff. A summary of those reviews indicate excellent progress in achieving the objective of providing safe pest controls for minor uses. In December 1997, CSREES sponsored a peer review of the project by a panel chaired by a retired Administrator of USDA-ARS and representatives from USDA, EPA, commodity groups, the food processing industry, the crop protection industry and the land grant university system. A report was issued January 1998. The report covered the areas of response to FQPA, project operations, accomplishments, good laboratory practices, the ARS companion program, and future outlook with specific recommendations for each area. The review panel was "in unanimous agreement that IR-4 is a very successful program which serves an important need to producers of agricultural products for ultimate consumption by the American public. The program is effectively and efficiently administered by a dedicated professional staff." The goal in 2000 and beyond will be to build on this basis and fully implement the recommendations of the panel. This review and previous reviews have resulted in significant improvement in the IR-4 program's productivity and quality of research. Additionally, the customers served by IR-4 have provided input to the program to enhance its effectiveness.

JOINTED GOATGRASS—AEGILOPS CYLINDRICUM, WASHINGTON

Question. Please provide a description of the research that has been funded under the Jointed Goatgrass, Washington grant.

Answer. Research is conducted by about 30 scientists in 10 western and mid-western states on systems for suppression of jointed goatgrass in winter wheat production systems. Research includes integrated cultural management, reduction of seed in the soil, identification of more competitive wheat varieties and crop rotations, and best management practices projects. These projects demonstrate to wheat producers the integrated system for managing jointed goatgrass and show how to determine the most effective and efficient way to introduce herbicide-resistant wheat into the integrated system. The premier research projects continue to be four regional, long-term integrated management studies conducted across nine states. In these studies, various cultural control practices such as seeding rates, row spacing, planting dates,

seed size, competitive varieties, fertilizer placement, crop rotations, and tillage practices are being evaluated as an integrated management system for the suppression of jointed goatgrass. Research is also being conducted on soil conditions responsible for persistence of jointed goatgrass in the soil seedbank, timing and intensity of tillage on seed persistence in the soil, gene flow between wheat and jointed goatgrass, identification of crop traits making wheat more competitive against jointed goatgrass and modeling on how agronomic practices affect herbicide-resistance in jointed goatgrass. All funded projects have a technology transfer component and a national extension coordinator who insures that growers and extension personnel are fully informed about all options for managing this devastating weed. The National Extension Coordinator is housed at Washington State University.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Jointed goatgrass infests nearly five million acres of winter wheat lands in the west and mid-west. Through the efforts of the national program, the rate of spread of this weed has decreased significantly in the past five years. However, jointed goatgrass still costs wheat producers in the U.S. an estimated \$145 million annually in lost yield, reduced quality, production of less profitable crops, increased management costs, and reduced land values. Control of jointed goatgrass in a standing wheat crop is impossible with currently available technology because seed survives in the soil for five years or more. Because jointed goatgrass is genetically related to wheat, there are no herbicides currently available that will control jointed goatgrass selectively in wheat. Jointed goatgrass has increased rapidly in the past 25 years in part because of widespread adoption of conservation tillage systems. Jointed goatgrass proliferated in such systems, and it greatly impeded the universal adoption of such reduced tillage. The principal investigator and the National Association of Wheat Growers believe this research is of high national and regional importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to reduce the devastating effect of jointed goatgrass on winter wheat production and quality, and to prevent the spread of this weed into new, non-infested areas. Numerous individual cultural control practices have been evaluated in several states as to their effectiveness for the suppression of jointed goatgrass and on the growth and yield of wheat. Four regional, long-term integrated management projects have been established where three or more individual cultural control practices have been combined into an integrated management system for the suppression of jointed goatgrass in winter wheat. Results from these projects show that combining three or more individual cultural control practices into an integrated management system will suppress jointed goatgrass and improve the yield and quality of winter wheat. Significant progress has been made in understanding gene flow between wheat and jointed goatgrass. This information will be very valuable in managing the introduction of herbicide-resistant wheat for the control of jointed goatgrass. A bioeconomic model has been constructed that combines jointed goatgrass population biology information, weather data, and responses of jointed goatgrass and wheat to various cultural control practices, and predicts wheat yields, response of jointed goatgrass, and economic outcomes from changing production practices. In 2000, two regional best management practices projects were initiated to demonstrate to wheat producers the integrated systems approach for managing jointed goatgrass and to determine the most effective and efficient way to introduce herbicide-resistant wheat into the integrated system. In 1999, a symposium on jointed goatgrass was held as part of the Western Society of Weed Science meetings. At this symposium, ten papers were presented outlining the latest research and technology transfer activities of this national program. Information presented at this symposium was used to establish new priorities for this program and to guide the program for the next five years. Since 1994, six regional symposia have been held to transfer to producers and extension personnel the latest information on the identification, biology, and management of jointed goatgrass in winter wheat. A World Wide Web site has been established and updated annually to further enhance information transfer. Summaries of annual progress reports are also posted on the website. Also, a videotape, a poster, and a slide set have been produced to assist extension personnel in transferring to producers information on jointed goatgrass biology and management.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$329,000; for fiscal years 1995–1997, \$296,000 each year; \$346,000 for fiscal year 1998; \$360,000 each year in fiscal years 1999 through

2000; and \$359,208 in fiscal year 2001 bringing the total appropriations to \$2,642,208.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant were as follows: for 1994, \$82,198 state appropriations, \$82,256 from industry, and \$14,871 miscellaneous; for fiscal year 1995, \$67,442 state appropriations, \$38,496 from industry, \$13,304 miscellaneous; for each fiscal year 1996–1997, an estimated \$70,000 state appropriations, \$50,000 from industry, and \$14,000 miscellaneous; for 1998, \$231,335 state appropriations, \$42,570 from state wheat commissions, and \$15,000 miscellaneous; for fiscal years 1999 and 2000, \$258,122 state appropriations, \$87,750 state wheat commissions, and \$72,100 miscellaneous. The total of non-Federal funds has been \$1,691,416.

Question. Where is this work being carried out?

Answer. The research is being conducted by university scientists in 10 western states that have serious jointed goatgrass infestations. These universities include Washington State University, which is the principal coordinating institution and which receives the grant, and at universities in Colorado, Kansas, Nebraska, Oklahoma, Utah, Oregon, Idaho, Montana, and Wyoming.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated to accomplish significant results in six years, and significant accomplishments have been made. However, the jointed goatgrass problem will require four more years to accomplish all of the objectives and to have effective management practices available for producers to control jointed goatgrass in winter wheat.

Question. When was the agency evaluation of this project? Provide a summary of the last evaluation.

Answer. Each year the sub-projects are peer reviewed for scientific merit and adherence to the program objectives by a panel of scientists and producers. CSREES's scientific staff reviews the overall grant annually. Sub-contract grants to the various universities are awarded using a peer review process coordinated by Washington State University.

LIVESTOCK AND DAIRY POLICY, NEW YORK AND TEXAS

Question. Please provide a description of the research that has been done under the Livestock and Dairy Policy, New York and Texas grant?

Answer. The purpose of this grant is to assess the possible economic impacts on the U.S. livestock and dairy sectors from various macroeconomic, farm, environmental, and trade policies and new technologies. Both Cornell University and Texas A&M University conduct analysis of these policies and disseminate the information to policymakers, farmers, and agribusinesses. Cornell focuses on sector-level dairy policies, and Texas A&M focuses on policies affecting livestock and dairy at the farm level.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Information on the implications of new and alternative farm, trade, and macroeconomic policies affecting the livestock and dairy sectors is of special interest to policy-making officials, farmers, and others. Such information enables farmers and agribusinesses to make necessary adjustments to their operations to enhance profitability and for national public officials to consider alternatives to sustain adequate supplies and minimize costs. The principal researchers believe this research to be of national, regional, and local significance.

Question. What was the original goal of this research and what has been done to date?

Answer. The original goal was to establish a specialized research program that could provide timely and comprehensive analysis of numerous policy and technological changes affecting livestock and dairy farmers and agribusinesses and advise them and policymakers promptly of possible outcomes. This goal has been achieved, and the program continues to provide timely assessments and evaluations of provisions and proposed changes in agricultural policies, the General Agreement on Tariffs and Trade, and the North American Free Trade Agreement; various income and excise tax measures; and alternative pricing measures for milk. The institutions were integrally involved in several current studies relating to dairy provisions in the 1996 farm legislation. These studies contributed significantly to the development of proposed regulations called for in this legislation. Both institutions maintain exten-

sion outreach programs to disseminate results of their analysis throughout the U.S. They have organized a national Dairy Markets and Policy Extension committee to advise and assist them in this effort. This latter committee was especially helpful to USDA in educating farmers about proposed milk marketing order changes last year.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$450,000; fiscal year 1990, \$518,000; fiscal years 1991–1993, \$525,000 per year; fiscal year 1994, \$494,000; fiscal years 1995–1998, \$445,000 each year; fiscal years 1999 through 2000, \$475,000 each year; and fiscal year 2001, \$568,746. A total of \$6,335,746 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$37,420 State appropriations in 1991; \$162,086 State appropriations and \$133,278 product sales for a total of \$295,364 in 1992; \$301,817 State appropriations, \$1,412 industry, and \$7,121 miscellaneous for a total of \$310,350 in 1993; \$24,702 State appropriations and \$5,961 industry for a total of \$30,663 in 1994; \$235,526 State appropriations for 1995; \$250,000 in State appropriations for 1996; and approximately \$245,000 in State funding for 1997 and 1998.

Question. Where is this work being carried out?

Answer. The research is being conducted at Cornell University and Texas A&M University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program is of a continuing nature for the purpose of assessing existing issues and proposed policy changes affecting the livestock and dairy industries.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. No formal evaluations of this project have been conducted. Annual proposals for funding, however, are peer reviewed for relevance and scientific merit. CSREES staff are also in regular contact with principal researchers at each institution to discuss progress toward project objectives. Discussions with congressional staff and USDA policy makers support the usefulness of policy analysis provided by this project.

LOWBUSH BLUEBERRY RESEARCH, MAINE

Question. Please provide a description of the research that has been funded under the Lowbush Blueberry Research, Maine grant.

Answer. Interdisciplinary research is being conducted on many aspects of lowbush blueberry culture and processing including investigations into factors affecting processing quality; biological control of insect pest; sustainable pollination, weed, disease, and fertility management; cold heartiness; and group water protection.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Maine produces 99 percent of all lowbush blueberries or 33 percent of all the blueberries in the U.S. This work has major local impact, and helps maintain the continued availability and high quality of this native fruit commodity.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original research goal was to provide answers to unique lowbush blueberry production, pest, and processing problems. Research to date indicates that the field sanitizer was able to use heat to control insect pests without adversely affecting plant growth, while providing a non-chemical alternative for pest management. Biological control agents were used to control fireworms. Lowbush blueberry yields were increased by use of native and alfalfa leafcutter bees. Mechanical harvesting was found to be effective and produced equivalent yields and fruit quality when compared to hand harvest, resulting in growers having a more efficient harvesting method for blueberries. Products for the use in food industry are being extracted from cull berries, therefore, improving utilization, economics in processing, and reducing waste.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$170,000; fiscal year 1991, \$202,000; fiscal years 1992 and 1993, \$185,000 per

year; fiscal year 1994, \$208,000; fiscal years 1995 to 2000, \$220,000 per year; and in fiscal year 2001, \$259,428. A total of \$2,529,428 has been appropriated to date.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Direct industry support was about \$65,000 per year from fiscal years 1996 to 2001.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Maine.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not yet been met. The University of Maine researchers estimate that the project will be concluded at the end of fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency merit review of this project was January 2000. Research accomplishments included: investigations of post emergence; grass specific herbicides to control weeds rather than the use of broad spectrum; timing of fertilization treatments; and comparisons of various fertilizer combinations have indicated that fertilizers containing nitrogen increase yields. Other research accomplishments include the insect management of blueberry maggots through behavioral control and the use of less toxic chemicals from control of blueberry flea beetles.

MAPLE RESEARCH, VERMONT

Question. Please provide a description of the research that has been funded under the Maple Research, Vermont Grant?

Answer. The research aims to determine the sources of heavy metals and other substances accidentally introduced into maple sap and syrup, and to explore methods to reduce or eliminate contaminants through modification of maple sap collection and syrup manufacturing equipment and through changes in production techniques.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local focus for this research?

Answer. Maple plays a substantial role in the cultural heritage of areas which produce syrup. Syrup is the first agricultural crop of the year in these areas, and provides a significant source of income to rural America during a season when other agricultural practices are inactive. Identifying sources of processing contaminants and finding ways to reduce contaminants is critical in assuring consumers that maple food products are not harmful.

Question. What was the original goal of this research and what has been accomplished?

Answer. The goal of this research project is to conduct investigations on maple tree physiology, the ecology and management of maple stands, and related aspects of the maple syrup industry in Vermont and throughout the northeast. The primary goal of this work has been to identify sources of lead and other contaminants of maple syrup and to determine ways to reduce these contaminants.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Work under this project began in fiscal year 1985. Annual appropriations in support of this project are as follows: fiscal year 1985—\$100,000; fiscal years 1986 and 1987—\$95,000 per year; fiscal years 1988 and 1989—\$100,000 per year; fiscal years 1990 through 1993—\$99,000 per year; fiscal year 1994—\$93,000; fiscal years 1995 through 1997—\$84,000 each year; fiscal years 1998 through 2000—\$100,000 per year; and fiscal year 2001, \$118,738. This sums \$1,649,738.

Question. What is the source and amount of non-Federal funds provided by fiscal years?

Answer. Non-Federal fiscal support for this project is provided by two primary sources and one secondary source. The primary sources are state appropriations and product sales. The secondary source is local support and national maple industry support, however that support is not available each year. The total non-Federal contribution from these sources provides an average ratio of .86 to 1. The low ratio was .6 to 1 early in the project. More recently the ratio has been 1.1 to 1.

Question. Where is this work being carried out?

Answer. This research is being conducted at the Proctor Maple Research Center, a field station of the Vermont Agricultural Experiment Station at the University of Vermont.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The work from this project, relative to maple tree physiology and management of maple stands has been completed. Identifying the sources of heavy metals and other contaminants in maple sap and syrup, as well as research determining the best and most cost-effective way to reduce contamination is ongoing with as anticipated completion date of 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Project proposals and progress reports are reviewed and evaluated annually by USDA. Satisfactory progress has been made on tree physiology and maple tree—sugar bush—management. Work on identifying sources and controlling contaminants of maple products is progressing and is being monitored by the agency.

MEADOWFOAM, OREGON

Question. Please provide a description of the research that has been funded under the Meadowfoam, Oregon grant.

Answer. This funding was used for genetics and biotechnology research directed towards increasing the productivity of the oilseed crop meadowfoam. This crop is grown as a source of oil for chemical, cosmetic, and personal care product industries. The research has focused on the development of genetically and agronomically-superior varieties for farmers, processors, and end users. The proposal will be internally and externally reviewed for scientific merit. This research will be reviewed by state and Federal scientists and administrators for merit and progress.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This research fills the need for the development of renewable sources of industrial chemicals and of new rotation crops for agriculture. This research is needed to create a more abundant and inexpensive supply of meadowfoam oil for the chemical industry. The oil produced by meadowfoam has unique physical and chemical properties that are being exploited by the chemical industry to develop a wide range of chemical feedstocks and end products. Meadowfoam can be grown on wet soils, a rarity, and is widely used by turf and forage seed producers as a rotation crop in grass seed production fields. The development of agronomically-superior varieties is needed to increase on-farm productivity, grower profits, and the supply of meadowfoam oil.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original long range goal of this research was to increase the productivity of meadowfoam as an oilseed crop for farmers. This research had led to the development of new varieties, Wheeler and OMF164, that out-yield previous varieties and state of the art tools for genetically manipulating economically-important traits, for example, chemical composition of the oil, insect resistance, and oil yield. Wheeler was officially released to the seed industry in 2000. OMF164 is scheduled for release to the seed industry in 2001. Significant progress has been made on the development of molecular tools and a genome map for increasing selection efficiency and precision and gaining an understanding of the genetics of economically-important traits.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in 1999 and the appropriation for fiscal years 1999 through 2000 is \$300,000 per year, and for fiscal year 2001 is \$299,340. A total of \$899,340 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Oregon State University is providing \$60,781 in matching funds.

Question. Where is this work being carried out?

Answer. The research is being carried out in field, greenhouse, and laboratory facilities at Oregon State University, Corvallis, Oregon.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional and related objectives?

Answer. The anticipated completion date for the original objectives is June 2001. The project start date was July 1, 1999. The original objectives have been met or will be met by June 2001, and significant progress has been made towards additional and related objectives. The latter should be met by June 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator as appropriate. The evaluation is conducted by the cognizant staff scientist who has determined that research to date is in accordance with the mission of the agency.

MICHIGAN BIOTECHNOLOGY CONSORTIUM

Question. Please provide a description of the work that has been funded under the Michigan Biotechnology Consortium grant.

Answer. The objective of the Consortium's research program is to develop bioprocessing technology to manufacture products from agricultural raw materials; to increase the utilization of agricultural raw materials; reduce agricultural surpluses; degrade agricultural and associated wastes, thereby decreasing environmental costs of agricultural products and processes; and to reduce the need to import foreign petroleum.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the development of value-added products from agricultural raw materials will increase their utilization, reduce commodity surpluses and environmental costs, and decrease the need for foreign petroleum thus contributing significantly to local, regional, and national priorities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to select and develop market-viable technologies for the production of industrial products from agricultural raw materials. The Consortium has used funding from the Special Grants program to develop technologies now in the marketplace. Examples include production of lactic acid from corn which resulted in the building of a \$200 million plant in Nebraska. Agricultural resources were used as a feedstock for plant growth formulations that enhance productivity and reduce plant stress; biodegradable plastic resins for compostable films used in lawn and leaf litter bags; agricultural mulch films and other soluble films; biodegradable plastic resins for injection molded products such as disposable cutlery; all-natural food flavors; calcium magnesium acetate deicer; and biodegradable adhesives. The byproduct of cheese production—whey—was used to produce high-quality, high-value optically-pure chiral intermediates for pharmaceuticals and agrochemicals.

A sand/manure separation system for dairy farms was developed to cost-effectively separate manure from sand and recycle both components. Numerous enzymes have been characterized and are now in use to provide value added modifications in the processing of agricultural products. Improved methods to clean up herbicides, pesticides, and other agricultural materials have been developed.

Special grant funding in fiscal year 2000 allowed the Consortium to develop high value animal feeds from agricultural residues; biodegradable paint/rust removers; biobased polymers for medical, electronic, and environmental applications; naturally-occurring bioactive compounds and biocontrol agents; and methods to improve the economics of ethanol production by producing high value co-products. Funding also supported a technology transfer program that brought researchers from over 30 land grant universities, Federal laboratories, and Departments of Agriculture together with Consortium researchers to review numerous commercially-promising biobased agricultural technologies.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$1,750,000; fiscal year 1990, \$2,160,000; fiscal year 1991, \$2,246,000; fiscal years 1992–1993, \$2,358,000 per year; fiscal year 1994, \$2,217,000; fiscal year 1995, \$1,995,000; fiscal years 1996 and 1997, \$750,000 per year; fiscal years 1998 through 2000, \$675,000 per year; and fiscal year 2001, \$723,405. A total of \$19,332,405 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant were as follows: \$1,750,000—State of Michigan, \$160,000—industry, and \$1,000,000 from miscellaneous in 1991; \$1,750,000—State of Michigan, \$175,000—industry, and \$1,000,000 from miscellaneous in 1992; \$1,750,000—State of Michigan and \$100,000 from industry in 1993; \$1,750,000—State of Michigan, \$175,000—industry, and \$100,000 from miscellaneous in 1994; \$200,000—State of Michigan and \$2,035,000 from in-

dustry in 1995; \$1,250,000—State of Michigan, \$350,000—industry, and \$6,000,000 from miscellaneous in 1996; \$402,500—industry and \$10,000,000 from miscellaneous in 1997; \$500,000—State of Michigan and \$1,060,000 from industry in 1998; \$1,400,000—State of Michigan and \$1,356,000 from industry in 1999; and \$1,500,000 from industry in 2000. A total of \$35,763,500 has been provided to support this work by non-Federal sources.

Question. Where is this work being carried out?

Answer. The research is being conducted on the campus of Michigan State University and at the Michigan Biotechnology Institute International. Demonstrations of technology occur throughout the U.S.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Consortium reports specific milestones for technology development over a five-year period. Specific milestones for technologies which will be commercialized in fiscal year 2001 were established in fiscal year 1997 and updated annually. The Consortium has been successful in effectively closing the gap between research and commercialization within each five-year period.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Michigan Biotechnology Institute was evaluated for scientific merit by an agency peer review panel on April 17, 2000. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received, and the agency is satisfied that the program is being administered in compliance with the purpose of the grant. A merit review panel will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2001.

MIDWEST ADVANCED FOOD MANUFACTURING ALLIANCE, NEBRASKA

Question. Please provide a description of the research that has been funded under the Midwest Advanced Food Manufacturing Alliance, Nebraska grant.

Answer. The stated purpose of the Midwest Advanced Food Manufacturing Alliance is to expedite the development of new manufacturing and processing technologies for food and related products derived from U.S.-produced crops and livestock. The Alliance involves research scientists in food science and technology, food engineering, nutrition, microbiology, computer science, and other relevant areas from 12 leading midwestern universities and private sector researchers from numerous U.S. food processing companies. Specific research projects are awarded on a competitive basis to university scientists with matching funds from non-Federal sources for research involving the processing, packaging, storage, and transportation of food products. Projects selected for funding are merit reviewed by non-participating university scientists, industry scientists, and scientists from professional organizations. Close cooperation between corporate and university researchers assure that the latest scientific advances are applied to the most relevant problems and that solutions are efficiently transferred and used by the private sector.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this project?

Answer. The principal researcher believes the food manufacturing industry is the number one manufacturing industry in the midwestern region and that opportunities for trade in high-value processed food products will grow exponentially on a worldwide basis. The Alliance is positioned to fill the void in longer range research and development for the food industry. Though the focus is regional, it is anticipated that impacts may also be local and national.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal was to expedite the development of new manufacturing and processing technologies for food and related products derived from U.S.-produced crops and livestock. This is accomplished by conducting a research proposal competition among faculty from the 12 participating universities to fund research projects where matching funds are available from industry. Proposals are reviewed for scientific merit by independent scientists, and final selection of projects includes consideration of industrial interest and commitment on non-Federal matching funds.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was \$470,000; for fiscal years 1995–2000, \$423,000 each year; and fiscal year 2001, \$460,984. A total of \$3,468,984 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. Industry matching funds were \$823,148 in fiscal year 1994; \$414,164 in fiscal year 1995; \$576,600 in fiscal year 1996; \$429,579 in fiscal year 1997; \$557,549 in fiscal year 1998; and \$490,496 in fiscal year 1999. Information on non-Federal funds for fiscal years 2000 and 2001 are not available at this time.

Question. Where is this work being carried out?

Answer. The work is being coordinated by the Nebraska Agricultural Experiment Station at Lincoln. Specific research projects are also being conducted at eight other universities that are part of the Alliance.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The overall objectives of the Alliance are ongoing. Funding supports the continuing and evolving needs and opportunities for foods manufactured and processed from U.S.-produced crops and livestock. Nine projects were funded from fiscal year 1998 funds with anticipated completion and final reports due by May 31, 2000. Reports from 1998 funded projects indicate that substantial progress has been made in the direction of expediting the development of new manufacturing and processing technologies. Eleven projects were funded from fiscal year 1999 funds with anticipated completion and final reports due by May 31, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal for fiscal year 2000 was conducted on May 24, 2000.

MIDWEST AGRICULTURAL PRODUCTS, IOWA

Question. Please provide a description of the research that has been done under the Midwest Agricultural Products, Iowa program.

Answer. The Midwest Agribusiness Trade Research and Information Center does applied research to improve the global competitiveness and marketability of agricultural products produced in the Midwest and disseminates the results to small and medium-sized agribusinesses. Projects include analyses of potential international markets for U.S. agricultural products and equipment/technology; attitudes of foreign consumers; and development of new/improved U.S. products to meet foreign needs. The overall project proposal was peer reviewed at the university level, and individual research activities are reviewed by the principal investigator and other faculty.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that agribusiness firms in the United States, especially small to medium-sized firms, have a large unrealized potential to expand export sales and foreign business ventures. These untapped opportunities exist in the Pacific Rim and in emerging markets such as Mexico, China, and Eastern Europe. The reluctance of small to medium-sized firms to explore these market opportunities is, in part, due to the high cost of market information and analysis and the perceived high risk of doing business in new markets. This project meets the needs of these firms at the local, regional, and national level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to enhance the exports of agricultural commodities, value-added products, and equipment produced by Midwestern agribusiness firms by providing research and educational programs as well as assistance to individual firms. Recent research has analyzed the impact of several international developments on U.S. Exports: Berlin Accord Reforms; development of Chinese agriculture and potential for exports of agricultural products and agricultural and processing equipment; comparative advantage of Argentina in corn, soybean, wheat, sunflower, beef, and pork production; and Central and Eastern Europe accession to the European Union. A "Port of Des Moines" study examined the potential for developing a U.S.-Canada-Mexico trade corridor along I-35 as a means of facilitating north-south trade and creating business opportunities in the central Midwest region. In total, over 20 research papers were prepared in 1999. The primary audience is small- to medium-sized agribusiness firms because they often lack the resources to conduct studies or acquire sufficient marketing information necessary for international trade.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992–1993 was \$700,000 per year; fiscal year 1994, \$658,000; fiscal years 1995–2000, \$592,000 per year; and fiscal year 2001, \$644,579. A total of \$6,254,579 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$185,495 State appropriations and \$373,897 industry for a total of \$559,392 in 1992; \$183,192 State appropriations and \$318,966 industry for a total of \$502,158 in 1993; \$127,948 State appropriations and \$500,394 industry for a total of \$628,342 in 1994; \$258,053 State appropriations and \$389,834 industry for a total of \$647,887 for 1995; \$165,425 State appropriations for 1996; \$162,883 State appropriations for 1997; \$143,850 State appropriations and \$51,384 industry for a total of \$195,234 in 1998; \$72,934 State appropriations and \$45,860 industry for a total of \$118,794 in 1999; and \$76,563 State appropriations in 2000. Industry contributions were not reported for 1996, 1997, and 2000.

Question. Where is the work being carried out?

Answer. The program is carried out by Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 24 months. However, the objective of expanding the export capacity of small to medium-sized agribusiness firms is an ongoing regional and national concern. The current phase of the program will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in April 2000, as it evaluated the project proposal for 2000, and concluded that: "The project has sound objectives and procedures that are helping agribusiness effectively expand markets for U.S. agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans. The principal investigators are well recognized for their leadership in this area."

MILK SAFETY, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Milk Safety, Pennsylvania grant.

Answer. The overall goal of the milk safety program is to provide insight into factors that help ensure an adequate and safe milk supply. The research has focused on factors that affect milk production, processing, manufacturing, and consumption. Special attention has been given to ways of preventing and/or treating pathogens that enter the milk supply. Projects are selected for funding each year based on competitive, peer reviews by scientists outside the recipient institution. The fiscal year 2000 grant is supporting research through June 30, 2001. A research proposal in support of fiscal year 2001 appropriations has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The question of microbial safety is of paramount interest to the milk/dairy industry at all levels. Dairy products have been associated with several large outbreaks of staphylococcal food poisoning. Coagulase negative *Staphylococcus* infections are one of the most common intramammary infections of dairy cattle, and bovine mastitis, the most important infectious disease affecting the quality and quantity of milk produced in the Nation, costs producers an average \$180 per cow per year. *Listeria monocytogenes* is present in about four percent of raw milk and has the potential to grow to dangerous levels during refrigerated storage, making pasteurization critical in preventing foodborne illnesses from this organism. The population of infants, elderly, and immunosuppressed individuals at risk for Listeriosis in the U.S. continues to grow rapidly. Understanding the growth of *Listeria* will provide pathways to minimize the occurrence of food poisoning related to milk and dairy products. Pathogenic *E. coli* species, including *E. coli* O157:H7, are of public health concern. For products which receive minimal thermal processing or which may be preserved primarily by acidification, development of additional means of controlling the growth of these foodborne pathogens is of critical importance in guaranteeing a safe milk supply. Ensuring safety of dairy products impacts not only consumer health and confidence in the safety of the food supply, but economic viability as well.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research is aimed at minimizing or eliminating future foodborne disease outbreaks from milk and dairy products. Researchers demonstrated that when subjected to a sublethal heat shock prior to pasteurization, *Listeria monocytogenes* becomes much more heat-resistant than previously thought, likely requiring the design of new pasteurization guidelines to ensure the safety of dairy products. A simple, fast, sensitive, specific and inexpensive method was developed for the detection of *Listeria monocytogenes* in dairy products that will allow dairy processors to rapidly and easily screen for the presence of this pathogen in their products and in the processing environment. A computer model of pathogenic growth in dairy products has been developed for common pathogens in specific products. These predictive models are valuable risk assessment and Hazard Analysis and Critical Control Point—HACCP—implementation tools for milk/dairy industry. It is estimated that *Staphylococcus aureus* is responsible for nearly one-third of all food poisoning in the U.S., and this illness results from the ingestion of Staphylococcal toxins. Researchers have identified potential approaches for enhancing natural defense mechanisms of the bovine mammary gland through vaccination and immunoregulation. Discoveries of factors influencing growth of *Staphylococcus aureus* are being used to prevent or contain growth of this pathogen in foods.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded for milk consumption and milk safety from funds appropriated as follows: fiscal years 1986 through 1989, \$285,000 per year; fiscal year 1990, \$281,000; fiscal year 1991, \$283,000; fiscal year 1992, \$284,000; fiscal year 1993, \$184,000; fiscal years 1994–1998, \$268,000 per year; fiscal year 1999, \$250,000; fiscal year 2000 \$297,500; and fiscal year 2001, \$374,175. A total of \$4,433,675 has been appropriated for milk safety.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The University estimates that non-Federal funds contributed to this project include the following costs and salaries: \$265,000 for fiscal year 1991; \$224,700 for fiscal year 1992; \$142,600 for fiscal year 1993; \$252,168 for fiscal year 1995; \$621,903 for fiscal year 1998; \$460,423 for fiscal year 1999; and \$265,168 for fiscal year 2000. No data available for fiscal years 1994, 1996, and 1997.

Question. Where is the work being carried out?

Answer. The research is being conducted at the Pennsylvania State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The researchers anticipate that research supported by this grant should be concluded in 2002. Continuing and evolving needs related to the safety of milk and dairy products are expected to reveal new related objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The proposal supporting the fiscal year 2000 appropriation was reviewed on May 25, 2000, and the agency science specialist concluded that the projects addressed important issues related to safety of milk and dairy products, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

MINOR USE ANIMAL DRUGS

Question. Please provide a description of the research that has been funded under the Minor Use Animal Drug grant.

Answer. The National Agricultural Program to Approve Animal Drugs for Minor Species and Uses—NRSP-7—was established to obtain the Food and Drug Administration—FDA—approval of animal drugs intended for use in minor species and for minor uses in major species. The objectives of the program are to identify the animal drug needs for minor species and minor uses in major species; generate and disseminate data for the safe, effective, and legal use of drugs used primarily in therapy or reproductive management of minor animal species; and facilitate the FDA in obtaining approvals for minor uses. Studies are conducted to determine efficacy, target animal safety, human food safety, and environmental safety. The shortage of drugs for minor food animal uses is a concern well recognized by animal producers, veterinarians, animal scientists, and regulators. The funds for the special research grant are divided between the four regional animal drug coordinators and

the headquarters at Cornell University for support of the drug approval program. The NRSP-7 funds are being utilized by the State Agricultural Experiment Stations where the regional animal drug coordinators are located as well as by other stations to develop data required for meeting approval requirements. Participants in the research program consist of the regional coordinators, State Agricultural Experiment Stations, USDA's Agricultural Research Service—ARS, schools of veterinary medicine, and the pharmaceutical companies. Research priorities are continually updated through workshops and meetings with producer groups representing species categories such as small ruminants, game birds, fur-bearing animals, and aquaculture species. Each request for drug approval is evaluated by the technical committee according to established criteria which include significance to the animal industry, cost of developing the necessary data, availability of a pharmaceutical sponsor, and food safety implications. The fiscal year 2000 research grants terminate between May and July 2002. The 2001 grant proposals have been requested by the agency. All grants are reviewed for relevance to industry needs and undergo scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Animal agriculture throughout the U.S. has relied on chemical and pharmaceutical companies to provide their industry safe and efficacious drugs to combat diseases and parasites. The high cost incurred to obtain data to approve these drugs, when coupled with limited economic returns, has limited the availability of approved drugs for minor uses and minor species. The economic losses due to the unavailability of drugs to producers for minor species and minor uses threatens the economic viability of some segments of the animal industry. The need for approved drugs to control diseases in minor species and for minor uses in major species has increased with intensified production units and consumer demand for residue-free meat and animal products. The program provides research needed to develop and ultimately culminate in drug approval by FDA for the above purposes. The goals are accomplished through the use of regional animal drug coordinators as well as a national coordinator to prioritize the need; secure investigators at Federal, state, and private institutions; and oversee the research and data compilation necessary to meet Federal regulations for approval. All drug approvals are national, although industry use may be regional. For example, certain aquaculture and the game bird industries are concentrated in specific geographic sections of the country. The administration believes this research to be of national, regional, or local need.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the NRSP-7 Minor Use Animal Drug Program was to obtain approval by the FDA for animal drugs intended for use in minor species and for minor uses in major species. This continues to remain the dominant goal of the program. In recent years, the research program has expanded or given additional emphasis to aquaculture species, veal calves, and sheep. The importance of environmental assessment, residue depletion, determination of withdrawal time, and occupational environmental safety have increasingly been given more attention during the approval process to help assure consumer protection.

Since the beginning of the program, over 300 drug use requests have been received from animal producers, universities, and veterinarians for the development of data in support of the filing of a New Animal Drug Approval. Currently, data representing 30 Public Master Files have been published in the Federal Register. The Public Master File publication enables pharmaceutical companies to extend their label claims to minor species by referencing the published file in their New Animal Drug Approval filing. Furthermore, these data also enter the public domain as presentations to professional groups, publication of peer-reviewed articles, and inclusion in the Food Animal Residue Avoidance Databank—FARAD. Through these channels, NRSP-7 provides data supporting the safe and effective use of therapeutics in minor species by consumers. Moreover, the Minor Use Animal Drug Program has averaged an expenditure of only about \$200,000 for each drug approved for minor species.

In 2000, two Public Master Files, based on data submitted by NRSP-7, were published in the Federal Register indicating drug approval by the FDA. They were: ceftiofur for the treatment of bacterial pneumonia in goats and tilmicosin for the control and treatment of chronic respiratory disease in sheep. In addition, two Public Master files are currently under review at the FDA Center for Veterinary Medicine—CVM. These drugs and their use are: oxytetracycline for otolith marking of fish and ivermectin pour-on for hypodermosis in American bison. New studies have been initiated for the study of tilmicosin in veal calves and tylosin for American Foulbrood in honeybees.

In addition to the development of data for FDA review, the NRSP-7 program initiated a species grouping program designed to make the drug approval process more efficient for all minor species. Research on species grouping was continued that will enable game birds and fish to be evaluated on the basis of one or two marker species. With species grouping, safety and efficacy studies of a drug in one species could be extrapolated to other species within the same class. Considering that the aquatic and game bird classes contain at present ten and eight economically-significant production species, respectively, rates of Public Master File publications could be increased many-fold. The FDA/CVM and the U.S. Geological Survey are cooperating and supporting this program to the fullest extent, thereby demonstrating a prime example of Federal interagency collaboration in coordination with academic institutions, pharmaceutical industries, and commodity interests to effectively meet an urgent public health need. Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from appropriated funds in the amount of \$240,000 per year for fiscal years 1982-1985; \$229,000 per year for fiscal years 1986-1989; \$226,000 for fiscal year 1990; \$450,000 for fiscal year 1991; \$464,000 per year for fiscal years 1992 and 1993; \$611,000 for fiscal year 1994; \$550,000 per year for fiscal years 1995-2000; and \$548,790 in fiscal year 2001. A total of \$7,939,790 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$156,099 state appropriations, \$29,409 industry contributions and \$11,365 miscellaneous in 1991; \$265,523 state appropriations, \$1,182 product sales, \$10,805 industry contributions, and \$59 miscellaneous in 1992; \$212,004 state appropriations, \$315 industry contributions and \$103 miscellaneous in 1993; \$157,690 state appropriations and \$7,103 miscellaneous in 1994; \$84,359 state appropriations in 1995; \$191,835 non-Federal support in 1996; \$357,099 non-Federal support in 1997; \$104,596 state appropriations and \$97,375 industry contributions in 1998; \$317,225 state appropriations and \$9,678 industry contributions, and \$7,000 miscellaneous in 1999; and \$349,250 state appropriations and \$9,500 industry contributions in 2000.

Question. Where is this work being carried out?

Answer. The grants have been awarded to the four regional animal drug coordinators located at Cornell University, the University of Florida, the University of California-Davis, Iowa State University, and to the National Coordinator at Cornell University. The location of the regional coordinator for the north central region moved from Michigan State University to Iowa State University due to personnel changes. Research is conducted at these universities and through allocation of these funds for specific experiments at the State Agricultural Experiment Stations, the USDA-ARS, the U.S. Department of Interior, and in conjunction with several pharmaceutical companies.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Selected categories of the Special Research Grants program address important national/regional research initiatives. The overall objectives established cooperatively with FDA and industry remain valid. However, specific objectives continually are met and revised to reflect the changing priorities for FDA, industry, and consumers. Research projects for this program have involved 20 different animal and aquaculture species with emphasis given in recent years to research on drugs for the expanding aquaculture industry and increasing number of requests from the sheep and game bird industries. The program involves research on biological systems that by their nature are ever changing and presenting new challenges and/or threats to agriculture. Especially with the new sensitivities about food safety and environment protection, there is a high priority for continuation of these ongoing projects.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency conducted a formal review of the Minor Use Animal Drug Program in 1997. An external review team of experts representing animal drug research and development, the veterinary profession, the pharmaceutical industry, and academia found the program to be very productive. Recommendations from the review included: (a) improve the visibility of the Minor Use Animal Drug Program; (b) improve working relationships with the veterinary and pharmaceutical communities; (c) and acquire additional support for the program by pharmaceutical companies, universities, and the Federal government to meet the identified national needs with emphasis on responsiveness to industry needs and food and environmental

safety. In 1999, stakeholders representing the sheep, aquaculture, goat, and game bird industries met with CSREES administration and NRSP-7 representatives to define research priorities for the Minor Use Animal Drug Program. Annually, grant proposals are scientifically peer reviewed, and twice a year the agency and program representatives meet with the FDA representatives to evaluate progress and to prioritize research requests. Workshops are held periodically to identify priorities for the program whereby producers, pharmaceutical companies, FDA, and researchers participate.

MOLLUSCAN SHELLFISH, OREGON

Question. Please provide a description of the research that has been funded under the Molluscan Shellfish, Oregon grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The research under this program was initiated in fiscal year 1995. The overall goal of the program is to benefit the west coast shellfish industry through conservation, genetic improvement, and wise management of genetic resources for molluscan shellfish. A molluscan shellfish germplasm repository and selective breeding program have been established. The program has worked cooperatively with the west coast oyster industry, and improved selected lines of oysters have been provided to commercial producers.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The researchers indicate that there is a national need for a molluscan broodstock development program. This line of research will benefit the commercial shellfish industries on the west coast and nationally through the conservation of shellfish lines with desirable traits, studies involving genetic manipulation to increase disease resistance and enhance growth, and judicious husbandry practices utilizing molluscan shellfish resources.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research program were to establish a repository for molluscan shellfish germplasm, to establish breeding programs for commercial production of molluscan shellfish, and to establish a resource center for the industry researchers, and other interested parties in the U.S. and abroad. The oyster broodstock selection program has been implemented in partnership with industry and performance trials of selected stocks continue at commercial sites. Over 120 families have been evaluated at commercial sites in fiscal year 2000. Production and evaluation of top-performing selected families are conducted each year, with top-performing families selected to produce the next generation. Comparisons between in-breed and outbreed crosses are also underway.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1995 with an appropriation of \$250,000; fiscal year 1996 was \$300,000; \$400,000 in each of fiscal years 1997 through 2000; and \$399,120 in fiscal year 2001. A total of \$2,549,120 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates a total of \$135,454 of non-Federal funding in fiscal year 1995 primarily from state sources; in fiscal years 1996 through 2000 no formal cost sharing was reported. However, the university indicates that significant resources in terms of equipment, facilities, utilities, and personnel have been applied to this program. There is also significant in-kind contributions from the industry.

Question. Where is this work being carried out?

Answer. Research will be conducted at Oregon State University.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Specific research objectives outlined in the original proposal were completed in 1996. Researchers have broadened the scope of the project from the original objectives, and it is anticipated that these specific objectives will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's fiscal year 2000 review concluded that the researchers were well qualified and that the research addresses an important opportunity in the

aquaculture industry. The research team is well qualified and has the appropriate background. Commercialization of research findings has been accelerated because of the close cooperation with industry and field testing at commercial sites. Progress on previous work is well documented and the work complements other research being funded though the USDA on molluscan shellfish. The proposed research is consistent with national goals and needs outlined in the National Science and Technology Council's—NSTC—Aquaculture Research and Development Strategic Plan.

MULTI-COMMODITY RESEARCH, OREGON

Question. Please provide a description of the research done under the Multi-commodity Research, Oregon program?

Answer. The Multi-commodity Marketing Research project helps to support the Food Innovation Center, a joint venture of Oregon State University and the Oregon Department of Agriculture for multi-disciplinary, multi-agency research and education. The project helps to keep Pacific Northwest agricultural businesses competitive by investigating and developing potential value-added market and product opportunities. The project analyzes domestic and international market potential and marketing strategies, conducts sensory analyses of consumers preferences, examines packaging and logistics problems, and performs strategic planning for the food industry. A major effort is directed at understanding Asian consumers and markets. The research proposal was peer reviewed at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Oregon and other Pacific Northwest states produce a wide variety of agricultural commodities and products with export potential to Pacific Rim countries. Research and analysis are necessary to guide agricultural producers and processors in assessing markets, developing market strategies, and creating appropriate value-added products.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research project is to gain better specific understanding of the technical, economic, and social relationships that define Oregon's value-added agricultural sector, and examine how these factors affect the economic performance of the sector. This project investigates and develops innovations in value-added agriculture to improve the economic performance of the agricultural and food manufacturing sectors in the Pacific Northwest.

Recent research results follow: A survey of food processors provided valuable data on processing costs and indicated increasing efficiency in the firms. A study of Chinese home infrastructure and refrigeration measured their impacts on demand for food imports from the U.S. China's soybean prices responded to changes in Chicago prices, but on a lagged basis. Asians living in the U.S. for a few years have very similar food preferences as people in their native lands, hence they provide a lower cost method of studying food consumption behavior in those cultures. Asians respond differently to hedonic scales than U.S. consumers; Asians never use the extreme "dislike" choices. A new pasteurization process has been developed and has a patent pending. A database of over 1,200 food processing firms allows the investigators to determine potential strategic gaps in the region's food processing industry and serves as a guide to future research and education programs.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The research began in fiscal year 1993. The appropriation for fiscal year 1993 was \$300,000; fiscal year 1994, \$282,000; fiscal years 1995 through 2000, \$364,000 per year; and fiscal year 2001, \$363,199. The total amount appropriated is \$3,129,199.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funding for this grant was \$177,574 in State appropriations in 1993, and \$162,394 in 1994. The project involves the use of Oregon State University administrative personnel, equipment, utilities and facilities that are indirect costs to the project. These costs constitute an Oregon State University contribution to the project that is not allowable as a reimbursable expense. Because the Oregon state appropriations process penalizes the university for reporting nonreimbursed indirect costs, the university has not reported the amount of non-Federal funds appropriated for fiscal years 1995–2001.

Question. Where is the work being carried out?

Answer. The research is carried out at Oregon State University in Corvallis and at the Northwest Food Innovation Center in Portland, Oregon.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1993 was for a period of 12 months, however, the goal of enhancing Oregon's value-added agricultural sector is an ongoing regional and national concern. Progress on the original objectives is as follows: baseline data have been accumulated; an economic growth assessment model is being refined; global competitiveness is being assessed for value-added Pacific Northwest agricultural products; targets for performance are being worked out with agricultural industries; and trade teams have been involved in assessing the ability of U.S.-based industries to meet the demands for noodle production for Asian markets. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in June 2000, as it evaluated the 2000 project proposal, and determined that: "The research is relevant and compatible with the USDA and CSREES missions, especially the profitability and competitiveness of the American agricultural sector. The stated objectives are scientifically valid and achievable, and the procedures specified for each objective are appropriate to the research tasks. The proposal was subjected to peer review by experts with the necessary scientific knowledge and technical expertise. The principal investigator and the associated researchers are competent to execute this project."

MULTI-CROPPING STRATEGIES FOR AQUACULTURE, HAWAII

Question. Please provide a description of the research funded under the Multi-cropping Strategies for Aquaculture Research grant in Hawaii.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. This research program focuses on the opportunities of alternative aquaculture production systems, including the ancient Hawaiian fish ponds on the island of Molokai. A community-based research identification process has been used to develop specific research needs and prioritize objectives in this program. Current research includes work in the area of water quality characterization to accelerate permitting of aquaculture systems. Field testing of alternative species and management systems in the ancient Hawaiian fish ponds is currently underway. The university indicates that the scope of the program will be refined in fiscal year 2001 proposal.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers indicate that the primary need for this research is to assist the native Hawaiians in improving the profitability and sustainability of the ancient Hawaiian fish ponds and other appropriate aquaculture systems as part of a total community development program on the island of Molokai.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this program was to develop technology for the co-production of shrimp and oysters in aquacultural production systems. Research led to the development of oyster production systems that have been field tested under commercial conditions. In fiscal year 1993, the university redirected this program to develop sustainable subsistence and commercial aquaculture systems on Molokai while maintaining the culture and physical environment unique to the island. Production methods have been developed for a number of species. Researchers have characterized water quality within and between fish ponds in order to establish criteria for permitting and management of the ancient Hawaiian fish ponds. Multi-dimensional field testing of restored fish ponds is underway to determine yield and management systems for native species and polyculture systems.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. This research was initiated in fiscal year 1987 and \$152,000 per year was appropriated in fiscal years 1987 through 1989. The fiscal year 1990-1993 appropriations were \$150,000 per year; \$141,000 in fiscal year 1994; \$127,000 in fiscal years 1995-2000, each year; and \$126,721 in fiscal year 2001. A total of \$2,085,721 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university reports a total of \$137,286 of non-Federal funding for this program in fiscal years 1991–1994; \$318,468 in fiscal years 1995–1996; \$116,730 in fiscal year 1997; \$197,000 in fiscal year 1998; and no non-Federal funds are available for this project for fiscal years 1999 and 2000. The university has provided direct technical and management support for this program.

Question. Where is this work being carried out?

Answer. Research is being conducted through the University of Hawaii on the island of Molokai.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original project was 1993. The original objectives were met. The specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's Program Managers review this program on an annual basis. The agency's fiscal year 2000 evaluation indicated that adequate progress was reported on specific tasks and that the research was relevant and addresses an important opportunity for the aquaculture industry on Molokai. The objectives were clearly stated and the project was integrated into several other community based programs to support aquaculture development on Molokai.

NATIONAL BEEF CATTLE GENETIC EVALUATION CONSORTIUM, NEW YORK

Question. Please provide a description of the work that has been funded under National Beef Cattle Genetic Evaluation Consortium, New York grant.

Answer. This is a new project. CSREES has requested the university to submit a grant proposal which has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Beef is the most popular meat in the U.S. In 1997, 25.4 billion pounds of beef were produced with a total retail value of \$50.6 billion. The production of high quality, healthy, and affordable beef begins by identifying the best breeding animals. Genetic superiority can be evaluated by estimating Expected Progeny Differences on prospective breeding animals. For selective breeding, Expected Progeny Differences have been the most important technology available to seedstock and commercial cattle producers. Analysis of beef records to calculate Expected Progeny Differences for the vast majority of seedstock cattle in the U.S. occurs at four universities: Colorado State University, Cornell University, University of Georgia, and Iowa State University. The success of this genetic evaluation program has been greatly influenced by the existence of an established delivery system to make this information readily available to all producers. Expected Progeny Differences are widely reported by breed associations through sire summary reports and artificial insemination companies that distribute semen of sires with superior Expected Progeny Differences. Application of this technology has resulted in significant genetic improvement trends for the economically-important traits. It is critically important to further develop, coordinate, and utilize this technology in order to further enhance the competitiveness of beef production, both domestically and globally.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a consortium involving the four universities that have been primarily responsible for the research and development of beef cattle genetic evaluation in the U.S. This project will develop and implement improved methodologies and technologies for genetic evaluation of beef cattle for the purpose of maximizing the impact genetic programs have on economic viability, international competitiveness, and sustainability of beef producers, and to provide consumers affordable and healthy beef products.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001. The appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided in fiscal year 2001 are approximately \$300,000 by the four universities involved and \$360,000 by the beef industry, primarily breed associations.

Question. Where is this work being carried out?

Answer. Research will be conducted at the four universities involved in this consortium: Colorado State University, Cornell University, University of Georgia, and Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives is fiscal year 2007.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. The proposal will be peer-reviewed at the university prior to submission. A merit review will be conducted by the agency prior to funding.

NATIONAL BIOLOGICAL IMPACT ASSESSMENT PROGRAM, VIRGINIA

Question. Please provide a description of the work that has been funded under the National Biological Impact Assessment Program, Virginia grant.

Answer. The National Biological Impact Assessment Program—NBIAP—supports the environmentally-responsible use of biotechnology products to benefit agriculture and the environment. This project supports the Information Systems for Biotechnology which is a national resource in agricultural biotechnology information. This program serves the research community by providing information about biotechnology regulations, environmental issues associated with the release of genetically-modified organisms, risk assessment, and risk management through a web site. The web site also contains searchable databases, documents and resource lists, monthly newsletters, and original printed reference materials. Risk assessment workshops are conducted to promote science-based regulatory decisions.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This program serves as a unique and comprehensive source of biotechnology information. This online system provides scientists, nationally and internationally, with timely and important information about new research and regulatory and environmental developments in agricultural biotechnology. This was the first online system to address the rapidly increasing information needs of the agricultural biotechnology community, and it continues to be the most comprehensive and heavily used source of critically-needed information.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original and current goal of the program is to facilitate and assess the safe application of new techniques for the genetic modification of plants, animals, and microorganisms to benefit agriculture and the environment. Since its inception in 1989, the program has developed tools and resources to provide scientists, regulators, teachers, administrators, and the interested public with value-added, unbiased information in a readily accessible form. The computer-based system has developed into an internet site serving more than 6,600 requests per month coming from over 42 countries. The site includes documents pertaining to regulatory oversight biotechnology products, policy statements, and risk assessment and management. Searchable databases include records of all environmental releases of genetically-engineered organisms conducted under authority of the USDA, Institutional Biosafety Committees, State Regulatory contacts, biotechnology research centers, and companies. A monthly News Report, covering research, regulatory, legal, and international issues is distributed by request to 1,800 e-mail and 600 print subscribers. Biosafety training workshops have been conducted for scientists and state regulatory officials. Current activities include risk assessment workshops and publication of a guidebook for safely conducting research in greenhouses.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from appropriated funds as follows: fiscal year 1989, \$125,000; fiscal year 1990, \$123,000; fiscal years 1991–1993, \$300,000 per year; fiscal year 1994, \$282,000; fiscal years 1995–2001, \$254,000 per year; and fiscal year 2001, \$253,441. A total of \$3,207,441 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Virginia Polytechnic Institute and State University—VPISU—contributes administrative and clerical support of approximately \$5,000 per year.

Question. Where is this work being carried out?

Answer. The program is administered and the research conducted in the Biochemistry Department at VPISU. Former and current partners in the program include Pennsylvania State University, Louisiana State University, North Carolina Biotechnology Center, Michigan State University, Arizona State University, the USDA-National Agricultural Library, Institute for Biotechnology Information, and the University of Minnesota.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Ensuring the environmentally-responsible use of agricultural biotechnology products is an ongoing and important task. Opportunities for plant and animal improvement through biotechnology are expanding as more genes are identified and new methods are developed for introducing specific beneficial genes into plant and animal populations. As more genetically-modified plants and animals are commercialized, there will be a continuing, high priority need to provide current, science-based information to assure long term safety and efficacy of the use of genetically-modified organisms in agricultural production systems.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external peer-review was conducted in April 2000. The panel concluded that this project is making a large, positive impact on the agricultural biotechnology community by providing objective, useful information in several easily accessible formats. The web site, News Report, workshop proceedings, and other reference material are well-designed, easy to use, and informative. The number of subscribers to the monthly News Report, number of hits on the web site, and number of workshop proceedings distributed collectively indicate a strong demand for the products of this program. A recent user survey clearly indicate that users appreciate the high quality, objectivity, and clear presentation of the information available. The panel strongly concluded the program should be continued, and, if possible, expanded to reach even more users. It was recommended that a mission statement be developed to help facilitate the continued success of the program.

NEMATODE RESISTANCE GENETIC ENGINEERING, NEW MEXICO

Question. Please provide a description of the work that has been funded under the Nematode Resistance Genetic Engineering, New Mexico grant.

Answer. This research is designed to investigate naturally-occurring compounds from diverse sources that may confer pesticidal resistance if introduced into agronomic plants. The main target pests are plant parasitic nematodes and also certain insects. The work is using molecular biological techniques to incorporate genes into agronomic plants which will shorten the timeframe to produce transgenic plants.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the successful development of these techniques and subsequent transfer of genes with insecticidal and/or pesticidal activity into agronomic plants will provide an environmentally-sound system for all plants susceptible to pests. The principal researcher believes the project has the potential for both regional and national application.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to provide an alternative approach for the control of plant parasitic nematodes and certain insects through the use of molecular biological technologies to transfer pesticide resistance to plants. More recently, an insecticidal protease inhibitor gene has been used in transformed plants. A unique technique utilizing insect intestinal membrane vesicles was used as a tool for detection of specific protein binding domains. The resulting gene has been successful in managing Colorado potato beetles for four years in field trials with transformed potato.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991 and the appropriations for fiscal years 1991–1993 were \$150,000 per year; \$141,000 in fiscal year 1994; \$127,000 in fiscal years 1995–2000 each year; and \$126,721 in fiscal year 2001. A total of \$1,479,721 has been appropriated thus far.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$65,000 state appropriations in 1991; \$62,000 in state appropriations in 1992;

\$75,000 in state appropriations in 1994; and \$75,000 state appropriations in 1995. For 1996, the university and the Plant Genetic Engineering Laboratory are providing matching contributions in faculty and staff salaries, facilities, equipment maintenance and replacement, and administrative support. In 1997, there were no matching non-Federal funds. In 1998 and 1999, state appropriated funds were \$48,000 and \$71,000, respectively. In 2000, the non-Federal funds were \$70,000.

Question. Where is the work being carried out?

Answer. Research is being conducted at the New Mexico State University and at collaborating universities in the region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not as yet been met. The estimated completion date for this project is in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation of this project was a merit review conducted in January 2000. In summary, the overall goal of this project is to use molecular technology to develop pesticide capability in plants of agronomic importance. A plant transformation system was developed to improve the historically difficult transformation of monocots more efficiently. In field trials of transformed eggplants and potatoes, high levels of effectiveness against insects have been found. Other constructs are being used in many crops to determine resistance to nematodes and other crop pests.

NEVADA ARID RANGELANDS INITIATIVE

Question. Please provide a description of the research that has been funded under the Nevada Arid Rangelands Initiative grant.

Answer. The Nevada Arid Rangelands Initiative will provide coordination of Federal and State agencies to address the highest priority issues related to management of public lands in Nevada. The project will support a mix of research, education, and action programs to develop healthy multiple uses for rangeland, improve management education programs, improve economics at the ranch community and county level, and develop a decisionmaking module for public land use.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research proposal is directed toward public land management in Nevada, but would have relevance to other states with large acreage of arid public lands.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to develop research management and educational programs to promote healthy, productive and sustainable use of Nevada rangeland.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and the appropriation for fiscal year 2000 was \$255,000 and for fiscal year 2001 is \$299,340. The total appropriation is \$554,340.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The estimate for non-Federal funds provided for this program from state funds was \$237,000 for fiscal year 2000.

Question. Where is the work being carried out?

Answer. Research will be conducted at the University of Nevada Research Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project is under development, however anticipated completion for the original objectives should be five years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed and subjected to the institutional project approval process. In addition it was reviewed by CSREES National Program Staff.

NEW CROP OPPORTUNITIES, ALASKA

Question. Please provide a description of the research that has been funded under the New Crop Opportunities, Alaska grant.

Answer. The overall goal of the "New Crop Opportunities" project is to investigate new opportunities in crops, value-added processing, and markets for Alaskan agricultural products, including forest products.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The profile of the agricultural industry is changing from a commodity-centered industry to one composed of diverse enterprises. There are a number of new crops in Alaska that show promise in consumer markets both inside and outside the state. New markets also appear feasible for crops that are in the experimental phase of production or can be wild harvested in Alaska. Value-added processing of agricultural crops in Alaska will contribute to the state's economic diversity.

Question. What was the original goal of this research and what has been the project to date?

Answer. The specific goal is to generate new knowledge that will benefit the agricultural industry and lead to new economic opportunities for entrepreneurs. The research is organized into three specific objectives: (1) new crops in promising consumer markets; (2) new markets for experimental field-cultivated and wild-harvested crops; and (3) value-added processing of agricultural crops. Research was begun in September 2000. Because of the short period of time in process, not all of the projects included have progress reports. Work continues on efficacy tests of *Trichoderma atroviride* in controlling diseases on ginseng. A golf green and research plots have been established at the Agricultural and Forestry Experiment Station in Fairbanks to continue the evaluation of turfgrass species, evaluation of fungicides for control of snowmold and other fungi, and develop best management practices for golf green maintenance in the subarctic. Research designs are complete for spring 2001 establishment of new plots and continued evaluation of existing plots for the evaluation of best management practices for forage legumes in interior Alaska. Field trials with salad greens for cut-salad and whole-fresh markets were evaluated in the fall of 2000 and variety selections have been made to continue the work in spring 2001. The horticultural component of the peony market study begins in the spring, and plans are being made for visits with appropriate marketers of the peony crop to European countries. A graduate student has begun the literature survey to accompany the work with cultivated lingonberry. A successful muskox industry workshop and trade show, including five of the six world producers of qiviut products, was held in November 2000 in conjunction with the Alaska Agricultural Symposium resulting in an organizing meeting for a new Association of Alternative Livestock Producers. A cost study has been completed on the potential for crushing oilseeds in Alaska and investigations of alternative markets for diverse oil products has begun.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and the appropriation for fiscal year 2000 was \$425,000. For fiscal year 2001, the appropriation was \$494,909. A total of \$919,909 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. There will be nine percent of the total grant amount received by the Agricultural and Forestry Experiment Station provided to the University of Alaska Fairbanks in fiscal years 2000 and 2001 for overhead recovery.

Question. Where is this work being carried out?

Answer. This work will be carried out by the School of Agriculture and Land Resources Management and the Agricultural and Forestry Experiment Station at its experimental farms in Fairbanks and Palmer, at various locations near Fairbanks, and at its remote research site in Delta Junction.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. The fiscal year 2000 projects are anticipated to be completed in three years from the start date. The objectives have not been met because the projects have just begun. There are no anticipated additional or related objectives that will be added to the existing projects.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

NEW CROP OPPORTUNITIES, KENTUCKY

Question. Please provide a description of the research that has been funded under the New Crop Opportunities, Kentucky grant.

Answer. Researchers at the University of Kentucky began work in 2000 on 13 projects. Research on horticultural crops has focused on: bacterial spot resistance, yields, and quality in bell and speciality peppers; blackberries for fresh and processing markets; identification of underutilized landscape plants and plants native to Kentucky that have landscape potential and development of production systems for these plants; greenhouse production of bedding plants, vegetables, flowering pot plants, and herbs using a controlled water table subirrigation system or a float system; and valuation of annual and perennial garden flowers. Research on agronomic crops has focused on: integrated pest management in corn; evaluation of high-value traits for corn in Kentucky; breeding soft white winter wheat for Kentucky; development of nitrogen fertilization strategies for the control of protein levels and quality in soft white winter wheat; testing of novel soybean varieties to provide reliable information grain yield and quality characteristics; development of packages of management practices for novel soybean varieties; breeding triple-null lipoxygenase soybean cultivars that should produce better-tasting soyfood products; analysis of the profit and risk potential of speciality grains; and determination of drying, storage, and germination characteristics of selected speciality grains.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This research addresses a regional need to find alternative crops to replace tobacco.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to offer new opportunities for crop diversification, technology transfer, and demonstrations. Accomplishments to date include: establishment of a web site to provide information about research projects of the New Crop Opportunities Center and results, as available; links to decision aids available through the USDA to help farmers determine the economic feasibility of specific new crops for their enterprises; information about a variety of alternative crops that has resulted from past research at the University of Kentucky; notification of upcoming meetings of interest to Kentucky farmers; and development of an exhibit about the New Crop Opportunities Center and its research. This exhibit has been on display at Lexington, Louisville, Princeton, Horse Cave, Versailles, and Morehead in Kentucky, and at a conference in Evansville, Indiana. Printed materials about the New Crop Opportunities Center have been distributed to all of these locations, as well as to County Extension Agents across the state. The exhibit will also be on display at six meetings in January. On-farm demonstration sites have been established around the state for the blackberry, pepper, soybean, and wheat projects. Interest in demonstration plots has been high. For example, 39 counties asked to participate in the blackberry demonstrations. Annual and perennial garden flowers were evaluated at the University of Kentucky and demonstrated at four locations around the state in 2000. Results from the first year of the pepper, greenhouse production of lettuces, greens and herbs, and the annual and perennial garden flower evaluation projects have been posted on the Center's web site as have the results for a blackberry marketing study conducted in 2000. Wheat and soybean breeding research has been initiated, as have wheat fertilization, and landscape and native plants project.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2000?

Answer. The work supported by this grant began in fiscal year 2000; the appropriation for fiscal year 2000 was \$595,000, and for fiscal year 2001 is \$723,405. The total appropriation is \$1,318,405.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds have been provided.

Question. Where is this work being carried out?

Answer. This work will be carried at the University of Kentucky, its research centers in eastern and western Kentucky, at arboreta and botanical gardens, and on cooperating farms across the state.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. The original objective of some of the research projects will be met by the end of fiscal year 2001. Other projects will require more time, and many will address additional or related objectives. These are expected to be completed by the end of fiscal year 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

NONFOOD AGRICULTURAL PRODUCTS PROGRAM, NEBRASKA

Question. Please provide a description of the research that has been funded under the Nonfood Agricultural Products Program, Nebraska grant.

Answer. This work focuses on the identification of specific market niches that can be filled by products produced from agricultural materials, developing the needed technology to produce the product, and working with the private sector to transfer the technology into commercial practice. Major areas of application include starch-based polymers, use of tallow as diesel fuel, improvements in ethanol production, use of vegetable oil as drip oil for irrigation wells, as a two cycle engine oil and as a chain saw bar oil, production of levulinic acid, the extraction of wax from grain sorghum, and production of microcrystalline cellulose from crop biomass. The Nebraska Dean and Director of Agricultural Research has initiated a review process that parallels the process used for Experiment Station projects. Two to three faculty members are asked to critically review the proposal using criteria as described by CSREES in the letter soliciting proposals for 2001.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes our ability to produce agricultural commodities exceeds our needs for food and feed. These commodities are environmentally-friendly feedstocks which can be used in the production of many biochemicals and biomaterials that have traditionally been produced from petroleum. The production of the commodities and the value-added processing of these commodities is regional in scope.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The objectives are to identify niche markets for industrial utilization of agricultural products; improve and develop conversion processes as needed for specific product isolation and utilization; provide technical, marketing, and business assistance to industries; and coordinate agricultural industrial materials research at the University of Nebraska, Lincoln. Accomplishments include commercialization of soybean-based drip oil for irrigation wells. Bruning Grain Co. Marketing is marketing approximately 12,000 gallons per year of "Soy Bio Drip." MCC Technologies, Inc. continues to develop a business plan for production of microcrystalline cellulose from crop residues such as corn cobs, wheat straw, and cellulose via a reactive extrusion process developed by the university's Industrial Agricultural Products Center. Various hardness grades of plastic particle media blast using a combination of commercially-available biodegradable polymers have been produced. A water resistant starch-based foam has been developed and a patent is pending. A commercialization strategy is being developed. Also, an alternative process for producing biodiesel has been developed and a patent is pending. A patent is pending on a sorghum-based road deicer that was developed and which is currently being produced for a trial test this winter. All of these commercialization projects are the result of research efforts, most of which have been supported by the Nonfood Agricultural Products Program. Two Small Business Innovation Research, Phase I, proposals have been funded for technologies developed at the Center. A Phase II proposal on levulinic acid is currently being prepared.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The funding levels for this project are \$109,000 in 1990; \$110,000 per year in fiscal years 1991-1993; \$103,000 in fiscal year 1994; \$93,000 in fiscal year 1995; \$64,000 per year in fiscal years 1996-2000; and \$63,859 in fiscal year 2001. A total of \$1,018,859 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funding for this project is: in fiscal year 1992, \$315,000; fiscal year 1993, \$330,000; fiscal year 1994, \$330,000; fiscal year 1995, \$309,000; fiscal year 1996, \$251,000; fiscal year 1997 \$250,000; fiscal year 1998, \$340,000; fiscal year 1999, \$260,000; and fiscal year 2000, \$250,000. These funds were from Nebraska Corn, Soybean, Wheat, Sorghum, and Beef Boards; World Wildlife Fund; Nebraska Bankers Association; United Soybean Board; National Corn Growers Association; Bioplastics, Inc.; Biofoam, Inc.; and MCC Technologies, Inc.

Question. Where is this work being carried out?

Answer. This work is being conducted at the Industrial Agricultural Products Center, L.W. Chase Hall, University of Nebraska, East Campus, Lincoln, Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of the original projects have been completed. Specific objectives have been identified in each renewal request.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is evaluated based on the annual progress report. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of this agency.

NURSERY, GREENHOUSE, AND TURF SPECIALITIES, ALABAMA

Question. Please provide a description of the research that has been funded under the Nursery, Greenhouse, and Turf Specialities, Alabama grant.

Answer. This is a new grant. The program objectives are: (1) evaluate woody landscape plants from a number of sources for those that are superior in the southeastern U.S. environment; (2) evaluate woody and herbaceous ornamentals for physiological adaptations including heat and drought tolerance; (3) evaluate a wide range of bedding plants and herbaceous perennials for landscape performance in major climatic regions of Alabama; and (4) evaluate performance and suitability of turfgrass genotypes for use in Alabama including biology and management of turfgrass pests and nutrient flux in turfgrass systems.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Nursery, greenhouse, and turf crops are of increasing importance in the state of Alabama and throughout the Nation. According to the 1998 Census of Agriculture, this segment of the agricultural economy grew at 18 percent per year during the period 1988 to 1998. This research will support the continued growth of this agricultural sector.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to identify landscape and ornamental plants that are particularly well-suited for the environment in Alabama and other areas of the southeastern U.S. By using plants that are so adapted, use of inputs such as fertilizers and pesticides can be reduced. This is a new grant, and the work has not yet begun.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001.

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated is \$284,373.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. There is no non-Federal funding for this project.

Question. Where is this work being carried out?

Answer. The work is being carried out by the Alabama Agricultural Experiment Station, Auburn University.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. The anticipated completion date for the original objectives is the end of fiscal year 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. A peer review of the project will be undertaken by the performing institution, and CSREES will conduct a thorough evaluation of the proposal once it is received.

OIL RESOURCES FROM DESERT PLANTS, NEW MEXICO

Question. Please provide a description of the research that has been done under the Oil Resources from Desert Plants, New Mexico grant.

Answer. The Plant Genetic Engineering Laboratory at New Mexico State University has been exploring the potential for the production of high value industrial oils from agricultural products. The effort has been focused on transferring the unique oil producing capability of jojoba into oilseed rape and soybean. With the development of technology to both isolate the enzyme components of oil biosynthesis and successfully transform the target plants, significant advances have been made with jojoba. In addition, oil enzymes have been studied in castor, oilseed rape, desert primrose, cyanobacteria, and meadowfoam.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes desert plant sources of valuable oils for industrial applications are typically low yielding and limited in climatic areas for farm production. Genetic engineering offers an opportunity to move genetic capability to high yielding major crops. Many of the oils and their derivative acids, waxes, and others can directly substitute for imports of similar polymer materials, especially petroleum.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to transfer the unique oil-producing capability of jojoba and other native shrubs into higher yielding crops such as oilseed rape and soybean. This is a form of metabolic engineering, and it requires the transfer of coordinated groups of genes and enzymes into the host plant to catalyze the necessary biochemical reactions. Recent progress includes successful transformation of tobacco and alfalfa plants with oil metabolism genes from the meadowfoam plant and a cyanobacterium.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. This research began in fiscal year 1989 with a \$100,000 grant under the Supplemental and Alternative Crops program. Grants have been awarded under the Special Research Grants program as follows: fiscal year 1990, \$148,000; fiscal years 1991–1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995–1996, \$169,000 each year; fiscal years 1997 through 2000, \$175,000 per year; and fiscal year 2001, \$174,615. A total of \$2,248,615 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Matching funds from State and private sources used to help fund this project were \$27,747 in fiscal year 1998 and \$71,000 in fiscal year 1999. New Mexico State University and the Plant Genetic Engineering Laboratory also provide \$90,000 for in-kind support per year including faculty salaries, graduate student stipends, facilities, equipment maintenance, and administrative support services.

Question. Where is this work being carried out?

Answer. The research is being conducted by the Plant Genetic Engineering Laboratory at New Mexico State University, Las Cruces, New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. An estimate of the total time in Federal funds required to complete all phases of the project is 3–4 years. The application of this research for improved management of natural resources will evolve and expand as technology in the area advances.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Oil Resources from Desert Plants, New Mexico project was evaluated for scientific merit by a review panel convened by CSREES on April 17, 2000. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received and the agency is satisfied that the program is being administered in compliance with the purpose of the grant. A merit review panel will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2001.

ORGANIC WASTE UTILIZATION, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Organic Waste Utilization, New Mexico grant.

Answer. Composted dairy waste is utilized as a pretreatment to land application. Composting dairy waste before land application may alleviate many of the potential problems associated with dairy waste use in agronomic production systems. Composting may also add value to the dairy waste as a potential landscape or potting medium. High temperatures maintained in the composting process may be sufficient for killing enteric pathogens and weed seeds in dairy waste. Noxious odors and water content may be reduced via composting. Composted dairy waste may be easier to apply, produce better seed beds, and not increase soil salinity as much as uncomposted dairy waste. Changes in the physical structure of the soil are being monitored for the effects of composted versus uncomposted amendments. This project undergoes annual peer review from academic institutions and experts from government and state agencies, and industrial partners.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the research will address the utilization of dairy waste combined with other high-carbon waste from agriculture and industry, including potash and paper waste, for composting. This approach to waste management will have high impact for states where dairy and agriculture are important industry sectors. This is especially true for New Mexico and the southwest U.S. where the dairy business is growing rapidly. This research will also provide an additional pollution prevention tool for the industrial sectors dealing with potash and paper waste. The principal investigator believes this research to be of local, regional, and national importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was and continues to be to determine the feasibility of simultaneously composting dairy waste from agriculture and industry. The research will determine effects of utilizing composted waste, as opposed to raw waste, as a soil amendment on plant growth, irrigation requirements, and nutrient and heavy metal uptake. Phase I, to determine the feasibility of simultaneous composting dairy waste with available high carbon wastes from agriculture and industry, has been completed. Phase II, to determine the appropriate ratios of waste to carbon substrate for successful composting is completed. Phase III, to determine the kinetics of nutrient release and effects of composted material on heavy metal uptake will be completed next year. The study of the second and third year application of the compost will be undertaken this year. This will identify the long term soil impact resulting from compost application.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal year 1996 was \$150,000; for fiscal years 1997 through 2000, \$100,000 per year; and for fiscal year 2001, \$99,780. A total of \$649,780 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds for the duration of this grant from the state appropriation is \$75,000. There is another \$50,000 in-kind support from the industrial partners. Additionally, a sum of \$15,000 from the New Mexico State Highway Department has been leveraged by this project.

Question. Where is this work being carried out?

Answer. This work is being carried out in New Mexico under the direction of the Waste-Management Education and Research Consortium in collaboration with The Composting Council and industrial partners, such as N-Viro in Ohio, Plains Electric, and McKinley Paper in New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion date of the initial phases was March 2000. The project has been progressing according to the specified targets. Phases I and II have been completed. Phase III is ongoing and will be completed by early 2001. Phase IV was added to evaluate the multi-year compost application on parameters such as plant growth, soil water retention, and soil salinity. Phase V will develop appropriate projects for the application of compost by state agencies for land reclamation. Particular attention will be paid to the unique soil characteristics of the desert south-

west with higher background levels of salts and minerals. Application rates and maturity indicators will be developed in field trials that tailor these organic soil amendments to native vegetation, climate, and soil types. In addition, research will be undertaken on organic fertilizers developed from the runoff of composted waste. Field tests will be used to determine the effectiveness of these products. Phase V is projected to be completed by mid-2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has been evaluated based on the semi-annual progress report and research findings presented at conferences. The cognizant staff scientist has reviewed the project and determined that this research is conducted in accordance with the mission of this agency.

PASTURE AND FORAGE RESEARCH, UTAH

Question. Please provide a description of the research that has been funded under the Pasture and Forage Research, Utah grant.

Answer. This is a multi-disciplinary effort to develop a forage livestock management system for improved profitability for Utah ranchers. The bulk of Utah's livestock production is based on forages. The primary tool for improving profitability of private grazing lands is through improved forage management. This research attempts to identify the physical and economical feasibility of utilizing intensively-rotated and irrigated pastures in the Intermountain West.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research proposed under this Special Research Grant will address the issues related to management of forage livestock production in Utah to improve profitability. The research will focus on Utah but have application in adjacent intermountain states.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to develop a comprehensive guide for the management of irrigated pastures to assist livestock producers reduce cost and increase net returns.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$200,000; for fiscal years 1998 and 2000, was \$225,000 per year; and for fiscal year 2001, \$249,450. A total of \$1,124,450 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds in support of this project and related activities were \$360,200 for 1997; \$356,000 for 1998; \$364,000 for 1999; and \$325,000 for 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Utah Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate the completion date for some objectives to be in 2002. Some issues will require additional time for resolution.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant is peer reviewed annually through the institutions project approval process as well as by the CSREES National Program Leader and the last on-site review took place in November 1999. The evaluation summary noted that the program, as implemented at the farm level, has already produced significant results in addressing problems of forage/livestock operations in Utah and the surrounding area.

PEACH TREE SHORT LIFE IN SOUTH CAROLINA, SOUTH CAROLINA

Question. Please provide a description of the research that has been funded under the Peach Tree Short Life in South Carolina grant.

Answer. Progress continued in 2000 with focus on the evaluation and longevity and productivity of Guardian rootstocks on peach tree short life sites in the southeast and replant sites throughout North America. More fundamental work has involved the biochemical characterization of the egg-kill factor produced by a bacteria on nematode eggs. Other basic studies involved the cloning of genes associated with

production and expression of toxins from bacteria. New studies were initiated on the use of solarization to reduce nematode populations for peach tree replant.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the principal researcher the problem of disease on peach, nectarine, and plum trees in the southeastern U.S. is very great. More than 70 percent of peach acreage in the southeast is affected. Research continued on the improvement of rootstocks and the use of the cultivar Guardian BY520-9, which has now been released in 22 states including California, New Jersey, and Michigan where bacterial canker is a problem.

Question. What was the original goal of this research and what has been accomplished to date.

Answer. The goal of this research was the continued evaluation of productivity of peach using Guardian BY520-9 rootstocks in the presence of peach tree short life and investigations into novel management for ring nematodes by bacteria. Recent accomplishments include the increase in bulk commercial production of Guardian seed while two new Guardian selections have had very good nursery trails. Guardian rootstock continues to be tested in 22 states and is performing well. A marker for a gene for rootstock resistance to two root-knot nematode species was sequenced and successfully used to correctly sort current commercial rootstocks according to their known nematode resistance or susceptibility. A major find is that the egg-kill factor produced by the bacteria kills root-knot nematode eggs as well as ring nematode eggs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1981, \$100,000; fiscal years 1982 to 1985, \$192,000 per year; fiscal years 1986 to 1988, \$183,000 per year; fiscal year 1989, \$192,000; fiscal year 1990, \$190,000; fiscal years 1991 to 1993, \$192,00 per year; fiscal year 1994, \$180,000; fiscal years 1995 to 2000, \$162,000 per year; and fiscal year 2001, \$178,606. A total of \$3,705,606 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources for this grant were as follows: \$149,281 state appropriations in 1991; \$153,276 state appropriations in 1992; \$149,918 state appropriations in 1993; \$211,090 state appropriations in 1994; \$193,976 in state appropriations in 1995; \$169,806 in state appropriations in 1996 and 1997; \$150,693 in state appropriations in 1998; \$92,099 in 1999; and \$92,099 in state appropriations in 2000.

Question. Where is this work being carried out?

Answer. This research is being conducted at the South Carolina Agricultural Experiment Station.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The researchers anticipate that the work may be completed in fiscal year 2001. Adequate progress has been made to assure that the objectives will be met before the completion date.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation of this project was a merit review completed January 2000. In summary, the evaluation of peach rootstocks with resistance to peach tree short life is of continued importance in managing this disease. The use of biological control strategies in suppression of plant parasitic nematodes are a complementary area of research in that it can enhance disease management by protecting the peach rootstocks. Solarization of orchard sites prior to peach tree replanting significantly altered the microbial community and suppressed nematode multiplication in the rhizosphere. Some accomplishments were the increased production and release of commercial Guardian seed and continued evaluation of rootstock in 22 states and provinces. A molecular techniques that separates resistant and susceptible peach rootstocks was validated.

PEANUT ALLERGY REDUCTION, ALABAMA

Question. Please provide a description of the research that has been funded under the Peanut Allergy Reduction, Alabama grant.

Answer. The industry, in conjunction with Alabama A&M University, the University of Florida, and the University of Georgia are trying to develop a response to

the peanut allergy problem and have determined that research is needed in the following areas: (1) the possibility of reducing the allergenic potential of peanuts through bioengineering and traditional breeding targeted at modifying the peanut proteins responsible for causing allergic reactions; (2) development of vaccines and other means to desensitize people with peanut allergies; and (3) development of better marketing, handling, and processing methods to reduce allergy risks.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Peanut allergies present a major problem for the growth of the peanut industry nationally, regionally, and locally. In addition, food and peanut allergy is becoming a major public health issue of national importance and a high priority research area.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research are to (1) Screen divergent peanut germplasm including cultivated and wild *Arachis* species for levels of Ara h1, Ara h2, and Ara h3 peanut allergens to determine the potential of breeding for reduced allergenicity; (2) Genomic cloning and characterization of Ara h1, Ara h2, and Ara h3 peanut allergen genes including the determination of gene family size and composition; (3) Characterization of Ara h1, Ara h2, and Ara h3 gene expression; (4) Determine the potential for differential gene silencing of multi-gene family members; and (5) Down-regulate allergen genes using anti-sense transformation. The award notification was received in September 2000. Personnel is being hired and preliminary experiments conducted.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in September of fiscal year 2000. The appropriation for fiscal year 2000 was \$425,000 and \$498,900 has been allocated for fiscal year 2001. The total appropriation is \$923,900.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. No non-Federal funds have been provided.

Question. Where is this work being carried out?

Answer. The research is carried out at Alabama A&M University in collaboration with the University of Florida and the University of Georgia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The anticipated completion date of the specific objectives outlined above is fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project with the award made in September 2000. Therefore, no agency evaluation has been conducted. An internal review of the proposed project was conducted prior to awarding the grant in September 2000. The first agency evaluation is anticipated in 2001.

PEST CONTROL ALTERNATIVES, SOUTH CAROLINA

Question. Please provide a description of the research that has been funded under the Pest Control Alternatives, South Carolina grant.

Answer. This grant supports research and technology transfer to provide growers with alternatives for managing pests and to implement the use of new alternatives reducing the sole reliance on chemical pesticides.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The investigators contributing to the research and technology transfer at South Carolina believe that need for the development of alternatives for managing pests on vegetables is a regional and national problem. Contributions from the South Carolina work are projected to impact vegetable production in the southern region and consumers of vegetable production from the southern region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this program is to investigate alternative methods of managing insects, plant diseases, and nematodes in vegetable crops as complements to or as substitutes for conventional chemical sprays. The role of indigenous predators, parasites, and pathogens in controlling insect pests are being evaluated. The diamondback moth is the most serious pest of brassica crops such as cabbage, broccoli,

cauliflower, and collards, and control of this pest alone costs growers millions of dollars per year. Integrated Pest Management approaches developed under this project conserve the indigenous biological control agents of the diamondback moth, especially the parasite, *Diadegma*, in a system that utilizes the microbial agent *Bacillus thuringiensis*, along with precise, yet time efficient, field scouting in collards in South Carolina. Other microbial agents, some from sources outside the U.S., are being tested to identify those that are most virulent against insect pests here in the U.S. Results from other work on cultural techniques that suppresses insects and diseases are being incorporated into grower recommendations. A system of forecasting melon diseases avoids over spraying the crop, saves money for growers, and lessens environmental impact by chemical pesticides. This is complimented by development of melon varieties that have natural resistance to plant diseases.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was \$125,000 per year. In fiscal year 1994 the appropriation was \$118,000; in fiscal years 1995 through 2000, \$106,000 per year; and in fiscal year 2001 is \$116,743. A total of \$1,120,743 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. South Carolina has provided approximately \$182,000 in personnel support and operating dollars per year from state appropriations, agricultural chemical industry, and other non-Federal grants-in-aid based on the principal investigator's estimate.

Question. Where is the work being carried out?

Answer. This research and technology transfer program is being conducted at the South Carolina Agricultural Experiment Station, Clemson University at Clemson, Florence, and Charleston, South Carolina.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the project were for five-years. The project was revised in 1998 and continues.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Staff at CSREES evaluate this project annually from the annual project report which is submitted with the proposal for the next year of funding.

PEST MANAGEMENT ALTERNATIVES

Question. Please provide a description of the research that has been funded under the Pest Management Alternatives special grant.

Answer. This special research grant supports projects that help farmers respond to the environmental and regulatory issues confronting agriculture. These special grant funds support research that provides farmers with replacement technologies for pesticides that are under consideration for regulatory action by the Environmental Protection Agency—EPA—and for which producers do not have effective alternatives. The passage of the Food Quality Protection Act—FQPA—of 1996 makes this special research grant of critical importance to the Nation's farmers. Through these grants, new pest management tools are being developed to address critical pest problems identified by farmers and others. Where effective alternative tactics have been developed, they are widely and rapidly implemented by farmers. The call for proposals for these special research grant funds is published in the National Register and funds are distributed through a national open and competitive grants program directed by CSREES. Research priorities are identified annually by stakeholders, commodity groups, government, and private scientists, and others interested parties.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research.

Answer. Insect, weed, and disease pests always present a risk to agricultural production of food and fiber. For the Nation's agricultural production system to keep pace with the domestic and global demand for food and fiber it must have access to safe, profitable, and reliable pest management alternatives. For a variety of reasons, fewer pesticides are available today than just a few years ago. The FQPA is a major factor in reducing the number of pest management alternatives for U.S. producers. This grant provides new pest management tools and pest management

information, with the intent of helping farmers remain competitive in today's global marketplace.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This research is conducted to help farmers respond to the environmental and regulatory issues confronting agriculture by providing them with new options for managing pests. The research supported by this special grant identifies new ways and products to manage pests during this time of great change. A few examples of successful outcomes from previous grants in this program include: ways to reduce organophosphates use in apple production; modified cropping systems that replace herbicide use in pumpkins and squash; surface amendments that reduce aerial pesticide pollutants; development of pest and natural enemy thresholds to improve pest scouting on wheat; models to improve pesticide use efficiencies in minor fruit crops; improved insecticide and herbicide spray technology; new selective insecticides to control broccoli insects; and use of non-traditional oil sprays to control mites on apples.

Question. How long has this work been underway and how much as been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1996 through 2000, \$1,623,000 each year, and fiscal year 2001, \$1,619,429. A total of \$9,734,429 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds are provided to this grants program.

Question. Where is the work being carried out?

Answer. All state agricultural experiment stations, all colleges and universities, other research institutions and organizations, Federal agencies, private organizations or corporations, and individuals are eligible to compete for this funding. This research is currently being carried out by State Agricultural Experiment Stations and other research organizations located in 23 States.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The economic and environmental pressures facing U.S. agriculture today surpass those of 1996 when Federal funds were first appropriated for this special research grant. There will be a need for continued investment in research to develop new approaches to managing pests for the foreseeable future as the FQPA is implemented.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each new Call for Proposals and all submitted project proposals are evaluated annually by a multi-disciplinary panel for both relevancy and scientific merit. A jointly sponsored USDA and EPA workshop to evaluate the progress and scope of this program was held in Arlington, Virginia on May 11, 1999. The conclusions were that the program was on course and making good progress and could do more with additional funding. The projects supported by this special research grant have consistently provided key knowledge needed in developing new approaches to pest management. The focus on pesticides targeted by FQPA assures that critical pest management alternatives are being addressed. This grants program has supported 93 projects in 29 states since it started five years ago.

PHYTOPHTHORA ROOT ROT, NEW MEXICO

Question. Please provide a description of the work that has been funded by the Phytophthora Root Rot, New Mexico grant.

Answer. Research supported by this grant has concentrated on developing breeding strategies for developing durable resistant cultivars. As part of this work, a genetic population is being developed that will be used for molecular analysis of resistance.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. This project aims to halt the spread of Phytophthora root rot and foliar blight before chile production in the U.S. is sharply inhibited. Through the combination of Phytophthora root rot and foliar blight resistant cultivars and proper cultural practices, southwestern chile growers will be ensured a sustainable and profitable future and a leading place in the world market. Phytophthora is one of the major diseases of chile and has limited production in all states growing chiles.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal has been to reduce loss of chile production to the Phytophthora syndrome of diseases. Since beginning this research, the project has discovered that there are at least three different disease syndromes caused by the pathogen. In addition, resistance in the host to Phytophthora is multi-genic for each syndrome. Furthermore, cultural practices have been found that lessen the severity of the disease under commercial production conditions.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of \$125,000 for that year. Fiscal years 1992 and 1993 appropriations were \$150,000 per year; \$141,000 in fiscal year 1994; \$127,000 per year in fiscal years 1995 through 2000; and \$137,696 in fiscal year 2001. A total of \$1,465,696 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds from state appropriations and the California Pepper Commission were \$255,614 in 1997; \$253,614 in 1998; \$250,000 from state appropriations and \$61,000 from the New Mexico Chile Commission in 2000; and a state appropriation of \$280,000 in 2001.

Question. Where is this work being carried out?

Answer. The research is being carried out at New Mexico State University in the Department of Agronomy and Horticulture. Greenhouse and field facilities are being utilized at the Fabian Garcia Science Center and at the Leyendecker Plant Science Research Center.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the research objectives is 2005. Additional special funding is sought for 2001 to continue New Mexico State University's Agriculture Experiment Station research efforts to control soil borne diseases in irrigated agriculture. The Federal funds provided in fiscal year 2000 helped accelerate research results.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Peer review is not required for renewal proposals provided that the project has not changed significantly, other scientific discoveries have not affected the project, or the need for the project has not changed. However, the CSREES Special Grant—Prevention of Soilborne Diseases in Irrigated Agriculture—has undergone scientific peer review. This project has been evaluated for technical quality and relevance to regional goals by researchers with the scientific knowledge and technical skills to conduct the proposed research work. They have read and made comments that were incorporated into the proposal.

PIERCE'S DISEASE, CALIFORNIA

Question. Please provide a description of the research that has been funded under the Pierce's Disease, California grant.

Answer. This is a new grant. CSREES has requested the University of California to submit a grant proposal defining a competitive process that will identify the best research, education, and extension programs to address this problem.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Pierce's Disease is a devastating disease of grapes that severely limits production wherever it occurs. It is vectored by the glassy-winged sharpshooter, which has recently expanded its range into California vineyards in the southern half of the state. California is the lead state in production of grapes for all uses, which include wine, fresh table, and raisins, with a total crop value approaching \$40 billion. Control of this important disease and management of its vector are essential to the continued viability of this vital agricultural industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new grant and the proposal for funding is presently being developed. The primary goals of the proposal will be to slow the spread of the glassy-winged sharpshooter and to discover a method of controlling Pierce's Disease.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001.

Answer. The work supported by this grant is being initiated in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$1,895,820.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. The total non-Federal contribution to this project for fiscal year 2001 is \$1,250,000. The State of California has designated \$750,000 for control of Pierce's Disease. In addition, the Town of Temecula in conjunction with Riverside County, both in California, have designated \$250,000 toward this project in fiscal year 2001. The viticulture industry in California has contributed \$250,000 toward this project in fiscal year 2001.

Question. Where is this work being carried out?

Answer. The work is being carried out by the California Agricultural Experiment Station. Funds will be awarded competitively to scientists from around the country involved in research on Pierce's Disease.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. The anticipated completion date for the original objectives is the end of fiscal year 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. Each proposal submitted to the project will undergo a peer review. CSREES will review annually the request for proposals developed for this program.

PLANT, DROUGHT, AND DISEASE RESISTANCE GENE CATALOGING, NEW MEXICO

Question. Please provide a description of the work that has been funded by the Plant, Drought, and Disease Resistance Gene Cataloging, New Mexico grant.

Answer. The specific objectives of this project are to construct, curate, and distribute cDNA libraries for genes that are differentially expressed in response to drought or disease. The DNA sequence and the pattern of expression of these genes will be determined, and this information will be made publicly available in databases. The specific plants under investigation include representatives from the major crop plant families: legumes, grasses, and the Solanacea.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Water deficit stress is the most severe and ubiquitous stress plants face. As urban and agricultural needs for water continue to compete, it is of national importance to understand which genes control drought resistance. This problem is especially pronounced in the arid southwest of the U.S.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal of this project was to develop the facilities to perform plant genomic research at the New Mexico State University in collaboration with other institutions in the state, Los Alamos National Laboratory, and the National Center for Genome Resources. The project was intended to develop plant functional genomics in the thematic area of biotic and abiotic stress responses. To date, cDNA libraries of drought responsive genes have been constructed from five different samples and one library of disease responsive genes. Scientists are now beginning to use microarray approaches to characterize gene expression profiles. DNA sequence information has been generated for several hundred genes from these libraries.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998 and has been supported with appropriations of the following amounts: fiscal years 1998 and 1999, \$150,000 per year; fiscal year 2000, \$212,500; and fiscal year 2001, \$249,450. A total of \$761,950 has been appropriated since fiscal year 1998.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. New Mexico Agricultural Experiment Station is providing six percent of co-Principal Investigators' salaries, at a cost of approximately \$9,000.

Question. Where is this work being carried out?

Answer. This work is conducted primarily on the main campus of New Mexico State University in Las Cruces, New Mexico. Some collaborative work is conducted with scientists at Los Alamos National Laboratory in Los Alamos, New Mexico, and with scientists at the National Center for Genome Resources in Santa Fe, New Mexico. A researcher from the Los Alamos National Laboratory, is collaborating on the

microarray technology, and a researcher from the National Center for Genome Resources is collaborating on the gene expression database technology.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Principal Investigators developed a detailed project outline for a five-year project, from 1998 through 2003, with specific yearly goals and objectives. Each year a detailed progress report is provided specifically addressing the bulleted yearly goals and objectives. The project is on schedule. The anticipated completion date for the project is May 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation of this project was a merit review in March 2000. This evaluation noted that the faculty at New Mexico State University have been conducting research on genes involved in disease and drought resistance on a wide range of crops and have recently developed expertise and collaborative efforts in bioinformatics. It was further noted that this project addresses high priority objectives in plant genetics that are directed to economically-important crops and approval of funding was highly recommended.

POTATO RESEARCH

Question. Please provide a description of the research that has been funded under the Potato Research grant.

Answer. Scientists at several of the State Agricultural Experiment Stations are breeding new potato varieties, high yielding, disease, and insect resistant potato cultivars, adapted to the growing conditions in their particular areas, both for the fresh market and processing. Research is being conducted in such areas as protoplast regeneration, somoclonal variation, storage, propagation, germplasm preservation, and cultural practices. Congressional language for fiscal years 1997 through 2001 has directed CSREES to award these funds on a competitive basis. In each of the years, CSREES published a request for proposals in the Federal Register and awarded grants competitively based on a scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This research effort addresses needs of the potato producers and processors throughout the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to improve potato production through genetics and cultural practices as well as improve storage for quality potatoes for processing and fresh market. This research has resulted in a number of new high yielding, good quality, disease, and insect resistant cultivars, which are now being used in the processing industry and in the fresh market. CSREES has been successful using a farmer review panel and a scientific peer panel in directing more regional comprehensive breeding programs that have resulted in potato varieties targeted to the specific growing conditions of that region. A number of the new cultivars have also been adaptable to other regions. These programs have also had success in identifying resistance to pests and pathogens in wild germplasm and are developing expertise to incorporate genetic engineering approaches as traditional components of the program.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1983, \$200,000; fiscal year 1984, \$400,000; fiscal year 1985, \$600,000; fiscal years 1986–1987, \$761,000 per year; fiscal year 1988, \$997,000; fiscal year 1989, \$1,177,000; fiscal year 1990, \$1,310,000; fiscal year 1991, \$1,371,000; fiscal years 1992 and 1993, \$1,435,000 per year; fiscal year 1994, \$1,349,000; fiscal years 1995 through 1998, \$1,214,000; fiscal years 1999 and 2000, \$1,300,000 per year; and fiscal year 2001, \$1,446,810. A total of \$20,698,810 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$401,424 state appropriations, \$4,897 product sales, \$249,830 industry, and \$30,092 miscellaneous in 1991; \$567,626 state appropriations, \$6,182 product sales, \$334,478 industry, and \$44,323 miscellaneous in 1992; \$556,291 state appropriations, \$9,341 product sales, \$409,541 industry, and \$44,859 miscellaneous in 1993; \$696,079 state appropriations, \$21,467 product sales, \$321,214 industry, and

\$226,363 miscellaneous in 1994; \$935,702 state appropriations, \$35,376 product sales, \$494,891 industry, and \$230,080 miscellaneous in 1995; and an estimated \$900,000 state appropriations, \$10,000 product sales, \$400,000 industry, and \$200,000 miscellaneous in each of the years 1996 through 2000. A total of \$13,170,056 in non-Federal funds have been provided from fiscal year 1991 through 2000.

Question. Where is this work being carried out?

Answer. The research work is being carried out at the New York, Idaho, Maine, Michigan, North Dakota, Oregon, Pennsylvania, Virginia, Washington, North Carolina, New Jersey, Wisconsin, and Colorado State Agricultural Experiment Stations. The grant to Colorado is divided by Colorado with the California and Texas Agricultural Experiment Stations.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated to accomplish significant results in about five years, but because genetic varietal development takes from 5 to 10 years, we anticipate significant progress by 2006.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Beginning in fiscal year 1997, these funds have been awarded on a competitive basis using a scientific peer review. In addition, CSREES conducts a formal meeting with representatives from the potato industry to review research needs and provide input to the agency on the merits of the proposals.

PRECISION AGRICULTURE, KENTUCKY

Question. Please provide a description of the research that has been funded under the Precision Agriculture, Kentucky grant.

Answer. Research will evaluate site-specific practices for production of corn and soybeans under field conditions. The work will compare various combinations of management practices, using site-specific technology, and evaluate economics of its application.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need for this research is to provide objective information about precision agriculture technologies to assist farmers in the development of management systems that are productive, economical, and environmentally benign.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to evaluate site-specified technologies and develop recommendations related to variation in fertility, erosion potential, drainage, and soil physical condition. The ultimate goal is to demonstrate the potential economic and environmental benefits from precision practices.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999 and the appropriation for fiscal year 1999 was \$500,000 in fiscal year 2000, \$850,000; and in fiscal year 2001, \$748,350 total of 2,098,350.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The estimate for non-Federal funds supporting this project, largely from state appropriations, was \$425,000 in fiscal year 1999 and \$787,000 in field year 2000.

Question. Where is this work being carried out?

Answer. This research will be conducted at the Kentucky Agriculture Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for this project is 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will be evaluated upon receipt of the required grant proposal.

PRE-HARVEST FOOD SAFETY, KANSAS

Question. Please provide a description of the research that has been conducted under the Pre-Harvest Food Safety, Kansas grant.

Answer. Longitudinal studies on the fecal shedding of *Escherichia coli* 0157:H7—*E. coli* 0157:H7—by cattle on beef cow-calf ranches are being done to determine the impact of various routine management practices on the shedding rate. The purpose of the research is to develop an understanding of the management factors that contribute to the incidence of *E. coli* 0157:H7 in beef cattle. During the past two years, the project has been enlarged to include more monitoring of environmental and wildlife samples to determine reservoirs for *E. coli* 0157:H7.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The presence of *E. coli* in beef animals sent to slaughter can contribute to the contamination of meat products produced from such animals. This has increased the need for control measures that could reduce the incidence of such food-borne human pathogens in food animals during the production cycle. With the implementation of mandatory Hazard Analysis Critical Control Point—HACCP—programs for *E. coli* 0157:H7 in slaughter plants, there is increased pressure for the livestock producer to deliver animals to slaughter with reduced prevalence of *E. coli* 0157:H7. This type of research has been identified as critical by all food animal commodity groups as well as public health officials and consumers. An additional problem has now emerged as we learn more about the ecology of the *E. coli* 0157:H7 organism, namely, the ubiquitous nature of this bacterium in the general environment, including water sources as well as various species of wildlife.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to determine the incidence of *E. coli* 0157:H7 in large versus small beef cow-calf operations and describe the management factors that contribute to or affect the rate of shedding of organisms in the feces of such animals. *E. coli* 0157:H7 has been detected in 3.11 percent of monthly fecal samples— $n=3152$ —with 4.57 percent of the 2,058 animals having at least one positive sample. Fecal shedding was normally transient; only one animal was positive on more than one sampling date. In addition, there was a difference in prevalence between farms. Sources of drinking water were also examined and 3.5 percent of 199 water samples were positive. Of particular interest was that 8.3 percent of 24 creek/stream samples and 2.9 percent of 103 pond samples were positive. In addition, isolates of *E. coli* 0157:H7 have been obtained from wildlife, especially deer. Management practices on the ten farms are being examined to determine if there are specific risk factors that can be identified. As the work has progressed, however, the significance of the rather widespread presence of *E. coli* 0157:H7 in the general environment has resulted in added objectives to this important study.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1996. The appropriations for fiscal years 1996 through 2000 were \$212,000 per year, and for fiscal year 2001 is \$211,534. A total of \$1,271,534 has been appropriated.

Question. What is the source and amount of non-Federal funds by fiscal year?

Answer. Non-Federal funds have been contributed to this project as follows: In fiscal year 1996 non-Federal funds were \$150,000 in state appropriations and \$91,450 in contributed indirect costs; 1997 non-Federal funds were \$165,000 in state appropriated funds and \$90,300 in contributed indirect costs; 1998 non-Federal funds were \$175,000 in state funds and \$91,500 in contributed indirect costs; 1999 non-Federal funds were \$109,957 in state funds and \$90,800 in contributed indirect costs; 2000 non-Federal funds were \$125,193 in state funds and an additional \$91,300 in contributed indirect costs.

Question. Where is this work being performed?

Answer. This research is being conducted at Kansas State University, University of Nebraska-Lincoln, and at ranches in Kansas, Nebraska, and Colorado.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date was October 1, 1998 for the original objectives. However, the project was not initiated until several months after the expected start date of October 1, 1995 and the original objectives were completed in late spring of 1999. As the project has progressed, the Principal Investigator has added other important questions to the original research plan and has planned to look more closely at management interventions that could help reduce the incidence of *E. coli* shedding in beef cattle. During the past two years, the project has added objectives which are focused on environmental issues such as prevalence of *E. coli* 0157:H7 in wildlife as well as in various water supplies used by the cattle. Thus the project is expected to continue for some time after the original expected termi-

nation date. The research team has been very productive and has completed the original goals of the project but has taken the initiative to look further at the environmental issues.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was evaluated by an on-site visit on October 28–29, 1997 by the CSREES National Program Leader. The project team was doing an excellent job, and the interactive collaboration was outstanding. The research team has also been successful in bringing other participants into the program. Also, the project leader provided a very comprehensive written report on December 4, 2000, which summarizes the current status of the research project. Several scientific papers have been given at scientific meetings. Three peer reviewed manuscripts have been published and two more are currently in the review process. Manuscripts are being published as rapidly as data are assembled, analyzed, and prepared for publication.

PRESERVATION AND PROCESSING RESEARCH, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Preservation and Processing Research, Oklahoma grant.

Answer. Research has focused on the effects of preharvest and postharvest factors on the market quality of fresh and minimally-processed horticultural products, including pecans, watermelons, spinach, and various herb, spice, and colorant crops for further processing as nutraceuticals. Researchers have developed harvester prototypes for maximizing active component yield from marigold flowers and from sage, for incorporation with drying and threshing systems to accommodate further processing. Research focuses on integration of production, harvesting and postharvest handling systems for fresh market, and processing market horticultural products. Research continues on methods to determine textural properties of pecans, and is being extended for development of improved pecan grading and sorting systems. Precision farming operations using remote optical sensing technology to optimize chemical inputs and improve profitability for Oklahoma spinach production are being developed and implemented.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Technological improvements in fruit, nut, and vegetable handling systems are needed to supply domestic markets and support continued participation in international commerce. Processing systems under development for commercial adaptation will support market expansion of pecans and various nutraceutical crops, affecting product market potential and value regionally. Improvements in combined production, postharvest handling, and processing systems are necessary to support growth of the state and national horticulture and related agriculture industries and ensure competitive involvement in national and international commerce of horticultural commodities uniquely suited for production in Oklahoma. New extraction facilities will continue to have a positive impact on local economies, incorporating a new-value added processing industry, providing local employment opportunities, and a new local market for Oklahoma produced commodities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research has been to define the major limitations for maintaining quality of harvested fruits, vegetables, tree nuts and nutraceutical crops, and prescribe appropriate harvesting, handling, and processing protocols to extend shelf life and enhance marketability of harvested horticultural commodities. Technologies and procedures previously developed for cucurbit, tree fruit, sweet corn, and okra systems are being applied to development of pepper, sage, spinach, and marigold cropping, handling, and light processing systems, with a targeted completion date of 2003. Research from this project provided the basis for commercial high relative humidity storage of peaches and is focusing on implementation of systems for maintenance of high active ingredients in nutraceutical crops to complement and extend efforts towards economical value-added extraction of foods.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$100,000; fiscal year 1986, \$142,000; fiscal year 1987, \$242,000; fiscal years 1988 and 1989, \$267,000 per year; fiscal year 1990, \$264,000; fiscal year 1991, \$265,000; fiscal year 1992, \$282,000; fiscal year 1993, \$267,000; fiscal year 1994, \$251,000; fiscal years 1995–2000, \$226,000 each year; and fiscal year 2001, \$225,503. A total of \$3,928,503 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. State funds have been provided as follows: fiscal year 1991, \$126,900; fiscal year 1992, \$209,783; fiscal year 1993, \$219,243; fiscal year 1994, \$308,421; fiscal year 1995, \$229,489; fiscal year 1996, \$366,570; fiscal year 1997, \$397,881; fiscal year 1998, \$205,662; fiscal year 1999, \$206,334; and fiscal year 2000, \$193,126. The state also invested \$16.1 million for development of an Agricultural Products and Food Processing Center and approximately \$2.0 million annually to staff and operate the facility.

Question. Where is the work being carried out?

Answer. This work is being conducted at the Oklahoma State Agricultural Experiment Station, in conjunction with ongoing production research at the Wes Watkins Agricultural Research and Extension Center and the South Central Agricultural Research Laboratories.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. It is expected that ongoing research will be completed in 2004. Additional related objectives beyond this date would address further opportunities for horticulture industry growth, innovative food processing technologies, and associated economic development.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal supporting the fiscal year 2000 appropriation was conducted on May 11, 2000. Additionally, scientists from outside the university routinely review proposals prior to submission to the agency. The project was evaluated as part of a comprehensive site review in the fall of 1995, with a recommendation by the review team to continue and substantially expand the value-added product development.

PRODUCE PRICING, ARIZONA

Question. Please provide a description of the research that has been funded under the Produce Pricing, Arizona grant.

Answer. CSREES has requested Arizona State University to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research is needed address a number of pricing issues and problems in the changing produce industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to understand a variety of pricing problems in the produce industry and to evaluate pricing alternatives.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This is a new project that begins in fiscal year 2001. The appropriation for fiscal year 2001 is \$75,833.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. We expect state appropriated funds to become a part of this project. The dollar amount will be included with the proposal.

Question. Where is this work being carried out?

Answer. Research will be conducted at Arizona State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What if the anticipated completion date of additional or related objectives?

Answer. The original objectives and anticipated completion date will be specified in the forthcoming proposal.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the project when the first proposal is received.

PROTEIN UTILIZATION, IOWA

Question. Please provide a description of the research that has been funded under the Protein Utilization, Iowa grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. The research will deal with the utilization of proteins to design new products. Research will be conducted at Iowa State University.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need for research is to create value added market for new protein products with potential for national and international markets

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal of this project is to develop technologies that will add value to soybean proteins using industrial enzymes. The investigators propose to (1) improve the functional properties of soy proteins; (2) restore the functional properties of head-treated soy proteins; and (3) enhance protein recovery from soybeans and soy products. Iowa State University will team up with Genecor International Inc. to utilize the company's industrial enzyme library in achieving the goal. This is a new project, and the accomplishments will be reported at the end of the project period.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$189,582.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The sources of matching funds will be known when the full proposal is received from the university.

Question. Where is this work being carried out?

Answer. Research will be conducted at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is August 2002.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since this the first year of the proposed award, no previous evaluation has been conducted.

RANGELAND ECOSYSTEMS, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Rangeland Ecosystems, New Mexico grant?

Answer. Current research is focused on the ecology of noxious and invasive weeds that are endemic to New Mexico's rangelands. Competitive research grants have been awarded that deal with studying the physiological and toxicological effects of these weeds on livestock.

Question. According the research proposal, or the principal researchers, what is the national, regional, or local focus for this research?

Answer. Noxious weeds are a serious problem in the southwestern U.S. More than one-half of the rangeland is infested in New Mexico and about one-fifth of the rangeland in Texas. Under this program, researchers are working to develop an integrated weed management approach in rangeland ecosystems for that region.

Question. What was the original goal of this research and what has been accomplished?

Answer. Research has led to the understanding of broom snakeweed and other noxious weeds resulting in a better understanding of plant's strategy for invasion and persistence. Currently, the primary focus of research is addressing the need for an integrated weed management approach for noxious weeds, especially broom snakeweed. Three general areas of research are ecology and management, biological control, and toxicology and animal health. One specific accomplishment is the biological control arena; several plant pathogens and insects are proving to be effective in broom snakeweed's control.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001.

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$100,000; fiscal year 1990, \$148,000; fiscal year 1991, \$150,000; fiscal years 1992 and 1993, \$200,000 per year; fiscal year 1994, \$188,000; fiscal years 1995 and 1996, \$169,000 each year; fiscal year 1997, \$175,000; fiscal year 1998, \$185,000; and

for fiscal years 1999 and 2000, \$200,000 per year; and for fiscal year 2001, \$299,340. A total of \$2,383,340 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$249,251 state appropriations in 1991; \$200,110 state appropriations in 1992; \$334,779 state appropriations in 1993; \$302,793 state appropriations in 1994; \$294,451 state appropriations in 1995; and an estimated \$300,000 in state appropriations in each fiscal year 1996 through 2000. A total of \$2,881,384 in non-Federal funds have been provided since fiscal year 1991 through 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at New Mexico State University and throughout the State of New Mexico under actual field conditions.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in 1991. Considerable progress has been made on many of the original objectives. Currently, additional and related objectives have evolved, and anticipated completion date for these is 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the grant is peer reviewed with oversight by an administrative executive committee within the College of Agriculture and Home Economics at New Mexico State University. Additionally, CSREES' senior scientific staff review the progress of the grant. Those reviews indicated progress in achieving the objectives.

RED SNAPPER RESEARCH, ALABAMA

Question. Please provide a description of the research that will be funded under the Red Snapper Research, Alabama grant.

Answer. The principal investigators will be developing techniques to culture red snapper in the Gulf of Mexico.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher indicates that there is a regional need for red snapper research because of its importance to the Gulf states and the fact that it is presently considered to be an over-fished species by commercial and recreational interests. Current harvest limitations mandated by Federal actions have resulted in economic losses to coastal communities. Research will provide critical knowledge in efforts to restore native populations and stimulate the development of aquaculture enterprises in the Gulf region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project was initiated in fiscal year 2000. The overall goal of the research is to develop hatchery, nursery, and growout methods for the mass production of red snapper that will lead to opportunities for aquaculture development and aid in management and restoration of wild stocks. Accomplishments in fiscal year 2000 included refinement of egg quality evaluation methods to improve larval survival, development of hormone spawning protocols to improve the stimulation of egg release and natural fertilization, evaluation of diets to improve sexual maturation of brood stock, and initiation of studies on photoperiod and temperature manipulation to improve brood stock spawning.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and the appropriation for fiscal year 2000 was \$510,000 and for fiscal year 2001 is \$723,405. The total appropriation for this project to date is \$1,233,405.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The principal investigators indicate that non-Federal support for this project is provided by the use of state-owned public and private facilities. For fiscal year 2000 state appropriations included \$20,000 for salary support and facility use and miscellaneous sources contributed \$11,000 for a total of approximately \$31,000.

Question. Where is this work being carried out?

Answer. The research is being conducted through the Alabama Agricultural Experiment Station at the Claude Peteet Mariculture Center located in Gulf Shores, Alabama, and at the Alma Bryant High School in Bayou La Batre, Alabama.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2002. The project was initiated in fiscal year 2000. Studies are currently underway relating to spawning, diet development, broodstock development, and methodologies for growout of food-sized fish. Project objectives are anticipated to be met in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this new project on an annual basis. The university submitted an accomplishment report for evaluation purposes for fiscal year 2000 activities that will be updated and included in the fiscal year 2001 proposal submitted to CSREES. The university is fulfilling its work objectives and expanding collaboration with other institutions conducting related research. The 2001 CSREES review will be completed within three weeks of submission of the fiscal year 2001 proposal. The researchers will be requested to develop the research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development as in the past.

REGIONAL BARLEY GENE MAPPING PROJECT

Question. Please provide a description of the work that has been funded under the Regional Barley Gene Mapping Project grant.

Answer. The Regional Barley Genome Mapping Project is a multi-disciplinary, multi-institutional project to develop a genome map of barley. Specific objectives are to: construct a publicly-available medium resolution barley genome map; use the map to identify and locate loci, especially quantitative trait loci controlling economically-important traits such as yield, maturity, adaptation, resistance to biotic and abiotic stresses, malting quality, and feed value; provide the framework for efficient molecular marker-assisted selection strategies in barley varietal development; identify chromosome regions for further, higher resolution mapping with the objective of characterizing and utilizing genes of interest; and establish a cooperative mapping project ranging from molecular genetics to breeding that will be an organizational model for cereals and other crop plants.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes barley breeders nationwide need information about the location of agriculturally-important genes controlling resistance to biotic and abiotic stresses, yield, and quality factors in order to rapidly develop new, improved cultivars and respond to disease and pest threats. This project provides that information along with appropriate molecular markers to track these traits through the breeding and selection process. The project is national in scope.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project has been to develop a restriction fragment length polymorphism map for barley and associated important genetic traits as a map to provide closely-linked molecular markers for barley breeders. The project successfully mapped 300 molecular markers. Portions of the map are described as very dense and contain key location points for enhanced utility. The project is now using the map to locate quantitative traits loci of economic importance. These include genetic determinations for yield, maturity, rust resistance, plant height, seed dormancy, and components of malting quality. Technical papers have been published to report research results to the scientific community.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$153,000; fiscal year 1991, \$262,000; fiscal years 1992–1993, \$412,000 per year; fiscal year 1994, \$387,000; and fiscal years 1995–1998, \$348,000 each year; fiscal year 1999, \$400,000; fiscal year 2000, \$425,000; and fiscal year 2001, \$586,706. A total of \$4,429,706 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$203,760 from industry in 1991; \$212,750 from industry in 1992; \$115,000 from industry in 1993; \$89,000 from industry in 1994; and \$35,000 from the State of Washington and \$108,000 in other non-Federal funding, for a total of \$143,000

in 1995, \$163,000 for 1996, \$178,240 in 1997. In 1998, \$147,000; for 1999, \$156,000; and for 2000, \$154,000.

Question. Where is this work being carried out?

Answer. Research is being conducted in the following state agricultural experiment stations; Oregon, Colorado, Washington, Montana, Idaho, North Dakota, Minnesota, New York, Virginia, and California.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to produce a genetic map of agronomically important traits of the barley genome. The anticipated time to complete this task was estimated at ten years with completion in 1999. The initial goals have been exceeded; however, maps are never "done". The next step will be physical mapping of gene-rich regions in order to study the genes and understand pathways. Researchers will focus on quality and disease resistance. This phase is projected for completion in 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In 1998, the special grant proposal was subjected to the project approval process at Oregon State University, which is the lead university, and reviewed by an agency scientist. This project is made up of many competitively-awarded mini grants. A subgroup of the National Barley Improvement Committee, which is composed of elected representatives of research, growers, and industry, serves as the peer panel to review and select proposals based on relevance to the original objectives and scientific merit. Multi-disciplinary, multi-institutional, and continuing projects are given the highest priority. The overall project and its mini-grants have been judged to be scientifically sound and appropriate for the stated objectives, based on comments and rating from peer scientists which is done on each support prior to selection.

REGIONALIZED IMPLICATIONS OF FARM PROGRAMS, MISSOURI AND TEXAS

Question. Please provide a description of the research that has been done under the program on Regionalized Implications of Farm Programs, Missouri and Texas grant.

Answer. The University of Missouri continuously provides regionalized analysis of alternative farm program designs. This includes providing farm level analysis of national changes in agriculture policy.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to give farm-level or micro view of macro-level changes; and to provide as accurate and robust an analysis as possible in order to point out regional differences in policy alternatives.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original, as well as current, goal is to provide the farm community, agribusiness groups, and public officials information about farm, trade, and fiscal policy implications by developing regionalized models that reflect farming characteristics for major production regions of the U.S. The researchers have developed a farm level policy analysis system encompassing major U.S. farm production regions. This system interfaces with existing agricultural sector models used for farm, macroeconomic, and trade policy analysis. The universities have expanded the number and types of representative farms to 80. Typical farm models also are being developed for Mexico and Canada under a collaborative agreement for use in analyzing impacts of the North American Free Trade Agreement.

Policy studies completed this past year at the request of policymakers and farm groups included analysis of the impacts of marketing loan provisions on farmers' economic viability; drought on farm income and farm viability; early provision of Agricultural Market Transition Act payments, risk management accounts; and other crop insurance and disaster assistance alternatives.

Results of these analyses were presented to more than 60 different groups across the U.S., including both congressional agriculture committees. The Agricultural and Food Policy Center web site, which contains copies of all Working and Briefing Papers, was visited more than 345,000 times and more than 2 billion bytes of information was transferred.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was \$346,000. The fiscal years 1991–1993 appropriations were \$348,000 per year; \$327,000 in fiscal year 1994; \$294,000 in each of the fiscal years 1995 through 2000; and \$293,353 in fiscal year 2001. A total of \$3,774,353 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$288,843 State appropriations and \$46,773 industry for a total of \$335,616 in 1991; \$45,661 State appropriations in 1992; \$33,979 State appropriations in 1993; \$40,967 State appropriations in 1994; \$161,876 State appropriations in 1995; \$187,717 State appropriations for 1996; \$137,100 for 1997; and \$161,400 for 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted by the Texas A&M University and the University of Missouri at Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program is of a continuing nature for the purpose of assessing the impacts of existing policies and issues and proposed policy and program changes at the individual firm level for feed grain, wheat, cotton, rice, oilseed and livestock producers. In addition, the representative farms are constantly being updated as farming practices change. Currently the researchers are making adjustments for the increasing use of Bt and Round-Up Ready seeds.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. No formal evaluation of this project has been carried out, however the CSREES representative is in regular contact throughout the year to track the progress of the stated objectives.

RICE MODELING, ARKANSAS

Question. Please provide a description of the research that has been funded under the Rice Modeling, Arkansas grant.

Answer. The purpose of this research project is to develop a regional, national, and global rice industry model for use in analyzing the impact of changes in domestic and foreign public policies on production, trade, stocks, substitute crops, farm prices, and domestic as well as global consumption.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Research is needed to assist both the U.S. rice industry and national policymakers in assessing the impact of existing and proposed changes in public policies for rice. This research enables improved analysis of both international and domestic policy changes on rice production, stocks, prices of substitute crops, and consumption. It has been, and is being used to analyze the impacts of farm policy proposals on the U.S. rice industry, to analyze the impact of the World Trade Organization—WTO—and the Uruguay Round agreements on United States trade, to analyze the impact of emerging rice importing and exporting countries on United States rice exports, and to analyze the market for different rice types—qualities—and seasonal demand and supply factors that affect the global rice market. The principal researcher believes this research addresses national, regional, and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop international, national, and regional models to analyze the impact of foreign and domestic policy changes, and forecast changes in production, trade, stocks, prices of substitute crops, farm prices, and consumption.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work actually began about four years ago and Federal research grants from various sources have totaled roughly \$2 million prior to this year. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was \$395,000; for fiscal years 1998 through 2000, \$296,000; and for fiscal year 2001, \$295,349 for a total appropriation of \$1,973,349.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds over the four years prior to this year totaled approximately \$500,000. For the 1996 fiscal year, state appropriations were \$178,000; and for 1997 and 1998, \$150,000.

Question. Where is the work being carried out?

Answer. The research is being carried out at the University of Arkansas-Fayetteville and the University of Missouri-Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The domestic portion of the rice model has been completed. The international modeling research is a little over half completed and the researchers estimate another five years is required. The purpose of constructing the models, however, is to provide on-going analysis of the impact of various policy proposals on the U.S. rice industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation of this project. However, annual proposals are peer reviewed for relevance and scientific merit. Also, each annual budget proposal is carefully reviewed for adherence to stated objectives and annual progress is discussed with the principal investigators.

RURAL DEVELOPMENT CENTERS

Question. Please provide a description of the research that has been funded under the Rural Development Centers Program grant.

Answer. There are four regional and two state level rural development centers funded under this grant. The four regional centers play a unique national role in linking the research and extension capacity of land-grant universities with local decisionmakers to address a wide range of development issues affecting rural America. The centers now collaborate on a number of national initiatives on key issues that touch all of rural America, but each continues a research program that addresses the particular needs of its region. National collaboration is underway on e-commerce and e-community opportunities; land use and sprawl; workforce quality in light of technological change, global competition, and Federally-restructured entitlement programs; community design methodology; the impacts of rural schools and public education on rural communities; and the complex links between food systems, rapidly changing agricultural production systems, and community systems.

Research priorities are also identified by stakeholders and partners within the regions. The North Central Regional Center for Rural Development has mobilized scientists to examine the community implications of moving to a more bio-based economy; e-commerce opportunities for remote areas and American Indian reservations; small stores and retail trade; leadership capacity and economic options in areas of population decline; the impact of Federal place-based poverty reduction programs; and methods of sustainable, participatory development. In the Northeast Regional Center, attention is directed to land use and rural development; other land use issues such as farmland preservation, farming on the urban fringe, and urban sprawl; and the emergence and adoption of information technology and its use for rural economic development. The Southern Center portfolio includes research on the food assistance needs of vulnerable populations; increasing diversity of the rural south; the quality of life for children and youth; opportunities and drawbacks of e-business; a systems approach to sustainable development; transitions in southern agriculture and related environmental issues; water quality and quantity issues; health care infrastructure; land use in urban-proximity areas; and workforce preparation and opportunities for new quality jobs in the south. In the west, research is underway on issues of rapid growth and sprawl; public land issues; the impact of energy deregulation on rural electric co-operatives; civic capacity and youth leadership; and the wildfire and residential interface and long term forest health issues.

The two state centers engage in research identified by stakeholders and partners in their respective states. In Louisiana, scientists are looking at rural school districts and teacher preparation; local government capacity; and access to and applications of information technology for rural organizations, agencies and individuals. In North Dakota, the principal investigator is studying the changing age structure and consequences for the state's labor force, as well as the contribution of the economic export services sector to counties in the state. In general, the research agenda of the centers taken together includes understanding trends and emerging issues in rural America; improving economic competitiveness and diversification; supporting the capacity for strategic planning; promoting constructive use and protection of our

natural resources; and helping individuals, families, businesses, farmers, ranchers, and communities adjust to change and achieve prosperity.

Question. According to the research proposal, or one of the principal investigators, what is the national, regional or local need for this research?

Answer. Rural communities and rural economies are increasingly complex and multi-dimensional. Restructuring in agriculture, the rapid rate of change and its uneven effects in rural America, and impacts of global markets are creating new challenges and opportunities for people, families, communities, farms, ranches, and businesses. The mix of challenges varies from one region to another and from one community to another. Some rural and urban communities struggle together with rapid growth, sprawl, congestion, and environmental degradation. Others contend with severe unemployment, out-migration, and loss of businesses and vital services. The significant Federal-state policy shift to “place-based” development puts an increasing burden on local communities to envision, plan, and create their own futures. Many communities lack the capacity to deal with these challenges or to grasp alternative opportunities. Increasingly, they are turning to the land-grant system for research, information, education, and assistance.

Although people living in rural America face an ever increasing number of public issues and problems needing resolution, the number of research faculty addressing broader rural issues is declining in many places. Multi-disciplinary, multi-state research supported by the four regional centers is even more crucial in this context. The regional centers have a proven track record of bringing together the most innovative minds—from both inside and outside the universities—to address cutting-edge issues without regard to state boundaries. They generate credible science-based information that clarifies these issues, and they provide science-based and tested tools for dealing with them. Their research and outreach activities support the public-private partnerships necessary to address the problems facing rural America.

The regional centers have assumed a national role in moving forward the scientific disciplines that underpin agriculture and community and economic development. Their approach increases the capacity for multi-disciplinary thinking and research; seeds new research fields; facilitates creation of new teams of scholars engaged in multi-state, multi-disciplinary and multi-institution research; and quickly moves research results to the constituents who need them. In this manner they play a unique role in the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The Rural Development Center mission is to strengthen rural families, communities, and businesses by facilitating collaborative research and extension education through land-grant institutions and their partners in the various regions and nationally. Research programs are undertaken after evaluating broad regional and national priorities. Following are some accomplishments of selected research activities conducted under the auspices of various centers.

The Southern Regional Development Center continues to receive national recognition for its Information Briefs, prepared to shed light on the host of challenges and opportunities facing governments, communities, and people in the South. They help national, state, and local leaders and officials understand and respond to the devolution of government services, rural transportation issues and welfare reform, family economics and individual development accounts, the cost of living, rural earnings capacity, job opportunities for low-income people, and child care issues. The center’s Millennium Series generates research on persistent and emerging problems in the rural South, as well as optimistic trends. Current topics include wage levels and quality jobs, the economic health of agricultural and non-agricultural firms, rural racial and ethnic diversity, rapid urbanization and its effects on natural and environmental resources, the demand for better educated workers, labor force skills, entrepreneurial opportunities and strategies to diversify the rural economy, the changing structure of families and related family services needs, and barriers to health care quality and access. The full complement of policy briefs will stimulate public dialogue needed to create vibrant, healthy rural communities in the rural South. The center was again chosen by the Economic Research Service to be involved in a small grants program to support research on food assistance and the needs of vulnerable populations in the south.

Like the other regional centers, the southern center links research with extension education in several ways. In fall 2000, it sponsored a direction-setting conference on “Sustainable Development: Building Quality Communities.” Co-chairs merged development perspectives from agriculture and natural resources and from community resource development to cross silos which have traditionally divided thinking about rural development across the country. In 2000, the center organized the first-ever institute designed to provide Extension agents a state-of-the-art health issues pro-

gram. Recent integrated programs were continued. For example, with land-grant faculty in the southeast, the center developed and continues to sponsor the Southern Regional Community Development Institute. Diverse extension educators—agriculture, natural resources, family and youth development, community development, and middle management—spend five days attending sessions on understanding community, strategic planning, asset-mapping, social infrastructure, local government, problem-solving, economic and sustainable development, and leadership skills. Demand for the training continues, and the center held its third Institute in the summer of 2000. The Mid-South Delta Institute also continues as an on-going participatory research and training program designed to help community leaders in northwest Mississippi develop skills in asset-mapping, strategic planning, building partnerships, and consensus-building.

The North Central Regional Center for Rural Development continues to expand its extensive repertoire of research that informs policy and sustainable community development programs. It now plays a national role in considering the community implications of moving to a more bio-based agriculture. It is supporting research and public advocacy coalitions around different issues related to biotechnology, work critical to the process of developing and maintaining a trusted and high quality scientific base. Other research examines points of intersection between trends in agriculture and rural economic and community vitality; demographic shifts and increasing ethnic diversity; and research on industrial recruitment and value-added firms locating in rural communities. Current research also focuses on ingredients to reduce gross migration in rural areas, e-commerce viability in remote areas and for diverse populations, the match between leadership development curricula and areas of persistent poverty, and the geography of rural financing and investment capital. Each of these research program areas is fully integrated with extension activities in the north central region. Its integrated approach has won national recognition for the center in the areas of workforce preparation, state of the art community visioning and strategic planning, social indicators for community and economic planning, and Federal program assessment including the Empowerment Zone/Enterprise Community initiative and national workforce preparation programs. The center has also supported research that enhances the scientific methods land-grant faculty use in applied research on rural development. For example, research demonstrates the power and utility of clustering geographic and demographic data and linking geodemographic clusters to Agriculture Census and Decennial data. Other research analyzes the future of small rural trade centers as providers of public services, the dynamics of rural retail trade, and the most critical needs of rural business communities. Through its workshops, conferences, training programs, and newsletter, Rural Development News, the North Central center provides research results and related educational materials to rural development professionals in land-grant and partner institutions and organizations across the country and internationally.

In the Northeast Regional Center, strategic planning during the first six months of 2000 under a new director resulted in valuable stakeholder input and a focused list of research and extension priorities. Small research and extension grants are now targeted for a more effective return on invested dollars. As a top priority, grants now support integrated activities on land use and rural development, with a land use conference to follow sometime in 2001. Farmland preservation, farming on the urban fringe, urban sprawl, and urban-rural conflict are issues highlighted for research and outreach. Information technology also emerged as an important area for research, and regional research and planning grew out of a joint four-center national conference in 2000. To facilitate research dissemination and networking capability in the region, the Northeast center set up specific briefing rooms on its website on land use/sprawl, community-supported agriculture, community design, business retention and expansion, workforce preparation, youth development, local government issues, entrepreneurship, leadership visioning, and consensus-building. In addition, the center identified and reported on two major trends affecting rural counties in the northeast: a persistent and growing gap between per employee earnings in metro and non-metro counties; and the steady increase in the share of self-employed workers in the total workforce. The center is now evaluating implications of these trends for development strategies.

As in the northeast, the Western Rural Development Center devoted part of 2000 to strategic planning and organizational development under a new director. One focus in the year was to build partnerships within the region, especially with the fabric of extension and experiment station program in the west. Input from these stakeholders helped identify priorities and programmatic goals. Because few faculty in the western land-grant institutions are actively involved in rural development work, the center organized a faculty development workshop, seeded the development of research proposals on rural development issues, and partnered with regional fac-

ulty on competitive grant programs, again in an effort to build the research capacity in the region. The center continued its work on a "Rapid Growth Toolkit" to help community leaders and local governments understand and address rapid growth at the community level.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1971, \$75,000; fiscal year 1972, \$225,000; fiscal year 1973, \$317,000; fiscal years 1974–1981, \$300,000 per year; fiscal years 1982–1985, \$311,000 per year; fiscal years 1986–1987, \$363,000 per year; fiscal year 1988, \$475,000; fiscal year 1989, \$500,000; fiscal year 1990, \$494,000; fiscal years 1991–1993, \$500,000 per year; fiscal year 1994, \$470,000; fiscal years 1995–1998, \$423,000 per year; fiscal years 1999–2000, \$523,000 per year; and fiscal year 2001, \$521,849. A total of \$11,685,849 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds available to the four regional centers, as previously reported, were: fiscal year 1991, \$1,117,000; fiscal year 1992, \$790,000; fiscal year 1993, \$900,000; fiscal year 1994, \$776,591; and fiscal year 1995, \$710,050; for a total of \$4,293,641 across those five years. Non-Federal funds available to the four regional centers since 1995 were: fiscal year 1996, \$3,559,662; fiscal year 1997, \$1,322,237; fiscal year 1998, \$2,660,048; fiscal year 1999, \$1,472,249; fiscal year 2000, \$1,300,990; fiscal year 2001, \$1,573,316. The total for 1996 through 2001 is \$11,888,502. Non-Federal partners sponsoring research and related extension programs through these centers since 1995 include the Farm Foundation, the Northwest Area Foundation, the University of Kentucky's Tennessee Valley Authority Rural Studies Program, the W. K. Kellogg Foundation, the Upjohn Institute, the Kerr Center for Sustainable Agriculture, the National 4-H Council, the Heartland Center, Farmer's Legal Action Group, Pegasus Satellite Television, and Cornell University's Conneman project. Other Federal partners include the U.S. Environmental Protection Agency, the Small Business Administration, and in USDA—Rural Development, Economic Research Service, Agricultural Research Service, Forest Service, Sustainable Agriculture Research and Education, and National Resource and Conservation Service. The regional centers continue to expand their non-Federal partnership base and have established an impressive record of brokering partnerships with private foundations and non-governmental organizations, as well as other Federal partners, to meet their goals and extend the impact of their allocated Federal dollars.

Question. Where is this work being carried out?

Answer. The four regional rural development centers include the following: Northeast Regional Center for Rural Development at Pennsylvania State University; North Central Regional Center for Rural Development at Iowa State University; Southern Rural Development Center at Mississippi State University; and Western Rural Development Center at Utah State University. The state level rural development centers are at North Dakota State University and Louisiana Tech University. Most of the research sponsored by the four regional centers is performed by resident faculty at land-grant universities in the respective region through subcontracts from that center's grant.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. The regional rural development centers were established to provide an on-going "value added" component to link research and extension and by doing so to increase rural development under the special conditions in each region. The work of the Centers is being carried out in all 50 states and in some territories. The Centers compile a report of annual accomplishments and share those with the states in the region. Accomplishments are now shared through sophisticated, interactive web sites. The list of needs is constantly evolving and is being addressed through projects that are matched to the constantly shifting local and regional agenda. The current phase of the program will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposals for the four regional and two state centers have all undergone merit reviews. The regional centers enlist the help of academic and private/public foundations personnel on advisory committees, boards of directors, and technical advisory committees to help establish research and extension priorities and operating rules and to provide professional, technical counsel and peer evaluation of Center projects and the investigators. The projects are evaluated annually through

peer review of scientific merit by the advisory committees and through merit review by the boards of directors against the five key issue areas and the objectives of each project for relevance, achievement, and initial impacts. Follow-up evaluation is carried out by the Center staffs in order to assess long-term impacts of these projects on local communities.

The Southern Rural Development Center was engaged in strategic planning over the course of the last six months of 2000. Input from over 150 individuals was studied by the Technical Advisory Committee and discussed at its fall 2000 meeting. That committee will submit recommendations in January 2001 to the Center's board of directors.

A full outside review of the North Central Regional Center for Rural Development was conducted in 2000. The review team concluded, "The Center is doing consistently high quality work. It has had considerable impact on rural development research and extension in the land-grant universities across the region, and nationally, and it has been of benefit to many non-government organizations, community leaders, and state and Federal agencies beyond the land-grant system." The team's positive assessment of the Center's performance led it to recommend that "The Center should continue its integrative research-engagement approach in its own projects but it is now time to take this approach beyond its own projects and become a promoter and teacher of an integrative approach throughout the region and the country. The Center is a leader in rural development at the national and regional levels and has facilitated and nurtured the development of leadership among the region's states and communities."

RURAL POLICIES INSTITUTE, NE, IA, MO

Question. Please provide a description of the research that has been funded under the Rural Policies Institute, Nebraska, Iowa, and Missouri grant.

Answer. The Rural Policy Research Institute is a consortium of three universities designed to create a comprehensive approach to rural policy analysis. The Institute conducts research and facilitates public dialogue to increase public understanding of the rural impacts of national, regional, state, and local policies on rural areas of the U.S.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. There is a need to estimate the impacts of changing state and national programs and policies on rural people and places. Objective public policy analysis can provide timely and accurate estimates of the impacts of proposed policy changes to allow more reasoned policy discussions and decisions. The principal researcher believes this research meets national, regional, and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Rural Policy Research Institute was to create a new model to provide timely, accurate, and unbiased estimates of the impacts of policies and new policy initiatives on rural people and places. That model was developed, and the Institute's policy analysis research and dissemination activities have expanded significantly. The Institute's programs develop in response to current and emerging issues in rural America. Work in 2000 centered on six Institute projects: the Community Policy Analysis Network, Rural Equity Capital Initiative, Rural Health Panel, Operation Rural Health Works, Targeted Rural Economic Development, and Rural Welfare Reform Panel. The Community Policy Analysis Network refined methods of modeling policy alternatives at the community level. Their efforts provide quantitative estimates of economic, demographic, and fiscal effects of policy alternatives on local communities of different types and in different regions. Members of the Network published 2 white papers, 9 journal articles and book chapters, and 15 staff papers and research reports. The Rural Equity Capital Initiative mobilized scientists to examine issues related to access to capital for rural development and resulted in 2 policy briefs, 5 presentations at conferences, and consultations with governors in Ohio and Missouri. Rural Health Panel members published 6 policy papers, 2 policy briefs, and 2 journal articles. They also contributed to congressional staff briefings on medicare, prescription drugs, and other rural health insurance issues and presented papers at seven professional meetings. Through Operation Rural Health Works, the Institute published a policy brief on community-level impacts of losing health care infrastructure and produced a video on saving rural hospitals. Other outreach included Congressional testimony, presentations at 13 professional meetings, and workshops in Washington, D.C., and 13 states. The Institute's work on Targeted Rural Economic Development is a new project area. It resulted in presentations and extension programs in four states, website publications,

and steps to establish partnerships for the project, including the U.S. Forest Service and the Economic Development Administration. The Rural Welfare Reform Panel published two white papers and a database on welfare reform research, and the Institute co-sponsored a national research conference and organized a congressional briefing on rural dimensions of welfare reform. During 2000, the Institute also analyzed classifications of metropolitan and micropolitan areas proposed by the Office of Management and Budget; developed methods to analyze the impacts of Living Wage legislation on workers, businesses, and the public sector; advised the National Governors' Association on workforce development and entrepreneurship; served as a consultant for the Wallace Institute on the Farm Bill and for the Kauffman Foundation on minority, rural, and non-profit strategic planning; served on the Pinchot Institute's Task Force reviewing the U.S. Forest Service Cooperative Forestry Programs; and worked with the Congressional Rural Caucus on numerous briefings. The Institute's work is published and cited in numerous academic journals, discussed in the media, and widely used by policy decision makers at all levels of government.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by these grants began in fiscal year 1991 and the appropriation for fiscal year 1991 was \$375,000. The fiscal year 1992 appropriation was \$525,000; for fiscal year 1993, \$692,000; for fiscal year 1994, \$494,000; for fiscal years 1995–2000, \$644,000 each year; and for fiscal year 2001, \$820,192. A total of \$6,770,192 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Aggregated non-Federal funds to support the Rural Policy Research Institute across the three involved universities include unrecovered indirect costs, salary support from university and other non-Federal sources, and various other grants, contracts, and reimbursable agreements. They amounted to \$316,458 for fiscal year 1991; \$417,456 in fiscal year 1992; \$605,302 in fiscal year 1993; \$537,834 in fiscal year 1994; \$584,516 in fiscal year 1995; for fiscal year 1996, \$576,782; for fiscal year 1997, \$186,859; for fiscal year 1998, \$153,614; for fiscal year 1999, \$168,450; for fiscal year 2000, \$137,254; and an estimated \$188,382 for 2001. Total to date, including the 2001 estimate, is \$3,872,907.

Question. Where is this work being carried out?

Answer. The Institute's member universities are: the University of Missouri-Columbia; the University of Nebraska-Lincoln; and Iowa State University, Ames.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1991 was for a period of 24 months; however, rural communities continue to be impacted by major socio-economic changes as well as state and Federal policy changes. Citizens and elected officials at all levels of government continue to need expert analysis of the impacts of current policies and policy changes and of alternatives. CSREES funding supports the Institute's ability to generate research on changing conditions in rural America and conduct briefings on a myriad of rural policy issues. The current phase of the program will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1999, as it evaluated the 1999 project proposal, and determined that: "[The Institute] is an effective interdisciplinary, multistate effort that supports the mandates for collaboration in the Agricultural Research, Extension and Education Reform Act of 1998. Its work supports CSREES strategic goals of enhancing economic opportunity and quality of life. The principal investigator and participants are well qualified to conduct the project."

RUSSIAN WHEAT APHID, COLORADO

Question. Please provide a description of the research that has been funded under the Russian Wheat Aphid, Colorado grant.

Answer. Funding will support two key areas of research that are needed to assure long-term and sustainable Russian wheat aphid management. These are: (1) Discovering new crop genes which provide resistance to the Russian wheat aphid and incorporating them into commercially-acceptable wheat varieties, and (2) Integrating the available control tactics into the most effective, efficient, and environmentally-sound production systems for the Great Plains.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Russian wheat aphid is an exotic invasive pest that entered the western U.S. without its normal complement of biological control agents. This insect has rapidly become the most important insect pest of wheat in the western U.S. From 1986–1991, the total economic impact was estimated to be in excess of \$657 million. In the same period, some 17.5 million pounds of insecticides were used nationally for Russian wheat aphid control. The cost to American farmers of insecticide treatments was over \$70 million. In addition, the intense use of insecticides on a crop that previously received little insecticide treatment raised concerns about the impact on water quality, human health, food safety, non-target organisms, and general environmental quality. Direct losses in Colorado have been as high as \$27 million in a single year with an average direct loss of above \$11 million per year since 1987.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of the research are to: (1) Discover new crop genes which provide resistance to the Russian wheat aphid and incorporate them into commercially-acceptable wheat varieties; and (2) Integrate the available control tactics into the most effective, efficient, and environmentally-sound production systems for the Great Plains. The techniques of molecular genetics are being employed to reach the goal of identifying new genes for resistance to Russian wheat aphid and incorporating them into commercially-acceptable wheat varieties.

In addition, the mapping effort of this project will access cDNA libraries produced under a National Science Foundation grant awarded to a team of U.S. wheat researchers for the purpose of developing tools for wheat genomics. Progress has been made in Integrating Tactics for Management of the Russian wheat aphid. In 1998, experimental dryland cropping systems were established in eastern Colorado. Long-term studies compare the experimental systems with typical wheat production systems in the area. The experimental systems were designed to optimize the effects of environmentally-sound pest management tactics and Russian wheat aphid numbers through the actions of predators and parasites. In addition, the experimental systems were designed to optimize water use efficiency and other agronomic and profitability factors.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal years 1998 through 2000 was \$200,000 per year; and for fiscal year 2001, \$249,450. A total of \$849,450 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. State appropriations and the Colorado Wheat Administrative Committee have demonstrated strong support for this effort. The total per year is approximately \$775,000 in new funding from the state of Colorado and redirected funds from within the university.

Question. Where is the work being carried out?

Answer. Research will be conducted on the campus of Colorado State University, at Colorado State University research stations, and on the farms of cooperators throughout Colorado. Outreach and extension activities are being shared with scientists and wheat growers in Colorado, Nebraska, Wyoming, Kansas, New Mexico, Texas, and Oklahoma.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project is anticipated to continue for a total of five years with a completion date of July 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was evaluated by a CSREES site visit on February 4 and 5, 1999. Laboratory, greenhouse, and field research facilities available for the research program underway are excellent and progress has been excellent. Greenhouse space appears adequate for the work, and the units are well adapted for the wheat breeding program. Rearing facilities and the support personnel for maintaining a source of aphids used for bioassays are also excellent. Research laboratories are very well equipped for the studies, either proposed or underway, and there is strong technical support for the research which involves application of techniques of molecular genetics to wheat breeding. The research scientists represent strengths in both classical or traditional wheat breeding and new molecular genetics-based

wheat breeding. The group also has strong, well recognized expertise in Russian wheat aphid biology, ecology, and management and also in dryland wheat production systems used in the Great Plains states. In short, there would appear to be few, if any, other locations which could match the combination of facilities, equipment, and scientific and technical support needed to achieve the goals of this project. The project is a multifaceted, multi-disciplinary program which is directed toward long-term solutions for Russian wheat aphid management utilizing a viable combination of approaches which requires the type of facilities and equipment available at this location.

SAFE VEGETABLE PRODUCTION, GEORGIA

Question. Please provide a description of the research that has been funded under the Safe Vegetable Production, Georgia grant.

Answer. This is a new grant and the University of Georgia is presently preparing a grant proposal for submission.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. According to the principal investigator, 1.37 billion tons of animal manure is produced annually in the United States. Approximately 90 percent of this is produced by cattle. Farm surveys indicated that 1 to 5 percent of the cattle shed *E. coli* 0157:H7, a human pathogen, in their manure. Since human consumption of organic produce is increasing at an unprecedented rate, and since many organic farmers use bovine manure as a fertilizer, research is needed to develop practical methods of treating manure to assure that it is safe when used as a fertilizer in vegetable production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to evaluate the hazards associated with manure used as fertilizer in vegetable production and to develop innovative and practical treatments to reduce the risk of spreading harmful microorganisms to crops from manure.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001.

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$284,373.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. This is a cooperative project between the Center for Food Safety and Quality Enhancement, University of Georgia, Griffin; the Coastal Plain Experiment Station, University of Georgia, Tifton; the USDA/ARS Soil-Microbial Systems laboratory, Beltsville, Maryland; and private industry. Industry has committed \$50,000 to this project for fiscal year 2001.

Question. Where is this work being carried out?

Answer. The work is being carried out at the Center for Food Safety and Quality Enhancement, University of Georgia, Griffin; the Coastal Plain Experiment Station, University of Georgia, Tifton; and the USDA/ARS Soil-Microbial Systems laboratory, Beltsville, Maryland.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. The anticipated completion date for the original objectives is the end of fiscal year 2004. This is a new project and research of the original objectives has just begun.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. A peer review of the project will be undertaken by the performing institution, and the agency will conduct a throughout evaluation of the proposal upon receipt.

SATSUMA ORANGE PRODUCTION, ALABAMA

Question. Please provide a description of the research that has been funded under the Satsuma Orange Production, Alabama grant.

Answer. This is a new grant and Auburn researchers are presently preparing a grant proposal for submission.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Satsuma oranges are a type of orange commonly referred to as tangerines. In the past, there was significant production of satsuma oranges in Alabama. However, a series of unusually cold winters has placed this important production system at risk of being lost. Research is needed to determine practical new methods for raising satsuma oranges and to develop cold tolerant plant material.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify new ways of producing satsuma oranges under potentially unfavorable environmental conditions. This is a new grant and the work has not yet begun.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001.

Answer. The work supported by this grant begins in fiscal year 2001 and the amount appropriated for fiscal year 2001 is \$473,955.

Question. What is the amount and source of non-Federal funds provided by fiscal year?

Answer. Presently no non-Federal funds are being provided.

Question. Where is this work being carried out?

Answer. The work is being carried out by the Alabama Agricultural Experiment Station, with a subcontract to the Citrus Research Station of the Louisiana Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have these been met? What is the anticipated completion date of the additional or related objectives?

Answer. This is a new project and the anticipated completion date has not yet been determined.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. This is a new project. A peer review of the project will be undertaken by the performing institution and the agency will conduct a throughout evaluation of the proposal upon receipt.

SCLEROTINIA DISEASE RESEARCH, MINNESOTA

Question. Please provide a description of the research that has been funded under the Sclerotinia Disease Research, Minnesota grant.

Answer. Research will focus on spring planted canola which is increasing in importance as an alternative crop in the upper midwest states of Minnesota and North Dakota. The main objective of the research is to develop strategies for growers to use to manage sclerotinia to prevent yield reductions in canola fields.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The scope of the research will be to investigate the disease Sclerotinia, also known as white mold, affecting canola. This is a serious disease that affects a number of rotational crops such as sunflower, soybeans, dry beans, and canola in the Red River Valley of Minnesota and North Dakota. Yield losses can be as high as 50 percent. Canola is a source of an excellent low-saturated fat edible oil the can be used to meet increased consumer demands for healthy oil.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The main objective of the research is to develop strategies for growers to use to manage sclerotinia to prevent yield reductions in canola fields. There are six sub-objectives which are: variety evaluation and selection; fungicide evaluation for control of sclerotinia; sclerotinia forecasting model for sclerotinia control; sclerotinia ascospore infection techniques for canola; influence of crop rotation on canola diseases; and survey of grower fields for sclerotinia.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001 ?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$237,476.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since the proposal has not been submitted to CSREES, the non-Federal funds and sources provided for this grant cannot be determined at this time.

Question. Where is this work being carried out?

Answer. Research will be conducted jointly by the University of Minnesota and the North Dakota State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is five years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the programmatic merits of the proposal by at least one senior scientist. Additionally, the university will provide a peer review prior to submitting their grant.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, ALASKA

Question. Please provide a description of the research that has been funded under the Seafood Harvesting, Processing, and Marketing, Alaska grant.

Answer. This project was initiated in fiscal year 2000. The goal of this project is to improve and develop technologies in seafood harvesting, processing, product development, and marketing Alaska. The CSREES Seafood Harvesting, Processing, and Marketing Program for fiscal year 2000 has six subprojects. They are entitled: "Building an Industrial Test Version of a High Capacity Automated Pinbone Removal Machine for In-Plant Tests", "Utilizing By-Catch: Developing Processes for Texturized, Cooked Minces for Food Service Application", "Opportunities for Flaked Products from Pink Salmon", "Feasibility Study—Evaluation of Spectroscopic and Imaging Technologies for Detecting Bruising in Salmon", "The Digital Observer Project—Development of Fish Recognition and Weight Estimation Software" and "Feasibility Study for Alaska Herring Food Product Diversification." A proposal in support of fiscal year 2001 has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Alaska harvests more than half of all the fish landed in the U.S. and upwards of 65 percent of the food fish. The subprojects in this program are designed to help increase the value of Alaska's Seafood Industry through fostering greater utilization of the fisheries resources as human food and greater efficiency in their production. Federal support for research in this area has dropped from \$17.3 million to little more than \$1 million nationwide, largely through a significant reduction in Saltonstall-Kennedy funds. The funds are appropriated from duty collected on imported seafood to National Marine and Fisheries Service, which in turn makes grants to U.S. universities. USDA traditionally has supported fish food research primarily from aquacultured fish. The State of Alaska and private industry have been supporting applied fisheries research. Though the product is harvested in Alaska, the benefits are shared with fishermen residents in Washington State, Oregon, California, and throughout the nation.

Question. What is the original goal of the research and what has been accomplished to date?

Answer. The objective is to complete the six subprojects listed above. These projects have considerable significance to the Seafood Industry. Informed people from government and industry helped to identify the most important objectives facing the industry. The subprojects mentioned address pertinent research needs in the areas of harvesting, processing, and marketing of Alaska seafood.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This project was started in fiscal year 2000 with an award of \$552,500. In fiscal year 2001, the amount to be appropriated is \$1,165,430. A total of 1,717,930 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. Our estimates for industry contributions for the subprojects are as follows: (1) Building an Industrial Test Version of a High Capacity Automated Pinbone Removal Machine for In-Plant Tests, Summer 2000. Industry contributions total \$18,000; (2) Utilizing By-Catch: Developing Processes for Texturized, Cooked Minces for Food Service Application. Industry contribution \$28,000; (3) Opportunities for Flaked Products from Pink Salmon. Industry contribution \$15,000; (4) Feasibility Study—Evaluation of Spectroscopic and Imaging Technologies for Detecting Bruising in Salmon. Industrial contribution \$8,500; (5) Digital Observer Project—Development of Fish Recognition and Weight Estimation Software. This is part of a much larger project for which the total industrial contribution is over \$200,000; and (6) Feasibility study for Alaska Herring Food Product Diversification. Industrial contribution \$13,200. Total industry contribution is approximately \$282,700.

Question. Where is this work being carried out?

Answer. Research is being conducted by scientists at the University of Alaska—Fishery Industrial Technology Center in Kodiak, Alaska; The University of Alaska, Fairbanks; The Center for Applied Regional Studies, Cambridge Massachusetts; Washington State University; and Cornell University.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The anticipated completion of the full objectives of this research is one year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was reviewed on August 30, 2000. The proposal aims to advance the Alaskan Seafood Industry through research problems facing harvesting, processing, and marketing of seafood. The goal is to increase the resources and value of Alaskan seafood. New and value added products will be developed from pink salmon, herring, and arrow tooth flounder. Appropriate new technologies will be developed.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, MISSISSIPPI

Question. Please provide a description of the research that has been funded under the Seafood Harvesting, Processing, and Marketing, Mississippi grant.

Answer. Research related to seafood safety, quality, and by-product utilization has been supported by this grant. For fiscal year 2000, funds supported research on: (1) antimicrobial potential of phloxine B against *Listeria monocytogenes*, *Escherichia coli*, *Saccharomyces cerevisiae*, and *Aspergillus niger*; (2) effects of starvation and acid stress on the growth characteristics, heat tolerance, freeze thaw stability, and virulence factor expression of *Aeromonas hydrophila*; and (3) processing yield and proximate composition, color, microbial counts, and surimi quality of mince obtained from under-utilized Gulf Coast fish. Funds from the fiscal year 2000 grant are supporting research through September 30, 2001. A proposal in support of fiscal year 2001 funds has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The national needs reflected in the project include providing consumers with affordable alternative seafood products and assessing the food safety implications of new antimicrobial agents and emerging pathogens. Continuation of this project will provide continued assistance to Gulf-Coast seafood processors in meeting new U.S. regulations as well as new international regulations that are important for Mississippi export products. Locally, catfish processors are a major employer of the severely economically-depressed Delta region of Mississippi. By further enhancing the value of catfish products, this project seeks to improve the livelihood of individuals both on the Gulf coast and in the aquaculture region of the state.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goals of the research were to improve the quality and safety of catfish and improve the utilization of catfish byproducts and underutilized marine species. Due to successes of the original project, subsequent efforts are focusing on additional uses of seafood and aquaculture foods by improving processing strategies and providing alternative products from waste materials. The project has thus expanded to include crab, shrimp, oysters, freshwater prawns, hybrid striped bass, tilapia, and crawfish. The Food and Drug Administration has passed rulings affecting the potential viability of Mississippi seafood and aquaculture harvesters and processors; emphasis is thus being placed on addressing possible adverse consequences resulting from these changes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1990 when \$368,000 was appropriated for this project. The appropriations for fiscal years 1991–1993 were \$361,000 per year; fiscal year 1994, \$339,000; fiscal years 1995–2000 \$305,000 each year; and fiscal year 2001, \$304,329. A total of \$3,924,329 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The State of Mississippi contributed \$1,949 to this project in fiscal year 1991; \$41,286 in fiscal year 1992; \$67,072 in fiscal year 1993; \$91,215 in fiscal year 1994; \$147,911 in fiscal year 1995; and \$61,848 in fiscal year 1996. Product sales contributed \$7,044 in 1991, \$13,481 in 1992, \$13,704 in 1993, and \$5,901 in 1994.

Industry grants contributed \$14 in 1992 and \$31,796 in 1993. Other non-Federal funds contributed \$80 in fiscal year 1991, \$838 in 1992, and \$17,823 in 1993. The total non-Federal funds contributed to this project from 1991 through 1996 was \$501,962. In fiscal year 1998, \$151,286 in state funds, \$8,790 in self-generated funds, and \$23,877 in other non-Federal funds were obtained. In fiscal year 1999, \$65,998.05 in state funds were contributed to this project. Information on funding for 2000 is not currently available.

Question. Where is this work being carried out?

Answer. Research is being conducted by scientists in the Departments of Food Science and Technology and Agricultural Economics of the Mississippi Agricultural and Forestry Experiment Station at Mississippi State University and at the Coastal Research and Extension Center, Seafood Processing Laboratory, in Pascagoula, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal investigators anticipate that research on the original objectives will be completed in 2000. Continuing needs by Mississippi seafood and aquaculture harvesters and processors related to improved quality, safety, and utilization will require research and development of new technologies to expand this industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The last review of the proposal was conducted on August 30, 2000. At that time, the agency science specialist believed that the projects addressed needs and interests of the regional seafood and aquaculture industries.

SEAFOOD SAFETY, MASSACHUSETTS

Question. Please provide a description of the research that has been funded under the Seafood Safety, Massachusetts grant.

Answer. Research will be conducted to improve the safety of seafood products.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher indicates the need to strengthen the local and Northeast region fisheries industry by addressing and solving priority seafood safety issues critical to assuring public health and maintaining consumer confidence in a variety of economically-important fisheries and aquaculture products.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to investigate handling, storage, and processing techniques which will improve the food safety of seafood products. Accomplishments to date include examination of fresh fish samples at the retail level for the human pathogen, *Listeria monocytogenes*, and evaluation of several chemicals classified as generally regarded as safe to inhibit the growth of the human pathogen under investigation.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000. The appropriation for fiscal year 2000 was \$255,000 and the fiscal year 2001 appropriation is \$277,388. The total appropriated for this project is \$532,388.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 2000, \$13,000 was obtained from the American Meat Institute, and an additional \$12,000 was made available from the Department of Food Science, University of Massachusetts, Amherst, Industrial Endowment Fund. Additional non-Federal funds are anticipated for the fiscal year 2001 grant.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Massachusetts-Amherst, Chenoweth Laboratory of the Department of Food Science through the Agricultural Experiment Station and in cooperation with seafood processing plants located in Gloucester and Boston, Massachusetts.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2002. Work is progressing and is still ongoing relative to the original objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency will evaluate the progress of this project on an annual basis. The university submitted an accomplishment report for evaluation purposes for fiscal year 2000 activities that will be updated in the new grant proposal submitted to CSREES for fiscal year 2001 funding. The 2001 CSREES review will be completed within three weeks of submission of the fiscal year 2001 grant proposal.

SMALL FRUIT RESEARCH, OR, WA, AND ID

Question. Please provide a description of the research that has been funded under the Small Fruit Research, Oregon, Washington, and Idaho grant.

Answer. Funding for this special grant has been used to enhance the production and quality of small fruits—blackberry, blueberry, caneberry, cranberry, marionberry, raspberry, strawberry, and grape in the Pacific Northwestern states of Idaho, Oregon, and Washington. Research has been focused on crop genetics, production/physiology, pest management, berry/grape processing, marketing, and wine production. Proposals are reviewed and selected after evaluation of their scientific merit and relevance to priorities identified within the region.

Question. According the research proposal, or the principal researcher, what is the national, regional, and local need for this research?

Answer. The importance of berry and grape crops to the region has long been recognized by the three northwest states: Washington, Idaho, and Oregon. These crops are mainstays of high-value, specialty horticulture. The universities and small fruits industry have made a strong commitment to the improvement of these crops as evidenced by the high level of internally-developed resources for research and marketing. There is a considerable demand for fresh and processed berry products in the U.S. and in urban Asian markets. Research on international consumer preferences, packaging, and products continues to be essential.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Genetic improvement of small fruit cultivars continues to be a powerful tool using germplasm collection and identification, field evaluation of new germplasm, and advanced selections from breeding programs, virus identification and elimination, and approaches that utilize genetic engineering. Research is identifying cultivars and developing cultural practices that growers can utilize to reduce crop losses. Research is evaluating and investigating nutritional factors, cultural management, temperature stress, effects of pruning, micro propagation, cold hardness/low temperature injury, and effects of viticulture practices on wine quality and of winery processing on wine quality.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001.

Answer. The initial support for this grant was an appropriation in fiscal year 1991 for \$125,000. The fiscal appropriation for 1992 and 1993 was \$187,000 per year; fiscal year 1994 was \$235,000; fiscal years 1995–1998 were \$212,000 each year; fiscal year 1999 and 2000 was \$300,000 each year; and is \$324,285 for fiscal year 2001. A total of \$2,506,285 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. There are no non-Federal funds supplementing this grant. This project involves the use of the Oregon State University administrative personnel, equipment, utilities, and facilities that are indirect costs to the project. These costs constitute an OSU contribution to this research project.

Question. Where is the work being carried out?

Answer. The research is being conducted at Oregon State University, Washington State University, and the University of Idaho. Oregon State University is the lead institution for this project.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives are still valid researchable issues, therefore this is a continuing process with priorities annually re-evaluated to appropriately adjust research direction within the project objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project evaluation process is accomplished annually by peer reviewers whom are chosen and organized by expertise according to the five technical working groups with input from the designated Agricultural Experiment Station

Representatives in Washington, Oregon, and Idaho. The Program Administrator in each state contacts possible reviewers for each proposal. The chair of the review process annually rotate between the Agricultural Experiment Station representatives. Each submitted proposal is peer-reviewed by a panel of five individuals—three scientists and two industry representatives—and is grouped into one of the Center Technical Working Groups, namely genetics, pest management, production/physiology, processing/packaging, and marketing. Proposals are evaluated on the following criteria: (1) The nature of the proposed research and its relevance to the needs of the small fruit industries; (2) The relevance of the proposal to current small fruit research designated priorities; (3) The scientific expertise of the scientists involved—training, experience, and accomplishments relative to specific areas of small fruit research; (4) The appropriateness of the level of funding requested, vis-a-vis, availability of funds; and (5) The likelihood of success. Reviewers complete an evaluation sheet for each proposal, rating the five criteria on a scale of one to ten, with ten being the best. Previously awarded projects are given special consideration in order to allow for funding for up to three years—when appropriate progress is demonstrated. Compilation of evaluations are distributed to the three Agricultural Experiment Station Directors and the USDA-Agricultural Research Service—ARS—Horticultural Crops Research Laboratory Research Leader, who make the final determination of funding for each proposed project. Notification of awards are made in December. The peer review of all proposals is coordinated and processed through the Northwest Center for Small Fruit.

SOUTHWEST CONSORTIUM FOR PLANT GENETICS AND WATER RESOURCES

Question. Please provide a description of the work that has been funded by the Southwest Consortium for Plant Genetics and Water Resources Grant.

Answer. Work funded by this grant is cooperative, innovative, and relevant to crop adaptation in arid and semi-arid lands. The primary objectives of research funded by the Southwest Consortium are: to determine and evaluate tolerance to biological and chemical stresses in desert plants, to determine the impact of these stresses on susceptibility of plants to pests and pathogens as well as on the activities of symbionts and beneficial organisms, and to determine and evaluate genetic modification of plants that are targeted for better adaptability to stress of arid and semi-arid environments and the problems of water use efficiency and water quality.

All funded research has a water and a genetic component and requires an interdisciplinary research team. The interdisciplinary research teams are formed from researchers at the five participating southwestern institutions, which include New Mexico State University, Texas Tech University, Los Alamos National Laboratory, University of Arizona, and the University of California in Riverside.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This research is highly significant on all levels. The Southwest Consortium conducts an integrated program that identifies specific problems of southwest agriculture, coordinates water and biotechnology research aimed at solving these problems, and facilitates the transfer of this information for further research, development, and commercialization. This coordinated arid lands research is relevant, necessary, and can be applied regionally, nationally, and locally, as well as be applied for international improvements of arid lands agriculture.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original and ongoing goal of this research is to provide funding for the development of innovative and competitive research that is relevant to arid lands agriculture. The Southwest Consortium is a mini-grant program which awards seed money to researchers from the five participating institutions. Projects are selected for funding based on a thorough external and committee peer review. Over 50 projects have been funded since the Consortium was established in 1986, with numerous accomplishments in research relevant to arid lands agriculture. Among the most recent accomplishments are: genetic analysis of heat tolerance in cotton; hydraulic lift to improve drought tolerance in crop plants; molecular mapping of heat tolerance genes in corn; exploration of plant defenses to aphids and whiteflies; and identification of stress induced gene products using enhancer gene traps. Data collected from the first ten years of the Consortium—1986–1995—show that Consortium funding has been successfully leveraged by researchers toward the acquisition of an additional \$4,836,208 in research funding from other agencies, and that a total of 88 peer review scientific publications resulted from Consortium work funded during this period.

Question. How long has this work been under way and how much has been appropriated through the year 2001?

Answer. The work supported by this grant began in fiscal year 1986 and has been provided with appropriations of the following amounts: fiscal year 1986, \$285,000; fiscal years 1987 through 1989, \$385,000 per year; fiscal year 1990, \$380,000; fiscal years 1991 through 1993, \$400,000 per year; fiscal year 1994, \$376,000; fiscal years 1995 through 2000, \$338,000 per year; and fiscal year 2001, \$368,188. A total of \$5,792,188 has been appropriated since fiscal year 1986.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The source of matching funds is derived from the support from the five participating institutions in the form of support researchers, salaries, facilities, equipment maintenance, and administrative assistance. It is estimated that the amount of non-Federal supporting funds during fiscal years 1993–2000 is \$100,000 per year.

Question. Where is this work being carried out?

Answer. Research on this grant is conducted at the five participating institutions in the laboratories and support laboratories of the principal investigators on each mini-grant project.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Southwest Consortium was initiated in 1986. Each year, additional and related objectives have been developed and the anticipated completion date for these is 2002. The original objectives of the project have successfully been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation provided.

Answer. Mini-grants are awarded competitively to support research that will lead to solutions of problems unique to agricultural production in the southwest. The mini-grant selection process is competitive with each proposal subjected to a rigorous review process that includes external scientific peer review and internal review by the Consortium Steering and Scientific Committees. A progress report is submitted for review by each funded mini-grant project prior to the award of second year funds. CSREES reviews the complete Southwest Consortium progress report on a yearly basis.

SOYBEAN CYST NEMATODE, MISSOURI

Question. Please provide a description of the research that has been funded under the Soybean Cyst Nematode, Missouri grant.

Answer. The research being funded by this grant is crucial to the development of effective management strategies to understand host parasite relationships of the pathosystems and each of its components. Work has dealt mainly with identifying *Heterodera glycines*-resistant genes and incorporating them into agronomically-superior cultivars. Basic studies elucidate the fundamental biology of the cyst nematode in regard to new management strategies. Applied work dealt with evaluating production systems and to new management strategies. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for the research?

Answer. The principal researcher believes that although this research is focused on the soybean cyst nematodes in Missouri, the problem is of regional and national significance. The soybean cyst nematode, *Heterodera glycines* is the most serious pest of soybean in the U.S. The problems continue to increase in the midwest where 12 states have yield reductions in soybean because of this nematode. Due to the nematodes ability to adapt to resistant varieties over time, new varieties are continually needed.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is managing soybean cyst nematode through the various management strategies including the development of new resistant soybean varieties. To date, several nematode resistant soybean lines have been or will be released. The need for breeding soybean lines to develop resistant varieties with a broad spectrum of resistance continues. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Other aspects of the work relates to field management strategies for these nematodes.

Question. How long has work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1979, \$150,000; fiscal years 1980–1981, \$250,000 per year; fiscal year 1982, \$240,000; fiscal years 1983–1985, \$300,000 per year; fiscal years 1986–1989, \$285,000 per year; fiscal year 1990, \$281,000; fiscal year 1991, \$330,000; fiscal years 1992–1993, \$359,000 per year; fiscal year 1994, \$337,000; fiscal years 1995–1997, \$303,000 per year; fiscal year 1998, \$450,000, fiscal years 1999–2000, \$475,000 per year; and fiscal year 2001, \$598,680. A total of \$7,503,680 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$105,012 state appropriations in 1991; \$84,368 state appropriations in 1992; \$168,017 state appropriations in 1993; \$118,725 state appropriations in 1994; \$33,498 in 1995 and 1996; \$33,723 in state appropriations in 1997; \$37,445 in state appropriations in 1998; and \$201,994 in 1999 and \$200,000 in 2000.

Question. Where is this work carried out?

Answer. This research is being conducted at the Missouri Agriculture Experiment Station and the University of Missouri.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Many objectives are being met, but genetic interaction of the soybean cyst nematode/soybean is extremely complex. The anticipated completion date of the continuing research is in 2004–2006.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation of this project was a merit review in January 1999 and the renewal project was evaluated in 2000. In summary, continued development of new management strategies for the soybean cyst nematode is extremely important. Progress continues with nematode resistance being released yearly as well as excellent progress in other management strategies. Certified seed of MPV437–NRR was made available to farmers in 1999. A new soybean variety, “Anand” was released in 2001. Another high yielding soybean strain, S96–1908 was developed that is resistant to all races of soybean cyst nematodes and is being evaluated in the uniform tests. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Seven genetic markers associated with loci controlling resistance to soybean cyst nematode were found in Peking, China, which may be useful in marker assisted selection for resistant lines. Other aspects of the work relates to field management strategies for these nematodes including effects of nutrient uptake on nematode development. A seven-year study of the effects of soybean cyst nematode on soybean growth and development was recently completed. It showed among other things that a grower’s choice of tillage methods and date of planting are relatively unimportant in their strategy to control soybean cyst nematodes. Another study indicated that nitrogen accumulation and fixation are limited under high soybean cyst nematode infections.

STEEP III—WATER QUALITY IN PACIFIC NORTHWEST

Question. Please provide a description of the research that has been funded under the STEEP III—Water Quality in the Pacific Northwest grant.

Answer. The STEEP III study was established in 1996 as the third phase of the tri-state STEEP Program entitled, “Solutions to Environmental and Economic Problems” to meet the needs of farmers and ranchers in the Pacific Northwest in solving severe problems with soil erosion and water quality, while maintaining economically- and environmentally-sustainable agricultural production. An open call for research proposals is held by three cooperating states, Idaho, Oregon, and Washington. Awards are made competitively after both internal and external peer reviews within the states, and merit review by the agency. The project is in a new phase and is just known as STEEP because the STEEP III objectives have been completed.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the research proposal, the soils of the Pacific Northwest wheat region are subject to severe wind and water erosion, which has taken a heavy toll of the topsoil in a little more than 100 years of farming. Due to the hilly terrain, water erosion has reduced potential soil productivity in the high rainfall areas of the region by about 50 percent. Wind erosion has reduced productivity on the sandy

soils in the lower rainfall areas. Also, off-site environmental costs of water erosion are large. Although many of these are difficult to measure, they include damage from sediment to recreational areas, roadways, and other areas which costs taxpayers millions of dollars annually. Wind erosion, which occurs mostly in the spring and fall, also can be costly and environmentally damaging to air quality and causes increasing concerns for human health and safety from blowing dusts. Water quality degradation is of increasing concern in the agricultural areas of this region, since sediment is a major pollutant of surface water runoff which may also carry potential chemical contaminants. The complex hydrology of the region's landscape has made it difficult to identify the sources of these chemicals in surface and ground waters. A new major emphasis has been the funding of direct seed research in combination with reduction in summer fallow and more complex crop rotations. Direct seed is synonymous with no till where tillage is eliminated or reduced to a very minimum. Consequently, soil and wind erosion are reduced significantly improving soil and water quality and contributing to salmon recovery.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The primary goals are: to obtain and integrate new technical/scientific information on soils, crop plants, pests, energy, and farm profitability into sustainable, management systems; to develop tools for assessing the impacts of farming practices on soil erosion and water quality; and to disseminate conservation technology to the farm.

The original STEEP and following STEEP II and STEEP III projects for erosion and water quality control, have provided growers a steady flow of information and technologies that have helped them meet economic, environmental, and resource conservation goals. Through the adoption of these technologies, the researchers believe that growers of wheat, barley, and other alternative crops have been able to reduce soil erosion by water and wind, improve water quality, and maintain or increase farm profitability. This has been accomplished through a tri-state, multi-disciplinary, multi-agency approach of basic and applied research, along with technology transfer and on-farm testing to assist growers with applying these research findings on their farms. The on-farm testing program has directly involved growers and stakeholders in the planning and conduct of the research and educational efforts—and has helped growers evaluate conservation options, such as residue management, to meet conservation compliance requirements.

STEPP programs have helped position farmers with new conservation technologies, such as direct seeding management systems, well in advance of deadlines to meet current and anticipated policy requirements. This preparation protects farmers against potential penalties and loss of government program benefits. The new emphasis on direct seeding has significantly reduced summer fallow through more annual cropping and through more emphasis on alternative crops.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1991, and the appropriations for fiscal years 1991–1993 were \$980,000 per year; in fiscal year 1994, \$921,000; in fiscal year 1995, \$829,000; in fiscal years 1996–2000, \$500,000 per year; and in fiscal year 2001, \$498,900. A total of \$7,688,900 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$938,812 state appropriations, \$63,954 product sales, \$156,656 industry, and \$16,994 miscellaneous in 1991; \$1,025,534 state appropriations, \$75,795 product sales, \$124,919 industry, and \$88,696 miscellaneous in 1992; \$962,921 state appropriations, \$62,776 product sales, \$177,109 industry, and \$11,028 miscellaneous in 1993; \$1,069,396 state appropriations, \$46,582 product sales, \$169,628 industry, and \$22,697 miscellaneous in 1994; and \$1,013,562 state appropriations, \$31,314 industry, and \$107,151 miscellaneous in 1995. In 1996, Washington received \$231,724 state appropriations; Oregon passed Measure 5 which reduced revenues and imposed funding restrictions so they were unable to provide any non-Federal cost-sharing or matching funds; and Idaho contributed \$81,525 state support, and \$86,242 in estimated non-Federal grant support, for a total non-Federal contribution of \$167,767. In 1997, Washington received \$197,234 state appropriations; Oregon continues to have Measure 5 as law and continues to be unable to provide any non-Federal cost-sharing or matching funds; and Idaho contributed \$27,235 state support and \$24,525 in estimated non-Federal grant support for a total non-Federal contribution of \$51,760. In 1998–2000, these same general levels of support have been continued with sources of funds from the Environmental Protection Agency, Washington Wheat Commission, and PM–10 Air Quality.

Question. Where is this work being carried out?

Answer. The work under STEEP III has been performed at laboratories and field research sites at the University of Idaho, Oregon State University, and Washington State University. Cooperative on-farm testing will be conducted in cooperation with growers on their fields in Idaho, Oregon, and Washington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The STEEP II project was completed in 1995, and the results were compiled in a final, 5-year report in January 1997 showing that the original objectives have largely been met. The STEEP III project started in 1996 and continued through the year 2000 as a 5-year project. Four modified objectives were identified in the new STEEP program for 2000. The objectives are: (1) determine the impact of farming practices and systems on soil, water, and air quality; (2) develop new technologies and increase efficiency of inputs which improve profitability of conservation farming systems; (3) assess the profitability of conservation systems; and (4) accelerate grower evaluation and adaptation of profitable conservation farm systems.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's program manager annually reviews progress reports, proposes new research on the STEEP Program, and attends the annual meetings to assess progress. The program is evaluated within the states each year by three committees: grower, technical, and administrative. Annual progress is reported at an annual meeting and compiled into written reports. These reports and the meeting are reviewed annually. Grower and industry input is solicited at the annual meeting on research objectives and accomplishments. The most recent evaluation was made at the January 2000 annual meeting which highlighted direct-seeding technology. This highly successful meeting attracted many growers, scientists, and agricultural experts from the tri-state region. Another annual review and reporting session is scheduled for January 2001. Farmer surveys are also distributed at each annual meeting, and results are compiled to assess whether objectives are being successfully achieved.

SUSTAINABLE AGRICULTURE, CALIFORNIA

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture, California grant.

Answer. This project aims to build upon and link across individual efforts to provide a more comprehensive picture of the potential impacts of ecologically-integrated farming systems and land management on environmental health, farm viability, and regional communities.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Central Coast of California is a global center of fresh fruit and vegetable production and innovative production and marketing methods. According to the research proposal, the project is needed to help the region respond to a new period of challenge arising from globalization of markets, environmental conservation needs, and the claims of Latino farm workers and small farmers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This project aims to develop economically-viable and environmentally-sound production systems for strawberries and vegetables, to enhance ecosystem health in multiple-use watersheds, and to assess the feasibility of alternative production and marketing strategies, including consumer education.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and the appropriation for fiscal year 2000 was \$255,000 and in fiscal year 2001 is \$392,135. The total appropriation is \$647,135.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds are shown in the project proposal, but the project entails a consortium approach involving several non-Federal partners, such as the Santa Cruz County Farm Bureau and regionally-based non-profit organizations which are likely to bring considerable in-kind contributions to the effort.

Question. Where is this work being carried out?

Answer. The work is being carried out by the Center for Agroecology and Sustainable Food Systems at the University of California-Santa Cruz in the Monterey Bay area of California.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date was May 1, 2001. The original objectives have not yet been completed.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. No evaluation has yet taken place since the project has been underway less than one year.

SUSTAINABLE AGRICULTURE, MICHIGAN

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture, Michigan grant.

Answer. This project is intended to develop agricultural production systems that are highly productive and profitable and which provide high quality ecosystem services to local communities and to the environment. It examines how to achieve a high nutrient flow from soil to crops and animals, and back to soil, with low loss to ground and surface waters. The grant is allocated by the Michigan Agricultural Experiment Station to priority areas within the general area of sustainable agriculture. Grants are awarded based on research merit and proposal submission.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research.

Answer. The principal researcher believes there is a need to better understand the biological processes occurring in Michigan's high-nutrient-flow crop and animal systems. With high water tables, networks of lakes and slow-moving streams, and concern about environmental standards, field contamination by agricultural production materials is a high priority.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The objective of this research is the identification, quantification, and description of production ecology information to permit its use in a significant way in farm management decision making. Key areas addressed include soil carbon and nitrogen flows, soil nematode population management, and weed seed predation and seedbank management.

Accomplishments to date include the development of on-farm compost demonstration sites, collection of research data and computer software models on water table management, completion of initial research trials on rotational grazing at three sites in Michigan, widespread testing of cover crops in several crop rotation systems, and tests of the use of nematology community structure as a method of detecting difference among farming systems. Findings from this project have demonstrated that rotational grazing reduces production costs, and increases net profits, compared to traditional cow management. This project has also shown that composting is an effective way of stabilizing livestock waste, controlling odor, and improving nutrient composition for later land application. Cover crop development as an integrated tool is becoming quite advanced. Frost seeding of wheat with clover is increasingly used; approximately one-third of Michigan's wheat acreage, by some estimates, is overseeded. Results are being integrated into a series of practical publications partially supported by this grant. The first in the series, "Michigan Field Crop Ecology," received an American Society of Agronomy award in 1998 for excellence as an Extension publication. A second volume, on field crop pest ecology was completed in January 2000, and similar volumes for fruit and vegetable ecology are under development. New work on organic apple production is very timely, given producers' growing interest in this area.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1994 with an appropriation of \$494,000; \$445,000 were appropriated in fiscal years 1995 through 2000; and \$444,021 in fiscal year 2001, bringing total appropriations to \$3,608,021.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Matching funds were provided at the state level for \$511,900 in fiscal year 1994, \$372,319 for fiscal year 1995, and \$359,679 in fiscal year 1996. Matching support was not reported in fiscal years 1997 through 2000.

Question. Where is this work being carried out?

Answer. This work is being carried out in Michigan at several locations by Michigan State University. Locations include the Kellogg Biological Station, the Upper Peninsula Experiment Station, and farms around the state.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project, begun in 1994, was proposed through April of 1997. Its specific objectives were met, with additional objectives addressed in subsequent related proposals. The current project is scheduled to go through July 31, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. A formal evaluation of the Principal Investigator's program was concluded in 1997, commissioned by the C.S. Mott Foundation through an independent consultant. The project continues to have annual peer review. According to the Principal Investigator, the proposal has gone through the normal Michigan State University review process. First, all teams and collaborators of the project have met and reviewed the entire proposal with several suggestions and changes being incorporated. Second, research administrators in the fields of agronomy/soil science and entomology/pest management covering the major dimensions of the proposal have reviewed it for scientific appropriateness and accuracy as well as for overall balance and likelihood of achieving objectives. Their comments have been included as revisions to the proposal.

SUSTAINABLE AGRICULTURE SYSTEMS, NEBRASKA

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture Systems program for Nebraska.

Answer. This project is aimed at integration of field crops, animal production, agroforestry, livestock waste management, and diversified enterprises to meet production, economic, and environmental quality goals.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Farmers and ranchers in Nebraska and throughout the Midwest face increasing difficulties in maintaining profitable operations that are sustainable under increased production costs and more stringent environmental regulations. They continue to seek alternative production systems, integration of crop and animal enterprises, value-added products, including those from woody perennials, and new marketing approaches to secure more of the food dollar. Work on crop residue utilization is highly important to assess the loss of erosion mitigation when grazing occurs as well as the benefits of winter forage to production of lean beef. Erosion is still a major problem with monoculture cropping, and work with contour strips, residue management, and animal grazing is essential to provide good recommendations to farmers for how to manage fragile lands.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This project has addressed a number of questions related to the management of integrated crop and livestock enterprises. The work on composting has answered questions about the costs of composting, improved the nutrient content of compost, and evaluated different spreading technologies. Because elevated levels of nitrate have been found underneath the composting sites, studies are underway to compare different crops and shrubs as scavengers of nitrogen. The work on contour strip cropping, residue management, no-till planting, and cover crops has demonstrated ways to reduce erosion on highly erodible land. Studies of grazing on corn residues under different tillage and management systems are determining the forage value of residue and the impact of grazing on subsequent crop production. Plots that have been managed with organic methods for six years are providing local experience in this topic of increasing grower interest.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. This project began in fiscal year 1992, with an appropriation of \$70,000; subsequent appropriations are as follows: \$70,000 in fiscal year 1993; \$66,000 in fiscal year 1994; \$59,000 in fiscal years 1995 through 2001; and \$58,870 in fiscal year 2001. Total appropriations to date are \$618,870.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Matching funds provided for this research include state funds in the amount of \$25,313 for fiscal year 1992; \$26,384 for fiscal year 1993; \$27,306 for fis-

cal year 1994; \$36,091 in fiscal year 1995; and \$24,267 in fiscal year 1996. No matching funds were reported in fiscal years 1997 through 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted by the University of Nebraska at several locations in Nebraska, with the major part of the project at the Agricultural Research and Development Center near Mead, Nebraska.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project proposed work through March of 1994. The current project proposes work addressing additional related objectives through June 30, 2001. It is expected that current objectives of the project will be met by this time period.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff. The grant was awarded competitively within the University of Nebraska, and the integrated farm project has been reviewed annually for technical merit and progress toward goals by the internal review process of the university.

SUSTAINABLE AND NATURAL RESOURCES, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture and Natural Resources, Pennsylvania project?

Answer. This project studies the cycling of nutrients in soil and crops with special emphasis on the development of indices for measurement of soil health. Specific goals are to identify indicators of a soil ecosystem that maintains a high level of active soil organic matter, and to develop nutrient and carbon budgets for managing on-farm cropping systems.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Degradation of soil health/quality is a most serious problem for agriculture both in the mid-Atlantic region and throughout the nation. State governments, both regionally and nationally, are attempting to address the issue of soil and water degradation in cropping systems and in intensive animal agriculture. Traditional soil test results are not providing the needed answers for effective nutrient management.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to understand the cycling of nutrients and to use that knowledge to develop practical indicators of soil quality and health. If farmers are to manage their farm lands properly, indicators of soil quality and health must be developed that can be used by agricultural producers and consultants. Efforts under this project have been devoted to this goal with significant accomplishments to date. Management practices have been found to affect soil microbiology, and the fate of nutrients from crop residues and legume cover crops is being elucidated. A significant indicator of soil quality has been identified: measurement of the decomposition of filter paper has been shown to be an effective indicator of plant residue decomposition, which in turn has been shown to be highly correlated to nitrogen mineralization and also shows promise as an indicator of soil biological activity. Experiments are underway to refine this approach. Results on microbial biomass work have been submitted for scientific publication by scientists at Rodale, and a Masters of Science thesis at the Pennsylvania State University—PSU—evaluated the ability of different indicators of soil quality to distinguish soil management histories.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported under this grant began in fiscal year 1993. The appropriation for fiscal year 1993 was \$100,000; \$94,000 per year in fiscal years 1994 through 1998; \$95,000 per year in fiscal years 1999 and 2000; and \$99,780 in fiscal year 2001. A total of \$859,780 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. A total of \$369,574 in matching support from university, state, and private industry sources was provided in fiscal year 1997. No matching support was reported in fiscal years 1998 through 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted by the Pennsylvania State University with cooperators throughout the state, at the Hunter Rotation Experiment at PSU's R.E. Larson Research Center near Rock Springs, Pennsylvania, at the Rodale Institute Research Center near Kutztown, Pennsylvania, and on farms around the state.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project has met the specific objectives set forth in the original project which began in 1993 with an ending date in 1995. The continuing project addresses additional objectives related to the overall goal. The ending date for the current project objectives is June 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff. The project undergoes regular internal evaluation and assessment as part of PSU's major effort in soil quality and nutrient management research.

SUSTAINABLE BEEF SUPPLY, MONTANA

Question. Please provide a description of the work that has been funded under Sustainable Beef Supply, Montana grant.

Answer. The Sustainable Beef Supply, Montana, project develops a system to provide information feedback among the various segments of the beef industry. This program is a cooperative effort between the Montana Stockgrowers Association and Montana State University. A systems approach was adopted to allow for tracking of weaned, feeder calves from ranches in Montana to feedlots in other states and eventually to the packing plant. Information collected throughout the production chain is to be shared among all owners of the cattle.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The beef industry is becoming more focused on consumers, and specific quality and consistency targets are being established in all segments of the industry. In order to meet customer and consumer expectations for safe beef and return additional revenue to cattle producers, a systems network must be developed to ensure that a high quality and consistent product is being produced. Central to this networking approach is the exchange of information from the producer to the end user, customer, or consumer. This systems approach for information transfer is the foundation of the Montana Beef Network.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This project has three primary objectives: develop and provide educational programs aimed at meeting beef quality assurance standards, production, and marketing goals; certify feeder calves that have met defined health management protocols; and provide information feedback from the feedlot and packing plant to the cow-calf producers showing if the feeder calves met industry requirements for quality, consistency, and red meat yield. The funding was used to develop and distribute 1,500 training manuals and present over 45 educational programs on the Beef Quality Assurance. County agents were trained to provide this educational training within their counties. Approximately 20,000 calves have been certified in 1999 and 2000. A state-wide audit of ranches has been initiated to determine value-added production and management practices. A research project was completed involving 12 ranches to determine if a standardized weaning protocol, which includes vaccinations and nutrition, could reduce morbidity of calves after they entered the feedlot. Results suggest a possible benefit in terms of reduced illness after the calves reach the feedlot. One-day short courses were conducted in Billings and Lewiston, Montana, to present issues pertinent to the beef industry. Ten interactive-television short courses were presented in 2000 that focused on carcass evaluation, genetic management, backgrounding calves, nutrition, drought management, and marketing.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The program supported by this grant began in fiscal year 1999. The appropriations were \$500,000 in fiscal year 1999; \$637,500 for fiscal year 2000; and \$742,363 for fiscal year 2001. The total appropriation is \$1,879,863.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Montana Department of Agriculture contributed \$15,000, and the Montana Stockgrowers Association contributed \$5,000 in fiscal year 2000. The Montana beef producers provided \$10,000 in fiscal year 2001.

Question. Where is this work being carried out?

Answer. This project is being conducted at Montana State University and on co-operating Montana ranches.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that it will take five years of funding to fully achieve the objectives of this project. Progress to date has been very encouraging. Approximately 1,300 producers have received beef quality assurance training, and 38,000 calves have been certified. The goal is to increase the certification effort to include 75,000 feeder calves each year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer-reviewed by faculty at Montana State University and also by Montana cattle producers prior to submission. The proposals were merit reviewed by the agency prior to funding.

SUSTAINABLE PEST MANAGEMENT FOR DRYLAND WHEAT, MONTANA

Question. Please provide a description of the research that has been funded under the Sustainable Pest Management for Dryland Wheat, Montana grant.

Answer. Montana State University researchers are studying the influence of four cropping sequences and two tillage systems on insects, weeds, plant pathogens, nutrient management, physical and biological properties of soil, economic profitability, and environmental benefits. The research is being conducted on large experimental blocks in the three different dryland farming regions of northern, central, and eastern Montana. Each site differs climatologically and agronomically from one another yet represents a significant production area within the state.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project addresses pest management issues under different cropping sequences and tillage practices utilized in the Northern Great Plains for dryland wheat production. The wheat-fallow-wheat system used by many farmers in the region favors the build up of many pests. Dollar losses due to insects, competitive weeds, and plant pathogens in dryland wheat production in Montana alone are staggering. For example, annual losses attributed to wheat stem sawfly exceeds \$25 million; wild oat infestations causes an estimated \$50 million in harvest losses and management costs; and wheat streak mosaic has a monetary loss of \$37.5 million. These and other pests also increase reliance on pesticides for crop protection which impacts environmental quality, increases production costs, and causes secondary pest outbreaks and resistance. The agronomic, environmental, and economical benefits of diversified crop rotations are numerous, but these benefits are largely unknown or not documented in dryland wheat production. This multi-disciplinary project can result in significantly reducing the economic impact of agriculturally-important pests by improving soil health, reducing production costs, and improving production efficiency.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research were to study the influence of cropping sequences, tillage systems, and different levels of inputs on dryland wheat production, pests, nutrient management, physical and biological properties of soil, economic profitability, and environmental benefits. The third cropping season was completed at the northcentral site and the second cropping season was completed at the central location in 2000. Data collection continues at these sites, but results and the influences of cropping sequences, tillage systems, and inputs into the systems have not been determined nor translated into useful strategies articulated for use by growers. Arthropod densities have increased from 1998 to 2000. Significantly more pests and beneficial arthropods were captured in spring wheat following fallow than other rotations. These arthropod data suggest that when pest numbers are elevated in particular crops, including spring wheat, mustard, sunflower, and Conservation Reserve Program land, beneficial numbers respond in kind. There was no detectable wheat streak mosaic virus, and there was no evidence of foliar fungal diseases in any of the wheat plots. The influence of crop rotation was not significant for Fusarium crown rot infection of spring wheat in 2000.

The main objectives at the third research site in northeast Montana are determining the effects of forages on wheat yields, intensively crop for a more efficient use of water, and determine the value of feeding high quality forage in late summer. The entire 25-acre site was cropped to spring wheat in 1999 and lentils in 2000. Rotations include traditional wheat-fallow, wheat hay barley, wheat-hay barley-pea, wheat-sorghum sudan, and alfalfa. Useful results have not been reported at this stage in the research program.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$200,000; for fiscal years 1998 and 1999, \$400,000 per year; for fiscal year 2000, \$425,000; and for fiscal year 2001, \$460,984. A total of \$1,885,984 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds of \$42,000, \$80,000, and \$80,000 from the Montana Wheat and Barley Committee were provided for project support during 1997, 1998, and 1999, respectively. The Montana Agricultural Experiment Station provided \$25,000 in state support. Private industries provided \$5,000 during 1999. Non-Federal funds of \$85,335 from the Montana Wheat and Barley Committee were provided for project support during 2000. The Montana Agricultural Experiment Station provided \$35,000 in state support. Private industries provided \$3,500 during 2000.

Question. Where is the work being carried out?

Answer. Research is being conducted in three distinct dryland areas of Montana in the north, central, and northeast located on producer-owned land. Each field site is within 45 miles of a Montana State University Agriculture Experiment Station research center.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initially proposed for a duration of three years. However, this project is envisioned as a long term project and will require a total of 12 years to see it to completion.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Yearly progress reports will be used to track the effectiveness of the program of research. Assessment of the precision of biological control organisms and estimates of profitability, marketability, and risk will be used to assess progress. An onsite visit and review is anticipated during the growing season of 2001.

SWINE WASTE TREATMENT, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Swine Waste Management, North Carolina grant.

Answer. Research funded through the current grant continues to support research, development, and demonstration of innovative technology for swine waste management. Primary focus has been on various alternatives or modifications to traditional lagoon/spray-field technology. Specifically, this particular funded project is focusing on determining the technical and economic feasibility of utilizing a combination of technologies—systems approach—involving solids separation, aeration, and constructed wetlands, as well as value-added processing of generated biosolids, to treat swine manure.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this project?

Answer. Nationally, regionally, and locally, discussions and efforts regarding animal waste management practices and the impact of animal agriculture on the environment are at the forefront of issues facing the livestock industry, pork production in particular. Soil and water quality issues associated with this industry have been identified to be: nutrient loading and fate of nitrogen, phosphorus, and metals—copper and zinc; and fate of pathogenic bacteria in the manure effluent and air emissions from animal production facilities. Air quality issues identified include emissions of ammonia nitrogen, greenhouse gases, dust, and odor. The attention directed to this subject area has resulted in research, development, and demonstration efforts by academic institutions, the private sector, as well as the livestock industry. The need for this project is further illustrated by the proposed Concentrated Animal Feeding Operations rule that was signed by the U.S. Environmental Protection Agency's Administrator on December 15, 2000. The rule proposes changes to the size

of operation requiring permitting and effluent guidelines under the National Pollutant Discharge Elimination System Permit Regulation and Effluent Limitation Guidelines and Standards for Concentrated Animal Feeding Operations.

In North Carolina, where livestock and poultry production account for approximately \$5 billion in farm gate income annually, the sustainability of this industry has enormous economic implications. Several other states and local regions in which animal production agriculture contributes to the economy are facing the same concerns. As such, this research project will have a local, state, and national impact.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The specific goals for this project include: determine the effectiveness of the system at reducing nitrogen, phosphorus, metals—copper and zinc—ammonia volatilization, pathogenic microorganisms, and odor in the treated wastewater; determine the effectiveness of utilizing specialized waste processing equipment including a pelletizer, fluidized bed dryer, and flash dehydrator for blending and processing biosolids removed from the system into value-added products; and determine the economic feasibility of the system to include capital and operational costs.

The original goal of this project was to evaluate a full-scale, on-farm constructed wetland system for swine waste which was supported by very promising reports of a five-year study of a prototype system on an actual swine farm. This goal has subsequently been re-enforced by the North Carolina Governor's request to develop alternatives to lagoons for swine waste management and the North Carolina Attorney General—Smithfield Foods, Inc. Agreement is to provide funding to implement and evaluate advanced technologies for swine waste management. The constructed waste management system described in the proposal has been installed, and a Ribbon Cutting ceremony was held to publicize startup of this full-scale system.

In addition to the system described in the proposal, a dissolved air flotation unit has been added to provide greater reduction of solids, oxygen demand, and organics in the influent to the wetland system. This unit may also provide some oxidation of the nitrogen to nitrate to provide higher levels of denitrification in the wetland system. Overall, the addition of this dissolved air flotation unit should provide the performance of the wetland system to potentially reduce its size and thus the footprint for the overall waste treatment system. In addition, arrangements have been made with a local vermicomposting facility to take the solids removed by the incline screen and the dissolved air flotation unit and process them into a marketable vermicompost.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was \$215,000; fiscal year 1998 was \$300,000; fiscal years 1999–2000 was \$500,000 per year; and fiscal year 2001 is \$498,900. A total of \$2,013,900 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This Federally-funded project has helped leverage funds from the state and private sector. From state funds for 1998, \$25,000; 1999, for \$1,098,000; and for 2000, \$0. From industry or commodity sources for 1998, \$242,000; for 1999 \$308,000; and for 2000 \$1,450,000.

Question. Where is this work being carried out?

Answer. This work is being conducted at North Carolina State University in Raleigh, North Carolina. The commercial site demonstration is located in Onslow County, North Carolina.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The current project term dates are July 1, 2000, to June 30, 2003. Based on progress to date, it is anticipated that project objectives will be completed by the June 30, 2003 date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES conducted an evaluation of the progress of this work during January 2001. The project has made significant progress towards meeting the original goals.

This project is effectively integrated with the other animal waste management efforts at North Carolina State University, particularly those efforts of the Animal and Poultry Waste Laboratory. The long term viability of the state's swine industry will be dependent upon waste management technologies that are documented to address water and air quality concerns. This project is coordinated with the three prin-

cipal areas being addressed by the College of Agriculture and Life Sciences at North Carolina State University. The first is development and performance verification and demonstration of alternative animal waste treatment technologies. The second is nutritional modification of swine diets such that lower concentrations of nutrients are excreted by the animal. The third is identification and quantification of the environmental risks associated with existing lagoon/sprayfield technology. Based on the work of over 50 projects and nearly two dozen different categories of technology, several promising technologies have been identified. They include covered lagoons, upflow biofiltration system, sequencing batch reactor process, constructed wetlands, and high temperature anaerobic digestion. This project has produced significant progress on the constructed wetlands research.

Efforts have been made to identify processes by which by-products of the alternative technology may be developed which have economic value. Examples of such work include: capturing biogas for energy; and use of nutrients in the processed waste effluent to grow plant, vegetable, and fish products. Diet related research has shown promise to reduce not only nutrients excreted but to also help control odor.

TECHNOLOGY DEVELOPMENT OF RENEWABLE RESOURCES, MISSOURI

Question. Please provide a description of the research that has been funded under the Technology Development of Renewable Resources, Missouri grant.

Answer. This is a new project thus a precise description of the research to be conducted is not currently available. The general focus however is genetic manipulations of soybeans for engineering applications.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. At this writing, a proposal has not been received. The grantee is conducting a thorough literature review and will submit a proposal in conjunction with the outcomes of the literature review. The requested date for proposal submission is March 31, 2001.

Question. What was the original goal of this research and what has been accomplished to date.

Answer. The original goal is to determine if soybeans can be altered to produce oils for engineering applications. The project has not begun, thus we are unable to cite any accomplishments.

Question. How long has the project been under way, and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. Other than a literature review, which is ongoing, the project has not begun. The total fiscal award, and the fiscal year 2001 award are identical \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. The source and amount of non-Federal funds has not been disclosed as the grantee is still working on the original proposal.

Question. Where is the work being carried out.

Answer. The project will be conducted in and around Rolla, Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion dates of additional or related projects?

Answer. The work has not begun thus no objectives have been met. The grantee will likely structure their original investigative work over a two year time span.

Question. When was the last agency evaluation of this project. Provide a summary of the evaluation conducted.

Answer. The agency has not conducted an evaluation of this project as we are awaiting the original proposal.

TILLAGE, SILVICULTURE, AND WASTE MANAGEMENT, LOUISIANA

Question. Please provide a description of the research that has been funded under the Tillage, Silviculture, and Waste Management Research, Louisiana grant.

Answer. This research has six components: Rice and Cotton Tillage, Bald Cypress and Water Tupelo Silviculture, and Dairy and Poultry Waste Management. More specifically, the Rice Scientists are looking for ways to improve stand establishment; the Cotton Scientists are focusing on the use of tillage systems to combat harmful insect populations; the Waste Management Scientists are quantifying the environmental and economic effectiveness of approved dairy and poultry waste disposal systems; and the Silviculturists are conducting a problem analysis on factors affecting Bald Cypress and Water

Tupelo regeneration. The project is annually subjected to the university's merit review process.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers hypothesize that the crops, forests, and waste issues addressed by this project extend beyond the state borders; thus, this research has, at a minimum, multi-state to regional application.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals were to: improve conservation tillage in rice and cotton farming; determine the effectiveness of no-discharge dairy waste treatment facilities; determine acceptable land treatment levels for poultry waste disposal; and to evaluate wetland forest regeneration processes. All components of the project have established research studies and are monitoring progress. For fiscal year 1998, the silviculture component was placed on hold and a sweet potato project was added. This decision was prompted by a staffing change in the Department of Forestry and Wildlife. Prior to this decision, an annotated bibliography of Bald Cypress Silviculture was completed; and the responsible scientists had begun work on Water Tupelo regeneration.

Question. How long has the project been underway, and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. The work began in fiscal year 1994. The appropriation for fiscal year 1994 was \$235,000. For fiscal years 1995–2000, the appropriation was \$212,000, and for fiscal year 2001 is \$211,534. A total of \$1,718,534 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. State funding in support of these areas of research exceeds \$750,000 annually.

Question. Where is the work being carried out?

Answer. Investigations are being conducted on the main campus at Louisiana State University as well as the Experiment Stations at Calhoun, Crowley, Chase, Winnsboro, St. Joseph, and Washington Parishes, Louisiana.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related projects?

Answer. The original work was scheduled for completion in 1999. Early term objectives have been met. The added experiments have closing dates ranging from 1999–2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The last field evaluation was completed on December 12, 1995. The evaluation summary complimented the scientists on the interdisciplinary components associated with this project, along with their investigative procedures, report writing, and external networking.

TOMATO WILT VIRUS, GEORGIA

Question. Please provide a description of the research that has been funded under the Tomato Wilt Virus, Georgia grant.

Answer. This project supports research to help in the reduction of major crop losses in the southeastern U.S. due to Tomato Spotted Wilt Disease. Research focuses on vector biology and the virus transmitted by the vector.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Tomato Wilt Virus has become a major yield-limiting constraint in a number of very important food crops. This is a world-wide problem, but in the last ten years, has spread invasively throughout the southeastern states. Since this virus was first observed in Georgia in 1986, it has caused over \$100 million in crop loss in Georgia alone. The wide host range of the virus and its vector makes this a disease that is difficult to manage. The new strategies to manage this virus in Georgia will be applicable to all states where it occurs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The primary goal of this research is to reduce losses in the major crops grown in the southwest due to spotted wilt. This primary goal has sub-goals of identifying the sources of virus and vectors, determining the dynamics of the thrip species that transmits the virus, elucidating how the virus is acquired by thrips to identify possible genes to enhance virus resistance in plants, and adapting to crops in the southeast the Risk Assessment Index for spotted wilt that is currently in implementation and refinement at the University of Georgia for peanut.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This grant began in 1999 and has been supported at the level of \$200,000 per year in fiscal years 1999 and 2000 and \$249,450 in fiscal year 2001. A total of \$649,450 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant are \$84,736 in fiscal year 1999.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Georgia and The Coastal Plain Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not been met since this is a complex research area. The anticipated completion date for the continuing research is the end of fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project has undergone peer review at the University level and an agency merit review in January 2000. In summary, some progress has been made on all objectives of this research. Some progress has been made in understanding the relationship of cellular receptor proteins in the guts of the vector. This will aid in the identification, characterization, and eventually cloning of these genes that then could be modified against the virus. Progress was also made in investigating the source of inoculum and seasonal dynamics of the vector. This included identification of several weed species that are alternative virus hosts. The Risk Assessment Index for management of spotted wilt disease was used to evaluate peanut cultivars and determine how they fit better into management of the virus on peanut.

TROPICAL AQUACULTURE, FLORIDA

Question. Please provide a description of the research that has been funded under the Tropical Aquaculture, Florida grant.

Answer. The research is focused on increasing the production efficiency of tropical ornamental fish culture, handling, and transportation techniques.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher indicates that the ornamental fish industry is unique and important to the local economy where 69 percent of the total U.S. production of ornamental fish occurs in Hillsborough County, and 95 percent of the total production of ornamental fish is in southern Florida. At a national level, the U.S. imports 60–70 percent of the ornamental fish sold that results in a significant trade deficit that can be reduced by increased domestic production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research under this grant is to improve culture and transportation techniques for the commercial tropical aquaculture industry in Florida. Accomplishments to date include progress on fulfilling the original research study objectives and formation of multidisciplinary research teams that are leading the various research studies.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000. The appropriation for fiscal year 2000 was \$170,000 and for fiscal year 2001 is \$197,564. The total appropriation for this project is \$367,564.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. For fiscal year 2000, state appropriations supported the salaries of principal investigators and the use of state-owned facilities to conduct research. The university estimates that significant non-Federal funding will be provided in fiscal year 2001 primarily from state sources to cover salaries of the principal investigators and operating expenses for the laboratory. As the program develops, additional non-Federal funding is expected.

Question. Where is this work being carried out?

Answer. Research is primarily conducted at the University of Florida's Tropical Aquaculture Laboratory located in Ruskin, Florida, in addition to some work at the main campus in Gainesville, Florida.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2001. Work is ongoing to complete the original objectives in fiscal year 2001. The anticipated completion date of additional objectives is fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency has requested that the principal investigators submit an annual accomplishment report along with the fiscal year 2001 grant proposal. This report will be evaluated in terms of progress and accomplishments related to the original objectives. The 2001 CSREES review will be completed within three weeks of submission of the fiscal year 2001 proposal. The researchers will be requested to develop the research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development as in the past.

TROPICAL AND SUBTROPICAL RESEARCH

Question. Please provide a description of the research that has been funded under the Tropical and Subtropical Research program grant.

Answer. Tropical and Subtropical Research program is operating in coordination with the Tropical and Subtropical Research Caribbean and the Tropical and Subtropical Research Pacific Administrative Groups. State Agricultural Experiment Stations that are members of the Caribbean group are Florida, Puerto Rico, and the Virgin Islands; members of the Pacific group are Hawaii and Guam.

Non-member institutional interests are represented by the Executive Director of the Southern Region Agricultural Experiment Station Directors, who is a member of the Caribbean group, and the Executive Director of the Western Region Agricultural Experiment Station Directors, who is a member of the Pacific group. The Agricultural Research Service—ARS—also has representation on the two groups, as does the CSREES scientist who manages the Tropical and Subtropical Research grant program.

Funds for the program are divided equally between the two Basin Administrative Groups. The research objective of the program developed by the Administrative Group is to improve the agricultural productivity of many of the subtropical and tropical parts of the U.S. Special research grants have been awarded for research on controlling insect, disease and weed pests of crops; increasing the production and quality of tropical fruits, vegetables, and agronomic crops; promoting increased beef production through development of superior pastures; detection of heartwater disease of cattle and the influence of heat stress on dairy cattle reproduction; better use of land and water resources; developing computer models for efficient crop production systems and animal feeding systems; developing computer models for land-use decisions; using biotechnology methodologies for improving plant resistance to viral and bacterial diseases; using biotechnology to develop non-chemical, or biological, strategies for controlling insect pests; and potential for growing new speciality crops.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes there is a need for the Tropical and Subtropical Research program to provide research-generated knowledge that enables informed choices in the responsible use of natural resources, facilitates the health and well being of American citizens through improved food safety and nutrition, provides frontline protection for the rest of the nation's farms and ranches from serious plant and animal diseases and pests, and enhances the ability of U.S. farmers to produce crops efficiently and economically and/or to introduce new crops and agricultural products with export potential to gain market share abroad. On a regional basis, the Tropical and Subtropical Research program addresses the unique challenges of practicing tropical agriculture, that is presence of pests year-round, heat stress, post-harvest processing to meet regulatory requirements for export, etc. The local need of Americans living in tropical regions of the nation for Tropical and Subtropical Research knowledge-based products is to design and implement sustainable agricultural development within fragile tropical agroecosystems—particularly on tropical islands—and to develop new crops and niche markets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to increase the production and quality of tropical crops; control pests and diseases of plants and animals; promote increased beef production; and conserve land and water resources. Grants have supported research on control strategies for Melon thrips; the biochemical nature of resistance to rust in nutsedge; development of bioherbicides for nutsedges; development of tomato cultivars with resistance to the spotted wilt virus; development of pheromones for monitoring and controlling the citrus root weevil; reducing the effects of heat stress in dairy cattle; development of a decision support system for vegetable production; finding cucurbits with resistance to silverleaf; developing a computer program for optimal supplementation strategies for beef and dairy cattle on tropical pastures; characterizing new strains of citrus tristeza virus in the Caribbean basin; determining the economic threshold for the citrus leaf miner on limes; using viral replicase genes to engineer rapid detection methods for geminiviruses; developing markers of bacterial spot resistance genes in tomato; breeding snap and kidney beans for resistance to golden mosaic, virus, and for heat tolerance; searching for resistance to papaya bunchy top disease; developing weed control for yam production; and bioengineering ringspot virus resistance in papaya.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The operation of the Tropical and Subtropical Research program was transferred from the Agricultural Research Service to the Cooperative State Research, Education and Extension Service, with funding being first provided in fiscal year 1983. Funds were appropriated in the amount of \$2,980,000 per year in fiscal years 1983 and 1984; fiscal year 1985, \$3,250,000; fiscal years 1986 through 1988, \$3,091,000 each year; \$3,341,000 in fiscal year 1989; fiscal year 1990, \$3,299,000; fiscal years 1991–1993, \$3,320,000 per year; \$3,121,000 in fiscal year 1994; \$2,809,000 per year in fiscal years 1995–1996; \$2,724,000 per year in fiscal years 1997 through 2000; and \$3,853,504 in fiscal year 2001. A total of \$58,571,504 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. For fiscal year 1997, more than \$1.0 million of non-Federal were provided to the Tropical and Subtropical Research program from state appropriations; \$856,000 for 1998; \$595,000 for 1999; and \$850,000 for 2000. These state funds were in the form of faculty salary time commitments and indirect costs covered by the institutions.

Question. Where is this work being carried out?

Answer. This research is being conducted in Florida, Puerto Rico, Virgin Islands, Hawaii, and Guam. Work is also being done in other Pacific and Caribbean countries through agreements between institutions but not using Tropical and Subtropical Research grant funds.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. Research on tropical crop and animal agriculture is to increase productivity net profits, decrease harmful environmental impacts, conserve water, and natural resources. Objectives for some projects have been completed, and new objectives addressing new issues are being developed in this ongoing project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The projects that are funded by the Tropical and Subtropical Research Special Research Grant have been peer reviewed by panels of scientists in the U.S. to assure that good science is undertaken. Also, as part of the grant renewal process, progress reports are reviewed by the two Administrative Groups and by the grant manager at the national level. Workshops in which research results and their application for agricultural production are developed are conducted every two years. Research papers are published in the appropriate regional, national, and international forums available.

The development in 1995 of the Strategic Plan for Tropical and Subtropical Research provided a mechanism to define priorities, examine program direction, and recommend operational changes. One of the principal points considered was to bring the Caribbean and Pacific Basin components closer and better coordinated. Each sub project is peer reviewed annually at the initiating institution, by the Tropical and Subtropical Research panel and by CSREES National Program Leaders.

TURKEY CORONAVIRUS, INDIANA

Question. Please provide a description of the research that has been funded under the Turkey Coronavirus, Indiana grant.

Answer. The objectives of the research are to: (1) develop enzyme-linked immunosorbent assays for detecting antibody to turkey coronavirus and turkey coronavirus antigen in turkey flocks; (2) elucidate immune responses in turkey poult infected with turkey coronavirus; and (3) determine which immunity, humoral, and/or cellular, will provide the most effective protection for turkey poult against turkey coronavirus infection.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This enteric disease of young turkey poult, called turkey poult enteritis or poult enteritis mortality syndrome, has contributed to significant economic losses by producers in Indiana, North Carolina, South Carolina, Virginia and other states. The cost to the industry is in the millions. Currently, no effective medication or vaccination is available for control and prevention of the disease. Although turkey poult that recover from the coronaviral enteritis may develop long-term immunity, little is known about the specific immunity. The proposed research will lead to further study on the understanding of immunological interaction between turkey poult and individual turkey coronaviral proteins and subsequent development of recombinant or a deoxyribonucleic acid vaccine for effective prevention of the disease. The enzyme-linked immunosorbent assays that have been developed in this research will provide efficient tools for diagnosis and control of turkey poult enteritis.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research was to develop enzyme-linked immunosorbent assays for monitoring antibody to turkey coronavirus and turkey coronavirus antigen in turkey flocks during acute outbreaks or recovery and in routine health monitoring and to develop effective vaccines to protect turkey poult against turkey coronavirus infection.

The investigators' laboratories have successfully propagated turkey coronavirus from intestines of infected turkey poult in 22-day-old turkey embryos, purified turkey coronavirus from the embryo intestines, and have demonstrated an acute enteritis with decreased body weight gain in 7 or 10-day-old turkey poult by oral inoculation of the purified turkey coronavirus. This establishes an infection model to study immunology, pathogenicity, and pathogenesis of turkey coronavirus.

The research team has been successful in adapting a commercially-available ELISA test used for infectious bronchitis virus for use in detecting antibodies against the coronavirus causing the poult enteritis syndrome. They have also developed a second test system which allows for measurement of cellular immunity of turkeys exposed to this virus. The combination of these two tests will permit a much more informative study of the immune response of turkey poult exposed to the turkey coronavirus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999. The appropriation for fiscal years 1999 and 2000 was \$200,000 per year, and for fiscal year 2001 is \$199,560. A total of \$599,560 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds expended on this project in fiscal year 1999 were \$72,311.06, including \$25,200 from state funds and \$47,111.06 from a private commodity group, and \$245,483.67, in fiscal year 2000 including both private and state funds.

Question. Where is this work being carried out?

Answer. Research is being conducted at Purdue University in the Department of Veterinary Pathobiology and the Animal Disease Diagnostic Laboratory.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is spring 2002. At present the project is on target to meet its stated objectives in the designated time period.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was initially funded in July 1999, and no evaluation has been performed. A review is tentatively scheduled to be conducted during summer 2001.

VALUE-ADDED PRODUCT DEVELOPMENT FROM AGRICULTURAL RESOURCES, MONTANA

Question. Please provide a description of the research that has been funded under the Value-Added Product Development From Agricultural Resources, Montana grant.

Answer. Carbohydrates, the most abundant and commercially-available renewable chemicals from agriculture resources, provide the starting point for the research to be carried out at the University of Montana. The goal of this research is to develop wide-range value-added biodegradable polymer materials with different properties, from abundant grain and potato starches, wood carbohydrates, and waste milk sugar from the cheese industry. Target applications for these polymers include biodegradable packaging materials, industrial use materials, consumer products, and medically-useful products. The validity of the basic technology to produce these polymers is established, but the long-range goals of the project require improvement of the technology to make it practical and commercially attractive. Additionally, at this stage of the research, it is very important to explore materials applications that coincide with process technology development.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project is centered around a growing national need to utilize renewable crop materials as resources for chemicals that are environmentally favorable and useful for consumer and industrial products. Biodegradable polymer materials are gaining favor globally because they address the need to start limiting the amounts of non-biodegradable solid materials that end up in landfills. These novel polymers have an added advantage in that the materials produced are both biodegradable and derived in significant part from renewable agriculture sources, thus adding value.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new grant in fiscal year 2001. Previous studies have established the validity of chemically-modifying carbohydrates into resins that can be extruded or made into films for use in packaging and other consumer products.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$331,270.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since this is a new grant, and a proposal has not yet been received, the source and amount of non-Federal funds for this research is unknown.

Question. Where is this work being carried out?

Answer. This work will be carried out at the University of Montana.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Since this is a new grant, no evaluation has been conducted.

VALUE-ADDED PRODUCTS, ILLINOIS

Question. Please provide a description of the research that has been funded under the Value-Added Products, Illinois grant.

Answer. The objective of this project is to develop a breeding and production research program aimed at introducing alternative crops, such as milkweed, to the midwest region. The first priority will be to develop protocols to generate sufficient supplies of milkweed floss and seed for the development of value-added products. Long-term objectives will be focused on improving yields, developing auto-fertile varieties, and developing machinery for milkweed harvest.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Alternative crops will allow growers to disrupt life cycles of corn rootworms and to minimize their risks associated with falling commodity prices. With the reduced profitability of corn and soybeans, growers are looking for ways

to supplement their businesses and an attractive option is the introduction of new crops to their farming practices. Value-added products and technologies expand agricultural markets and create new job opportunities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This grant is new in fiscal year 2001. Research to date has identified alternative crops that can produce materials with unique properties and high value-added industrial uses. The New Crops program at the National Center for Agricultural Utilization Research in Peoria, Illinois, has identified several crops with these characteristics that are suited for midwest production.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$94,791.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since this is a new grant, and a proposal has not yet been received, the source and amount of non-Federal funds for this research is unknown.

Question. Where is this work being carried out?

Answer. This work will be carried out at the Western Illinois University.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated date of additional or related objectives?

Answer. This project is expected to be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. Since this is a new grant, no evaluation has been conducted.

VIDALIA ONIONS, GEORGIA

Question. Please provide a description of the research that has been funded under the Vidalia Onion, Georgia grant.

Answer. The original research emphasis had been focused on pungency which became secondary in importance with the appearance of a new disease known to producers as Center rot. This newly-recognized disease caused a rotting of affected onions around the center leaf deep into the bulb. The disease crisis necessitated a revision of the goals of this grant and focused on the identification of this new pathogen, the incidence of the disease in the production system, the mode of disease transmission, the affect of the disease on onions in storage, and management options available to producers to prevent the disease.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. Vidalia onions are a specialty crop of great importance to the economy of certain areas of Georgia. This grant funds research to improve product quality and pest management in Vidalia Onion production thus maintaining the national and international economic competitiveness of this vital production system.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research has demonstrated that chemical tests can be used to accurately predict the pungency of onions prior to harvest, and perhaps flavor categorization, to consumers. The results have also indicated that several diseases affecting onions are the most serious problem in regard to quality and production. With the appearance of Center Rot in the Vidalia production system, this grant has focused entirely on understanding and managing this disease.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The project was funded for \$84,000 for 1998; \$100,000 per year in fiscal years 1999 and 2000; and \$249,450 in fiscal year 2001. A total of \$533,450 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. The non-Federal funding for this project was \$193,137 from the state of Georgia, and \$251,427 in private funding.

Question. Where is the work being carried out?

Answer. The work is being conducted at the Coastal Plain Experiment Station in Tifton, Georgia and in test plots in several commercial field sites in the State of Georgia.

Question. What was the anticipated completion date for the original objections of the project? Have those objectives been met? What is the anticipated completion date of additional objectives?

Answer. The anticipated duration for the original project was five years. The initial objective of establishing procedures for pungency testing has proceeded ahead of schedule. The plant disease problems that have emerged will likely require several additional years, although the incidence and severity of these diseases are highly variable from year to year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A site visit was made by the CSREES Liaison for the Vidalia Onion Special Grant on the University of Georgia campus at Athens, Georgia, on January 14, 2000. The purpose was to discuss the progress and direction of this special grant with the principal investigators and their University Administrators. The project history was reviewed. The emphasis and goals of this special grant changed in fiscal year 1999 because of an emergency production problem caused by a new disease that threatened the product quality and consumer confidence of the entire Vidalia industry. The original research emphasis had been focused on pungency which became secondary in importance with the appearance of this new disease known to producers as Center rot. This newly recognized disease caused a rotting of affected onions around the center leaf into the bulb. The revised goals of this grant focused entirely on the identification of the pathogen, incidence of the disease in the production system, mode of transmission, the affect of the disease on onions in storage, and management options to prevent the disease.

The project accomplishments were reviewed, and the research objectives and performance goals for fiscal year 2000 were presented, justified, and discussed. Future research needs and related production issues were also discussed. The principal investigator demonstrated good progress, strong leadership, and judicious use of project funds. The site visit also allowed the Federal partner to provide input to the direction of the project and for the state scientist to demonstrate the accomplishments, competency, and merit of their research activities.

VITICULTURE CONSORTIUM, NEW YORK AND CALIFORNIA

Question. Please provide a description of the research that has been funded under the Viticulture Consortium, New York and California grant.

Answer. The University of California and Cornell University in New York conducted research on varietal responses of grapes, modeling of water requirements, management of diseases including Phyloxera, and other cultural aspects of grape production. Funds were awarded by the lead institutions on a competitive basis to fund projects in various grape-producing states within their region. Grants were made based on peer reviewed proposals and selected competitively by regional groups based on priorities developed by researchers, extension, and industry personnel.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research being carried out is designed to help the viticulture and wine industries remain competitive in the U.S. and in the global market. Further, disease and insect problems are a concern of the industry, especially in new strains of phyloxera while overall improvement in all cultural management approaches to grape production need to continue.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to maintain or enhance the competitiveness of the U.S. Viticulture and wine industry in the global market. Each year the project directors meet with stakeholder advisory boards to determine research priorities. These priorities are then used to guide the formulation of a request for proposals.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1996 and 1997, \$500,000 per year; fiscal year 1998, \$800,000; fiscal years 1999 and 2000, \$1,000,000 per year; and fiscal year 2001, \$1,496,700. A total of \$5,296,700 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Each year the viticulture industry provides matching contributions in excess of the appropriated Federal funds.

Question. Where is the work being carried out?

Answer. These funds are distributed through a competitive grants process administered through Cornell University and the University of California. Each year a request for proposals is sent to all states in which there is a viable grape industry. This results in research being conducted in as many as 12 different states in any one year.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research priorities set by the guidance group have not been met. The research is varied and complex and will take many years to complete. Current priorities include: optimize grape production efficiency while reducing costs; increase yield and grape quality; identify new grape varieties for different growing regions; develop effective pest management systems; and determine impact of viticultural practices and components of grapes and grape products.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project underwent merit review in January 2000. The research proposals are peer-reviewed in both regions before selection. The review group is composed on industry, research, and extension personnel that are experts in viticulture.

WATER CONSERVATION, KANSAS

Question. Please provide a description of the research that has been funded under the Water Conservation, Kansas grant.

Answer. This research program is designed to develop and disseminate technical and economic information on the efficient use of water for irrigated crop production in western Kansas. The program has the following five objectives:

- Develop regression models to estimate the longevity of subsurface drip irrigation systems using calculations of annual system performance deterioration based on 13 years of operating pressures and flow rates;
- Evaluate use of livestock effluent with subsurface drip irrigation and its effect on water redistribution and corn water use patterns;
- Develop best management practices for nitrogen fertigation using subsurface drip irrigation systems for corn;
- Estimate the long-run economic impacts of irrigation efficiency improvements for irrigated corn, wheat, and grain sorghum in the farm sector and affiliated sectors of the High Plains economy; and
- Disseminate irrigation research information and best management practice recommendations to Kansas irrigators through a series of extension bulletins and updates based on research-based information.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need to conserve water has focused attention on more efficient alternatives such as subsurface drip irrigation. This research will be of particular significance within the state and region. However, it also has national and international applications as advanced irrigation systems, such as subsurface drip irrigation, which will be needed to improve irrigation water use efficiency in the next century. Economic research initiated in 1998 is examining the impact of adoption of improved water conservation techniques on the entire regional economy rather than just on the short term economics faced by the individual irrigator. This research will help determine whether society should have a role in providing incentives to increase adoption rates of water conservation technology.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research goal is to determine the feasibility of subsurface drip irrigation and other alternative irrigation systems in western Kansas to sustain irrigated corn production to support the beef feedlot industry. The project also supports an educational effort through collection and dissemination of information on efficient irrigation methods. Subsurface drip irrigation acreage is increasing in Kansas, and farmers are obtaining results on their own farms.

The computer program Irrigation Economics Evaluation System—IEES—was distributed by the Kansas State University Cooperative Extension Service and is being used by Kansas irrigators. A report has been published that documents the data requirements and algorithms used in the model. A user's guide is also available.

A report entitled, "Economic Analysis of Alternative Irrigation Systems for Continuous Corn and Grain Sorghum in Western Kansas" has been completed. The results of this study indicate that a low drift nozzle, center pivot system is the most

profitable center pivot system to use for irrigation of corn and grain sorghum. Overall, a surge flood system was the most profitable because of its relatively low ownership costs. Although the subsurface drip system shows some potential, it is only economically feasible when above-average crop yield and price conditions exist.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1993 with an appropriation of \$94,000; \$88,000 in fiscal year 1994; \$79,000 each fiscal year from 1995 to 2000; and \$78,826 in fiscal year 2001. The total funds appropriated are \$734,826.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The state of Kansas non-Federal funds provided to this project were as follows: fiscal year 1997, \$119,659; fiscal year 1998, \$135,993; and fiscal year 1999, \$129,850. No funds were reported in fiscal year 2000.

Question. Where is this work being carried out?

Answer. The research is being conducted at Kansas State University. The field portion of the research is being conducted on Research Centers at Colby and Garden City, Kansas. Additional work is being carried out on campus at the Departments of Agronomy and Agricultural Economics in Manhattan, Kansas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original anticipated completion date for the project was 1998. One of the most important objectives of the study is to evaluate longevity of the subsurface drip irrigation systems. These sites are unique to the region, and very little information is available on system longevity. Pressing water quality problems of a regional and national scope has necessitated a change in the objectives to developing nutrient management practices under subsurface drip irrigation and use of livestock wastewater with subsurface drip irrigation. Additionally, changes in the Federal farm program which allow greater planting flexibility has an effect on how irrigators make water/land allocation decisions. Field and economic studies related to allocation strategies, nutrient management, and wastewater usage should be completed in 3 years. The projected completion date is 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed in January 2000. The reviewers found the project concept to be valid and the timetable for accomplishments to be on target.

WEED CONTROL, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Weed Control, North Dakota grant.

Answer. A major focus has been developing and evaluating systems to reduce herbicide use in crop production. The experiments of longest duration are field evaluations of sustainable, reduced tillage and conventional crop rotation systems to ascertain changes in weed species and densities and in economic returns over time when weed management is reduced. Another emphasis has been weed biology, particularly understanding the unique physiological and genetic traits of herbicide-resistant kochia and wild oat in an effort to recommend the most cost-effective management alternatives. Another goal has been to improve the efficiency of postemergent herbicide use by utilizing additives that maximize weed control with reduced amounts of herbicide and by reducing spray volume and adapting new nozzle designs that improve application techniques.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research address new methods to control weeds using systems control. The principles concerning effective use of additives with postemergent herbicides are being applied to improving the efficiency of postemergent herbicide use across the nation. Similarly, adaptation of herbicide application technology that allows reduced spray volumes while sustaining herbicide effectiveness is of nationwide benefit. The increased understanding of the inheritance and management of herbicide resistance in kochia and wild oat will be beneficial to management of these weeds in the central and northern regions of the U.S. where these weeds are abundant and cause major losses annually. The long-term field experiments should provide useful information on the positive and negative impacts of reduced weed management systems wherever spring-sown small grains are the primary crop.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The initial major activity was a long-term series of experiments to evaluate changes in weed species and populations and the economic returns in conventional, sustainable, and reduced tillage systems with rotations that are up to four years long. The research was initiated in 1993. At least two complete cycles of crop rotations of eight years will be necessary to accurately assess what farmers can expect from adopting new management systems. Resistance of wild oat to many of the major herbicides used for its control in the U.S. has been documented. This project has been the first to identify specific mutations that cause wild oat resistance. Also, resistance to a new herbicide for wild oat control has been confirmed, which had not been reported previously. Molecular biology and physiological studies were initiated to better understand the cause of this resistance in wild oat, so management strategies can be recommended.

Question. How long has this work been underway and how much has been appropriated by fiscal year through year 2001?

Answer. The support by this grant began in fiscal year 1992 and appropriation for fiscal years 1992 and 1993 was \$500,000 per year; \$470,000 in fiscal year 1994; \$423,000 per year in fiscal years 1995 through 2000; and \$435,041 in fiscal year 2001. A total \$4,443,041 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$27,030 state appropriations in 1992; \$48,472 state appropriations in 1993; \$41,969 state appropriations in 1994; \$71,847 state appropriations in 1995; \$62,134 state appropriations in 1996; \$78,579 state appropriations in 1997; and an estimated \$70,000 state appropriations in each year of 1998 through 2000. A total of \$540,031 in non-Federal funds has been provided from fiscal year 1991 through 2000.

Question. Where is this work being carried out?

Answer. Research is being conducted at the North Dakota State University.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date for the long-term rotation experiment, utilizing the conventional, reduced tillage and sustainable management systems, was anticipated to be a minimum of five years, but the experience with atypical environmental conditions suggest that 8 to 10 years will be necessary to attain a relatively steady state or logical end of the research. The current intent is to continue the research until at least 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A scientific peer review of the written proposal was conducted in fiscal years 1998, 1999, and 2000 by CSREES prior to awarding the grant. CSREES' senior scientific staff review the progress of the grant. Those reviews indicated progress in achieving the objectives.

WETLAND PLANTS, LOUISIANA

Question. Please provide a description of the research that has been funded under the Wetland Plants, Louisiana grant.

Answer. The agency approved a proposal entitled, "Biological Approaches to Coastal Wetland Restoration" from the Louisiana Agricultural Experiment Station. The research is a collaborative effort among scientists of the Louisiana Agricultural Experiment Station Rice Research Station, the Department of Agronomy, and the USDA-Natural Resources Conservation Service's Plant Materials Program. The knowledge and technology resulting from this project should lead to an increased ability to economically propagate and maintain the genetic quality of *Spartina alterniflora*-smooth cordgrass—which is an important species used in coastal wetlands restoration. Plant biotechnology and genetic improved methods are proven and well established in crop production but have also been applied on a limited basis for bioremediation and coastal wetlands reclamation. This project will develop the knowledge base and strategies for genetic improvement needed for the economic and rapid establishment of *Spartina alterniflora* over large areas of established and reclaimed coastal wetlands areas. Collections from naturally existing populations will be characterized and superior plants will be intermated in a recurrent selection breeding program to develop improved populations that can be established from seed. Plant cloning artificial seed production and molecular biology will also be used

as tools to facilitate genetic characterization, genetic improvement and establishment of a commercial seed industry. Production research will focus on aspects of seed processing and production, including evaluation of pest control and management strategies to maximize seed production.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. There is local, regional, and national need for this research. Coastal wetlands erosion is a serious environmental problem in many coastal locations around the United States. The program is particularly severe in Louisiana where an acre of coastal wetlands is lost to erosion every 20 minutes. Current technologies, even at great expense, can only slightly reduce these losses. The research this grant is funding has the potential to provide a significant improvement with respect to both the magnitude and expense of further coastal erosion control efforts.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop an economically-feasible approach to controlling coastal wetlands erosion that would use vegetation to retain areas threatened by erosion and to rebuild lost land. To accomplish this, a system that incorporates agricultural principles involved in crop production is required. Specifically, a seed-based system using appropriate planting material is required. While last year was the first year of funding from the agency for this project, progress has been rapid in developing this seed-based system. Field trials in the marsh were initiated in 1999.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999, and the appropriation for fiscal years 1999 through 2000 was \$600,000 per year and for fiscal year 2001 is \$598,680. A total of \$1,798,680 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$18,391 state appropriations, \$5,319 industry grants, and \$8,691 miscellaneous in 1999. In addition, the University had \$110,081 in unrecovered indirect costs. State appropriations for 2000 was \$44,441.

Question. Where is the work being carried out?

Answer. Research is being conducted at the Louisiana Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new program, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project, and there has been no prior agency evaluation. An agency evaluation is planned for fiscal year 2001.

WHEAT GENETICS, KANSAS

Question. Please provide a description of the research that has been funded under the Wheat Genetics, Kansas grant.

Answer. This project provides partial support for the Wheat Genetics Resource Center at the University of Kansas. The Center focuses on collection, evaluation, maintenance, and distribution of exotic wheat-related germplasm needed to develop new wheat cultivar resistant to disease, insects, and environmental stress.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes most cultivated varieties of wheat are derived from common sources. They lack the rich genetic diversity needed to develop resistance to diseases, insects, and environmental stress. The replacement of genetically-rich primitive cultivar and land races by modern, more uniform cultivars all over the world is causing erosion of wheat germplasm resources. New pests or those that have overcome varietal resistance pose a constant threat to U.S. wheat production. Genetic resistance often resides in wild relatives of wheat. The researchers believe this program, which was established in Kansas, is providing service to wheat breeders nationally and internationally.

Question. What was the original goal of this research and what has been accomplished?

Answer. The original goal of this research was to enhance the genetic diversity available to wheat breeders nationally and internationally by collecting, evaluating, maintaining, and distributing germplasm derived from wild relatives of wheat. To date, 39 germplasm releases have been made containing new genes for resistance to such pests as Hessian fly, greenbug, leaf rust, soil-borne mosaic virus, and Russian wheat aphid. Germplasm stocks with resistance to leaf rust and powdery mildew are under development. Evaluation of germplasm for important resistance genes was carried out by Center scientists and cooperating institutions. Center scientists have introduced antifungal protein genes into the wheat plant which enhances its survival against pathogen attacks. One transgenic wheat line gave enhanced resistance to wheat scab, a devastating disease of wheat. In 1998, the center filled 20 requests from U.S. wheat breeders for seed from the germplasm collection and 10 requests for seed of germplasm releases, as well as 34 requests from international breeders.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Work supported by this grant began in fiscal year 1989. Appropriations were for fiscal year 1989, \$100,000; fiscal year 1990, \$99,000; fiscal year 1991, \$149,000; fiscal years 1992–1993, \$159,000 per year; fiscal year 1994, \$196,000; fiscal years 1995–1997, \$176,000 each year; \$261,000 per year for fiscal years 1998 through 2000; and \$260,426 in fiscal year 2001. A total of \$2,433,426 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds provided for this grant were as follows: \$609,309 in 1991; \$531,167 in 1992; \$730,082 in 1993; \$468,960 in 1994; \$563,671 in 1995; \$457,840 in 1996; \$495,820 in 1997; \$155,279 in 1998; \$452,600 in 1999; and \$527,000 in 2000. Sources include state appropriations, product sales, and other organizations, such as state commodity associations.

Question. Where is this work being carried out?

Answer. This research is being conducted at Kansas State University at the Wheat Genetics Resource Center. The principle investigator also reports collaborative projects with other departments at Kansas State University, as well as other institutions in the U.S.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The collection, evaluation, and enhancement of wheat germplasm is continual process. Therefore, this project does not have a defined completion date. Some objectives related to germplasm evaluation have been completed in fiscal year 1999, and other objectives which are related to other genetic sources are still in the developmental stage.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is peer reviewed annually by the institution, Kansas Agricultural Experiment Station, and was found to address important issues in the winter wheat industry in Kansas and other states. The research has been productive based on germplasm releases and peer-reviewed journal articles and other publications. Additionally, each annual proposal is reviewed by CSREES National Program Staff.

WHEAT SAWFLY RESEARCH, MONTANA

Question. Please provide a description of the research that has been funded under the Wheat Sawfly Research, Montana grant.

Answer. This is a new grant, and CSREES has requested Montana State University to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The wheat stem sawfly is a long-standing pest of dryland cereal production in the northern Great Plains. Recently, this sawfly has adapted to become a pest of winter wheat. Historically, it was a pest of spring wheat only, but changes in its seasonal biology have now allowed it to expand its host range significantly. At a regional level, Montana, western and central North Dakota, north-central Wyoming, southeastern Idaho and the Nebraska panhandle are all impacted by the wheat stem sawfly. Its range also extends northward in to the Canadian prairie provinces, with losses estimated at over \$100 million annually in this area. Losses due to this insect are focused in Montana with annual losses ranging from \$20–\$30 million. Montana is where the impact of the sawfly is centered, and infestation lev-

els can be up to 100 percent in areas with the heaviest damage. These localized heavy infestations can be particularly catastrophic to individual producers who may not be able to withstand heavy losses for several years in a row.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new project with initial goals to expand upon exploratory work on five novel avenues aimed at two critical stages of the sawfly, for example, mating and overwintering. The first is to develop an understanding of the role of multiple components of a complicated grouping pheromone system involved in insect mating. A related thrust is to focus on host plant attractants, repellents, and induced signals in the plants defenses as new ways to manipulate the insect in its environment. Second, investigations toward expanding knowledge based on preliminary indications that two partially effective natural enemies are impacting the sawfly in wheat, and that induced plant signals may be critical in the effectiveness of these enemies. The investigators will also look at the pheromones, kairomones, and allomones used by these beneficial species as a potential monitoring tool to better understand the broad distribution of the species, and to target new release sites. Third, they will examine the chemical cues released by pathogen-infected wheat plants, to better understand the nature of facultative use of overwintering sawflies by these pathogens. This process kills sawfly larvae, although in an unknown fashion. Fourth, they will fully elucidate the chemistry of the resistance mechanisms expressed by several grass and weed species attacked by the sawfly. The resistance shown kills many sawfly larvae, but in a way that is not completely understood. Each of these target areas will allow us to identify and develop practical tools for sawfly management. Finally, they will use Russian wheat aphid-resistant isolines to examine sawfly and multiple pest resistance traits in wheat. This information will provide cereal breeders with a new arsenal to use in developing insect-resistant varieties.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001, and the appropriation for fiscal year 2001 is \$331,270.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is a new project which will begin during 2001; other potential funding sources have not yet been developed.

Question. Where is the work being carried out?

Answer. The research will be conducted throughout Montana, with the main laboratory focus being centered at the main Montana State University campus in Bozeman. Annually, there will be a need to field test new behaviorally active compounds, and this will be handled at the level of individual farm cooperators, with Montana State University Research Centers in wheat producing parts of the state aiding in the coordination of this effort. For the work on the natural enemies, a considerable effort will be concentrated on understanding the distribution in the eastern part of Montana, with the Research Centers at Sidney and Huntley assisting.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The work proposed is to conduct basic research to aid in applied goals. The timelines are somewhat lengthy because of this. However, all goals should be reached by 2005, except for the pathogen-based approaches, which will require approximately seven years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project and will be evaluated through accomplishment reports at the outset. An on-site review of another Montana special grant will enable a review of initial set-up and progress on this project at the beginning of the work.

WOOD UTILIZATION RESEARCH

Question. Please provide a description of the research that has been done under the Wood Utilization Research grant.

Answer. The research includes: developing processes to upgrade wood products made from small-diameter or low quality trees to higher value structural applications; catalyzing the formation of new business enterprises; reducing environmental impact while improving systems for timber harvesting and forest products manufacturing; increasing the life of wood in use through preservation and good design; and assisting industry to be more innovative.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The forest products industry is very fragmented with many small firms which benefit from publicly-sponsored research. Research provides the woodworking machinery and tooling industry with the technology needed to be more competitive in the global economy. Most of the companies helped by this research are too small to afford in-house research groups. Shifts in resource availability and increased costs of the timber that is still available demand more complete usage in order for wood to remain competitive.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to generate new knowledge that will benefit the wood industry and the environment. New scientists are trained. Consumers benefit from better and more environmentally-sound products. Among the major accomplishments of the eight centers are (1) design of glue-laminated beams, reinforced with plastics, to save 25–40 percent of the wood fiber that would otherwise be needed; (2) technology to apply wood preservatives using super fluids to reduce environmental problems associated with present commercial treatments; (3) better harvesting systems that are efficient and environmentally acceptable; (4) increase of wood machining speeds and reduction of saw blade width to increase productivity and save raw material; (5) a patented system to apply pressure and vibration to prevent enzymatic sapstain which degrades hardwood lumber by \$70 to \$200 million per year; (6) reduction of quantity of wood bleaching chemicals needed by wood pulp producers; (7) design and strength of wood furniture frames to minimize wood requirements; (8) adoption of European frame saw technology to composite lumber to provide a new raw material source for industry; (9) improved technology to non-destructively scan standing trees for mechanical properties of the wood; (10) reduced warp in structural lumber produced from small-diameter trees; (11) characterization of the wood products industry; (12) heartwood formation; (13) recovery of preservatives from treated wood; (14) installation of a statistical process control system in one sawmill with impressive cost savings; and (15) development of cost effective and environmentally-friendly processes for removing high value chemicals from bark.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows:

| <i>Fiscal year</i> | <i>Amount</i> |
|--------------------|------------------------|
| 1985 | \$3,000,000 |
| 1986 | 2,852,000 |
| 1987 | 2,852,000 |
| 1988 | 2,852,000 |
| 1989 | 2,852,000 |
| 1990 | 2,816,000 |
| 1991 | 2,852,000 |
| 1992 | 2,852,000 |
| 1993 | 4,153,000 |
| 1994 | 4,176,000 |
| 1995 | 3,758,000 |
| 1996 | 3,758,000 |
| 1997 | 3,536,000 |
| 1998 | 3,536,000 |
| 1999 | ¹ 5,136,000 |
| 2000 | ² 5,136,000 |
| 2001 | 5,773,271 |
| Total | 61,890,271 |

¹ Provided a \$500,000 increase for the six existing centers and \$1,000,000 for the two new centers

² Provided \$577,000 to establish a new center in Alaska.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The following are non-Federal funds provided by states:

—Mississippi State University non-Federal funds were: State appropriations, \$2,498,800, \$2,178,725, \$2,353,225, 2,331,691, \$2,650,230, \$2,778,535, \$2,582,617, 2,543,017, \$2,717,448, and \$2,993,888 for 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, and 2000 respectively. In addition, industrial funds averaged \$958,871 for the 5 years from 1995 to 2000 in support of Mississippi's research.

- Oregon State University state appropriations were: \$1,337,962, \$1,394,304, \$1,256,750, \$1,252,750, \$1,417,755, \$1,117,000, \$1,100,000, \$1,352,000, \$1,337,000, and \$1,492,000 for 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, and 2000, respectively. Estimated non-public support was \$802,000 this year.
- Michigan State University non-Federal contributions were \$605,000, \$590,000, \$700,000, and \$600,000 for 1997, 1998, 1999, and 2000 respectively.
- Three new locations were added in 1994: University of Minnesota-Duluth non-Federal match was \$590,000, \$550,000, \$560,000, \$371,930, \$307,532, \$510,939, and \$1,506,000 for 1994, 1995, 1996, 1997, 1998, 1999, and 2000, respectively.
- North Carolina State University was \$126,000, \$165,000, \$135,000, \$163,216, \$323,134, \$518,258, and \$556,486 for 1994, 1995, 1996, 1997, 1998, 1999, and 2000 respectively.
- University of Maine was \$600,000, \$445,723, \$459,100, \$477,464, \$526,210, \$148,032, and \$619,898 for 1994, 1995, 1996, 1997, 1998, 1999, and 2000, respectively.
- Two new centers were added in 1999:
 - The University of Tennessee non-Federal funds for 1999 and 2000 were \$150,987 and \$241,696 respectively.
 - The consortium of the Universities of Idaho and Montana and Washington State University non-Federal funds for 1999 and 2000 were \$305,000 and \$406,000, respectively.
- An additional new center was added in 2000: The University of Alaska non-Federal funds for 2000 were \$257,872.

Question. Where is the work being carried out?

Answer. There are nine locations. The initial three—Oregon State University, Mississippi State University, and Michigan State University—were joined by the University of Minnesota-Duluth, North Carolina State University, and the University of Maine in fiscal year 1994. In 1999, they were joined by a center at the University of Tennessee and a second center at the University of Idaho, which includes a consortium of the University of Idaho, University of Montana, and Washington State University. In fiscal year 2000, funds for a wood utilization center in Alaska were appropriated. This Center is just getting organized now.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to build and maintain three strong regional centers of wood utilization research. These centers have been established, and six additional centers have been established. Projects begun in 1999 will be completed by 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. On-site reviews of centers are conducted on a rotating basis. Each center's plans are reviewed yearly or more frequently. Progress reports are reviewed yearly. Center directors met together for joint planning in June 1996, February 1999, and December 2000. Centers all have advisory committees or research committees which meet periodically. The agency conducts informal on-site reviews periodically. The Minnesota and Oregon sites were visited in 1996; the North Carolina site was visited in 1997. Oregon State was visited in 1998. A Departmental panel reviewed the original three centers in 1992 and 1993. At that time, the original objectives were broadened to address environmental concerns. The centers are helping industry meet environmental objectives by conducting research leading to sustained timber production; extending the timber supply through improved processing; developing new structural applications for wood; and developing wood extractives to substitute for pesticides, preservatives, and adhesives.

WOOL RESEARCH, TEXAS, WYOMING, AND MONTANA

Question. Please provide a description of the research that has been funded under the Wool Research, Texas, Wyoming, and Montana grant.

Answer. The overall goals for this research are to develop objective measures of wool, mohair, cashmere, and other animal fibers to improve the quality of wool products while enhancing the profitability of the U.S. sheep and Angora goat industries. Specific objectives include: develop and evaluate measurement techniques for rapid objective evaluation of wool, mohair, cashmere, and other animal fibers; increase the use of objective measurements to increase fiber production, quality, and income to producers; and increase consumer acceptance of fabrics made from these fibers. The fiscal year 2000 grants terminate between May and August 2001. The 2001 grant

proposals have been requested by the agency. All grants are reviewed for relevance to industry needs and undergo scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Collaboration exists among researchers in Texas, Wyoming, and Montana associated with this grant and other Federal, university, and industry scientists to assure responsiveness to the needs of those involved in wool and mohair production, marketing, and processing. The sheep and goat industries and the principal researchers believe that this research is of national, regional, and local need. The research on wool, conducted by means of this grant, represents the only research efforts in the U.S. focused on improving the efficiency of measuring and assuring wool, mohair, and cashmere quality for garments made from these fibers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal for this research is to develop and evaluate objective measures of wool, mohair, cashmere, and other animal fibers with a focus on improving the efficiency of manufacturing and predicting the quality of products made from these fibers while enhancing the profitability of the sheep and Angora goat industries. Research accomplishments included the development of rapid and inexpensive measurements of average fiber diameter and distribution of animal fibers and other fiber properties such as fiber length and color. Each of these properties are very important for grading and processing to determine ultimate softness, durability, dye characteristics, comfort, and garment price. Within the past year, evaluation of laser and automatic image analysis techniques have been completed by the three cooperators in this project in collaboration with Yocom-McColl Testing Labs, the main animal fiber testing lab in the U.S. Two of the principal investigators authored American Society for Testing and Materials standard methods of test for these instruments that are now published by the Society and, therefore, accepted and in use by the U.S. textile industry. Due in large part to efforts expended under this grant, all animal fibers tested for fiber diameter distribution by this commercial laboratory are now tested using one or the other of these new instruments. This has resulted in labor savings that have produced a reduction in the price for some associated fiber tests. Producers, traders, and processors now receive more accurate fiber data at reduced cost and with shorter turnaround times. Because this form of testing is also recognized by the international textile community, U.S. animal fibers are now more readily accepted and accessible as international commodities. Additional instruments, primarily for measuring length and strength, have also been evaluated with the ultimate objective of better describing domestic wool that will eventually permit electronic trading of animal fibers. These measurements impact the efficiency of the sheep and Angora goat industries, the effectiveness of monitoring the quality and consistency of imported products, and the satisfaction of buyers of wool, mohair, and cashmere textiles. Other experiments, aimed at enhancing our ability to establish the value of specialty animal fibers were successfully completed and reported for mohair, cashmere, and other fibers. Experiments were also conducted to identify more productive rams and billie goats; to select for finer and more valuable mohair in Angora goats; to establish the genetic, nutrition, and management requirements for the concurrent production of lean lamb meat and high quality wool; and to demonstrate the economic advantages to producers of skirting and classing their raw wool prior to marketing. Research and education efforts have kept U.S. processors and producers current on the status of the wool markets world wide. A functional home page was built for the purpose of electronic marketing of wool, mohair, and cashmere with plans to have it in use by the private sector in late 2000 or early 2001. It is important that the U.S. producers of wool, mohair, and cashmere are competitive in the world market and that consumers are assured high quality textiles.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Grants have been awarded from appropriated funds in the amount of \$150,000 per year for fiscal years 1984–1985; \$142,000 per year for fiscal years 1986–1989; \$144,000 for fiscal year 1990; \$198,000 for fiscal year 1991; \$250,000 per year for fiscal years 1992–1993; \$235,000 for fiscal year 1994; \$212,000 per year for fiscal years 1995–1997; \$300,000 per year for fiscal years 1998–2000; and \$299,340 in fiscal year 2001. A total of \$3,780,340 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were as follows: \$150,913 state appropriations, \$11,800 product sales, \$5,817 industry, and \$3,556 miscellaneous in 1991; \$111,394 state appropriations, \$25,451 product sales,

\$41,442 industry contributions, and \$3,068 miscellaneous in 1992; \$152,699 state appropriations, \$39,443 product sales, \$40,804 industry contributions, and \$3,556 miscellaneous in 1993; \$150,094 state appropriations, \$35,284 product sales, \$36,484 industry contributions, and \$3,556 miscellaneous in 1994; \$67,345 state appropriations, \$10,000 product sales, and \$34,325 industry contributions in 1995; \$39,033 non-Federal support in 1996; \$174,486 non-Federal support in 1997; \$200,307 state appropriations and \$13,000 industry contributions in 1998; \$202,854 state appropriations, \$14,385 industry contributions, and \$34,000 miscellaneous in 1999; and \$208,475 state appropriations, \$13,000 industry contributions, and \$30,500 miscellaneous in 2000.

Question. Where is this work being carried out?

Answer. The research is in progress at Texas A&M University, Texas Agricultural Experiment Station at San Angelo, the University of Wyoming at Laramie, and Montana State University at Bozeman.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The original objectives to improve the efficiency and profitability of wool, mohair, and cashmere production and marketing are still valid. Specific objectives for individual laboratories and experiments are continually revised to reflect the changing research priorities for the wool, mohair, and cashmere industries and to satisfy consumer demands for products from these fibers. It is anticipated that five years will be required to complete the current research.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external review of the overall wool research program was conducted in 1998 in Las Cruces, New Mexico, by a team consisting of industry experts and peers from the scientific community. The review team concluded that the program was very productive and beneficial to the U.S. wool, mohair, and cashmere producers as well as the allied fiber industries. Research achievements, noted by the review team, included program input for testing methods and standards used to buy and sell wool for international trade. This has been very important in advancing issues important to domestic producers and maintaining competitiveness in the world market. World-wide acceptance of standards for the objective measurement of natural animal fibers due, in part, to this program, has set the stage for the electronic marketing of wool and other fibers to aid the U.S. fiber industries in remaining competitive in the world market. Viable sheep and goat industries will support jobs for people in rural areas, supply alternative foods for public consumption, use natural means of brush control to abate fire on rangeland and inhabited areas, and provide alternative uses of land unsuitable for cultivation and cattle grazing.

In addition to the program review, grant proposals are annually reviewed and the research facilities are periodically visited. The principal investigators meet annually to evaluate progress and re-evaluate research priorities according to industry needs. Because the research encompassed in this grant is a component of a regional research project, accomplishments are reported annually to scientific peers and representatives from the sheep, goat, wool, mohair, and cashmere industries. In addition, the overall regional research project is peer reviewed every third year.

FEDERAL ADMINISTRATION AND SPECIAL GRANTS

AGRICULTURAL DEVELOPMENT IN THE AMERICAN PACIFIC

Question. Please provide a description of the research that has been funded under the Agricultural Development in the American Pacific program.

Answer. The Agricultural Development in the American Pacific—ADAP—is a primary means for Land Grant research, extension, and instruction programs of the five participating institutions of American Samoa Community College, College of Micronesia—including the College of the Federated States of Micronesia, College of the Marshall Islands, Palau Community College—, Northern Marianas College, University of Guam, and University of Hawaii, to collaborate and cooperate to enhance their impact on Pacific tropical agriculture and communities. ADAP is a mechanism to address common regional client-based issues while maintaining cultural, rural, economic, and environmental integrity. This research grant is awarded non-competitively to a program planned and approved by the five involved Land Grant institutions.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the five participating institutions are geographically dispersed yet facing many similar issues which can best be served through extensive networking and communication. ADAP facilitates communications and seeks to raise levels of academic achievement and faculty skills and improves the overall quality of education at the Pacific Land Grants. ADAP's most unique feature is that twice each year it brings together the five Deans/Directors to discuss agriculture and human resources issues facing isolated, tropical ecosystems in the Pacific, and to plan and implement activities to address those issues. Oftentimes, discussions go beyond ADAP funding and opportunities to areas of increased partnership such as that found with the 1890 Land Grants. ADAP priorities are categorized in three areas: sustainable systems, collaborations/partnerships, and communication systems. Activities include joint and collaborative efforts to improve animal waste management, animal health, and information distribution; to business development and human nutritional improvement; to improving leadership capabilities at the institutional level; building mutually beneficial relationships with the 1890 Land Grant institutions; and the seeking of recognition of Pacific tropical agriculture by the National Association of State Universities and Land Grant Colleges.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. ADAP's goals are to develop human resources and information capacity within the institutions to manage more effectively agricultural programs within and among the institutions, and to focus available resources on critical agricultural issues of the Pacific. Ongoing projects include animal health surveys, livestock waste management, artificial insemination demonstration/education, market and production information tracking systems—co-developed with island “state” Departments of Agriculture— and a website that contains relevant publications from around the world. ADAP is also continuing to work with the 22-nation Secretariat of the Pacific Community in developing a paraveterinary education program. This program will use distance learning and site visits to train students from the cooperating nations and territories in animal health. This is a critical need for the Pacific region. Both ADAP and the Secretariat of the Pacific Community contribute support as well as skilled personnel to assist in this project. In another regional cooperative effort, ADAP led a retreat for strategic planning among the “state” and national Departments of Agriculture in the Pacific region in July 1999. That retreat identified food insecurity as a major issue for Pacific Island nations, and ADAP is formulating a number of island forums, in collaboration with the Secretariat of the Pacific Community and the Food and Agriculture Organization—FAO, Pacific office— to address the issue. In February 2000, the ADAP directors met with the University of the South Pacific and other international organizations in Apia, Samoa, to work on ways to communicate and collaborate better on issues of mutual interest.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. This work was funded for seven years with an annual appropriation of \$650,000 to the former Extension Service. In fiscal year 1994, an appropriation of \$608,000 was made to CSREES to continue the ADAP program. In fiscal year 1995 the appropriation was \$527,000. The fiscal years 1996 and through 2000 appropriations were \$564,000 each year and fiscal year 2001 is \$562,759. The appropriation total to CSREES is \$4,517,759.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds are not provided. Unspecified in-kind support, such as facilities, equipment, and administrative support is provided by each institution and, in some specific projects, by non-ADAP collaborating institutions.

Question. Where is this work being carried out?

Answer. American Samoa Community College, College of Micronesia, College of the Federated States of Micronesia, College of the Marshall Islands, Palau Community College, Northern Marianas College, University of Guam, and the University of Hawaii are carrying out this work.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The ADAP program has been achieving original program objectives, particularly in the areas of improvement in institutional capacity and communications. It is anticipated that an additional 5 to 10 years will be needed to fully achieve collaborative integration of the American Pacific land-grant programs.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A formal review of the ADAP program was conducted July 1–10, 1997, and included visits by review team members to American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and University of Hawaii. ADAP incorporated review recommendations in preparing and adapting a new five-year strategic plan. An agency specialist conducts a merit review of the proposals submitted in support of the appropriation annually. In a review of the April 1999 proposal, progress was judged to be satisfactory.

AGRICULTURAL WASTE UTILIZATION, WEST VIRGINIA

Question. Please provide a description of the research that has been funded under the Agricultural Waste Management, West Virginia grant.

Answer. The West Virginia Department of Agriculture is conducting a project to validate the applicability and effectiveness of anaerobic filtration for treating municipal and agricultural wastes. Anaerobic filtration is a leading-edge technology specifically developed to biologically recover nutrients and energy from organic waste streams and produce an effluent which meets discharge permit requirements. West Virginia State College has worked on three objectives. One is to conduct field trials to determine the effect of digested solids on vegetable crops and pasture grasses. Task two is to assess the feasibility of using various digested waste products as a base for fish feeds. Task three is to move the anaerobic digester from Moorefield, West Virginia, to West Virginia State College for research and training.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The current need for this technology is local, national, and international. The beneficiaries of this technology will be both the people and the environment anywhere in the world where problems of food, fertilizer, and energy shortages are currently in conflict with the preservation of environmental quality. The direct benefits include enhanced and expanded waste water capacity, creation of new jobs, and revenue from by-products and water quality improvement.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to determine the applicability of anaerobic digestion to convert organic waste materials to energy in the form of biogas, thereby reducing the amount of organic matter for disposal. The goal will go beyond the testing of waste materials in the digester and proceed with a program to compare the microbiological loading of rivers, where known environmental pollution is measurable, and where the total bacterial concentration in the rivers could be determined in real-time with a bioprobe. The subsequent goal is to manage the remaining solids from anaerobic digestion in an environmentally-sound manner.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal year 1998 was \$360,000; for fiscal year 1999, \$250,000; fiscal year 2000, \$500,000; and fiscal year 2001, \$494,909. A total of \$1,604,909 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funds are not being expended.

Question. Where is this work being carried out?

Answer. Research is conducted at West Virginia State College, Charleston, West Virginia. Prior to 2000, most of the anaerobic digestion work was at a private farm near Moorefield, West Virginia.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives is June 30, 2000. These objectives are being met within the original schedule. The additional objectives should be completed by June 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The anaerobic digester sludge samples collected are analyzed at the laboratories of the West Virginia Department of Agriculture in Moorefield, West Virginia. The typical analyses consists of: total solids, volatile solids, volatile fatty acids, total kjeldahl nitrogen, phosphorus, pH, and fecal coliform. The separated solids are collected and sent to West Virginia State College for use in field studies to determine plant growth response to the nutrients. The perennial crops, blueberries and pasture grass, were planted in 1999 on the 2/3 acre field site. A fish production

facility was built with approximately 40 fish tanks and associated aquaculture equipment. This facility will be used to assess the feasibility of using various digested waste products as a fish feed. The anaerobic digester at the Moorefield, West Virginia, site was dismantled to be moved to Charleston, West Virginia.

AGRICULTURE WATER POLICY, GEORGIA

Question. Please provide a description of the research that has been funded under the Agriculture Water Policy, Georgia grant.

Answer. The research will investigate policy implications of agricultural water use in Georgia and across the southeastern U.S. The agency has received the grant proposal describing the proposed research and expected outcomes of the research.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Agricultural water use in the southeast U.S. has increased dramatically over the last two decades. At the same time, population growth in this region has led to increased demands for municipal water sources. The proposed research will evaluate these conflicting needs and develop policies aimed at maximizing the utility of the water supply to meet municipal and agricultural demands.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to identify future water resource related problems, design alternative policies to correct these problems, estimate financial and non-monetary benefits of the alternative policies, and develop consensus among agricultural producers regarding preferred policies. This is a new grant; therefore, no work has been accomplished to date.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This is a new grant. The work supported by this grant begins in fiscal year 2001, and the appropriation for fiscal year 2001 is \$365,195.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds and outside sources were provided for this grant in fiscal year 2001.

Question. Where is this work being carried out?

Answer. The majority of the work is being conducted at the Georgia Water Policy Center at Georgia State University. Additional work will be conducted through a collaborative arrangement established with Georgia Southern University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is a new grant. The anticipated completion date for this project is February 2004. No objectives have been completed at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency is conducting a review of the proposal submitted by Georgia State University. Subsequently, an annual evaluation of the project is expected.

ANIMAL WASTE MANAGEMENT, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Animal Waste Management, Oklahoma grant.

Answer. This research project is designed to develop sustainable, environmentally safe, and ecologically-sound best management principles and practices for beneficial animal waste applications for High Plains Agriculture in support of rural economic development through a Federal-state-local partnership. Emphasis will be placed on the rapidly expanding swine industry in the semi-arid region, but information gained will also be applicable to the beef and dairy industries which play major roles in agriculture production in the region.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Oklahoma Panhandle region and contiguous counties in the states of Colorado, Kansas, New Mexico, and Texas generates nearly \$3 billion in sales of agricultural products annually. The Oklahoma Panhandle is the most productive agricultural region in the state with agricultural receipts in excess of \$900 million, which represents 31 percent of the receipts in the region. Texas County, in the Oklahoma Panhandle, ranks number one in the state with sales of \$668 million in 1997 and twentieth of all counties in the U.S. in agricultural sales. The majority of sales are related to livestock production and the rapid expansion of the swine in-

dustry in this semi-arid region has only strengthened that position. Oklahoma has moved to ninth in position in the U.S. for swine sales and Texas County, has risen to third nationally with nearly \$200 million in swine sales from a position of 645 in 1992. The rapidly expanding swine industry was projected to add \$650 million in pork and value-added products in Oklahoma through the slaughter and processing of over 4 million hogs per year. Information gained from this study will provide the database to develop best management practices to maximize beneficial nutrient use and minimize nuisance odor in semi-arid cropping and rangeland production systems. Practices developed will have significant implications regionally, nationally, and internationally. The semi-arid agro-ecosystem is unique with climatic conditions consisting of low rainfall that promotes both dryland and irrigated agricultural practices; extremes in high and low temperatures; soils characterized with alkaline pH, low in organic matter, and high in calcium carbonate. This unique agro-ecosystem makes information gained from more humid environments inapplicable.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to develop best management practices that will protect ground water supplies from pollution of nutrients, salts, and pathogens; maintain air quality; and minimize odors derived from the entire swinehouse, lagoon, land-application, soil-cropping and or rangeland production system, thus maintaining the quality of life in the rural sector. The work shows a positive response to animal waste applications particularly for the forage production systems. This will have an immediate impact for producers who have a diversified livestock production system that includes swine, beef, and/or dairy. Studies of ammonia loss from applications indicate there can be significant losses following land applications. This has several implications for producers and the environment due to ammonia loss and ammonia deposition. Ammonia is one of several factors associated with air quality in the region that contributes to the quality of life. This project has been able to accurately predict conditions that contribute to ammonia loss that will be included in the best management practices for the region. Developing this and other best management practices will allow producers to minimize ammonia losses and improve air quality in the region.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for the fiscal years 1998, 1999, and 2000 at \$250,000 per year and for 2001 is \$274,395. A total of \$1,024,395 has been appropriated for this project.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This project has been matched by \$750,000 non-Federal funding. Sources for this funding have been State and agricultural industries.

Question. Where is this work being carried out?

Answer. This work has been initiated at The Oklahoma Panhandle Research and Extension Center located in Goodwell, Oklahoma. Further work will continue to be done at this site. The Center will provide the land area and a portion of the facilities and equipment necessary to conduct the major portion of the study. Other study sites have been developed on private land in cooperation with swine operations in the panhandle region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was February 29, 2000. Some of the original objectives have been answered in regard to air quality and ground water protection. However, work needs to continue on the implications of ammonia deposition and the effect on water quality in the region. Additional work needs to continue on the issues related to soil quality and cropping system management. Completion of these objectives and additional objectives related to these will be February 28, 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was evaluated at the end of December 2000 when the summary report of the 1999–2000 accomplishments was submitted. Significant progress has been made toward accomplishing the specified goals.

Results to date indicate significant amounts of ammonia will be volatilized, lost as a gas, almost immediately following effluent application to bare soils. Preliminary indications are that applications made to soil, which have significant quantities of plant residue or growing plants will reduce the quantity of ammonia lost by this pathway. An accurate predictive model has been developed to determine the amount

of ammonia loss following application. This model will be included in development of best management practices for swine effluent application. Swine effluent applications to corn, sorghum, and forages have demonstrated that it is an acceptable method to supply nutrients for crop production. Of particular interest has been the response of the forage buffalo grass that is native to the Great Plains where work has been completed that indicates there is very limited potential for phosphorus from a swine lagoon reaching the aquifer in the region.

Results of this project to date have been disseminated to the scientific community and general public via: one conference, four refereed publications one published proceeding, eleven proceedings papers, eight abstracts, one completed thesis, nineteen presentations at national or regional meetings and five publications in preparation.

BIOTECHNOLOGY RESEARCH, MISSISSIPPI

Question. Please provide a description of the research that has been done under the Biotechnology Research, Mississippi grant.

Answer. This was a new special grant in fiscal year 2000. First year accomplishments include the hiring of two doctoral-level biotechnologists and the selection of two crops, sweet potato and hot pepper, as the initial target crops for improvement through genetic modification. CSREES has requested Alcorn State University to submit a grant proposal for fiscal year 2001 that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The overall purpose of this project is to establish a Biotechnology Center at Alcorn State University that will focus on plant biotechnology research geared toward small farmers in Mississippi. Emphasis will be placed on improving the productivity and efficiency of crops and plants grown by small farmers in order to improve profitability and ensure long-term viability.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to enhance Alcorn State University's research efforts in biotechnology through genetic improvement research utilizing biotechnology techniques and to improve the livelihood and viability of limited-resource producers in Mississippi and the southeast. First year accomplishments include the hiring of two doctoral-level biotechnologists and the selection of sweet potato and hot pepper as target crops for improvement through genetic modification.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This project began in fiscal year 2000 with an appropriation of \$425,000 and \$589,700 in fiscal year 2001. The total amount appropriated is \$1,014,700.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. A \$150,000 grant from the World Bank in fiscal year 1996 and state funds have supported this work in previous years.

Question. Where is this work being carried out?

Answer. The research is being conducted at Alcorn State University in Lorman, Mississippi, and at field locations in Preston and Mound Bayou, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator anticipates completing the original objectives of the project by 2003. Additional or related objectives have not been specifically identified at this time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Alcorn State University project was evaluated by a merit review panel convened by the agency on April 17, 2000. The panel recommended approval of the project pending receipt of supplemental information on scientific and administrative aspects of the project. The supplemental information was received, and the agency is satisfied that the program is being administered in compliance with the purpose of the grant. A review panel will be convened to re-evaluate the project upon receipt of a proposal for fiscal year 2001.

CENTER FOR AGRICULTURE AND RURAL DEVELOPMENT

Question. Please provide a description of the research that has been done under the Center for Agriculture and Rural Development program.

Answer. The research monitors the final form and implementation of the Uruguay Round Agreement and evaluates its impacts on global trade and implications for U.S. Agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. As the Uruguay Round—UR—Agreement implementation proceeds, researchers will monitor the development of these policy changes and analyze the likely impacts of these decisions with emphasis on obtaining differential impacts for developing economies, developed economies, and those in transition. Researchers will also explore possible directions for the next Round or Mini-round of the World Trade Organization.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal is to assess and evaluate various proposals affecting agricultural trade, to provide analytical support to the Office of the U.S. Trade Representative, and to provide information to farmers and agribusiness firms on the competitive implications of trade agreements. Theoretical studies and empirical and descriptive analyses of policy issues and technical problems pertaining to the Uruguay round of negotiations were completed and provided to negotiators and the agribusiness community. Knowledge developed in this phase is now being used to monitor the effects of the Uruguay Round Agricultural Agreement—URA.

This grant supports six projects focusing on URA and the World Trade Organization—WTO—monitoring and implementation problems; implications of the URA and WTO for Eastern Europe, Baltic, and the Newly Independent States; development of a model to assess the North American Free Trade Agreement and its linkages with the General Agreement on Tariffs and Trade; trade implications of U.S. food and development aid in developing countries; integration of China into world agricultural markets; and special projects as requested for the United States Trade Representative's office. Major emphasis is placed on developing and improving international livestock and grain sector models.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. This research program was initiated in fiscal year 1989. Grants have been awarded from funds appropriated as follows: fiscal year 1989, \$750,000; fiscal years 1990 and 1991, \$741,000 per year; fiscal years 1992–1993, \$750,000 per year; fiscal year 1994, \$705,000; fiscal year 1995, \$612,000; fiscal year 1996, \$655,000; fiscal years 1997 through 1999 \$355,000; fiscal year 2000, \$355,000; and fiscal year 2001, \$427,058. A total of \$7,551,058 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$111,210 State appropriations and \$175,616 miscellaneous for a total of \$286,826 in 1991; \$113,779 State appropriations and \$173,117 miscellaneous for a total of \$286,896 in 1992; \$120,138 State appropriations and \$164,707 miscellaneous for a total of \$284,845 in 1993; \$161,000 State and \$30,000 miscellaneous for a total of \$191,000 in 1995; \$70,000 State appropriations and \$44,000 miscellaneous for a total of \$114,000 in 1996; \$60,325 in State appropriations and \$61,500 in miscellaneous funds for a total of \$121,825 in 1997; and \$72,000 in State appropriations and \$75,000 in miscellaneous funds for a total of \$147,000 in 1998.

Question. Where is the work being carried out?

Answer. The research program is carried out by the Center for Agriculture and Rural Development at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the project envisioned the development of models capable of providing guidance to policymakers, researchers, and farmers and others of the impact of agricultural trade proposals on the U.S. agricultural sector. As such the objectives are ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluations; however, each annual proposal is peer reviewed for relevance and scientific merit. Also, an informal evaluation of this project takes place as a part of each annual project review and approval process.

CENTER FOR INNOVATIVE FOOD TECHNOLOGY, OHIO

Question. Please provide a description of the research that has been funded under the Center for Innovative Food Technology, Ohio grant.

Answer. Funds from the fiscal year 2000 grant are supporting research projects on the use of neural networks to classify food ingredients, on maximizing the concentration of ellagic acid and lycopene in raspberries, developing protocols for producing swiss cheese starter cultures, developing improved methods for coating snack food and cereal products, and studying the use of ozonated water for washing packaged salads

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the value-added food processing industry is the largest industry in the mid-western states, including Ohio where the industry contributes over \$17 billion to the annual economy. From an economic development point of view, processing and adding value to crops grown within a region is the largest possible stimulus to that region's total economic product. This program aims to partner with and encourage small and medium-sized companies to undertake innovative research that might otherwise not be undertaken due to risk aversion and limited financial resources for research and development in these companies. The principal researcher believes that, although the initial impact of this research will be regional, the recipient organization of this grant is part of a technology transfer network and proactively seeks opportunities to deploy technologies developed through this research to the food industry on a national basis.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of the research was to develop innovative processing techniques to increase food safety and quality or reduce processing costs. The neural network project has developed a model for predicting the optimum processing parameters for meat product ingredients; the raspberry and tomato products have resulted in useful information to increase the positive health effects from consuming the fruits; the Swiss cheese project has developed a standardized method for producing starter cultures that lowers production costs; the coatings work has resulted in improved methods for adding flavorings to food products at lower cost; and the ozonation project, when complete, will very likely increase the shelf life and safety of packaged salad products.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1995. The project received appropriations of \$181,000 per year in fiscal years 1995 through 1997; \$281,000 in fiscal year 1998; \$381,000 each in fiscal years 1999 and 2000; and \$759,326 in fiscal year 2001. A total of \$2,345,326 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In fiscal year 1995, non-Federal funds included \$26,000 from state funds and \$70,000 from industry memberships. In fiscal year 1996, non-Federal funds included \$26,000 in state funds and \$80,000 in industry funds. In fiscal year 1997, non-Federal funds included \$35,000 in state funds and \$95,000 in industry memberships. In 1998, \$35,000 in state funds and \$105,000 in private industry memberships contributed to the support of the project. During 1999, industry funds increased to \$125,000, and state of Ohio match increased to \$50,000. Data on fiscal year 2000 are not currently available.

Question. Where is this work being carried out?

Answer. Research is being conducted in the laboratories of the Ohio State University and at various participating companies in Ohio, Illinois, and Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The principal investigator anticipates that all projects supported by the fiscal year 2000 grant will be completed by February 28, 2001, and for funds awarded in fiscal year 2001, the principal investigator anticipates completing the objectives by July 31, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The last review of the proposal was conducted on June 22, 2000. At that time, the agency science specialist believed that the projects addressed issues relevant to food manufacturing, were sci-

entifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

CENTER FOR NORTH AMERICAN STUDIES, TEXAS

Question. Please provide a description of the research that has been done under the Center for North American Studies, Texas program.

Answer. The purpose of this grant is to develop linkages with educational and other institutions in Mexico and Canada in order to share data and faculty, conduct research identifying trade opportunities and marketing problems, conduct policy analyses, and develop a broad range of training programs preparing agricultural firms for international marketing opportunities. The research proposal was peer reviewed at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Center for North American Studies—CNAS—program director believes that citizens of the United States, Mexico, and Canada have some similar concerns about the impact of the North American Free Trade Agreement—NAFTA—and that new, innovative approaches involving international cooperation are needed to assess and evaluate these issues. Research and training are needed to provide information to evaluate alternatives for expanding U.S. exports and to resolve potential social, economic, and environmental conflicts.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The goal is to promote strong agricultural ties among the three North American countries, foster greater cooperation in resolving critical agricultural issues of common interest, and ensure the continued competitiveness of U.S. agriculture. Accomplishments over the last five years include: preparation of a briefing book on the millennial World Trade Organization—WTO—negotiations for agricultural leadership and Congressional staff; survey of 100 agribusiness firms to determine views on upcoming millennial WTO negotiations; research on “strategic intent” of southern Texas food marketing firms; continued investigation of technical trade barriers as a substitute for tariffs; a study of El Niño and La Niña on fruit and vegetable production; impacts of NAFTA on livestock, meat, feed, fruit, and vegetable trade; a range management watershed study along both sides of the Rio Grande River; and study of the competitive response of Texas food marketers to NAFTA. Since a new CNAS publication series was started in June 1998, seven applied research papers have been published. In 1999, the Center conducted 47 seminars/workshops for producers and agribusinesses to increase the international capacity of the U.S.; over 3,200 people attended. Collaborative work included a workshop on International Strategic Alliances workshop developed jointly with a Mexican and a Canadian university; an expanded database on Mexican agriculture; and a video conference for a Mexican agribusiness audience.

Question. How long has this work been underway, and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Work supported by this grant began with an appropriation of \$94,000 in fiscal year 1994; \$81,000 in 1995; \$87,000 per year for 1996 through 2000; and \$86,809 in fiscal year 2001. A total of \$696,809 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: \$39,000 State appropriations in fiscal year 1994; \$54,000 in 1995; \$60,000 in 1996 and 1997; \$84,500 in 1998; and \$80,000 in 1999 and 2000.

Question. Where is the work being carried out?

Answer. The program is being carried out at Texas A&M University through the Texas Agricultural Experiment Station in collaboration with other segments of the Texas A&M University System and Louisiana State University Agricultural Center.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 12 months. The current phase of the program will be completed in the year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. CSREES performed a merit review of the project in April 2000, as it evaluated the 2000 project proposal, and concluded that: “The project has sound objectives and procedures for helping U.S. firms to be successful in international markets and for helping policy makers understand the impacts of policies and trade agree-

ment alternatives. Therefore, the project contributes to CSREES goals of a highly competitive agricultural production system and enhanced economic opportunity for Americans. The principal investigator is well recognized for his leadership in this area.”

CLIMATE CHANGE RESEARCH, FLORIDA

Question. Please provide a description of the research that has been funded under the Climate Change Research, Florida grant.

Answer. The research supported by this grant seeks to promote the effective use of climate information to improve decisionmaking within the agricultural sector in Florida. The primary objective is to reduce economic risk and improve the economic and social well being of Florida’s rural population involved in agricultural production.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. The need for this research emerges from the growing capacity to forecast climatic anomalies at seasonal lead times suggesting an unprecedented opportunity to tailor agricultural decisions to anticipated weather conditions. This could include decisionmaking to either mitigate the impact of unfavorable conditions, or to take advantage of favorable conditions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of the research include: to characterize stakeholder needs; uses and perceptions of climate forecasts; evaluate the usefulness of and limitation of climate forecasts; and to adapt and enhance research tools, methodologies, and data products required for translating climate forecasts into information required to support agricultural decision/policy making.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and the appropriation for fiscal year 2000 was \$170,000 and for fiscal 2001 is \$169,626. A total of \$339,626 has been appropriated to support this research.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Information on non-Federal funds and sources is not available.

Question. Where is this work being carried out?

Answer. This research is being conducted at the University of Florida, Gainesville.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that work currently underway will be completed in September 2001.

Question. When was the last evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The research proposed to be funded by this grant has been reviewed and approved by three qualified experts identified by the institution in April 2000. In addition, the proposal has been reviewed by qualified staff in CSREES prior to the release of funds. No additional evaluation is anticipated until the research is complete.

COTTON RESEARCH, TEXAS

Question. Please provide a description of the research that has been funded under the Cotton Research, Texas grant.

Answer. Texas Tech Universities has developed an integrated research effort to address cotton production issues using a comprehensive approach in order to strengthen the cotton industry in the high plains. Priority production and marketing issues will be studied.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The proposed project is expected to help support a broad-based program to address priority research needs of cotton grown on the Texas high plain. The specific issues will include production, processing, marketing and utilization.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to improve the economics of cotton production in West Texas and expand the demand for cotton grown in the area.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal years 1998–1999 was \$200,000 per year; \$170,000 for fiscal year 2000; and \$498,900 in fiscal year 2001. A total of \$1,068,900 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds are from the state of Texas and provide salaries and benefits for experiment station employees. Funds supporting the project were \$156,000 in fiscal year 1998; \$149,000 in 1999; and \$187,000 in 2000.

Question. Where is this work being carried out?

Answer. The work will be conducted at the Texas A&M University Research and Extension Center, Lubbock and Texas Technical University Campus, research facilities, and on area farms.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate the project should be completed in fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project received a comprehensive review and evaluation at its inspection by Texas A&M and Texas Tech Universities and CSREES National Program Staff. Each research project is peer reviewed annually, and the combined proposal is reviewed and approved by the institution.

CURRICULUM DEVELOPMENT/MISSISSIPPI VALLEY STATE UNIVERSITY

Question. Please provide a description of the research that has been funded under the Curriculum Development and Strengthening-Mississippi Valley State University grant.

Answer. Funds were used to strengthen academic programs, including accreditation and reaccreditation. Of the ten programs eligible for accreditation, nine have been accredited. Assessment of the criteria has begun for the one remaining eligible program. Academic programs have been broadened to include more agriculture-related courses consistent with the needs of students from the Mississippi Delta, students from other parts of the State, as well as out-of-state students. Curriculum additions have had a positive impact on student enrollment. Courses continue to be modified to reflect the needs of graduates as well as employers in the Mississippi Delta, with particular emphasis on those areas that employers have the greatest need. The funds continue to provide enhancements related to other program and administrative support areas that positively impact program delivery and administration at Mississippi Valley State University—MVSU.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this proposal?

Answer. The primary need for this project is to satisfy a local need. The need is for strengthening university capacity and curriculum development at MVSU. The Delta region is well known for its high level of poverty, high rates of unemployment, infant mortality, teen pregnancies and other chronic social problems. The MVSU Social Work Department is working diligently to improve the quality of life in the Delta counties and communities. In following the university's primary mission of teaching, the Social Work Department is offering an affordable quality education that is the key to overcoming many personal and social problems encountered by living in an impoverished agriculture environment. The Social Work Department offers an educational program that prepares professionals whose primary goal is to empower clients to overcome their personal and social problems.

Question. What was the original goal of this project and what has been accomplished to date?

Answer. The original goal was to provide funding to strengthen the academic programs of the university. This funding has strengthened the fiscal and academic areas of the university. The university's cash flow and cash availability have remained steady and sufficient all year long. Student recruitment has improved to show a positive ratio between applications received and students admitted. Approximately one-half of the applicants are enrolled. Increased quality of instruction and programs have benefitted students. This is reflected in the higher graduation rate, increased student enrollment, enriched faculty, and improved community relationship.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. This program was initiated in fiscal year 1987. Grants have been awarded from funds appropriated as follows: fiscal year 1987, \$750,000; fiscal years 1988 and 1989, \$625,000 per year; fiscal year 1990, \$617,000; fiscal year 1991, \$642,000; fiscal years 1992 and 1993, \$668,000 per year; fiscal year 1994, \$593,000; fiscal year 1995, \$544,000; fiscal years 1996–2000, \$583,000 per year; and \$645,577 in fiscal year 2001. A total of \$9,292,577 was appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Mississippi Valley State University received State and private funding during the period of this grant. The State figures provided here are for enhancement funds gained above the university's standard formula generated funds. The sources and amounts are as listed:

SOURCE

| Fiscal Year | State | Private | Total |
|-------------|-----------|-----------|-----------|
| 1987 | \$0 | \$168,640 | \$168,640 |
| 1988 | 0 | 1186,036 | 186,036 |
| 1989 | 68,658 | 190,258 | 258,916 |
| 1990 | 207,879 | 369,358 | 577,237 |
| 1991 | 333,263 | 337,700 | 670,963 |
| 1992 | 349,427 | 470,220 | 819,647 |
| 1993 | 35,750 | 358,680 | 394,430 |
| 1994 | 590,890 | 568,970 | 1,159,860 |
| 1995 | 841,654 | 530,300 | 1,371,954 |
| 1996 | 1,197,917 | 590,824 | 1,788,741 |
| 1997 | 309,717 | 755,629 | 1,065,346 |
| 1998 | 313,738 | 538,423 | 852,161 |
| 1999 | 909,419 | 389,812 | 1,299,231 |
| 2000 | 1,416,455 | 424,070 | 1,840,525 |

Question. Where is this work being carried out?

Answer. These funds are intended to strengthen programs at Mississippi Valley State University. The program has been carried out on the campus at Itta Bena and at off-campus sites in Anguilla and Greenville and the Greenwood Center since the Spring Semester of 1996.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives completion date was June 1992, and the primary objective of erasing the financial deficit was accomplished at that time. The university has been operating on a sound financial basis as of July 1993. Academic program strengthening has progressed very well. The objectives of the current grant will be completed by September 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The program staff in the agency conducts an annual evaluation of reports submitted by the principal investigator. The evaluation reflects steady enhancement in curriculum development and improved support for strengthening administrative units. The academic and administrative organization is being expanded and initiatives are being designed to integrate in-service learning and undergraduate research into the academic curriculum. These initiatives are redefining the academic focus of the institution. Student life and services are being improved. Additionally, much attention is being devoted to teach education effectiveness. The Department of Natural Sciences and Environmental Health realizes that in an ever changing scientific technological environment, a labor force must be educated to meet the demands of the workplace and its employers. As such, the department hopes to foster an environment which meets the needs of students and faculty in the natural and environmental sciences by exposing them to different technologies and experiences that will make them competent and knowledgeable in their chosen fields. Of particular concern are those issues in the areas of aquaculture and agriculture.

Presently, these areas are under studied and constantly changing. More and more, genetically-engineered crops are being used to avoid problems with drought and pesticides. This raises various concerns about its impact on the consumers and the exosphere. Many catfish farmers are concerned about their fish in regard to the pesticides and herbicides that are being used on crops in the Delta. The Department of Natural Sciences and Environmental Health aims to upgrade its facilities and the abilities of its researchers to address these issues and share the gained knowledge in a forum of fellow scientists.

DATA INFORMATION SYSTEM QUESTIONS

Question. Please provide a description of system development activities that have been funded.

Answer. CSREES continues to fund activities under contract with a major information technology firm for the design and development of the Research, Education, and Economics Information System—REEIS. Previously funded tasks include the conduct of an inventory of databases targeted for inclusion in REEIS; a comprehensive assessment of information needs within the Research, Education, and Economics—REE—mission agencies and State partner institutions; design and development of a Web accessible catalog of databases identified in the inventory; a comprehensive review of state-of-the-art information technology systems available for use in developing the system; ongoing design and development of a REEIS proof-of-concept prototype; and conduct of a comprehensive interagency data modeling effort that identifies and describes data, data relationships, and sources of data from across the research, extension, education, and statistics domains of the REE mission agencies and State partner institutions. Also, a cooperative agreement with the University of Arkansas was established to provide national leadership in coordinating the efforts of a National Steering Committee charged with guiding the continuing development of the system. The Committee held its latest meeting in August 2000. Funding has also been provided under the REEIS initiative for the design and development of an Evaluation and Accountability System for Extension—EASE—which is targeted for linkage in REEIS.

Question. What is the national, regional or local need for this activity?

Answer. At present, USDA's REE mission area agencies and their university partners lack a central, integrated, user-friendly electronic information system capable of providing access to thousands of programs and projects for which they are responsible and which focus on food, agriculture, natural resources, and rural development. Such an information system is increasingly needed to enable the Department and its partners to readily conduct baseline and ongoing assessments and evaluations of research, education, extension, and economic programs and projects. In recent years, this need has become more urgent for several reasons. First, the United States needs a visionary publicly-funded research and development program to produce essential knowledge and innovations for meeting growing competition in a global market—which is largely attributable to the expanding research and development efforts of foreign nations. Second, a comprehensive information system is needed to serve as a primary reference source for development of new research and education programs on such diverse issues as increasing productivity in agriculture, processing and improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Third, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds to provide a basis for redirecting funds to higher priority issues. Fourth, the Government Performance and Results Act—GPRA—has imposed reporting demands which current databases and decentralized information systems are not prepared to adequately satisfy. It is also envisioned that REEIS will play a key role in implementation of the Agricultural Research, Extension, and Education Reform Act—AREERA—of 1998. In this regard, REEIS would be well-positioned to:

- Provide linkages for decisionmaking among REE agencies;
- Enable consistent reporting on identical or similar issues;
- Provide the public with understanding of the role and mission of REE agencies;
- Expand REE's outreach to a broader base of constituencies;
- Provide a better vehicle to facilitate interaction among REE agencies and their university partners;—Link commonalities of research, extension, and teaching projects and programs through a single interface; and
- Foster global interactions.

The REEIS customer base includes not only the REE mission agencies and their state partners institutions but other Federal agencies that partner with the research, extension, and education components of the Department. The Department

of Education, the Department of Health and Human Services, the Department of Energy, the Department of Defense, the Environmental Protection Agency, and the National Science Foundation are among the Federal agencies that share and exchange data with the REE mission agencies and fund programs that address problems of mutual concern. Web-enabled access to data and information in the REEIS data store and state-of-the-art capabilities for manipulating and organizing the data will permit a greater knowledge base of information to be more easily shared among stakeholders pursuing common areas of interest. It is expected that Federal agencies with programs in food safety, natural resources and the environment, rural economics and community development, human nutrition, and science education, for example, will be key players in assisting the REEIS development team in refining many of the system requirements for REEIS. As full implementation of the system is realized, greater inter-agency communication and collaboration resulting from use of REEIS will lead to a strengthening of alliances across the Federal sector.

Question. What was the original goal of this initiative and what has been accomplished to date?

Answer. The original goal of this initiative was to develop an information system that provides real-time tracking of research, extension, and education projects and programs; has the capability to communicate vertically between field, State, and Federal locations; enables the REE agencies and their partners to conduct rapid and comprehensive policy assessments and program evaluation analysis; facilitates assessment of technologies and practices employed in extension, education, economics, and research activities at the field and/or regional levels; provides clear and transparent public access to relevant parts of the information; and provides information management tools to enhance the timeliness and accuracy of REE-wide responses to inquiries about program objectives and expenditures.

Since launching of the REEIS initiative, substantial system planning and development work has been completed. Work accomplished under a series of multi-task contracts with a private sector information technology firm was instrumental in meeting major milestones considered to be critical components and a prerequisite to the design, development, and implementation of REEIS. Major tasks included the conduct of a comprehensive strategic information audit of information needs within the REE agencies and partner institutions; the identification and inventory of major research, extension, education, and economics/statistics databases maintained or supported by the REE mission agencies; the design, development, and preparation of the REEIS database catalog prototype that affords Web access to the inventory of 38 databases initially identified as candidates for inclusion in REEIS; the design and evaluation of the Web interface to the REEIS database catalog; a comprehensive review of state-of-the-art information technology systems available for use in developing REEIS; the design and development of several iterations of a Web accessible REEIS proof-of-concept prototype; and the completion of a comprehensive REEIS interagency data modeling effort.

Activities completed in fiscal year 2000 included the development and assessment of alternative system architectures and the development and testing of a REEIS prototype populated with actual data from selected core databases.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Congress first appropriated \$400,000 for REEIS in fiscal year 1997 to begin planning its design and development. The fiscal year 1998 appropriation was \$800,000. This was followed by appropriations of \$1,000,000 in fiscal year 1999, \$2,000,000 in fiscal year 2000, and \$2,120,325 in fiscal year 2001. A total of \$6,320,325 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Non-Federal funding does not apply at this time.

Question. Where is this work being carried out?

Answer. Leadership responsibility for REEIS resides within the CSREES Science and Education Resources Development unit in Washington, D.C. This provides for effective linkage within the REEIS platform of the Current Research Information System, the Food and Agricultural Education Information System, and other appropriate research, extension, education, and statistics databases. The REEIS leadership works closely with the four REE mission agencies and the university system to ensure that primary users as well as key stakeholders are involved in the REEIS development process. A sizeable effort continues under contract with a major private sector information technology firm for the design, development, testing, and implementation of REEIS. Three staff persons, including a newly recruited REEIS director, are assigned full time to direct, manage, and coordinate agency and contracting

activities. Plans are to recruit several full time computer specialists to operate and maintain the system.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Initial implementation of REEIS was targeted for fiscal year 2000. However, the need to satisfy Department requirements for justification of the information technology investment for REEIS has delayed the use of fiscal year 2000 funds for implementation. These requirements include the preparation of several preliminary reports that include a cost/benefit analysis, a security plan, telecommunications plan, risk analysis, and a system architecture. Preparation of these reports is currently in progress. A cooperative agreement with the University of Arkansas has been extended in order to conduct a series of joint application design sessions and preparation of detailed system requirement documents needed for initial implementation. Pending the release of fiscal year 2000 funds, initial implementation is to begin in fiscal year 2001 with completion targeted for the first half of fiscal year 2002. Finalization of complete system requirements is to follow. Required to achieve broad implementation is the need to conduct ongoing needs assessments within the mission area and with its partners to align information system products and services with strategic information requirements necessary for meeting agency mission and goals and satisfying GPRA reporting requirements. Updating and maintenance of technical system assessments, conducting ongoing information technology evaluations, and enhancements of REEIS user interfaces will be essential to ensure currency and responsiveness over the life of the system. Additional activities include enlistment, training, and retention of essential personnel and staff, and the enhancement of several legacy systems and databases to permit effective inclusion in REEIS.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Progress and accomplishments of the REEIS initiative continue to undergo review and evaluation by the REE mission agencies, the REEIS National Steering Committee, our State partner institutions, and outside sources. The most recent in-depth evaluation of the project was conducted in June 2000 by a Department-wide information technology review board. Factors considered in the evaluation included REEIS system objectives, cost control measures, project scheduling, performance considerations, security policy, system architecture recommendations, and level of support for the Secretary's priorities. A user evaluation of this project was conducted at the August 2000 meeting of the REEIS National Steering Committee comprised of representatives of the REE mission agencies, university partners, and key stakeholders. Committee members were presented the opportunity to critique the latest iteration of the REEIS proof-of-concept prototype in terms of its potential for responding to primary users, satisfying primary uses, and meeting priority system requirements. An independent verification and validation study is planned for fiscal year 2001. The study seeks to verify that results of development activities fulfill their requirements and validate that development products satisfy user needs under defined operating conditions.

GEOGRAPHIC INFORMATION SYSTEM

Question. Please provide a description of the research that has been funded under the Geographic Information System program.

Answer. The purpose of this program is to promote collaborative and innovative transfer of systems technologies to state and local governments and others in the public and private sectors. The current program is being carried out by the non-profit National Consortium for Rural Geospatial Innovations in America—RGIS. The directors and participants of the Consortium are the sub-contractors who are carrying out the program by working on agro-environmental problems at the national, regional, state and neighborhood levels. They represent a wide spectrum of site-based expertise including six academic institutions, one regional development authority, and the Southwest Indian Polytechnic Institute site added by Congress in 1997. This institutional arrangement has helped fill a role in linking some of the otherwise disparate efforts of agencies and academic institutions to apply them now in seven regions of the country.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that local officials are facing increasingly complex land management issues that require rapid access to resource knowledge and databases for decision making. This project is needed to transfer relevant

technology to state and local governments, including Native American communities whose limited training budgets and sometimes-isolated location make it difficult to use the latest technology. The technology developed by the Consortium is useful in improving the management of natural resources. While concentrating on issues related to agriculture, the independent, non-profit nature of the National Consortium for Rural Geospatial Innovations in America facilitates linkages across disciplinary and institutional barriers and makes it possible to use analyses at the state and local levels which were initiated at the Federal level. While the early phases of the geographic information system concentrated on building information systems related to rural, physical, and natural resources, the current challenge is to integrate human economic, social, and demographic information in order to better understand the relationship of human communities to the landscape. At the other end of the spatial scale, the role of the public sector in geographic information system-based precision farming technologies, data capture, and information synthesis is the subject of a current study group.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this work was to serve as a pilot project for the transfer of geographic information systems technology related to natural resources to local governments. The Consortium has carried out this function. Economic and biological data are being presented in various formats to state and local governments and individuals. Through its seven regionally-distributed sites, including the new Southwest Indian Polytechnic Institute site in New Mexico, the Consortium has implemented a variety of geographic systems technologies to local governments—both rural and urban. These include the recent expansion of transfer of geographic information technology through various distance education and Internet technologies. It is anticipated that the fiscal year 2001 grant will support work under this program through March 2002. The proposal for this work in 2000 has been received and reviewed.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, \$494,000; fiscal year 1991, \$747,000; fiscal years 1992 and 1993, \$1,000,000 per year; fiscal year 1994, \$1,011,000; fiscal year 1995, \$877,000; fiscal year 1996, \$939,000; fiscal years 1997 through 1999, \$844,000 per year; fiscal year 2000, \$850,000; and fiscal year 2001, \$1,022,745. A total of \$10,472,745 has been appropriated since the beginning of the program.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. For fiscal year 1990 through fiscal year 1997, to date, the work in this program had \$5,009,834 in non-Federal support. In fiscal year 1990, non-Federal support was \$714,940 consisting of equipment, databases, and other miscellaneous contributions from foundations, city, and state governments. In fiscal year 1991, non-Federal support was \$25,000 from county government. In fiscal year 1992, non-Federal support was \$366,016 from county government, computer companies, and state governments consisting of equipment, software, facilities, and miscellaneous support. In fiscal year 1993, non-Federal support was \$713,900 consisting of financial and miscellaneous support from foundations, county, and state governments. In fiscal year 1994, the non-Federal support was \$713,643; in fiscal year 1995, the non-Federal support was \$987,000; in fiscal year 1996, it was \$567,173; and in fiscal year 1997, it was \$456,582. In 1998–2000, non-Federal dollars exceeded \$1,000,000, and it is anticipated that they will again in 2001.

Question. Where is this work being carried out?

Answer. The National Consortium for Rural Geospatial Innovations in America is administratively centered at the University of Wisconsin-Madison. The University of Wisconsin-Madison, functioning as the Great Lakes and Administrative center, continues a long history of involvement in the application of this technology at the local level with strong focus on soils/land-use and the institutional aspects of the integration of a new technology.

The southeastern center in Valdosta, Georgia, in affiliation with the South Georgia Regional Development Center, has developed a comprehensive plan of the City of Adel as a model for other urban centers in the 10-county region.

The southwestern center, in Fayetteville, Arkansas, serves several local governments through its training facilities at the University of Arkansas, basing its technical approach on expertise and past experiences with the Federally-developed system known as GRASS. They have developed pilot projects for some local jurisdictions and state level databases, which they have provided online.

Central Washington University focuses on training for state planning and on three local governments and the Yakima Nation in the Yakima watershed.

The north central center in Grand Forks, North Dakota, in affiliation with the University of North Dakota, focuses on relating real time weather data to other spatial attributes.

Native American communities are being reached through the newly-developed Southwestern Indian Polytechnic Institute facilities in Albuquerque, New Mexico.

Two new sites were added in fiscal year 1999. They are Pennsylvania State University and the Geographic Information Systems Consortium at Wilkes University and Kings College in Pennsylvania. These two sites have replaced the NCRI-Chesapeake site and will be involved in providing Geographic Information Systems solutions to environmental problems that local government and regional planning commissions are dealing with in the Upper Susquehanna/Lackawanna Watershed.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives to build institutional frameworks for developing and disseminating geographic and related information to local decision makers is constantly evolving. Each site has developed approaches to addressing regional needs for modern technologies, and many innovative applications have been implemented. Technologies, including Internet-based educational and information exchange, have been developed to respond to the Consortium's customers. The Consortium has been asked to include these new technologies in order to bring its primarily rural users into new eras of public education and information management.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Proposals have been internally reviewed by Departmental personnel in different agencies. Beginning in 1995, the program has also been externally reviewed by local advisory committees and qualified professionals inside and outside of government. Their various comments and suggestions are sent to the agency and have helped with the favorable merit reviews. A 3-day review of the program was conducted in November 2000 by Departmental personnel in conjunction with a satellite training broadcast of Geographical Information Systems technologies to tribal colleges. The program was found to be making good progress towards objectives and producing useful documents for their clientele.

GERMPLASM DEVELOPMENT IN FORAGE GRASSES, OHIO

Question. Please provide a description of the research that has been funded under the Germplasm Development in Forage Grasses, Ohio grant.

Answer. This project was initiated in fiscal year 2000 as a subcontract under the Hydroponic Tomato Production grant funded at \$100,000 and was funded as a stand alone grant for 2001. The goals of the program are to identify and clone genes responsible for apomixis and to use them to develop apomictic germplasm in commercially-important grasses such as corn, wheat, and rice. Apomixis is the development of seed embryos without fertilization which produces offsprings identical to the parent plant and greatly speed up development of new plant cultivars.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. These three grain crops are grown world wide and are the principle food source for much of the world's population. The apomictic character which can freeze the genetic make up of the first generation following cross breeding, equatorial to negative reproduction, greatly speeds up the development of new cultivars. This could be a major contribution toward feeding the world's growing population. This work has national and international impact.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify and clone the genes responsible for apomixis in grass plants and to use them to develop improved germplasm for important grain crops such as corn, wheat, and rice. To date five RNA clones from an apomictic forage grass have been sequenced, and their gene expression is being evaluated.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$99,780.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal finds and sources provided for this grant were as follows: \$68,400 state appropriations in fiscal year 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at the University of Toledo and Miami University of Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is estimated by the principal investigator to be 2005.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation was in a fiscal year 2000 review and evaluation of the subcontract of the Hydroponic Tomato production Special Research Grant Proposal which was performed by CSREES National Program Staff. DNA sequences for gene segments from *Tripsaum dactyloides* have been isolated and sequenced. This will be used to map and identify value-added genes.

GULF COAST SHRIMP AQUACULTURE

Question. Please provide a description of the research that has been funded under the Gulf Coast Shrimp Aquaculture grant.

Answer. The Oceanic Institute and the Gulf Coast Research Laboratory have submitted a grant proposal that is currently under review. The research has addressed three major areas of research including broodstock development, aquatic animal health, and the development of economically viable biosecure culture systems. Researchers are developing improved high health stocks of marine shrimp with enhanced production traits and resistance to specific viral pathogens. The program continues to respond rapidly to the viral diseases and emerging pathogens that have significantly impacted the U.S. shrimp farming industry. Efforts to identify important viral pathogens and develop enhanced detection methods for these pathogens continues. Studies aimed at preventing new introductions of exotic viral pathogens in commercial and wild shrimp stocks have intensified. Technologies to enhance biosecure broodstock, hatchery, and production facilities are being developed and refined.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher indicates that there is potential to enhance domestic production of marine shrimp through aquaculture in order to reduce the approximately \$3 billion annual trade deficit in marine shrimp. Research is directed at the critical needs of the industry including improved supply of high quality seed, improved shrimp health management, improved biosecurity and environmental protection, and enhanced production efficiency in shrimp culture systems. The U.S. has the opportunity to become a major exporter of shrimp seed and improved broodstock, disease control and biosecurity technologies, products, and services.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to increase domestic production of marine shrimp through aquaculture. High-health, genetically-improved, and specific pathogen-resistant stocks have been developed and evaluated under commercial production conditions. These improved stocks serve as the genetic base for most of the commercial shrimp production in the U.S. Researchers have responded to severe disease outbreaks caused by the introduction of exotic viral pathogens into U.S. Studies have focused on the prevention and detection of shrimp viral diseases which have decimated domestic commercial production. Biosecure and environmentally-compatible production systems have been developed that have enhanced U.S. production technology. Diagnostic and disinfection techniques for a number of important viral pathogens have been developed.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, \$1,050,000; fiscal year 1986, \$1,236,000; fiscal year 1987, \$2,026,000; fiscal year 1988, \$2,236,000; fiscal year 1989, \$2,736,000; fiscal year 1990, \$3,195,000; fiscal year 1991, \$3,365,000; and fiscal years 1992–1993, \$3,500,000 per year; fiscal year 1994, \$3,290,000; fiscal year 1995, \$2,852,000; fiscal year 1996, \$3,054,000; fiscal years 1997 through 2000, \$3,354,000, per year; and \$4,167,811 in fiscal year 2001. A total of \$49,623,811 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The U.S. Marine Shrimp Farming Consortium estimates that non-Federal funding for this program approaches 50 percent of the Federal funding for fiscal years 1991–2001. The source of non-Federal funding is primarily from state and miscellaneous sources. There is also substantial in-kind contributions from commercial cooperators.

Question. Where is this work being carried out?

Answer. The work is being carried out through grants awarded to the Oceanic Institute in Hawaii and the Gulf Coast Research Laboratory in Mississippi. Research is also conducted through subcontracts with Tufts University, the Waddell Mariculture Center in South Carolina, the Texas Agricultural Experiment Station, and the University of Arizona.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original specific research objectives was 1987. The original specific objectives have been met, however new challenges to the U.S. farm-raised shrimp industry continue the need for shrimp culture research. Researchers anticipate that the specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project proposal is reviewed annually by the agency's Program Managers and the Program Specialist. The fiscal year 2000 agency evaluation concluded that the research objectives were clearly stated and the proposed research was consistent with the National Science and Technology Councils—NSTC—Strategic Plan for Aquaculture Research and Development. Facilities and expertise were very good, and the research activities were closely linked to the U.S. shrimp farming industry with the industry cooperating in many components of the research. The agency conducted an on-site review of this program in October 1999. The external review team indicated that the quality of the science was high, that researchers continue to provide information critical to the development of the shrimp farming industry in the U.S., and that the overall Consortium management was excellent.

LIVESTOCK MARKETING INFORMATION CENTER, COLORADO

Question. Please provide a description of the research that has been done under the Livestock Marketing Information Center, Colorado program.

Answer. The Livestock Marketing Information Center—LMIC—is a well-respected source of market-related data and analyses for the livestock sector. Direct participants in the Center include 23 universities, 3 USDA agencies, and 8 private sector organizations. Livestock producers, livestock firms, and State and Federal agencies, and other institutions also access its data and information. The grant has significantly enhanced the ability of the Center to provide objective analyses of livestock markets and make recommendations to livestock producers.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Recent changes in the structure of the livestock industry and in farm legislation have forced producers to pay more attention to market signals. Market prices have become more volatile because of changing domestic and international markets, thereby increasing producers' need for high quality market information and interpretation.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to increase the ability of livestock producers to make economically-sound business decisions in a changing global economy.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by the grant began in fiscal year 2000 with an appropriation of \$170,000, and \$184,593 in fiscal year 2001. The total amount appropriated is \$354,593.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Center includes a consortium of faculty from 23 universities; participating universities contribute about \$170,000 of non-Federal funds a year.

Question. Where is this work being carried out?

Answer. The work will be carried at the Livestock Marketing Information Center, Denver, Colorado, in cooperation with Colorado State University and 22 other universities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project was a period of 12 months, ending in May 2001. However, there are ongoing needs for timely analysis to support decisionmaking processes of livestock producers and others in the livestock industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in March 2000, as it evaluated the 2000 project proposal, and concluded that: "LMIC is a excellent home for this project. It has been recognized in a number of awards and is a leading institution in the adoption of electronic technology since the early 1980s, making its data and information readily available on the Internet for easy access and customized output. The principal investigator and staff have the attitudes, skills, and abilities to do an outstanding job. The project is consistent with CSREES' goals of a globally-competitive agricultural system and enhanced economic opportunity."

MARICULTURE, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Mariculture, North Carolina grant.

Answer. The agency requested that the university submit a grant proposal that has yet to be received. The long-term goal of the project is to develop methods for mass propagation of marine finfish for commercial cultivation and possible stock enhancement. Specific objectives address improved control of reproduction, broodstock husbandry practices, growout technologies, larval rearing, and analysis of intensive production systems in selected marine finfish species including the southern flounder and the black sea bass.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal investigators forecast an increasing need for the development of aquacultural production systems and methodologies for a variety of marine finfish. Results from this research will have broad application in the identification and development of marine species with commercial potential in the U.S.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research program was to develop sustainable aquaculture production systems for marine finfish. Captive mutton snapper were successfully matured and spawned, and the resulting larvae reared through the juvenile stages. Juveniles were supplied to commercial and governmental organizations for commercial grow-out trials. Initial results appear promising with good survival rates and excellent feed conversion ratios. Current research involves southern flounder and black sea bass and focuses on controlling reproduction, developing broodstock husbandry practices, evaluating stocking densities, optimization of environmental factors and feeding regimes for larval rearing, and evaluating production economics in intensive systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal year 1998 was \$150,000; for fiscal years 1999 and 2000, \$250,000 per year; and for fiscal year 2001, \$324,285 was made available. A total of \$974,285 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The university estimates that approximately \$115,000 of non-Federal funds were provided for this project in fiscal year 1998; \$61,941 were provided for fiscal year 1999; and \$125,000 for fiscal year 2000. These funds came primarily from state and private sources.

Question. Where is this work being carried out?

Answer. The research will be conducted at the Center for Marine Science Research at the University of North Carolina at Wilmington.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in fiscal year 1998. The original goals that were to be completed in fiscal year 2000 have been met. The anticipated completion date for the current proposal is fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The fiscal year 2000 agency evaluation concluded that the proposal was well-written and the objectives were clearly stated. The methodology and experimental design were sound, and the research was relevant and addressed a potential opportunity for the aquaculture industry. Facilities were excellent and have been enhanced through this program. The research team was well qualified and had the appropriate expertise. The proposed research is consistent with national goals and needs outlined in the National Science and Technology Councils—NSTC—Aquaculture Research and Development Strategic Plan.

NATIONAL ALTERNATIVE FUELS LABORATORY, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the National Alternative Fuels Laboratory, North Dakota grant.

Answer. Through a nationally-marketed collaboration program in which the National Alternative Fuels Laboratory matches about half of its Federal funding with non-Federal money to work on industry-relevant research, the National Alternative Fuels Laboratory staffs have developed a Federal Aviation Administration-certified lead-free ethanol- and biodiesel-containing alternative to leaded aviation gasoline that is now commercially available in South Dakota, and will be introduced at airports throughout the U.S. in a year or two in response to increasing pilot demand. They have resolved ethanol-in-gasoline performance and environmental issues to accelerate the use of ethanol, and they have initiated new biomass fuel developments, including processes, to produce Environmental Protection Agency-approved, high-octane, emissions-cleaning gasoline additives from agricultural resources. In addition, they have initiated and coordinated the 27-member Red River Valley Clean Cities Coalition to increase the number of alternative fuel vehicles in regional public and private fleets and have built E85 refueling sites in North Dakota.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Our nation needs to develop commercially-viable alternatives to fossil fuels to ensure energy security, improve air quality, and provide employment and economic development opportunities. It is crucial to national security and economic development that these new fuels are accurately represented in the marketplace and given an opportunity to compete fairly with traditional fossil fuels. The National Alternative Fuels Laboratory provides unbiased scientific data on fuel performance and environmental effects. Regional need for the research derives from the need to support regional agriculture and associated industries through development of new biomass fuel industries based on new crops and conventional crop residues, and development of economic uses for agricultural co-products.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The primary original goal was to develop a database of at-the-pump-sampled conventional, reformulated, and alternative transportation fuels sold in the upper midwest and throughout the U.S. to enable comparison of current and historical fuels on the basis of chemical and physical properties. This fuels database is being expanded to include how gasoline chemistry affects air quality and fuel performance. Another original goal was to provide information on conversion of crop residues, agriculture processing wastes, high-cellulose-content municipal wastes, and other biomass materials to alternative fuels. The National Alternative Fuels Laboratory program supported North Dakota's first two public E85 refueling sites, initiated an ongoing industry-supported effort to develop and build a new agricultural co-product-to-carboxylic acid plant in the Grand Forks region—carboxylic acids are building blocks for bio-based polymers and fuels—helped resolve ethanol blend evaporative emissions issues and E85 engine cold-start problems, and initiated an ongoing industry collaboration to demonstrate the viability of producing and utilizing biomass-based clean-burning gasoline and diesel fuel additives.

Question. How long has this work been under way, and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The National Alternative Fuels Laboratory work began in fiscal year 1991 and was, in part, sponsored by this grant. Federal appropriations in fiscal year 1991 through fiscal year 1993 were \$250,000 per year. Later awards were \$235,000 in fiscal year 1994; \$204,000 in fiscal year 1995; \$218,000 per year in fiscal years

1996 through 2000; and \$258,430 in fiscal year 2001. A total of \$2,537,430 has been appropriated over 11 years.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. To date in fiscal year 2000, \$80,000 in non-Federal collaborative funding has been secured from Kraus Group Inc., an alternative fuels infrastructure developer, and the American Lung Association of Minnesota. A total of \$1,240,000 in non-Federal funds has been secured for performance of the National Alternative Fuels Laboratory program objectives over the duration of this grant. During fiscal year 1991 through fiscal year 1993, non-Federal funding from the state of Illinois totaled \$630,000. For fiscal year 1994, non-Federal funding of \$105,000 was secured from the American Corn Growers' Association, the Renewable Fuels Association, and others. For fiscal years 1995, 1996, 1997, 1998, and 1999, non-Federal funding totals of \$50,000, \$60,000, \$140,000, \$90,000, and \$95,000, respectively, were secured from corn grower organizations, state agriculture departments, alternative fuels technology companies, and regional economic development agencies.

Question. Where is this work being carried out?

Answer. The work is performed at the University of North Dakota Energy and Environmental Research Center in Grand Forks. The Center is a research, development, demonstration, and commercialization facility that employs about 200 scientists, engineers, and support personnel.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original objectives was April 30, 1992. The objectives were met. The work was then expanded to include partnerships with industry and agriculture. The National Alternative Fuels Laboratory has been established as a center of expertise for development and demonstration of bio-based fuels, investigating fuel chemistry effects on engine performance and air quality, dissemination of accurate and objective information regarding ethanol in gasoline, and ethanol feedstock assessment and process development. Additional tasks include commercializing an ethanol-based aviation gasoline, implementing industry collaborations to produce carboxylic acids and fuel additives from regional agricultural resources, and administering the Red River Valley Clean Cities Coalition. These tasks should be completed by 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

NATIONAL CENTER FOR PEANUT COMPETITIVENESS, GEORGIA

Question. Please provide a description of the research that has been done under the National Center for Peanut Competitiveness, Georgia grant.

Answer. The grant supports an interdisciplinary research and education program to enhance the competitiveness of the U.S. peanut industry by examining alternative production systems, developing new products and new markets, and improving product safety.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Peanuts are a very important crop in several southern states. In many counties, peanuts provide more than 50 percent of all crop income. Peanut producers have been major beneficiaries of government income protection programs, but Federal farm and trade policies are changing and producers must become more competitive and market oriented.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project helps peanut producers be more competitive in the global market. Recent accomplishments follow. An expert management system adapted to hand-held computers enables county agents to meet farmers in the field and recommend least-cost weed control practices, thereby saving farmers several dollars in chemical costs and placing less burden on the environment. An interdisciplinary team developed a disease-risk index model that successfully predicts the likelihood of disease and economic result. Ongoing research is helping to develop expert decision support systems to enable producers to improve their competitiveness. New

production practices such as twin-row planting patterns and strip-till production practices are being evaluated in several locations.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998. Appropriations have been as follows: \$150,000 in fiscal year 1998; \$300,000 in fiscal years 1999 and 2000; \$399,120 in fiscal year 2001. Total appropriations to date total \$1,149,120.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are as follows: in fiscal year 1998, the state of Georgia contributed \$141,181 and the state of Alabama, \$15,000; in 1999, the state of Georgia contributed \$504,354 and the state of Alabama, \$67,553.

Question. Where is this work being carried out?

Answer. The Center is located at the University of Georgia at Griffen and involves university cooperators from nearby peanut producing states, such as Auburn University in Alabama and the University of Florida.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1998 was for a period of 36 months, however, the need to improve the competitiveness of U.S. peanut growers continues to grow. The current phase of the program will be completed in 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in July 2000, when it evaluated the current year's project proposal, and concluded that: "The project has sound objectives and procedures for helping the U.S. peanut industry become competitive, thereby contributing to the CSREES goals of a highly competitive agricultural production system and enhanced economic opportunity for Americans. The principal investigator and other faculty named in the proposal are recognized for their leadership in the industry. The subcontracts with Auburn University and University of Florida are appropriate and help to create a true regional effort."

PM-10 STUDY, WASHINGTON

Question. Please provide a description of the research that has been funded under the PM-10 Study, Washington research grant.

Answer. The PM-10 Study in Washington addresses the effects of emissions of PM-10 and PM-2.5 sized particulates, or dust, from agricultural land on air quality and development of control strategies. These studies are being conducted by scientists at the University of California-Davis and the Washington State University, in cooperation with Federal, state, and local agricultural, environmental, and health agencies and farmers and growers in both states. The California program had focused on developing and refining methods to accurately measure and detect the sources of PM-10 and PM-2.5 emissions from various agricultural-susceptible California crops and soils. In addition, the California research had been expanded to include dust and gaseous emissions from cattle feedlots, dairies, and the poultry industry. The Washington State University scientists are using refined instruments on field sites to measure and predict the effects of wind erosion and agricultural practices in the Columbia River Basin region on PM-10 and PM-2.5 emissions, under both natural wind erosion and with portable wind tunnel studies. Alternative cropping and tillage practices, residue management, and weed control practices are being developed and compared for control of PM-10 and PM-2.5 emission pollution under Columbia River Basin conditions. Models using regional weather data have also been developed in Washington to predict potential air quality degradation by PM.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. There has been growing national concern over the potential health and safety aspects of air pollution from dusts and suspended particulate matter resulting in passage of the 1990 Clean Air Act, as well as state air quality laws in both California and Washington. Because of particular problems from PM-10 and PM-2.5 emissions in the arid regions of the Western U.S., research on the role of agricultural operations in intensively cultivated soils—such as in California and the Columbia River Basin—as sources of PM-10 and PM-2.5 pollution will assist growers

to develop alternative agricultural management practices to control PM-10 and PM-2.5 emissions is critical.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research were to measure the PM-10 emission rates from significant crop and tillage practices, to determine the source of PM-10 emissions on soils in agricultural regions of central and southern California and the Columbia River Basin in the Pacific Northwest, and to explore cost-effective alternative agricultural practices to control these emissions. More recently, studies of finer PM-2.5 particulates have been included because of their recognized potential health risks. In California, field measurements were continued on both PM-2.5 and PM-10 emissions on production practices on almonds, figs, walnuts, cotton, wheat, and on ammonia emissions from dairy farms and feedlots. Similar studies in the Columbia River Basin are being conducted in Washington on a number of agricultural practices in the rain-fed and dryland croplands. Susceptible climatic and soil conditions and tillage and cropping practices have been identified and are being used to develop prediction tools to assist growers to adopt alternative practices to reduce potential air pollution by PM-10 and PM-2.5 particulate emissions. During 1998, an intensive study was undertaken to evaluate emission differences in almond harvesters. Data have been taken in California to assess land preparation techniques.

A Light Detection and Ranging system has been developed at the University of California-Davis that makes it possible to take a snapshot of the shape of an emission plume from a source such as a harvester and make estimates on the amount of particulate material emitted into the atmosphere and its subsequent transport. Efforts continue to calibrate the Light Detection and Ranging System. New predictive tools are being developed by Washington to predict dust storms from extreme weather events.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in March 1994. The appropriation for fiscal year 1994 was \$940,000; fiscal year 1995, \$815,000; for fiscal years 1996 through 2000, \$873,000 per year; and for fiscal year 2001, \$435,041 for Washington State University only. California was not funded under this grant for fiscal year 2001. A total of \$6,555,041 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. In California, the program is matched by State funds in the form of salaries, benefits, and operating costs. In Washington, there were no state or non-Federal funds in support of the PM-10 project in 1994 and 1995. In 1996, state support was \$22,566, and in 1997, state support was \$102,364. Similar funding was continued in 1998 to 2000.

Question. Where is this work being carried out?

Answer. Previous work was being directed by participating scientists at the University of California-Davis and currently by scientists at Washington State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives of this project is 2001. The first four objectives of the project on soil particle characterization were anticipated to be completed in 1999. The objectives on field control will continue. In 1998, a manual for practices was developed and circulated for use by growers in Washington State to reduce wind erosion on agricultural land. Implementation and development of these management practices will be a major role of this project in the future. Quarterly and annual reports on the Washington State project to date are available.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's Program Manager annually reviews the research progress reports and proposed new research and attended the last annual meeting of the program to assess progress in December 2000. The program is also evaluated each year by technical, administrative, and agency personnel. Progress is reported at research review meetings three times a year, with the November 1998 advisory committee members. A formal on-site review by a panel of experts was conducted of the Washington program in November 1997.

PRECISION AGRICULTURE, ALABAMA GEOSPATIAL TRAINING AND APPLICATION CENTER

Question. Please provide a description of the research that has been funded under the Precision Agriculture, Alabama Geospatial Training and Application Center grant.

Answer. This grant will develop training programs for farmers in the use of Global Positioning Systems, Geographical Information Systems, Remote Sensing and Variable Rate Technology for precision farming application.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project will focus on the southeastern area of the U.S. However results will apply to any location where precision farming is applied.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to provide training for farmers and agricultural service representatives in the use of precision farming technology.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and was funded at \$425,000, and in fiscal year 2001 is funded at \$585,709. The total appropriation is \$1,010,709.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The estimate for non-Federal funds from state appropriation and other sources was \$300,000 for fiscal year 2000.

Question. Where is this work being carried out?

Answer. The project will be conducted at the U.S. Space and Rocket Center Huntsville, Alabama, and the Tennessee Valley Research and Extension Center at Belle Minci, Alabama.

Mr. Skeen. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is 2004.

Mr. Skeen. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was peer reviewed and subjected to the project review and approval process by the submitting organization. In addition, each proposal is reviewed by CSREES National Program Staff.

PRECISION AGRICULTURE/TENNESSEE VALLEY RESEARCH AND EXTENSION CENTER,
ALABAMA

Question. Please provide a description of the research that has been funded under the Precision Agriculture/Tennessee Valley Research and Extension Center, Alabama grant.

Answer. The Precision Agriculture Tennessee Valley Research and Extension Center Project will focus on evaluating and demonstrating the utility of geospatial applications to crop production in the area. The work will cover issues such as: Global Position Sensor, variable rate applicators, yield monitor, computer software and soil moisture monitoring equipment. This is a cooperative effort with the Geospatial Training and Application Center Project and will provide field laboratory for hands-on training of participants in that training program.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The activities of this program will be carried out in the Tennessee Valley of Alabama, however, the training supported in part by this project will have broader application and therefore could have regional and national significance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to evaluate precision technologies at the Tennessee Valley Research and Extension Center for applications to site-specific farming and to support training in the use of those technologies.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This work started in 2000 as part of the Precision Agriculture, Geospatial Training Center Project and was funded in 2001 as a separate stand alone project. The appropriate for fiscal year 2001 is \$146,677.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were estimated at \$97,000 for fiscal year 2000.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Tennessee Valley Research and Extension Center and area farmers fields.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed at the institution and was subjected to the project review and approval process. In addition it was reviewed by CSREES National Program Staff.

SUSTAINABLE AGRICULTURE DEVELOPMENT, OHIO

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture Development, Ohio grant.

Answer. A proposal has been requested from the University of Toledo. The principal researcher has indicated that the proposal will address the building of capacity and international linkages between universities in the U.S. and in Lebanon.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal research has indicated that the globalization of agriculture has led to a need to increase international interactions in research and education.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. According to the project leader, the general goal will be to build research capacity among universities in the U.S. and Lebanon in biotechnology. This goal will be accomplished through support for research and training of Master's degree students at the American University of Lebanon and through the training of students from Lebanon for Ph.D. degrees at the University of Toledo and the Ohio State University. Research and training under this project will include the identification and analysis of plants native to Lebanon with potential medicinal, bioactive, or ornamental value. Since the proposal has not yet been funded, there are no accomplishments to report to date.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$473,955.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Since the project has not yet been funded, there are no non-Federal funds to report at this time.

Question. Where is this work being carried out?

Answer. The work is expected to be carried out in the U.S. and Lebanon by the University of Toledo, the Ohio State University, and the American University of Beirut.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives and completion date have not yet been determined.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. No evaluation has yet taken place since the project has not yet begun.

URBAN SILVICULTURE, NEW YORK

Question. Please provide a description of the research that has been funded under the Urban Silviculture, New York grant.

Answer. This is a new project thus a precise description of the research to be conducted is not currently available. The general focus however is "types of greenery most conducive to solving air quality problems in the Mott Haven and Hunts Point neighborhoods of New York City."

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. At this writing, a proposal has not been received. The grantee is conducting a thorough literature review and will submit a proposal in conjunction with

the outcomes of the literature review. The requested date for proposal submission is April 30, 2001.

Question. What was the original goal of this research and what has been accomplished to date.

Answer. The original goal is to determine the types of vegetation and planting design(s) most conducive to ameliorating air quality conditions in the Mott Haven and Hunts Point neighborhoods in greater New York City.

Question. How long has the project been under way, and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. Other than a literature review, which is ongoing, the project has not begun. The total fiscal award, and the fiscal year 2001 award are identical \$237,476.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. The source and amount of non-Federal funds has not been disclosed as the grantee is still working on the original proposal.

Question. Where is the work being carried out.

Answer. The project has not yet begun, but research sites are targeted for the Mott Haven and Hunts Point areas of greater New York City.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion dates of additional or related projects?

Answer. The work has not begun thus no objectives have been met. The grantee will likely structure their original investigative work over a two-year time span and reflect in their proposal that this time span will only allow for the establishment of multiple research designs, not quantitative air quality amelioration results.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. The agency has not conducted an evaluation of this project. CSREES' project administrator traveled to New York City on January 18, 2001 to meet with Congressman Serrano's office and the grantee regarding the nuances of grant proposals originating under the Federal Administration sector of CSREES' budget.

WATER QUALITY, ILLINOIS

Question. Please provide a description of the research that has been funded under the Water Quality, Illinois grant.

Answer. The Illinois Groundwater Consortium grew out of a fiscal year 1990 appropriation of \$500,000 to Southern Illinois University at Carbondale to focus on the short- and long-term effects of agricultural chemical contamination on the state's environment, on groundwater quality and quantity, and ultimately, on human health and welfare. As a result of this appropriation, the university joined forces with the Illinois State Geological Survey, the Illinois State Water Survey, the University of Illinois Cooperative Extension Service, the University of Illinois Agricultural Experiment Station, and shortly thereafter, the Edwardsville Campus of Southern Illinois University, to create the Illinois Groundwater Consortium. The Consortium's primary mission, then and now, is to work effectively toward providing a solid scientific basis for agricultural chemical management and regulatory decision affecting Illinois groundwater. The consortium has worked to address the concerns of the agricultural and agrochemical industries, as well as the valid concerns of the agencies charged with protection of environmental quality. Projects supported with consortium funding are peer-reviewed by researchers at 30 different universities and agencies from across the Nation, and results are presented, critiqued, and published annually at the Consortium's Research and Planning Conference.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to some estimates, Illinois depends on groundwater for nearly half of its water usage, with the downstate region being most heavily dependent on groundwater sources. The quality and quantity of groundwater resources in Illinois are of critical concern for the entire estate, from safe drinking water supplies to the rapidly growing urban northeastern region to reliable irrigation waters in the agriculturally-oriented south.

Between 1996 and 1999, research funded by the Illinois Groundwater Consortium was targeted to studies of the impacts, recovery, and remediation of groundwater supplies following the Midwestern region after flooding. The extensive 1993-1994 flooding of the Mississippi, Missouri, and Illinois Rivers and their tributaries had devastating effects on the farmlands, communities, and natural resources of the area. These effects have major implications for agricultural practices, water quality, and public policy decisions. This natural catastrophe resulted in a need for further

research into the impact of the flooding on surface/groundwater, soils, and their rehabilitation, biodiversity, and economic and public policy in the region.

The more recent focus of the Consortium is on the impacts on groundwater of land use practices and changes in such practices resulting from urbanization as well as agricultural activities such as the growth of large animal feedlots. While the impact of land use practices is most immediately seen in surface waters and river systems through pollution, changes in biodiversity and habitat, and silting, the impact of agricultural contamination on groundwater resources is of equal, and perhaps more compelling, concern.

In addition, there is a continuing need to disseminate results of groundwater studies to the public to enable Consortium findings to be expeditiously beneficial to those needing the information. To facilitate this objective, the Consortium expanded its participant institutions to include Southern Illinois University-Edwardsville. The strategic location of the Edwardsville campus in the heart of the flood damage area, as well as its qualified research scientists who work in the Consortium's high priority research areas, add strength to the Consortium's capabilities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The Illinois Groundwater Consortium was established to coordinate and support research on the effects of agricultural chemicals and other phenomena or events, anthropogenic or natural, on Illinois' groundwater. In working toward these goals, it is important to achieve a balance between the need to maintain the productivity and cost-effectiveness of the Nation's agricultural systems and the need to maintain the integrity of the natural environment. In this context, the Consortium has worked to address the concerns of the agricultural and agrochemical industries as well as those of the agencies charged with protection of environmental quality.

The highest priorities of the Consortium are: (1) the funding of research upon which public policymaker working on land-use or groundwater-protection issues can base decisions, and (2) the broad dissemination of this information. Projects funded by the Consortium that are completed, under way, or proposed include the following:

- Short-term projects, largely flood-based and mostly completed:
 - Effect of extended inundation on soil productivity;
 - Effectiveness of methods of remediation for flooded soils;
 - Movement of chemicals—pesticides, herbicides, heavy metal elements, etc.—from flooded soils into surface and ground waters, including rural wells;
 - Impacts on soil fertility and nutrient balance caused by flooding;
 - Impacts of flooding on plant and aquatic life, including endangered and dangerous species, and microbial communities;
 - Effectiveness of riparian buffer strips under flooded conditions; and
 - Groundwater quality changes resulting from flood-related land-use developments in both the bottomlands where farming practices change, and in the uplands where new communities are being developed.

Long-term projects, largely current and future, are focusing on the effects of land-use practices and changes in practices:

- Changes in soil chemistry and productivity over time;
- Long-term effects on and recovery of microbic activity;
- Long-term assessments and consideration of cultural—social, political—contexts of decision making;
- Impacts of urbanization on groundwater quality and quantity;
- The roles of nitrogen and nitrate: Changes in nitrogen-fixing bacteria, isotopic analyses to identify sources of nitrate, and nitrate management for water quality protection;
- Recommendations for long-term, systems-based planning and management for watershed and bottomland management;
- Examination of public policy decisions with implications for agriculture and water quality; and
- Educational outreach to management agencies, educational institutions, and farmers.

Information on the occurrence, transport, and fate of agriculture chemicals in varied hydrogeological settings in Illinois, and the effects of regulatory and inventive policies and strategies, has been acquired through joint efforts of experts in the state of Illinois who are members of the Illinois Groundwater Consortium.

Question. How long has this work been underway and how much as been appropriated by fiscal year through fiscal year 2001?

Answer. Research grants have been awarded from funds appropriated as follows:

| <i>Fiscal year</i> | <i>Funding Amount</i> |
|--------------------|-----------------------|
| 1990 | \$500,000 |

| <i>Fiscal year</i> | <i>Funding Amount</i> |
|--------------------|-----------------------|
| 1991 | 590,000 |
| 1992 | 750,000 |
| 1993 | 750,000 |
| 1994 | 690,000 |
| 1995 | 500,000 |
| 1996 | 500,000 |
| 1997 | 500,000 |
| 1998 | 500,000 |
| 1999 | 0 |
| 2000 | 297,500 |
| 2001 | 348,232 |
| Total | 5,925,732 |

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant were: \$255,891 state appropriations in 1991; \$447,237 state appropriations in 1992; \$644,054 state appropriations in 1993; and \$623,124 state appropriations in 1994. Non-Federal and State funds for 1995–1997 have exceeded the Federal funds. In 1998, state appropriations totaled \$151,650; in 1999, \$156,198; and in 2000, \$181,881.

Question. Where will the research be carried out?

Answer. The active research programs sponsored by the Illinois Groundwater consortium are being carried out throughout the state of Illinois, including, but not limited to, the heavily populated northeastern part of the state, the Karst watershed in southwestern Illinois, the drainages of the Sangamon and Illinois Rivers, and in natural conservation areas such as Horseshoe Lake. Researchers undertaking these programs are staff at the member institutions of the Consortium, including the University of Illinois, the Carbondale and Edwardsville campuses of Southern Illinois University, the Illinois State Geological Survey, and the Illinois State Water Survey. The Consortium is coordinated in the Office of Research Development and Administration in the Graduate School of Southern Illinois University-Carbondale.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Illinois Groundwater Consortium was established to support research on Illinois' groundwater. In the first and subsequent proposals, we identified both short-term objectives, which are project goals that could be accomplished within 1–2 years, and long-term objectives that could be accomplished within 2–5 years. The Consortium's highest priorities are: (1) to fund research that has practical implications for the people of Illinois and will contribute to sound policy and management decisions, and (2) to achieve broad dissemination of this information.

With respect to the first priority, the Consortium's first major focus—what we might think of as a first phase of a coordinated research program—was a 5-year study of the impacts and recovery of the 1993–1994 flooding in the Midwest. By the end of calendar year 2000, we had completed six years of studies involving 24 projects, primarily directed to the flooding event. That phase is completed now; and in 1999, the Consortium Board of Directors met and decided on the scope and direction of a second phase of groundwater study. Six projects are currently funded by the Illinois Groundwater Consortium as part of the next phase of projects for fiscal years 2000 through 2003. Projects in this phase will address two major issues. One concerns the effects of land-use practices and changes in such practices on groundwater quality and quantity, emphasizing long-term assessments and consideration of cultural—social and political—contexts of decision making. The second issue consists of intensified educational outreach efforts to management agencies, educational institutions, and farmers in the form of “user friendly” publications.

In terms of the second priority of the Consortium—dissemination of research findings—results of projects completed in previous years and progress reports on projects underway are published each year as part of the “Proceedings of the Annual Research and Planning Conference” of the Consortium and in the Consortium's “Groundwater Bulletin.” Distribution of both these publications is broad, by way of mailing lists to public and private institutions and individuals, as well as through related conferences and workshops. Illinois Groundwater Consortium-funded research has been the basis for publications and educational materials used in classrooms, by management agencies and by farmers. These include “50 Ways Farmers Can Protect Their Groundwater—the 1950 Ways' series” which serves as a textbook and informational resources in all 50 states and internationally. A new series of

these books, entitled "Secret Agent Worms" and funded by the Illinois Environmental Protection Agency, is being developed for educational use at the grade-school level.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has not been subject to formal agency review. The USDA regularly reviews the Consortium's proposals for funding, along with the titles, principal investigators' names and affiliations, and budgets. In addition, individual project proposals are peer-reviewed by at least three faculty/researchers drawn from 36 different universities, state, and Federal labs and surveys, the Department's research laboratories, and other research centers. The reviewers rate proposals on criteria pertaining to scientific merit, quality of the research team, likelihood of the work resulting in publications and grant support from other sources, and relatedness of the project to the key objectives of the Consortium.

WATER QUALITY, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Water Quality, North Dakota program grant.

Answer. The original goal of this research was to develop an understanding of the occurrence, transport, and fate of agricultural chemicals found in representative field settings in the northern Great Plains region of the U.S. In 1996, the scope of the program was expanded to include additional water management issues in the Red River of the North drainage basin. The Red River Water Management Consortium, a partnership between public and private sectors was established to address critical water quality and quantity issues in an area where agriculture is the predominant industry. A major objective of the Red River Water Management Consortium is to use results from the initial phases of this research program to find economical, practical, and timely technological solutions to water-related issues facing the region. By providing co-funding for the program, the Consortium members become active stakeholders in the research and ensure the practicality of the work performed.

Since the Consortium was established, the Energy and Environmental Research Center has advocated a better understanding of the critical nature of the climatic cyclicality as the primary factor affecting the economy of this region. In order to live successfully in a setting that is highly influenced by cyclic climatic phenomena, the Energy and Environmental Research Center advocates developing technically-based tools as a means of protecting the region from the harmful effects of both flooding and drought and the evaluation and implementation of creative water management concepts through basinwide partnerships between basin stakeholders. The Center believes that the effective Federal, state, and local agency, municipality, and industry partnership established by the Consortium can become a model for agricultural watersheds throughout the Nation.

The focus of current work is on (1) the assessment, development, and implementation of new technologies for addressing water-related concerns within the basin; (2) water resource assessment and analysis, including the development of mechanisms for providing easy access to water-related information so proper water management decisions can be made; (3) the determination of agricultural, industrial, municipal, and recreational impacts on water resources, both current and potential, and the identification of potential solutions to water quality and quantity problems and needs; (4) water quality monitoring and coordination of monitoring activities; (5) education and information dissemination on water issues facing this region of the U.S.; and (6) development of watershed management strategies for the Red River of the North Basin focusing on water quality and quantity to ensure continued economic development and growth of the area.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Red River Water Management Consortium provides a mechanism for transferring results of the initial research to vested stakeholders of the region and for addressing water quality and quantity issues resulting from agricultural practices and development. The overall goal of the Consortium is the development of long-term watershed management strategies focusing on water quality and quantity which can be used as a model for watershed management in other agricultural regions in the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to understand the occurrence, transport, and fate of agricultural chemicals and their impact on groundwater re-

sources in representative field settings in the northern Great Plains region so scientifically valid decisions could be made for their management and regulation. All fieldwork under this portion of the program has been completed, and a final comprehensive report of research findings will be completed by July 2001.

Results from this program have been reported in journals, conference proceedings, and through presentations at national, state, and local meetings. To date, more than 40 presentations or publications have resulted. In addition, two doctoral dissertations and one master's thesis have resulted from this research.

Finally, the researchers have established the Red River Water Management Consortium as a mechanism for transferring the results of the initial and other ongoing research to vested stakeholders in the region and to the general public in order to address water quality and quantity problems resulting from agricultural practices and agricultural development.

Question. How long has this work been under way and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. In 1989, \$1.0 million was appropriated under the groundwater research program. Beginning in 1990, funds have been earmarked under the direct Federal Administration program. Work supported by this grant was initiated in fiscal year 1990, with an appropriation of \$987,000. Subsequent appropriations have been \$750,000 in fiscal year 1991; \$500,000 per year in fiscal years 1992–1993; \$470,000 in fiscal year 1994; \$407,000 in fiscal year 1995; \$436,000 per year in fiscal years 1996–1998; \$340,000 in fiscal year 2000; and \$394,131 in fiscal year 2001. A total of \$6,656,131 has been appropriated for this water quality research program.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Consortium members provide co-funding to support their participation in the program. Co-funding provided by the Consortium for fiscal year 1996 totaled \$59,700 and fiscal year 1997 totaled \$80,000. In fiscal year 1998, members provided \$90,000 in complementary funding through membership fees, of which \$86,000 came from non-Federal sources and \$4,000 came from the U.S. Environmental Protection Agency—EPA—319 funds. In fiscal year 1999, complementary funding consisted of \$90,000 in membership fees, of which \$86,000 came from non-Federal funding and \$4,000 came from EPA 319 funds. An additional \$102,000 in non-Federal funds came from other sources, including the North Dakota Industrial Commission, the City of Grand Forks, the Minnesota Department of Natural Resources, the Bremer Foundation, the Red River Basin Board, and internal Energy and Environmental Research Center funds. In addition in fiscal year 1999, other Federal sources provided \$52,825 in complementary funding, which include the EPA's Riparian Project—319 funds—and the U.S. Department of Energy-Energy and Environmental Research Center Jointly Sponsored Research Program. In fiscal year 2000, \$90,000 was provided by membership fees as complementary funding, and \$33,600 in other Federal complementary funding was provided through the EPA's Riparian Project.

Field activities to determine the long-term trends of nitrate and sulfate and to determine the source of sulfate were conducted in cooperation with the North Dakota State Water Commission, which provided \$41,000 in cash equivalent funding for sample analysis and field instrumentation. Instrumentation of sites occurred in fiscal year 1997, and sampling and analysis continued through fiscal year 2000.

In fiscal year 1998, the U.S. Army Corps of Engineers contracted through the Consortium a \$100,000, 6-month effort to improve the decisionmaking capability regarding ongoing flooding within the Devils Lake Basin, a subbasin of the Red River of the North Basin. This work produced decision support tools, forecasts, data, and forums that continue to be used by the Corps' St. Paul district, the states of North Dakota and Minnesota, the International Joint Commission, and the people of the Devils Lake region.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of North Dakota through its Energy and Environmental Research Center and at field sites and agricultural product-processing facilities in North Dakota, Minnesota, and Montana as well as in major municipalities along the Red River Valley. In addition, a portion of the pesticide research was conducted at North Dakota State University. Cooperative efforts have resulted in work also being performed at cooperative institution locations such as the University of Waterloo, Victoria University, the University of Montana, the Resource Conservation and Development Council offices in the Red River Basin, and the North Dakota State Water Commission.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives of the project, specifically the field-related research, was fall 1995. This research has been completed; and the sites have been decommissioned, with the exception of those relating to long-term nitrate and sulfate monitoring and analysis. Work on nitrate and sulfate trends and occurrence was scheduled for completion in 1999. All field work related to the impacts of agricultural chemicals on groundwater has also been completed. A final report detailing that research is slated for July 2001. The Consortium was established in 1996 as a mechanism for transferring the information derived from this research program to the technical community and to the public for use in addressing water quality and quantity issues relating to agriculture and agricultural development. Wise water management is the key to the economic viability of agriculture in our region. It is anticipated that the Red River Water Management Consortium activities will continue for several years in order to meet the objectives as defined by the non-Federal sponsors and the agency.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last formal agency evaluation of this project was conducted in September 1996. The agency Technical Project Officer attended a meeting of the Consortium to evaluate and determine the status of this effort. Since that time, the agency Project Officer has been kept apprised of project activities. Significant progress has been made by the Consortium during its nearly 5 years, and the program is an excellent example of how Federal and State agencies, research and academic institutions, private industry, and the general public can work together to solve problems in an economical manner to benefit people, communities, and the Nation. To date, all project objectives have been met.

WETLAND PLANTS, WEST VIRGINIA

Question. Please provide a description of the research that has been funded under the Wetland Plants, West Virginia grant.

Answer. The research involves an interdisciplinary investigation of the vegetation—plant composition, species richness, species diversity, and dominance—disturbance history, soils, geology, and hydrology of six wetland sites in West Virginia. Geographical Information Systems' maps of the six sites will be developed using black and white aerial photographs of the sites from 1940, 1950, 1960, 1970, 1980, and 1990. Results will be used to develop models for studying, managing, and even creating wetland habitats.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Wetlands in West Virginia have declined at least 24 percent between the 1780's and 1980's. To compensate for the loss of these systems and their functions, mitigation is required. To do this effectively, a better understanding and more information of the wetland as an ecosystem must be obtained specifically; i.e., at specific sites and locale.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is a new proposal, and the realization of its goals are underway.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$141,688.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds have been identified to support this project.

Question. Where will the research be carried out?

Answer. Research will be conducted at the Canaan Valley Institute in Charleston, West Virginia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The requested grant proposal has not yet been received.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. No prior evaluation has been conducted.

EXTENSION FEDERAL ADMINISTRATION PROJECTS

AFTER-SCHOOL PROGRAMS, CALIFORNIA

Question. Please provide a description of the extension program that has been funded under the After-School Program, California grant.

Answer. This program will improve the quality, accessibility, and sustainability of 4-H After-School Programs in Los Angeles public housing communities, public schools, and other locations in the community. In addition, Los Angeles County Extension Staff will provide leadership to improve after-school programs administered by other agencies and organizations by offering model after-school program sites, staff development and training, and quality experiential curricula. CSREES has requested the University of California to submit a grant proposal that has not yet been received. The proposal will include specific program objectives.

Question. According to the proposal, or the principal researcher, what is the national, regional or local need for this program?

Answer. The need for this extension program is great. Los Angeles County has a population of more than 2.5 million children and youth under age 18, more than 26 percent of the total youth population of California. The county's youth population is one of the most diverse in the United States, with 58 percent Latino, 21 percent Caucasian, 10 percent African American, and 10 percent Asian American. Of California's minority youth population, 45 percent resides in Los Angeles County. Thirty-six percent have limited proficiency in English, and 37 percent live in low-income households. Low rates of academic attainment threaten a future competent and productive workforce. In response to these challenging statistics, research has shown that engagement in quality after-school programs is one predictor of school success. In addition, quality after-school programs have been shown to improve social, emotional, and physical competencies. Therefore, this program aims to improve educational, economic, employment, and environmental factors in the lives of Los Angeles families and communities.

Question. What was the original goal of this extension program and what has been accomplished to date?

Answer. The planned goals of this extension program are to first, develop and improve model 4-H After-School Programs in Los Angeles; second, infuse research-based, age-appropriate curricula into programs; third, provide staff development and training; and fourth, conduct applied research on youth and family development issues. Because this is a new project, a report on accomplishments is not available.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$398,122.

Question. What are the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are estimated to be as follows: \$128,900 state appropriations and \$360,700 miscellaneous in fiscal year 2001.

Question. Where is this work being carried out?

Answer. This extension program will be conducted in public housing communities, public schools, and other locations within the city of Los Angeles.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is projected to be 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. University of California will conduct a merit review prior to submitting the proposal for fiscal year 2001.

AGRICULTURE IN THE CLASSROOM

Question. Please provide a description of the program that has been funded under the Ag in the Classroom grant.

Answer. Agriculture in the Classroom is an academic program to develop agricultural literacy in kindergarten through 12th grade students. Funds appropriated are used to leverage agricultural literacy activities in all 50 states, the District of Columbia, and U.S. territories by providing national leadership and guidance to State Agriculture in the Classroom Coordinators. This supports the education of more than five million students through over 130,000 teachers annually. Activities during

the past year include cooperative agreements to develop and distribute instructional materials that meet State standards of learning, and to document the effectiveness of Ag in the Classroom teaching programs, maintenance of a national web site to provide fast, cost effective dissemination of information and materials, a national newsletter, collaboration with the Smithsonian Institution and Sustainable Agriculture Research and Education to educate about prairie agriculture, cooperation with the White House Office of Science and Technology Policy to promote Global Science and Technology Week, and planning and conducting an annual national conference.

Question. What is the national, regional, or local need for this program?

Answer. In the Federal Agriculture Improvement and Reform Act of 1996, Congress noted the importance of increasing the number of young Americans pursuing baccalaureate or higher degrees in the food and agricultural sciences. Agricultural literacy is a critical first step in creating interest and awareness of career opportunities in the food and agricultural sciences. Education studies cite that students learn best by example. Agriculture provides hands-on learning experiences in academic disciplines including the physical and biological sciences, social sciences, language arts, and mathematics. Developing agricultural literacy among America's youth is key to ensuring a high-quality, globally-competitive food and agricultural workforce.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The Secretary of Agriculture established the Ag in the Classroom Program in 1981 to help future generations become agriculturally literate. The program encourages teachers to integrate food and agricultural topics into their curricula. The original purpose of the program was to promote agricultural literacy in the primary and secondary education system.

Each state develops or distributes education materials compatible with state teaching and learning standards and conducts in-service and, in some cases, pre-service, teacher education. Results show that Agriculture in the Classroom helps teachers and students understand the complexity of the food and fiber system and better appreciate its impact on the economy and society. Teachers integrate food and agricultural topics into their broad curricula.

A national web site coordinates and facilitates ideas exchange among the Ag in the Classroom State Coordinators; most states also have web sites. Outstanding teachers are presented with National Teaching Awards yearly at the national conference; they share their award-winning materials and techniques with other teachers nationwide.

USDA annually sponsors a national conference to bring the Ag in the Classroom community together to expand experiences, ideas, materials, information, and techniques among state programs, educators, government agencies, agribusiness, and agricultural organizations. A quarterly newsletter provides updates and teaching materials on agricultural topics. A National Resource Guide and outreach to educational associations are being funded to enhance and extend Ag in the Classroom efforts, especially in modestly funded states, and to increase collaboration with 4-H and FFA programs.

States have received acknowledgments from thousands of teachers and administrators who report strong links between agriculture and State required competencies, increased use of instructional technology, meaningful experiential learning for students and teachers, and the objectivity and educational appropriateness of Ag in the Classroom teaching support materials. Thousands of teachers receive continuing education credit or graduate credit.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. A total of \$2,912,886 has been appropriated for this program by fiscal year as follows: fiscal year 1986, \$76,000; fiscal years 1987 and 1988, \$74,000 per year; fiscal year 1989, \$87,000; fiscal year 1990, \$135,000; fiscal year 1991, \$170,000; fiscal years 1992 and 1993, \$208,000 per year; fiscal year 1994, \$185,000; fiscal year 1995, \$208,000; fiscal year 1996, \$204,880; fiscal years 1997 through 2000, \$208,000 per year; and \$451,006 in fiscal year 2001.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is not a grants program and does not require matching funds. Ag in the Classroom is highly leveraged through a variety of public and private funding that supports State programs. The USDA cooperative agreements that are in place have non-Federal matching funds.

Question. Where is the work being carried out?

Answer. National leadership for Agriculture in the Classroom is provided by the Higher Education Programs unit in CSREES. Each state manages its own unique

program. Nationally, the program impacts an estimated 130,000 teachers and over five million kindergarten through grade 12 students annually. States depend heavily on many volunteers—teachers, farmers, agribusiness, farm organization spokespersons, and others—to reach the large numbers of teachers and students served by their programs.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related activities?

Answer. Beginning in 1981, under the direction of the Secretary of Agriculture, an Agriculture in the Classroom program was initiated in every State, the District of Columbia, and the U.S. territories. Developing agricultural literacy among America's youth is a continuing effort to serve each new generation of students, and to ensure a high quality food and agricultural workforce for the future.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. State Directors report that evaluations have been conducted over the past several years. Findings are positive: Ag in the Classroom is an effective teaching tool. A committee of western educators researching agricultural literacy is focusing on the Ag in the Classroom program, and two studies on the teaching effectiveness of the program began this year.

During each national conference formal evaluations are conducted and results are considered in defining future goals for the program. Yearly state summaries are prepared and distributed at the national conference. The summaries include accomplishments, impacts, and evaluations by states. Recent impacts identified are the introduction of food and agricultural topics into the curricula in urban and suburban schools, the inclusion of agriculture in the social studies core curriculum in several states, and the use of food and agricultural topics to meet mandated teaching and learning standards. Teachers without agricultural backgrounds have been quick to use Ag in the Classroom materials in their lesson plans.

BEEF IMPROVEMENT, ARKANSAS

Question. Please provide a description of the program that has been funded as the Arkansas Beef Improvement Program.

Answer. The Arkansas Beef Improvement Program uses verification methods with producer input to demonstrate cost effective management practices for beef cattle and forage production. These demonstrations are conducted on family-owned beef cattle operations throughout Arkansas. Although the Arkansas Beef Improvement Program continues to have whole farm demonstrations, special projects or problem areas have been identified and are under examination. This allowed the program to expand to help answer additional beef cattle and forage production issues. Information learned throughout the Beef Improvement Program is transferred to the public via field days, monthly articles, fact sheets, quarterly newsletters, press articles, and a special Beef Improvement Workshop program.

Question. What is the national, regional or local need for this program?

Answer. Two major areas demonstrate a national, regional and local need for the Beef Improvement program. Arkansas is a very unique state in which the northern area resembles much of the mid-south region of the U.S. and the southern area of Arkansas represents the southern U.S. region. Many of the beef cattle production, forage production, and environmental problems that are in Arkansas are also in these two areas. Therefore, answers to production problems in Arkansas may apply to many states of the southern region. In addition, the Beef Improvement Program demonstrates the need for planning, implementing, and monitoring a business plan. These decisionmaking skills, or processes, are utilized throughout the ranching industry.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The overall goal of the Arkansas Beef Improvement Program was to enhance the efficiency and profitability of the Arkansas beef cattle producer. This program uses demonstration farms to implement and evaluate management practices. To date there have been 14 farms committed to the five-year whole farm demonstration. Currently, three farms are in the fourth year of the program, and one farm is in its second year. Ten farms have completed their five-year commitment. There have been 26 farms involved with the Beef Improvement Special Projects. The commitment with these projects is usually two to three years but is dependent upon the farm and project. Currently, there are 18 active projects.

Question. How long has the program been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. \$200,000 has been appropriated to this project from fiscal years 1993 through 1995; in fiscal years 1996 through 2000, \$197,000 per year; and in fiscal year 2001, \$196,567 for a total of \$1,781,567.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The State of Arkansas provided \$118,154 for fiscal year 2000.

Question. Where is the work being carried out?

Answer. Currently there are 22 active whole farm demonstrations and special project demonstrations. These are being conducted on family farms located throughout Arkansas and represent the structure of the beef cattle industry of Arkansas. The forage base is bermudagrass, fescue, and native grass, and some of the beef cattle producers also operate poultry or swine operations. In addition to the demonstration farms, a workshop was developed to teach the lessons learned from the Beef Improvement effort. Twenty-nine workshops have been conducted with more scheduled for the spring of 2001. These workshops have been very well received and are usually scheduled a year in advance. In addition to these educational methods, an Arkansas Beef Improvement Newsletter is published and mailed to county extension agents and extension personnel in surrounding states. Monthly articles are published in Arkansas Cattle Business, which reaches over 13,000 beef cattle producers in Arkansas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Arkansas Beef Improvement Program currently has four whole farm demonstrations and 18 special projects. Three of the whole farm projects will finish in 2001, and the fourth whole farm project will finish in 2003. The special projects include cow herd performance, pasture renovation, cull cow management, replacement heifer development, establishing breeding and calving seasons, backgrounding farm raised calves, hay quality and supplemental feeding, and stockpiled forages. These projects range from two to five years in length. As farms complete special projects, additional farms are selected for special projects. This allows the program to investigate different management systems under different environmental conditions. Eight farms started special projects in fiscal year 2000, and these will be completed in two to five years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES review of this project is conducted annually. The 2000 review was positive, with continued encouragement for dissemination of results and materials developed in this project through public and industry publications to producers in other states.

BOTANIC GARDEN INITIATIVE, ILLINOIS

Question. Please provide a description of the program that has been funded under the Botanic Garden Initiative, Illinois grant.

Answer. The Chicago Botanic Garden grant proposal for fiscal year 2000 funded their Garden in Every School Initiative which is intended to increase student interest and understanding of science and other related subjects using gardening as the focus.

Question. What is the national, regional, or local need for this program?

Answer. The Chicago Botanic Garden expects the grant to result in educational curricula, lesson plans, garden design and construction recommendations, and garden activities that will serve as a model for other cities throughout the U.S.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal is to develop an innovative program that increases green spaces at Chicago's public schools and teaches elementary school students the value of plant science, math, nutrition, business, and literature. Students and teachers, in collaboration with the Chicago Botanic Garden, will build and maintain gardens by using the Life Lab curriculum, a nationally-acclaimed and widely-used science curriculum.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000 and the appropriation for fiscal year 2000 was \$106,263 and for fiscal year 2001 the appropriation is \$237,476 for a total of \$343,739.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds sources provided for this grant have not been determined at this time.

Question. Where is this work being carried out?

Answer. This work is conducted at the Chicago Botanical Garden.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related-objectives?

Answer. Current progress indicates the anticipated completion date for the original objectives is five years.

Question. When was the last agency evaluation of this project? Provided summary of the last evaluation conducted.

Answer. In June 2000, the project manager for this grant conducted an on-site review of the program. Based on this evaluation, a number of revisions were recommended, and these changes have been incorporated in the Chicago Botanic Garden's grant proposal.

CONSERVATION TECHNOLOGY TRANSFER, WISCONSIN

Question. Please provide a description of the program that has been funded under the Conservation Technology Transfer, Wisconsin grant.

Answer. The project integrates Land Grant outreach programs with technical assistance dimensions of the Federal Farm Bill. It leverages funding at the University of Wisconsin with Federal, State, and Local sources to provide education and technical support to livestock producers regarding animal waste.

Question. According to the extension proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project is necessary to meet Federal regulations on nonpoint source pollution, especially those pertaining to animal waste. It has already served as a regional model for cooperation with the Cooperative Extension Service, the Agricultural Research Service, and the Natural Resources Conservation Service. At least six other states have requested information and/or direct assistance from Wisconsin to copy specific partnership elements that integrate Land Grant activities with the Natural Resources Conservation Service and help streamline assistance to local landowners.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project was to coordinate conservation education on soil and water issues including nutrient management. To date, one of our greatest successes integrates university research and extension outreach with the USDA's Natural Resources Conservation Service technical assistance mission. This effort has resulted in cooperative programs that educate farmers about nutrient management planning.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 2000. The appropriation for fiscal year 2000 was \$170,022 and for fiscal year 2001 is \$473,955. The total amount appropriated is \$643,077.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources provided for this grant are expected to be \$1,200,000 from state and local funds for fiscal year 2001. Commitments are still being secured.

Question. Where is this work being carried out?

Answer. This project is being conducted with individual producers and land managers throughout Wisconsin, in coordination with the USDA's Agricultural Research Service Station in Madison and the Natural Resources Conservation Service.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is June 30, 2001. The university has proposed expansion of this effort, which would require identification of continual non-Federal funding sources to meet the needs of conservation technology education in Wisconsin.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The most recent agency evaluation was spring 2000. Several changes were made as a result of written comments from fiscal year 2000. An onsite evaluation of the project is planned for fiscal year 2001.

DAIRY EDUCATION, IOWA

Question. Please provide a description of the program that has been funded under the Dairy Education, Iowa grant.

Answer. CSREES has requested the college to submit a grant proposal that has not yet been received.

Question. What is the national, regional, or local need for this program?

Answer. There are tremendous financial pressures on dairy producers. Farm families are in need of better education, applied research, and technical advocacy so that they can continue to compete. It is important to remember that the average cow size of dairy farms in Iowa is 66 cows and that most farm operations are conducted by families who do the work themselves. Many have already left the farm industry because of the lack of educational support. Seventy-two percent of Iowa's dairy cows are owned by nearly 3,000 family-based businesses located in a 17-county region in northeast Iowa near this Dairy Center at Calmar. The Center will be a direct service to all these families. In addition, within the remainder of Iowa and the states of Minnesota, Illinois, and Wisconsin there are two million dairy cows and nearly 32,000 producers who will be served by this Center. If the family dairy farm is to survive in these difficult economic times, new methods of production will need to be developed, tested in a production facility and promoted. This Center will serve as an advocate for the family dairy farm, combining farmer ownership with Iowa State University Extension, and Northeast Iowa Community College leadership. Federal funds provided by this grant are expected to strengthen the educational effort and explore solutions to the needs of dairy producers and the dairy infrastructure of northeast Iowa.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of the Dairy Initiative is to enhance the economic viability of current dairy businesses and to increase the number of entries into the dairy industry. The Dairy Education, Demonstration, and Applied Research Center opened October 14, 2000. Seven-hundred dairy farm families came together to make this Center happen. The facility will train tomorrow's dairy professionals, demonstrate best practices to current producers, and apply the latest innovations in a field trial situation. Already, the number of students who have enrolled in the dairy program of education has almost doubled. We expect an additional doubling by 2001.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$237,476.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funds and sources to be provided for this grant are as follows: \$554,000 state appropriations; \$2.1 million paid or committed from Northeast Iowa Community College; \$500,000 from Iowa State University; \$550,000 from Dairy Foundation members and contributors; and additional unidentified miscellaneous funds in fiscal year 2001.

Question. Where is the work being carried out?

Answer. Research and education will be conducted at the Dairy Center located at Calmar, Iowa. There is a 150 cow, three-row freestall barn that features two manure handling systems; the double eight subway milking parlor has parallel stalls on one side and herringbone on the other; and a methane digester will be used to capture energy and odor from the manure. This is truly a unique facility in the world and was designed by the farmer members of the Foundation to best respond to their needs for education and training.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was met when the facility opened October 14, 2000. The methane digester should be operational by May 1, 2001. Education and research projects have been conducted at the Center since October 16, 2000. This will be a continual process, however, as the facility upgrades technologies to demonstrate and apply innovations. The quarterly newsletters of the Foundation report on dairy related activity.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A visit to this project has been scheduled, however no evaluation has yet been done.

DELTA TEACHERS ACADEMY

Question. Please provide a description of the program that has been funded under the Delta Teachers Academy project.

Answer. The National Academy proposes to continue its Delta Teachers Academy in the Lower Mississippi Delta Region—219 counties and parishes near the Mississippi River including portions of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, Missouri and Tennessee—focusing on educational improvement in core subject areas. The program was launched in 1992 with a pilot grant of \$500,000 from the U.S. Department of Education. USDA funding began in 1994. The program provides long-term academic enrichment annually to approximately 500 elementary and secondary school teachers by teaming them with university scholars for in-service training during the school year and with summer institutes at 11 Academy field offices throughout the seven Delta states. Through its Fellows Program, the Delta Teachers Academy sustains the professional development of more than 1,100 Academy graduates throughout the region. This grant is not awarded competitively; however, we require annual applications reporting the previous year's accomplishments and describing planned activities and expenditures for the coming year. These applications undergo merit review before the awards are made.

Question. What is the national, regional, or local need for this project?

Answer. The 219-county Lower Mississippi Delta region has been cited by the Educational Testing Service and the National Center for Education Statistics as notably lagging in student performance in core academic areas. According to the grant recipient, 33 percent of the children in the region live below the poverty line compared to 20.5 percent nationally. In 1996, 60 percent of Louisiana's public school sample ranked "below basic" on the National Assessment of Education Progress test for eighth-graders. The USDA's Economic Research Service correlated poor educational performance, rural poverty, and limited economic development. The Delta Development Commission cited serious educational problems including poor student performance in core content areas, demoralized teachers with little opportunity for academic development, and region-wide difficulty in recruiting and retaining qualified teachers. The Commission noted that 75 percent of the region's workforce lacks the basic reading skills necessary for technical training, and specifically cited improved teacher training as one means for breaking the cycle of poverty and economic noncompetitiveness.

Question. What was the original goal of the program and what has been accomplished to date?

Answer. The original and continuing goal of the project is to address the problem of insufficient professional development opportunities for the elementary and secondary teachers of the seven-state region. The Delta Teachers Academy focuses on core subjects of English, geography, history, mathematics, and science. Some sites also focus on humanities, language arts, social studies, reading, civics, and interdisciplinary subjects. The Delta Teachers Academy began by offering educational development activities for 100 teachers from 50 rural districts at 10 sites. Training has expanded to 600 teachers at 40 sites across the entire seven-state region. More than 1,100 graduates whose professional development is sustained through the Academy's Fellows Program lead teacher in-service training at their home schools. The project has improved student performance and teacher training, morale, recruitment, and retention in the region.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. A total of \$27,653,300 million has been appropriated to the Department of Agriculture for this project, including \$2,000,000 in fiscal year 1994; \$3,935,000 in fiscal year 1995; \$3,876,000 in fiscal year 1996; \$3,850,000 in fiscal year 1997; \$3,500,000 each year in fiscal years 1998 through 2000; and \$3,492,300 in fiscal year 2001.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. There are no non-Federal funds identified for this project.

Question. Where is the work being carried out?

Answer. The Delta Teachers Academy project is coordinated out of The National Faculty's office in Atlanta, Georgia and at 11 Academy field offices located throughout the seven Delta states. The project is conducted currently at 23 sites in the seven-state Lower Mississippi Delta region including Arkansas, Kentucky, Illinois, Louisiana, Mississippi, Missouri, and Tennessee.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to provide three full years of training to each faculty team established by the Delta Teachers Academy. Training consists of four two-day academic sessions and one two-week summer institute for each team. This objective was met for the 24 faculty teams funded under the original fiscal year 1994 USDA grant. Since that time, 15 additional teams funded in 1995, one team funded in fiscal year 1996, 20 new teams funded in fiscal year 1997, and 14 teams funded in fiscal year 1998 have all completed three-year training cycles. Training for 440 new scholars in 18 teams established in fiscal year 1999 continued into fiscal year 2000. Nine new teacher cohorts established in fiscal year 2000 will continue their training in fiscal year 2001 along with 14 new teams to be established in fiscal year 2001 for three years of training for 500 scholars.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An assessment of the Delta Teachers Academy performance was conducted by the independent research and evaluation firm of Westat, Inc. of Rockville, Maryland, during fiscal year 2000. That work will continue into fiscal year 2001, and a report will be available by September 2001.

In a previous evaluation completed in August 1997, Westat found the majority of participants reported that the Academy met their personal and professional needs by renewing their enthusiasm for teaching, improving self-confidence, increasing their sense of professionalism, improving their knowledge of specific content areas, enhancing teaching methods, and interacting with peers. Teachers are applying what they have learned from the Academy in their classrooms. For example:

- 88 percent said the Academy prepared them to assume leadership roles in their schools;
- 89 percent noted changes in student work habits, attitudes, aspirations, and achievements;
- 90 percent applied academic content from the program in their classrooms;
- 78 percent used skills and strategies learned at the Academy in their classroom teaching;
- 83 percent said their teaching approaches became more effective in improving student learning.

A site visit of the Delta Teachers Academy in New Orleans, Louisiana, and the National Faculty's Summer Institute at Tulane University was conducted by CSREES' National Program Leader for Higher Education and Evaluation in 1996. The visit confirmed that Delta Teachers Academy strengthened participating teachers' abilities by improving their knowledge base, helped them become leaders of other teachers by requiring them to conduct staff development at their home schools, and had a positive impact on student learning. School superintendents reported greater student enthusiasm, more homework, and higher test scores for students whose teachers were participants in the Delta Teachers Academy program.

A U.S. General Accounting Office review of the Academy's programs was conducted in 1995. Report GAO/RCED-95-208 included summary statistics on more than 1,000 teacher evaluations of Academy sessions as well as the General Accounting Office's survey of participants. On average, participants reported that the Academy was more effective than any other teacher development program they had participated in, was very effective in renewing or enhancing knowledge in one or more academic subjects, and was generally effective in enhancing the teaching skills and strategies required for teaching challenging academic content.

DIABETES DETECTION AND PREVENTION, WASHINGTON AND HAWAII

Question. Please provide a description of the extension activity that has been funded under the Diabetes Detection and Prevention, Washington and Hawaii grant.

Answer. This grant supports a pilot project and collaborative effort, The Partnership for Diabetes Awareness, Education and Screening. This unique collaboration has as its centerpiece a partnership between the Cooperative Extension programs at two Western Region Land-Grant Institutions, Washington State University and the University of Hawaii-Hilo, and the century-old Joslin Diabetes Center, an affiliate of the Harvard Medical School and located in Boston, Massachusetts. The program is designed to provide (1) diabetes awareness, prevention education, screening, and management services to selected minority under-served rural and urban populations in Washington and Hawaii using innovative non-invasive ocular fluorescence detection technology and blood glucose measures; (2) culturally-sensitive and science-based diabetes prevention and care education materials; and (3) case management support and follow-up services for patient referrals.

Question. According to the proposal, or the project director, what is the national, regional, or local need for this extension program?

Answer. This program grows out of a need to reach more of the millions of Americans who have undiagnosed diabetes, to reduce the racial disparities associated with the disease in the U.S., and to ensure a healthy and productive workforce. Diabetes is currently one of the leading causes of death and disability in the U.S. adult population, and is highest among certain racial and ethnic populations, especially Native Americans, African Americans, Hispanic Americans, and Asians and Pacific Islanders.

Question. What was the original goal of this project and what has been accomplished to date?

Answer. The goal of this integrated extension outreach project continues to be to provide (1) screening for diabetes among selected rural and urban minority patient populations in Washington and Hawaii, using an innovative non-invasive ocular fluorescence detection technology and blood glucose measures; (2) culturally-sensitive and science-based diabetes education prevention and care materials; and (3) case management support and follow-up services for patient referrals.

Accomplishments to date include the following: (1) establishment of a memorandum of understanding between the USDA-CSREES and the Joslin Diabetes Center to identify the parties involved, the purpose, the background of the parties and authority, the roles and responsibilities of the parties, and the duration of the partnership; (2) development, review, field-test, and publication of a culturally-sensitive and science-based instructional flip-chart for use by extension faculty with the targeted audience; (3) partnerships with eight community-based agencies/institutions with development and testing of the ocular fluorescence detection instrument; (4) cooking demonstrations for managing diabetes through diet; (5) a presentation on the Joslin/Extension partner model at a national diabetes education conference sponsored by the West Virginia Extension Service; (6) partnership with the National Diabetes Education Program sponsored by the Centers for Disease Control and Prevention and the National Institute for Diabetes and Digestive and Kidney Diseases; (7) partnerships with state Diabetes Control Program offices and the Hawaii and Washington State Cooperative Extension programs; (8) site visits by staff of the Joslin Diabetes Center to Hawaii and Washington programs, and a site visit by USDA staff to Hawaii program; (9) a face-to-face planning meeting held in Seattle Washington, and five telephone conference calls to review and examine progress toward objectives; (10) dissemination of information about the pilot project to the human sciences land-grant community; and (11) participation by county extension faculty in diabetes education training programs to enhance their knowledge.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1999. The funds appropriated to date are:

| <i>Fiscal year</i> | <i>Amount</i> |
|--------------------|---------------|
| 1999 | \$550,000 |
| 2000 | 550,000 |
| 2001 | 923,963 |
| Total | 2,023,963 |

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This grant is supported with additional funds and in-kind services provided by the Joslin Diabetes Center and state support from the Cooperative Extension Programs in Hawaii and Washington.

Question. Where is this work being carried out?

Answer. The program is being conducted in a diabetes screening and health center in a shopping center in Hilo, Hawaii, and in community facilities in Washington. In addition, the Cooperative Extension offices in Hawaii and Washington, and local partnering groups, are intimately involved in program implementation.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is September 30, 2002. The project is on-target to reach the original objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A formal agency evaluation has not yet occurred. Oversight and monitoring activities are regularly conducted through telephone calls, annual reports, e-

mail, and face-to-face visits where these are tied to other agency travel. A mid-course evaluation of program outputs and the delivery process to date is anticipated in April 2001.

EFFICIENT IRRIGATION, NEW MEXICO AND TEXAS

Question. Please provide a description of the extension program that has been funded under the Efficient Irrigation, New Mexico and Texas grant.

Answer. The waters of the Rio Grande are a critical resource for the region as 98 percent of the water use in the Rio Grande Basin comes from the river. This project will provide extension education to increase the efficiency of agriculture and urban landscape irrigation and encourage the development of efficient water markets in the Rio Grande Basin.

Question. According to the extension proposal, or the project director, what is the national, regional, and local need for this program?

Answer. Growing demand and drought have created critical water supply issues for much of the southwest. This project is designed to improve irrigation efficiency and water conservation in the Rio Grande basin in New Mexico, Texas, and Mexico. The crux of the problem is that a total water management system, which would assist agriculture and urban interests, does not exist. As a result, water is released on demand often resulting in inefficient management. Water problems will only increase as the population in this region grows and more industry is located to this region.

Question. What was the original goal of this extension project and what has been accomplished to date?

Answer. According to the project proposal, subject areas addressed will include irrigation district studies; irrigation education and training; institutional incentives for efficient water use; on-farm irrigation system management; urban landscape and in-home water conservation; environment, ecology and water quality protection; saline waste water management and water use; basin-wide hydrology, salinity modeling and technology; and communications/oversight/biometric support/accountability.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$1,895,820.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. Sources of any non-Federal funds will be identified in the grant proposal.

Question. Where is the work being carried out?

Answer. This extension program will be carried out by Texas A&M University and New Mexico State University. Coordination will be provided through Texas A&M University Extension.

Question. What was the anticipated completion date for the original objectives of this project? Have the objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. The anticipated completion date for the first phase is March 31, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. An agency review will be conducted prior to awarding the grant.

EXTENSION SPECIALIST, MISSISSIPPI

Question. Please provide a description of the program that has been funded as the Basic Weather Service for Research and Extension Project—Extension Specialist, Mississippi.

Answer. The Basic Weather Service and Extension project is designed to fill a void in weather data due to closure of the Ag Weather Service facility in Stoneville, Mississippi. The funding is being used to gather and disseminate critical agricultural weather data for producers and researchers in Mississippi and surrounding states.

Question. What is the national, regional or local need for this program?

Answer. The closure of the Ag Weather Service facility created a void in the availability of and access to critical weather data that producers and researchers use to make management decisions and to formulate work plans within the state and region. The agricultural weather data collected by this project serves a national need to provide data for the Weekly Weather and Crop Bulletin and the Soil Climate Analysis Network.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of the project is to collect, maintain, and disseminate weather information for producers and researchers in Mississippi and surrounding states. Electronic weather stations and links with other web sites to deliver weather data have been installed and developed. The project is providing timely data to producers in the Delta.

Question. How long has the program been underway and how much has been appropriated by fiscal year through 2001?

Answer. The funding for fiscal years 1997 and 1998 was \$50,000 each year; for fiscal years 1999–2000, \$100,000 each year; and for fiscal year 2001, \$99,780. A total of \$399,780 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The state of Mississippi through the Mississippi Cooperative Extension Service and Delta Research and Extension Center provided \$41,350 in state appropriated funds to support this project in 1997, 1998, and 1999. Although a 2000 contribution was not formally matched, state personnel services were provided.

Question. Where is the work being carried out?

Answer. The project is conducted at the Delta Research and Extension Center in Stoneville, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of the additional or related objectives?

Answer. One of the original objectives—installation of equipment to collect weather data and establishment of a web site—has been completed. The agriculture community—producers, markets, suppliers of goods and services, and financial institutions—depend upon weather information as a guide for business planning and decision making. As agriculture implements new programs in pest management, crop production, and site-specific farming, additional and nearer to real-time weather data and products are needed for their success. A denser weather station network with additional specific weather parameters is a new objective. Its completion is dependent upon the best use of scarce current funding and new funding opportunities and existing and new interagency cooperative efforts. At least one weather station per county is desired in the 19-county area of the Mississippi Delta.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of the project and Internet web site is being conducted with an on-line statistics instrument and through e-mail responses about the site. An advisory group has been identified and is functioning to provide feedback on the weather center's current status as well as assessing needs for future plans for the project's continued mission. The Internet site rose rapidly to the top ten on the Extension server and receives over 100,000 hits annually.

FAMILY FARM BEEF INDUSTRY NETWORK, OHIO

Question. Please provide a description of the work that has been funded under the Family Farm Beef Industry Network, Ohio grant.

Answer. This is a new project. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. What is the national, regional, or local need for this program?

Answer. The decline of the "family farm" as the functional, sustainable backbone of rural society is a problem receiving increased national attention. The declining rural population in many states has drastically altered the tax base, which has affected the quality of primary education, medical care, and other tax-supported services. In Ohio, the continuing integration of the pork industry, with the resulting recent over-supply of pork and decreased revenue achieved from marketing grain through hogs, has forced many northwest Ohio farmers to look at other avenues to increase farm income in order to survive. Marketing grain through cattle is currently an economically-viable option due to the structure of the cattle feeding industry. However, this will require training a new generation of cattle feeders in Ohio, developing relationships with Ohio cow-calf producers looking for opportunities to increase their profitability, and developing marketing channels for beef that is produced to meet the requirements of targeted processors and consumer groups.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of this project is to develop producer education and beef production marketing channels to allow closely aligned family farms, both cow-calf and feedlot, the opportunity to survive in a changing social and economic climate.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001. The appropriation for fiscal year 2001 is \$1,317,096.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The non-Federal funding provided for fiscal year 2001 is approximately \$30,000 from Ohio State University.

Question. Where is this work being carried out?

Answer. This work is being conducted at Ohio State University and at cooperating feedlot operations, cow-calf operations, and beef processors in northwest Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that this project will continue to grow and develop and will require approximately five years to be fully developed.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. The proposal will be peer-reviewed at Ohio State University prior to submission. The agency will conduct a merit review prior to funding.

FOOD ANIMAL RESIDUE AVOIDANCE DATABASE

Question. Please provide a description of the program that has been funded under the Food Animal Residue Avoidance Database, or FARAD, grant.

Answer. The research is aimed at preventing and mitigating the occurrence of illegal chemical residues in foods of animal origin. This is done by assembling standardized databases of technical information from widespread sources. The data from these sources is used in sophisticated algorithms to calculate appropriate withholding times for producers, veterinarians, and USDA regulators. The goal is both residue prevention or avoidance and residue mitigation of chemical contamination incidents, such as dioxins in milk.

Question. What is the national, regional, or local need for this program?

Answer. There is a continuing need for residue avoidance research and also residue mitigation research. This is of national and local importance to the economic welfare of food producers and all consumers of food products of animal origin.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal was to prevent and mitigate the occurrence of illegal chemical residues in foods of animal origin. FARAD has been successful in accomplishing its goals, but this is an on-going process that continues to be an issue for producers of food animals.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 2001?

Answer. FARAD began in 1982 and has been supported by a variety of funding sources. However the specific work supported by this grant begins in fiscal year 2001. The appropriation for fiscal year 2001 is \$284,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year 2001?

Answer. The non-Federal funds and sources provided for this grant are as follows: Non-Federal support is for the salaries of all the principal investigators and other "in-kind" contributions by the three universities involved. In addition, North Carolina State University has provided approximately \$50,000 to support FARAD.

Question. Where is this work being carried out?

Answer. Work is carried out at three cooperating universities: the University of California-Davis, the University of Florida, and North Carolina State University. At the University of California, a bibliographic citation management program and a pharmacokinetic data management program will be developed and maintained. FARAD Access Centers at the University of California and North Carolina State University respond to database inquiries requiring literature research and evaluation. At the University of Florida, an approved drug database will be maintained and a publication of electronic and hard-copy drug compendia will be developed.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The specific work support by this grant begins in fiscal year 2001. This work is on-going, and progress will be reported annually in a progress report requested from the principal investigators.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The specific work supported by this grant begins in fiscal year 2001. As with other projects, the results will be reported in an annual report submitted by the principal investigators.

FOOD ELECTRONICALLY AND EFFECTIVELY DISTRIBUTED (FEED) DEMONSTRATION
PROJECT, OREGON

Question. Please provide a description of the project that has been funded under the Food Electronically and Effectively Distributed (FEED) Demonstration Project, Oregon grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. The brief description available now is that the project is to better coordinate through electronic technology, companies wishing to donate food with transportation companies and independent truckers wishing to help get that food to the food bank's storage locations in order to ultimately feed hungry people.

Question. According to the proposal, or the principal researcher, what is the need for this project?

Answer. Oregon was found to have a very high prevalence of hunger. This finding is as a result of a publication by the USDA-Economic Research Service entitled, "Hunger Across the U.S."

Question. What was the original goal of this project and what has been accomplished to date?

Answer. The original goal of this project is to coordinate transportation to fight hunger. The food bank will be able to take advantage of new interactive on-line information systems that will allow donors to enter donation information, which will link with transportation companies and independent truckers who have the transportation capacity to get donations transported. This program starts in 2001 so there are no data to report on progress.

Question. How long has this work been underway and how much has been appropriated for fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year is \$166,633. This work will just be beginning in 2001.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. At this time, there are no non-Federal funds to report.

Question. Where will this work be carried out?

Answer. The work will be carried out across the State of Oregon.

Question. What was the anticipated completion date for the original objectives of the project? Have objectives been met? What is the anticipated date of additional or related objectives?

Answer. The proposal, which has not been received, will outline the objectives of this project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will begin in 2001, so there are no evaluation data yet on this project.

INCOME ENHANCEMENT DEMONSTRATION, OHIO

Question. Please provide a description of the program that has been funded under the Income Enhancement Demonstration, Ohio project.

Answer. The Federal funds support the Agricultural Business Enhancement Center which plays a major role in the development of the agricultural sector of Northwest Ohio. The Center provides a variety of management training programs, helps farmers and other agribusinesses develop comprehensive business plans, and facilitates business networking.

Question. According to the research proposal, or principal researcher, what is the national, regional, or local need for this program?

Answer. The Center seeks to enhance the competitiveness of agricultural firms in Northwest Ohio and create greater economic opportunity for local residents. To be

successful in business, farmers and other agribusiness firms must be able to adapt to a large number of major changes affecting the entire food system, from the farmer to the consumer. These include changes in farm programs, globalization of markets, new technologies, information systems, consumers' concerns for food safety and nutrition, and society's concern for protecting the environment. Individuals, families, firms, and communities in Northwest Ohio need to understand the changes, and develop and implement effective strategies for dealing with change.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal of the project was to help people develop new businesses and restructure and expand existing businesses in order to enhance incomes in Northwest Ohio. The Agricultural Business Enhancement Center conducts economic research on market opportunities, provides a variety of management training programs, helps individual farms and other agribusinesses develop comprehensive business plans, and facilitates networking with businesses in other regions of the U.S. and around the world.

Recent accomplishments include: A group of growers formed a cooperative that was successful in bidding for market locations at two travel centers on the Ohio Turnpike; additional centers will be requested. Perrysburg Farmers Market was organized in 1999. Northwest Ohio Pork Task Force is exploring alternatives to revitalize the area's pork industry. The Center is helping the Ohio Farm Bureau and Ohio Wheat Growers Association examine the feasibility of producing strawboard from wheat straw.

The Center is participating in a USDA/CSREES grant to provide growers with production and business planning assistance for developing hydroponic vegetable production operations. Participants in the first "How to Get Started in Green House Production" gave the seminar very high ratings. A study tour to Ontario, Canada, also was well received.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The project began in 1991. Appropriations have been as follows: \$145,000 in fiscal year 1991; \$250,000 in fiscal years 1992 through 1995; \$246,000 in fiscal years 1996 through 2000; and \$245,459 in fiscal year 2001. Appropriations to date total \$2,620,459.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The State of Ohio has appropriated the following funds: \$35,100 in fiscal year 1991; \$72,368 in fiscal year 1992; \$56,930 in fiscal year 1993; \$30,547 in fiscal year 1994; \$49,935 in fiscal year 1995; \$51,432 in fiscal year 1996; \$48,664 in fiscal year 1997; \$53,736 in fiscal year 1998; \$56,186 in fiscal year 1999; and \$128,200 in fiscal year 2000.

Question. Where is the work being carried out?

Answer. The Agricultural Business Enhancement Center is located in Bowling Green, Ohio and serves eight counties in the Toledo Metropolitan Area. Project leadership is being provided by the Department of Agricultural Economics, Ohio State University, Columbus, Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1991 was for a period of 12 months, however, the ongoing needs of producers and agribusinesses to adjust to major changes in the agricultural sector continues to provide the Center with many challenges. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed the last annual merit review of the project in June 2000. The project is continuing to meet its goal of finding new economic opportunities for people in northwest Ohio. In the last CSREES review it was noted that: "The project director and staff are well qualified to carry out the project and have proved their ability to do so. The project supports CSREES' goals of a highly-competitive production system and enhanced economic opportunity. The proposal was merit reviewed, according to CSREES guidelines, by three Ohio State University faculty members representing the state, district, and local extension."

INTEGRATED COW-CALF RESOURCES MANAGEMENT (CHIPS), IOWA

Question. Please provide a description of the program that has been funded as "CHIPS: Cow-Calf Integrated Resource Management, Iowa Program."

Answer. CHIPS is an integrated cow-calf resource management—IRM—program developed to assist Iowa beef producers in maximizing the profit potential of their individual livestock operations. CHIPS technicians provide technical services to participating cooperators that assist in the decisionmaking process as long-term plans are developed and finalized. The intent of the program is to strengthen the area's economy and at the same time, enhance the competitiveness of the individual's beef operation. CHIPS technicians work one-on-one with participants, offering support and services intended to improve the level of productivity, reduce production costs, and/or incorporate technology systems that are designed to improve the "bottom line". The program has systematically grown to extend services to over 210 beef producers in over 60 Iowa counties.

Question. What is the national, regional, or local need for this program?

Answer. Today's beef industry is both volatile and challenging. Factors and variables that the producer has little or no control over, constantly challenge this rapidly changing industry. To address this volatile and rapidly changing agricultural infrastructure, the CHIPS program has adjusted its direction and focus to meet the ever-changing management and technical needs of Iowa beef producers. CHIPS technicians and support staff work closely with program participants to collect and analyze individual operation data. This information is used to develop management recommendations that enhance the performance and economic stability of the operation. This approach supports individual economic survival as well as strengthening the local and regional economic community.

The CHIPS program also serves the industry by providing leadership and support to industry educational efforts. Working closely with the Iowa State University Extension Service, educational programs and demonstration projects have been developed and delivered, enhancing the educational opportunities provided to Iowa beef producers.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The overall goal of CHIPS is to have a positive effect on the area's economy by improving the long-term profit potential of the local cattle industry. To address this broad project goal, CHIPS has set forth the following objectives: Improve profit potential of cooperator farms; Identify issues and trends in the area of beef management; Provide CHIPS cooperators with intensive technical assistance to develop goals and individualized farm recommendations, including management areas such as pasture and forage production, rations, utilization of resources, record systems, and government farm program compliance; Help producers develop management skills to improve efficiency and reduce costs of production as CHIPS recommendations are implemented.

During fiscal year 2000, CHIPS technicians conducted over 1,317 farm and office visits. Numerous management areas were addressed during these one-on-one contacts. Over 32,000 head of calves and beef cows were weighed and over 6,000 breeding animals were permanently identified. Data collected are used in a variety of record programs, including CowSense and breed association records. Over the past 12 months, CHIPS cooperators completed 139 reproduction-related programs and 26 Standardized Performance Analysis records—incorporating financial and performance information—were individually analyzed. More than 510 forage and soil samples were collected and approximately 325 ration projections were developed for cooperators. As this activity summary indicates, the number of participating cooperators utilizing the record keeping programs and other program services continue to grow and expand.

Networking projects continue to be emphasized by the CHIPS program. Examples include: Direct working relationship with the Chariton Valley Beef organization, CHIPS Heifer Development Program, educational efforts in conjunction with the Iowa Beef Center, and Iowa State University Extension, support a number of existing beef projects, and direct cooperation with the Iowa Quality Beef Program.

Question. How long has the program been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. \$138,000 per year was approved for fiscal years 1992 and 1993; \$276,000 for fiscal year 1994; \$350,000 for fiscal year 1995; \$345,000 per year for fiscal years 1996 and 1997; \$300,000 per year in fiscal years 1998 and 1999; \$250,000 in fiscal year 2000; and \$284,373 in fiscal year 2001. Federal funding through fiscal year 2001 totals \$2,726,373.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. CHIPS cooperators pay client fees of approximately \$3.00 per beef cow. The fee structure is on a sliding scale that adjusts for cow herd size. In fiscal year 2000, approximately \$50,000 in client's fees was collected.

Question. Where is the work being carried out?

Answer. The CHIPS program is being operated in six designated technician areas in Iowa. CHIPS services and technical support are currently being offered to beef producers in approximately 60 counties in the following Iowa areas: southeast—16 counties, south central—8 counties, southwest—8 counties, northwest—8 counties, east central—8 counties, and central—12 counties.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met?

What is the anticipated completion date of additional or related objectives?

Answer. Over the past several years, the CHIPS program has made considerable progress in achieving the project's goals. Cooperators are utilizing more of the data collection and record keeping programs that are currently offered. This data collection process has been important as producers make long-term decisions. CHIPS continues to adapt and modify program offerings and services.

The Iowa beef industry now faces a challenging and exciting time period. CHIPS is positioned to be a prominent player in both the development of the Iowa beef industry and the providing of technical support to beef producers throughout the state. In fiscal year 2000, a marketing educational segment was incorporated in the service offerings of CHIPS to assist producers as marketing decisions are finalized.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES review of the project is conducted annually. The 2000 review was positive, with suggestions made for more widespread dissemination of the results and materials developed, as well as increased emphasis on environmental management with the beef producers.

NATIONAL EDUCATION CENTER FOR AGRICULTURAL SAFETY, IOWA

Question. Please provide a description of the extension project that has been funded under the National Education Center for Agricultural Safety, Iowa grant.

Answer. The mission of the National Education Center for Agricultural Safety—NECAS—is to reduce the level of preventable illnesses, injuries, and fatalities among agricultural populations. The NECAS serves farmers, ranchers, members of their families and their employees, and the people who supply goods and services to agriculture. The center is one of few centers in the world that provides actual hands-on, real life training opportunities. The center also works with rural fire departments, emergency planning agencies, and emergency medical technicians in a multi-state area to provide training for those who respond to rural emergencies.

The NECAS is located in Peosta, Iowa. The facility is located at the Northeast Iowa Community College. Phase Two of construction has just been completed. The facility has a tractor over-turn demonstration area, hog confinement building complete with a manure pit, two silos, and a grain bin that allow the center to provide examples of situations commonly encountered on farms and ranches and teach actual rescue techniques. Additional classes on First Aid, Cardiopulmonary Resuscitation, and First Responder courses are provided for members of farm families.

The Center has assisted local farmers and small corporations to screen workers for employment health risks and conducts programs on hearing loss prevention, use of personal protective equipment, skin cancer prevention, and the identification and mitigation of risks of animal handlers and confinement workers.

The Center operates an 11,000 square foot facility that was funded by the state of Iowa with matching private donations. The USDA grant provides funds for salaries and operating expenses. Donations from individuals and agri-business provide donations of equipment, curriculum, and program development funds. The National Safety Council and Northeast Iowa Community College underwrite additional operating costs not covered by the USDA grant or donations.

Question. According to the extension proposal, or the project director, what is the national, regional, and local need for this program?

Answer. According to information compiled annually by the National Safety Council, there were 770 work-related fatalities among agricultural workers in 1999. The Council also estimates that there were more than 150,000 disabling injuries among agricultural workers in 1999. While deaths have declined by 30 nationwide, disabling injuries have increased by 7 percent since 1998. Approximately 23 out of every 100,000 agricultural workers died from injuries received in workplace incidents. Farm accidents kill the young and the old. Between 100 and 125 children and youth are killed on farms each year.

Fatal injury incidents are preventable, and the number of disabling injuries which occur annually can be reduced. The NECAS has developed interactive training for at-risk audiences, including senior farmers, children and youth, and couples who

work off the farm to earn enough income to remain in the farming business. The Center provides extensive training for those who are first on the scene at farm emergencies. It is often a member of the farmer's family who discovers an accident victim. NECAS trains family members to stabilize this victim until emergency medical help arrives. NECAS also trains rural emergency responders on how to protect themselves when responding to an emergency. These many volunteers respond from their place of business or home and arrive on the scene without protective gear or tools.

An extensive array of programs for youth are offered in a Tri-State Area. NECAS holds safety day camps, fall harvest safety day, chain saw safety, tractor safety, and hunter safety programs.

Question. What was the original goal of this training center and what has been accomplished to date?

Answer. The original and continuing goal of this Project is to develop, implement, and evaluate diverse training methods for met training needs of at-risk agricultural audiences. The Center has recently completed a program in conjunction with the Iowa Fire Marshall's Office to deliver a program on Farm Chemical Awareness through the Iowa Communications Network. This fiber optic network has the capacity of linking more than 100 training sites across the state. More than 700 rural firefighters, from 33 different locations, participated in this six-hour course. The Center recently trained an emergency medical crew from Kansas at the center and has implemented a number of out-reach causes to small businesses and rural fire departments.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant began in fiscal year 1998 with an allocation of \$195,000 per year for fiscals year 1998-2000 and for fiscal year 2001 is \$194,571. The total appropriation to date has been \$779,571.

Question. What is the source and amount of non-Federal funds provided by fiscal year.

Answer. The sources of non-Federal funds are as follows: \$450,000 in 1998 from the state of Iowa for construction of the second phase of the facility. Donations from individuals and agri-business companies totaled \$75,000. In 1999, contributions of \$135,200 were received from individuals, the state of Iowa, and agri-business. In 2000, contributions of \$103,875 were received from the State Fire Marshall of Iowa, individuals, and agribusiness sources.

Question. Where is the work being carried out?

Answer. Training and educational programs under the grant are being conducted at the NECAS located on the Northeast Iowa Community College Campus in Peosta, Iowa. NECAS also presents programs at a variety of meetings and participates in agricultural trade shows and events and presents programs upon request to agricultural groups, local fire departments, and agri-businesses at off-site locations.

Question. What was the anticipated completion date for the original objectives of this project? Have the objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives, was March 31, 2001. Many of the objectives have been met. Anticipated completion of additional objectives is March 31, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES merit review of the project application and site review were conducted in the spring of 1999. Another site visit is scheduled for June of 2001. The project will be completing its fiscal year on March 31, 2001. The National Education Center for Agricultural Safety evaluates all its programs and has supplied USDA with copies of all programs conducted and the evaluations received on each event. The NECAS utilizes external farm safety and health evaluators and has two Advisory Committees to maintain its focus on the most pressing issues affecting the safety and health of our nation's agricultural populations.

PILOT TECHNOLOGY PROJECT, WISCONSIN

Question. Please provide a description of the program that has been funded under the Pilot Technology Project, Wisconsin grant.

Answer. The primary industrial extension activity of the Manufacturing Technology Transfer program is the delivery of technical assistance to manufacturing companies. Executive direction in determining the assistance required is provided by the University of Wisconsin-Stout's Northwest Wisconsin Manufacturing Out-reach Center. Direct consultation and long-term in-plant assistance is delivered pri-

marily through the efforts of university project managers. Direct assistance may be delivered through co-op students, staff of the University of Wisconsin System, both two- and four-year institutions, and Extension services; the Wisconsin Technical College System; secondary schools; the private sector, professional societies, and private consultants, or attendance at state or national seminars. The project also draws on many other state resources to add expertise and capacity to network facilitation and in-plant extension activities.

Question. What is the national, regional, or local need for this program?

Answer. America's manufacturers continue to face tremendous global competition. There are enormous pressures to improve the quality of products and reduce the time consumed to bring new products to market, and there remains an ever-increasing demand to reduce the costs of products. Currently there is a strong movement in manufacturing to use speed-to-market combined with new product introduction as a tool to obtain a competitive advantage. Large companies are not the only ones influenced by these trends. Small and medium-size manufacturers often supply directly to the market or are vital elements of a supply chain. Hence, they must be able to respond quickly to changing market conditions while continuously improving productivity and product quality.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The Manufacturing Technology Transfer program's principal objective is the development of a competitive, secure manufacturing base through the mechanism of industrial extension. The program principally targets small and medium-size manufacturers in rural Wisconsin. This funding will: continue to provide valuable industrial extension service to the target audience; support the continued development of an industrial extension model; and investigate the use of new manufacturing technologies to support global competitiveness of manufacturers. Productivity improvements were reported by the companies showing impressive economic impact to the region through client operations assessments and plant evaluations, strategy development for continuous improvement, implementation of new organizational and operational methods, implementation of new manufacturing technologies, establishment of quality assurance/total quality systems, establishment of ongoing training programs, and on-site instruction in new technologies, improved methods, and processes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This project has been underway since fiscal year 1992 and was funded for \$165,000 per year in fiscal years 1992 through 1995; \$163,000 in fiscal years 1996 through 2001; and \$162,641 in fiscal year 2001 for a total of \$1,637,641.

Question. What is the source of and amount of non-Federal funds provided by fiscal year?

Answer. University of Wisconsin-Stout provides \$24,367 as in-kind match. Funds from other state, University, and partner resources are pooled with USDA funds to carry out the described efforts.

Question. Where is this work being carried out?

Answer. The University of Wisconsin-Stout, Menomonie, Wisconsin, carries out the work. From this location, companies are served throughout Wisconsin, but primarily in the northwest counties.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 12 months. However, the Manufacturing Technology Transfer program was developed as a continuously evolving industrial extension strategy for serving the needs of the manufacturing community. Success is measured by meeting the objectives of each year's proposal, including the delivery of modernization assistance and development of an industrial extension model. The current phase of the program will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. To measure the success of the project, a client evaluation process has been developed which includes an evaluation questionnaire. Evaluations are performed both by program staff and by an objective, third party survey house. Evaluations indicate significant forward strides in job creation, new businesses, expanded productivity, and enhanced international competitiveness. In 2000, the U.S. Department of Commerce performed an agency evaluation of this project. Evaluation highlights showed that the program: provided 191 technical assistance projects for 107 companies; sponsored 35 educational events attended by 436 individuals and 252 companies; helped create or retain 140 jobs; and achieved \$13.4 million in economic

impacts. Clients indicated that assistance from the project helped reduce labor costs, reduce material costs, reduce inventory costs, and increase sales. Clients said the program provided affordable, objective assistance and local access to the resources they need to help them prosper.

POTATO PEST MANAGEMENT, WISCONSIN

Question. Please provide a description of the work that has been funded by the Potato Pest Management, Wisconsin grant.

Answer. The goal of work supported by this funding is to advance the use of bio-intensive integrated pest management and reduce reliance on high-risk pesticides. The project is a collaborative effort involving the University of Wisconsin, the World Wildlife Fund, and the Wisconsin Potato and Vegetable Growers Association. Market-based incentives to accomplish these goals will be developed and tested. An environmental, performance-based label standard for Wisconsin fresh market potatoes will be developed. Market research will be conducted to develop a marketing plan, certification, and testing mechanisms to move certified product from Wisconsin fields through the value chain to selected retailers. Environmental indicators and measurement methods will be developed. A pilot project will begin research with selected potato growers to identify key ecosystem conservation opportunities on their lands including crane damage mitigation. A collaboration advisory committee will be formed to help develop a plan for targeted outreach to project growers.

Question. What is the national, regional, or local need for this program?

Answer. In 1996 this grower-university-environmental group partnership in Wisconsin established concrete targets for reducing use of high-risk pesticides in potato production. This innovative, voluntary, multi-stakeholder project can provide the USDA with valuable insights into Food Quality Protection Act—FQPA—transition issues. This project will help develop marketplace incentives that reward farming practices that reduce the impact of agricultural pesticides on health and the environment. This is in response to the growing consumer demand for products that are produced with sustainable methods. The activity benefits Wisconsin by putting its growers in a leading position to capture this expanding market. It offers value-added options to the vegetable industry facing over-production, low prices, and new FQPA regulatory demands.

Question. What was the original goal of this program, and what has been accomplished to date?

Answer. This is the first year that the pesticide risk reduction goals and the integrated pest management measurement system will be combined with developing a marketing strategy for eco-labeled potatoes.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Answer. Fiscal year 2001 is the first year of this Special Grant and \$189,582 was appropriated. The project's foundation of applied field research, measurement, and extension has been funded from numerous sources over the past five years. The potato growers, the University of Wisconsin, foundations, the World Wildlife Fund, the USDA grants, and the Environmental Protection Agency support through American Farmland Trust have contributed to the groundwork.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Wisconsin potato growers contribute more than \$150,000 annually to support University of Wisconsin research and technology transfer that is critical to the project. The Wisconsin Department of Agriculture, Trade and Consumer Protection has provided \$25,000 for value-added marketing.

Question. Where is the work being carried out?

Answer. The work is being done with fresh market potato growers in the following Wisconsin counties: Adams, Columbia, Barron, Green Lake, Langlade, Marquette, Portage, Sauk, Waupaca, and Waushara.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The initial phase of developing the eco-label standard and marketing strategy will be completed this year. Additional research will be needed to improve the environmental indicators incorporated in the standard, to test and improve the marketing strategy, to assist more growers in meeting the standard, and to extend the initiative to processing potatoes and to other vegetable crops grown in rotation with potatoes.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project, and a proposal has been requested from the University of Wisconsin. The proposal will be peer reviewed prior to submission to the Agency. The proposal will undergo merit review by Agency staff prior to release of funds.

RANGE POLICY DEVELOPMENT, NEW MEXICO

Question. Please provide a description of the extension program that has been funded under the Range Policy Development, New Mexico grant.

Answer. The Range Policy Development project has collected local economic data throughout the State. Local data have been used to develop an economic model to help explain the relationships between local economies and primary industries. The model enables policymakers to better understand how local and State economies are tied to primary industries, especially those industries that use public lands. The focus of the project is on the livestock grazing industry.

Question. According to the extension proposal, or the principal project investigator, what is the national, regional, or local need for this project?

Answer. In New Mexico and throughout western states, many local economies are dependent on the use and management of public range and forest lands. However, there exists a great deal of disagreement about the true level of dependence of individual communities on these public land-based industries and, consequently, disagreement about the local, statewide, and regional impacts of public policies that alter the use and management of these lands. Through better understanding of how public lands impact local and regional economies, we now can predict the outcomes of potential legislation or amended land use policies, resulting in policies that enhance, rather than detract from, local economies. The model was used to analyze the economic impacts of rangeland reform. The Bureau of Land Management and the Governor's State team chose to use the tool to analyze county alternatives for the State Environmental Impact Statement.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The model has been requested by the U.S. Forest Service to help improve Region 3 Land Use Plan Amendments in response to newly listed Threatened and Endangered Species. New Mexico is in the process of developing detailed input-output models for each county from local and state tax revenue data. Economists are following up with workshops across the state to present information from economic forecasts to local decision makers. Further, the project calls for increasing the utility of the models by expanding the scope of the database to include oil, gas, cheese processing, dairy, and food livestock industries in addition to the grazing enterprises.

Question. How long has this work been under way and how much has been appropriated through fiscal year 2001?

Answer. This project was initiated in December 1994. In fiscal year 1995, \$200,000 was appropriated, in fiscal years 1996–2000, \$197,000 per year; and in fiscal year 2001, \$196,567. The total appropriation for the project is \$1,381,567.

Question. What is the source and amount of non-Federal funds to support this project?

Answer. The project budget does not indicate any non-Federal support. However, Agricultural Research Stations in five other States have economists currently working to expand upon the New Mexico project, ultimately to build a regional model.

Question. Where is this work being carried out?

Answer. This extension project is being carried out at New Mexico State University. Broad regional interest in the project has led to efforts to expand applications to fit other regional sites.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. According to the project director, most of the original objectives of the first phase have been accomplished. The second phase of the project was initiated September 15, 1999. This phase will investigate the hypothesis that recreation—in particular, Federal land-based dispersed recreation—generates sufficient revenue to offset the significant and now documented economic contributions of the consumptive industries, such as range, forestry and mining, and crop and livestock agriculture. Recreation expenditure patterns and economic cycles will be investigated. Production agriculture and range livestock are vital segments of rural economies. These sectors produce sustainable long-term income and wealth and are the basis of the customs and culture of rural economies. The anticipated completion date is September 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposals for continued funding are subject to merit review each year. The most recent merit review of the proposal for this project was conducted in late spring of 2000. The review focused upon the relevance of the project goals, the suitability of the proposed research methods, and the progress to date of the project. The review determined that adequate progress had been made toward fulfilling the objectives of the second phase of this project.

RURAL DEVELOPMENT, ALASKA

Question. Please provide a description of the program that has been funded under the Rural Development, Alaska project.

Answer. This program provides technical assistance to small business to create and retain jobs in rural, under-served areas of Alaska and to stimulate local economies. The Southeast Alaska component will focus on forest-oriented, home-based and cottage businesses. The Western Alaska component is focusing on youth entrepreneurship, workforce development, e-commerce, and tourism.

Question. What is the national, regional, or local need for this research?

Answer. Remote areas in Alaska and other parts of the U.S. are struggling to survive in today's very competitive international marketplace and with the many management and policy changes being deployed on public lands. Alaska's indigenous population needs technical assistance to help them define new economic opportunities. Strategies and development tools designed in this region can be utilized in other areas of the United States and territories.

Question. What was the original goal of this program and what has been accomplished?

Answer. The original goal of the program was to create new economic opportunities in remote areas of Alaska. The project has been underway only a few months and project goals have not been accomplished to date.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This project was begun in fiscal year 2000. Appropriations include \$276,285 for fiscal year 2000 and \$616,640 for fiscal year 2001. The total amount appropriated is \$892,925.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. No non-Federal funds have been provided for this project.

Question. Where is this work being carried out?

Answer. The work is being carried out by the University of Alaska Fairbanks Cooperative Extension Service.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The initial project proposal has a completion date of September 30, 2002. The proposal for fiscal year 2001 funding has not been submitted to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The initial project proposal underwent a merit review within the agency. Since the project is recently initiated, no reviews have been conducted to date.

RURAL DEVELOPMENT THROUGH TOURISM, NEW MEXICO

Question. Please provide a description of the program that has been funded under the Rural Economic Development Through Tourism, New Mexico project.

Answer. The Rural Economic Development Through Tourism Project—REDTT—involves applied research and outreach focused on locally-based tourism development strategies to enhance economic opportunity in small and rural communities in New Mexico. Components of the agenda support training of local leadership and tourism professionals, strategic planning and market development, and technical assistance to communities.

Question. What is the national, regional, or local need for this program?

Answer. This is an ongoing pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural tourism as a development strategy. The grant has demonstrated that a long-term commitment of resources and activity can lead to effective development of tourism resources and build new market opportunities and tourism products for small communities. As rural America and farmers and ranchers seek out new eco-

conomic opportunities, this proposal has strong potential for contribution to a national strategy in rural tourism development.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The applied research and outreach project was designed by the State Cooperative Extension Organization to increase the ability of the public sector to enhance economic opportunity for rural communities through tourism development. A regional task force composed of Extension professionals and community leaders from business, industry, education, and government—local, state, and Federal—was developed to guide and advise the development and implementation of locally-based programming and research. The results include video training materials, a public relations package, image studies and profiles, regional tourism guides, development of tourism bus packages, festival planning workshops, development of regional tours, and a mini-grants program for tourism development.

Question. How long has this work been underway and how much has been appropriated through fiscal year 2001?

Response. In fiscal years 1992 through 1995 the amount of \$230,000 was appropriated. The appropriation for fiscal years 1996–1997 was \$227,000 per year; for fiscal year 1998 was \$247,000; for fiscal years 1999–2000, \$280,000 per year; and fiscal year 2001, \$279,384. Total appropriated funds to date is \$2,460,384.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Fiscal year 1992 included \$38,764 in state matching funds. Fiscal years 1993, 1994, 1995 and 1996 included \$39,360 of state matching funds. Fiscal years 1997 and 1998 included \$39,040 state matching funds and fiscal year 2000 included \$50,804 in state matching funds. The proposal for fiscal year 2001 has not been submitted to date.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through New Mexico State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1993. The original objectives of this research have been met. The additional objectives presented for the 2000 year will be completed by March 31, 2001. The fiscal year 2001 proposal has not been submitted to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Each year, the project has demonstrated accomplishments in the reports submitted. Impacts include increases in attendance of local festivals, increase in the number of tour bus visits to New Mexico, training to over 700 tourism employees in the region, and establishment of a number of new businesses. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

RURAL REHABILITATION, GEORGIA

Question. Please provide a description of the program that has been funded under the Rural Rehabilitation, Georgia project.

Answer. The program has tested the feasibility of providing satellite-based adult literacy education, in association with vocational rehabilitation services, to handicapped adults in rural Georgia. The program has developed curriculum, tested and adapted technology, established student recruitment and retention strategies, expanded to statewide coverage, and provided successful adult literacy education. Current proposal is addressing technology based literacy education.

Question. What is the national, regional, or local need for this program?

Answer. A state task force has estimated that 25 percent of Georgia's adult population is functionally illiterate. Functional illiteracy is regarded in Georgia as a form of disability. This project and other interests in Georgia have determined functional literacy to be a major issue. While this project proposal is based on state needs, similar problems exist throughout the country with various targeted populations.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal of this program was to prove that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. This program has demonstrated that satellite-based literacy training, in cooperation with vocational rehabilitation services, can successfully provide adult literacy education designed to improve critical reading, writing, and thinking skills for handicapped rural adults. Over the past nine years, test scores and attendance and completion rates of students in the satellite-based program have shown that distance learning is an effective delivery system for instructing low-level readers and non-readers. Test scores and attendance rates of students in this program have been comparable to those of students in traditional urban classes. The project is currently working to perfect a process for Internet-based instruction and student assessment.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Funding for this program was initially appropriated in fiscal year 1989, and the program has been in operation since March 1989. Through fiscal year 1998, appropriations for this program have been as follows: \$129,000 in fiscal year 1989; \$256,000 per year in fiscal years 1990 through 1992; \$250,000 per year in fiscal years 1993 through 1995; \$246,000 per year in fiscal years 1996 through 1998; \$236,160 for fiscal year 1999; \$246,000 in fiscal year 2000; and \$245,469 in fiscal year 2001, for a total of \$3,112,619.

Question. What is the source of and amount of non-Federal funds provided by fiscal year?

Answer. The fiscal year 1998 source of non-Federal funds provided for this program are state appropriated funds from the Georgia Department of Adult Education. Prior years sources also included private contributions from the Woodruff Foundation and other local foundations. Through fiscal year 1998, the total amount of non-Federal funds provided for the project has been \$8,006,901. The breakdown by fiscal year is: \$164,000 in fiscal year 1988; \$270,500 in fiscal year 1989; \$809,675 in fiscal year 1990; \$656,765 in fiscal year 1991; \$65,000 in fiscal year 1992; \$1,019,821 in fiscal year 1993; \$20,000 in fiscal year 1994; \$872,500 in fiscal year 1995; \$1,500,000 in fiscal year 1996; \$1,319,320 in fiscal year 1997; and \$1,309,320 in fiscal year 1998. \$236,160 in non-Federal funds was provided for the 2000 budget year by project partners. The proposal for 2001 funding has not been submitted to date.

Question. Where is this work being carried out?

Answer. The Georgia Tech Satellite Literacy Project is sponsored and operated by four organizations: Georgia Institute of Technology's Center for Rehabilitation Technology, the Center for Rehabilitation Technology, Inc., Literacy Action, Inc., and the Georgia Department of Technical and Adult Education. The program grantee is CRT, Inc., a private, not-for-profit business advisory board to the Center for Rehabilitation Technology, College of Architecture, Georgia Institute of Technology, from which the literacy instruction has been provided.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It was anticipated that it would take 3 years to demonstrate that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. That original objective was met in fiscal year 1991. Additional objectives since fiscal year 1991 have been to expand the outreach of the satellite based adult literacy program to enough additional sites throughout the State of Georgia so that all potential participants have reasonable access to the program, and to continually upgrade the quality of class programming and the technical capacities of the system. The fiscal year 1997 technological upgrades expanded the capacity of the program more than twenty-five-fold, from seventy-seven to over 2,000 downlink sites, and a six-fold increase in broadcast hours, and made materials available as supplemental tools to all Georgia literacy classes. As of December 1997, the Georgia Tech Satellite Literacy Program was in a period of transition from that of providing literacy instruction via direct television broadcasts to classrooms to that of development and dissemination of technology-based instructional aids. The project has been renamed the Lifelong Learning Network, or LNN. This change was made based upon the request of the major sponsor, the Georgia Department of Technical and Adult Education, Office of Adult Literacy. The LNN will develop and produce video-based instructional supplements, technology-based curriculum and training for adult literacy practitioners, and multi-media projects for literacy students. The completion date for fiscal year 2000 funding proposal is March 1, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency receives annual reports on the project that are used, together with agency merit review, to assess its progress. Based on these reports, the agency has found that the project has made steady progress in demonstrating the feasibility of utilizing distance learning technology and teaching methods to provide adult literacy education programs to handicapped adults throughout the State of Georgia. The project has been successful in applying the latest distance education technology to both control the program cost per participant and, most recently, to expand the availability of the program. The proposal is peer reviewed within the agency for compliance with program guidelines and project merit each year.

TECHNOLOGY TRANSFER PROJECTS, OKLAHOMA AND MISSISSIPPI

Question. Please provide a description of the program that has been funded under Technology Transfer Projects, Oklahoma and Mississippi.

Answer. The original work involved the transfer of uncommercialized technologies from Federal laboratories and universities to rural businesses and communities. The objectives have evolved to providing more one-on-one assistance to small manufacturers. This type of assistance responds to the stated needs of a small manufacturing community and meets a recognized gap in the existing service provider community. In turn, this innovative and unique program has opened an entirely new clientele base for the Cooperative Extension Service.

Question. What is the national, regional, or local need for this program?

Answer. While every community, state, region, and even nation has a vital need for exploring, understanding, and developing technology, many do not have the necessary resources to meet this need. As an example, the Internet has many potential possibilities for education and business to entertain, but without investigation, these potential users will probably not utilize these technologies until they have been demonstrated to be worthwhile and effective. This puts those groups at a disadvantage with the potential for them to fall farther and farther behind. Projects such as the Technology Transfer Project provide a way for these groups to take advantage of these technologies in the adoption process and integrate them into their operations, thus enhancing their position. Mississippi is in particular need in this respect because of the very low economic resources and rural nature of the state. The Oklahoma Manufacturing Extension Partnership has received national acclaim for its noteworthy and highly effective partnership with the land-grant universities.

Question. What is the original goal for this program and what has been accomplished to date?

Answer. The original goal for the project was the exploration, evaluation, development, and education-transfer of innovative technologies to rural businesses, communities, and governments.

Within the activities of this project, numerous technologies have been explored and evaluated for potential use by various groups. Technologies such as micro-computers, satellite dishes, Geographic Information System—GIS—technology, remote sensing technology, the Internet, computer networking, cellular telephones, specialized software and wireless communications have all been evaluated and educational programs developed. Rural communities and governments have been primary targets of the educational activities associated with the project since its inception. With the educational objective of this project being a primary factor, numerous workshops have been provided to teach clientele how to best utilize these technologies. Demonstrations, either as pilot projects or as exhibits and presentations, have been utilized in many areas to extend dissemination of information and skills.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. Funding appropriated to date is as follows: \$350,000 per year in fiscal years 1984 and 1985; \$335,000 in fiscal year 1986; \$333,000 per year in fiscal years 1987 through 1990; \$331,000 per year in fiscal years 1991 through 1995; \$326,000 per year in fiscal years 1996 through 2000; and \$325,283 in fiscal year 2001. Total appropriations are \$5,977,283.

Question. What is the source and amount of non-Federal funds?

Answer. Oklahoma State University and Mississippi State University—MSU—have provided considerable amounts of matching support from state funds over the life of the project. Over the past five years, support has included a significant portion of engineering faculty salaries as well as the administrative support of county and district extension staff. Matching funds have been at least equal to the amount of the project funds in the last 10 years. Matching funds have included faculty salaries, technology equipment costs, travel, supplies, and administrative support. If all monies required to develop and implement technologies associated with this project were counted, the total would be far greater than the Federal funds provided. For

example, equipment expenditures in MSU Extension to support technology activities in the past year alone were \$500,000.

Question. Where is this work being carried out?

Answer. The work is being carried out by Mississippi State University and Oklahoma State University and, more importantly, on the shop floors of the small rural manufacturers. In Mississippi, work related to this project is also being carried out in some community colleges, on the Internet, and in every county. Demonstrations, educational workshops, Internet access, video-conferencing sessions, satellite conferences, and one-on-one sessions have been conducted in businesses, local government offices, Extension offices, schools, farms, and even homes, where appropriate. In Oklahoma, the program is being delivered in the Southeastern quadrant of the state where the counties are in the lower tier of per-capita income and have higher than average unemployment.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project objectives were to be completed in 12 months and have been met. However, the technology transfer process is continuous because the pace of introduction of new technologies is ever increasing and the gap between the technological competence and utilization by rural and urban manufacturers is ever widening. New specific and measurable objectives have been developed each year. The achievement of those objectives has been documented in annual reports. The objectives of both programs have been the delivery of high-quality engineering assistance and technology transfer services to small manufacturers, conducting joint workshops, client referral, joint research and application projects, and demonstration of value of service to clients. The current phase of the program will be completed in fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In Mississippi, site visits and merit reviews have been conducted by university evaluators annually as well as client surveys by project staff themselves. Survey results have documented job creation, productivity enhancement, and local community economic activity. The Technology Transfer Program has impacted the integration of emerging technologies that are benefitting the citizens, ranging from assisting small businesses and industries in integrating new computer hardware and software for conducting electronic commerce, to providing extensive on-line information resources. The Technology Transfer Funds have served as a catalyst for the development of a long-range telecommunications network plan for the total extension service to link all county extension offices and research centers directly to the Mississippi data/video backbone and provide access to the Internet. Evaluations are conducted on every educational workshop and activity.

In Oklahoma, appraisal of program performance was conducted by the Oklahoma Alliance for Manufacturing Excellence in the year 2000. The impact for the companies served was valued at \$13.7 million and the economic value of the number of new jobs created and saved was \$8.9 million. During fiscal year 2000, client satisfaction surveys were conducted and the program and its staff were rated very high. A U.S. Department of Commerce review during fiscal year 2000 indicated that the Oklahoma program should serve as a national model.

VOCATIONAL AGRICULTURE, OKLAHOMA

Question. Please provide a description of the program that has been funded under the Vocational Agriculture, Oklahoma grant.

Answer. CSREES has requested that the Retired Educators for Agricultural Programs—REAP—a 501(c)3 organization, submit a grant proposal that has not yet been received.

Question. What is the national, regional or local need for this program?

Answer. The need for this outreach effort is due to the diminishing numbers of African American agriculture education teachers in Oklahoma and the scarcity of the African American youth enrolled in vocational agriculture and participating in 4-H and FFA programs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this program was to build a foundation to promote personal and economic opportunities in agriculture for African American youth in Oklahoma through project development and partnerships with educational and other community resources.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. The work supported by this grant begins in fiscal year 2001 and the appropriation for fiscal year 2001 is \$275,393.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. The Oklahoma Department of Agriculture has provided funding to the project over the past three years as follows: \$52,500 per year in fiscal years 1999 and 2000 and \$49,500 in fiscal year 2001. The Oklahoma Conservation Commission, in cooperation with the Oklahoma Natural Resources Conservation Service, has provided to REAP \$25,000 in fiscal year 1998, \$50,000 in fiscal year 1999, and \$95,630 in fiscal year 2000.

Question. Where is this work being carried out?

Answer. A pilot program has been conducted in Creek, Muskogee, Okfuskee, Okmulgee, and Tulsa counties in Oklahoma. The pilot also reached Logan, Oklahoma, and Seminole counties. Non-Federal funding listed above helped to carry out these pilot projects.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is an ongoing project with the objective of involving more African American youth in agriculture education programs. Since the program inception in 1994, more than 100 young students have become involved and pursued additional education in the field of agriculture.

Question. When was the last agency evaluation of this project? Provide a summary of the evaluation conducted.

Answer. This is the first year the Retired Educators for Agricultural Programs has received funding from the agency. An evaluation will be conducted upon completion of the project.

WOOD BIOMASS, NEW YORK

Question. Please provide a description of the program that has been funded under the Wood Biomass, New York grant.

Answer. The goal of the project is to facilitate the commercialization of willow biomass crops as a locally grown, renewable feedstock for bioproducts and bioenergy in the Northeastern and Midwest regions of the U.S. The goal will be reached by simultaneously applying research results to optimize the production system to produce the highest yields at the lowest possible cost, educating potential producers so that they can make informed decisions about producing the crop, educating other key target audiences, and by expanding markets for bioenergy and bioproducts. The scenario is challenging because there is currently not enough willow biomass established to fulfill market needs, while at the same time there are currently no long-term commitments that will assure producers of a stable market in the future.

Question. According to the extension proposal, or the principal researchers, what is the national, regional, or local need for this project?

Answer. The researchers hypothesize that the project is of national interest. This project will serve as a model for bringing other closed loop biomass feedstocks through the research, development, and deployment phases to commercialization. Research on biomass crops spans more than 20 years at USDA and the Department of Energy during which time-significant progress has been made. Several of these crops, including willow biomass crops, are now poised to make the next step towards commercialization. However, as is the case with any new crop, ongoing research will be necessary to optimize crop production and improve returns to local producers. The near-term energy market strategy for willow biomass is co-firing at pulverized coal power plants. Longer-term conversion uses include gasification and combined heat and power systems. Increased effort by other outside groups is focused on the fabrication of new biobased materials and chemicals from willow biomass as an alternative to products currently derived from non-renewable fossil fuels. A major benefit of the willow biomass cropping system is the production of environmental and social benefits simultaneously with renewable energy and bioproducts. Benefits include offsetting carbon emissions from fossil fuels, reduced power plant emissions when the biomass is co-fired with coal, rural economic development, reduction in soil erosion and non-point source pollution associated with conventional agriculture, and the creation of wildlife habitat. These efforts can play a major role in bolstering America's farm and forestry sectors, increasing energy independence, strengthening the protection of the environment, mitigating waste problems, and enhancing recycling policies and practices. The production, quantification, and valuation of these

benefits is essential in order to make the system economically viable under the current electric energy industry structure.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. Overall program goals are: (1) Promote willow biomass crops as an alternative farm crop for domestically produced, renewable bioproducts and bioenergy. (2) Provide verification of scale-up estimates of yields and production costs from small research plots to commercial size fields. (3) Test and refine the production system for willow biomass crops, which will provide a base of experience and knowledge to launch commercial production. (4) Facilitate information exchange among the diverse groups of participants in the project (e.g. farmers, agricultural specialists, natural resources professionals, scientists, business interests, economists, engineers, policy makers). (5) Cooperate with the Salix Consortium to advance prospects for the commercialization of willow biomass systems.

Significant progress towards these goals has been made. Focused outreach and education efforts by the State University of New York—Environmental Science and Forestry—the South Central Resources Conservation and Development, and Cornell Cooperative Extension Service have produced a positive change among many target audiences. The focus of inquiries has changed from knowledge level questions to how they can participate in the program either as potential producers of willow biomass crops or as contractors involved in the establishment and management of the crop. Over 100 landowners, representing over 4,000 acres of land in central and western New York State, have expressed interest in participating in the large-scale demonstration project. New planters, which have been modified by staff in the Department of Agricultural and Biological Engineering at Cornell University, have increased planting efficiency for willow crops from 0.5 acres per hour to 2.5 acres per hour. The first 120 acres of willow biomass crops, including 20 acres planted specifically under this project, grown at a commercial scale are due to be harvested in the winter of 2001.

Question. How long has work been underway and how much has been appropriated by fiscal year through fiscal year 2001?

Answer. This aspect of the program began with an appropriation of \$200,000 in fiscal year 1995. An additional \$197,000 was appropriated by the Congress for fiscal years 1996 through 2000, and \$196,567 in fiscal year 2001. The total amount appropriated is \$1,381,567.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. Four state partners and approximately 18 private partners contribute resources at a ratio of nearly 1.5 to 1 for this project.

Question. Where is the work being carried out?

Answer. The fieldwork is being conducted on private and state land near Syracuse, New York. Tours of the demonstration farms in the last year alone have been conducted for numerous groups including high school and university students, two national conferences, and visitors from four different countries. Presentations have been given at numerous local, regional and national events including the National Farm Bureau meeting, the Chautauqua Institution, the International Poplar Council meeting, International Energy Agency meetings. Outreach and educational activities have been conducted at research locations in several other states including Delaware, Maryland, New Jersey, Pennsylvania, and Vermont.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the completion date of additional or related objectives?

Answer. The completion date for the original award was September 30, 1996. Due to some delays in crop establishment related to weather and landowner agreements and the need to monitor and harvest the original plantings at the end of the first rotation of 4 years, the completion date is now 2003. Several new dimensions have been added to the project as well.

Question. When was the last agency evaluation of the project? Provide a summary of the last evaluation conducted.

Answer. A field review of the project was conducted on August 20–21, 1997. Excerpts from the review report include (1) positive accolades for their regular reporting; (2) positive accolades for the outreach effort being conducted by Cornell University; (3) praise for the scientific outreach by the principal investigators; (4) praise for connecting the willow program to poultry waste and riparian issues in New York state; and (5) praise for gaining the acceptance of willow biomass as an agricultural crop for state property tax purposes. On the concern side, the agency's project administrator flagged the delay in establishing the demonstration farm and requested

diligence in bringing this aspect of the project to fruition. Subsequent reports from the project reveal that this aspect has been satisfactorily addressed.

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2002

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

NONDEPARTMENTAL WITNESSES

[The following testimonies were received by the Subcommittee on Agriculture, Rural Development, and Related Agencies for inclusion in the record. The submitted materials relate to the fiscal year 2002 budget request for programs within the subcommittee's jurisdiction.]

PREPARED STATEMENT OF THE AD HOC COALITION

Mr. Chairman, Members of the Subcommittee, this statement is respectfully submitted for the hearing record on behalf of the ad hoc coalition¹ composed of the organizations listed below. The coalition supports sustained funding for Title I of Public Law 480 at a baseline program level which is not less than last year's level and which will preserve the program as a long-term food aid and market development initiative for American agriculture.

The principal focus of this testimony is to request that Title I funding for fiscal year 2002 be restored to a sustainable level for needed humanitarian assistance abroad and market development for American agricultural products. For fiscal year 2001, the program level was \$159.7 million. Unfortunately, the President's budget for fiscal year 2002 requests an appropriation which would support a program level of only \$139 million. At the very least, Congress should sustain the program level established for fiscal year 2001, and should further evaluate carefully the need to increase the Title I program level in each succeeding year.

Although the coalition favors a higher Title I program level than the Administration proposes, the coalition does support the Administration's request for \$835,159,000 for Title II donations. Under the Food for Progress program, the Administration estimates that \$94 million in Commodity Credit Corporation (CCC) funds will be used to support Food for Progress donations in fiscal year 2002, including \$64 million for the purchase of approximately 229,000 metric tons of commodities and \$30 million for transportation and other non-commodity costs. The coalition welcomes this continued commitment of CCC funding for Food for Progress. The Administration, moreover, pledges to maintain significant levels of shipments under the regular Section 416(b) program when CCC inventory stocks are available. Commodities will be shipped over the next year to complete the Section 416(b) programming approved during 2000 and to provide for new programming, including programming for the President's Global Food for Education Initiative, which currently consists of 632,533 metric tons of commodities to 38 countries valued at more than \$130 million, as discussed more fully below. The coalition strongly applauds

¹The ad hoc coalition is composed of USA Rice Federation, National Association of Wheat Growers, Wheat Export Trade Education Committee, US Wheat Associates, National Council of Farmer Cooperatives, American Soybean Association, American Maritime Congress, Maritime Institute for Research and Industrial Development, Transportation Institute, T&CO Transport Corporation, National Barley Growers Association, US Canola Association, National Sunflower Association, National Corn Growers Association, and Liberty Maritime Corporation.

this initiative, and believes that it will become a pillar of U.S. humanitarian assistance for many years to come.

AN OVERVIEW OF U.S. FOOD ASSISTANCE PROGRAMS

Mr. Chairman, the scope and magnitude of U.S. food aid in recent years has been remarkable. As shown in the attached charts prepared by Foreign Agricultural Service (FAS), the fiscal year 2000 food aid program reached a total of 95 countries, more than half the countries in all the world. The destinations for U.S. food aid last year included 45 countries in Africa, 17 in Asia and the Middle East, seven in Europe, 14 in Latin America and the Caribbean, two in the Near East, and 10 in the Newly Independent States of the former Soviet Union. (See Attachment I.) These 95 recipient countries received donations or concessional sales of 35 different commodities. (See Attachment II.) In fiscal year 2000, USDA-administered programs were responsible for 4.6 million metric tons of shipments, and US AID administered Title II shipments totaled 2.1 million metric tons, for a combined food assistance program of 6.7 million metric tons, valued at more than \$1.4 billion.

The President's Global Food for Education Initiative, on a pilot program basis this year, is expected to provide up to 9 million needy children with nutritious school lunches. Ultimately, this innovative program is expected to provide food donations worth \$300 million per year. Other major initiatives in recent years have included the Russia Food Aid Package and the Ethiopia/Horn of Africa program. The latter distributed about 800,000 metric tons of food in Ethiopia to avert famine in 2000.

While our bounty continues to meet many emergency food assistance requirements around the globe, Congress should keep in mind that long-term market development for American agriculture is an important goal. That goal is one of the purposes of Title I.

THE TITLE I PROGRAM PROMOTES LONG-TERM MARKET DEVELOPMENT

Mr. Chairman, the 1996 Farm Bill directs the Secretary of Agriculture to give priority in negotiating agreements under Title I to developing countries that have the demonstrated potential to become commercial markets for competitively priced U.S. agricultural commodities. The concessional sales market of today will become the commercial market of tomorrow. In an intensely competitive world agricultural marketplace, the United States must use its concessional sales program to gain access, establish a foothold and build relationships upon which future commercial trade in agricultural commodities can depend.

Under the Public Law 480 Title I program, the United States has made concessional sales of commodities with a total value of about \$31.2 billion since 1955. Along with other export enhancement programs, Title I has proved to be a catalyst for strong, long-term growth in U.S. agricultural exports. With the benefit of sustained market-development initiatives, the value of U.S. farm exports rose to an all-time high of nearly \$60 billion in 1996. After declining to \$49 billion in 1999, the value of total U.S. farm exports has recently regained some ground, reaching a level of \$53 billion in 2000.

The United States must intensify its efforts to develop new overseas markets for U.S. farm commodities. With deeply depressed farm prices and strong competition from a host of producing countries, the need for enhanced market development funding has seldom been greater. Congress should increase its market development program and certainly should not cut the program level for Title I as recommended by the Administration. Title I has proved its worth over decades of experience.

THE SHARP DECLINE IN TITLE I FUNDING

Throughout the 1980s, Congress maintained high funding levels for the Title I program. Unfortunately, Title I program levels experienced a sharp drop at the beginning of the last decade—from \$725.3 million in 1990 to \$395.3 million in 1991. The value of commodities shipped dropped below \$200 million in 1995, and (except for extraordinary CCC-funded Russian shipments) has remained near this historical low since then. For fiscal year 2000, concessional sales and donations of about 1.2 million metric tons of commodities valued at \$233 million were programmed to 12 countries under Title I and the Food for Progress program using Title I funds, including carryover funds from prior years.

Mr. Chairman, the carryover in the Title I program account at the beginning of fiscal year 2000 had been significantly higher than the historical average, and Congress cut back the level of new budget authority for that fiscal year in order to permit the FAS to draw down on the unobligated reserves in the program account. This has been done. At the beginning of fiscal year 2000, the carryover was approximately \$170 million; at the beginning of fiscal year 2001, this had been reduced to

about \$50 million, an amount which is considered a prudent reserve level by program managers. Unfortunately, the Title I program level requested by the administration for fiscal year 2002 represents a \$20 million reduction from the fiscal year 2001 program and is a little more than 10.7 percent of the peak 1965 Title I program level, (\$1.3 billion in commodity value). In inflation-adjusted dollars, the Title I program has lost about 97 percent of its value to American farmers since the record-setting year of 1965. The coalition believes that it is important now to stabilize funding, stop the persistent downward trend, and begin to increase resources devoted to this critical and proven program.

A RENEWED COMMITMENT TO MARKET DEVELOPMENT FOR AMERICAN AGRICULTURE

Mr. Chairman, Congress has maintained since World War II a strong bipartisan commitment to market development for U.S. agricultural commodities. Until the mid-1960s, Title I shipments accounted for about 20 percent of the annual value of all U.S. agricultural exports. The concessional sales program was a principal catalyst for market development through the 1970s, when the total value of U.S. agricultural exports increased nearly six-fold—from about \$7 billion in 1970 to \$40.5 billion in 1980. The program was funded at high levels during periods of war and peace, even during periods of large Federal budget deficits.

The time has come, Mr. Chairman, to reemphasize the importance of concessional sales and to revitalize the program. The time has come for a renewed commitment to this historic initiative, a program that has blazed a trail for billions of dollars in commercial shipments of American agricultural products. However, in making this renewed commitment, both Congress and the Administration should seek to improve the program's effectiveness in the economy of the twenty-first century.

Under current criteria, a developing country is considered eligible for Public Law 480 Title I if it has a shortage of foreign exchange earnings and has difficulty meeting all of its food needs through commercial channels. The program managers at FAS should review country eligibility standards, ensuring that all eligible countries are actively considered. There must surely be a substantial market for Title I concessional sales—during 1999 and 2000, donations of food under USDA-administered programs totaled 12.3 million metric tons. Many countries currently receiving Section 416(b) and Food for Progress donations can be expected to graduate to Title I concessional sales arrangements. The shift from Section 416(b) donations to Title I participation could be rapid, and both FAS and Congress should prepare for this eventuality.

There has been legitimate concern that many eligible countries are reluctant to sign agreements following allocations at the beginning of a fiscal year. Perhaps FAS should establish a reasonable deadline for participation under concessional sales terms. The allocations for countries choosing not to participate could be shifted to other countries, well in advance of the close of the fiscal year. This reform could reduce the occasionally excessive carryover of unobligated balances, and help to ensure that program benefits are extended to all eligible countries. As Congress turns to new farm legislation this year, the need for more program flexibility should be addressed. The current cap of 500,000 metric tons of shipments under Food for Progress seems to make little sense. If this cap were lifted, Title I funding in greater amounts could be allocated to Food for Progress. This and other reforms could strengthen the concessional sales program, along with its companion program, Food for Progress.

CONCLUSION

Mr. Chairman, the United States has shipped food assistance in record amounts over the past two and one-half years and large shipments are expected to continue throughout the remainder of this year. Congress and the Administration deserve great credit for this humanitarian effort. But extraordinary food aid shipments will not last forever. American farmers require strong commercial markets to maintain their share of world trade in agricultural commodities.

In 1996, U.S. agricultural exports accounted for nearly 23 percent of total world agricultural trade by commodity value. As noted above, the value of U.S. agricultural exports has declined by nearly 12 percent since the record was set in 1996. Farm prices are depressed. Overseas competitors have enjoyed record crops. Traditional markets have been destabilized by economic upheavals. The response must include a renewed commitment to proven market development strategies, such as Title I of Public Law 480, by restoring the program to at least the fiscal year 2001 level.

PREPARED STATEMENT OF THE ADVANCED MEDICAL TECHNOLOGY ASSOCIATION
(ADVAMED)

AdvaMed, the Advanced Medical Technology Association (AdvaMed) (formerly the Health Industry Manufacturers Association) and its members appreciate this opportunity to provide testimony on funding for FDA in fiscal year 2002. AdvaMed represents more than 800 innovators and manufacturers of medical devices, diagnostic products and medical information systems. Our members produce nearly 90 percent of the \$68 billion health care technology products consumed annually in the United States and nearly 50 percent of \$159 billion purchased around the world annually.

SUMMARY

AdvaMed believes that four key points must be considered when setting FDA funding levels for fiscal year 2002.

- The coming revolution in medical technology poses significant premarket review challenges for FDA
- Device premarket review times have improved, but delays remain in FDA approval of breakthrough technologies
- FDA should be given the full resources it needs to meet the coming revolution in medical technology. Added funding for device premarket review should be coupled with further policy changes to prepare FDA for the future.
- AdvaMed looks forward to working closely with FDA and Congress to determine the extent of the agency's resource needs and ensure that it is ready to meet the premarket review challenges that lie ahead.

SIGNIFICANT PREMARKET REVIEW CHALLENGES ON THE HORIZON FOR THE AGENCY

Last year, AdvaMed testified as to the critical importance of preparing FDA for the coming revolution in medical technology. Patients will be denied access to important new tests and treatments if the agency does not have the resources and procedures in place to review in a timely manner the breakthroughs that result from this revolution.

The agency has made significant gains in reviewing incrementally improved 510(k) medical technologies within statutory review times as a result of its actions to expand the 3rd Party review program—as directed by this Subcommittee. Nevertheless, FDA Acting Principal Deputy Commissioner Bernard Schwetz recently testified before your Subcommittee on the challenges the agency faces, noting “the United States is leading the world into an era of extraordinary scientific achievements that can yield unprecedented gains for human health and nourishment.”

Some of the breakthrough technologies approved by FDA over the past year underscore the dramatic potential of emerging science not only to save and improve lives but also to lower health care costs. They also illustrate why FDA faces a considerable challenge in maintaining timely reviews for the increasing number of major breakthroughs it will face. The vast majority of those breakthroughs will be premarket applications (PMAs).

FDA for example, recently approved digital mammography—after at least 5 years—for breast cancer. This is in addition to the ten year's the product spent in development. This breakthrough in early detection of breast cancer will help save many women's lives in the coming years. The effectiveness and efficiency of this technology will only improve in the coming years as it is coupled with additional breakthroughs like and computer-aided diagnosis and tomosynthesis. FDA's review of digital mammography underscores the challenges the agency faces in reviewing breakthrough technologies in a timely manner. Unfortunately, such premarket review delays are not uncommon for breakthrough medical technologies.

Similarly, combination products—products that are both a device and a drug or biologic have faced significant premarket review delays. Such combination products are reviewed by at least two FDA centers. Unfortunately, combination device drug/biologic products reviewed by the Drug and Biologic centers have faced significant review delays. Nevertheless, a significant number of the breakthrough products in the current R&D pipeline will be combination products never before seen by the Agency.

Medical technology companies also are becoming increasingly concerned about increases in the overall development time for new technology. Delays in any area of the technology development process—design, pre-clinical, clinical testing, and FDA review—prevent patients from gaining access to new technologies and discourages further innovation.

For these reasons, the premarket review challenges posed by innovative medical technologies will only increase in the coming years as FDA faces an ever-increasing number of breakthroughs products.

This fact was highlighted in a report by the Lewin Group on the "Outlook for Medical Technology Innovation" that was released last year. A key finding from the report was that medical device and diagnostic manufacturers have doubled their R&D over the past decade to bring these breakthroughs to fruition. Additionally, a report scheduled for release later this year by the Lewin Group is expected to quantify the significant increases in R&D spending that medical technology companies have made over the last five years.

In making these heavy R&D investments, AdvaMed members are acutely aware of the challenges FDA faces in making these innovations available to patients in a timely manner.

AdvaMed believes that FDA should be given the resources and expertise needed to streamline the entire medical technology development and review process in order to begin the process of preparing FDA for a new age of rapid biomedical and pharmaceutical innovation. This new age is rapidly approaching, and the time to start preparing is now.

FDA NEEDS ADDITIONAL PREMARKET RESOURCES TO PREPARE FOR THE NEW AGE IN MEDICAL TECHNOLOGY INNOVATION

This new era of biomedical breakthroughs is arriving at a time when the agency lacks the resources to meet even its current premarket review duties. In 1998, FDA Senior Associate Commissioner Linda Suydam estimated the agency was \$165 million short of what it actually needs to do its job. In the intervening period, we have learned that medical technology manufacturers have doubled their R&D—the Lewin Report found companies are investing \$9 billion a year or approximately 12.9 percent of revenue. Additionally, while the agency has received important appropriations increases including \$7 million in fiscal year 2000 and \$7.7 million in fiscal year 2001 for device premarket review, premarket review times for premarket applications (PMA) have nevertheless remained flat for the last 3 years. AdvaMed believes FDA's device review program will continue to warrant significant increases as the agency prepares for the coming explosion in medical technology innovation.

AdvaMed believes FDA should have the resources it needs to meet its statutory time frames, both now and in the future. This means completing final actions for premarket approval applications for breakthrough products within 180 days and 510(k)s for incremental advances within 90 days. The fiscal year 2000 Annual Report released by the Center for Devices and Radiological Health's Office of Device Evaluation reported that PMA reviews continue to be double the statutory review times. It also shows that despite budget increases, little improvement has been made in PMA review times.

DIALOGUE NEEDED TO UNDERSTAND RESOURCES NEEDED

AdvaMed believes strongly that it is essential to understand the total resources needed in order for the agency to meet its statutory device review timeframes and has worked for many years to try and determine what is needed. This requires a dialogue with the agency. Toward this end, we applaud the Committee's effort last year to include report language requesting the agency to provide this information to the Committee with respect to the fiscal year 2002 budget. To our knowledge, the agency has not yet provided this information to the Committee.

AdvaMed strongly recommends a dialogue on this issue between appropriators and the FDA so that appropriators may begin to understand and work toward appropriate resources for the agency. Such a dialogue must also include the resources needed at the Drug and Biologics Centers to review combination device drug/biologic products. AdvaMed would be happy to participate in any such discussions if the Committee believes this would facilitate such a dialogue.

Similarly, we understand the Agency may not have used its contracting out authority as it was encouraged to by this Committee last year due to lack of resources. As the pace of medical technology innovation quickens, it will become increasingly important for FDA to look to outside expertise to make sure the agency does not become an ever-tighter regulatory bottleneck.

AdvaMed strongly believes FDA must remain on the cutting edge of science and that one useful way to achieve this goal is for FDA to make greater use of the expertise of the researchers who are advancing this science and applying it to medical technology breakthroughs. However, unless it is known how much the Agency believes it needs to contract out for premarket activities, the Committee will not be able to plan for the needed resources.

REGULATORY CHANGES ARE NEEDED TO PREPARE FDA FOR THE NEW AGE OF MEDICAL TECHNOLOGY INNOVATION

Increased FDA funding for premarket reviews is only part of the answer to timely patient access to medical innovations. In order to meet the coming biomedical revolution, the agency must be as innovative in its regulation of new technologies as researchers are in developing them. FDA has shown a commitment to finding new approaches to getting its job done, and this commitment should be encouraged and expanded on.

FDA has demonstrated this commitment through successfully implementing some key provisions of the FDA Modernization Act. Recently the agency fully implemented and expanded the types of products eligible for the third-party review program. Additionally, the agency also worked cooperatively with stakeholders on FDAMA's least burdensome concept.

CONCERN ABOUT IMPORT USER FEE PROPOSAL

While we do not yet fully understand the Administration's proposed import user fee proposal, we are concerned about its potential impact on medical technology manufacturers. As you may know, in this global economy, medical technology manufacturers rely on component parts and bulk supplies or biomaterials from around the world. The biomaterials shortage of the early 90's forced many technology manufacturers to have to find biomaterials from around the globe in order to manufacture implantable technologies. Additionally, many technology manufacturers import pre-manufactured parts into the U.S. from their internationally-located facilities for final assembly in the U.S. We also believe the proposal would require significant authorizing language.

CONCLUSION

AdvaMed urges this Subcommittee to help prepare the FDA for the coming era of biomedical innovation. To ready FDA for this era and ensure that patients enjoy timely access to the coming dramatic breakthroughs in medicine, a dialogue must be opened on the resources needed to adequately fund FDA's device and drug/biologics premarket review programs and ensure that statutory review times are met. AdvaMed stands ready to assist in such a dialogue if requested.

AdvaMed thanks the committee for this opportunity to present our views and we look forward to working with you to help prepare FDA for the coming revolution in biomedical innovation.

PREPARED STATEMENT OF THE ALACHUA COUNTY BOARD OF COUNTY COMMISSIONERS

Mr. Chairman, thank you for allowing the Alachua County Board of County Commissioners to submit this written testimony before your Subcommittee regarding two significant projects. They are the Partners for a Productive Community Enhancement Initiative, and the Critical Services to Underserved Areas Initiative.

PARTNERS FOR A PRODUCTIVE COMMUNITY ENHANCEMENT INITIATIVE (\$2.3 MILLION IN FUNDING REQUESTED)

In response to a spiraling crime rate in southwest Alachua County, the Alachua County Sheriff's Office requested help from the Board of County Commissioners in 1993. Specifically, the Sheriff reported that 57 percent of its 911 calls came from an area that had only 3.2 percent of the County's population.

The County Commission responded by providing \$38,000 in funding for a Program Manager to staff the Partners for a Productive Community (PPC) Program in fiscal year 1994. The PPC was launched as a strategic planning effort with three goals: the establishment of neighborhood-based services, the development of public/private partnerships and a focus on crime prevention. This Program has enjoyed great success due to the coordinated efforts of the Sheriff's Office, the Courts and the Alachua County Department of Community Support Services. Furthermore, since the inception of this Program, the County has budgeted over \$1.6 million to support the Program through the Community Support Services Department and Sheriff's Office. Additionally, over \$2.4 million has been leverage from other county departments, local social service providers and the Sheriff's Office through a local law enforcement grant.

The goal of the Sheriff's Office was to reduce the number of calls from the area, and to develop a relationship of trust with the area's residents. The goal of the Courts was to help with the swift prosecution of cases, and to increase personnel

in key areas. Finally, the goal of the County's Department of Community Support Services was to develop and implement a neighborhood needs assessment, and to determine the social service needs in accordance with the results of the assessment. The Community Support Services Department was also responsible for developing public/private community partnerships, and community based organizations comprised of tenants, property owners and managers. Thus, this project represents a multi-agency strategy to stabilize, revitalize and sustain five specific neighborhoods of Alachua County.

In addition to improving the area's basic infrastructure, Federal funding is also being requested to provide community recreational programs for the area's youth. These activities will provide positive alternatives to crime, and allow youth to participate first hand in community improvement programs. In doing so, these programs will build and encourage positive self-esteem, leadership skills and academic achievement. To complement these programs, additional improvements will be made in the community Safe Havens. Finally, the requested funding will also allow the PPC to expand this successful demonstration program into other at risk Alachua County communities such as Archer, Florida. Specifically, the PPC will develop a partnership strategy to address the unmet needs of health care, education, training, employment, youth recreation and transportation for the residents of Archer.

This request for Federal funding is justified by the tremendous improvements and accomplishments that have been made in these neighborhoods since 1995. These achievements include: free community day care for 75 children, 30 community day care slots, 24 in-home day care slots, the creation of 30 new jobs by the Early Progress Center, the reduction in 911 calls from 57 percent to 14 percent of total calls in the area, and substantial increases in the property values for four of the five neighborhoods.

Furthermore, the implementation of seasonal recreation programs in the targeted communities by the Y.M.C.A. has been instrumental in providing positive, character building activities for children, teenagers and adults. Day camps are provided during the summer months, and back-yard sports are provided at the end of the school day during the school year. In addition, two 4-H Clubs serving 60 neighborhood children were established along with after school and community teen programs. Adult literacy and GED classes were made available at a nearby school campus. Finally, other programs have been established for the purpose of creating a sustainable neighborhood. These programs include quarterly informational forums concerning small business development, educational opportunities, self-help seminars, budget management and landlord/tenant issues.

With respect to community-wide improvement programs, a total of nine neighborhood cleanups were completed this year. With the active involvement of the residents of the neighborhoods, the Alachua County Office of Codes Enforcement has been able to reduce from twenty to two the number of abandoned and vandalized buildings. Furthermore, a new Waste Collection Ordinance which was supported by the PPC permits the efficient and timely citation of violators.

The sustaining factor within this Program is the formally organized Partners for a Productive Community Council. The Council is the guiding force that deals with issues and determines unmet needs. For example, a block captain organization was started this year with the assistance of the PPC Council, and the Alachua County Sheriff's Office. This group monitors and manages crime prevention programs block by block. In recognition of the numerous accomplishments described above, the PPC received the National Association of Counties' Achievement Award in 1996 for distinguished and innovative contributions to improving county government. Additionally, the League of Women Voters presented the County with a similar award for outstanding community service.

Furthermore, in December 1999 Alachua County received Official Recognition from the Executive Office of Weed and Seed for two of the neighborhoods being served by the Partners for a Productive Community Program. Pursuant to this recognition, these communities have been awarded a \$175,000 Weed and Seed Grant for prevention and intervention strategies focusing on Cedar Ridge and Linton Oaks neighborhoods. This grant will further strengthen the long-term efforts to improve the quality of life in these neighborhoods.

As noted above, the Federal funding requested will also be used to expand the successful Partners Initiative into the rural community of Archer, which is located in the southwestern portion of Alachua County. Archer and the rural areas surrounding it have a population of 6,348, of which 16 percent fall below the poverty level. While the City of Archer has one elementary school, emergency rescue, fire and police services are contracted from Gainesville/Alachua County. There are also two public housing communities, and a small obsolete community center which is used as a congregate meal site for senior citizens. Consequently, many of Archer's

residents travel to Gainesville for employment, social services, recreational activities, adult and continuing education and health care.

Recently, the University of Florida, School of Nursing received \$200,000 from the Florida Legislature to provide primary health care through a clinic based in Archer. Presently, this clinic is on the State Department of Health's list to be eliminated due to the limited area that it serves. Should this occur, there will be a need for additional funds to meet the health care needs in this area. Thus, a portion of the Federal funding in this request could be channeled through the Alachua County Health Department in our continuing effort to develop partnerships, maximize resources and expand services to the citizens of Alachua County through our rural service initiative.

Employment opportunities, recreation for teens and outreach social services continue to be a challenge for the community of Archer. According to the Alachua County Sheriff's Office, Archer's crime rate is disproportionately high for a community its size. In 2000, the Alachua County Sheriff's Office received 2,657 calls for service. Of the dispatched calls, 30 were assaults and batteries, and 5 were for sexual battery. The largest number of dispatched calls (869) concerned burglary and theft.

In conclusion, Alachua County is requesting \$2.3 million in Federal funding to continue its highly successful and award winning neighborhood revitalization programs; and to expand these successful model programs to other neighborhoods, including the City of Archer, Florida.

CRITICAL SERVICES TO UNDERSERVED AREAS (\$1.81 MILLION IN FUNDING REQUESTED)

Without a safe and reliable source of public utilities, the residents who live in the southeastern portion of the City of Gainesville and Alachua County must rely upon the use of obsolete private water systems, septic tanks and propane gas for their utility services. In addition to the health and safety concerns, this lack of a public utility infrastructure serves as a deterrent to the area's economic revitalization.

While several subdivisions in the target area are in immediate need of a public utility infrastructure, it is the County's intent to approach this model program by focusing on the Kincaid Road subdivision as Phase I of the Initiative. This subdivision currently has over 150 homes on septic tanks, with many of them also using propane gas for heating. Historically, there are numerous health risks associated with malfunctioning septic tanks, including the possible contamination of ground water which could lead to the development of diseases within the area.

Gainesville Regional Utilities (GRU) indicates that the infrastructure needed to provide wastewater service to this area includes: the wastewater collection system lift stations, grinder pumps and on-site plumbing to connect to a new gravity sewer system. GRU estimates that the construction and extension of a central wastewater system to the Kincaid Road subdivision will cost approximately \$1,585,000, while the extension of the natural gas lines is estimated at about \$225,000. Thus, the total cost of Phase I of this model program is \$1.81 million. Finally, it's important to note that GRU is currently planning wastewater facilities to serve the Kincaid Road subdivision, and may perform additional engineering work as in-kind services. The additional engineering work is estimated to cost approximately \$121,000.

While Alachua County is requesting assistance from the Federal government in funding this portion of the model program for the area's revitalization, the County has already begun numerous other programs and projects that have had an positive, significant impact on the area's redevelopment. For example, in July of 1996, the County began a series of neighborhood meetings in Greentree Village, which is a subdivision of about 60 households in the target area. Residents were encouraged to express their concerns about the area's problems and establish priorities. As a result of these meetings, the County assisted Greentree Village in the establishment of a crime watch program and the creation of a backyard recreation program through the Y.M.C.A.

Several new public buildings and facilities have also been located within the target area to encourage its redevelopment. During 1998/99, Alachua County expended about \$5.5 million to purchase and renovate the Eastgate Shopping Center for the Alachua County Sheriff's Office. This new facility is 56,200 square feet in area, and it serves as the base of operations for the County's 239 sworn deputies, and 260 non-sworn administrative and support personnel. Completing this law enforcement complex is the new Alachua County Communications and Emergency Operations Center which recently opened adjacent to the new Sheriff's Office. This facility cost about \$5.3 million and operates as a joint center for both Alachua County and the City of Gainesville.

Finally, with a contribution of approximately \$430,000 from Alachua County, the City of Gainesville has completed a new Technology Enterprise Center (TEC) within

the target area. This \$3.0 million business incubator consists of a new, two-story 30,000 square foot facility located in the City of Gainesville Enterprise Zone. Over 60 percent of the construction funds for the TEC were provided by a grant from the U.S. Economic Development Administration. The purpose of business incubators is to promote the growth and development of new enterprises by providing flexible space at affordable rates, a variety of support services, access to management, technical and financial assistance, and opportunities to interact with other entrepreneurs and business experts. Even though this facility has just recently opened, about 13,000 square feet of the TEC has already been leased to a leading technology accelerator company specializing in speeding pioneering technology entrepreneurs to the market. It is expected that when fully operating, the TEC will foster the creation of higher wage jobs, the expansion of the tax base and the augmentation of new business development within the target area.

In conclusion, Alachua County is undertaking the redevelopment of an existing urbanized area, which includes the modernization of its utility infrastructure. These improvements will build upon numerous previous programs and projects that have already had a positive impact upon the area. Phase I of this model program includes the extension of a central wastewater system to the Kincaid Road subdivision, as well as the extension of natural gas lines. The support of this Phase of the project through Federal funding will serve as an impetus for the continued revitalization of these residential areas.

CONCLUDING COMMENTS FOR WRITTEN TESTIMONY

The two initiatives described above represent well-conceived programs that address the social, physical and economic needs of the citizens of Alachua County. Furthermore, they demonstrate the County's continuing commitment to programs that emphasize a balance between environmental protection, economic development and social equity for all of the residents of the County. Therefore, we hope that the Subcommittee will find these two critically important projects worthy of your support. Thank you for your consideration.

PREPARED STATEMENT OF THE AMERICAN DIETETIC ASSOCIATION

Mr. Chairman, the American Dietetic Association and its 70,000 food and nutrition professionals respectfully urge your subcommittee to support adequate funding for USDA's Continuing Survey of Food Intakes by Individuals (CSFII). A minimum of \$8 million is needed annually for this purpose. Congress, USDA, other government entities and the public all rely on the information provided by CSFII for developing sound agriculture and food policy. We kindly request that this letter be entered into the official record of written statements and testimony.

CSFII data are used to identify and target Americans in need of food assistance, track consumption of agricultural commodities and assess risks in the food supply. By providing information on individual and household consumption, CSFII data identify trends in food patterns and connections between diet and health.

Despite the importance of this survey, the USDA discontinued the CSFII in Fiscal Year 2001 due to lack of adequate funding. In the absence of CSFII, USDA plans to rely on dietary data collected by the U.S. Department of Health and Human Services (DHHS). However, the information collected by DHHS is insufficient for formulating agriculture, food and nutrition policy. Congress, USDA, and the public will be severely disadvantaged by the loss of the USDA data they have relied upon over the years.

Together, USDA's CSFII and the DHHS survey, known as the National Health and Nutrition Examination Survey (NHANES), comprise the core of America's national nutrition monitoring system. Though USDA and DHHS have been working diligently for several years to coordinate data collection and to integrate survey methodologies, the plan did not include a merger of the two surveys or the discontinuation of one of the system's two core components.

In January 2001, USDA submitted a report to this Committee outlining its plan to merge its survey activities with those of the DHHS. This report did not address many of the issues and concerns of Congress, as identified in Conference Report No. 106-948 accompanying the Agriculture, Rural Development, Food and Drug Administration, and Related Agency Appropriations Act for fiscal year 2001. In fact, the DHHS survey is inadequate to support USDA's agriculture and food policy decision-making. Without its own survey, USDA can no longer be assured it will receive the types of data needed in a timely fashion to support the multi-faceted functions of the Department.

The USDA should continue data collection as it works with DHHS to lay out a clear plan to use complementary research, collection, and analysis for both CSFII and NHANES, without losing the vital and rich data collected by each survey. However, it is critical that USDA has an in-house mechanism to collect the data it needs on a timely basis. For this reason, the American Dietetic Association respectfully requests that Congress provides a minimum of \$8 million annually to the Agricultural Research Service specifically for the CSFII survey.

Thank you for your consideration of this request.

INTEGRATION OF THE NATIONAL HEALTH AND NUTRITION EXAMINATION SURVEY AND
THE CONTINUING SURVEY OF FOOD INTAKES BY INDIVIDUALS

INTRODUCTION

Conference Report No. 106-948 accompanying the Agriculture, Rural Development, Food and Drug Administration, and Related Agency Appropriations Act for Fiscal Year 2001, contained the following directive: "The conferees direct the USDA, in consultation with the Department of Health and Human Services, to prepare and submit a report to the House and Senate Committees on Appropriations, by December 31, 2000 that describes the process for integrating the National Health and Nutrition Examination Survey (NHANES) and the Continuing Survey of Food Intakes by Individuals (CSFII). The report should: (1) include a timeline and steps to accomplish the goals set forth in the National Nutrition Monitoring and Related Research Act of 1990; (2) be prepared in consultation with representatives of user groups (i.e., anti-hunger groups, consumer advocates, commodity organizations, food producers, nutrition professionals, and public and voluntary health organizations); (3) address the strengths and potential weaknesses of merging the two surveys and identify how problems will be addressed and by whom; (4) identify funding needs and sources; and (5) include recommendations for inclusion in reauthorization of the National Nutrition Monitoring and Related Research Act."

BACKGROUND

The Department of Agriculture, through its Agricultural Research Service (ARS), conducts the Continuing Survey of Food Intakes by Individuals (CSFII) and the Department of Health and Human Services, through its National Center for Health Statistics (NCHS) (part of the Centers for Disease Control and Prevention), conducts the National Health and Nutrition Examination Survey (NHANES). The CSFII which has been conducted on a periodic basis is designed to assess food consumption and related behavior in the U.S. population using personal interviews. The most recent CSFII survey was conducted in 1998. NHANES is designed to assess the health and nutritional status of the U.S. population using personal interviews and a direct physical examination. NHANES, previously periodic, has been conducted on a continuous basis since 1999.

DISCUSSION

The backdrop for discussions on integrating the CSFII and NHANES is the National Nutrition Monitoring and Related Research Act (NNMRA) of 1990 which set goals and mechanisms to bring about greater coordination of nutrition monitoring activities across agencies. More recently, leadership of HHS and USDA have identified a more comprehensive integration of these two surveys as a major priority. USDA/HHS staff have been engaged in intensive discussions of alternative models and approaches for the last three years and have arrived at a basic approach. This process of integration has involved input by users of the data from both surveys. In addition, both agencies have regularly met with and solicited the feedback of stakeholders from inside and outside government on the advantages and disadvantages of integrating the surveys.

Extensive planning efforts between both agencies assures that the quality of the data collected in the future will be improved. Proven and now fully automated methods of data collection will be used, the needs of customers and stakeholders will continue to be met, and data will be released in a timely manner. However, some issues still remain to be addressed.

Objectives for Integrating the Survey

The goals of USDA and HHS in conducting and integrating nutrition surveys is fully consistent with those stated in the Conference Report and the general thrust of the NNMRA. USDA's and HHS' particular focus has been to:

- Continue to meet priority agency and outside user needs for nutrition and dietary data.
- Reduce the complexity of using multiple surveys conducted with different methods.
- Improve analytic comparability between previously parallel efforts of the two Departments.
- Accelerate efforts to implement initiatives anticipated by the 10-year plan and the nutrition monitoring act.
- Achieve cost efficiencies in the face of uncertain and constrained resources.

Discussions between USDA and HHS on alternative strategies for integrating nutrition monitoring efforts have addressed the following questions/issues. What is the potential impact on users of diet and nutrition data? How can existing data resources be maintained and improved? What is the projected availability of funding and what are the alternative methodological approaches (e.g., sample sizes, telephone and in-person interview modes) to achieve the survey goals? What is the advisability and feasibility of using either multiple data collection mechanisms or a single, consolidated mechanism?

USDA/HHS Approach to Integrating the NHANES and the CSFII

Discussions between USDA and HHS have led to an approach to integrating the two surveys into a single mechanism. While many details remain to be addressed the elements of this approach include:

- Collection of data from a nationally representative sample of 5,000 persons each year as part of the continuous NHANES data collection mechanism. The contents of this diet and nutrition component of the survey will include 24-hour recall, a dietary supplement interview, body measures, and nutritional biochemistries from blood and urine specimens.
- Use of a new USDA computerized dietary recall data collection system.
- Processing of dietary recall data through the USDA SurveyNet program.
- Augmentation of dietary supplement interview data with information collected from supplement manufacturers.
- Addition of a second day 24-hour recall to NHANES in order to obtain more representative data on an individual's dietary intake.
- Release of data from this integrated survey database as a timely joint USDA/HHS effort.
- Conduct of an ongoing research program on methods to improve collection and analysis of dietary data.

Advantages/Disadvantages of Integrating the Surveys

The major advantages of integrating the two surveys include:

- (1) A single survey will be less costly than maintaining two separate field operations.
- (2) Dietary recall data will be available from two days on each individual rather than a single day.
- (3) Using the combined assets of USDA and HHS the data will be released in a more timely manner.
- (4) Through the extensive concomitant research of the NHANES program more comprehensive diet and nutrition data will be linked directly to health status data.
- (5) Data collection will proceed on a continuous basis through the ongoing NHANES mechanism rather than periodically.

The potential disadvantages of integrating the two surveys include:

- (1) It was rare for the NHANES and CSFII to be in the field simultaneously. For those years in which both surveys would have been conducted, the overall sample size would have been 10,000 (i.e., 5,000 in each survey). With a single integrated effort, the maximum sample in any year will be 5,000 under the proposed approach.
- (2) NHANES operational constraints raise the possibility that the proposed survey approach will not adequately address seasonal differences in food consumption.
- (3) A plan for obtaining information previously collected through the Diet and Health Knowledge Survey (DHKS), a telephone follow-up to a subsample of the CSFII, is not yet a component of the integrated approach.
- (4) An integrated approach involves tradeoffs and compromises on design and content and it may not be possible to include as much detail on population sub-groups and program participation of special interest to the USDA community as was possible in separate survey undertakings. Similarly, tradeoffs may be necessary between the interests of users of health status data and users of diet and nutrition data in the context of a single mechanisms meeting multiple objectives.
- (5) An advantage of two independent surveys is the assurance that if something happened to the one survey the remaining survey would independently continue.

With the integrated survey, its success will depend on the ability of both agencies to have adequate funding and resources to carry out the integrated survey.

USDA and HHS have concluded that the advantages significantly outweigh the potential disadvantages and are committed to working to minimize the impact of any of the potential negative impacts. The agencies feel that stakeholders and users of the data will be convinced that the integration plan has considerable merit and can help advance the goals of nutrition monitoring.

Timeline

While survey integration discussions between ARS and NCHS have been taking place a new method of fully computerized dietary data collection based on a common set of dietary intake questions, developed in consultation with users of the data, has been developed. Further, NCHS has modified NHANES so that a sample of the U.S. population is collected each year to enable annual updating of estimates. Field pilot testing of the dietary intake system has taken place and an additional operational test is being planned. The full implementation of the new system is scheduled to take place in 2002. It will be used for an in-person interview with participants in the ongoing NHANES and a follow-up interview by telephone for a second, nonconsecutive day of data collection on all 5,000 respondents yearly. This will be a nationwide sample collected over a 12 month period.

Outstanding Issue

There are several significant remaining issues which need to be addressed prior to implementation. First, ARS and NCHS are examining the funding implications of an integrated approach, both in terms of total funding required and the extent to which USDA and HHS would support the various elements of an integrated plan. At the same time, there are other tradeoffs and constraints on the NHANES mechanism, both in terms of funding, burden on individual respondents, and tradeoffs with other potential subjects that might be addressed.

Secondly, details of the roles of USDA and HHS components need to be refined, including the logistics of operations, the development of ongoing mechanisms for user and stakeholder input from both the USDA and HHS communities, and the relationship of integration efforts to other NHANES partners and operations.

USDA and HHS have agreed to take the following steps to refine their integrated approach and move toward implementation:

- Submit this report to House and Senate Appropriations Committees and actively solicit comment on the report from users and stakeholders, including those listed in the Appendix.
- Resolve the outstanding issues addressed above, including funding and operational issues, and make necessary revisions to the approach based on user and stakeholder feedback.
- Conduct an operational test in 2001 of the newly developed USDA computerized dietary recall data collection system to assure compatibility with the NHANES automated systems.
- Develop more detailed operational implementation plans and protocols and obtain necessary clearances in 2001 from Institutional Review Boards for the protection of human subjects in research, and the Office of Management and Budget under the Paperwork Reduction Act.
- Implement an integrated approach reflecting comments from users and stakeholders in 2002.

Funding, Needs and Sources

Funding for the joint integrated survey will be provided by both ARS and NCHS. ARS funds will primarily be used for dietary collection and continued improvement of the dietary intake system. This will include processing of the dietary data. Funds for the selection of the sample to be interviewed, contacting and screening the respondents, the facilities to carry out the interviews, and other costs associated with the NHANES will be provided by NCHS and its collaborators.

It is highly desirable to consider expanding the sample size of participants for the dietary intakes to 10,000 or more as expressed by many stakeholders. This can be done as a freestanding but linked intake outside of the current NHANES data collection model but would require additional funding. Funding for the DHKS is essential and will require additional funds. If the full value of any dietary assessment is to be realized, it will require continuous research on dietary intake methodology so that methods can be continuously refined and developed.

SUMMARY

The USDA and HHS believe a combined, continuous, ongoing effort resulting in an integrated survey, which brings together the complementary expertise of ARS and NCHS, is preferable to two surveys. It is important that this monitoring effort be viewed as a critical research tool. It is also important that this national monitoring program be buttressed by research sufficient to enable the program to keep pace with changing foods, diet and eating behaviors, and with evolving survey mechanisms. With guidance from the several communities who need diet and nutrition information, USDA/HHIS is confident that the Nation's needs can be met.

USER GROUPS CONSULTED TO DISCUSS THE INTEGRATION OF THE USDA AND HHS DIET AND NUTRITION SURVEYS

For the development of this report, several mechanisms were used to solicit input from user groups on the issues associated with the integration of the USDA and HHS surveys. Organizations that participated in recent meetings or provided written input include:

- American Heart Association
- Nancy Chapman and Associates
- Library of Congress, Congressional Research Service
- National Food Processors Association
- Institute of Food Technologists
- Society for Nutrition Education
- American Society for Nutritional Sciences
- American Dietetic Association

The agencies also received multiple comments from individuals following these meetings.

USDA and HHS staff have had a continuing dialogue with stakeholders as the approach to integrating these surveys has been developed. These include:

- The ARS “What We Eat in America” conferences
- The ARS “CSFII Survey Users Group” meetings
- The NCHS “Data Users Conferences”
- ARS/NCHS “Workshop on the Integrated CSFII–NHANES National Food and Nutrition Survey”
- ARS expert working group on the “New USDA Automated Dietary Recall Method”

PREPARED STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION

The American Farm Bureau Federation has identified four USDA program areas for which priority fiscal year 2002 funding is essential. They are:

- programs key to the proper implementation of the Food Quality Protection Act (FQPA);
 - programs to expand foreign markets for agriculture;
 - programs to ensure the development and use of biotechnology products; and
 - programs to guarantee proper implementation of CAFO and TMDL regulations.
- These priorities are highlighted in the first portion of this statement. The second portion contains a list of additional programs supported by Farm Bureau.

PROGRAMS KEY TO THE PROPER IMPLEMENTATION OF THE FOOD QUALITY PROTECTION ACT (FQPA)

Passed in 1996, the Food Quality Protection Act (FQPA) is our nation's new food safety law, establishing revised health standards and a new risk assessment process for measuring the safety of crop protection products. Farm Bureau supports increased funding for USDA's Food Quality Protection Act implementation activities. Proper implementation of this law based on sound science is critical to ensure the availability of vital crop protection products.

The following offices and programs are critical to proper implementation of FQPA and must be funded as increased levels:

Agriculture Research Service (ARS).—Integrated Pest Management (IPM) research, minor use tolerance research (IR–4), and research on alternatives to methyl bromide. The Office of Pest Management Policy, should also be funded at increased levels with funding being designated under the Secretary of Agriculture's office, not ARS.

Cooperative State Research and Extension Service (CSREES).—IPM research grant, IPM application work, pest management alternatives program, expert IPM decision support system, minor crop pest management project (IR–4), crops at risk

from FQPA implementation, FQPA risk avoidance and mitigation program for major food crop systems, methyl bromide transition program, regional crop information and policy centers, Pesticide Impact Assessment Program (PIAP), and the pesticide applicator training program.

Economic Research Service (ERS).—IPM research, pesticide use analysis program, and the National Agriculture Pesticide Impact Assessment Program (NAPIAP). Additional funding for FQPA implementation activities is needed in the following programs: National Agriculture Statistics Service (NASS) pesticide use surveys, Food Safety Inspection Service (FSIS) increased residue sampling and analysis, Agriculture Marketing Service (AMS) and the Pesticide Data Program (PDP).

PROGRAMS TO EXPAND FOREIGN MARKETS FOR U.S. AGRICULTURE

Creating new overseas markets and expanding those that we have is essential for a healthy agricultural economy. Continued funding of export development programs is fundamental to improving farm income in the short and long term. We recommend maximum funding of all export development programs consistent with our commitments under the World Trade Organization (WTO) trade rules.

Public Law 480.—We support increased funding for Public Law 480 programs, the primary means by which the United States provides foreign food assistance. The Public Law 480 programs provide humanitarian and public relations benefits, positively impact market prices, and help develop long term commercial export markets.

GSM Credits.—AFBF supports the full funding of the GSM credit guarantee programs. These important export credit guarantee programs can help make commercial financing available for imports of U.S. food and agricultural products on deferred payment terms.

Market Access Program (MAP) and Foreign Market Development Program (FMD).—Congress should fully fund the MAP and FMD programs. These programs need the expertise of a fully supported Foreign Agricultural Service (FAS) that is expanded to cover all existing and potential market posts.

Export Enhancement Program (EEP).—The 1996 FAIR Act authorizes direct export subsidies of U.S. agricultural products through the EEP program through fiscal year 2002 to counter the unfair trading practices of foreign countries. AFBF supports the full funding and use of this program in all countries, and for all commodities where the U.S. faces unfair competition.

Dairy Export Programs.—Farm Bureau supports full funding and use of the Dairy Export Incentive Program (DEIP) to allow U.S. dairy producers to compete with foreign nations that subsidize their commodity exports. Farm Bureau supports using savings from the elimination of the Commodity Credit Corporation purchase program for WTO-legal export development programs.

Sanitary and Phytosanitary Management.—To address the need for additional inspections created by increased volumes of imports and exports, Farm Bureau supports increased funding for USDA's Animal and Plant Health Inspection Service (APHIS).

Foreign Agriculture Service.—Farm Bureau recommends increased support for the Foreign Agriculture Service.

PROGRAMS TO INSURE THE DEVELOPMENT AND USE OF BIOTECHNOLOGY PRODUCTS

USDA must take the lead in biotechnology coordination efforts. It is essential that the Department act in a timely manner to evaluate and move approved products and technologies to the marketplace. USDA should develop a positive national strategy for biotechnology research, development and consumer education. Agriculture's competitive advantage in world markets will be maintained only with the continued support and encouragement of these technological advancements.

Grain Inspection, Packers and Stockyards Administration (GIPSA).—Farm Bureau supports sufficient funding for the establishment of a GIPSA biotechnology test certification laboratory. The creation of such a laboratory is a key element to the acceptance of biotechnology. The ability to accurately test and identify products of biotechnology for identity preserved and segregation purposes is essential.

Codex Alimentarius Commission.—Farm Bureau supports increased funding for the U.S. CODEX office so that it can adequately represent American interests in this important body which develops the international food safety standards used as guidance by the World Trade Organization. Increasingly, biotechnology is the focus of CODEX discussions where an ongoing international effort is being led by the EU to place limits on our ability to export products of biotechnology by incorporating the precautionary principle into the CODEX general principles or biotechnology labeling discussions.

Agriculture Research Service (ARS).—Farm Bureau supports sufficient funding for plant-breeding research programs because they are important for maintaining a broad-based research and assuring advancement of the technology.

PROPER IMPLEMENTATION OF CAFO AND TMDL RULES

Final Total Maximum Daily Load (TMDL) and EPA proposed Concentrated Animal Feeding Operation (CAFO) regulation would impose billion of dollars in costs on agriculture across the country. These attempts at regulatory expansion over agriculture are not necessary to achieve improvement to nonpoint source water quality. Voluntary, incentive-based programs have proven effective by directly assisting farmers to obtain results while maintaining the farm business.

Environmental Quality Incentives Program (EQIP).—EQIP is an important program for assisting producers in dealing with increased water quality regulation. We support a substantial increase in EQIP funding over previous years.

Conservation Technical Assistance (Natural Resources Conservation Service).—Conservation program delivery and technical assistance must be a priority for NRCS funding. Emphasis should be placed on traditional technical assistance and the development of reliable resource data for assisting producers dealing with nutrient management. Estimates show that \$550 million is necessary for this effort to help farmers improve farming practices and protect water quality.

OTHER ISSUES

Agricultural Research.—Farm Bureau believes that agriculture research and the distribution of that research to producers is critical to the future of our industry. One of the areas of agreement when the 1996 farm bill was enacted was that funding for agricultural research would be increased to allow U.S. producers to maintain their competitive position in world markets. Farm Bureau recommends a significant increase in agriculture research funding over the next five years.

Emerging Diseases and Exotic Pests Research.—Disease has a direct impact on food safety and is fundamental to international trade. Funding is urgently needed to develop rapid diagnostics, vaccines, and products necessary to protect U.S. plants and animals from disease outbreaks that occur naturally as well as those that could be intentionally introduced. Farm Bureau supports full funding for ARS emerging diseases and exotic pests research including ways to prevent the importation of exotic species in the ballast tanks of cargo ships.

Animal Pest Research.—Farm Bureau believes the control of plant and animal pests is an important factor in reducing farm costs. Farm Bureau supports research funding for scrapie, Johne's, PRRS (porcine reproductive and respiratory syndrome), cryptosporidiosis, FMD (foot-and-mouth disease), VS (vesicular stomatitis), BSE (bovine spongiform encephalopathy), hog cholera, salmonella and E.coli.

Plant Pest Research.—Farm Bureau recommends continued research and implementation of detection, exclusion, control and eradication measures for plant pests including research for:

- methods to halt the spread of the Asian Longhorned Beetle, a deadly threat to maple trees.
- an effective control of fire ants and ways to provide safer, effective and practical treatments of multiyear certification of field and container-grown nursery stock.
- ways to manage domestic European honeybees in the area where Africanized honeybees exist.
- the magnitude of the threat of the root-lesion nematode, *Pratylenchus neglectus*.
- smut and bunt diseases of cereals, including kernal bunt.

Food Quality and Safety Research.—Farm Bureau supports funding for research to insure the safety of food. Specifically we support funding for research:

- to insure the safety of food additives;
- on the irradiation (sold pasteurization) of food;
- on inspection methods to eliminate the risk from pathogens;
- food safety technology advances;
- voluntary food safety guidelines to help prevent microbial contamination of fresh produce.

Binational Agricultural Research and Development Fund.—Farm Bureau supports increased funding for BARD and other similar programs that maximize cooperative research efforts.

Genome Research.—Access to diverse genetic resource materials is crucial for the development of new plant varieties that are more resistant to insect infestation and disease and more tolerant to other adverse environmental conditions. Genomic research is also important to improving the economical traits of importance in live-

stock and poultry that affect animal health and reproductive efficiency. Farm Bureau supports increased funding for the food Genome Project currently administered by the National Science Foundation as well as additional money for plant, animal and microbial genome research at USDA.

Natural Resources Research—Farm Bureau supports funding to study carbon credits and carbon sequestration. We favor continued research on reuse of water; conversion of saline waters; air and water pollution; water and soil conservation; recharging of groundwater basins; drainage; forestry management and utilization; restoration of strip-mined areas; weather forecasting and modification; treatment of domestic, industrial and animal waters; coal desulfurization and other natural resource problems.

Research for new Products for Ag Commodities—Farm Bureau supports increased funding for research and development for new commodities and for new uses of commodities currently under production.

Health and Nutrition Research—Farm Bureau supports funding of nutrition research on relationships between agricultural products and coronary heart disease and cancer.

National Animal Health Emergency Management System—Farm Bureau supports full funding for the National Animal Health Emergency Management System that was developed in cooperation with the states, industry and the veterinary profession. These monies will enhance APHIS's emergency preparedness and response capabilities to address emergency animal disease issues that threaten the U.S. food supply.

ARS and APHIS Laboratory Facilities—Farm Bureau supports full funding for a joint APHIS and ARS facility at Ames, Iowa, to meet national needs for research, diagnosis and product testing for animal health. The existing facilities are antiquated and inefficient and without this new laboratory facility, the U.S. will fail to meet international standards and to provide the level of animal disease protection necessary to achieve a world-class National Animal Health Emergency Management System. We support adequate funding for ARS biocontainment facilities that are critical to maintaining world-class research on both foreign and domestic diseases.

Plant Pest Control.—Farm Bureau supports funding for control and/or eradication programs for plant and animal pests including: grasshoppers; multiflora rose; autumn olive; Johnsongrass and other designated noxious weeds; eradication of fruit flies; Russian Wheat Aphid; gypsy moth, southern pine bark beetles; and Plumbox virus.

Boll Weevil Eradication.—Farm Bureau recommends full funding for Boll Weevil eradication to provide a 30 percent match with producer funding to facilitate the orderly eradication and/or containment of the pest across the balance of the cotton-growing area.

Pseudorabies.—Farm Bureau supports adequate funding of the pseudorabies eradication plan developed by the swine industry.

Brucellosis.—Farm Bureau supports funding for a brucellosis control program leading to eradication of this disease in swine. The Federal government should continue full funding of brucellosis control activities in all infected states. Because brucellosis is transmittable from wildlife to domestic livestock and humans, we support funding to compensate livestock owners for losses brought about by contact with wildlife.

Johne's Disease.—Farm Bureau supports funding to develop an accurate blood test for Johne's Disease; to reduce producers' cost to test for Johne's Disease; and for a multi-year program to identify Johne's disease infected animals and to provide an indemnity payment for the disposal of these infected animals.

Inspection and Grading of Meat and Poultry.—Farm Bureau recommends that funding for any new federally mandated seafood inspection program should be consistent with existing funding for other food commodities.

Conservation Operations.—We continue to be concerned about adequate Natural Resources Conservation Service (NRCS) conservation operation funding. Conservation program delivery and technical assistance should be a priority for NRCS funding. Emphasis should be placed on traditional technical assistance and the development of reliable resource data for assisting producers to deal with nutrient management and other conservation concerns.

Grazing Lands Conservation Initiative (GLCI).—We support funding for technical assistance under the GLCI as authorized in the 1996 farm bill.

Environmental Quality Incentive Program (EQIP).—With regard to conservation programs under the Commodity Credit Corporation Program (CCC), we believe that emphasis should be placed on EQIP. EQIP is an important program for assisting producers dealing with increased water quality regulation and other conservation concerns. We support a substantial increase in EQIP funding over previous years.

Forestry Incentive Program (FIP).—Farm Bureau supports funding for the Forestry Incentive Program and suggest funding at \$6 million.

Farmland Protection Program.—Farm Bureau supports \$65 million in funding for the Farmland Protection Program.

Wildlife Services.—Wildlife Services should receive increased funding for both operational and research programs.

Ag in the Classroom.—Most students no longer have firsthand farm experience and, therefore, lack a basic understanding of our food and fiber system. The Agriculture in the Classroom program provides real world examples that teach about agriculture production food safety, nutrition and healthy lifestyles, and career opportunities. Farm Bureau supports an increase to \$750,000 for Ag in the Classroom under CSREES.

Risk Management Agency.—Farm Bureau supports long term funding for the Risk Management Agency.

Ag Marketing Equity Capital Fund.—Farm Bureau supports funding for the Agricultural Marketing Equity Capital Fund to help producers develop value-added enterprises.

WIC Market Coupon Program.—Farm Bureau supports increased funding for WIC market coupon program.

Rural Development Issues.—Farm Bureau supports the community and business programs of the office of Rural Economic and Community Development. We support funding for rural development and recommend targeting a greater portion of all funds towards stimulating commerce in rural areas.

PREPARED STATEMENT OF THE AMERICAN FARMLAND TRUST

Last summer, the U.S. Department of Agriculture hosted five listening sessions around the country on “Maintaining Farm and Forest Land in Rapidly Growing Areas.” Hundreds of producers, community members and elected officials testified on how rapid growth in traditionally agricultural areas impacts their operation and their community. Although this was the first forum on urban edge agriculture held by USDA, the same concerns and calls for assistance are being heard at conferences hosted by the National Governor’s Association and the U.S. Conference of Mayors. During a recent NGA conference on “Private Lands, Public Benefits,” U.S. Environmental Protection Agency Administrator Whitman highlighted the needs of farmers faced with sprawling development and the need to build programs that address them.

Why are farmers and ranchers in urban edge areas gaining so much attention? Because they have become an integral part of the U.S. farm economy and their numbers are growing. According to the USDA Economic Research Service, there are now over 1,800 counties where agriculture is threatened by rapid growth. Within those 1,800 counties, agriculture in the nation’s Metropolitan Statistical Area (or MSA) counties accounts for over a third of total agriculture production and land value. That is equivalent to the farm economy of Ohio, Indiana, Illinois, Iowa, Missouri, Kansas, Nebraska and the Dakotas combined. Or, to look at it another way, it’s equivalent to the total value of all agricultural exports.

Throw in Texas, Mississippi and the rest of the South and the total output still would not equal the production of a larger group of urban edge agriculture that includes those counties adjacent to MSAs that are the next targets of sprawl. Today, more than half the nation’s agricultural production occurs within commuting distance of our rapidly expanding cities.

Agriculture in these counties faces the same price and supply challenges of traditional agriculture, but farmers and ranchers in these areas also must contend with nuisance suits, trespassing and escalating land values. With ninety-percent of the U.S. population living downstream from urban edge farms, they also have the greatest impact on our environment and quality of life. Farm and ranchlands in urban areas reduce runoff, provide wildlife habitat and scenic landscapes. Once the land is paved over, it becomes much more difficult to improve environmental quality. Yet, these producers receive little to no Federal assistance from USDA. We cannot afford to let this growing sector of U.S. agriculture continue to struggle without Federal assistance.

We urge you to use the fiscal year 2002 agriculture appropriations bill to recognize the value and needs of urban edge farmers and ranchers by funding key programs that protect the land by giving producers an alternative to development, build public support for agriculture by improving environmental stewardship and make urban edge agriculture profitable long term.

Protect the Land and Create An Alternative to Development

Urban edge farms are disappearing. The 1997 National Resources Inventory (NRI) showed a loss of 1.2 million acres of cropland, pasture and rangeland a year—a rate 50 percent higher than in 1992. The amount of topsoil we are paving over each year is roughly equivalent to what we are saving with all Federal soil conservation programs, CRP included. And what the NRI doesn't show is that the land is also being fragmented, broken up like a checkerboard. For every acre paved, an AFT study estimated an additional 2 to 3 acres become harder to farm because of conflicts with neighbors over noise, odors, dust and chemical drift. The USDA Economic Research Service estimates 164 million acres of farmland are now threatened by sprawling development. Selling conservation easements under the Farmland Protection Programs locks in a land base for agriculture and gives farmers and ranchers a way to retain their way of life instead of selling to developers. Protecting this land through the Farmland Protection Program requires a much stronger commitment from Congress. If we want to ensure agriculture remains viable in the 1,800 counties faced with rapid growth, Congress needs to ramp up the Farmland Protection Program significantly. In the next ten years, at least \$1 billion a year is needed to slow the loss of farmland to development. States and local governments are doing their part, committing over \$200 million a year to purchase development rights. We must acknowledge that the benefits generated by protecting well-managed farmland flow to the entire nation, and we must make the Federal government a full partner in achieving them. In fiscal year 2002, we urge Congress to allocate \$200 million to the Farmland Protection Program.

The demand is there from farmers and ranchers and the infrastructure is there to use it effectively. This January, when USDA announced the availability of \$30 million in FPP funds, applications to protect over 780 farms and ranches were submitted. Unfortunately, recent cuts to the program will allow USDA to help less than 10 percent of those landowners. Around the country, there are another 4,000 farmers and ranchers waiting to sell their development rights if funding were available. With more states and counties starting their own farmland protection programs, the expertise and manpower to carry out an expanded Federal program is ready to go. By partnering with state and local programs, Federal dollars were leveraged six times.

Build Public Support for Agriculture By Improving Environmental Stewardship

Eighty percent of all Americans, more than 190 million people, live in urban areas, yet less than one-tenth of one percent of the budget for forestry and conservation programs is dedicated to these areas. Continued support for large agriculture programs will require increasing the connection between voters and agriculture. Demonstrating the public benefits improved water quality, wildlife habitat and open space—agriculture producers will build this connection to urban and suburban residents. Essentially, we have to recognize that farmers and ranchers produce more than food and fiber. They are our nation's most important environmental managers as well. We can help stabilize the farm economy by assigning value to the environmental commodities produced by farmers and ranchers and start paying for them. We already have most of the programs in place to do this; we just have not funded them adequately. It was very disappointing to see the Administration's budget request cut key conservation programs. These cuts send the entirely wrong message to farmers and ranchers who have been oversubscribing to these programs by a 5 to 1 margin.

The Wetlands Reserve Program, Environmental Quality Incentives Program and the Wildlife Habitat Incentives Program all return benefits to the public that we know voters are demanding. A recent Gallup poll ranked water quality and open space as top concern of voters. Last year, voters approved more than \$7 billion to protect open space. Unfortunately, Congress has not met that demand. Instead, we continue to spend billions of dollars on income support for a small segment of farmers and ranchers. In fiscal year 2002, we need to put conservation programs on equal footing with commodity programs. Funding for WRP needs to be increased to allow USDA to enroll 170,000 acres next year. To reduce the backlog of farmers waiting to enroll in EQIP, we urge you to increase its funding to \$350 million. Finally, to make up for the recent cut to WHIP funding and to meet the critical habitat improvements needed along our nation's rivers and streams, we urge you to increase WHIP to \$70 million in fiscal year 2002. Only at these levels, can USDA serve the current needs of farmers and ranchers and look at new ways to expand them in urban edge areas.

Make Farming Profitable Long Term

Since selling development rights or adopting conservation practices is an economic as well as environmental choice, we need to address economic viability of farming and ranching in urban edge areas. Farmers can survive, even thrive, in urban edge areas if they are given technical and financial assistance to adapt their operation to the consumers and markets around them. In the last ten years, farmers markets have exploded into our cities and suburbs. These consumers are looking for fresh, locally-grown food and farm products. In fiscal year 2002, Congress should increase funding for Resource, Conservation and Development to at least \$45 million to hire on the ground experts to help urban edge producers take advantage of their local markets by diversifying their production, developing new products and implementing direct marketing. At the same time, Congress should increase funding for the Sustainable Agriculture, Research and Extension to \$30 million this year to help communities improve their agriculture infrastructure, develop new marketing programs and apply new research results to help producers reduce their operating costs.

For farming to prosper in rapidly growing areas, we need to protect the land base; we need farmers making profits; and, we need to have a general public that wants agriculture to be a visible part of their community. USDA has the tools and programs to make all of these steps happen, but without adequate funding not enough resources will reach farmers and ranchers in the urban edge. It is time to recognize the importance of this sector of U.S. agriculture to our farm economy and our farm communities. Voters are demanding these changes and state and local governments have started listening. We hope the fiscal year 2002 agriculture appropriations bill will launch the Federal commitment to urban edge agriculture.

PREPARED STATEMENT OF THE AMERICAN FEDERATION OF GOVERNMENT EMPLOYEES, LOCAL 3354 AND THE AMERICAN FEDERATION OF STATE, COUNTY, AND MUNICIPAL EMPLOYEES, LOCAL 3870

RURAL AMERICA NEEDS MORE COMPASSION

Family farmers, the ill-housed rural poor, and small rural communities must receive a share of the budget surplus! We urge you to do whatever you can to make sure the budget allocations for agriculture and rural development are sufficient to enable the appropriations requested below.

- The debate on Capitol Hill over what to do with the historic opportunity presented by the budget surpluses has focused on the relative merits of tax cuts for the wealthy and elimination of the debt. Too little attention has been paid to what this issue is really about—making it impossible for the government to invest in any of the long list of priorities that would truly make America better off.
- Our nation has an enormous backlog of much-needed public investment—especially in supporting family farms over factory farms, in rural housing, and in rural community and economic development. AFGE and AFSCME believe that public investments are by far a more prudent and responsible use of current and future surpluses than meager tax cuts for working families and windfalls for the rich.
- We ask the Members of this Subcommittee to increase investments in family farmers, the ill-housed rural poor, small rural communities, and the USDA employees who deliver these programs. The fiscal year 2001 Federal budget amounted to only 18 percent of Gross Domestic Product, the smallest percentage since 1966. The tax cuts that have been proposed for the top 1 percent of wealthy Americans, if withheld, would provide over \$500 billion for these, and other, investments over the next ten years. We need to increase government investments for the common good, not give away the budget surpluses to private greed!

THE BUSH BLUE PRINT FOR USDA—OUR CONCERNS

The Congressional Budget Office (CBO) baseline to simply maintain 2001 levels of discretionary spending for Agriculture is \$19.6 billion. According to the Administration, funding of “core operations”, as distinct from emergency assistance, was \$18.6 billion. The proposed discretionary budget authority level for fiscal year 2002 is \$17.9 billion. That’s going in the wrong direction, no matter which baseline number is used.

In human terms, the Blue Print states the President’s fiscal year 2002 Budget will:

- Finance the acquisition of decent, safe, and affordable housing by 57,000 low-to-moderate income families in rural America, compared to 80,000 housing units claimed in the fiscal year 2001 budget;
- Create 40,000 jobs in rural areas, compared to 55,000 the fiscal year 2001 budget was estimated to create;
- Give access to 1.4 million poor, rural residents to clean, safe drinking water, compared to 1.7 million for whom new or improved water systems were provided in the fiscal year 2001 budget.

With respect to the USDA employees who provide these services throughout rural America, the Blue Print states as follows: "In the early 1990s, under the previous Bush Administration, an effort was begun to streamline USDA's county office structure to improve service and reduce costs. Nearly one-third of USDA's field offices have been closed since that time. However, there are still about 5,600 USDA county-level offices serving one million farmers (not counting 1,300 USDA rural development offices that serve farmers and other rural residents). The Department will review the efficiency of USDA's remaining field office structure, recognizing that many farmers and other rural customers want to use computers and fax machines to transact business with USDA. To meet those needs, the budget includes funds to continue efforts to streamline and modernize USDA's county office structure through completion of a common computing environment and reengineering the way USDA conducts business. In 2002, customers will be able to conduct business with the county-based agencies electronically. The Administration expects long-term savings and improved service from merging the information technology services of the three county-based agencies . . ."

We have major differences with this analysis, and its implications for rural America, as follows.

AFGE AND AFSCME FUNDING PRIORITIES FOR AGRICULTURE APPROPRIATIONS

Increased Salaries & Expenses funding for the Department of Agriculture's Rural Development mission area is our No. 1 funding priority for the Subcommittee's Appropriations for Agriculture, Rural Development, and Related Agencies! Congress should appropriate at least \$654.5 million for Rural Development salaries and expenses in 2002, for the reasons outlined below.

Since 1995, the Congress has increased Rural Development programs by 69 percent overall; yet, our staffing levels have been cut by 28 percent. Our servicing areas in the Field, and our workload in the National and Finance Offices, has doubled or tripled. With decreased staffing, customer service suffers. Almost no funds have been allocated to training for the past six years! The situation has deteriorated to the point where State Directors have had to stop most overtime work. Use of privately owned vehicles for official travel has been prohibited, and use of government-owned vehicles has been limited. These restrictions on travel and overtime make it next to impossible for our employees to do our jobs! Timely inspections are not completed. Interviews of potential borrowers have to be conducted by phone. Night meetings of community leaders and organizations, county commissions, city councils, real estate interests, and potential customers cannot be attended.

It is laborers and white and blue-collar workers that are the infrastructure of our rural communities, in addition to our farmers. If we can't provide housing, utilities, and jobs to enable them to be productive taxpaying citizens, how can we say the cost outweighs the benefits? Low-income rural Americans need public servants, with sufficient expense funds to support travel, overtime, training and information technology, to deliver these housing, community, and business development programs.

The Rural Development (RD) loan and grant programs are just as important, even more so in terms of number of people reached, as the various programs delivered by FSA. RD needs staff to deliver these programs, just like FSA needs staff to deliver its programs! It is even more imperative that Congress increase the appropriated S&E funding for Rural Development because RD does not have access to CCC funds, university grants, user fees, or any other outside source of funds to help support its employees. "If we're going to have meaningful programs supporting family farmers and rural communities, we need to maintain USDA's infrastructure of county offices, with sufficient staff, that is responsible and accountable to deliver these programs." Bill Christison, President, Family Farm Coalition

The House Budget resolution included a provision, supported by our unions, to ensure parity in pay increases between the military and civilian employees. This will require an increase of 4.6 percent above the fiscal year 2001 levels. Salaries & Benefits has been running approximately 75 percent of RD's total S&E account. Therefore, additional appropriations of approximately \$20 million will be required to maintain current staffing levels. We also urge the Subcommittee to provide at least

\$15 million for employee training, an increase of approximately \$13.5 million over fiscal year 2001 levels.

In addition, we believe the nature of many of the programs administered by Rural Development warrants some additional offices, not reduction. The communities and families we serve range from very low income to moderate income. Many are elderly, handicapped, very poorly educated, have no telephone, and definitely no computer or fax machine. To become successful homeowners, they need home buyer education and credit counseling, provided in person, preferably by a USDA employee who is a resident of their own community. To meet this need, we propose adding 700 more staff for RD.

Approximately 600 of these staff years would go to local offices to provide one person per office whose main duty is to provide home buyer education and credit counseling to our Rural Housing borrowers, also assisting in other program areas as needed. The remaining 100 staff years would be used to increase IT staff in St. Louis, Washington, and in the States. We estimate the fully loaded cost of these staff years to average \$57,000, requiring an additional human capital investment of \$40 million.

Funds to increase Rural Development staff, and direct loan programs, should be obtained in the following ways, and by reducing the tax cut proposed by the Bush Administration for wealthy Americans:

We can support the Administration's proposal to eliminate the \$25 million in rural housing funding from HUD because rural housing is best provided through USDA's field delivery structure throughout rural America. Those funds should be added to the budget of Rural Development, and not just eliminated.

We also believe that Members of Congress should find a way to reuse the subsidy recapture funds from the 502 program to further invest in successful homeownership for low-income rural Americans. During fiscal year 2000, RHS recaptured \$30,656,000 in Principal Reductions According to Subsidy (PRAS), and \$88,332,000 in Interest Subsidy. These funds are collected and returned to Treasury when borrowers pay off their loans. When compared to the costs to the government of foreclosing on low-income rural homeowners, we would all benefit by reinvesting some of these funds in our proposed homebuyer education and credit counseling initiative because foreclosure losses would be significantly reduced. If just one percent more rural homeowners are successful as a result of this education and counseling, losses to the government would be reduced by \$75 million.

Public investments in Rural Housing are both compassionate and conservative.

Since its inception in 1950, the Section 502 direct program has produced over 1.9 million units of safe, decent, sanitary housing and supported a variety of innovative housing development opportunities such as the mutual self-help housing program (sweat equity). Over the past ten years, however, the program's production capacity has declined 41 percent, from 26,203 units in 1988 to only 15,561 in 1998. It is even more startling to compare the paltry 1998 production to the over 132,000 units produced in 1976.

As of February 7, 2001, RHS had 30,778 qualified applications pending for Section 502 loans totaling \$2,180,340,430. As of that time, however, we only had approximately \$784,781,000 available in unobligated funds. An additional investment of at least \$1.4 billion is needed in the Sec. 502 direct loan program.

We are glad to hear that Senators Kit Bond (R-MO) and John Kerry (D-MA) are planning to introduce new housing production bills. We ask them, and the Members of this Subcommittee, to both authorize, and appropriate, significant new investment in rural housing production. The National Rural Housing Coalition's October 2000 report documents the following needs:

- Rural homeowners are more likely than homeowners as a whole to live in substandard housing.
- Rural homeowners, particularly minority households, face excessive housing related costs.
- The limited availability of credit on reasonable, affordable terms and conditions makes it harder to get a loan and limits the utility of the secondary market for rural housing loans.
- The rate of federal assistance to non-metro households is only about half that for metro households.

Greater investments in the Section 502 (Single Family Direct Loans), Section 504 (Housing Repair Loans), Section 514 (Farm Labor Housing), Section 523 (Self-help Housing Loans & Grants), and Section 525 (Technical Assistance Grants). We also need to increase investment in Rural Rental Housing, to meet the housing needs of the poorest of the poor who cannot pay back a mortgage loan to at least \$250 million, plus increased Rental Assistance. It costs money to house the poorest of the

poor, both construction and rental assistance. We subsidize homeownership some \$98 billion per year in the form of interest deductions. Rebuilding the 515 rural rental program costs less than homelessness or nursing homes.

PUBLIC INVESTMENTS IN LIMITED RESOURCE AND BEGINNING FARMERS ARE
COMPASSIONATE AND CONSERVATIVE TOO

Investment in the Farm Ownership Direct Loan program needs to be increased, at least back to fiscal year 2000 levels. In Oklahoma, all available funds for fiscal year 2001 have already been used up. In many states, as much as 70 percent of the farm land will change ownership over the next fifteen years. Unless the direct farm ownership loan program is significantly enhanced, most of that farm land will go to the existing large farms, and the benefits and productivity of family farming will continue to be wiped out.

We also ask the Subcommittee to provide the authorized amount of \$10 million for Outreach and Technical Assistance Program for Minority Farmers. The Outreach and Technical Assistance program is the most effective tool developed to carry out the mission of USDA as the technical provider for small farmers. For a very small investment, the program has significant multiplier effects in poor communities where there exist few other possibilities for sustainable economic development.

AFGE and AFSCME also supports the need to increase Salaries & Expense funding for Farm Service Agency to incorporate the temporary employees funded through emergency appropriations during each of the last several years into the baseline S&E appropriation, as requested by the National Association of County Office Employees (NASCOE).

FSA should be required to allocate more staff resources to the Farm Loan Programs. The program management standard for excellence in our direct farm loan programs is that each responsible loan officer should never have a caseload of more than 56 borrowers. Today, our farm loan officers in many states have an average caseload of 150 to 200 borrowers. This makes it impossible to adequately perform the supervised credit functions, which ensure the success of the program. We have also not had sufficient staff, or contracting funds, to perform real estate appraisals, chattel appraisals, and year-end farm analysis. For several years, these functions have been contracted out due to the arbitrary employee downsizing targets of the Clinton Administration. Now, we're not even getting enough money to contract for these services.

As NASCOE has urged, staffing levels and patterns should be based on real strategic planning and performance measures/goals. The USDA County-Based Agency Study conducted at the request of your Subcommittee indicated that approximately 30 percent of FSA's workload is support for the Farm Loan Program. The Appropriations Subcommittees should allocate 30 percent of FSA's Salaries & Expenses to support of the Farm Loan Program. The Agricultural Credit Insurance Fund could be used for this purpose by changing the legal language and increasing the appropriation for S&E from this account.

FUNDING FOR THE COMMON COMPUTING ENVIRONMENT

The Office of the Chief Information Officer (OCIO) is requesting \$100 million in additional funding for IT modernization in fiscal year 2002. While AFGE Local 3354 and AFSCME Local 3870 support the need for a common computing environment and modernization of the IT capabilities in our Field Offices, we can only support appropriating these funds AFTER Congress has FIRST found the money to support increased investments in staff and direct loan programs, as outlined above.

We agree with much of what Senate Government Affairs Chairman Thompson (R-TN) said in his March 16 letter to Senate Budget Committee Chairman Domenici (R-NM) and ranking member Conrad (D-ND). While Senator Thompson lauded the administration's plans to promote e-government projects and tighten federal computer security, he also emphasized that any workforce cuts should be guided by strategic planning. He did not call for increased funding to support the administration's proposed e-government fund, as Senator Lieberman (D-CT), the ranking Democrat on the Government Affairs Committee, had done the previous week. Senator Thompson added that "workforce restructuring should be done pursuant to a strategic plan and that there are areas where increases in human resources are necessary."

The Bush Administration Blue Print for USDA suggests that these funds to "streamline and modernize USDA's county office structure through completion of a common computing environment" will be combined with a "review of the efficiency of USDA's remaining field office structure, recognizing that many farmers and other rural customers want to use computers and fax machines to transact business with

USDA". We believe this perspective continues the type of arbitrary assumptions for which Senator Thompson correctly criticizes the Clinton Administration. "E-government" is apparently seen as a means to downsize the Federal workforce while also increasing customer service. As stated above, such an approach would exclude the low-income rural citizens served by Rural Development from access to homeownership and other economic opportunities. Guaranteed lenders demand, and should have, appropriate electronic access to USDA. But small, isolated, poor rural communities cannot be served by "e-government" alone. Like Senator Thompson, we believe there are some areas where real strategic planning, as distinct from pie-in-the-sky silver bullets, means Federal hiring should be stepped up.

CONTRACTING OUT

AFGE and AFSCME believe the No. 1 management improvement needed to achieve a Common Computing Environment, or otherwise more effectively deliver USDA programs to the people we serve, is to reduce the waste of funds for poor quality work that results from current USDA contracting out practices. Until this problem is addressed, we cannot support the Administration's assumption that "merging the information technology services of the three county-based agencies" will lead to "long-term savings and improved service."

During 1998, an Information Technology Functional Team, consisting of labor and management from the IT organizations of Rural Development, NRCS, and FSA, developed "Information Technology Contracting Recommendations". This official agency document recommends that Federal staffing for IT support be increased, through reductions in more expensive contractor personnel, as the least costly and best service solution. The reason for this conclusion was simple: It costs \$50,000 per FTE less, on average, to utilize Federal employees, rather than contractors, to provide Information Technology support to the USDA county-based agencies!

Despite this fact, and these recommendations, the OCIO has continued to increase reliance on contractors, and our IT organizations in St. Louis and Washington have not even been allowed to back-fill Information Technology positions as they become vacant due to retirement and attrition. Since 1993, the Rural Development IT workload has been cut by over 30 percent, while our workload has increased from 4 million to 11 million lines of code. We do not support continued pouring of funds into a SWAMP (Stop Wasting America's Money on Privatization) of waste, fraud, and abuse through contracting out. Therefore, we also do not support continued massive funding of the OCIO's requests until, and unless, the reforms advocated below have been enacted by Congress, and implemented by USDA.

The House Report on the fiscal year 2001 Agriculture Appropriations Act attempted to address this issue:

The Committee directs the Department to make cost comparisons of the use of private contractors with Federal employee performance and to employ the most efficient organization process as described in OMB Circular A-76. The Committee also directs the Department to report on its contracting out policies, including the agency budgets for contracting out, with its annual budget submission for fiscal year 2002.

I can assure the Members of the Subcommittee that USDA ignored this directive. No cost comparisons of the use of private contractors with Federal employee performance were conducted during fiscal year 2001 by either Rural Development or the Farm Service Agency. Therefore, we will submit language to be added to the Agriculture Appropriations bill for fiscal year 2002 to ensure that cost comparisons are conducted.

Finally, USDA has listed thousands of Rural Development and Farm Service Agency jobs as commercial, subject to contracting out, under the FAIR Act, totally ignoring employee input that many of our functions should be classified as inherently governmental. No less an authority than Comptroller General, David Walker, recently stated: "Government can never privatize the duty of loyalty to the greater good, namely, the need to look out for the collective best interests of all rather than the narrow interests of a few." The loan and grant programs of Rural Development and Farm Service Agency provide subsidies to enable very low to moderate-income rural Americans become successful homeowners, small family farmers, and to provide economic development of small rural communities. These are inherently governmental functions, and we will also submit bill language designed to address this further concern regarding threatened privatization of Department functions.

PREPARED STATEMENT OF THE AMERICAN FOREST & PAPER ASSOCIATION

The American Forest & Paper Association (AF&PA) submits this written testimony for the record in support of USDA research programs that contribute prag-

matic solutions to our nation's sustainable forestry needs. Both USDA Forest Service Research and USDA Cooperative State Research, Education, and Extension Service (CSREES) have the obligation to support research to benefit all forest landowners, public and private. These organizations are uniquely qualified to support collaborative, long-term research and deserve well-targeted funding increases to focus resources where they are critically needed: on forest productivity, utilization, and inventory issues.

AF&PA INTEREST IN FOREST RESEARCH

AF&PA has a substantial interest in promoting research to improve and document forest productivity. As the national trade association of the pulp, paper, and forest products industry, we represent approximately 84 percent of paper production, 50 percent of solid wood production, and 90 percent of industrial forestland in the United States. Forests provide a renewable raw material source for our industry, which attempts to meet consumer demand while providing rural communities with stable, living-wage job opportunities. We face a significant global competitiveness challenge, as companies throughout the southern hemisphere grow trees three to four times faster at a fraction of the cost, often without environmental compliance standards similar to those in the United States. We also face a significant domestic challenge as the entire forestry community needs timely access to more consistent, comprehensive, and accurate forest measurement data.

AF&PA is a member of the National Coalition for Sustaining America's Non-federal Forests and supports the overall objective of well-targeted increases in federal investments to support forestland stewardship. Research contributes cutting edge, science based solutions to ensure that our nation's forests can be managed sustainably for all values.

RELATED AF&PA PROGRAMS

Two AF&PA programs recognize the critical contribution of forest research to sustainable forestry: the Sustainable Forestry Initiative (SFI)SM Standard and Agenda 2020. The Sustainable Forestry Initiative (SFI)SM Standard is a condition of AF&PA membership and requires that participants support "forest research to improve the health, productivity, and management of all forests." The AF&PA Agenda 2020 program is a collaborative effort initiated with the U.S. Department of Energy to promote research that enhances energy efficiency in areas such as forest raw material supply. Competitive grants are awarded to universities and agency labs based on matching funding, scientific peer-review, and collaboration.

Agenda 2020 provides an outstanding model of a public/private partnership that efficiently allocates Federal funding to support research that benefits the nation. AF&PA would like to expand this partnership and add USDA agencies as formal Agenda 2020 partners.

GENERAL RESEARCH RECOMMENDATIONS

AF&PA supports funding increases within existing authorizations for USDA agencies best qualified to conduct long-term forest productivity research to benefit all landowners. The need for pragmatic research designed to produce and measure healthier, faster growing forests far exceeds supply. Well-targeted increases in Federal funding support are needed to re-build research capacity and focus resources in areas where the nation will receive the best return on investment: biotechnology/genetics, soil productivity, tree physiology, forest measurements and forest products utilization.

A portion of this funding should be allocated through competitive grants that support collaborative Agenda 2020 research. Greater use of tools such as matching funding, competitive grants, and scientific peer-review will leverage scarce resources, ensure quality research, and help measure success. To the greatest extent possible, agency research priorities should be established in collaboration with university, state, and private sector forest researchers and managers. This will ensure that research objectives remain relevant to all forestland owners.

AF&PA concurs with the recommendations contained in the 1998 National Research Council report: "Forested Landscapes in Perspective: Prospects and Opportunities for Sustainable Management of America's Nonfederal Forests." The report, commissioned by the Secretary of Agriculture, calls for greater funding in forest science, technology and research programs. In "Report to the Secretary of Agriculture" dated November 1, 1999, the Forest Research Advisory Council (FRAC) urged USDA to "foster competitive grant or other programs" to address "sustainable intensive timber production" and "forest assessment (inventory)." This represented

the views of 20 forest research experts from Federal and State government, industry, academia, and the conservation community.

AF&PA forest research recommendations are also consistent with the Congressional findings of the 1998 Farm Bill. It is important to review some of those findings since it gets to the heart of the forest community's ability to compete in the global marketplace. Congressional findings included:

- “Uncertainty over the availability of the United States timber supply, increasing regulatory burdens, and the lack of Federal Government support for research is causing domestic wood and paper producers to move outside the United States to find reliable sources of wood supplies, which in turn, results in a worsening of the United States trade balance, the loss of employment and infrastructure investments, and an increased risk of infestations of exotic pests and diseases from imported wood products” and
- “Wood and paper producers in the United States are being challenged not only by shifts in Federal Government policy, but also by international competition from tropical countries where growth rates of trees far exceed those in the United States. Wood production per acre will need to quadruple from 1996 levels for the United States forestry sector to remain internationally competitive on an ever decreasing forest land base.”

FISCAL YEAR 2002 USDA RECOMMENDATIONS—AGRICULTURE APPROPRIATIONS
COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES)

Four programs administered by the USDA Cooperative Research, Education, and Extension Service (CSREES) make a significant contribution to supporting university research, forestry education, and vital partnerships. These are McIntire-Stennis, The Renewable Resources Extension Act (RREA), the National Research Initiative (NRI), and the Initiative for Future Agriculture and Food Systems (IFAS).

AF&PA strongly supports these programs and specifically recommends a total \$39.9 million increase (4.0 percent) for the USDA Cooperative State Research, Education, and Extension Service (CSREES) targeted at three (3) priorities, summarized and discussed below.

[Dollars in millions]

| Budget Item | Fiscal year 2001 Total Funding | Fiscal year 2002 Targeted In- crease | Fiscal year 2002 Total Funding |
|--|-----------------------------------|--|-----------------------------------|
| McIntire-Stennis | \$21.9 | \$8.1 | \$30.0 |
| RREA | 3.2 | 11.8 | 15.0 |
| NRI | 106.0 | 20.0 | 126.0 |
| Total—Priority Programs | 131.1 | 39.9 | 171.0 |
| Total CSREES fiscal year 2001 Budget—Enacted | 988.6 | | |
| Percent Increase | | 4 | |

\$8.1 million increase for the Cooperative Forestry Research Program (McIntire Stennis Act).

This program provides critical core funding for forestry research and scientist training efforts at universities. It is authorized at \$105 million, was funded at \$21.932 million in fiscal year 2001 and matched more than three times by universities with state and nonfederal funds. AF&PA suggests that a total \$8.1 million increase be targeted as follows:

- \$3 million—forest productivity research as defined by Agenda 2020
- \$2.1 million—forest information technology
- \$1.1 million—wood utilization and processing technology
- \$1.9 million—assessing economic impacts of policy decisions

\$11.8 million increase for the Renewable Resources Extension Act (RREA) program.

This program provides the foundation for extension and outreach efforts delivered to private landowners through universities. It is authorized at \$15 million and was funded at \$3.192 million in fiscal year 2001. Cutting-edge sustainable forestry solutions developed through research are of limited benefit unless they can be effectively delivered to the nation's forest landowners. AF&PA suggests a total \$11.8 million increase to fully fund this important program, with new funding targeted at developing databases, communications materials, and effective delivery mechanisms to

ensure that landowners have easy access to forest management advice and professional services.

\$20.0 million increase for the National Research Initiative Competitive Grants Program (NRICGP) targeted at forestry research in the areas of forest biotechnology, forest soil productivity, tree physiology, and forest information technology.

This program is a significant source of funding (\$106 million in fiscal year 2001) for basic and applied research in several categories related to agricultural crops, sustainable forestry, and related market/trade issues. It has great potential to contribute to the nation's sustainable forestry research needs, though only ten percent (10 percent) of the available funding has been allocated to forestry research. AF&PA supports a total \$40 million increase targeted at Agenda 2020 priorities, equally divided between fiscal year 2002 and fiscal year 2003, as a reasonable means to increase the emphasis on critical forestry research needs.

FISCAL YEAR 2002 USDA RECOMMENDATIONS—INTERIOR APPROPRIATIONS FOREST SERVICE RESEARCH & DEVELOPMENT

AF&PA supports increased funding for Forest Service research in three areas of critical importance:

- Forest Productivity Research with a Competitive Grants funding component,
- Forest Inventory & Analysis (FIA) program,
- Forest Products Laboratory in Madison, Wisconsin. Improved science in these areas transcends ownership categories and will result in enhanced tree growth, improved knowledge for sustainably managing all forest values, and increased wood utilization efficiency. As authorized by the Forest and Rangeland Renewable Resources Act of 1978, Section 2 (a)(1), Forest Service research should “support the protection, management, and utilization of the Nation's renewable resources.” This Act refers not just to public lands, but to private lands as well. AF&PA recommends a total \$31.5 million increase (13.7 percent) for Forest Service Research & Development targeted at three (3) priorities, summarized and discussed below.

\$11 million increase for Forest Inventory and Analysis (FIA).

This is consistent with recommendations in the Memorandum of Understanding (MOU) between the Forest Service and the National Association of State Foresters. Forest Inventory and Analysis (FIA) provides data needed to measure forest growth, health, and other essential information needed to make resource allocation and forest policy decisions.

\$16 million increase to build forest productivity research capacity, with \$10 million dedicated to Competitive Grants to support Agenda 2020 priority research in biotechnology, forest soil productivity, tree physiology, and forest information technology.

The number of scientists and projects focused on producing more wood products from fewer acres has dramatically declined as the agency has moved away from commodity production. Forest Service regional experiment stations have both an obligation and the unique ability to address the nation's sustainable forestry needs through long-term research. Section 1672 of the Agricultural, Research, Extension, and Education Act of 1998 (Research Title of the Farm Bill) specifically identified improving long-term forest productivity as a priority research need and allows the Secretary of Agriculture to award competitive grants for such research.

We recommend that the Forest Service implement a formal competitive grants program at fully authorized levels to support collaborative forest productivity research through Agenda 2020 in the areas of biotechnology, soil productivity, tree physiology, and forest information technology. This will help build stronger partnerships between the agency and our nation's university-based forestry schools.

\$5.5 million increase for Forest Products and Utilization Research at the Forest Products Laboratory in Madison, Wisconsin and other labs, with \$2 million to support core functions and \$3.5 million dedicated to the housing research initiative.

A \$2 million funding increase for core functions will ensure continued technological innovation in using renewable wood products. Forest products and utilization research contributes to improved forest productivity and sustainability by focusing on efficient and effective use of wood fiber. AF&PA also endorses the housing research initiative and suggests that \$7 million equally divided between fiscal year 2002 and fiscal year 2003 is a reasonable and responsible means to provide technological innovation needed to respond to increased housing demand.

CONCLUSION

In conclusion, AF&PA recognizes a critical need for increased investment in forest research and respectfully recommends well-targeted increased appropriations within USDA. At least two USDA agencies are uniquely qualified to support collaborative, long-term research in priority areas: forest productivity, utilization, and inventory. Increased appropriations for these forest research priorities are a needed investment that will pay substantial dividends for our nation's future.

PREPARED STATEMENT OF THE AMERICAN HONEY PRODUCERS ASSOCIATION, INC.

My name is Richard Adee. I am President of the American Honey Producers Association, Inc., and I am submitting this statement in its behalf. The American Honey Producers Association, Inc. is a national organization of commercial beekeepers with activities in most of the States in this country.

First, the Association wishes to thank the Subcommittee for the support it has provided in the past for agricultural research activities in behalf of the beekeeping industry. It has enabled the Agricultural Research Service to staff its bee laboratories at the minimum level necessary to meet with critical needs of the industry. To continue this research, the Association supports funding for bee research at the ARS facility at Weslaco, Texas, at not less than the level appropriated for fiscal year 2001. The Association also recommends an increase of \$500,000 in the level of funding for the ARS honey bee breeding, genetics, and physiology laboratory at Baton Rouge, Louisiana.

BACKGROUND

Honey bees pollinate over 90 cultivated crops and are an essential element in the productivity achieved by American agriculture. It is estimated in a Cornell University study published in 2000, that the annual value of agricultural production attributable to honey bee pollination amounts to \$14.6 billion. These include the production of such diverse crops as almonds, apples, oranges, melons, vegetables, alfalfa, soybeans, sunflower, and cotton, among others. Their increased value comes in the form of both increased yields and improved quality. In addition, honey bees are responsible for the production of an average of 200 million pounds of honey annually, the sales of which helps sustain this nation's beekeepers.

Since 1984, the survival of the honey bee has been threatened by continuing infestations of mites and pests for which appropriate controls are being developed by USDA scientists. Unfortunately, there is no simple solution to these problems. The honey bee industry is too small to support the cost of the needed research, particularly with the current depressed state of the industry. Further, there are no funds, facilities, or personnel elsewhere available in the private sector for this purpose. Accordingly, the beekeeping industry is dependent on research from public sources for the scientific answers. The key to the survival of the honey industry lies with the honey bee research program conducted by the Agricultural Research Service.

RESEARCH AT THE ARS WESLACO, TEXAS, LABORATORY

The Association recommends that the appropriation for the Weslaco laboratory be approved at not less than current levels. This will enable the laboratory to continue its work in finding a chemical solution to parasitic mites that are causing a crisis for the U.S. beekeeping and pollination industries.

Varroa mites are causing the loss of hundreds of thousands of domestic honey bee colonies annually as well as devastating wild bee colonies. The only chemical which has received a general registration for varroa mite control, fluvalinate, is being rendered ineffective by the development of resistant mite populations. The USDA honey bee lab at Weslaco, Texas, has been working hard trying to find alternative chemicals to control the varroa mite. It appears that the laboratory has found a chemical, coumaphos, with the potential of being equally effective as fluvalinate. This is a real break through for the bee industry, but as of today we have only been able to obtain section 18 emergency registrations. Much work still remains to be done before a section 3 general registration is granted by EPA.

A new pest, the small hive beetle, found in Florida has caused severe bee colony losses. Apparently, it originated in South Africa. Estimates put the losses in just one season at over 30,000 colonies. There is evidence that the beetles are spreading to other areas in the East coast. As the beetles spread, they will just devastate the bee industry. In order to contain the beetle, several states have quarantined bees from Florida, North Carolina, South Carolina, and Georgia or are actively considering such quarantines. Despite these precautions, the beetle has recently spread

to California. There is a fear that its spread in California will be difficult to control because of similarity of soil conditions with those in Florida. It seems that coumaphos may help control this insect as well as the varroa mite, but as previously stated it has not received a section 3 registration and it is unclear when such a registration will be granted by EPA.

The USDA-ARS honey bee research scientists at the Weslaco laboratory have been working overtime to find chemicals, techniques, pheromones, or other methods of controlling the beetle. Time is of the essence, as a control must be found immediately as all the bee colonies in the Western Hemisphere are at risk.

Additionally, the requested appropriation will enable the Weslaco lab to continue its work in finding new and improved methods for control of other parasitic mites, such as the tracheal mite, as well as solving beekeeping problems that interfere with honey production and effective crop pollination, and determining the impact and spread of Africanized honey bees.

RESEARCH AT THE ARS BATON ROUGE, LOUISIANA, LABORATORY

The Association also recommends an increase of \$500,000 in the appropriation for the ARS laboratory at Baton Rouge, Louisiana. The Baton Rouge lab is the only laboratory world-wide focusing on the development of long-term, genetic-based solutions to the varroa mite. Existing stocks of U.S. honey bees have several desirable traits but are not genetically resistant to the parasitic mites. Research scientists with the Baton Rouge laboratory have been to the far corners of the world looking for mite resistant bees. In eastern Russia, they found bees that have co-existed for decades with the mites and survived. The bees were brought to the United States and are in the process of being evaluated to assure that the resistance holds up under a wide range of environmental and beekeeping conditions. Attributes such as vigor, pollination, and honey production are being tested.

There is an immediate need to propagate the resistant queen bees in large numbers for wide scale distribution to beekeepers so that this evaluation can be accomplished. The work is slow and tedious. It is also costly. The requested appropriation will accelerate the research, development, and transfer of queen bee stock resistant to varroa mites by providing for the employment of an additional research scientist and supporting staff whose salaries are not included in the USDA budget.

SUMMARY

In conclusion, we wish to thank you again for your support of honey bee research in the past. We also would appreciate your continued support by approving an appropriation at not less than current levels for the Weslaco, Texas, lab, by adding an additional amount of \$500,000 to the appropriation for the Baton Rouge bee facility, and by otherwise supporting the Administration's request for bee research. Only through research can we achieve and maintain profitability in the U.S. beekeeping industry and continue to provide stable and affordable supplies of bee pollinated crops which make up fully one-third of the U.S. diet.

I would be pleased to respond to any questions that you may have.

PREPARED STATEMENT OF THE AMERICAN HORSE PROTECTION ASSOCIATION, INC.

Dear Chairman Cochran and Members of the Subcommittee: On behalf of the American Horse Protection Association, Inc., I am writing to offer its views concerning the fiscal year 2002 appropriation for the Horse Protection Act program administered by the Animal Plant and Health Inspection Service (APHIS). AHPA is a national nonprofit humane organization devoted exclusively to equine welfare. Since the Association's incorporation in 1966, the prevention of abuse to show horses, and in particular Tennessee Walking Horses and similar gaited breeds, has been one of its principal areas of interest and concern.

The authorized appropriation for the Horse Protection Act program is a maximum of \$500,000 annually, which is exceedingly low in absolute terms for a program which is responsible for enforcing the Act at approximately 500 horse shows and sales per year. As a practical matter, since Fiscal Year 1994 the effective level of Horse Protection Act program enforcement expenditures has not exceeded \$400,000. At this level, APHIS is severely limited in its efforts to effectively enforce the Horse Protection Act.

AHPA recommends that the fiscal year 2002 appropriation be increased to the full \$500,000 for the reasons set forth below.

In 1970, Congress enacted the Horse Protection Act (Pub. L. No. 91-570, 15 U.S.C. Sec. 1821 et seq) in response to concern for show horse abuse—particularly

among Tennessee Walking Horses. "Soring", as the abuse is commonly known, involved the infliction of pain to the horse's feet and legs to accentuate its naturally animated gait and to hasten the training process. The Act was substantially amended in 1976 to expand the kinds of conduct that were prohibited and to strengthen the Agriculture Department's enforcement capabilities (Pub. L. 94-360) directing it to detect and punish violators, either civilly or criminally.

The legislative history of the Act is clear: Congress regarded soring to be an inhumane practice which gave those trainers and owners who sore horses an unfair competitive advantage over those who safeguarded the welfare of their animals. Congress intended to eliminate soring, and believed that the competitive and financial interest of those who sore horses should not receive any recognition. Most importantly, Congress clearly mandated enforcement responsibility to the Department of Agriculture.

Historically, Congress and the Agriculture Department have recognized that there is a close relationship between soring and the kinds of "action devices" and shoes and pads that a horse wears, especially if the effects of the devices and shoes and pads are accentuated by making the animal's feet and legs painful through the application of chemical irritants or blistering agents. As a result, enforcement under the Act has focused in part on prohibiting the use of equipment and techniques that reasonably can be expected to sore a horse. APHIS field enforcement at horse shows is intended to detect horses that show evidence of being in pain prior to or after showing. In addition, APHIS personnel attend shows to monitor the performance of Designated Qualified Persons (DQPs), employees of Horse Industry Organizations (HIOs) appointed by horse show management to inspect horses for soring violations.

Last year marked the 30th anniversary of the passage of the Horse Protection Act. Yet, soring of horses remains a serious problem today. At an equine welfare forum in 1999 hosted by the American Association of Equine Practitioners and the American Veterinary Medical Association, Ron DeHaven, Deputy Administrator for APHIS, pointed out that nine of the last 10 presidents of the Walking Horse Trainers Association as well as nine of the last 16 "Trainers of the Year" have either Federal cases pending or convictions of soring. Moreover, although the Walking Horse industry often cites a 98 percent compliance rate, APHIS Veterinary Medical Officers (VMOs) write alleged violations for only the clearest, most egregious cases of soring. As a result, a very small percentage of documented cases of soring actually become the subject of USDA enforcement action. Furthermore, the informed judgment of APHIS VMOs suggests that an even larger number of horses are sored, but escape detection. Finally, at present, the number of cases being pursued by the Department of Agriculture's Office of General Counsel has dramatically dropped—without explanation.

In recent years, due to funding restrictions APHIS attendance at Walking and Racking horse shows has been at an all time low. Nevertheless, the presence of APHIS VMOs at horse shows and sales makes a big difference in detecting and deterring soring abuses. Enforcement data from at least the last five show seasons, for example, demonstrates consistently that when VMOs are present, DQPs do a better job. Disqualification rates at shows attended by VMOs are regularly two to three times as high as the rates at shows inspected by DQPs alone. This indicates clearly that DQPs are more thorough and accurate, and adhere more closely to the inspection standards required by Horse Protection Act regulations when VMOs are present. Furthermore, the presence of VMOs is a powerful deterrent: On many reported occasions, exhibitors have withdrawn their horses from shows when VMOs appear on the show grounds unannounced.

During the past few years, certain factions of the Walking Horse industry have promoted the concept of "self-regulation" under the Act, with the intent of restricting USDA's enforcement role in general. In this regard, AHPA would like to call the Subcommittee's attention to a Strategic Plan published in 1997 by USDA which, in fact, does call for a cooperative effort between the Department and horse industry organizations to improve enforcement of the Act and eliminate soring. However, it also confirms USDA's legal mandate to enforce the Act, and calls for a number of reforms, including more consistent inspection procedures, uniform rules and penalties among the HIOs, tighter conflict-of-interest prohibitions, and more funding for APHIS inspections at horse shows. It does not, in any way, call for industry self-regulation which, in and of itself, is contrary to the Act.

In addition, at least one of the HIOs, the National Horse Show Commission, has historically been antagonistic to USDA's enforcement efforts. For example, during the 1990s the Commission collected a mandatory fee of \$1 per show per exhibitor per day to help support the industry's Show Horse Support Fund, a lobbying and legal defense fund. In our view, it is highly unusual and a conflict of interest for an organization—that exists to administer a DQP program so that show manage-

ment can fulfill its responsibilities under the Act—to be the instrument by which money is collected to fund industry efforts to oppose USDA enforcement. This same HIO continues a misleading effort to convince members of Congress to include language in the appropriations bill to direct APHIS to abandon its longstanding, established, and judicially affirmed practice of finding a horse to be sore if it shows a repeated, consistent pain reaction in response to digital palpation. Contrary to information that the Subcommittee may have received, an evaluation of a horse's movement and general appearance are always part of a soring examination (see 9 C.F.R. Sec. 11.21). However, gait impairments or general signs of discomfort are not necessary elements of a finding that a horse is sore. Furthermore, despite repeated assertions by the Commission, the American Association of Equine Practitioners has never adopted or endorsed the concept that a horse may be found sore only if it exhibits signs or symptoms in addition to a repeated, consistent pain reaction in response to digital palpation.

Enforcement experience under the Act has shown that USDA presence at horse shows and sales is the best and most effective way to fight soring horses. In order for APHIS personnel to do the best job possible enforcing the Horse Protection Act, as mandated by Congress, their presence at horse shows must be expanded. For these reasons, AHPA requests that the Subcommittee recommend a \$500,000 Horse Protection Act program appropriation for fiscal year 2002, and resist any attempt to insert language which would limit APHIS's enforcement role, including but not limited to a prohibition of relying on digital palpations as the primary diagnostic test to determine whether a horse is sore.

Thank you for considering the Associations' views. We would be pleased to answer any questions you or your staff may have.

PREPARED STATEMENT OF THE AMERICAN INDIAN HIGHER EDUCATION CONSORTIUM

Mr. Chairman and Members of the Subcommittee, on behalf of the American Indian Higher Education Consortium (AIHEC) and the 30 Tribal Colleges that comprise the 1994 Land grant Institutions, we thank you for this opportunity to share our funding requests for fiscal year 2002.

This statement covers two areas: a) it provides a brief background on the Tribal Colleges, and b) it outlines the 1994 Tribal College Land Grant Institutions' ambitious plan through our authorized land grant programs and the RCAP program to fulfill the agricultural potential of American Indian communities and to ensure that American Indians have the skills needed to maximize the economic development potential of our resources. Before providing this information, immediately following is a summary of our fiscal year 2002 requests.

SUMMARY OF REQUESTS

We respectfully recommend the following funding levels for fiscal year 2002 for our on-going land grant programs. Specifically, we request: \$5 million for the 1994 institutions' extension grants program; \$12 million for the Native American endowment fund; \$3 million for the higher education equity grants; and \$3 million for the 1994 institutions' research program.

In addition, we request \$5 million be set aside out of the Native American—Rural Community Advancement Program, for the 1994 Tribal College Land Grant Institutions to address the critical facilities and infrastructure needs at the colleges that impede our ability to participate fully as land grant partners.

BACKGROUND ON TRIBAL COLLEGES

Today, almost 140 years after enactment of the first land grant legislation, Tribal Colleges, more than any other institutions, truly exemplify the original intent of the land grant legislation. The first Morrill Act was enacted in 1862 specifically to bring education to the people and to serve their fundamental needs. The Tribal Colleges fit this definition well, as they are community-based institutions.

The Tribal College Movement was launched in 1968 with the establishment of Navajo Community College, now Diné College, in Tsaile, Arizona. A succession of Tribal Colleges soon followed, primarily in the Northern Plains region. In 1972, the first six tribally controlled colleges established the American Indian Higher Education Consortium to provide a support network for member institutions. Today, AIHEC represents 32 Tribal Colleges and Universities located in 12 states, begun specifically to serve the higher education needs of American Indian students. Collectively, they serve American Indian students from over 250 federally recognized tribes.

Tribal Colleges offer primarily two-year degrees, although in recent years some institutions have begun to offer baccalaureate and graduate-level degrees. The vast majority of the Tribal Colleges are fully accredited by independent, regional accreditation agencies.¹ Tribal Colleges serve as community centers, providing libraries, tribal archives, career centers, economic development and business centers, public meeting places, and child care centers. Despite our many obligations, functions, and notable achievements, Tribal Colleges remain the most poorly funded institutions of higher education in this country. Most of the 1994 Institutions are located on Federal trust territory; states have no obligation and in most cases, do not fund the Tribal Colleges. In fact, most states do not even fund our institutions for the non-Indian state resident students who attend our colleges despite the fact that non-Indian enrollment at the Tribal Colleges averages 20 percent.

Today, one in five American Indians live on reservations. As a result of two hundred years of Federal Indian policy—including policies of termination, assimilation and relocation—many reservation residents live in abject poverty comparable to poverty found in Third World nations. Through the efforts of Tribal Colleges, American Indian communities receiving services they need to reestablish themselves as responsible, productive, and self-reliant citizens. It would be tragic not to expand the modest investment in, and capitalize on, the human resources that will help open new avenues of economic development, specifically through enhancing the Tribal Colleges land grant programs, and adequate access to information technology.

1994 LAND GRANT PROGRAMS-AMBITIOUS EFFORTS TO REACH ECONOMIC DEVELOPMENT POTENTIAL

Tragically, due to lack of expertise and training, millions of acres on our reservations lie fallow, under-used, or have been developed through methods that render the resources non-renewable. The Equity in Educational Land Grant Status Act of 1994 is our hope for turning this situation around. Our current land grant programs are modest, yet vitally important to us. It is essential that American Indians learn more about new and evolving technologies for managing our lands. We are committed to becoming, as we were when your forefathers came to this land centuries ago, productive contributors to the agricultural base of the nation and the world.

Extension Program.—As 1994 Land Grant Institutions enter into partnerships with 1862 Institutions through extension projects, recent years show impressive efforts to address economic development through land use. Our extension program illustrates an ideal combination of Federal resources and Tribal college-state institution expertise, with the overall impact being far greater than the sum of its parts. These programs have grown substantially in idea and scope since they were initially implemented in fiscal year 1996. The current single year competitive grants for what have developed into flourishing multiyear projects is no longer an effective or efficient way to administer these vital programs. A mechanism for multiyear funding needs to be explored to give these programs financial stability. Some examples of the innovative programs that are funded through annual competitively awarded grants include:

- United Tribes Technical College and North Dakota State University Extension Service are collaborating to provide diabetes prevention education to Native Americans through nutrition education. Diabetes and its complications have spread epidemically throughout Indian Country. Through nutrition, health, and wellness education programs, which are culturally appropriate and community supported, program participants will have a greater understanding of their role in how to control and even prevent this disease.
- Northwest Indian College in conjunction with Washington State University has launched a tribal grants program aimed at increasing the capacity to address issues such as natural resources restoration and utilization, tribal agricultural projects, air and water quality, food and nutrition, and projects focused on gaining tribal youth participation. The program works with individuals and leaders of Washington and Idaho tribes and will serve the American Indian families, tribal economics, and whole communities. It will also expand to develop ties with the University of Idaho, University of Alaska, and the Oregon State University extension programs.

¹The Tribal Colleges and Universities are accredited by regional accreditation agencies and must undergo stringent performance review on a periodic basis. The higher education division of the respective regional accreditation agency accredits twenty-seven of the TCUs. Two new TCUs are at the Pre-candidate stage as they complete work to attain Candidate status; one TCU is at Candidate status. Two TCUs are accredited as "Vocational/Adult Schools by the "schools" division of the respective regional accreditation agency.

In fiscal year 2001, the 1994 institutions were awarded \$3,280,000 for extension grants. Additional funding is needed to supplement these programs designed to address the inadequate extension services provided on reservations by the states. It is important to note that this program is specifically designed to complement and build upon the Indian Reservation Extension Agent program and is not duplicative of ongoing extension activities.

For the reasons outlined above, we request Congress support this vital program by appropriating funding at the authorized level of \$5 million and include report language that would open the door to multiyear funding to encourage the growth and further success of these essential programs.

Native American Endowment Fund.—The endowment installments paid into the 1994 Tribal College Land Grants Institutions account remain with the U.S. Treasury only the interest is distributed to our colleges. It is important to note that these funds are not scored as current budget outlay or authority. The latest annual interest payment distributed among all 30 of the 1994 Land Grant Institutions totaled \$1,141,821.

Just as other land grant institutions historically received large grants of land or endowments in lieu of land, this sum assists 1994 Land Grant Institutions in establishing and strengthening our academic programs in such areas as curricula development, faculty preparation, instruction delivery, and to address critical infrastructure issues. As earlier stated, Tribal Colleges often serve as primary community centers. Although conditions at some have improved substantially, many of the colleges still operate under deplorable conditions. In order for the 1994 Institutions to become full partners in this nation's great land grant system, we need and deserve the facilities and infrastructure necessary to engage in education and research programs vital to the future health and well-being of our reservation communities. We respectfully request Congress build upon this much-needed base fund by increasing the fiscal year 2002 endowment fund payment to \$12 million.

1994 Institutions' Educational Equity Grant Program.—Closely linked with the endowment fund, this program has provided almost \$52,000 per 1994 Institution to assist in academic programs. Through the modest appropriations made available since fiscal year 1996, the Tribal Colleges have been able to begin to support vital courses and planning activities specifically targeted to meet the unique needs of our respective reservations. Some examples include:

- Sisseton Wahpeton Community College in Sisseton, South Dakota, has leveraged the equity grant funds with funding from the 1994 Institutions' endowment program to remodel the college kitchen for the development of a food service operation/food safety laboratory and curriculum. The goal of the program is to prepare students to run a modern food service operation including receiving, storing, preparing, cooking, holding, and serving foods. Attention to food safety, including prevention of food borne illness, is a top priority of the program. This project is designed to work in cooperation with the Sisseton Wahpeton Sioux Tribe Indian Health Hospital.
- Fort Peck Community College in Poplar, Montana, is building on its delivery system for instructional programs in food and agricultural sciences designed to meet the technological and social demands of modern living in rural Montana. Through collaboration with current USDA programs and agencies, Fort Peck Community College is focusing on the production, marketing, and distribution of locally produced agricultural commodities; enhanced rural development using distance education technology; and family and consumer sciences through Native customs, values, and traditions.

Other Tribal Colleges have started courses and programs in natural resource management, environmental sciences, horticulture, forestry, nutrition, and buffalo production and management. We respectfully request the Subcommittee expand this program by increasing the funding to \$3 million, to allow the colleges to build upon the courses and activities that the initial funding launched.

1994 Research Program.—We are requesting increased funding for our research program, which was authorized in the Agriculture Research, Extension, and Education Reform Act of 1998, at "such sums as necessary." We recognize the budget constraints that Congress is working under. However, we feel the current \$1 million is simply not adequate, with 30 institutions competing for these research dollars. This research program is vital to ensuring that Tribal Colleges finally become full partners in the nation's land grant system. Many of our institutions are currently conducting agriculture based applied research, yet finding the resources to conduct this research to meet their communities' needs is a constant challenge. This research authority opens the door to new funding opportunities to maintain and expand the research projects begun at the 1994 Institutions. The following is a prime example of the first projects to be funded under this new program.

—Turtle Mountain Community College in Belcourt, ND, in partnership with North Dakota State University, has launched a project to assess the risk of mosquito-borne Western equine encephalomyelitis (WEE) infection to horses and humans on the Turtle Mountain Chippewa Reservation (TMCR). Through collection and examination of both adult and larvae vector mosquitoes from throughout the reservation, this research will determine the spatial distribution and the proportion of WEE vector species on the TMCR that is infected with the virus. The results will be published in the *Journal of Medical Entomology*.

Other projects include soil and water quality projects, amphibian propagation, pesticide and wildlife research, range cattle species enhancement, and native plant preservation for medicinal and economic purposes. We urge the subcommittee to fund this program at \$3 million to enable our institutions to develop and strengthen their research potential.

Rural Community Advancement Program (RCAP).—In fiscal year 2001, \$24 million of the RCAP funds were appropriated for loans and grants to benefit Federally recognized Native American Tribes. Report language declared that the conference committee expected \$4 million be made available for community facility grants for Tribal College improvements. As stated earlier, the facilities at many the 1994 Land Grant Institutions are in desperate need of repair and in many cases replacement. We urge the Subcommittee to designate \$5 million of the Native American RCAP funds to address the critical need for improving the facilities at the 30 Tribal College Land Grant Institutions. Additionally, we respectfully request report language directing the Department of Agriculture to set aside \$5 million of this RCAP program funds for each of the next five fiscal years to allow our institutions the means to solidly address our facilities needs.

CONCLUSION

The 1994 Land Grant Institutions have proven to be efficient and effective tools for bringing education opportunities to American Indians and hope for self-sufficiency to some of this nation's poorest regions. The modest Federal investment in the Tribal Colleges has already paid great dividends in terms of employment, education, and economic development, and continuation of this investment makes sound moral and fiscal sense. American Indian reservation communities are second to none in their need for land grant programs and no institutions better exemplify the original intent of the land grant concept than the Tribal College Land Grant Institutions.

We appreciate your long-standing support of the Tribal Colleges and Universities and are grateful for your commitment to making our communities self-sufficient. We look forward to continuing our partnership with you, the U.S. Department of Agriculture, and the other members of the nation's land grant system—a partnership that will bring equal educational, agricultural, and economic opportunities to Indian Country.

Thank you for this opportunity to present our funding requests before this Subcommittee. We respectfully request your continued support and full consideration of our fiscal year 2002 appropriations requests.

PREPARED STATEMENT OF THE AMERICAN PHYTOPATHOLOGICAL SOCIETY

The American Phytopathological Society (APS) appreciates the opportunity to provide the Subcommittee with our recommendations for fiscal year 2002 appropriations for essential research programs administered by the U.S. Department of Agriculture (USDA). The APS represents more than 5,000 scientists and practitioners of plant pathology. The APS promotes the health of plants and their products in sustainable agricultural, landscape, and forest ecosystems through environmentally sound and cost-effective approaches to assure a safe, abundant, and reliable supply of food, feed, and fiber.

For the fiscal year 2002 agricultural appropriations bill, our top priorities are to increase funding for the USDA National Research Initiative (NRI) by 15 percent and, more specifically, to increase funding by \$5 million for microbial genomics, especially genomics of microbial pathogens, within the NRI and within the Agricultural Research Service (ARS). The NRI provides critical support to individual investigators for basic, fundamental research. In addition to our top priorities, we urge the Subcommittee to maintain the \$120 million in funding for the Initiative for Future Agriculture and Food Systems (IFAFS) as the IFAFS program provides support for microbial genomics as well. The IFAFS focuses on providing support to multi-institutional, multidisciplinary research. The NRI and the USDA microbial genomics programs are essential to plant disease management in the future.

The NRI has been the primary source of Federal funds awarded competitively for research on plant diseases and their management since its formation in 1991 as the flagship competitive grants program of the USDA. Within the USDA, the NRI is particularly valuable and unique as it supports research focused on the fundamental understanding of plant diseases that serves as the foundation for applied research for plant disease management. The ability of the NRI to support this fundamental work is in jeopardy as the costs of modern-day research in the biological sciences has skyrocketed in recent years and funding for the NRI has not kept pace with these costs. While funding for research has increased significantly over the past 10 years and in some cases has doubled during that period, funding for the NRI has remained essentially flat and, for fiscal year 2001, funding was reduced by \$14 million, with much of this decrease occurring in the plant sciences. A report released by the National Academy of Sciences in 2000 again recommends that funding for the NRI be increased to the level authorized in 1991, which is five times its current level of \$106 million. Because of the reduced funding for plant sciences, the NRI was unable to support critical genomics research.

The NRI has supported many significant scientific and technical breakthroughs. Some of the accomplishments funded by the NRI include:

- The first cloning of a plant gene responsible for recognition and rejection of a microbial plant pathogen by the plant and now known to be one of a family of genes with counterparts responsible for recognition and rejection of infectious microbial agents by certain human and animal tissues;
- Identification of the harpin protein responsible for a generic resistance response in plants and approved in 2001 by the EPA as a natural plant-pathogen product now being sold under the trade name “Messenger”; and
- Discovery of a gene expressed uniquely in roots and responsible for the widespread susceptibility of plants to root knot nematodes that is now providing us with an entirely new method of developing crop plants with genetic resistance to these pests.

In spite of these and other accomplishments, we are deeply concerned that because of flat funding, our discipline, so critical to assuring a safe and secure food supply, is being left behind both by the fast-pace of change in agriculture and the revolution in the biological sciences. New plant disease problems continue to emerge while the older problems continue to threaten the efficiency and productivity of American farms or keep our farmers locked into the use of pesticides.

Genomics has opened entirely new vistas for improvements in human, animal, and plant health. Plant pathology is poised along with our contemporaries in the medical and veterinary fields to take advantage of the new information on sequences of genomes. However, still missing in this explosion of information on genome sequences is information on the sequences of genomes of our most important plant pathogens. Of some 100 microbial genomes (other than viruses) that have been sequenced now, only one plant pathogen, a bacterial pathogen of citrus, has been completely sequenced, and this work was done in Brazil. Because of the small size of most microbial genomes, sequencing can be done inexpensively and quickly. With \$5 million devoted to the sequencing of microbial genomes and, particularly, to plant pathogens, we could begin to revolutionize plant pathology. Once we have the sequences of the most important plant pathogens, it will advance significantly our efforts to discern the function of the genes (i.e., functional genomics).

The availability of information on both genome sequences and the function of genes for a select and representative list of plant pathogens would open entirely new approaches to understanding, managing, and even predicting plant disease outbreaks and epidemics just as is now happening for medicine. Such information can also improve diagnostics in cases where phytosanitary laws are used as trade barriers and help authorities track down any bioterrorist release of a notorious plant pathogen. The APS is in the process now of prioritizing the plant pathogens for which sequences are needed. Our goal is to select those pathogens that would be representative of all plant pathogens from a practical and scientific standpoint.

We recognize that the National Science Foundation, the Department of Energy, and the National Institutes of Health are investing in microbial genomics. We appreciate, greatly, the support from these agencies. However, the focus of the microbial programs in the other agencies is not on agriculturally important plant pathogens. We believe that the USDA can and should play a leading role in microbial genomics, especially as it relates to plant pathogens.

We, strongly, urge you to include \$5 million for microbial genomics and a 15 percent increase for the NRI in the fiscal year 2002 agricultural appropriations bill. These programs will assist in our effort to maintain healthy plants so that we have a safe and secure food supply.

Thank you for this opportunity to present our views.

PREPARED STATEMENT OF THE AMERICAN RIVERS

American Rivers is joined by over 500 local, regional and national conservation organizations¹ from all 50 states in calling for \$325 million in funding for the Environmental Quality Incentives Program and in supporting an expansion two important conservation programs administered by the U.S. Department of Agriculture. Specifically, we support increasing the acreage limits of the Conservation Reserve Program to 40 million acres, and eliminating the acreage limit in the Wetlands Reserve Program and enrolling 250,000 acres yearly, beginning in fiscal year 2002.

The Environmental Quality Incentives Program (EQIP) is a voluntary program that helps farmers and ranchers facing threats to soil, water, and other natural resources develop and implement successful conservation practices. The Conservation Reserve Program is a voluntary program that partners the U.S. Department of Agriculture (USDA) with farmers and ranchers, helps protect millions of acres of the nation's agricultural lands from erosion while increasing wildlife habitat and protecting ground and surface waters. The Wetlands Reserve Program is a voluntary program that protects and restores the nation's wetlands, bring tangible economic and environmental benefits to rural communities.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

The health of America's agricultural lands is fundamental to the nation's well being. These lands support an industry of great value, provide important habitat for a large portion of the nation's birds, fish, and wildlife, and significantly affect river health. The Environmental Quality Incentives Program (EQIP) is voluntary program that helps farmers and ranchers facing threats to soil, water, and other natural resources develop and implement successful conservation practices.

EQIP focuses largely on lands that face significant natural resource problems or are particularly environmentally sensitive. As these priority areas are identified locally, conservation districts convene working groups of key Federal, State, and local agency representatives to propose conservation plans for these areas. Communities play a significant role in the planning process, ensuring that the plans fully reflect local needs and priorities. Once Natural Resource Conservation Service (NRCS) representatives select conservation plans, EQIP staff provide technical, educational, and financial assistance to farmers or ranchers to help them implement management plans for nutrients, manure, pests, irrigation, water, and wildlife habitat practices. Farmers may also apply for 5- to 10-year EQIP contracts that provide financial incentives and cost-sharing assistance to implement conservation practices outlined in the conservation plan required for use of most agricultural lands.

CONSERVATION RESERVE PROGRAM

With the dust bowl of the 1930's, the United States learned the hard way about the destructiveness of agricultural erosion. In the years since, the nation has also come to recognize the damage caused by runoff that carries pollutants into river, lakes, and other bodies of water.

One of the Federal government's largest and most effective environmental improvement programs grew out of concern about the impacts of agricultural soil erosion and polluted runoff. The Conservation Reserve Program (CRP), a voluntary program that partners the USDA with farmers and ranchers, helps protect millions of acres of the nation's agricultural lands from erosion while increasing wildlife habitat and protecting ground and surface waters. The program provides incentives for farmers and ranchers to voluntarily implement long-term conservation practices on erodible and environmentally sensitive lands in return for annual rental payments and cost-share assistance.

The benefits of CRP are clear. The total acreage of new wildlife habitat created by the program is twice that of the National Wildlife Refuge System and all state-owned wildlife areas in the contiguous 48 states combined. According to NRCS, each acre enrolled in CRP reduced topsoil erosion by an average of 19 tons per year, improving water quality in lakes, rivers and other water bodies. USDA estimates show that, over the life of the initial 36.4 million-acre enrollment, CRP will have resulted in a \$2.1-\$6.3 billion increase in net farm income, \$3.3 billion in future timber resources, and up to \$4.2 billion in surface water quality improvements. The Fish and Wildlife Service estimates that the wildlife benefits will total \$1.4 billion for water

¹ These groups have endorsed "The River Budget 2002", a report of national funding priorities for local river conservation. A list of groups endorsing the River Budget can be viewed at www.americanrivers.org.

fowl hunting and \$4.1 billion for non-consumptive wildlife benefits such as photography and wildlife watching.

WETLANDS RESERVE PROGRAM

Wetlands are a critical component of many ecosystems, providing myriad of benefits for people and wildlife. They filter sediments and pollutants from runoff water, protect water quality, provide critical habitat for millions of birds and other wildlife, absorb water to reduce floods, and improve soil moisture for vegetation. The economic benefits of healthy wetlands are many, including improving wildlife watching and photography. In 1991, almost 109 million people spent \$59 billion on fishing, hunting, and wildlife watching and photography.

The Wetlands Reserve Program (WRP) is a volunteer program aimed at protecting and restoring the nation's wetlands, bringing tangible economic and environmental benefits to rural communities, recreationists, landowners and family farmers nationwide. Participating landowners receive technical and financial assistance from the NRCS to restore wetlands, including marginal agricultural land. In exchange for selling a conservation easement or entering into a cost-share restoration agreement, landowners receive all or a percentage of restoration costs and/or an annual payment. The program currently has more than 5,230 contracts in 48 states. Participating landowners retain control over access to their lands and may lease them for undeveloped recreational activities and other uses that are fully consistent with wetland protection and enhancement. Wetlands restored by WRP also help reduce the "dead zone" in the Gulf of Mexico by intercepting polluted runoff from farms and city streets along the Mississippi River.

FARM CONSERVATION PROGRAMS: PROTECTING AMERICA'S WATER QUALITY

Water quality is an issue that touches many lives. Each year, sediment and nutrients are inadvertently washed off the landscape, into feeder streams, and ultimately into our nation's rivers—reducing farm income, increasing channel maintenance costs, threatening drinking water supplies and filling side channels used by river wildlife. The costs associated with sediment and nutrient loss are enormous. On the Mississippi River, for example, farmers annually lose more than \$300 million in applied nitrogen, dredging costs annually top \$100 million, and habitat preservation efforts on the Upper Mississippi River will soon reach \$33 million a year.

Fertilizers, animal waste, and inadequately treated human waste have contributed to high levels of nutrients—nitrogen and phosphorus. Once they are released into the Mississippi, these nutrients ignite a chemical chain reaction that reduces the amount of oxygen dissolved in the water, limiting the types of river species that can survive. They also contribute to a "dead zone" in the Gulf of Mexico—a 7,000 square-mile zone where dissolved oxygen is simply too low to support marine life. In rare cases, nutrients like nitrogen and bacteria from human and animal waste can contaminate well-water and other drinking water supplies, affecting human health.

Like nitrogen and phosphorous, sediment continues to enter the Upper Mississippi River at unsustainable levels—that is, sediment enters the Mississippi at a rate that exceeds the river's ability to move sediment downstream. In addition to filling side channels, burying mussel beds and blocking the sunlight needed by aquatic plants, this imbalance increases the cost of removing sediment from the navigation channel—a Federal responsibility which now costs more than \$100 million annually.

Much of this sediment is the result of historic farm practices that have left large sediment deposits in small feeder streams. While great strides have been made in improving agriculture practices to reduce erosion and run-off, limited resources for these efforts limits the scope and effectiveness of conservation efforts by farmers.

Although many landowners—both in the Upper Mississippi River basin and across the country—are anxious to enroll their land into easement programs, create buffers of trees and grasses along streams, or adopt soil-conserving tillage practices, demand for Federal technical assistance far exceeds supply. Funding for conservation programs, outreach and education, and research and monitoring must be increased to meet the demand for programs like EQIP and CRP.

American Rivers is strongly supportive of these successful programs and the tremendous efforts of the American farmer to protect water quality. We strongly urge you to appropriate \$325 million to the U.S. Department of Agriculture for the Environmental Quality Incentives Program and to provide sufficient funding to supporting an expansion of the Conservation Reserve Program acreage limits to 40 million acres and the Wetlands Reserve Program to 250,000 acres in fiscal year 2002.

PREPARED STATEMENT OF THE AMERICAN SEED TRADE ASSOCIATION, INC.

Mr. Chairman and members of the Subcommittee, thank you for this opportunity to provide you with our views on the fiscal year 2002 agricultural appropriations bill. The American Seed Trade Association (ASTA) appreciates greatly your leadership in supporting the USDA National Plant Germplasm System (NPGS). We, strongly, urge you to include a \$10 million increase for the NPGS in the fiscal year 2002 agricultural appropriations bill.

The ASTA, founded in 1883, is one of the oldest trade associations in the United States. With over 900 members, the ASTA is the premiere advocate for the seed industry and related interests. Our diverse membership consists of the leading companies that are developing, providing, supporting, and promoting new varieties that hold tremendous promise and opportunity for farmers and consumers everywhere.

Our request for a \$10 million increase for the NPGS is the number one appropriations issue and the number one legislative issue for ASTA. This increase will allow seed companies to meet the diverse challenges facing our customers. Support for significant increases to the NPGS goes well beyond industry; we, also, have the support of our customers and the scientific community. Earlier this month, the following organizations joined in our request for a \$10 million increase for the NPGS, the: Alaska Division of Agriculture; American Association of Botanical Gardens and Arboreta; American Malting Barley Association; American Nursery & Landscape Association; American Society for Horticultural Science; American Society of Agronomy; American Society of Plant Physiologists; American Soybean Association; American Sugar Cane League of the USA; Association of Official Seed Certifying Agencies; Beet Sugar Development Foundation; Busch Agricultural Resources, Inc.; Crop Science Society of America; Florida, Texas, and Hawaii Sugar Cane Growers National Association of State Universities & Land-Grant Colleges; National Association of Wheat Growers; National Barley Growers Association; National Barley Improvement Committee; National Campaign for Sustainable Agriculture; National Corn Growers Association; National Cotton Council; National Council for Science and the Environment; National Farmers Union; National Grain Sorghum Producers; National Sunflower Association Pickle Packers International, Inc.; Society of American Florists; Soil Science Society of America; Sonoma County Grape Growers Association; Southwest Peanut Growers Association; Turfgrass Breeders Association; USA Rice Federation; U.S. Beet Sugar Association, and The U.S. Rice Producers Association.

The Agricultural Research Service (ARS) has recognized the need for significant increases in funding for the NPGS, as well. The ARS requested an increase of \$20 million for fiscal year 2001 and again for fiscal year 2002. We are disappointed that the Administration's proposed budget failed to provide an increase for the NPGS and reduced funding for the Arctic germplasm collection in Palmer, Alaska.

As you know, narrow genetic bases can result in widespread crop losses. In 1970, Southern corn leaf blight cost farmers 15 percent of the corn crop; in the 1950s and early 1960s, about 70 percent of the wheat crop in the Pacific Northwest was wiped out by stripe rust; and the Irish potato famine of the 1840s was the result of the reliance on only a single variety of the potato. To prevent catastrophic losses, breeders must have open access to extensive, well-maintained, and well-documented genetic resources.

The NPGS germplasm collections underpin crop-breeding efforts throughout the U.S. Preservation of and filling gaps in the base collections is a unique Federal responsibility. The NPGS acquires germplasm; develops and documents information on the germplasm; preserves and distributes germplasm; and maintains quarantine facilities for testing imported germplasm for pests and pathogens before introduction in the U.S. The NPGS ensures that scientists and plant breeders have access to diverse germplasm to develop varieties that meet new and changing circumstances.

Preserving the genetic diversity of plants is essential to the future of agriculture as the genes to add new traits, such as tolerance to diseases and resistance to insects, are often present in wild relatives of the major crops. Most of the U.S. crops raised and used for food, fiber, ornamentals, and industrial feedstocks originated from outside of the U.S. Consequently, the plant breeding community is highly dependent upon germplasm from other countries, some of which is endangered. Once lost, the germplasm cannot be fully reconstructed.

Unless we have a wide diversity of genetic resources, there will be nothing available to improve plants or to prevent plants from becoming genetically susceptible to pests, pathogens, and abiotic stress. With sufficient genetic resources, we will have an abundant, safe, nutritious, and affordable supply of food and fiber that is produced in an environmentally friendly manner and that ensures a reasonable return for our farmers and livestock producers. American agriculture can provide as

well renewable resources for a wide range of everyday consumer products if diverse genetic resources are available and accessible to U.S. scientists and plant breeders.

To ensure that these genetic resources are accessible and that they remain available, the NPGS must obtain a significant increase in funding. In 1991, the NPGS reported that an annual budget of \$40 million would be required to remedy shortfalls in secure storage, backup, evaluation, and development of core germplasm collections. Today, funding for the NPGS remains below \$30 million. We recognize the tight budget constraints under which the Subcommittee must operate; however, the following outlines the precarious situation of the NPGS:

- Funding for the NPGS has declined significantly, in constant dollars, since 1992, jeopardizing vital germplasm;
- Lack of funding has resulted in decreased supplies of germplasm that limits distribution and impedes the progress of research and breeding programs;
- 93 percent of all clonally-propagated samples and 19 percent of all seed samples are not duplicated and are at high risk of catastrophic loss;
- No backup has been made for citrus and nearly all tropical fruit crops in the NPGS due to the lack of funds to develop effective storage methods;
- Without a significant infusion of funds, many of the clonally-propagated crops in the collection will remain at risk of catastrophic loss as long-term backup methods for these crops have not been developed;
- Internationally, destruction of natural habitats, limited gene bank capacity, inadequate management, and lack of consistent funding has left much of the world's germplasm at high risk of loss;
- Acquisition of endangered germplasm has slowed and may stop completely without an increase in funding;
- Due to funding constraints, the Plant Germplasm Quarantine Office established quotas for importing germplasm thereby restricting the amount of materials available to U.S. scientists and plant breeders;
- Funding is insufficient for the Quarantine Office to take full advantage of molecular diagnostic techniques;
- 99 percent of the germplasm accessions at Griffin, GA, and 68 percent of the accessions at Pullman, WA, have not been tested for viability within the past 10 years due to lack of funding;
- At least 30 percent of all NPGS accessions need to be regenerated during the next couple of years and with current funding it will take at least 9 years;
- 18 percent of NPGS accessions are unavailable for distribution primarily due to lack of funding; and
- Without an increase in funding, many NPGS sites will be unable to pay for utilities, general operations, and facility repairs.

To fulfill its mission to provide access to diverse genetic resources, the NPGS must have a balanced program that includes (1) acquisition of germplasm to fill gaps in the collections and to preserve endangered germplasm; (2) maintenance and preservation of germplasm with secure backups to prevent loss; (3) adequate documentation and characterization of the germplasm; (4) sufficient supplies of viable seeds to allow for distribution; and (5) quarantine facilities that make germplasm available in a timely manner. The steady decline in available funding has had an extremely negative impact on the ability of the NPGS to have a balanced program.

Inadequate funding is jeopardizing the security of the U.S. food and fiber system. Genetic diversity is the engine that drives plant breeding. Without new sources of genetic variation, plant breeders cannot make improvements. Without improvements, we will be unable to ensure the continued economic viability and security of our food and fiber system.

The NPGS is a fundamental, strategic resource that we cannot afford to jeopardize. Without a significant infusion of funds, the NPGS will not be able to ensure the preservation of important germplasm that is vital to our existence and prosperity. Our ability to provide breeders with the blueprints and genetic codes is necessary to ensure new, plentiful foods, fibers, consumer products, and drugs. If the NPGS is not funded at a sufficient level, biodiversity will be reduced and we could lose the very germplasm needed for a possible wonder drug or the cure for some dreaded disease. The NPGS is a good investment for taxpayers and for the American consumer.

We, strongly, urge you to provide an increase of \$10 million for the NPGS for fiscal year 2002. We recognize that this will be difficult and that there are many competing priorities for limited resources; however, we cannot afford to be complacent about the fundamental resources that underpin our future for food and fiber.

Thank you for the opportunity to present our views on the importance of the USDA National Plant Germplasm System. We look forward to working with you to

ensure that the NPGS is able to provide the germplasm necessary for U.S. agriculture to meet the demands and challenges of the 21st Century.

PREPARED STATEMENT OF THE AMERICAN SHEEP INDUSTRY ASSOCIATION

The American Sheep Industry Association (ASI) is a federation of state member associations representing the nearly 67,000 sheep producers in the United States. The sheep industry views numerous agencies and programs of the U.S. Department of Agriculture as important to lamb and wool production. Sheep industry priorities include rebuilding and strengthening our infrastructure, critical predator control activities, maintaining and expanding research capabilities and animal health efforts.

The rapid changes that have occurred in the domestic sheep industry and continue to take place put further emphasis on the importance of adequately funding the U.S. Department of Agriculture programs important to lamb and wool producers.

We appreciate this opportunity to comment on those portions of the USDA fiscal year 2002 budget.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The mission of APHIS, "to protect U.S. animal and plant resources from diseases and pests," is very important to the sheep industry of the nation.

Wildlife Services Wildlife Services

With well over one-quarter million sheep and lambs lost to predators each year, the Wildlife Services (WS) program of USDA-APHIS is vital to the economic survival of the sheep industry. The value of sheep and lambs lost to predators and predator control expenses are second only to feed costs for sheep production. Costs associated with depredation currently exceed our industry's veterinary, labor and transportation costs.

The American Sheep Industry Association strongly supports the President's salary increase recommendations of \$1.26 million for WS operations and \$454,000 for methods development. For a number of years, salary cost increases have been mandated without offsetting appropriations. In Fiscal Year 2000 for example, Congress mandated \$849,000 for pay cost increases. These funds had to come out of the operations budget, meaning less available money for the field work.

Method development has also been overlooked for a number of years. Since fiscal year 1989, the NWRC operations budget increased from \$2.02 million to \$2.89 million in fiscal year 2000. During the same period of time, method development has been given a number of new Congressional directives including aquaculture research, wildlife disease research, ungulate research and the reopening of three field offices in Hawaii, Washington and Mississippi. To add to the budget strain of NWRC operations is a new multi-million dollar research facility with no monies to staff and maintain the building. Maintenance cost for this facility now approach \$1.5 million annually. ASI requests that the current method development budget be increased an additional \$6.0 million to \$17.46 million. We also request that of this \$6.0 million, \$2.5 million go to staffing, operating and maintaining existing facilities, \$1.0 million for bird, rodent and ungulate research, and \$2.5 million for alternative capture systems and canine research.

Aerial hunting is one of Wildlife Service's most efficient and cost-effective core programs. It is used not only to protect livestock, wildlife and endangered species, but is a critical component of the Wildlife Services rabies control program. A lack of adequate funding for safety purposes was found to have contributed to a number of accidents experienced within the WS program in recent years. Following an independent review of the WS aerial program, recommendations were provided the Department to improve aerial safety. A December 2002 deadline was set by the Department to implement these recommendations. ASI requests \$2.9 million in additional funding be provided WS so the agency can complete the implementation of the safety recommendation.

Expanding wolf populations in Montana, Idaho, Wyoming, Minnesota, Wisconsin and Michigan continue to create increased demand for assistance in managing wolf depredation. While resources have been provided Montana, Idaho and Wyoming, \$750,000 in additional funding is still needed in Minnesota, Wisconsin and Michigan to manage a wolf population approaching 3,000 animals.

Wildlife Service's cooperative nature has made it the most cost effective and efficient program within federal government in the areas of wildlife management and public health and safety. Wildlife Services has over 2,000 cooperative agreements with agriculture, forestry groups, private industry, state game and fish depart-

ments, departments of health, schools, county and local governments and others to mitigate the damage and danger that the public's wildlife can inflict on private property and public health and safety. WS is one of the few federal programs that has been consistently at or above the 50:50 federal to cooperative funding ratios. In fiscal year 2000, \$36,434,699 in cooperator dollars went to Wildlife Services. The agency, however, only had \$21,275,873 in finding available at the field level in Fiscal Year 2000 to match the funding provided by WS cooperators. Another \$2.2 million is needed to meet increasing customer demand for the agency's services.

Wildlife Services must document its operations in order to conduct program analysis and comply with Federal reporting requirements. The agency's current information technology support system has become antiquated which could result in incomplete data collection and analysis. To update and maintain the information system, an additional \$700,000 is needed.

Scrapie

Adequate funding for scrapie eradication and other supportive efforts, such as the Voluntary Scrapie Flock Certification Program and the National Scrapie Slaughter Surveillance Study are of critical importance to the sheep industry, as well as all segments of the livestock industries. The national regulation for scrapie eradication to be issued by USDA in 2001 is supported with the Administration's budget request of \$18 million for fiscal year 2002 which is strongly supported by ASI. ASI appreciates this Subcommittee's efforts in recognizing the seriousness of this devastating disease and the real need for control and eradication. ASI and others have urged APHIS to step up its efforts in scrapie control/eradication through a more aggressive regulatory approach. APHIS has received published and received comments on both an ANPR and a Proposed Rule over the past three years; we expect the publication of a Final rule to begin eradicating scrapie through interstate movement restrictions soon. According to APHIS, an aggressively funded scrapie eradication effort will take seven to ten years and cost approximately \$100 million over the life of the program. As it has been with all disease eradication programs, scrapie eradication will take adequate funding in order to be successful. Through the successful section 201 trade action this past year, USDA/APHIS has received sufficient CCC funding to begin the eradication program and the surveillance study. At this critical point in time, it is important that funds be APPROPRIATED to conduct the "base program" activities such as hiring Veterinary field personnel so that the federal program will be implemented uniformly State to State and enforced properly. We therefore urge the subcommittee to support the Administration's request for an \$18 million increase for Scrapie eradication in appropriated funds.

AGRICULTURAL MARKETING SERVICE

Lamb Market Information and Price Discovery Systems

The sheep industry strongly supports the fiscal year 2002 budget for Market News of USDA-Agricultural Marketing Service. Furthermore ASI supports necessary increases in appropriations for the full implementation of the mandatory price reporting system for livestock.

FOREIGN AGRICULTURAL SERVICE (FAS)

The sheep industry participates in FAS programs such as the Market Access Program (MAP) and the Foreign Market Development Program. ASI strongly supports continued appropriations at the current level for these critical Foreign Agricultural Service programs. ASI is the cooperator for American wool and sheep pelts and has achieved solid success in increasing exports of domestic product. Exports of American wool have been increased dramatically with approximately 30 percent of U.S. production competing overseas.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

ASI urges increased appropriations for the range programs of the Soil Conservation Service to benefit the private range and pasture lands of the United States with conservation assistance. We support the budget item and recommend an increased level for the Grazing Lands Conservation Initiative, which ASI has worked with, along with other livestock and range management organizations, to address this important effort for rangelands in the U.S.

RESEARCH, EDUCATION AND ECONOMICS

As a result of the successful section 201 trade action, the sheep industry must become more competitive. We are also striving to be profitable and sustainable as

a user of and contributor to our natural resource base. Research, both basic and applied, and modern educational programming are essential if we are to succeed. We have been disappointed in the decline in resources USDA has been targeting toward sheep research and out-reach programs. With net increases in the animal systems category of the agriculture research budget, for example, sheep and wool research has either declined or remained static for the past several years. In order for the sheep industry to be more globally competitive in the future, we must invest in the discovery and adoption of new technologies for producing, processing and marketing lamb and wool. We urge the subcommittee to send a strong message to USDA supporting sheep research and education funding increases.

Agricultural Research Service

Emerging and Exotic Diseases and Pests of Plants and Animals—we request the subcommittee's support for the administration's allocation of \$6.782 million in this area. The animal disease portion should be substantial and is urgently needed to protect the U.S. livestock industry. ARS has planned for \$5 million of these funds to be directed toward BSE research. We agree that BSE is an extremely important disease issue globally and believe that research is needed to help keep the U.S. free of this devastating disease. With this in mind, we remind the subcommittee that scrapie is a TSE that is endemic in the U.S. and we recommend that a new or expanded research effort directed toward BSE be designed in such a manner that the research will assist with scrapie eradication needs. We also respectively remind the subcommittee that scientists in the animal disease research unit (ADRU), ARS, Pullman Washington, have made significant progress in the early diagnosis of TSEs, which is important in early recognition and eradication of TSEs. The programs of these scientists at ADRU should be enhanced and expanded to include, for instance, the development of rapid and accurate methods for strain typing of TSEs within the United States and world and to understand the basis of genetic resistance and susceptibility to these devastating diseases.

We urge your support to restore the \$300,000 used for collaborative research between ARS animal disease research unit in Pullman, Washington and the U.S. sheep experiment station in Dubois, Idaho concerning malignant catarrhal fever (MCF) research. These monies were established by congressional action in last year and have been successfully utilized to initiate research leading to control methods for this important disease of sheep and cattle. Health and disease management was one of the four focus areas included in the President's Section 201 relief decision. This additional funding will be key in helping us address two very important diseases.

Research into Johne's disease has received additional funding through ARS over the past several years, focusing on cattle. Johne's disease is also endemic in the U.S. sheep population and is not well understood as a sheep disease. The same food safety concerns exist in both sheep and cattle; other countries are also very concerned about Johne's in sheep.

We urge the subcommittee to send a strong message to ARS that Johne's disease in sheep should receive more attention at the National Animal Disease Research Center (NADC) with an emphasis on diagnostics.

Genetic resources are the underpinning for all livestock production systems and therefore have a great influence upon economic returns. To effectively address changing consumer demands, natural resource utilization and protection of animal biodiversity from economic changes as well as catastrophic events such as disease epidemics requires utilization and protection of the full breadth of animal genetic resources. To accomplish this a national system for the maintenance, characterization and utilization of animal genetic resources is important. We recommend that the subcommittee fund the national animal germplasm, program (NAGP) so that the NAGP can become fully functional and effective in collecting, storing and assessing animal genetic resources.

Economic Research Service

The mandatory price reporting line item in the Administration's budget includes retail price reporting which needs to include lamb as lamb is covered under mandatory reporting provisions.

RURAL DEVELOPMENT

The National Sheep Industry Improvement Center is critical to the industry and we fully support an appropriation of \$5 million for fiscal year 2002. The Center is providing \$14 million funds for loans in the sheep industry to rebuild and strengthen the infrastructure of the industry with loans made for wool, lamb and goat programs in 2000. Nearly one dozen loan applications are now in the review process

for approval. The Center also provided \$5 million for 23 grants for American Lamb product development, marketing, and promotion in 2000 and 2001 with projects beginning in every region of the United States to strengthen efforts with American Lamb. The Center is a premier vehicle of the U.S. sheep industry's adjustment plan therefore adequate funding is critical to the industry.

COOPERATIVE STATE RESEARCH EDUCATION AND EXTENSION SERVICE (CSREES)

Minor Use Animal Drugs is a "Special Research Grant" that has had great benefit to the U.S. sheep industry. The research under this category and the companion "NRSP-7" program through FDA/CVM has provided research information on therapeutic drugs that are needed for the approval process. Without this program—American sheep producers would not have effective products to keep their sheep healthy. We appreciate the Administration's request of \$549,000 for this program and we urge the subcommittee to recommend that it be funded at \$750,000 to more fully meet the needs of our rapidly changing industries.

Ongoing research in wool is critically important to the sheep industry. ASI supports continued funding of \$300,000 for fiscal year 2002 through the special grants program of the CSREES.

The industry greatly appreciates this opportunity to discuss these programs and appropriations important to the sheep industry.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR MICROBIOLOGY

The American Society for Microbiology (ASM), the largest single life science organization in the world, comprised of more than 42,000 members, appreciates the opportunity to provide written testimony on the fiscal year 2002 budget for the U.S. Department of Agriculture (USDA) research and education programs.

The ASM represents scientists who work in academic, medical, governmental and industrial institutions worldwide and are involved in research to improve human health and the environment. Microbiological research is directly related to agriculture involving foodborne diseases, bioterrorism, new and emerging plant and animal diseases, soil erosion and soil biology, agricultural biotechnology, and the development of new agricultural products and processes. The ASM is a member of the Coalition on Funding Agricultural Research Missions (CoFARM), which represents scientific societies and organizations involved in formulating research directions and needs for agricultural research.

The U.S. agricultural system is one of the most productive and efficient in the world, due in part to past investments in science. Agricultural research has led to many advances including biotechnology, which contribute to a more abundant, nutritious, efficient and environmentally friendly food supply, while at the same time reducing agriculture's reliance on chemical fertilizers, pesticides, and fungicides. USDA's research budget, however, has not grown commensurate with its record of achievement and broad and unique responsibilities to support science and technology in agriculture. According to the National Science Foundation's (NSF) Division of Science Resources Studies, agricultural research made up only 4 percent of all public funds devoted to basic research and only 2 percent of total R&D expenditures for fiscal year 2000. If the lowest cost food for the nation's consumers and agricultural exports are to continue to be successful policy for the United States, then it must be understood that continued, sustained Federal investment in agricultural research is necessary.

COOPERATIVE STATE RESEARCH, EDUCATION AND EXTENSION SERVICE

In 1989 the Board on Agriculture of the National Research Council (NRC) recommended that public investment through competitive research grants in agriculture, food, and the environment be made a national priority. To address this monumental task, Congress (1991) created the National Research Initiative Competitive Grants Program (NRI) in the hope of generating new knowledge and reinvigorating research in agriculture, food, and environmental science (National Research Initiative: a Vital Competitive Grants Program in Food, Fiber, and Natural Resources Research, NRC, 2000). The ASM strongly supports competitive peer reviewed research that is open to all the nation's scientists. However, the ASM is disappointed with the continued decline in merit-based research programs at the USDA, such as the NRI, whose budget was decreased by 11 percent for fiscal year 2001. ASM recommends that NRI be funded at the fiscal year 2000 level of \$119 million.

This funding will improve important research in agriculture including food safety and nutrition, plant, animal and microbial genomics, and emerging pest and disease management. In conjunction with other coalition groups like CoFARM, the ASM believes Federal support for agricultural research is essential to building the broad knowledge base needed to commercialize new and improved agricultural products and tools.

The ASM is pleased to see continued support for the Initiative for Future Agriculture and Food Systems (IFAFS). This competitive grants program differs from the NRI in that it provides mandatory funding for research and extension projects that is multi-disciplinary and applied in scope and targets critical agriculture issues.

AGRICULTURAL RESEARCH SERVICE

U.S. agriculture is experiencing severe problems caused by new and reemerging infectious diseases in plants and animals, a threat that requires immediate attention. The imminent threats of Bovine Spongiform Encephalopathy (BSE) and foot-and-mouth disease in animals and plum pox in plants are examples requiring new and extensive research. Cost effective and real-time monitoring may now be feasible, allowing for more immediate diagnosis. Funding and enhancing agricultural research is the surest way to prevent and control infectious and zoonotic diseases afflicting livestock and aquaculture today and mitigating the threats of tomorrow.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

The Animal and Plant Health Inspection Service (APHIS) has the critical role of policing the U.S. infrastructure that is in place to prevent, diagnose and respond to a disease introduction. The U.S. needs a comprehensive biosafety system to prevent foreign animal and plant diseases from entering the domestic agriculture system. This sentinel network requires new, accurate and cost effective diagnostic tools and updated information technology.

INFECTIOUS DISEASES IN PLANTS AND ANIMALS

It is important to recognize a growing threat to the U.S. agricultural system that requires immediate attention—the threat of new and emerging infectious diseases. Like the human population, U.S. agriculture is also experiencing severe problems caused by new and emerging infectious diseases in plants and animals. Changes in agricultural practices, population growth, climate, microbial evolution, animal migration, and international trade and travel are all factors in introducing new plant and animal diseases into the U.S. agriculture system. The lack of knowledge to manage effectively and control new and reemerging infectious diseases often leads to very serious consequences from lost productivity from quarantines to embargoes, and the destruction of plants and animals to control the spread of diseases. For example, citrus canker has cost millions in tree destruction in Florida. Research, monitoring, surveillance, and new sources of resistant genetic material, including the use of biotechnology, may enable continued growth of citrus trees commercially and by homeowners. New technologies, e.g. the polymerase chain reaction, now enables us to detect minute quantities of etiological agents, including those previously ascribed to physiological problems in plants, such as the class of viruses known as luteoviruses.

FOOD SAFETY

Foodborne illness continues to pose a major public health problem in the U.S. The ASM recommends that Congress provide additional funding to USDA to expand food safety research. In a recent report it was estimated foodborne diseases cost the U.S. \$8 billion in medical costs and lost productivity and an estimated 76 million illnesses a year (CDC). Further reducing foodborne illness requires not only preventing contamination through improved processing and inspection, but also educating consumers to avoid unsafe consumption choices and to prepare food safely to avoid cross-contamination. The 1997 Food Safety Initiative recognizes this with funding for a national media campaign to encourage safe food handling.

Microorganisms continue to adapt to their changing environments and begin to “out smart” current techniques to control their presence. Many foodborne microbes have developed resistance to conventional food preservation and disinfection techniques and continue to proliferate. It is also important to note that the diversity of microorganisms affecting food safety changes with time, processing techniques, location and other factors. To illustrate the growing problem, one need only examine the number of USDA and FDA regulated food product recalls because of harmful bac-

teria. In 1995 the USDA and FDA recalled 265 products due to microbial hazards; in 1999, the number of recalls rose to 337.

MICROBIAL GENOMICS

Microbes are involved in all aspects of agriculture—from beneficial uses of microbes in food (i.e., yogurt, cheese, and bread) to pest controls to the spread of disease in plants and animals and the contamination of the food supply. Studying the genomes of agricultural microbes could lead to the development of new technologies to provide improved foods and better pest control to protect the nation's crops, to reduce the incidence of plant and animal disease, and to ensure a safer food supply. Thus, ASM is highly supportive of microbial genomics through the NRI and IFAFS programs. Coordination and cooperation with the National Science Foundation in this area is particularly promising.

BIOBASED PRODUCTS

The ASM continues to support the promising research to accelerate the conversion of agricultural materials and byproducts into biofuels, such as soybean oil conversion into (bio)diesel fuel. Such scientific advancements in biobased product research have the added benefit of enhancing farm income, strengthening U.S. energy security, rural revitalization, and environmental stewardship. Current scientific estimates suggest that energy production from biofuels could generate up to 10 percent to 15 percent of the nation's energy needs. ASM believes agriculture can play a positive role in achieving U.S. energy security and encourages Congress to consider the benefit biofuels represents to the entire agriculture and consumer community.

GLOBAL COMPETITIVENESS

Recent adoption of the Uruguay Round, which confines the use of import restrictions on agriculture products of the General Agreement on Tariffs and Trade (GATT) and the North American Free Trade Agreement (NAFTA) pose great challenges to American agriculture. While domestic advances in agricultural technology, including biotechnology, have achieved great strides in food production, safety, and nutrition, they will also provide similar advances to other nations. Agricultural competitiveness in the global economy depends upon the ability of producers and processors to make measurable production and quality gains while providing desirable products that are reliable and safe. Agricultural research in food safety, production systems, and biotechnology will be key instruments in maintaining America's agricultural competitiveness, while providing food security.

The ASM encourages Congress give high priority to agricultural research for fiscal year 2002. Many of today's scientific achievements leading to the development of biotechnology, genetically modified foods, improved crops and plant-based products and an improved environment have their roots in the basic research conducted by the USDA. The future holds several challenges from the monitoring of the ecological impact of transgenic plants to research in plant and animal diseases that is requisite to combating agricultural bioterrorism. We urge the Administration and Congress to assist the USDA to address these issues.

The ASM appreciates the opportunity to provide written testimony and would be pleased to assist the Subcommittee as the Department of Agriculture bill is considered throughout the congressional process.

PREPARED STATEMENT OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS

Chairman Cochran and Members of the Subcommittee: The American Society of Civil Engineers (ASCE) is pleased to offer this testimony on the President's proposed budget for the Natural Resources Conservation Service (NRCS) for fiscal year 2002.

ASCE was founded in 1852 and is the country's oldest national civil engineering organization. It represents more than 125,000 civil engineers in private practice, government, industry and academia who are dedicated to the advancement of the science and profession of civil engineering. ASCE is a 501(c)(3) non-profit educational and professional society.

NRCS & THE SMALL WATERSHED DAM REHABILITATION PROGRAM

ASCE is concerned that no funds have been requested in the President's budget to fund the Small Watershed Dam Rehabilitation Program that was authorized on November 9, 2000, in PL-106-472, Section 313. We hope the outcome of the fiscal year 2002 appropriations process will enable this vital work to begin and expand

as we seek to preserve, protect and better manage our nation's water and land resources. Every state in the United States has benefited from the Small Watershed Program.

Of the 75,000 dams in the United States, 95 percent are regulated by the states. Approximately 10,400 of these dams are small watershed structures built under the United States Department of Agriculture programs authorized by Congress beginning in the 1940s (primarily the Flood Control Act of 1944, PL-534 and the Watershed Protection and Flood Control Act of 1953, PL-566). By the year 2020, more than 85 percent of all dams in the United States will be more than 50 years old, the typical useful life span.

THE URGENT NEED FOR FEDERAL ACTION

The benefits from the 10,400 improved watershed dams are enormous. The dams provide downstream flood protection, water quality, irrigation, local water supplies and needed recreation. Yet these benefits to lives and property are threatened. The small watershed dams are approaching the end of their useful lives as critical components deteriorate. The reservoirs become completely filled with sediment, downstream development increases the potential hazards and significantly changes the design standards, and many dams do not meet state dam safety standards.

Although these dams were constructed with technical and financial assistance from the Department of Agriculture, local sponsors were then responsible for operation and maintenance of the structures. Now these dams are approaching the end of their useful lives, yet the resource need is still great. The flood control benefits, the irrigation needs, the water supply, the recreation and the conservation demands do not end. In fact, they are more necessary than ever as downstream development has dramatically increased the number of people, properties and infrastructure that are protected by the flood control functions of these dams. The Federal government has a critical leadership role in assuring that these dams continue to provide critical safety and resource needs.

The NRCS in the Department of Agriculture has estimated the cost of rehabilitating the small watershed dams at \$542 million. While the average rehabilitation cost per dam is approximately \$242,000, the local sponsors typically do not have sufficient financial resources to complete these necessary repairs to assure the safety and critical functions of these dams. The Federal government must recognize the urgent need to provide assistance to maintain these dams. Congress should reinforce its earlier commitment to the goals of the Flood Control Acts of 1944 and 1953.

EXTENT OF THE PROBLEM

ASCE views funding of dam safety repairs as a critical need. In the recently released Report Card for America's Infrastructure dams received a grade of D. Nearly 2,000 unsafe dams have been identified in this country and many of the owners do not have sufficient funding sources. Last year Congress proposed funding \$60 million a year for 10 years, but the legislation enacted only authorizes \$90 million spread over five years. However, this is an important first step in recognizing and resolving the enormous problem with deteriorating and aging dams. Many of these urgent repairs and modifications are needed because of the following: downstream development within the dam failure flood zone, replacement of critical dam components, inadequate spillway capacity due to significant watershed development and increased design criteria due to downstream development.

Many of the small watershed dams do not meet minimum state dam safety standards and many that are being counted on for flood protection can no longer provide flood protection due to excessive sedimentation and significant increases in runoff from development within the watershed. The dams suffer from cracked concrete spillways, failing spillways, inoperable lake drains and other problems that require major repairs that are beyond the capability of the local sponsors.

THE COST OF NO ACTION

These small watershed dams have been a silent and beneficial part of the landscape; but failure to make the necessary upgrades, repairs and modifications will increase the likelihood of dam failures. Continued neglect of these structures may easily result in reduced flood control capacity causing increased downstream flooding. Failure of a dam providing water supply would result in a lack of drinking water or important irrigation water.

The floods in Georgia in 1993 and in the Midwest in 1994 are recent reminders of natural events that can cause enormous disasters, including dam failures. The failure to act quickly will clearly result in continued deterioration and a greater number of unsafe dams until a dam failure disaster occurs. The failure of a 38-foot

tall dam in New Hampshire in 1996, which caused \$5.5 million in damage and one death, should be a constant reminder that dam failures happen and can have tragic consequences.

Completion of the needed repairs will result in safer dams, as well as continued benefits. Failure to establish a mechanism to reinvest in these structures will greatly increase the chances of dam failures and loss of benefits, both having significant economic and human consequences. Costs resulting from flood damage and dam failure damage are high and unnecessarily tap the Federal government through disaster relief funds or the National Flood Insurance Program.

RECOMMENDATION

ASCE urges the committee to approve full funding at the authorized level of \$10 million, and an additional \$5 million to make up for funding not received in fiscal year 2001 for the Small Watershed Dams Rehabilitation Program (PL-106-472, Section 313). Additionally, we would like to see these rehabilitation funds be a separate line item in the NRCS budget in an effort to better track the rehabilitation funding approved by Congress. While, this is well short of the demonstrated need of \$60 million a year for 10 years, it would be a step in the right direction.

The condition of our nation's dams, and the need for watershed structure rehabilitation, should be a national priority before we have to clean up after dam failures that we know are likely to happen if nothing is done.

ASCE also supports a research and development (R&D) program as we get the structural rehabilitation process underway. In the USDA, the Agricultural Research Service (ARS) undertakes that work. We respectfully request that \$1.5 million be included in the ARS budget for small watershed research. These funds would be used for evaluation of upstream and downstream changes to the stream channel systems in cases of decommissioning, evaluation of the water quality impact of stored sediment releases, and the evaluation of impacts of the loss of flood protection, among other things.

NRCS & the Snow Telemetry Program

In the West, water—much of which flows from mountain snows—is one of our most precious natural resources. This year the West is faced simultaneously with potential drought, wildfires, and an energy crisis in part due to reduced hydropower generation. To effectively manage this important resource, it is essential to have accurate water-supply data.

Therefore, we respectfully request that you include \$8,515,000 (a \$2,525,000 increase) in the Natural Resources Conservation Service's Conservations Operations Account (CO-01) and Snow Survey and Water Supply Forecasting Subaccount (CO-45) in the Agriculture appropriations bill. This service is administered by the National Water and Climate Center (NWCC), and operates in each western state. The base budget amount of \$5,990,000 is not adequate to operate and maintain the existing system of 656 SNOTEL (SNOW-TElemetry) sites and 1,110 snow courses measured manually.

The vital information obtained through this water-supply data is used by various government agencies and other public and private entities and individuals to project spring and summer water supplies for agriculture, municipal, and industrial uses, hydropower production, recreation, fish and wildlife management, endangered species needs, flood control, and other purposes. Non-Federal cooperators contribute money and in-kind services in support of the system.

Over the past five years, level Federal appropriations in the face of increasing costs has left the Snow Survey and Water Supply Forecasting program in serious circumstances. Given past and present funding requests from the Executive Branch, and the subsequent erosion in program resources, the NWCC has prepared a protocol for discontinuing 10 to 15 percent of the SNOTEL sites. In order to protect the nation's \$30 million investment in this vital network, a \$2,525,000 increase is needed over and above the \$5,990,000 base amount, for a total of \$8,515,000.

PREPARED STATEMENT OF THE AMERICAN SOCIETY OF PLANT PHYSIOLOGISTS

Mr. Chairman, the American Society of Plant Physiologists representing 6,000 plant scientists, appreciates this opportunity to submit comments to the Subcommittee for its consideration of fiscal year 2002 appropriations for research sponsored by the Department of Agriculture.

Support by the Subcommittee for the National Research Initiative Competitive Grants Program (NRI) provides the agricultural research community and America's

farmers with a highly acclaimed program that determines awards through a rigorous peer review process.

The National Research Council Board on Agriculture and Natural Resources committee report on the NRI last year strongly endorsed support for this competitive grants program. The NRC committee “found the NRI to have financed high-quality scientific work within congressional guidelines. . . . The committee reiterates the extraordinary importance of public merit-based peer-reviewed research in food, fiber and natural resources. In the committee’s opinion, past public research and current private activities cannot meet the needs that are being created by population growth, climate change and natural resource deterioration or the challenges related to food safety and nutrition and to the growing convergence of foods and medical research.”

The NRC committee recommended that a major emphasis of the NRI continue to be the support of high-risk research with potential long-term payoffs. Much of this research would be classified as fundamental in the traditional use of this term.

A major conclusion of the NRC committee was that, “Without a dramatically enhanced commitment to merit-based peer-reviewed, food, fiber and natural resources research, the nation places itself at risk.”

In addition to the direct benefits to farmers and consumers that result from the leading research discoveries sponsored by the NRI, increased support for the program would help maintain the strength and vigor of the nation’s agricultural research community. We urge the Subcommittee to increase support for the NRI, including NRI-sponsored plant research to help meet the important long-term research needs of America’s farmers.

The Initiative for Future Agriculture and Food Systems (IFAFS) has provided grants at levels that enable scientists of different institutions and disciplines to work together in addressing important research questions. ASPP urges the Subcommittee to continue support for IFAFS in the fiscal year 2002 appropriation at the level authorized by statute.

The Agricultural Research Service (ARS) continues to address effectively many important research questions for American agriculture. American farmers and consumers are well-served by the large number of successful research efforts of ARS scientists. Continued support for a balanced research portfolio in the Department including intramural and extramural research is needed to address the many and sometimes devastating problems farmers face in growing crops.

ASPP supports the request of the National Coalition for Food and Agricultural Research (National C–FAR) to double support for agricultural research over five years—a rate of increase averaging more than 14 percent a year. We encourage the Subcommittee to increase support for all agricultural research programs supported by the Department of Agriculture by more than 14 percent this year.

What could be done with this requested increase in funding? In the plant science area alone, we know that extraordinary advances can be achievable with sufficient support and time. Increased funding can be expected to accelerate the time in which advances could be made.

The age of genomics and biotechnology has brought revolutionary new tools to plant scientists to better serve the needs of agriculture. Following this paragraph is a look back to what has happened in agriculture in the past century to offer some guideposts for a look ahead to the new century before us. The look ahead includes projections of what may be expected to be achieved earlier or later in this new century depending upon levels of support for research. We appreciate the assistance of ASPP Education Foundation Chairman Bob Goldberg, Professor at the University of California, Los Angeles, and founding editor-in-chief of the widely cited science journal, *THE PLANT CELL*, for his contributions to this following look back and ahead for plant science and agriculture.

Starting with the year 1900, we find that Mendel’s laws of genetics were not widely understood. The tools and knowledge base of those studying plants at the time are now seen as quite primitive. The study of Botany focused more on the classification of species of plants. The study of plant physiology within Botany to learn more of the structure and functions of plants would not emerge as a strong separate discipline until the end of the first quarter of the century.

Despite the modest state of plant science and agriculture in 1900, the ensuing 100 years reaped increases in crop yields in the range of 300 percent. In addition, the number of Americans needed to work on farms to produce food for the rest of us dwindled from one in two people to nearly one in 100.

Along the way, developments in the area of plant breeding, genetic engineering, genomics, irrigation, use of fertilizers, computers, and other advances helped transform plant science, American agriculture and the nation itself.

For the 21st Century, plant scientists predict even more impressive gains—gains for which there are a definite need. In the next 50 years, we will have to produce more food than has ever been produced in the collective history of people on earth. On a world scale, agriculture on a per capita basis is on a decline as we begin the 21st Century. Today we have hunger even in parts of prosperous nations like the U.S.

At the same time, the world is near the limits of available land and other resources for agriculture. More environmentally benign agricultural practices and more productive plants will be needed. In addition to demands on cropland for food, there will be increased demands on farmers to grow energy feedstocks. Some plant scientists predict that plants will rival petroleum for the production of industrial chemical products such as polymers, polyurethane, nylon and other materials. New high value energy crops will provide new profitable markets for American farmers who will become less dependent on government subsidies.

Major crops will be genetically modified to fix nitrogen as is now found in legumes, leading to less use of applied fertilizers and to a cleaner environment. Dead zones in the Gulf of Mexico and other cases of contaminated waterways reportedly linked to agricultural runoff would be addressed through use of engineered crop plants that can fix nitrogen.

The lines between agricultural research and medical research will blur as advances in plant science will address nutritionally related human health diseases on a mass public health scale. Calcium deficiency is common in the diets of American adolescents, particularly girls, leaving many with less dense bones more susceptible to fracture and osteoporosis later in life. Foods commonly eaten by children will be engineered by plant scientists to contain higher levels of calcium. A number of common mineral and vitamin deficiencies in diets causing various maladies for people here and abroad will be addressed by enhanced foods engineered by plant scientists. Anemia, the most widespread ailment related to nutritional deficiency in the developing world, will be addressed by a new “Golden Rice” with higher levels of usable iron. This rice will also contain higher levels of beta carotene, which converts to Vitamin A after human consumption. This enhanced rice could prevent 500,000 cases of child blindness annually.

Millions of Americans and many more people overseas have allergies to proteins in widely consumed existing foods such as wheat and milk. We have already seen success in laboratory experiments supported by the NRI that are eliminating allergens in wheat and milk. Researchers have identified a number of other foods that could be made safer for consumption through this research using biotechnology. Millions of cases of allergic reactions to foods will be averted through these genetically enhanced foods. High value, allergen-free wheat and other commodity products will be grown by American farmers who will find new premium markets for their products.

Plants have long been a major source of pharmaceutical products. As plant scientists combine use of modern transformation technologies with increased knowledge of plant genomes, many more life saving medicines will be developed. Some of these plant-based pharmaceutical products will take the form of edible vaccines—such as bananas genetically engineered to produce a vaccine for hepatitis B or deadly infant diarrhea.

Genomics will help in understanding hybrid vigor to produce enhanced, higher yielding crops. Plant scientists will learn how to change the size and number of plant seeds and organs. The earliest events controlling plant reproduction will be understood.

Scientists may learn how to engineer plants that will better capture higher levels of carbon dioxide in the atmosphere for use with the sun’s energy in photosynthesis, leading to faster growing plants and possibly an additional harvest season for some crops.

Plants engineered to tolerate higher levels of salinity will help farmers salvage more of their crops in dry seasons. Increased tolerance of future engineered plants to environmental stresses of cold and freezing will be a boon to the horticultural industry and other growers. The Federal government will experience savings in emergency spending for crop disasters—some disasters that will be avoided through use of new, enhanced plants.

Just as we found in the century past, the advances in the 21st Century will transform plant science, American agriculture, the nation and world our grandchildren will inhabit. Indeed, this transformation will have to occur because the well-being and even survival of many in future generations will require it.

Again, thank you for this opportunity to submit comments to the Subcommittee. We appreciate the Subcommittee’s leadership in support of agricultural research.

PREPARED STATEMENT OF THE ASSOCIATION OF RESEARCH DIRECTORS

Chairman Cochran, and other distinguished members of the Committee, I am Carolyn Brooks, Dean of the School of Agricultural and Natural Sciences and Research Director at the University of Maryland Eastern Shore and Chair of the Association of Research Directors (ARD) of the eighteen Historically Black Land-Grant Colleges and Universities, including Tuskegee University (hereafter referred to as the 1890s). Mr. Chairman, I submit, on behalf of the ARD, this written testimony in support of the fiscal year 2002 Federal Budget recommendations, primarily those submitted by the National Association of State Universities and Land-Grant Colleges (NASULGC).

GENERAL INFORMATION

The role of the 1890 Land-Grant institutions, relative to research in the food, fiber, and agricultural sciences, partnering and collaborating with USDA, NASULGC and other entities, is to conduct basic and applied research to ensure a safe, economical and adequate food supply, promote a sustainable environment, conserve the natural resource base, and contribute to the improvement of the socio-economic well-being and overall quality of life of diverse rural and urban populations. Research at our institutions is increasingly multi-institutional, multi-state and stakeholder driven and is focused on:

- Economically competitive and sustainable small-scale agricultural systems;
- Crop diversity/alternative crops and marketing strategies for farmers;
- Food safety and quality;
- Family and community development;
- Protection and improvement of water quality and quantity;
- Waste management and prevention of environmental pollution;
- Value-added plant and animal products; and
- Improved nutrition and health of urban and rural populations.

The 1890 Land-Grant mission of providing access to higher education and opportunities for betterment of life for all Americans constantly guides the plans and initiatives in research, outreach and academic programs of these institutions. The general philosophy of the 1890s is that “men and women of talent and ability, regardless of their economic and social condition, can contribute to the common good, with hard work and the opportunity to develop and prosper.” Although the 1890s proudly keep pace with mainstream education and cutting-edge advancement, these campuses hold true to focusing on viable research programs that focus on societal needs and increasing diversity within the human resource capital.

BUDGET RECOMMENDATIONS

The 1890s/ARD request continuing support of these research efforts, which will result in having positive impacts and valuable benefits for the people served and will involve students, giving them valuable training and experience in research methodology and practices. Research initiatives the 1890s/ARD request congressional support for in the fiscal year 2002 Federal Budget are:

To Strengthen The Evans-Allen Base Program

The Evans-Allen formula funding provides the 1890s with their primary financial support to conduct research in the food, fiber, and agricultural sciences. The research conducted by these institutions provides both proactive and reactive responses to public concern about environmental, social, economic, and health issues, small-scale agriculture, and small business enterprises. The NASULGC/ARD budget request for this research program is \$36,197,000.

To Enhance Research and Teaching Initiatives

The 1890s are the major producers of African-American minority human capital resources in food, fiber, and agricultural sciences. The human capital resources produced by these institutions meet a significant employment need of their land-grant partners, which include USDA agencies, private industry, and 1862 Land-Grant Universities. Initiatives to be supported are:

The Capacity Building Grants Program.—This highly competitive program is needed to continue to build and enhance the capacity of the 1890s in research and teaching endeavors. Because of a history of neglect and underfunding, it is amazing how the 1890s have been able to do so much with so little. At least 80 percent of all African Americans who receive baccalaureate degrees in the agricultural sciences have received their education from 1890 institutions. These students deserve the same quality of education provided at higher funded institutions. Capacity Building grants assist the 1890s to raise the quality of research and teaching programs at

our institutions. We have a unique and vital mission as intellectual, educational, service centers and funding that recognizes this is crucial to our vitality and quality. The NASULGC/ARD budget request for this grant program is \$15,000,000.

The Facilities Grants Program.—Funds may be used by the recipient institutions to purchase land, acquire state-of-the-art equipment, and renovate or construct facilities to enhance their teaching, research and extension land-grant programs. The NASULGC/ARD budget request for this grant program is \$15,000,000.

CLOSING COMMENTS

Mr. Chairman, based on past accomplishments of which we are extremely proud, and a visionary approach, the 1890s/ARD are positioning themselves to enter the 21st Century with a renewed commitment and capacity to implement their land-grant research mission. Full appropriations of the fiscal year 2002 budget recommendations as stated above will facilitate this and is vital to the ARD member institutions. I thank you very much for allowing me to address this honorable body and if there is a need for additional information, you may contact me as indicated below.

PREPARED STATEMENT OF THE ASSOCIATION OF STATE DAM SAFETY OFFICIALS, INC.

Chairman Cochran and Members of the Subcommittee: The Association of State Dam Safety Officials (ASDSO) is pleased to offer this testimony on the President's proposed budget for the Natural Resources Conservation Service (NRCS) for fiscal year 2002.

The Association of State Dam Safety Officials is a national organization of more than 2,000 state, Federal and local dam safety officials and private sector individuals dedicated to improving dam safety through research, education and communications. Our goal is to save lives, prevent damage to property and maintain the benefits of dams by preventing dam failures. Several devastating dam failures occurring in the 1970s focused attention on the potential catastrophic results of dam failures. These dramatic failures demonstrate that dams should always be properly constructed, operated and maintained to continue to provide important benefits and prevent failures.

ASDSO is concerned that no funds have been requested in the President's budget to fund the Small Watershed Dam Rehabilitation Program that was authorized on November 9, 2000, in Public Law 106-472, Section 313. We hope the outcome of the fiscal year 2002 appropriations process will enable this vital work to begin and expand as we seek to preserve, protect and better manage our nation's water and land resources. Every state in the United States has benefited from the Small Watershed Program.

Dams are an important part of the nation's infrastructure. They provide flood control, water supply, irrigation, hydropower and water quality benefits. Of the 75,000 dams in the United States, 95 percent are regulated by the states. Approximately 10,400 of these dams are small watershed structures built under the United States Department of Agriculture programs authorized by Congress beginning in the 1940s (primarily the Flood Control Act of 1944, Public Law 534 and the Watershed Protection and Flood Control Act of 1953, Public Law 566). By the year 2020, more than 85 percent of all dams in the United States will be more than 50 years old, the typical useful life span.

THE URGENT NEED FOR FEDERAL ACTION

The benefits from the 10,400 improved watershed dams are enormous. The dams provide downstream flood protection, water quality, irrigation, local water supplies and needed recreation. Yet these benefits to lives and property are threatened. The small watershed dams are approaching the end of their useful lives as critical components deteriorate. The reservoirs become completely filled with sediment, downstream development increases the potential hazards and significantly changes the design standards, and many dams do not meet state dam safety standards.

Although these dams were constructed with technical and financial assistance from the Department of Agriculture, local sponsors were then responsible for operation and maintenance of the structures. Now these dams are approaching the end of their useful lives, yet the resource need is still great. The flood control benefits, the irrigation needs, the water supply, the recreation and the conservation demands do not end. In fact, they are more necessary than ever as downstream development has dramatically increased the number of people, properties and infrastructure that are protected by the flood control functions of these dams. The Federal government

has a critical leadership role in assuring that these dams continue to provide critical safety and resource needs.

The NRCS in the Department of Agriculture has estimated the cost of rehabilitating the small watershed dams at \$542 million. While the average rehabilitation cost per dam is approximately \$242,000, the local sponsors typically do not have sufficient financial resources to complete these necessary repairs to assure the safety and critical functions of these dams. The Federal government must recognize the urgent need to provide assistance to maintain these dams. Congress should reinforce its earlier commitment to the goals of the Flood Control Acts of 1944 and 1953.

EXTENT OF THE PROBLEM

ASDSO views funding of dam safety repairs as a critical need. Nearly 2,000 unsafe dams have been identified in this country and many of the owners do not have sufficient funding sources. Last year Congress proposed funding \$60 million a year for 10 years, but the legislation enacted only authorizes \$90 million spread over five years. However, this is an important first step in recognizing and resolving the enormous problem with deteriorating and aging dams. Many of these urgent repairs and modifications are needed because of the following: downstream development within the dam failure flood zone, replacement of critical dam components, inadequate spillway capacity due to significant watershed development and increased design criteria due to downstream development.

Many of the small watershed dams do not meet minimum state dam safety standards and many that are being counted on for flood protection can no longer provide flood protection due to excessive sedimentation and significant increases in runoff from development within the watershed. The dams suffer from cracked concrete spillways, failing spillways, inoperable lake drains and other problems that require major repairs that are beyond the capability of the local sponsors.

THE COST OF NO ACTION

These small watershed dams have been a silent and beneficial part of the landscape; but failure to make the necessary upgrades, repairs and modifications will increase the likelihood of dam failures. Continued neglect of these structures may easily result in reduced flood control capacity causing increased downstream flooding. Failure of a dam providing water supply would result in a lack of drinking water or important irrigation water.

The floods in Georgia in 1993 and in the Midwest in 1994 are recent reminders of natural events that can cause enormous disasters, including dam failures. The failure to act quickly will clearly result in continued deterioration and a greater number of unsafe dams until a dam failure disaster occurs. The failure of a 38-foot tall dam in New Hampshire in 1996, which caused \$5.5 million in damage and one death, should be a constant reminder that dam failures happen and can have tragic consequences.

Completion of the needed repairs will result in safer dams, as well as continued benefits. Failure to establish a mechanism to reinvest in these structures will greatly increase the chances of dam failures and loss of benefits, both having significant economic and human consequences. Costs resulting from flood damage and dam failure damage are high and unnecessarily tap the Federal government through disaster relief funds or the National Flood Insurance Program.

RECOMMENDATION

ASDSO urges the committee to approve full funding at the authorized level of \$10 million, and an additional \$5 million to make up for funding not received in fiscal year 2001 for the Small Watershed Dams Rehabilitation Program (Public Law 106-472, Section 313). Additionally, we would like to see these rehabilitation funds be a separate line item in the NRCS budget in an effort to better track the rehabilitation funding approved by Congress. While, this is well short of the demonstrated need of \$60 million a year for 10 years, it would be a step in the right direction.

The condition of our nation's dams, and the need for watershed structure rehabilitation, should be a national priority before we have to clean up after dam failures that we know are likely to happen if nothing is done.

ASDSO also supports a research and development (R&D) program as we get the structural rehabilitation process underway. In the USDA, the Agricultural Research Service (ARS) undertakes that work. We respectfully request that \$1.5 million be included in the ARS budget for small watershed research. These funds would be used for evaluation of upstream and downstream changes to the stream channel systems in cases of decommissioning, evaluation of the water quality impact of

stored sediment releases, and the evaluation of impacts of the loss of flood protection, among other things.

PREPARED STATEMENT OF BERNARD H. BERNE, M.D., PH.D.

I am a resident of Arlington, Virginia. I serve the Food and Drug Administration (FDA) as a Medical Officer and as a reviewer medical device approval applications. I am testifying as a private individual.

I ask your Subcommittee to deny the Administration's request to provide \$6,000,000 for costs related to occupancy of new FDA facilities at White Oak, Maryland. This request appears in the President's Budget for fiscal year 2002 on p. 435 under the heading "Department of Health and Human Services", "Food and Drug Administration", "Salaries and Expenses". The Budget states on p. 436 that these funds would support the first phase of FDA's consolidation into the White Oak, Maryland, site.

The General Services Administration (GSA) is now starting to design and construct this facility. These would be the first funds that Congress would appropriate to the Department of Health and Human Services (HHS) and FDA to support the White Oak project. Please deny these funds for the following reasons:

ECONOMIC CONSIDERATIONS

FDA will need to pay rent to GSA if it occupies this facility. FDA's future budgets, which your Subcommittee would fund, would pay these rents. The rents would likely be higher than rents that GSA and FDA pay to private property owners, since GSA would not need to enter into competitive bidding processes.

Congressional authorizing committees need to evaluate the current costs of the consolidation and compare them to the costs of maintaining FDA's current facilities. No Congressional committee has done this during the past ten years.

All or nearly all of FDA's offices that would move to White Oak are presently located in satisfactory leased facilities. Some, such as my own, are in excellent buildings. There is no urgent need or economic reason to relocate these offices to White Oak.

Despite this, the requested \$6,000,000 would support the relocation of the Office of Compliance of FDA's Center for Drug Evaluation and Research (CDER) to White Oak. There is no clear need for this relocation, since it would put 20 miles between this office and all other CDER offices. The relocation would clearly decrease FDA's efficiency by decreasing interactions between this office and related ones.

GSA has recently encountered delays in its design and construction efforts. It appears that FDA will not be able to utilize any of the appropriated funds in fiscal year 2002. FDA apparently can not occupy the facility until fiscal year 2003.

The Budget request is therefore premature. There is no need to provide the requested \$6,000,000 at this time.

LOCATION

White Oak is an unsatisfactory location for FDA's headquarters consolidation. The project would promote urban sprawl.

FDA's White Oak facility would occupy 125 acres next to a golf course in a suburban residential neighborhood in Montgomery County, Maryland. The FDA site is outside of the Capital Beltway on a largely forested 750-acre property surrounded by heavily congested roads and highways. The site is three miles from the nearest Metro station, and has only infrequent bus service.

An FDA consolidation at White Oak would bring 6000 FDA employees to this Washington area suburb. Most would need to commute for much longer times and distances than they presently do. White Oak is more than 20 miles from most present FDA facilities.

I and thousands of other FDA employees presently commute to work by Metro, as our workplaces are near Metro stations. This will be impossible at White Oak.

FDA employees driving to White Oak will add traffic congestion and air pollution to the Washington Metropolitan Area. This is especially unfortunate because the Washington Metropolitan Area already has the second worst traffic congestion of all urban areas in the United States.

FDA employee surveys have revealed widespread opposition to this relocation. Last July, a survey of those employees who would relocate first to White Oak showed that 70 percent opposed the move. Many stated that the relocation would impair FDA's ability to regulate drugs and medical devices.

A number of the employees noted that the first White Oak building will have few window offices. Many of the employees who would relocate to White Oak in the first phase presently have windows in their offices. The design of this building and the location of the facility will have long-lasting adverse effects on FDA's ability to recruit and retain qualified employees. The Washington Metropolitan area has a number of better sites at which FDA can consolidate. Among these is the Southeast Federal Center in downtown Washington, D.C. This underutilized 50-acre federally-owned property is adjacent to the Navy Yard Metro Station. It is only one mile from the U.S. Capitol and the headquarters of the U.S. Department of Health and Human Services.

LEGAL ISSUES

On February 23, 2001, I and a number of other FDA employees joined the Sierra Club and the Forest Conservation Council in a law suit that is intended to stop the White Oak project. For a number of reasons, FDA's occupancy of any buildings at White Oak would be illegal. The U.S. District Court for the District of Columbia is presently considering this suit.

The White Oak facility would house the Office of the Commissioner of Food and Drugs, as well as most other FDA headquarters offices. This would violate 4 U.S.C. § 72, which states: "All offices attached to the seat of government shall be exercised in the District of Columbia, and not elsewhere, except as otherwise expressly provided in law." 4 U.S.C. § 72 is derived from the 1790 Act that established the District of Columbia as the Nation's capital. The first Congress enacted this law, which President George Washington signed.

There is no law that expressly provides that FDA's headquarters offices shall be exercised outside of the District of Columbia.

The FDA Revitalization Act (Public Law 101-635; 21 U.S.C. § 369b), authorizes the Secretary of HHS to award contracts to acquire property and to construct and operate a consolidated FDA headquarters facility. This Act does not provide the location of the consolidated facility.

I ask Congress not to appropriate funds to support an illegal activity. The 1790 Act had the worthy purpose of ensuring that all central offices of the Federal government would consolidate in the Federal capital District, and not elsewhere. The consolidated FDA facility would be one such office that is "attached to the seat of government".

Article 1, Section 8, of the Constitution gives Congress exclusive jurisdiction over the District of Columbia. Your Committee should take no action to support the location of FDA's headquarters at a location that is outside of the District. Any such action would tend to vitiate this section of the Constitution, which 4 U.S.C. § 72 is intended to support.

Executive Order 12072, Aug. 16, 1978, states in Section 1-1, Subsection 101: "Federal facilities and Federal use of space in urban areas shall serve to strengthen the nation's cities and to make them attractive places to live and work. Such Federal space shall conserve existing urban resources and encourage the development and redevelopment of cities."

White Oak is not in or near any city. An FDA consolidation at White Oak (which is in an "urban area", the Washington Metropolitan Area) would not strengthen any cities. The FDA facility would not encourage the development or redevelopment of any cities.

Executive Order 12072, Section 1-1, Subsection 101, contains the word "shall" in several locations. FDA therefore can not legally locate its headquarters in suburban White Oak.

Executive Order 12072 and several Federal statutes require that heads of Federal agencies consult with local city officials to obtain their recommendations for and objections to all proposed new Federal facilities. Neither GSA nor FDA officials ever consulted with officials of the District of Columbia or of the City of Rockville in Montgomery County, Maryland, concerning the White Oak facility.

This lack of consultation violated Executive Order 12072 and several laws. It prevented District and Rockville officials from recommending alternative sites for the consolidated facility within their own jurisdictions and from objecting to the selection of the White Oak site.

The Public Buildings Act of 1959 requires that the Committee on Environment and Public Works of the U.S. Senate approve prospectuses that describe the location and maximum costs of any large buildings that GSA may wish to construct before Congress can appropriate funds to design and construct such buildings. That Committee has never approved a prospectus that describes FDA's White Oak facility.

The Treasury and General Government Appropriations Act, 2000 (Public Law 101-58) appropriated funds to GSA that could support the first phase of FDA's consolidation in Montgomery County, Maryland. However, Public Law 101-58 contains a provision at 113 Stat. 451 that states: "Provided further, That funds available to the General Services Administration shall not be available for expenses in connection with any construction, repair, alteration, or acquisition project for which a prospectus, if required by the Public Buildings Act of 1959, as amended, has not been approved, except that necessary funds may be expended for each project for required expenses in connection with the development of a proposed prospectus."

The Public Buildings Act of 1959 requires a prospectus that describes FDA's White Oak facility. No prospectus that described this facility had been approved before Public Law 101-58 was enacted into law. Therefore, GSA may only legally use the funds appropriated in this act for "required expenses in connection with the development of a proposed prospectus". GSA cannot legally use the funds to design and construct any buildings.

Despite this prohibition, GSA is presently designing and starting to construct the first phase of the consolidation without an approved prospectus. This is illegal.

The Budget asks Congress to appropriate funds in the Agriculture, Rural Development, Food and Drug Administration Appropriations Act, 2002, that would enable FDA to occupy new facilities at White Oak that GSA would construct illegally. Your Committee should not initiate the appropriation of any such funds.

The prospectus approval process is designed to assure that Congress evaluates the need, location, and maximum cost for all GSA building projects. Congress has never done this for the facilities that FDA would occupy at White Oak.

The National Environmental Policy Act (NEPA) of 1969 requires that Federal agencies compare in an Environmental Impact Statement (EIS) alternative locations for any large new Federal facility. However, the EIS for the White Oak FDA facility did not make any such comparisons.

The EIS only compared the environmental impacts of an FDA consolidation at White Oak with the "no action" alternative. Following this legally inadequate comparison, GSA and FDA officials selected White Oak as the location for the facility.

GSA and FDA officials therefore violated NEPA when they selected the White Oak site. Congress should not appropriate funds to support this illegal selection.

A Federal court may prevent FDA from consolidating its facilities at White Oak for one or more of the above reasons. Congress should not provide funds for FDA to occupy the White Oak facility until the Federal courts decide whether the project can proceed.

I therefore ask that your Committee not provide the requested \$6,000,000 to FDA in this legislation. Thank you.

PREPARED STATEMENT OF THE CALIFORNIA INDUSTRY AND GOVERNMENT CENTRAL
CALIFORNIA OZONE STUDY COALITION

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry and Government Central California Ozone Study Coalition we are pleased to submit this statement for the record in support of our fiscal year 2002 funding request of \$500,000 from CSREES for the Central California Ozone Study (CCOS).

Ozone and particulate matter standards in most of central California are frequently exceeded. In 2003, the U.S. Environmental Protection Agency (U.S. EPA) will require that California submit SIPs to for the recently promulgated, national, 8-hour ozone standard. It is expected that such SIPs will be required for the San Francisco Bay Area, the Sacramento Valley, the San Joaquin Valley, and the Mountain Counties Air Basins. Photochemical air quality modeling will be necessary to prepare SIPs that are acceptable to the U.S. EPA.

Central California Ozone Study (CCOS) is designed to enable central California to meet Clean Air Act requirements for ozone State Implementation Plans (SIPs) as well as advance fundamental science for use nationwide. The CCOS field measurement program was conducted during the summer of 2000 in conjunction with the California Regional PM10/PM2.5 Air Quality Study (CRPAQS), a major study of the origin, nature and extent of excessive levels of fine particles in central California. CCOS includes an ozone field study, a deposition study, data analysis, modeling performance evaluations, and a retrospective look at previous SIP modeling. The CCOS study area extends over central and most of northern California. The goal of the CCOS is to better understand the nature of the ozone problem across the region, providing a strong scientific foundation for preparing the next round of State and Federal attainment plans. The study includes six main components:

—Developed the design of the field study

- Conducted an intensive field monitoring study from June 1 to September 30, 2000
- Developing an emission inventory to support modeling
- Developing and evaluating a photochemical model for the region
- Designing and conducting a deposition field study
- Evaluating emission control strategies for the next ozone attainment plans

CCOS is directed by Policy and Technical Committees consisting of representatives from Federal, State and local governments, as well as private industry. These committees, which managed the San Joaquin Valley Ozone Study and currently managing the California Regional Particulate Air Quality Study, are landmark examples of collaborative environmental management. The proven methods and established teamwork provide a solid foundation for CCOS. The sponsors of CCOS, representing state, local government and industry, have contributed approximately \$8.7 million for the field study. The Federal government contributed \$500,000 for some data analysis. In addition, CCOS sponsors are providing \$2 million of in-kind support. The Policy Committee is seeking Federal co-funding of additional \$8.5 million to complete the data analysis and modeling portions of the study and for a future deposition study. California is an ideal natural laboratory for studies that address federal, agriculture-related issues, given the scale and diversity of the various ground surfaces in the region (crops, woodlands, forests, urban and suburban areas).

For fiscal year 2002, our Coalition is seeking funding of \$500,000 through the U.S. Department of Agriculture (USDA) Cooperative State Research, Education, and Extension Service (CSREES). Domestic agriculture is facing increasing international competition. Costs of production and processing are becoming increasingly more critical. The identification of cost-effective options for addressing environmental options affecting agricultural costs will contribute significantly to the long-term health and economic stability of local agriculture. A CSREES grant is needed to address the issue of biomass burning and alternatives to open burning. Biomass burning is managed in order to minimize smoke impacts and avoid violations of ambient air quality standards. The air quality impacts of using biomass as a fuel source and as an alternative to open burning need to be addressed. CCOS will improve the ability to assess the impacts of biomass power plants.

There is a national need to address national data gaps and California should not bear the entire cost of the addressing these gaps. National data gaps include issues relating to the integration of particulate matter and ozone control strategies. The CCOS field study took place concurrently with the California Regional Particulate Matter Study—previously jointly funded through Federal, State, local and private sector funds. Thus, CCOS was timed to enable leveraging of the efforts for the particulate matter study. Some equipment and personnel served dual functions to reduce the net cost. From a technical standpoint, carrying out both studies concurrently was a unique opportunity to address the integration of particulate matter and ozone control efforts. CCOS was also cost-effective since it builds on other successful efforts including the 1990 San Joaquin Valley Ozone Study. Federal assistance is needed to effectively address these issues and CCOS provides a mechanism by which California pays half the cost of work that the Federal government should pursue.

Scientists at the University of Nevada, Desert Research Institute (DRI) are involved with the CCOS. To expedite research studies related to biomass burning and smoke management for CCOS, it is requested that funds provided by CSREES be allocated directly to DRI.

We appreciate the Subcommittee's consideration of our request. Thank you very much.

PREPARED STATEMENT OF THE COALITION FOR APHIS/ANIMAL CARE APPROPRIATIONS

The Coalition for APHIS/Animal Care Appropriations first wishes to express its appreciation to the subcommittee and to the full committee for helping to improve Animal Welfare Act (AWA) enforcement in fiscal years 2000 and 2001 through the first funding increases the program has experienced in a decade. As you know, the Animal Welfare Act sets minimum standards of humane care for millions of animals in research institutions; in zoos, circuses, roadside menageries, and other exhibits; at the facilities of breeders and dealers; and during transportation by common carriers, such as airlines. After such a long period of budget stagnation and program retrenchment, the Animal Care (AC) division of the Animal and Plant Health Inspection Service has put the new funds to good use by, among other things, increasing the number of compliance inspections, which are crucial to protecting human and animal health and safety as the law requires, from a low of 8,772 to a projected

10,086 this fiscal year. Moreover, Animal Care has initiated a more vigorous effort directed at unlicensed facilities, and has more frequently been able to confiscate and place animals immediately when necessary to relieve suffering.

Our testimony today urges the subcommittee to continue to support this steady and much needed improvement in AWA enforcement, which would entail a modest total increase of \$3.8 million in fiscal year 2002 in three critical AWA-related programs. We have attached materials providing details on each component of this request and have summarized as follows:

- Ideally, Animal Care should be conducting 17,000 AWA compliance inspections per year (AC also carries out over 1,000 precicensing and preregistration inspections annually), conducting internal audits and inspector quality reviews, and expanding its programs for regulated industries. To sustain the progress it has achieved in the last two years, Animal Welfare will need a modest increase of \$2.4 million in fiscal year 2002, for a total appropriation of \$14.5 million.
- Ironically, Animal Care's enhanced AWA activities have now brought to the fore problems elsewhere, specifically in Investigative and Enforcement Services. This division supports AC's inspectors through timely and complete investigations of alleged Animal Welfare Act violations. Like AC, IES has experienced severe erosion in its purchasing power; unlike AC, however, it has not begun a recovery from the resulting erosion in its programs. In 2000, it had only 56 investigators, down from 73 in 1992. AWA investigations have dropped from approximately 800 in the early 1990s to 329 in 2000. A relatively small increase in fiscal year 2002 of \$1 million, for a total appropriation of \$7.263 million, would enable IES to add much-needed field investigators, especially in areas with high concentrations of animal welfare licensees and registrants. More investigations could be completed in less time and better tracking of unlicensed facilities would be possible. Because IES has other responsibilities unrelated to its role in AWA enforcement, we respectfully request that the following report language also be included so as to avoid confusion within the division:

“The Committee directs that the \$1 million of additional funds for Investigative and Enforcement Services be used for enhanced enforcement of the Animal Welfare Act.”

- An important resource for assisting research institutions in complying with the AWA is the Animal Welfare Information Center, which serves as a clearinghouse and education resource for all individuals involved in the care and use of animals for experimentation. However, its \$750,000 appropriation is unchanged since AWIC's creation in 1985. With an additional \$400,000 in fiscal year 2002, for total spending of \$1.150 million, the Center could, among other things, conduct more user workshops, develop web-based training, and expand its website content and improve the search engine to maximize access to the data available.

We thank the subcommittee for this opportunity to express our support for this modest request, one that is very small in the context of the department's budget but large in its ability to sustain and advance the progress in AWA enforcement that Congress has made possible in the past two years.

COALITION FOR APHIS ANIMAL CARE APPROPRIATIONS FISCAL YEAR 2002 BUDGET
REQUEST FOR ANIMAL WELFARE ACT ENFORCEMENT

Animal Care (Animal and Plant Health Inspection Service)

Fiscal year 2002—\$14.500 million (Needed increase of \$2.4 million)

Between fiscal year 1992 and fiscal year 1999, the appropriation for the Animal Welfare program under Animal Care remained stagnant, which meant a decrease in spending power. The number of inspectors responsible for nearly 10,000 sites fell from 88 to 64. Inspections dropped precipitously, from nearly 18,000 to 9,000. With respect to commercial dog breeders alone—some of the most problematic of licensees and the area where many unlicensed facilities operate—the average rate of inspection fell from three per year to one, which includes the average of four to eight visits required by noncompliant facilities. Audits by the Office of Inspector General found that “APHIS did not ensure all sites are periodically inspected” and “did not perform all required reinspections.” A 1998 audit found that “of 221 sites used by 3 airlines in one APHIS region, only 32 percent had been inspected since January 1995.” In the meantime, problems during air travel continue to result in the death, injury, and loss of animals.

In Fiscal Year 2000 and 2001, the Animal Welfare portion of Animal Care's budget rose by a cumulative \$3 million, to \$12.167 million. This increase has allowed a strengthening in the number of inspectors to 80 and a slow recovery in the num-

ber of annual inspections (although in fiscal year 2000 the number still went down, it slowed considerably and actually went up in the last half of the year as the new staff went out into the field; just over 10,000 inspections are projected for fiscal year 2001). Animal Care has initiated a more vigorous enforcement effort directed at “puppy mills” that are in chronic violation of the law, as well as at those not licensed at all.

These improvements are long overdue and most welcome and demonstrate the effective use to which Animal Care is putting its increased funding. They also show the tremendous need that remains. In order to ensure that all sites are visited at least once annually and all noncompliant facilities receive the needed follow up, AC should be conducting at least 17,000 compliance inspections per year. (AC also carries out over 1,000 precicensing and preregistration inspections annually.) APHIS also expects—and indeed, is already seeing—a rise in the number of airline-related incidents it must investigate as a result of new reporting requirements mandated in the FAA Reauthorization Act (Public Law 106– 181, Section 710).

A \$2.4 million increase in fiscal year 2002, for a total appropriation of \$14.5 million, would enable AC to maintain all current AWA activities; strengthen its field staff by hiring, training, and equipping an additional 12 inspectors; increase AWA inspections to approximately 11,600 and improve follow-up inspections to verify correction of violations; increase searches for unlicensed and unregistered operations and other illegal activities; handle Animal Welfare Act complaints more quickly; expand programs for regulated industries; and implement internal audits and inspector quality reviews.

Investigative and Enforcement Services (Animal and Plant Health Inspection Service)

Fiscal year 2002—\$7.263 million (Needed increase of \$1 million)

APHIS’s Investigative and Enforcement Services provides crucial support to Animal Care’s inspectors (in addition to three other APHIS divisions) through timely and complete investigations of alleged Animal Welfare Act violations. IES staff perform a variety of critical functions, such as conducting investigations; tracking unresolved cases; coordinating investigative efforts within APHIS and with other Federal and State agencies; and training APHIS inspectors in documenting violations and gathering evidence.

As with AC, ten years of static budgets have eroded IES’s purchasing power, resulting in a substantial reduction in force, from 73 investigators in 1992 to 56 in 2000. Only 329 AWA investigations occurred in 2000, a 58 percent drop from a yearly high of 800 in the early 1990s. The average time needed to complete an investigation in 2000 was about 140 days; in the early 1990s, it was 60 days. Clearly the budget shortfalls during the last decade have had a serious detrimental impact on IES’s operations, which in turn adversely affects the health Coalition for APHIS ANIMAL CARE Appropriations Page 4 and well-being of regulated animals, who may not receive relief until a case is resolved. Moreover, the deterrent effect of a sanction is severely diminished when action is not taken soon after the violation.

IES’s fiscal year 2001 budget is insufficient to keep up with the projected growth in demand for its investigative and enforcement services in the next few years as a result of the addition of 250 inspectors to Plant Protection and Quarantine, and the addition of a total of 35 inspectors to Animal Care between Fiscal Year 2000 and 2002.

Because IES has fallen so far behind, the modest increase of \$400,000 in the IES budget for fiscal year 2001 was insufficient to cover current program activities; most of it was immediately absorbed by cost of living increases. The APHIS Administrator made a one-time transfer to allow IES to fill critical vacancies in the central part of the country.

An increase of \$1 million in fiscal year 2002, for a total appropriation of \$7.26 million, will enable IES to fill a critical vacancy for an enforcement specialist and continue to support the four field investigator positions now temporarily funded through the APHIS Administrator, as well as add four new field positions strategically placed in areas with high concentrations of animal welfare licensees and registrants. With these additional funds, other improvements in IES functions would occur, including:

- Reducing time to complete investigations;
- Allowing investigators to accompany Animal Care staff to noncompliant facilities;
- Deploying “quick-response” teams to respond to high-priority violations;
- Implementing electronic case report format to accelerate case routing and processing;
- Increasing tracking of unlicensed operators.

With this additional funding, IES would be able to respond more quickly to the growing number of new animal care violation cases and to enhance enforcement efforts directed toward protecting the welfare of animals under the Animal Welfare Act.

The Animal Welfare Information Center (Office of Research, Education and Economics/National Agricultural Library)

Fiscal year 2001—\$750,000

Fiscal year 2002—\$1.150 million (Needed increase of \$400,000)

The Animal Welfare Information Center (AWIC) was created by legislative mandate in the 1985 amendment to the Animal Welfare Act, the Improved Standards for Laboratory Animals Act. The AWIC's purpose is to serve as a clearinghouse and educational resource for all individuals involved in the care and use of animals for experimentation. The Center provides information on appropriate care for animals including minimization of pain and distress, preventing unintended duplication of experiments, training for laboratory employees, legal requirements regarding the use of animals in research, and reduction and/or Coalition for APHIS ANIMAL CARE Appropriations Page 5 replacement of the use of animals in research, where possible. The website address for AWIC is <http://www.nal.usda.gov/awic> and users have accessed this site nearly half a million times in one year alone. It is an invaluable resource for the research community, yet its funding has remained stagnant at \$750,000 since its creation more than fifteen years ago.

We are seeking a \$400,000 increase in appropriations to enable the AWIC to provide much needed services. These additional monies would permit the Center to sponsor workshops in different regions of the country and to develop web-based training to educate the regulated community and thereby ensure increased compliance with the Federal law. The website would be expanded with additional material and an updated search engine to maximize access to the data available and the efficiency of obtaining the data.

Submitted on behalf of the Coalition for APHIS ANIMAL CARE Appropriations, representing regulated industry, the scientific community, humane organizations, and their members across the U.S.: The American Humane Association; The American Society for the Prevention of Cruelty to Animals; The American Veterinary Medical Association; The American Zoo and Aquarium Association; The Humane Society of the United States; National Association of Federal Veterinarians; Society for Animal Protective Legislative; Working for Animals used in Research, Drugs, and Surgery (WARDS)

PREPARED STATEMENT OF THE COALITION OF EPSCoR STATES

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to submit this testimony on behalf of the Coalition of EPSCoR States¹ regarding the U.S. Department of Agriculture Experimental Program to Stimulate Competitive Research (USDA EPSCoR). USDA EPSCoR is extremely important to agricultural research in the state of Mississippi and in our nation. I appreciate the opportunity to submit this testimony.

I would also like to extend my appreciation to you, Mr. Chairman, for your strong support of USDA EPSCoR. This important program is having a significant impact in Mississippi and in the other USDA EPSCoR states. Your support and the support of this Subcommittee have been absolutely crucial in establishing and maintaining this important program. Mr. Chairman, those of us committed to improving Mississippi's research and development capability deeply appreciate your support and your effort. Thank you for your fine work representing Mississippi in the United States Senate.

Seven Federal agencies have EPSCoR or EPSCoR-like programs, including USDA. EPSCoR works to improve our country's science and technology capability by funding activities of talented researchers in states that have historically not received significant Federal R&D funding. USDA EPSCoR was established in fiscal year 1992 with the goal of increasing the amount of agricultural research at academic institutions within states that have received limited competitive funding from USDA.

The Mississippi EPSCoR program began in 1988 with the naming of the state EPSCoR Committee by the Governor. Mississippi EPSCoR obtained its first funding in 1989 from USDA EPSCoR's sister program in the National Science Foundation.

¹Alabama, Alaska, Arkansas, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, North Dakota, Oklahoma, Puerto Rico, South Carolina, South Dakota, Vermont, West Virginia, and Wyoming.

Since that time, EPSCoR has had an enormously positive impact within the state and at the four research institutions and their affiliates.

Because of the multi-institutional framework of EPSCoR and of the commitment of the state EPSCoR Committee to creating a critical mass of scientists and engineers around specific issues as well as a more fully developed statewide infrastructure, Mississippi EPSCoR has produced a stronger, more competitive research community and closer working relationships among the institutions that participate in the federal EPSCoR programs: Jackson State University, Mississippi State University, the University of Mississippi, the University of Southern Mississippi, and the University of Mississippi Medical Center.

Mr. Chairman, USDA EPSCoR is helping to improve the quality and competitiveness of agriculture research in Mississippi. Since the program was established in 1992, a number of Mississippi researchers have received USDA EPSCoR Strengthening Awards. These investigators have been located at Mississippi State University, the University of Mississippi Medical Center, and the University of Southern Mississippi. The amount of USDA research funds received by Mississippi increased by more than 500 percent between 1990 and 1996, a clear indication that Mississippi researchers are becoming more effective.

Important examples of Mississippi's research include studies in such areas as kenaf processing, which is a potential economic opportunity for rural states; rapid detection of E coli, an important factor in food safety; and disease mechanisms in channel catfish, which impacts a significant cash crop across the southern part of the country. These projects and many, many others address issues important to rural states and to the rest of the nation. USDA EPSCoR allows researchers across our country to contribute to our economy and our agricultural research knowledge base.

USDA EPSCoR states are those whose funding ranks no higher than the 40th percentile of all states, based on a three year rolling average. The following states are eligible: Alaska, Arkansas, Connecticut, Delaware, Hawaii, Idaho, Kentucky, Maine, Mississippi, Montana, Nevada, New Hampshire, New Mexico, North Dakota, Rhode Island, South Carolina, South Dakota, Utah, Vermont, West Virginia, Wyoming, and the Commonwealth of Puerto Rico. Let me stress that EPSCoR relies on rigorous merit review in order to ensure that it funds only high-quality research.

USDA makes four types of competitive awards through USDA EPSCoR: Research Career Enhancement Awards, Equipment Grants, Seed Grants, and Strengthening Standard Research Project Awards. Proposals must be related to the program priorities of the National Research Initiative Competitive Grants Program, which address critical issues facing agriculture today.

- Research Career Enhancement Awards help faculty enhance their research capabilities by funding sabbatical leaves. Applicants may not have received a NRICGP competitive research grant within the past five years.
- Equipment Grants strengthen the research capacity of institutions in USDA EPSCoR states. Each request shall be limited to one major piece of equipment within the cost range of \$10,000–\$250,000. The grant cannot exceed 50 percent of this cost or \$50,000, whichever is less. The principal investigator for this grant is responsible for securing non-Federal matching funds.
- Seed Grants enable researchers to collect preliminary data in preparation for applying for a standard research grant. Seed Grant awards are limited to a total cost of \$75,000, including indirect costs, for two years and are non-renewable. Applicants must indicate how the research will enhance future competitiveness in applying for standard research grants.
- Strengthening Standard Research Project Awards fund standard research projects of investigators who have not received a NRICGP grant within the past five years.

Through USDA EPSCoR, Mississippi and the other USDA EPSCoR States contribute more effectively to our nation's science and technology capability, and help provide our country with needed, high-quality, peer-reviewed research. This program allows all regions of our country to contribute to our nation's science and technology capability while allowing flexibility to meet regional research needs. USDA EPSCoR is a sound investment of taxpayer dollars.

Mr. Chairman, the Subcommittee has for several years directed USDA to set aside 10 percent of USDA NRICGP funds for USDA EPSCoR. Those funds have provided significant opportunity and significant success in Mississippi and the other EPSCoR states. I request that the Subcommittee once again include report language directing USDA to set aside 10 percent of its NRI competitive grant funds in fiscal year 2002 for an EPSCoR program. These funds will allow the EPSCoR states to continue providing for the agricultural research needs of rural America and of our nation.

I thank the Subcommittee for the opportunity to submit this testimony.

PREPARED STATEMENT OF THE COALITION FOR FOOD AID

Mr. Chairman, on behalf of the members of the Coalition for Food Aid, I respectfully submit for the record this statement supporting a total fiscal year 2002 program level of \$1.1 billion for the Public Law 480 ("Food for Peace") program. Although this will only make up \$83,000,000 of the \$673,000,000 cut in Public Law 480 that has occurred since fiscal year 1993, it will at least bring the program closer to its program level of fiscal year 1997 and 1998. Within the Public Law 480 budget, we urge that the title II program be appropriated \$887,000,000, a \$50,000,000 increase over the fiscal year 2001 appropriations, but \$40,000,000 less than the actual fiscal year 2001 title II allocation. We are also seeking Committee Report language to encourage improved U.S. Agency for International Development (USAID) and U.S. Department of Agriculture (USDA) administration of food aid programs.

The members of the Coalition are private voluntary organizations and cooperatives (jointly referred to as "PVOs") that develop and implement food aid programs overseas, including title II programs. We are very concerned about the decline in Public Law 480. In fiscal year 1993, Public Law 480 provided 6 MMT; in fiscal year 2001 it will only provide 2.9 MMT.

For PVOs, it is not just a matter of how much food aid is provided—it is how this food is used. Food aid is more than a hand out of U.S. grain, oilseed and dairy products, dry peas, beans and lentils, and other agricultural products. When linked with human and economic development activities that are developed and implemented by PVOs, food aid can have a lasting benefit. This makes title II a very effective program.

FOOD AID IS NEEDED

For developing countries that are strapped with debt and cannot afford to import adequate amounts of food to meet the nutritional needs of their populations, food aid is very important. According to the United Nations Food and Agricultural Organization report, "The State of Food and Agriculture 1998," approximately 828,000,000 people are chronically undernourished in the world. While no region is immune to hunger, the vast majority of these people live in 87 low-income, food-deficit countries. The USDA Economic Research Service reports that about 15 MMT of food aid is needed a year to meet the "food gap" in the 60 countries that are considered to be least developed and reliant on food imports.

Hunger has many causes and manifestations, but is most often associated with poverty and lack of empowerment. In developing countries, where poverty is endemic, employment opportunities are lacking, governments are unable to provide basic health and education services or sanitation and clean water due to low revenues and high debt burdens, agricultural productivity and marketing systems are usually weak and under-performing, and many people struggle just to meet their basic needs.

During the Uruguay Round Trade Agreement negotiations, it was acknowledged that low-income, net food-importing countries often have hard currency limitations and cannot afford to meet their food needs through commercial imports. Their need for food aid was expected to increase as the availability of subsidized commercial commodities decreased. Because of this, the Ministers declared that donor countries would seek to increase food and agricultural aid to these low-income countries.

Emergencies abroad also require food aid interventions. Recent events dramatically show the need—severe human and property losses due to hurricanes in and earthquakes in Ecuador and India, and ongoing emergencies in Africa caused by drought and war. These disasters compound the suffering of the poor, erase the economic progress made by struggling, developing countries and thrust millions of low-income, and even middle-income, families into poverty.

RESPONSIBLE USE OF US RESOURCES

The essence of US food aid programs is the expression of American good will through "people-to-people" programs. American farmers produce the food, American businesses process, package and transport the food, and American PVOs make sure it is used properly and effectively. PVOs target areas of need, establish programs in cooperation with local communities and institutions, and provide efficient management.

PVOs are supported by the American public through contributions and are accountable to their donors. When they receive food and cash assistance from the U.S.

Government, they must account for the use of the resources and are audited and evaluated according to U.S. Government procedures. They have established mechanisms for food monitoring and reporting from point of departure from the U.S. to the ultimate recipient. In the case of monetization (commodity sales and the use of funds for pre-approved program activities) or if funds have been provided for program support, itemized records of the use of such funds are maintained. They also keep records to assess the ultimate impact of the program on the intended beneficiaries.

EFFECTIVE PROGRAMS FOR LASTING BENEFITS

Food aid can tackle the root causes of hunger in many ways. It is not accomplished just by distributing U.S. commodities—it takes thoughtful planning and outreach to make sure these programs help people to help themselves. There are many examples. Nutritious foods along with immunization and health care are provided during critical growth periods for mothers and children. Infrastructure and sanitation in poor communities are improved by giving food as payment for work on sewage and water systems. Land use and conservation are enhanced when food is provided as an incentive for community participation in reforestation and land conservation projects. Agricultural productivity and incomes are improved by selling donated food and then using the sales proceeds to finance agricultural, small business and credit programs.

One innovative approach to food aid programming is monetization—the sale of donated commodities in poor, food deficit countries and the use of the sales proceeds for such things as (1) the distribution of food to pregnant women, mothers, children and others; (2) purchasing equipment, services and supplies to enhance the impact of food-for-work, school feeding or child and maternal health care programs; and (3) supporting programs that help improve agriculture productivity, marketing, post-harvest storage and processing or provide employment and business opportunities to increase incomes of the poor. The process of monetization itself can stimulate wider participation of traders in the market of the recipient country, thereby strengthening the free market system. The sales transactions are carefully planned to avoid interference in commercial trade or local production and marketing.

LINKAGES TO U.S. AGRICULTURE: AID TO TRADE

In contrast to developing countries the U.S. agricultural sector is the most productive in the world. A great part of the American tradition is to lend a helping hand to those less fortunate. The United States has used its agricultural bounty to help others through food aid programs. The donations have a positive impact on the U.S. economy, creating business for farmers, food processors, packaging companies, railroads, ports and shipping companies.

Food aid is one intervention in a range of programs that can lead from aid to trade. Many of the countries where PVOs operate have not been analyzed or targeted by U.S. agricultural organizations since they are low income and are not current targets for commercial sales. Yet, there is growing interest among agricultural organizations to explore how food aid can be integrated into their long-term planning.

In the short term food aid provides an additional market for U.S. goods. There is a long term benefit, as well. If properly planned, food aid programs promote “food security”—the ability of people to produce, to buy or otherwise to access enough food to meet their nutritional needs. As a family improves economically, it can afford to buy more and as a developing country improves its economic situation, the demand for food and higher-valued food increases. Thus, there are linkages between food aid programming and future market development.

History has shown that U.S. food aid can be the foundation for trade. Today, 40 percent of our commercial agricultural exports are sold to countries that were food aid recipients.

Agricultural organizations cooperate in different ways with PVOs. Some provide information about their products and respond to questions by PVOs about the efficacy of using a particular commodity. Others directly assist or work with a PVO to conduct market analyses and to develop monetization plans in a target country.

As an example, the U.S. soybean producers, through their contributions to the United Soybean Board (USB) and state soybean boards, initiated a collaborative effort with PVOs to identify the best uses for donated soybean products in developing countries. The purposes are (1) to provide soybeans, soybean meal and soybean oil to countries that need these products, (2) to have a long-term benefit by integrating the proceeds from the sales of these products into economic and social development programs implemented by PVOs, and (3) to identify opportunities to use soy protein

products to improve the nutritional quality of foods available in a target country. PVOs and USB have been working together to plan effective programs that use food aid in ways that can have a benefit on the recipient country's economy and a nutritional benefit to targeted populations.

TITLE II FUNDING INCREASE NEEDED

The fiscal year 2001 expenditures for title II will exceed appropriations by \$90,000,000. These extra funds are carryovers and transfers from other accounts. USDA's budget submission states that in fiscal year 2002 such carryovers and transfers can not be assumed.

In fiscal year 2001, USAID asked PVOs to reduce commodity levels for several ongoing programs because of budget shortages. Thus, even with the transferred funds that increased the total program level for title II, cuts were made in ongoing programs. Since developing a title II proposal is a very lengthy, costly and in-depth process, when USAID states that it has limited resources or wants to limit the number of programs it approves, PVOs are hesitant to draft proposals to start new programs. USAID also places constraints on PVOs by making it difficult to develop and to gain approval of certain types of programs, such as food for education and HIV/AIDS programs.

Thus, without increased appropriations, title II actual expenditures are very likely to drop in fiscal year 2002 and valuable programs that reduce malnutrition and improve the availability of food in poor households will be cut. We therefore ask you to appropriate \$887,000,000 for title II, which will provide \$50,000,000 more than the fiscal year 2001 appropriations, and about 125,000 MT in additional food aid.

REFORMING FOOD AID PROGRAM ADMINISTRATION

USAID's administration of title II programs is through an unwieldy and constantly changing set of regulations, guidelines, policy announcements, handbooks and individual program officer decision-making. At USDA, the process is murky and unpredictable for Food for Progress and surplus disposal programs. There are some disturbing trends in USDA policy governing surplus disposal under section 5(d) of the Commodity Credit Corporation (CCC) Charter Act and the Section 416 program, including the way the fiscal year 2001 Global Food for Education Initiative ("GFE") is being managed. There is little or no consultation between USDA and PVOs about the program approval criteria or elements for a successful project, even though many PVOs can offer a great deal of help due to years of hands-on, field experience. The review process used by USDA is not transparent and changes are made in program rules midstream, after proposals have been developed to meet the program rules that were originally published.

PVOs try to navigate this administrative maze, but it is exhausting and takes away from their ability to target programs to meet local needs.

U.S. PVOs should be considered partners in U.S. food aid. Reforms are needed that will enhance the positive impacts of food aid by streamlining administration and giving PVOs greater flexibility to pick the right commodity for the right use, supporting monetization as a valuable method for food distribution and strengthening economies, providing flexibility for a PVO to develop the type of project that would be most appropriate for the local setting and circumstances, and focusing on the use of food as a resource for growth and development. User-friendly program guidance and flexibility for PVOs to adapt a program to meet the changes encountered during the implementation phase are necessary.

If a PVO has demonstrated the capability to conduct programs, the administrative agency should give the PVO flexibility to develop a program that responds to local needs without trying to micromanage PVO decisions. This would give PVOs greater flexibility to make programmatic changes as they work to achieve program objectives. PVO programs are audited according to U.S. Government-proscribed procedures, are subject to U.S. government audit and are independently evaluated. Besides a high level of accountability, the value added by a PVO is its ability to develop a program that meets local needs and to work directly with communities, institutions and people in poor countries to make lasting changes.

Mr. Chairman, thank you for this opportunity to submit testimony on Public Law 480 and other food aid programs. We appreciate your support for food aid over the years and seek your continued help to maintain funding for this program.

PREPARED STATEMENT OF THE COALITION TO PROMOTE U.S. AGRICULTURAL EXPORTS

As members of the Coalition to Promote U.S. Agricultural Exports, we commend the Chairman and members of the Subcommittee for their interest and support of U.S. agriculture and express our appreciation for this opportunity to share our views.

The Coalition to Promote U.S. Agricultural Exports is an ad hoc coalition of over 80 organizations, representing farmers and ranchers, cooperatives, small businesses, regional trade organizations, and the State Departments of Agriculture (see attached). We believe the U.S. must continue to have in place policies and programs that help maintain the ability of American agriculture to compete effectively in a global marketplace still characterized by subsidized foreign competition.

Farm income and agriculture's economic well-being depend heavily on exports, which account for one-third or more of domestic production, provide jobs for millions of Americans, and make a positive contribution to our nation's overall trade balance. In 2001, U.S. agriculture exports are projected to be around \$53 billion, down \$7 billion from 1996. This is caused by a combination of factors, including continued subsidized foreign competition and related artificial trade barriers. U.S. agriculture's trade surplus is also expected to be about \$13 billion, down over 50 percent from 1996, with continued low commodity prices also forecast.

According to recent USDA information, the EU and other foreign competitors are outspending the U.S. by a factor of 20 to 1 with regard to the use of export subsidies and other expenditures for export promotion. In 1998 (the most recent year for which data is available), in addition to spending \$6 billion in export subsidies, our leading foreign competitors spent a combined \$1 billion on various activities to promote their exports of agricultural, forestry, and fishery products, including some \$379 million by the EU.

According to USDA, spending by these competitor countries on market promotion increased by 50 percent over the 1995-98 time period, while U.S. spending remained flat. We have no reason to believe that this trend has changed since then. Furthermore, almost all of this increase has been directed to the high-value and consumer-ready product trade.

Information compiled by USDA also shows that such countries are spending over \$100 million just to promote sales of their products in the United States. In other words, they are spending more to promote their agricultural exports to the United States, than the U.S. currently spends (\$90 million) through MAP to promote American-grown and produced commodities worldwide! In fiscal year 1999, the U.S. recorded its first agricultural trade deficit with the EU. In fiscal year 2000, that trade deficit nearly doubled to \$2 billion.

Because market promotion is a permitted "green box" activity under World Trade Organization (WTO) rules, with no limit on public or producer funding, it is increasingly seen as a centerpiece of a winning strategy in the future trade battleground. Many competitor countries have announced ambitious trade goals and are shaping export programs to target promising growth markets and bring new companies into the export arena. European countries are expanding their promotional activities in Asia, Latin America, and Eastern Europe. Canada, Australia and New Zealand have also sharply bolstered their export promotion expenditures in recent years.

As the EU and our other foreign competitors have made clear, they intend to continue to be aggressive in their export efforts. For this reason, we believe the Administration and Congress should immediately strengthen funding for MAP and other export programs, and ensure that such programs are fully and aggressively utilized. Since MAP was originally authorized, funding has been gradually reduced from a high of \$200 million to its current level of \$90 million—a reduction of more than 50 percent. Again, given what our foreign trade competitors are doing, we believe it's time to restore funding for this vitally important program up to its original level. American agriculture is the most competitive industry in the world, but it can not and should not be expected to compete alone against the treasuries of foreign governments.

In order to reverse the decline in funding over the past decade for a number of our agricultural export programs, the Coalition is strongly supporting legislation (S. 366) introduced by Senators Murray (D-WA) and Craig (R-ID), et al. that would authorize no less than \$90 million and up to \$200 million per year for MAP. The bill would also provide a minimum of \$35 million for the Foreign Market Development (FMD) Cooperator Program for cost-share assistance to help boost U.S. agriculture exports. Further, it would allow up to 50 percent of available funds under the Export Enhancement Program (EEP) to be used for related market development and promotion activities.

Both MAP and FMD are administered on a cost-share basis with farmers and other participants required to contribute up to 50 percent of their own resources. These programs are one of the few tools specifically allowed under the Uruguay Round Agreement to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition. By any measure, they have been tremendously successful and extremely cost-effective in helping maintain and expand U.S. agricultural exports, protect American jobs, and strengthen farm income. In addition to helping achieve these objectives, enactment of S. 366 would provide needed flexibility to respond to changing market conditions and capitalize on potential new market opportunities. It would also send a powerful message to our foreign competitors and strengthen the U.S. negotiating position in future trade talks.

For all these reasons, we want to emphasize again the need to help strengthen the ability of U.S. agriculture to compete effectively in the global marketplace. As a nation, we can work to export our products, or we can export our jobs. USDA's export programs, such as MAP and FMD, are a key part of an overall trade strategy that is pro-growth, pro-trade and pro-job.

Again, as members of the Coalition to Promote U.S. Agricultural Exports, we appreciate very much this opportunity to share our views and we ask that this statement be included in the official hearing record.

PREPARED STATEMENT OF THE COLORADO RIVER BASIN SALINITY CONTROL FORUM

The Congress concluded that the Colorado River Basin Salinity Control Program should be implemented in the most cost-effective way and realizing that agricultural on-farm strategies were some of the most cost-effective strategies authorized a program for the Department of Agriculture. With the enactment of the Federal Agriculture Improvement and Reform Act of 1996 (FAIRA), the Congress concluded that the Salinity Control Program could be most effectively implemented as one of the components of the Environmental Quality Incentives Program. Since the enactment of FAIRA, the Salinity Control Program has not been funded at a level adequate to ensure that salinity damages from the use of Colorado River water in the United States will not increase.

The Salinity Control Program has been subsumed into the EQIP program without the Secretary of Agriculture giving adequate recognition to the requirement in Section 202(c) in the Colorado River Basin Salinity Control Act to carry out salinity control measures. Water users hundreds of miles downstream are the beneficiaries of this water quality improvement program. Agriculturalists in the Upper Basin, however, see local benefits as well as downstream benefits and have submitted cost-effective proposals to the State Conservationists in Utah, Wyoming and Colorado. Priority Area proposals for EQIP funding are ranked in each state under the direction of the Natural Resources Conservation Service (NRCS) State Conservationist. Existing ranking criteria, however, does not consider downstream benefits (particularly out of state benefits) when proposals are being evaluated.

After longstanding urgings from the states and directives from the Congress, the Department has concluded that this program is different than small watershed enhancement efforts common to the EQIP program. In this case, the watershed to be considered stretches more than 1,200 miles from the river's headwater in the Rocky Mountains to the river's terminus in the Gulf of California in Mexico. The Department has now determined that this effort should receive a special fund designation and has appointed a coordinator for this multi-state effort.

The NRCS has earmarked funds to be used for the Colorado River Basin Salinity Control Program and has designated this an area of special interest. This was done at the urging of this Senate subcommittee. The Forum appreciates the efforts of the subcommittee in this regard. Since the designation, there has been earmarked about \$4.5 million annually. The states added about \$1.5 million in up-front cost-sharing and local farms, we estimate, contributed about another \$2.0 million. The plan for water quality control of the river prepared by the Forum, adopted by the states, and approved by the EPA requires that the USDA portion of the effort to be funded at \$12 million. Hence, there is a shortfall from the Federal designated funds of about \$7.5 million. State and local cost-sharing is triggered by the Federal appropriation. The entire effort is only at about 40 percent of what is needed. The USDA indicated that a more adequately funded the total national EQIP program would result in more funds being allocated to the salinity control program. The Basin states have cost sharing dollars available to participate in on-farm salinity control efforts. The agricultural producers in the Upper Basin are waiting for their applications to be considered so that they might also cost share in the program.

The Forum urges that this subcommittee support the funding of more than \$200 million from the CCC in fiscal year 2002 for EQIP. The Forum also requests that this subcommittee advise the Administration that \$12 million of these funds be designated for the Colorado River Basin Salinity Control Program.

OVERVIEW

The Colorado River Basin Salinity Control Program was authorized by Congress in 1974. The Title I portion of the Colorado River Basin Salinity Control Act responded to commitments that the United States made, through a minute of the International Boundary and Water Commission, to Mexico with respect to the quality of water being delivered to Mexico below Imperial Dam. Title II of the Act established a program to respond to salinity control needs of Colorado River water users in the United States and to comply with the mandates of the then newly legislated Clean Water Act. Initially, the Secretary of the Interior and the Bureau of Reclamation were given the lead Federal role by the Congress. This testimony is in support of funding for the Title II program.

After a decade of investigative and implementation efforts, the Basin states concluded that the Salinity Control Act needed to be amended. Congress agreed and revised the Act in 1984. That revision, while keeping the Department of the Interior as lead coordinator for Colorado River Basin salinity control efforts, also gave new salinity control responsibilities to the Department of Agriculture. Congress has charged the Administration with implementing the most cost-effective program practicable (measured in dollars per ton of salt removed). It has been determined that the agricultural efforts are some of the most cost-effective opportunities.

Since Congressional mandates of nearly three decades ago, much has been learned about the impact of salts in the Colorado River system. The Bureau of Reclamation has conducted studies on the economic impact of these salts. Reclamation recognizes that the damages to United States' water users alone are hundreds of millions of dollars per year.

The Colorado River Basin Salinity Control Forum (Forum) is composed of gubernatorial appointees from Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming. The Forum has become the seven-state coordinating body for interfacing with Federal agencies and Congress to support the implementation of a program necessary to control the salinity of the river system. In close cooperation with the Federal agencies and under requirements of the Clean Water Act, every three years the Forum prepares a formal report analyzing the salinity of the Colorado River, anticipated future salinity, and the program necessary to keep the salinities at or below the levels measured in the river system in 1972.

In setting water quality standards for the Colorado River system, the salinity concentrations measured at Imperial, and below Parker, and Hoover Dams in 1972 have been identified as the numeric criteria. The plan necessary for controlling salinity has been captioned the "plan of implementation." The 1999 Review, Water Quality Standards for Salinity, Colorado River System, includes an updated plan of implementation. In order to eliminate the shortfall in salinity control resulting from inadequate Federal funding for the last several years for USDA, the Forum has determined that implementation of the salinity control program needs to be accelerated. The level of appropriation requested in this testimony is in keeping with the agreed to plan. If adequate funds are not appropriated, State and Federal agencies involved are in agreement that damage from the high salt levels in the water will be widespread and very significant in the United States and Mexico.

STATE COST-SHARING AND TECHNICAL ASSISTANCE

The authorized cost sharing by the Basin states, as provided by FAIRA, was at first difficult to implement as attorneys for USDA concluded that the Basin states were authorized by FAIRA to cost share in the effort, but the Congress had not given USDA authority to receive the Basin states' funds. After almost a year of exploring every possible solution as to how the cost sharing was to occur, the states, in agreement with the Bureau of Reclamation, with state officials in Utah, Colorado and Wyoming and with NRCS State Conservationists in Utah, Colorado and Wyoming, agreed upon a "parallel" program wherein the states' cost sharing funds will be used. We are now several years into that program and, at this moment in time, this solution to how cost sharing can be implemented appears to be satisfactory.

With respect to the states' cost sharing funds, the Basin states felt that it was most essential that a portion of the program be associated with technical assistance and education activities in the field. Without this necessary support, there is no advanced planning, proposals are not well prepared, assertions in the proposals cannot be verified, implementation of contracts cannot be observed, and valuable

partnering and education efforts cannot occur. Recognizing these values, the “parallel” state cost sharing program expends 40 percent of the funds available on these needed support activities. Initially, it was acknowledged that the Federal portion of the salinity control program funded through EQIP was starved with respect to needed technical assistance and education support. The Forum is encouraged with the Administration’s determination that 19 percent of the EQIP funds will be used for technical assistance but observes that this is still not adequate funding for the technical assistance needed. The Forum urges this subcommittee to appropriate adequate funds for these support activities rather than to direct NRCS to borrow these needed funds from the CCC.

PREPARED STATEMENT OF THE COLORADO RIVER BOARD OF CALIFORNIA

Your support and leadership are needed in securing adequate funding for the U.S. Department of Agriculture with respect to its on-farm Colorado River Basin Salinity Control Program for fiscal year 2002. This program has been carried out through the Colorado River Basin Salinity Control Act, since it was enacted by Congress in 1974. With the enactment of the Federal Agricultural Improvement and Reform Act (FAIRA) in 1996, specific funding for salinity control projects in the Colorado River Basin were eliminated from the Federal budget, and aggregated into the newly created Department of Agriculture Environmental Quality Incentive Program (EQIP) as one of its program components. With that action, Congress concluded that the salinity control program could be more effectively implemented as one of the components of the EQIP. Prior to FAIRA, the Department of Agriculture had specific line item funding for salinity control projects as high as \$14.7 million, but in recent years the level of appropriations have been reduced to between \$3.4 and \$5.1 million which is inadequate to ensure that water quality standards in the Colorado River, with regards to salinity can be met. California’s Colorado River water users are presently suffering economic damages in the hundreds of million of dollars per year due to the river’s salinity.

The Colorado River Board of California (Colorado River Board) is the state agency charged with protecting California’s interests and rights in the water and power resources of the Colorado River System. In this capacity, California along with the other six Basin States through the Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin States’ salinity control efforts, established numeric criteria, in June 1975, for salinity concentrations in the River. These criteria were established to lessen the future damages in the Lower Basin States of Arizona, California, and Nevada, as well as assist the United States in delivering water of adequate quality to Mexico in accordance with Minute 242 of the International Boundary and Water Commission. The goal of the Colorado River Basin Salinity Control Program is to offset the effects of water resource development in the Colorado River basin after 1972 rather than to reduce the salinity of the River below levels that were caused by natural variations in river flows or human activities prior to 1972. To maintain these levels, the salinity control program must remove 1,480,000 tons of salt loading from the River by year 2015. In the Forum’s last report entitled 1999 Review, Water Quality Standards for Salinity, Colorado River System released in June 1999, the Forum found that additional salinity control measures were necessary to meet the implementation plan that had been adopted by the seven Colorado River Basin States and approved by the Environmental Protection Agency. Since implementation of the EQIP, Federal allocations by the Department of Agriculture have not equaled the Forum’s identified funding needs for the Department of Agriculture’s portion of the program. The Forum identified a “backlog” of salinity control measures which stands at 384,000 tons. This is in addition to future controls designed to lower the River’s salt loading by 372,000 tons by 2015 in order to meet the established salinity standards. The Forum has presented testimony to Congress in which it has stated that the rate of implementation of the program beyond that requested by the past President is necessary.

The President’s request for funding the Department of Agriculture in fiscal year 2002 is unknown at this time, however, the Colorado River Board urges that the subcommittee support funding of more than \$200 million from the Commodity Credit Corporation in fiscal year 2002 for EQIP. Of the amount to be appropriated for EQIP, the Colorado River Basin Salinity Control Forum, at its meeting in Henderson, Nevada, in October 2001, recommended a funding level of \$12.0 million for on-farm salinity control in the Colorado River Basin for fiscal year 2002 to maintain water quality consistent with the established standards. This subcommittee should advise the Administration that \$12 million of these funds be designated for the Col-

orado River Basin Salinity Control Program. These Federal dollars, if earmarked, would be augmented by state cost sharing of 30 percent with an additional 30 percent provided by the agricultural producer with whom the Department of Agriculture contracts for implementation of salinity control measures. The Colorado River Board supports the recommendation of the Forum. The salinity control program has proven to be a very cost effective approach to help mitigate the impacts of higher salinity. Continued Federal funding of the program is essential.

In addition, the Colorado River Board recognizes that the Federal government has made significant commitments to the Republic of Mexico and to the seven Colorado River Basin States with regard to the delivery of quality water to Mexico. In order for those commitments to be honored, it is essential that in fiscal year 2002 and in future fiscal years, the Congress provide funds to the Department of Agriculture to allow it to continue providing needed technical support to the producers for addressing salinity control in the Basin.

The Colorado River is, and will continue to be, a major and vital water resource to the 17 million residents of southern California as well as throughout the Lower Colorado River Basin. As stated earlier, preservation of its quality through an effective salinity control program will avoid the additional economic damages to users of Colorado River water in California, Arizona, and Nevada.

The Colorado River Board greatly appreciates your support of the Federal/State Colorado River Basin Salinity Control Program and again asks for your assistance and leadership in securing adequate funding for this program.

PREPARED STATEMENT OF COLORADO STATE UNIVERSITY

Mr. Chairman, Members of the Subcommittee, my name is Anthony Frank. I am Vice President for Research and Information Technology at Colorado State University, located in Fort Collins, Colorado. I appreciate this opportunity to submit my testimony for the record of proceedings on the fiscal year 2002 Department of Agriculture Budget. I am happy for this opportunity to thank you for your previous support of the Russian Wheat Aphid research program and the Center for Economically Important Infectious Animal Diseases. I would like to update you on these two programs.

As you know, this Committee has provided federal funds to support Russian Wheat Aphid (RWA) research at Colorado State University. The Russian Wheat Aphid research program is a five-year \$1.25 million (\$250,000 per year) initiative to develop methodologies that will control the aphid and diminish the significant costs of lost wheat production and insecticide applications in western wheat producing areas. We are entering our final year of research activities for which we require federal financial support.

In 1997, Colorado experienced its worst RWA infestation in 10 years, costing about \$10 million in insecticide application alone. In 2000, RWA damage was widespread and especially threatening throughout the wheat growing region. This pest costs wheat producers in Colorado alone, where the RWA is especially troublesome, over \$11 million per year in direct economic loss.

Through Federal, State government, and private assistance, CSU researchers have made significant progress in combating the RWA. About \$1 million per year is invested in RWA research and outreach from state, university and industry sources. The most notable achievement is the creation and production of the first commercial variety of RWA resistant wheat, called "Halt." After seven years of extensive development and testing, it became available to growers for planting in the fall of 1996. Early results indicate that farmers who plant "Halt" and experience RWA infestations can save a minimum of \$12 to \$13 per acre. In the worst year of RWA infestation, the elimination of insecticide treatments alone would have saved Colorado farmers at least \$13.8-\$15 million. Since the introduction of "Halt," four other wheat cultivars have been released: "Prairie Red," "Prowers," "Prowers 99," and "Yuma".

A long-term solution to the Russian wheat aphid problem requires the development of additional cultivars with multiple sources of resistance. The process of identifying, developing and testing takes several years. The accomplishments of this five-year program will lay a foundation for an on-going, but much less costly effort, which will continue, without federal funds, to provide growers with cost-effective, environmentally sound management of RWA into the future.

Your committee has also acknowledged the importance of research in animal infectious diseases and has supported our Center for Economically Important Animal Infectious Diseases for the past three years.

The Center for Economically Important Infectious Animal Diseases is working to prevent or control those infectious diseases that are the most economically devastating to the animal industry. Chief among these are vesicular stomatitis, bovine tuberculosis, transmissible spongiform encephalopathy (chronic wasting). Importantly, the Center, working closely with local USDA and CDC laboratories, represents a significant component of our nation's ability to respond to other emerging threats to animal agriculture.

Despite the fact that vesicular stomatitis has been present since 1995, very little is known about it. The virus emerges and then disappears. It appears to be concentrated in the Southwest, Rocky Mountains and Great Plains and to affect primarily cattle, horses and swine. Scientists haven't been able to identify how the virus is transmitted, nor identify its host. And, equally important, scientists don't know if the disease can be spread to other species.

Bovine tuberculosis infects approximately 50 million cattle. It is a recognized cause of tuberculosis in humans. Tuberculosis in cattle impacts milk production, weight and reproduction. This disease costs cattlemen approximately \$378 million annually. Although much progress has been made in controlling this disease in the U.S., there is still considerable threat to beef herds primarily due to the inadequate testing and quarantine of steers entering from Mexico and the lack of an effective diagnostic tool that can be used on the farm.

Chronic wasting disease is a strain of transmissible spongiform encephalopathies. "Mad cow disease" falls into this category. Chronic wasting disease has been showing up in deer and elk along the northern Front Range of Colorado. Very little is known about how this disease is transmitted or its potential for transmission to related species.

During the past three years, the Center has been involved in many research projects and is recognized nationally and internationally as the leading entity in the field of infectious animal diseases and food safety pathogens. During this time, it has made major contributions related to the following animal diseases:

Vesicular Stomatitis

- Development of a laboratory test that is better and faster for detecting VS virus in infected animals and insects.
- Use of Geographical Information Systems software to understand how the disease spreads and why some animals get the disease.
- Collection of data to determine how the virus is maintained in the environment when it is not causing disease outbreaks.

Mycobacterium bovis and Mycobacterium tuberculosis

- Development of a laboratory test that can identify a greater percentage of animals shedding the bacterium, and development of a similar laboratory test for captive elephants and other non-domestic species.

Mycobacterium avium subsp. paratuberculosis (Johne's disease)

- Development of more sensitive laboratory tests for use in young cattle so that infected animals can be removed as early as possible to decrease spread and reduce costs.

Food safety

- Determination of the optimal type and number of diagnostic tests for identifying *Toxoplasma gondii* in pigs in order to increase cost-effectiveness while maintaining sensitivity.

Clostridium perfringens

- Development and optimization of tests to detect *C. perfringens* in equine fecal samples and environmental samples.
- Identify some of potential risk factors for future development of a plan to prevent this disease in foals.

Brucella abortus

- Development and testing of new oral formulations of vaccine for use in bison and wild ungulates in Yellowstone National Park and elsewhere, as conventional intra-muscular injections are not easy to use in wild species.

Continued appropriations will enable the Center to advance its work in the following areas: (1) detection of economically critical diseases early, including the development of diagnostic tests that may be performed on the farm; (2) evaluation of prevention strategies, including vaccination programs for efficiency and cost effectiveness; (3) analysis of the impact of animal movement and trade on the spread of infectious diseases; and (4) using analytical tools, including risk assessment and

geographic information systems, determination of risk of the spread of economically critical infectious diseases.

Once again, I thank you for the financial investment you have made to the Russian Wheat Aphid research program and to the Center for Economically Important Animal Infectious Diseases and look forward to your continued support.

PREPARED STATEMENT OF COLUMBIA UNIVERSITY

Mr. Chairman, thank you for this opportunity to submit a statement for the Outside Witness Hearing Record. This statement provides a recommendation to improve and refine one of USDA's primary missions and goals relating to U.S. agriculture, the development of world supply and demand estimates for agricultural production and products.

The supply and demand analysis that USDA conducts requires the most accurate tools and mechanisms available. Columbia University's International Research Institute for Climate Prediction is recognized as the leader in climate modeling and interannual to seasonal forecasting. The IRI's partnership with USDA in would result in improved supply and demand estimates, and therefore be of immense benefit to the U.S. agricultural economy. The details of this proposed linkage are discussed below.

OBJECTIVES

(1) \$1 million for the involvement of IRI analysis and expertise to utilize improved and available tools and mechanisms for foreign agricultural supply and demand estimates. (2) \$1 million for support of the IRI's Center for Health and Food Security for the development of an independent institution that will focus on Africa and work cooperatively with the Federal Government in the accomplishment of USDA missions and goals.

BACKGROUND

USDA's World Supply and Demand estimates for agricultural products could utilize, but currently do not, the most sophisticated and accurate analytical tools available. The importance of advanced planning in crop production and reserve stocks in times of fluctuating foreign demand can assist the agricultural economy in maintaining financial stabilization and provide warnings to mitigate foreign famine. Foreign draught and famine, in addition to the tolls of human life and suffering, cause social and political unrest in third world countries, contributing to instability and economic hardships on third world national economies. Improved supply and demand estimates assist domestic producers and the entire agricultural economy, as well as provide the advance planning necessary to avoid or minimize damage in third world economies.

Columbia University's International Research Institute for Climate Prediction has developed the world's most accurate and long-range climate models and forecasting techniques in the areas of temperature and precipitation variability from average conditions. These two factors determine the surplus or deficit in foreign agricultural production. USDA does not currently utilize IRI analysis or input. Improvement of the accuracy of USDA's long-range supply and demand estimates could be achieved with the involvement of IRI analysis and expertise in the an effort to obtain the necessary and available tools and mechanisms for foreign agricultural supply and demand estimates.

Africa represents the most vulnerable continent to temperature and precipitation variations caused by climate forcing agents such as El Niño and La Niña. The IRI is establishing a Center for Health and Food Security that will integrate global interannual to seasonal forecasts with regional climate modeling to provide the most accurate climate forecasting and predictive analysis for private and governmental decision makers. The agricultural component of this effort is crucial to the production of USDA's supply and demand estimates, and also to key planting decisions both within the U.S. and abroad. The IRI's Center for Health and Food Security will focus on Africa and function as an independent institution that will work cooperatively with the Federal Government in the accomplishment of USDA missions and goals.

Thank you for this opportunity to submit this proposed linkage for the Subcommittee's consideration in deliberations on the fiscal year 2002 Agriculture Appropriations Bill.

PREPARED STATEMENT OF COMMUNITY MEDICAL CENTERS

Mr. Chairman and Members of the Subcommittee: My name is Dr. Philip Hinton and I am the Chief Executive Officer of Community Medical Centers in Fresno, California. Community Medical Centers is a not-for-profit, locally owned healthcare corporation that is committed to improving the health of the community. I am pleased to provide the subcommittee with a request for assistance in securing Federal monies for a critical project in the Central San Joaquin Valley that would improve healthcare delivery to the growing Hispanic and minority populations by creating a network of clinics accessible to the rural areas. These populations in the five county area of Fresno, Madera, Tulare, Kings and Mariposa face some of the most devastating and worst health outcomes in the state of California and in the nation:

- the third highest asthma mortality rate in the nation;
- the highest rates of teen pregnancy in the state;
- the highest incidence of diabetes among the Hispanic population
- late or no prenatal care for pregnant women
- greater likelihood for newborns to be of low birth weight than the rest of the state
- some of the lowest immunization rates in the nation (62 percent at age 2 versus 79 percent nationally)
- the highest rates of syphilis in the state.

These health outcomes are not acceptable and yet they exist because of the following reasons:

- Limited access to care*
 - Low ratio of primary care providers to population. Fresno County has 178 physicians/100,000 population vs. 235/100,000 in the state.
- Virtually no specialist care located in rural areas*
 - Isolation of rural communities from urban areas and poor public transportation.
- Financial constraints*
 - Many people are without health insurance
 - Accessing healthcare in the urban areas results in a day's lost wages
 - Lack of childcare providers means that patients must bring their entire family with them when they visit the clinic.
- Educational issues concerning health*
 - Lack of understanding of preventive care
 - Cultural barriers to addressing health issues before they become acute crisis
- Language barriers*
 - Over 100 languages are spoken in the area

Coupled with high unemployment rates that are twice the state and three times the national average, and adults and children living below the poverty line hovering at 25 percent and 32 percent respectively, the statistics and indicators point to the need for aggressive action to address the tremendous health care needs of the population in this five county area.

Community Medical Centers proposes to address this health situation with a pilot project to improve the health of farm workers and residents of the rural communities who make up 41 percent of the population of the region.

Community Medical Centers has proposed developing a collaborative network that will include local healthcare providers, Federally Qualified Health Centers, county health and human services agencies, local hospitals, dentists, schools, churches and local communities. The network will work to aggressively deliver both preventive and primary health care to the people of the five county region. The new Regional Health Center on the campus of the Regional Medical Center in downtown Fresno will be the center for coordinating these activities. The new Regional Health Center is just one component of a more comprehensive, \$210 million medical complex that will also include a new facility to house Level I burn and trauma services, emergency services, in-patient surgery, cardiac services and intensive care beds as well as a University of California San Francisco (UCSF) Medical Education and Research Center to house the teaching program. The Regional Health Center will deliver primary and specialty care, offer easy access to higher level care in an inpatient and outpatient setting, and access the faculty and residents of the UCSF-Fresno Medical Education Program.

This \$35 million project will:

- Improve access to the rural areas by partnering with existing centers and local healthcare providers to provide access for all patients and utilize and coordinate mobile health care units to go into the areas that are under-served. In addition, provide trained bilingual personnel to qualify people for health care programs and educate them about preventive care.

- Focus on preventive care and high prevalence diseases by offering asthma education and management programs; early diagnosis, dietary and medical management of diabetes; teen pregnancy prevention programs; prenatal care; screenings for cancer, diabetes and high blood pressure; and dental and mental health services.
- Result in a healthier community by providing primary care to a significant portion of the population and reducing their dependency on hospital emergency rooms for these services; improve people's quality of life and health thereby reducing hospital admissions for asthma, diabetes, hypertension and complications associated with these diseases; reduce the number of premature births.
- Realize significant savings in medical costs by focusing on the health needs of the population and emphasizing prevention and disease management as opposed to depending on hospitalization for primary care. We predict a 20 percent decrease in emergency room visits and hospitalization that would result in a significant savings of \$18 million per year.

The human statistics point to the need to address this situation now before it progresses to a crisis. Community Medical Centers is working with the County of Fresno to contribute \$17.5 million of state and local monies toward this pilot project. These monies, coupled with an additional \$17.5 million from the Federal government, would provide key funding support and ensure completion of this critical health care initiative facing our community.

We have identified the USDA Rural Community Facilities Loans and Grants program funded by the appropriation bill for Agriculture, Rural Development and Related Agencies as a source of funds. Because our pilot program would serve a vastly under-served rural population with significant health care needs in a five county area, we request your assistance in including a \$17.5 million "soft" earmark of these funds to establish a comprehensive primary care and disease prevention program for the residents of these areas. Language in the bill's accompanying report acknowledging the Committee's understanding of our need may prompt the USDA's reviewing authorities to look more favorably on our application for program funding, an application process that we are committed to undertake.

Enclosed is a recent article in the Fresno Bee that highlights the crisis in healthcare that we are facing in the area. The emergency departments in area hospitals are overcrowded and inundated by people who could best be served in a primary care setting that we are proposing. Unless, this critical situation is addressed soon, the conditions will only worsen.

We appreciate your attention to this matter and we hope that you will favorably consider our request to improve healthcare delivery in the Central San Joaquin Valley in California.

PREPARED STATEMENT OF THE COUNCIL FOR AGRICULTURAL RESEARCH, EXTENSION,
AND TEACHING

Thank you, Mr. Chairman. I appreciate the opportunity to provide testimony again this year in support of the highly successful research, education, and extension partnership between the United States Department of Agriculture (USDA) and the Land-Grant University System.

My name is Daniel M. Dooley, Chairman of the Council for Agricultural Research, Extension, and Teaching, commonly called CARET. CARET is a national group of lay support persons working on behalf of the Land-Grant University System. The CARET group, a collaboration of farmers, ranchers and others interested in maintaining America's competitive edge, was formed a number of years ago for the expressed purpose of enhancing national support and understanding of the important role played by the land-grant colleges in the food and agriculture systems, as well as the role of this system in enhancing the quality of life for all citizens of the nation.

Each of the CARET members from across the land can share from personal experience the importance of maintaining a competitive technological edge. In my particular case, I have benefited from university research that has substantially improved production and reduced costs by limiting chemical usage.

I will not burden you with a recitation of all of the contributions that the Land-Grant University System partnership with USDA has made to America's food, fiber, and agricultural production system. I do want you to know, however, that this unique partnership has been an essential ingredient to the success of American agriculture and the health of the American public—in essence, the foundation of this nation's way and quality of life.

Suffice it to say, the Land-Grant University System is very unique and has been a critical component to the long-term success of the nation's agricultural community. It has provided technology and education enabling farmers, ranchers, and other stewards of natural resources in this country to manage their productive resources in a way that is efficient, yields the greatest and most nutritious quality and quantity of food in the world, and protects the natural environment. The contributions of the Land-Grant University System to American agriculture has had an enormous impact on the nation's economy, our balance of trade, the quality of our workforce, and the health and quality of life for every American citizen. Indeed, the greatest single investment you can make in the long-term health of the American people is to ensure that appropriate investments are made in future technology for the food and fiber system. Unfortunately, this research and education system that has given so much to the country sometimes is taken for granted.

The purpose of my testimony today is to request support for the fiscal year 2002 budget recommendations of the National Association of State Universities and Land-Grant Colleges (NASULGC) Board on Agriculture. CARET joins NASULGC in calling for a doubling of the nation's agricultural research and education funding over the next five years—\$200 million in fiscal year 2002. CARET believes that this new funding will help the Land-Grant University System meet the challenges it will be called upon to address in maintaining a highly nutritious and healthy food supply, revitalizing our nation's communities (both rural and urban), cultivating an educated workforce, and protecting our natural environment. CARET also supports continued funding for the Initiative for Future Agriculture and Food Systems (IFAFS).

Although the United States has the safest food supply in the world, millions of Americans are afflicted by food-borne illnesses each year. The young, elderly, and people with compromised immune systems are the most susceptible. Estimates of the annual health care costs for these illnesses range from \$2.9 billion to \$7 billion. Greater investment in the agricultural research and education system could help reduce the number of food-related illnesses and costs. Additionally, great opportunities exist to utilize technology to tailor food for specific health and nutrition benefits if proper investments are made.

Conservation and economic growth require a delicate balancing act. While agriculture presents challenges to the environment, it also knows that the environment must be respected and protected. Science and education are helping the agricultural industry to protect fragile ecosystems and deal with urban expansion by developing sustainable production systems that protect the long-term productivity of essential resources. Funding of agricultural science and education programs will continue to ensure an adequate and safe food supply and the protection of our precious natural resources.

For four decades, agricultural production in the United States has enabled an unyielding string of successes in our trade balance. Today, experts project that at least \$60 billion in food and raw materials—one-third of the nation's production will be sold overseas. Agriculture is one area in the nation's economy without a trade deficit. This competitive advantage should not be lost because of insufficient investments in our agricultural research and education system.

All of the technology and knowledge in the world are useless without the well-trained mind of someone to learn from it, apply it, and expand it. Undergraduate education in colleges of agriculture and life sciences is largely neglected in Federal funding. All of the nation's students need to be equipped to become leaders in our nation's workforce. Their future and the nation's future are one in the same, and the nation can ill afford to poorly invest in this critical area.

Tomorrow's science comes with a high price tag, with great advances in biotechnology, genetics, satellite imagery, and other highly technical fields looming on the horizon. Only if funding sources are adequate will new scientific investigation:

- build agricultural production efficiency and profitability
- protect the nation's environment
- revitalize and sustain our nation's communities
- bring diverse student populations into the food and agricultural sciences

The budget recommendations that are being advanced by CARET on behalf of the Land-Grant University System are the result of a broad number of stakeholder meetings and receipt of substantial input from those that benefit from the research and education activities.

It is the belief of the CARET membership that doubling of the nation's agricultural research and education funding over the next five years—\$200 million in fiscal year 2002—is the only way to equip American agriculture for the 21st Century. This amount of funding will facilitate the maintenance of America's competitive edge throughout the broad range of the production, processing, distribution, and retail

system that moves commodities around the world. CARET also firmly believes that this funding level for agricultural science and education will enhance the health and welfare for our own citizenry as well as the people of the world. Certainly, we do not want the recent headlines about the food supply in the European community and other places in the world to be the future headlines in American newspapers.

So, when you go home tonight and sit down at your dinner table, just remember that you do not have to think or worry about: Will there be enough food for me and my family to eat? Will this food harm or make my family and me sick if we eat it?

However, if adequate funding for agricultural research and education is not provided now and in the future, your children and grandchildren may have to worry about these and many other questions in relation to the food and fiber that the nation produces and consumes.

Thank you for this opportunity to provide this testimony in support of the appropriations for continuing the fine work being done and the work that must be done at America's Land-Grant University System—a true national treasure!

PREPARED STATEMENT OF DEFENDERS OF WILDLIFE

On behalf of our 435,000 members and supporters nationwide, Defenders of Wildlife thanks you for the opportunity to submit testimony on the fiscal year 2002 Agriculture Appropriations bill. Defenders is a national, non-profit organization dedicated to the protection of wild animals and plants in their natural communities. We focus our efforts on the accelerating rate of extinction of species and the associated loss of biological diversity, and on habitat alteration and destruction. Consequently, we have a special interest in the U.S. Department of Agriculture's natural resource protection programs. These programs include the Wildlife Habitat Improvement Program (WHIP), the Wetland Reserve Program (WRP), the Farmland Protection Program (FPP), the Environmental Quality Incentives Program (EQIP), the Conservation Reserve Program (CRP), and the Conservation Reserve Enhancement Program (CREP). We also strongly support the proposed Conservation Security Act (CSA) because of its potential beneficial impacts on wildlife habitat and ecosystem quality.

Most farmers who volunteer to participate in the USDA's natural resource protection programs are turned away due to lack of funding. Defenders of Wildlife therefore strongly supports the fiscal year 2002 appropriation of \$150 million for WHIP, \$300 million for WRP, \$200 million for FPP, and \$550 million for EQIP, and adequate funding for other natural resource protection programs offered through the USDA. We oppose any efforts to zero-fund WHIP, WRP, and FPP in fiscal year 2002.

Effective implementation of USDA conservation programs requires increased technical assistance at the field level. Nominal funding levels for resource conservation technical assistance and research have remained practically unchanged over the last few years, despite a USDA mandate to implement more conservation programs over a broader geographical area. In real terms, Federal funding for technical assistance to deliver conservation programs, and for the research and development of new conservation technologies, has actually declined over the last ten years. This situation has resulted in the inability of reduced staffs to provide effective and efficient service to the growing numbers of producers waiting to participate in conservation programs. Defenders of Wildlife therefore encourages the fiscal year 2002 appropriation of \$1,710,000 for Conservation Technical Assistance in support of USDA conservation programs.

A major constraint to improving the effectiveness and efficiency of existing USDA conservation programs is the lack of adequate monitoring and evaluation of field level projects and their impacts on natural resource quality, especially native wildlife and their habitats. Defenders of Wildlife believes that \$5 million should be allocated to defining and implementing a pilot monitoring program(s) over the next two years to evaluate conservation program impacts toward achieving improved native wildlife habitat, water and air quality, and soil health. Defining and implementing a pilot monitoring program(s) would be a cooperative effort involving the United States Department of Agriculture, the United States Environmental Protection Agency, the United States Fish and Wildlife Service, the National Marine Fisheries Service, and the United States Geological Survey. The experience from this pilot effort would be used in designing a permanent monitoring and evaluation program.

Applied research is lagging behind increased regulatory requirements that mandate producers to improve the environmental and ecological performance of their operations. Defenders of Wildlife proposes that producers receive incentives for re-

search, development, and testing of new conservation management practices. Such a program would require a fiscal year 2002 appropriation of \$10 million.

The Land Grant Universities and the USDA Agricultural Research Service also require increased financial support for research and development of production practices that, to the extent possible, simultaneously meet profit and production goals and reduce adverse environmental impacts on wildlife habitat, water, air, and soil resources. Defenders of Wildlife supports funding of this program at \$20 million for fiscal year 2002.

In fiscal year 2002, the USDA has a tremendous opportunity to assist agricultural producers to be effective stewards of natural resources on their lands. The appropriations amounts recommended in this testimony would make realization of that opportunity possible.

On behalf of Defenders of Wildlife, I thank you again for this opportunity to submit testimony.

PREPARED STATEMENT OF EASTER SEALS

Easter Seals appreciates the opportunity to report on the notable accomplishments of the USDA Cooperative State Research, Education, and Extension Service (CSREES) AgrAbility Program and request that funding for the AgrAbility Program be increased to \$4.6 million in fiscal year 2002.

The AgrAbility Program is an essential, unduplicated, hands-on resource for farmers, ranchers, and farmworkers with disabilities and their families. AgrAbility is the only USDA program dedicated exclusively to helping agricultural producers with disabilities. The Secretary of Agriculture hailed the importance of the program at an event held at USDA in July 2000 to celebrate the tenth anniversary of the Americans with Disabilities Act. This event was held to celebrate AgrAbility as USDA's contribution to fulfilling the promise of the Americans with Disabilities Act. It demonstrates the value of public-private partnership by securing donations of funds, talent, and materials to magnify the impact of a modest Federal investment. The fiscal year 2001 appropriation of \$2.8 million funds 18 state programs.

DISABILITY & AGRICULTURE

Agricultural production is one of the nation's most hazardous occupations. Each year, approximately 200,000 people working in agriculture experience injuries that limit their ability to perform essential farm tasks. Tens of thousands more become disabled as a result of non-farm injuries, illnesses, other health conditions, and the aging process. Approximately 500,000 agricultural workers nationwide have physical disabilities that prevent them from performing one or more essential farm tasks.

The presence of a disability jeopardizes rural and agricultural futures for many of these individuals. Rural isolation, a tradition of self-reliance, and gaps in rural service delivery systems frequently prevent agricultural workers with disabilities from taking advantage of growing expertise in modifying farm operations, adapting equipment, promoting farmstead accessibility, and using assistive technologies to safely accommodate disability in agricultural and rural settings. Yet, with some assistance, the majority of disabled agricultural workers can continue to earn their livelihoods in agriculture and participate fully in rural community life.

AGRABILITY'S ROLE AND ACCOMPLISHMENTS

The AgrAbility Program was established under the 1990 Farm Bill in response to the needs of farmers with disabilities. The Farm Bill authorizes the Secretary of Agriculture to make grants to Extension Services for conducting collaborative education and assistance programs for farmers with disabilities through state demonstration projects and related national training, technical assistance, and information dissemination. Easter Seals is proud to be a partner with the University of Wisconsin Extension Service to provide the national training and technical assistance portion of AgrAbility. Thousands of people in states with and without state AgrAbility projects are aided through this initiative.

AgrAbility combines the know-how of the Extension Service and disability organizations to provide people with disabilities working in agriculture the specialized services that they need to safely accommodate their disabilities in everyday farm operations. AgrAbility received strong bipartisan support during the 1998 reauthorization of the USDA research and education programs, and was extended through fiscal year 2004. The \$6 million authorization level for AgrAbility was continued.

Under the statute, state and multi-state AgrAbility projects engage Extension Service agents, disability experts, rural professionals, and volunteers to offer an

array of services, including: identifying and referring farmers with disabilities; providing on-the-farm technical assistance for agricultural workers on adapting and using farm equipment, buildings, and tools; restructuring farm operations; providing agriculture-based education to prevent further injury and disability; and, upgrading the skills of Extension Service agents and other rural professionals to better promote success in agricultural production for people with disabilities.

In 2001, USDA received an allocation from Congress of \$2.8 million. These funds support eighteen state projects in Colorado, Delaware, Illinois, Indiana, Iowa, Kentucky, Minnesota, Mississippi, Missouri, Nebraska, North Carolina, North Dakota, Pennsylvania, South Dakota, Tennessee, Texas, Utah, and Wisconsin.

AgrAbility provides customized assistance to farmers, ranchers, and farmworkers with disabilities and their families. The nature and degree of assistance depends on the individual's disability, needs and agricultural operation. For Example:

- Grover Greer, of Anguilla, Mississippi, has farmed in the Mississippi Delta for 26 years. Thanks to the work of AgrAbility and other state agencies, his son is now doing the same. Born with cerebral palsy, Jonathan, 17, operates a 25-acre turfgrass business. A hoist and hand controls allow Jonathan to independently operate his tractor to irrigate and maintain the grass. While they anticipate the business growing and providing Jonathan with employment, Grover says, "The more important point is that he is happy and self-sufficient." Jonathan is putting to good use his abilities and motivation to be a successful turfgrass farmer.
- Max Rodemeyer from Latimer, Iowa was diagnosed with Multiple Sclerosis in his twenties. Now in his forties, he has difficulty climbing, crouching and walking long distances. With these limitations, he was unsure whether or not he could continue to operate his 900-acre family farm. Through modifications recommended by Iowa AgrAbility, a joint effort between Iowa State University Extension and Easter Seals Iowa, Mr. Rodemeyer has been able to remain gainfully engaged in farming. Mr. Rodemeyer uses a Kawasaki Mule, All Terrain Vehicle to get from building to building and to check his crops. All of his tractors have lower and wider steps to make it easier for him to mount and dismount. Mr. Rodemeyer uses a special seed vacuum to load seeds into his planter, as he is not able to lift 50-pound bags. Through these modifications, and the assistance of Iowa AgrAbility, Max is doing what he always has done and what he wants to continue to do, farm.
- Richard Mauer, of Newport, Pennsylvania, has operated his 450-acre dairy farm since he purchased it from his father in 1966. Thirty years later, a stroke that left Mr. Mauer partially paralyzed threatened his ability to remain in farming. After reading about AgrAbility in a magazine, Mr. Mauer contacted AgrAbility for Pennsylvanians to seek assistance. AgrAbility staff helped Mr. Mauer make modifications to his farm including extra steps on tractors, a new more automated milking system with computerized monitors and automatic shut-off mechanisms, and a automatic wagon hitch that minimizes the number of times Mr. Mauer must climb on and off a tractor. These modifications have helped Mr. Mauer remain in farming, and his farm currently produces approximately 550 gallons of milk a day. He also serves as a mentor for other farmers with disabilities throughout Pennsylvania. Overall, AgrAbility Projects in 24 states along with the national project accomplished the following since 1991:
 - provided assistance, including nearly 5,000 on-site visits, to over 8,760 farmers, ranchers and farmworkers or their families affected by disability;
 - educated over 137,000 agricultural, rehabilitation, and health professionals on safely accommodating disability in agriculture;
 - recruited and trained more than 5,300 volunteers and peer supporters to assist farmers, ranchers and farmworkers with disabilities; and,
 - reached 9,500,000 people through more than 6,100 exhibits, displays, and demonstrations to increase awareness of the challenges affecting and resources available to farmers, ranchers and farmworkers with disabilities.
- Nationally, the AgrAbility technical assistance and education grant was awarded to Easter Seals national headquarters and the University of Wisconsin Extension Service in 2000. This new partnership is generating innovative and effective activities at the national level that will have a significant impact on the effectiveness of the state AgrAbility projects and the lives of farmers with disabilities. Some of the initiatives underway or planned at the national level include:
 - a national needs assessment conducted with state AgrAbility project staff that will identify priorities for designing new tools and training;
 - organizing a consensus conference with the Farm Foundation to engage leading agricultural interests in identifying and addressing concerns of farmers with disabilities;

- refining the AgrAbility website, including offering AgrAbility technical information and tools electronically that were previously only available in paper format;
- developing a comprehensive training package on rural case management with the Marshfield Clinic and National Farm Medicine Center; and,
- developing distance education programs for State AgrAbility Project staff to increase access to training.

IMPACT OF CURRENT FUNDING LEVELS

A funding floor of \$150,000 per state was set in the 1990 Farm Bill to assure that the state programs were appropriately resourced to meet diverse, statewide agricultural accommodation needs. However, because funding has not approached the \$6 million authorized level, state projects have only received slightly over \$100,000 per state. In the 1998 reauthorization of the USDA research and education programs, the Committee reaffirmed a commitment to that funding floor of \$150,000 per state. Easter Seals strongly supports full funding of state programs to assure that they continue to be effective for farmers with disabilities. The fiscal year 2002 request of \$4.6 million would bring all current states up to the \$150,000 level and would allow eight currently unserved states to implement AgrAbility programs.

AgrAbility projects are underfunded relative to need and objective. At the current funding level, only a few staff can be hired to provide statewide education and assistance to farmers with disabilities, educate rural professionals, recruit volunteers, and work with rural businesses on disability-related issues. Rising demand for services and the great distances that must be traveled to reach farmers and ranchers severely strains even the most dedicated of AgrAbility's outstanding staff. Easter Seals fears that failure to invest adequately in this worthwhile program will ultimately cause it to falter.

One of the consequences of limited funding is that, in every grant cycle, some states with existing AgrAbility programs and a demonstrated need for services, are not renewed and are forced to discontinue services to farmers with disabilities in that state. These states often have difficulty obtaining the access to the limited public and private funding sources that the Federal seed money granted them. More than a dozen states have sought AgrAbility funding without success. Other states, including Louisiana, Michigan, Montana/Idaho, New Hampshire, New Jersey, New York, South Carolina, Ohio, and Vermont, had USDA-funded AgrAbility projects in the past. Each of these states can demonstrate significant unmet needs among farm and ranch families affected by disability that AgrAbility could potentially address. Any loss of programs will greatly affect farmers with disabilities in states for whom AgrAbility is the primary resource through which they seek information and assistance on farming with a disability.

FUNDING REQUEST

The need for AgrAbility services has never been greater, and its accomplishments to date are remarkable by any standard. Easter Seals is proud to contribute to the ongoing success of the USDA-CSREES AgrAbility Program. Please support the allocation of at least \$4.6 million for AgrAbility in fiscal year 2002 to ensure that this valuable public-private partnership continues to serve rural Americans with disabilities and their families. Thank you for this opportunity to share the successes and needs of the USDA AgrAbility Program.

PREPARED STATEMENT OF FLORIDA STATE UNIVERSITY

Mr. Chairman, I would like to thank you and the Members of the Subcommittee for the opportunity to present testimony before this Committee. I would like to take a moment to briefly acquaint you with Florida State University (FSU).

Located in Tallahassee, Florida's capitol, FSU is a comprehensive Research I university with a rapidly growing research base. The University serves as a center for advanced graduate and professional studies, exemplary research and top quality undergraduate programs. Faculty members at FSU maintain a strong commitment to quality in teaching, to performance of research and creative activities and have a strong commitment to public service. Among the faculty are numerous recipients of national and international honors, including Nobel laureates, Pulitzer Prize winners as well as several members of the National Academy of Sciences. Our scientists and engineers do excellent research, have strong interdisciplinary interests, and often work closely with industrial partners in the commercialization of the results of their research. Having been designated as a Carnegie Research I University several years

ago, Florida State University currently is approaching \$125 million per year in research awards.

FSU will soon initiate a new medical school, the first in the U.S. in over two decades. Our emphasis will be on training students to become primary care physicians, with a particular focus on geriatric medicine-consistent with the demographics of our state.

Florida State attracts students from every county in Florida, every state in the nation, and more than 100 foreign countries. The University is committed to high admission standards that ensure quality in its student body, which currently includes some 192 National Merit and National Achievement scholars, as well as students with superior creative talent. We consistently rank in the top 25 among U.S. colleges and universities in attracting National Merit Scholars to our campus.

At Florida State University, we are very proud of our successes as well as our emerging reputation as one of the nation's top public universities.

Mr. Chairman, let me tell you about a project we are pursuing this year through the U.S. Department of Agriculture/Agricultural Research Service Account. Florida State University (FSU), Harbor Branch Oceanographic Institution (HBOI), and USDA's Agriculture Research Service (ARS) are collaborating on a five-year research and development program to design low-cost, energy efficient recirculating aquaculture production systems for marine species in new environments. These efforts will expand the aquaculture opportunities for subtropical marine species to inland sites throughout the southern United States.

There is an increasing global awareness of the need for sustainable aquaculture development. By the year 2025 global population is projected to reach 8.5 billion, with a projected demand for seafood of 120 million metric tons (MMT). Capture fisheries reached the carrying capacity more than ten years ago, but the demand for seafood has shown no signs of abating. The Food and Agriculture Organization (FAO) reported that in 1995 aquaculture only accounted for 26 percent of the total world harvest of food fish. In 1997, U.S. seafood imports increased both in volume and value with shrimp topping the list at 278,600 metric tons valued at \$2.7 billion dollars. Shrimp imports continue to be the second largest contributor to the U.S. trade deficit and it is expected that finfish imports will follow the same scenario. There remains a great need for U.S. aquaculture production to fill this void and relieve some of the harvest pressure on wild fish stocks.

Competition for access to the limited U.S. coastal land resources requires innovative approaches to develop and expand marine aquaculture into new environments. HBOI has work underway demonstrating that many saltwater species thrive in freshwater systems with the appropriate chemical makeup. Experimental and demonstration trials have shown that some species of marine fish and shrimp can be successfully acclimated and grown to market size in hard freshwater systems, thus, expanding the sites where marine species can be cultured.

In response to public concern about environmental protection of coastal waters and producer concern about biosecurity to protect farmed aquatic resources from disease and poor water quality, farmers are turning to recirculating aquaculture production systems. In many locations around the U.S., regulatory constraints already require the use recirculating aquaculture systems. In order to use these systems to produce marine finfish, we need to improve the filtration efficiency and develop cost effective recirculating production systems.

The objectives of the five-year research program are to: develop the culture technology to produce marine or brackish water species in new environments (i.e., fresh water); improve the energy efficiency (i.e., solar) and reduce the production costs for enclosed aquaculture production systems; and design low-cost recirculating systems for intensive aquaculture production. The goal of our work is to design a cost effective and energy efficient solar aquaculture system capable of sustained production of warm-water species throughout the year in colder climates. The research team will design and test low-cost recirculating nursery and growout production systems for marine finfish. Our design will also include a computer control system for all solar components, water and interior temperatures, recirculating systems, and other mechanical components. Findings will expand U.S. aquaculture production of salt-water species into new locals, result in better utilization of land resources and reduce the demand for imported aquaculture products.

The collaborating institutions are seeking an appropriation of \$1.7 million in fiscal year 2002 to support the development of sustainable marine aquaculture systems through the U.S. Department of Agriculture's Agricultural Research Service (ARS) account.

Mr. Chairman this is an excellent project that will yield great rewards for our nation and is just one of the many ways that Florida State University is making important contributions to solving some key problems and concerns our nation faces

today. Your support would be appreciated, and, again, thank you for an opportunity to present these views for your consideration.

PREPARED STATEMENT OF FRIENDS OF AGRICULTURAL RESEARCH—BELTSVILLE

Mr. Chairman, and Members of the Subcommittee, thank you for this opportunity to present our statement supporting funding for the Department of Agriculture's Agricultural Research Service (ARS), and especially for the Agency flagship research facility, the Henry A. Wallace Beltsville Agricultural Research Center (BARC), in Maryland. Our organization—Friends of Agricultural Research—Beltsville—is dedicated to supporting and promoting the Center's agricultural research, outreach, and educational mission.

Now without preliminaries, Mr. Chairman, we will go directly to the heart our recommendations, which are based on expressed industry needs and our consultations with the Department of Agriculture.

We first will list three high priorities where we recommend establishing new research positions. Second, we will suggest relatively new or ongoing research areas that need additional funding. Last, we will allude to other fundamental research topics and needs.

RECOMMENDATIONS FOR NEW POSITIONS

Biochemist or Molecular Biologist Position for Dry Bean Research.—American farmers annually plant two million acres to dry beans, generating a farm-gate cash value of approximately \$280 million. Farmers plant another 300,000 acres to snap beans for fresh markets and processing, generating approximately \$280 million annually. The United States is one the world's largest exporter of dry beans. Much of the export goes to Africa and Latin American, where dry beans provide excellent sources of protein, vitamins, minerals, and calories for the diets of hungry, low-income people. Beans are important to the American diet as well.

U.S. dry bean and snap bean production is constrained by persistent low yields and plant diseases. Production restraints are complex and poorly understood. Though traditional investigative approaches have produced several improved bean cultivars, further progress requires a more comprehensive, multidisciplinary approach. Thus, we are pleased to join the National Dry Bean Council in recommending a new scientific position within the Vegetable Laboratory for developing molecular markers to identify genes for improving yields and resistance to diseases. The new position will contribute to dry bean improvement throughout the United States and beyond.

Soil and Water/Hydrologist Position for Irrigation and Water Management Research in the Mid-Atlantic States.—Just in the past ten years, irrigation agriculture from New Jersey to Florida has grown by 20 percent. Irrigation agriculture in the region now totals almost five million acres. Yet irrigation expertise and research are lacking. Growers need better information to manage irrigation timing and drainage to improve profitability and protect the environment from associated crop production risks. They need information about efficient, safe use of waste (recycled) water, especially for irrigating turfgrass and ornamental landscapes, and protecting local and regional water quality. They need strategies to deal with sporadic drought conditions and competition among alternative demands for local and regional water supplies. We concur in recommending a new science position to address these expanding issues.

Research Position for Organic Farming Systems.—Certified organic cropland doubled from 1992 to 1997. Organic livestock sectors—eggs and dairy—grew even faster. Forty-nine states committed 1.3 million acres to organic production, two-thirds of them to crops in 1997. Almost half the states were raising certified organic livestock. Organic farming systems rely on cultural and biological pest management, virtually prohibiting synthetic chemicals in crop production and antibiotics or hormones in livestock production. Organic farming provides habitat for predators and parasites of crop pests. Organic farmers use planting, and harvesting dates and crop rotation to maintain soil fertility, and cycle animal and green manures as fertilizer. Approximately 2 percent of our best fruit and vegetable crop acreage—apples, carrots, lettuce, and grapes—was managed organically in 1997. Certified organic livestock production was less than one percent of total production but growing.

Several USDA agencies are active in the expanding the organic farming industry. Since the early 1990s BARC has been in at the forefront of research on organic and sustainable farming systems. The Center needs this new position to enhance and expand its support of this rapidly growing sector of American agriculture.

RECOMMENDATIONS FOR ONGOING WORK

Bio-mineral Soil Amendments for Nematode Control.—Losses to soil nematodes cost farmers billions every year. The soybean cyst nematode alone can cut soybean yields by 10 percent, often more. Citrus and vegetable crops also are vulnerable to intensive nematode damage. Growers are squeezed by expanding nematode infestations, developing nematicide resistance, and de-registration of traditional nematicides because of environmental concerns. BARC in cooperation with industry and others is pursuing new, more effective approaches to nematode control, including promising research lines using such re-cyclable soil amendments as animal wastes, composts, and mineral by-products. We recommend a substantial increase in funds supporting these promising approaches.

Animal Improvement Programs.—For many years America's dairy cows have steadily increased milk production at the rate of about 45 gallons per year. Approximately two-thirds of those increase trace to genetic progress. Much of the credit for that success stems from the cooperative national and international genetic evaluation programs of BARC's award winning Animal Improvement Programs Laboratory. Now under funded, the laboratory needs additional support to continue its historical support for the nation's dairy farmers, livestock and food industries, and American consumers.

OTHER RESEARCH OR INITIATIVES

Mr. Chairman, the foregoing includes only our most prominent recommendations. They are neither comprehensive nor exclusive. For instance, we recommend support for BARC's work on value-added products, co-utilization, and cooperation with industry to use foundry sand in soil amendments. Finally, we will note the exponential growth of a relative new field called "agricultural bioinformatics," which generally refers to using advanced computer expertise to support such studies as genomics, molecular biology, gene and chromosomal mapping, and database mining for genetic improvement.

Since our last statement before this Subcommittee, BARC has celebrated several milestone events marking the Center's long, distinguished record of leadership and accomplishment. In closing, we briefly will note selected BARC milestones and will allude to another milestone event planned for later this year.

Last June BARC celebrated its 90th anniversary year. The event—in conjunction with BARC's annual public field day—featured priceless period photos and great research accomplishments through the decades. Also in June, the Center was officially named the Henry A. Wallace Beltsville Agricultural Research Center in honor of former Secretary Henry Wallace. During Secretary Wallace's tenure, BARC grew and expanded, shifted its emphasis from applied research to "research into the laws and principles underlying agriculture in its broadest aspects."

In September, FAR—B was pleased to co-sponsor another in BARC's outstanding series of international symposia. This one, appropriately entitled Healthy Animals 2000, was markedly successful. Then just last month the American Society for Horticultural Science designated BARC a "Horticultural Landmark." The Society has declared only two other Historical Landmarks: Monticello, honoring our third President, and the Como Park Conservatory in St. Paul, Minnesota. Last, we note that BARC is planning a groundbreaking ceremony later this year to modernize the Beltsville Human Nutrition Research Center

Mr. Chairman, that concludes our statement. We are grateful for your past support of the BARC mission. And, we again thank you for the opportunity to present our testimony.

PREPARED STATEMENT OF FRIENDS OF THE NATIONAL ARBORETUM

Chairman Cochran and members of the Subcommittee, thank you for the opportunity to submit testimony in support of the U.S. National Arboretum (USNA) on behalf of Friends of U.S. National Arboretum (FONA)

In 1997 the Agricultural Research Service (ARS) commissioned development of a new Master Plan for the USNA. The new Master Plan was developed under contract with the ARS by a noted outside consultant and was essentially completed by mid-1999. Since fiscal year 2000, FONA and key Members of Congress have been urging implementation of the new Master Plan, which should start with the capital funding for the design and implementation of such long lead-time items as the new entrance from Bladensburg Road and the new visitor's center. FONA respectfully requests \$3,000,000 for planning, design and construction of the new entrance off

Bladensburg Road and \$110,000 for planning and design of the new Education and Visitors Center.

FONA is advised that starting in fiscal year 2002, the Gardens Unit as well as the Education and Visitor Services Unit will have to decrease staff because of budgetary constraints at the very time that the success of the facility and interest in horticulture is bringing increased number of visitors to the site. These units have not had a program increase since fiscal year 1996 and are further threatened by having funds diverted to meet increased utility and service costs. FONA strongly urges an increase in the USNA's operating budget equivalent to 7 FTE's for these key functions in fiscal year 2002.

The Congressionally mandated purposes of the USNA are research and education. As part of the ARS, the USNA has a strong research program. Yet an independent consultant recently found that it was not very visitor friendly. Its Gardens Unit as well as its Education and Visitor Services Unit are chronically underfunded, and these components of the education function cannot compete favorably against research projects for program funding within the ARS. It has been the urgent recommendation of FONA that funding of the facilities component of the USNA, including specifically the Gardens and Education and Visitors Services Units, should be removed from within the Plant, Microbial, and Insect Genetic Resources, Genomics and Genetic Improvement (301) program area and established as a stand-alone program area. FONA urges implementation of this recommendation in the appropriation for fiscal year 2002.

Thank you for your continued support of the national treasure that is our U.S. National Arboretum.

PREPARED STATEMENT OF THE COACHELLA VALLEY WATER DISTRICT; IMPERIAL IRRIGATION DISTRICT; THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA; AND SAN DIEGO COUNTY WATER AUTHORITY

This is a fiscal year 2002 budget request to provide \$2 million from the Department of Agriculture's wildlife habitat program for habitat conservation and enhancement in and around the Salton Sea area related to agricultural activities in Riverside and Imperial Counties in California. The requested funds would be used to conserve and enhance habitat that could be affected by agricultural water use efficiency improvements needed in order to provide water to meet urban water needs in southern California, and do so without adversely impacting the region's farm economy. More effective water use is a critical part of California's Colorado River Water Use Plan.

California's Colorado River Water Use Plan is a major undertaking by the State and its agencies that will enable California to reduce its reliance on Colorado River water by up to 800,000 acre-feet per year. In the past, California has taken up to 5.2 million acre-feet per year from the river; but due to increased use by other states, California must now find the means to live within its normal year apportionment of 4.4 million acre-feet. Key components of California's Colorado River Water Use Plan include core voluntary cooperative water conservation/transfers from agricultural use to urban use which are needed to meet California's water needs and maintain its urban and agricultural economies. At the same time, we must conserve and enhance critical wildlife habitats that could be affected by water conservation. California and its Colorado River water users will be making expenditures in the billions of dollars to implement California's Colorado River Water Use Plan.

The requested funds would be used to create lower salinity habitat in the Salton Sea deltas and surrounding areas, provide for wetland/upland restoration projects, and enhance piscivorous bird habitat. The local program implementing agency would be the Imperial Irrigation District.

Our collective agencies thank you for your consideration of this important funding request, and respectively request that the funding be part of the Department of Agriculture's fiscal year 2002 budget.

PREPARED STATEMENT OF THE HUMANE SOCIETY OF THE UNITED STATES

We appreciate the opportunity to provide testimony to the Agriculture and Rural Development Subcommittee on funding items of great importance to the Humane Society of the United States and its 7.7 million supporters nationwide. As the largest animal protection organization in the country, we urge the Committee to provide these priority funding items in the fiscal year 2002 budget:

—\$3.8 million increase for Animal Welfare Act Enforcement, broken down as follows:

- \$2.4 million increase for APHIS/Animal Welfare inspections
- \$1 million increase for APHIS/Investigative and Enforcement Services
- \$400,000 increase for ARS/Animal Welfare Information Center
- \$325,000 for Iowa's Leopold Center for Sustainable Agriculture to promote use of hoop barns, under the Cooperative State Research, Education, and Extension Service
- \$1,988,673 for Wildlife Services Methods Development to conduct 1st year of study evaluating relative effectiveness of non-lethal and lethal predator control management for livestock protection
- \$102,000 increase for APHIS enforcement of Horse Protection Act

ANIMAL WELFARE ACT ENFORCEMENT

We are grateful that the Committee has begun to address the severe budget shortfall in the U.S. Department of Agriculture's Animal and Plant Health Inspection Service (APHIS)/Animal Welfare budget, by providing a \$1 million increase in fiscal year 2000 and a \$2 million increase in fiscal year 2001. Before that, as you know, funding for enforcement of the Animal Welfare Act had been stagnant since 1991. The Animal Care (AC) unit received \$12.14 million in fiscal year 2001 to cover, among other things, inspections of approximately 10,000 separate locations at regulated entities—research facilities; exhibitors such as zoos and circuses; animal dealers and breeders; and animal carriers such as airlines and ground freight handlers.

While the increases of the past two years are making a real difference, more is needed to ensure that regulated facilities and the public can depend upon having a high quality inspection program and consistent enforcement of the Animal Welfare Act's requirements. This is vital to protect the health and safety of millions of animals. It is also important for people, as strong enforcement protects them against (1) the sale of unhealthy pets by commercial breeding facilities commonly referred to as "puppy mills"; (2) laboratory conditions that may impair the scientific integrity of animal-based research; (3) risks of disease transmission from, and dangerous encounters with, wild animals in or during public exhibition; and (4) injuries and deaths of pets on commercial airline flights due to mishandling and exposure to adverse environmental conditions. To help meet these needs, we respectfully request that the Committee provide an additional \$3.8 million in fiscal year 2002, allocated to the following three key components. The Humane Society of the United States is pleased to join forces on this request with a broad coalition of organizations representing regulated facilities and animal protection interests.

Animal Welfare Inspections—\$2.4 million increase

In 2000, USDA was able to conduct fewer than 9,000 Animal Welfare Act compliance inspections, down from 18,000 in 1992. Thanks to the modest increases of the past two years, the AC division has begun to reverse this decline, and expects to complete just over 10,000 inspections this year. While this is an encouraging sign that attention will be paid to long-neglected facilities, it highlights the need for further progress. At these still-low levels, many facilities continue to escape oversight for long periods of time, giving rise to situations that threaten both human and animal health and safety. Forty-five percent of the sites that are inspected are found to have apparent violations of the minimum standards under the Act. Facilities with serious deficiencies require between four and eight reinspections per year until compliance is achieved. To ensure that every site is visited at least once a year and all noncompliant facilities receive the necessary follow-up, AC should conduct a minimum of 17,000 compliance inspections per year. A \$2.4 million increase in fiscal year 2002 would bring the Animal Welfare budget to \$14.5 million, enabling AC to hire, train, and equip an additional 14 inspectors; conduct approximately 11,600 inspections and improve follow-up inspections to verify correction of violations; increase searches for unlicensed and unregistered operations and other illegal activities; handle animal care complaints more quickly; expand outreach to regulated industries and the public; develop industry-specific training courses; and implement internal audits and inspector quality reviews to ensure consistent quality in inspections.

Investigative and Enforcement Services—\$1 million increase and Committee Report language

As AC inspectors improve their identification of problems at facilities, the workload at Investigative and Enforcement Services (IES) grows. However, ten years of static IES budgets have resulted in a substantial reduction in the number of investigators, from 73 in 1992 to 56 in 2000, creating a bottleneck in the overall enforcement system. Only 329 Animal Welfare Act investigations were undertaken in 2000, down from 800 in the early 1990s. In the early 1990s, cases took an average of 60

days to complete; in 2000, it was 140 days. A \$1 million increase in fiscal year 2002 directed at enhanced enforcement of the Animal Welfare Act would bring IES' budget to \$7.26 million, enabling it to fill a critical vacancy for an enforcement specialist; continue to support four field positions now temporarily funded through the APHIS Administrator; add four new field staff strategically placed in areas with high concentrations of animal welfare licensees and registrants; reduce time to complete investigations; deploy "quick-response" teams to address high-priority violations; and improve tracking of unlicensed operators. We also respectfully request inclusion of the following language in the Committee Report: "The Committee directs that \$1 million of additional funds for Investigative and Enforcement Services be used for enhanced enforcement of the Animal Welfare Act."

Animal Welfare Information Center—\$400,000 increase

Created by Congress in 1985, the Animal Welfare Information Center (AWIC) serves as a clearinghouse and education resource for all individuals involved in the care and use of animals for experimentation. AWIC provides information on training for laboratory employees, and legal requirements and appropriate care for animals in research, including minimizing pain and distress, preventing duplication of experiments, and reducing or replacing animals in research when possible. It is an invaluable resource for the research community, and users have accessed its website, <http://www.nal.usda.gov/awic>, nearly half a million times in one year alone. However, the AWIC budget has remained stagnant at \$750,000 since its creation more than 15 years ago. A \$400,000 increase in fiscal year 2002 would bring AWIC's budget to \$1.15 million, enabling it to develop web-based training to enhance compliance with the Federal law; expand its website with additional material and update the search engine to improve access to the data available; and sponsor workshops in different regions of the country.

HOOP BARNS/LEOPOLD CENTER FOR SUSTAINABLE AGRICULTURE

The hoop barn is an emerging alternative for livestock production that offers many advantages to the factory farm system of animal housing. A typical hoop barn is shaped like a Quonset hut (a half cylinder lying on its flat side) and contains a deep bedding of straw or corn stalks. No individual cages confine the animals, and open ends, which can be closed if weather requires, allow access to pasture. Animals in hoop barns enjoy greater freedom of movement and have the opportunity to interact socially.

Because they are not tightly confined in an overcrowded, high-stress environment, animals in hoop barns tend to be healthier than their counterparts in factory farms. That means farmers using hoop barns do not need to rely on antibiotics to prevent disease and promote growth, a common practice on factory farms that is contributing to the development of antibiotic-resistant strains of bacteria that threaten public health. Products from hoop producers are being sought out by meat suppliers and restaurants based on the enhanced flavor and texture characteristics of the meat. In addition, hoop barns are better for the environment, because they use solid manure composting rather than the liquid waste disposal system used by factory farms, which jeopardizes groundwater and produces noxious odors. Furthermore, they offer an affordable alternative for farmers. Hoop barns are approximately one-third the cost of conventional factory farm structures. They are easy to install and versatile (they can be used for different species or for storage of hay or equipment). This flexibility helps family farmers withstand fluctuations in market demand and avoid corporate buyouts.

The Leopold Center for Sustainable Agriculture at Iowa State University has been in the forefront of research and development on hoop barns. We request funding of \$325,000 under the Cooperative State Research, Education, and Extension Service account to enable the Center to make the benefits of hoop barns available on a wider scale. These funds would be used by the Center to:

- Evaluate several production, marketing, and systems questions where current hoop knowledge is in the early stages, including but not limited to: disease/pest vector control, gestation applications, and social, community, and environmental effects.
- Develop a "Best Management Practices" manual for raising pigs in hoops. This will provide guidance to farmers on how to install and operate hoops for optimal results in a range of different climates and other factors, so that use of these structures can be effectively and readily adapted to suit individual farming needs. It will include information on animal behavior, animal husbandry and nutrition, health strategies, environmental impacts, marketing strategies, and economic costs and returns for pigs raised in hoop structures.

- Establish a network of hoop demonstration sites and producers with multiple locations in Iowa and other states, including Florida (a major pork consumption state). This objective would include dissemination of information through field days, tours, producer exchanges, etc.
- Address potential use of hoop barns for production of other animal species.
- Work with industry producer groups, processors, retailers, and community groups to promote awareness of use of hoop barns in pork production. This would include factors such as quality of pork, community issues, targeted marketing, and market linkages of producers, processors, retailers, and consumers.

Wildlife Services Non-Lethal Predator Control Demonstration Program

We appreciate the Committee's inclusion of a provision in the fiscal year 2001 Agriculture Appropriation Act for the Wildlife Services Methods Development division to "conduct pilot projects in up to four States representative of wildlife predation of livestock in connection with farming operations for direct assistance in the application of non-lethal predation control methods . . ." in order to evaluate the effectiveness of non-lethal measures. We believe this investigation can help advance what has often been a contentious debate in Congress surrounding USDA's use of lethal predator control for livestock protection.

We have worked closely with Wildlife Services personnel during the past few months, as they identified three states (Idaho, California, and West Virginia) to investigate and developed a study protocol designed to produce statistically meaningful results. To accomplish this objective, experts at the National Wildlife Research Center and at USDA headquarters suggest that a four-year study be undertaken involving eight to twelve sheep ranches in each of the three states. Participating ranches would be provided the current regime of assistance (blending lethal and non-lethal techniques) for half of the study period, and would be provided only non-lethal assistance for the other half of the study period. Participants would be divided into two groups, with one group receiving the non-lethal assistance for the first two years and the current regime for the last two years, while the other group would receive help in the reverse order (current regime first, then non-lethal only). Again, according to the Wildlife Services experts, this "switchback" study design will minimize bias and variables that would distort evaluation of the relative effectiveness of lethal vs. non-lethal measures. Participants would be offered compensation for verified livestock losses due to canid predators (except wolves) during the non-lethal only phase of the study, in order to assure their continued participation in the study. Because the lambing season was already underway in two of the three states by the time the protocol was developed, and because the necessary funding was not in hand, we and the sponsors of the original provision, Senators Bob Smith and Barbara Boxer, agreed with Wildlife Services personnel that it would be preferable to defer the first year of the study until fiscal year 2002.

The detailed study protocol should be available from Wildlife Services for the Committee's consideration. Attached is a one-page budget break-out prepared by Wildlife Services that shows projected study needs for each of the four years. Accordingly, we request that the Committee provide \$1,988,673 in fiscal year 2002 to initiate this study, along with report language referencing the objective and key elements of the study.

HORSE PROTECTION ACT ENFORCEMENT

Enacted by Congress in 1970, the Horse Protection Act was passed to end the obvious cruelty of physically soring the feet and legs of horses. In an effort to exaggerate the high-stepping gait of Tennessee Walking Horses, unscrupulous trainers use a variety of methods to inflict pain on sensitive areas of the feet and legs for the effect of the leg-jerk reaction that is popular among many in the show-horse industry. Just as in 1970 the practice of soring was rampant, in 2001 the practice continues unabated by the well-intentioned but seriously underfunded and understaffed APHIS inspection program.

The authorization limit for enforcement of the Act has remained at \$500,000 since the enactment of the law 30 years ago, and annual appropriations continue to fall short of even that low funding level. We appreciate that the Committee began to address this shortfall last year, with an increase of \$37,000 that brought the funding level up to \$398,000 in fiscal year 2001. We respectfully urge that the Committee provide funding at the full authorization level of \$500,000 for fiscal year 2002 (a \$102,000 increase), to improve enforcement of the Horse Protection Act. We also urge the Committee to resist any effort to include report language that might restrict the USDA from enforcing this law to the maximum extent possible.

Again, we appreciate the opportunity to share our views and priorities for the Agriculture and Related Development Appropriation Act of fiscal year 2002. We hope

the Committee will be able to accommodate these modest funding requests to address some very pressing problems affecting millions of animals in the United States. Thank you for your consideration.

Proposed Costs for Direct Predation Damage Management Assistance by WS to Sheep Producers in a Pilot Study in CA, ID and WV for 2002-2005

PREPARED STATEMENT OF THE ILLINOIS SOYBEAN ASSOCIATION AND THE UNIVERSITY OF ILLINOIS

We appreciate the opportunity to provide testimony on behalf of the Soybean Disease Biotechnology Center, an important initiative for soybean producers in Illinois and the United States.

Request.—The Illinois Soybean Association, an organization of approximately 4,000 leading soybean producers, and the University of Illinois, a major land-grant institution, propose to establish a Soybean Disease Biotechnology Center within the National Soybean Research Laboratory (NSRL) at the University of Illinois. We request a Federal appropriation of \$3.5 million to match a \$500,000 contribution from the Illinois Soybean Checkoff Board to establish the Center.

The Illinois Soybean Checkoff Board will entertain proposals from Center scientists for future program support, and the University of Illinois will contribute core

staff, space, general support services, greenhouse facilities, and utilities. This will greatly leverage Federal support of soybean disease biotechnology research.

Rationale.—The Soybean Disease Biotechnology Center will be the first line of defense against major soybean diseases that threaten the U.S. soybean industry, especially the soybean cyst nematode (SCN). The Center will bring the power of new sciences of structural, comparative, and functional genomics and genetic transformation to bear on SCN and other current and potential disease threats, including major diseases not yet in the U.S., such as soybean rust.

Center researchers will identify and create new and improved mechanisms of disease tolerance and resistance, so as to protect the soybean crop and increase its profitability throughout the industry. Genetic stocks of the National Soybean Germplasm Collection, located at the University of Illinois, will be a unique, readily accessible resource for the Center, as will wild species that are related to soybean and have novel sources of disease resistance.

Location Advantages.—The Soybean Disease Biotechnology Center will be synergistic with two campus resources: the Keck Center for Comparative and Functional Genomics and the National Center for Supercomputing Applications. They offer high throughput genetic sequencing, unequaled bioinformatics capabilities, and unique, one-of-a-kind genetic analysis tools, including micro-arrays. Center researchers will also have ready access to the University of Illinois Biotechnology Center, which provides recombinant DNA and protein services, immunological resources, flow cytometry, high capacity transgenic plant production, and cell and tissue culture facilities.

Outstanding USDA–ARS programs in soybean pathology will interface directly with the Center, and there will be direct access to superb conventional greenhouse and controlled environment facilities in adjacent, connected structures. As part of this project, a bio-containment greenhouse will be constructed specifically to provide the levels of isolation and protection required for sophisticated disease biotechnology research. An elaborate system of research farms will be available for testing new developments in a wide range of soil and climatic conditions that are representative of the Midwest. Space is available in the NSRL to create specialized, state-of-the-art laboratories for the Center.

The Soybean Disease Biotechnology Center will interface with the new St. Louis-headquartered Danforth Plant Science Center and participate in the Illinois Missouri Biotechnology Alliance. Its association with the NSRL will assure that research in the Soybean Disease Biotechnology Center will fully complement and benefit from other soy research programs across the nation. This will assure that the results of fundamental soybean disease biotechnology research are quickly translated into practical technology, useful information, and sustainable competitive advantage for the industry.

This is an excellent time to establish the proposed Center because the University of Illinois is ramping up its post-genomics biotechnology program. A multi-million investment of state funds is providing new biotechnology faculty positions in functional genomics, bioinformatics, developmental biology, microanalytic systems, and cellular and molecular bioengineering, and is creating elaborate new facilities for basic biotechnology and bioinformatics research. Some new positions in plant disease biotechnology have been filled with outstanding scientist/educators who already have established impressive track records. The new state-funded Post Genomics Institute (to be completed in 2002) will enable a much-expanded basic biotechnology research program that will support and complement activities of the Center. The Center will also benefit from the investment of Illinois in an expanded University of Illinois business incubator and two new University research parks to assure rapid commercialization of promising new technologies from the University's research program.

Summary.—We request that \$3.5 million be appropriated to establish a Soybean Disease Biotechnology Center within the National Soybean Research Laboratory at the University of Illinois. These funds, complemented by state funds and industry contributions, will be used to staff, equip, house, and operate the center, and launch and sustain its programs. We greatly appreciate the legislative initiative that created the National Soybean Research Laboratory and look forward to this opportunity to extend its world-renowned capabilities with the Soybean Disease Biotechnology Center.

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS, THE UNIVERSITY OF MISSOURI, AND SOUTHERN ILLINOIS UNIVERSITY

Our testimony is on behalf of the federally funded project entitled the Illinois-Missouri Alliance for Biotechnology (IMBA). We much appreciate the strong, continuing support of the committee for this effort, which began in fiscal year 1995. The project continues to produce valuable results and open new options for the corn and soybean industries in the Midwest and for the nation as a whole.

Request.—In order to enhance this productive and strategically essential program, we request that \$3.0 million be appropriated for IMBA for fiscal year 2002. It is particularly important to push this initiative forward at this time because of the race among nations to capitalize on dramatic findings in the field of genomics. Powerful tools are now available to determine the function of genes in microorganisms, plants, animals, and humans. Knowledge of gene function will allow much better targeting of projects on genes of major economic, health, and social promise. The increased appropriation will allow us to fund a larger proportion of worthy proposals, expand use of the powerful tools of genomics, and include more socioeconomic research that addresses stakeholder concerns about product quality and safety as well as economic and social impacts of biotechnology. An increased appropriation will provide significant economies of scale and scope, thus disproportionately increasing funds directly available for research and increasing annual leveraged contributions to about \$9 million.

Needs and Opportunities.—IMBA is focused on the world's most important agricultural challenge, meeting the nutritional needs of a growing population. Rapidly growing population, urbanization, and affluence, especially in Asia, are causing a dramatic increase in the consumption of animal protein. These changes are leading to unprecedented growth in large animal production facilities and in global markets for animal products. Corn and soybeans are economically and nutritionally superior to other grain crops for feeding swine, beef, dairy, poultry, and confined fish. These classes of livestock are increasingly being produced in large-scale, confinement facilities around the world. With superior technology, Illinois, Missouri, and surrounding Midwestern states can be principal global suppliers, not only of corn and soybeans, but also of value-added livestock and other food products produced from these crops. To capture these emerging markets, however, the U.S. will have to compete vigorously against sophisticated foreign producers and will have to address consumer concerns about quality, safety, and efficacy of products containing genetically modified corn and soybeans.

Mission, Objectives, and Strategy.—IMBA seeks to maximize the benefits of biotechnology for the American agriculture and food sector and the American consumer by improving the quality, safety, affordability, and acceptance of agricultural and food products. It accomplishes this mission by supporting competitively funded, cutting-edge biotechnology research conducted as part of research programs organized around clearly defined, practical objectives. IMBA scientists are strongly encouraged to work closely with the private sector to assure that promising new discoveries move rapidly to practical application in Midwest agriculture.

After approval by Congress, program funds are transferred by USDA-CSREES to the Illinois Agricultural Experiment Station, which serves as repository until the funds are dispersed within the program. To avoid spreading the IMBA research investment too thinly, the scope of the program is limited to the corn and soybean industries; geographical scope to Illinois, Missouri, and other Midwestern states; and disciplinary scope to biotechnology, including technical, economic, and social dimensions of that subject.

IMBA-funded biotechnology research grants are awarded competitively, based on relevance to IMBA objectives, soundness of proposed research strategy, and scientific merit. Proposals are evaluated by scientific peers to assure that the best strategies are brought to bear on agricultural problems and opportunities that are important to the region. A Program Manager located at the University of Missouri works with an Executive Management Committee to design and develop a biotechnology research investment portfolio that addresses the following objectives: 1) develop new and improved uses for corn and soybeans and increase the value of these crops as raw material for manufacturing various products, 2) lower the cost of producing, processing, and utilizing these products, 3) maximize positive and minimize negative impacts of the corn and soybean industries on the environment and conserve nonrenewable resources that are consumed by the corn and soybean industries, 4) anticipate and understand the economic and social impacts of agricultural biotechnology and capture as many benefits as possible for the American agriculture and food sector, 5) define the roles of experts and knowledge systems in resolving social conflicts over agricultural biotechnology so as to understand and manage agri-

cultural biotechnology risks as perceived by consumers, and 6) understand and improve economic, organizational, and institutional approaches to value-enhancement and identity preservation.

In designing the IMBA research portfolio, the Executive Management Committee defines and seeks an appropriate balance among the above objectives, among projects with varying degrees of uncertainty and risk, and among goals that can be achieved in relatively short and long periods of time. Provision is made for some high risk funding of promising but unproven scientists with good ideas. Overall program evaluation is performance-based, in accordance with the principals of the Government Performance and Results Act.

Recent Achievements of IMBA Research.—IMBA-supported projects continue to progress on several broad fronts. To foster rational discourse on biotechnology, IMBA supported the initial development of AgBioForum, a unique, web-based, peer-reviewed journal designed to reach and educate a broad audience on issues of central importance. AgBioForum articles are widely reproduced in the classroom, by the media, and as references in academic journals. Total readership has surpassed 175,000 and include people from universities, industry, government, international organizations, and commercial sites, among others. Major themes in 1999 and 2000 issues of AgBioForum include: public acceptance of agrobiotechnology, industry consolidation, private-public interactions in agricultural biotechnology, farm level economics, agrobiotechnology in less developed countries, biotechnology and functional foods, regulatory approval of biotech products and functional foods, and economics of animal biotechnology.

IMBA scientists produced genetically transformed soybeans that are 20 to 60 percent higher in oil. Linkage maps and fast oil analysis procedures developed by this group will simplify selection of soybean lines for oil and protein content. Nucleotide sequence information they have collected is revealing the specific genes involved in protein and oil synthesis in soybeans and how these genes differ among lines with different oil quantity and quality. Progress is being made toward project goals of producing lines with increased total oil content and better fatty acid composition than major competing oils.

Drawing on support from IMBA, a scientist is making excellent progress on several fronts toward greater soybean resistance to sudden death syndrome (SDS) and soybean cyst nematode (SCN). He identified new markers for the most important SDS resistance genes, thus facilitating selection for these genes. One hundred thousand cultivars from 10 public and private breeding programs were screened in one season with these markers, yielding 10 with potential for superior resistance to both SDS and SCN. Two patents were generated by this project. The rapid selection tools are being commercialized. Private firms are developing varieties using this method. These varieties will be identified with a SDS-Guard trademark.

IMBA scientists pioneered nitrogen-related genetic changes that increase corn yield by 10 percent and reduce leaching of nitrogen into ground water. Seeds of six promising transgenic lines were provided to ICI Garst, Inc. to plant three field trials. Monsanto is also planting transgenic lines in four environments. Both companies are already developing second generation transgenics with enhanced performance. This project also generated two patents.

With support from IMBA, scientists are assessing the efficacy of adding isoflavones to corn foods as a way to reduce the incidence of breast tumors in animal models. The ultimate goal is to create transgenic corn that produces one or more of these unique compounds so that corn products are healthier for humans. Wild-type mice and mice lacking estrogen receptor alpha have been fed diets containing two isoflavones, namely, genistein and daidzein. In both cases, a link between activity of the gene and availability of the isoflavone has been established. The study was extended to include colon tumors. The research reveals an extremely complex relationship in which isoflavones may reduce or increase tumors depending on the genetic makeup of the animal. Knowledge gained in this research will allow scientists to predict negative and positive effects depending on an animal's or person's genetic makeup.

IMBA-supported scientists identified more than 8,000 diet-regulated genes, 33 of which map to locations associated with diabetes. Ultimately, it should be possible to identify each individual's unique food-related genetic profile, anticipate certain responses to food, and adjust eating habits accordingly. These tests will also facilitate treatment of various chronic and acute food-related disorders, including obesity, some forms of cancer, and heart disease. Results of this work are being commercialized by Electropharmacology, Inc., in partnership with major pharmaceutical and biotechnology companies.

IMBA-funded scientists are studying the process of apomyxis, which allows seed to be produced in the absence of sexual reproduction. If hybrid corn plants could

be produced that produce seed through apomyxis, that seed would produce plants genetically identical to the hybrid parents, unlike seed produced on current hybrid plants. This would enable farmers to save seed from hybrid parents for use as seed the next year. The goal is to reduce seed production costs while enhancing hybrid purity.

Phytic acid contains much of a plant's phosphorus. It is relatively undigestible to non-ruminant animals, including humans. Thus, much of the phosphorus is passed into ground and surface waters, creating pollution. IMBA scientists working to produce soybeans with low levels of phytic acid identified a bacterial gene that produces an enzyme, phytase, that breaks down phytic acid, making it digestible. They introduced this gene into a model plant, *Arabidopsis*, producing plants that store phytase in their seeds. Seeds are being ground and processed with corn meal to see if the soybean phytase will break down the phytic acid in corn meal. Phytase genes are also being introduced directly into soybeans. This opens up two possibilities: (1) a method to produce phytase as a feed supplement or for use in grain processing, and (2) to incorporate the phytase directly into feed crops, thus reducing their phytic acid content.

Several IMBA scientists are cooperating to develop high oil, high oleic acid oil, corn hybrids. Grain produced with these hybrids will command a premium based on higher digestible energy level, added value in manufacturing certain kinds of food products, and potential human health benefits. These scientists have identified molecular markers that will make it much easier to select for oil concentration and for specific fatty acid profiles. They also have developed new genetic constructs that, when introduced into elite germplasm, should enhance oil concentration and oleic acid concentration.

Cooperators.—Current cooperators in IMBA projects include the Universities of Illinois and Missouri, Southern Illinois University, Iowa State University, and the USDA-Agricultural Research Service group at Woodward, Oklahoma. Private, non-profit cooperators include Sapien's Institute and Northwestern University. Commercial firms cooperating or involved in negotiations include Monsanto Company, ICI Garst, Inc., DuPont/Pioneer, ADM-Growmark, Clarkson Grain, Cargill, Biosys, Zeneca Agrochemicals, Novartis, DowElanco, Genentech, Healthtech, Electropharmacology, and others. Each project is generating potential new and improved products, and private firms are evaluating the commercial potential of each product of IMBA research.

Summary.—We believe IMBA projects constitute an outstanding portfolio of promising research investments focused on the major problems and opportunities associated with the U.S. corn and soybean industries. Because of the economically important subject matter being addressed by IMBA, unique opportunities afforded by advances in genomics, outstanding capabilities of participating institutions, and the innovative research management approach being employed, we believe that IMBA will continue to be highly productive and will generate an unusually high return on the Federal investment. This will more than justify the appropriations to date and the \$3.0 million requested to continue the project in fiscal year 2002.

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS

Our testimony is on behalf of the Livestock Genome Sequencing Initiative (LGSI), an extremely important scientific initiative with profound implications for the future of U.S. agriculture. We request that \$1.6 million be appropriated through USDA, coordinator of the international LGSI consortium, to complete the funding of Stage I for cattle (\$800,000) and Stage I of the pig (\$800,000).

These funds would be provided to the University of Illinois, as a member of international consortium, to lead the completion of the whole-genome physical map for cattle and for the pig. Specifically, the funding will be used to sequence the ends of 100,000 bacterial artificial chromosomes (BACs) that contain large inserts of cattle and pig DNA. This will enable scientists to build and enhance the quality of a whole-genome, high-quality physical map for each species, the critical first step in sequencing the genomes.

Concept.—International participants in a Livestock Genome Sequencing Initiative will create a map of the entire genomes of cattle and pigs and will sequence all the DNA in those genomes, so that every gene in each of the two species is identified by its unique sequence and location on specific chromosomes. The resulting map and sequence information will be placed in databases that can be accessed by scientists using bioinformatics to help establish the function of each of tens of thousands of genes, thus leading to valuable practical applications. Similarities to the human ge-

nome will be extremely useful in the mapping and sequencing effort and subsequent research.

Justification.—Mapping and sequencing genes are the essential first steps to learning the function of each gene. Knowledge of gene location and sequence, as is amply demonstrated by the human genome-sequencing project, opens a whole new vista of approaches to health, welfare, and quality of life issues and serves as the basis for future biological research. Diagnostics and cures for some of the major scourges of mankind, including cardiovascular disease, cancer, diabetes, and obesity are among the potentials of this initiative. In livestock, the initiative will enable powerful, environmentally safe approaches to disease prevention, resistance, and treatment; stress alleviation; increased productivity and profitability; improved food quality, safety, functionality, and diversity; improved odor and waste management; improved environmental quality; and enhanced quality of life for food animals. Most important, the initiative will address the growing aspirations of the world's population for nutritious, healthy, safe, and affordable livestock products.

Even though it is an international undertaking, there is a very important global competitiveness dimension to this initiative as well. To illustrate, China, the world's largest pork producer, and Denmark, the largest pork producer per capita and a major world exporter of pork and pork products, are launching an aggressive swine genome sequencing initiative. If the U.S. is to remain technologically competitive in global food markets, it is absolutely essential for the U.S. to be among the first to map and sequence food animal genomes. This fundamental biological information is the foundation for sustainable competitive advantage.

Economic Development Impact.—Rapid population growth, urbanization, and growing affluence in the most populous parts of the world are resulting in rapidly expanding world markets for livestock products. Enormous future growth is very likely, as developing countries improve both political and economic systems. To compete effectively for those markets, Illinois and the nation must be among the first to implement new livestock technology derived from genomics. Livestock production adds great value to the feedgrains produced in Illinois and the Midwest, and technological leadership will allow that value to be captured in the areas where the new technology is implemented.

The current \$7.5 billion in cash value of agricultural products at the farm gate in Illinois alone would be multiplied at least 10-fold if feed grains were exported as livestock and other processed products instead of as grain or feed, with proportionate increases in other major livestock states. This increased value would accrue to Illinois and the nation as increased profits throughout the swine and cattle industries, reduced costs of government farm programs, increased employment and economic development, and improved consumer products.

University Capabilities.—The University of Illinois is uniquely positioned to lead in the mapping of the pig and cattle genomes. The University's Biotechnology Center, which includes the W. M. Keck Center for Comparative and Functional Genomics, provides one of the highest-throughput public gene mapping and sequencing capabilities in the nation, as well as a number of state-of-the-art genetic analysis capabilities, such as micro-array analysis. Cutting edge bioinformatics capabilities are provided by the National Center for Supercomputing Applications.

These superb research support capabilities enabled University of Illinois scientists to be the largest recipients of any institution of competitive Federal funding for cattle, pig, and soybean genome research. The infrastructure is further enhanced by sizeable public investments in facilities, including the Edward R. Madigan Laboratory and Post-Genomics Institute (\$75 million of state funds, to be completed in 2002).

Additional state appropriations are enabling many distinguished scientists of demonstrated excellence to join a distinguished faculty that is already internationally preeminent in the genomics area. Also, the University has a long history of productive alliances and cooperation with other public and private institutions, both here and abroad, in biotechnology research. For example, the University was the first in the Western Hemisphere to import Chinese swine and exploit their advantages in prolificacy, disease resistance, and superiority for genetic research.

Sponsor and Funding Status.—Under the leadership of USDA-ARS, an international consortium for cattle and pig genome mapping and sequencing is being formed. The consortium, which will initially undertake the mapping of the cattle genome, is presently comprised of the USDA-ARS, University of Illinois, Shirakawa Institute of Animal Genetics (Japan), AgResearch (New Zealand), and the Alberta Livestock Genomics Initiative (Canada). Expectations are that by summer, 2001, the consortium will look to begin sequencing the pig genome.

The consortium will operate in two stages for each species. First they will create physical maps of the genomes, at a cost of \$2.5 million per species. Then they will

sequence the genomes, so that the tens of thousands of genes can be identified. This second stage will cost about \$97.5 million per species. The current consortium members have \$1.7 million of the \$2.5 million for the Physical Map (Stage I) for cattle. They expect to make available \$1.7 million of the \$2.5 million for the Physical Map (Stage I) for the pig. This leaves an immediate need for \$800,000 dollars per species (total \$1.6 million) to complete Stage I. Funds to invest in Stage II, the genome sequencing of cattle and of the pig, will be recruited from public and private sources by the international consortium.

Request and Summary.—For fiscal year 2002, \$1.6 million is requested to be appropriated through the USDA to complete the funding of Stage I for cattle (\$800,000) and of Stage I of the pig (\$800,000). If appropriated, these funds will be provided to the University of Illinois, as a member of the international consortium, to lead the completion of the whole-genome physical map for cattle and for the pig. Specifically, the funding will be used to sequence the ends of 100,000 bacterial artificial chromosomes (BACs) that contain large inserts of cattle and pig DNA. This will greatly speed and facilitate building a whole-genome, high-quality, physical map of each species, the critical first step in sequencing the genomes.

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS

Our testimony is in support of a proposal to launch an innovative research program in a Renewables Bioprocessing Research and Development Laboratory under development at the University of Illinois. The mission of the Laboratory is to develop, test, and refine multistage processes by which major grains, especially soybeans and corn, are produced and converted to new and improved foods, feeds, pharmaceuticals, fibers and plastic materials, energy sources, and industrial feedstocks. We request \$1.5 million to conduct integrated, multi-stage, “sample-linked” process research on specific soy- and corn-based products as a proof of concept and demonstration of approach.

Vision.—In the post-genomics age, it is possible for plants, animals, and microbes to be genetically altered in specific, controlled, and safe ways. This will lead to enhanced grains and other raw materials for manufacturing new and improved food and non-food products. The new foods will not only be safer, more nutritious, of higher quality, more convenient, and more affordable, but will also perform important medicinal and preventive health-related functions. They will prevent and mitigate important food-related diseases and maladies, such as cancer, heart disease, diabetes, and obesity; improve physical and mental performance; extend longevity; and, in general, increase quality of life.

Enhanced soy and corn foods will be prominent in these new developments. In many cases, specific pharmaceuticals designed to address major health problems will be produced in corn and soybeans. These crops have the advantage of not harboring potential contaminants, such as viruses and other pathogens that endanger humans and animals. Genomics will also open the door to a new vista of environmentally friendly, renewable resources, including animal feeds, bio-based textiles and other materials, fuels and other energy sources, and industrial feedstocks. Genetically altered microorganisms herald the day when corn and soybean constituents can be converted to virtually any desired end product in an efficient, industrial fermentation process. Illinois can capture great economic benefits by leading the way into this bio-based economy of the future.

Concept.—We plan to create a Renewables Bioprocessing R&D Laboratory, a unique facility and program in which soybeans, corn, and other grains can be initially separated into useful raw fractions, via wet or dry grain milling or other means, and further processed at pilot scale into various food, feed, and non-food finished products. The facility will be designed, equipped, and operated to conduct, on a pilot scale, all stages of multistage industrial processes in a coordinated, integrated manner, such that samples of raw grains that enter the facilities are identity preserved, monitored, and evaluated through entire processes leading to finished products and minimal, recycled waste streams. These unique capabilities and so-called “sample-linked” research approach will greatly expedite the development of new products and process technology based on genetic enhancement and will facilitate the design, engineering, and refinement of related equipment.

Need.—To assure that value added by genetic enhancement is realized by the end user, it is essential that enhancements are preserved from primary production, harvest, storage, and transportation operations through every step in complex, multistage processing and manufacturing processes to end-product packaging, distribution, and preparation. Thus, research on these new products must track quality changes in specific samples or lots all the way from genetic enhancement of

germplasm and breeding lines to customer satisfaction with the use of the final prototype product. Examples of such value chains would be those connecting genetically enhanced corn to cholesterol-lowering margarines containing appropriate levels of stanol esters; genetically enhanced soybeans to phytoestrogen-containing pharmaceuticals for post-menopausal women; and genetically enhanced soy that imparts to feed and hence to animal products a heart-healthy, high proportion of omega-3 fatty acids.

If the promise of genomics is to be realized in a timely and efficient manner, research and development leading to these new products and outcomes must be fully coordinated and integrated over several disciplines, functions, and stages in complex value chains. To reduce development time, research on the various stages must be concurrent rather than sequential, with research on each stage fully coordinated with other stages. Such research will require an extraordinary degree of cooperation and communication among diverse participants, especially among private and public participants. To be productive and cost effective, such research will require innovative and unique expertise, policies, protocols, procedures, facilities, and equipment. The Renewables Bioprocessing R&D Laboratory will meet these needs.

Location Advantages.—The Renewables Bioprocessing R&D Laboratory will be headquartered at the University of Illinois in facilities constructed as part of the renewal of the University's South Farms. This will put it in close proximity to field-scale grain production research facilities and feedlot scale animal production research facilities. It will also be conveniently located for participation by tenants in the University's new incubator and research park (south site). This will provide great advantages for small firms and startups that otherwise could not gain access to state-of-the-art facilities. While it will be most convenient for participation by regional institutions, agencies, and firms, other groups will be invited to participate in this unique program. Until the new facilities are in place, the program will utilize some space in existing pilot plants.

Related Facilities and Programs.—The Renewables Bioprocessing R&D Laboratory will complement various Federal facilities available at the National Center for Agricultural Utilization Research at Peoria. It will be differentiated from other facilities and programs in Illinois and other states by its special emphasis on feeds and foods, especially soy- and corn-based functional feeds, foods, and pharmaceuticals; its close coordination with and proximity to world-class plant, animal, and microbial genomics research and educational programs at the University of Illinois; and its support of research on waste stream management and recycling. Ready access to outstanding University of Illinois engineering and biomedical research capabilities will be valuable to public and private individuals, institutions, and firms using the facility.

Operation.—Each section of the Renewables Bioprocessing R&D Laboratory will be supervised by a professional trained and experienced in the category of activities carried out in that section and will be operated by experienced technicians. A director and staff will provide broad oversight, personnel management, financial management, and coordination. It is anticipated that when the Laboratory is complete and the concept fully refined and demonstrated, the Laboratory will operate on a fee-for-service basis, providing services at the marginal cost to both public sector and private sector clients.

Anticipated Questions.—The following questions might appropriately be asked concerning this proposal.

Question: Why not submit this request to various competitive grant programs, such as CSREES, NIH, or NSF competitive grants?

Answer: The proposed projects are not single investigator efforts, but extremely complex undertakings involving several disciplines, functions, and stages in complex value chains. Therefore they do not lend themselves to the typical single investigator competitive grant program. The purpose of such research is defeated if only one or a few stages of a multistage process can be investigated.

Question: If the goal of the proposed program is to develop food and non-food products, why shouldn't this reach be carried out by the private sector.

Answer: The private sector should be involved in this research, but only a very few, large private firms have the facilities and organizational capabilities required to carryout the research described. In fact, no private firms have the pilot-scale capabilities envisioned for the Laboratory. The advantage of the proposed facility and program is that university researchers, small and medium-sized private firms, and startups will have access to unique facilities, equipment, capabilities, and research protocols at a marginal cost. Through unique public/private cooperation, they will gain otherwise unattainable economies of scale and scope. Among other advantages, participants can address the needs of specialized niche markets that may not be ad-

dressed by larger firms. The vast majority of potential products fall into that category.

Budget.—We request an appropriation of \$1.5 million to conduct the initial projects in the Renewables Bioprocessing R&D Laboratory and to refine and demonstrate the concept of fully-integrated, multi-stage, “sample-linked” research. These funds will be used to offset the costs of specific experiments conducted under the unique protocols of the Laboratory, including the design and installation of prototype processing equipment unique to specific projects. We believe this effort will clearly demonstrate the advantages of the integrated, sample-linked research approach and will create a large demand for services such as those provided by the proposed program.

PREPARED STATEMENT OF THE STATE OF ILLINOIS

As you begin to formulate your appropriations and funding priorities for fiscal year 2002, I respectfully urge you to consider the following items for inclusion in the upcoming agriculture appropriations bill. Each request is followed by a brief description of the project. These projects and funding requests are of particular importance to the State of Illinois and I hope that you will be able to include them in this legislation. In addition, I am grateful for all assistance that you have been able to provide to the State of Illinois—your efforts are greatly appreciated and provide numerous benefits throughout the state.

NATURAL RESOURCES AND ENVIRONMENT

Illinois River Basin Restoration Program, “Illinois River 2020”—Farm Bill Components

The Illinois River Basin Restoration Program is a comprehensive proposal of authorizations and appropriations that will address the serious threats to the Illinois River and its tributaries and implement Illinois’ goals for the restoration, enhancement, and conservation for the Illinois River and its 55 county watershed. The Illinois River Basin Restoration Program is a two-tiered approach to provide a voluntary, incentives-based program that restores and protects the Illinois river hydrology and water quality, addresses urban non-point source issues, farmland protection and open space, land treatment for stormwater, and best management practices for upland areas that drain into the river and its tributaries.

The following natural resources and environment requests relate directly to the Illinois River Preservation Initiative:

Environmental Quality Incentives Program (EQIP)

Request. Fully fund the Environmental Quality Incentives Program (EQIP) at its authorized level and increase Illinois’ share by \$4 million.

The EQIP provides financial, technical, and educational assistance to farmers and ranchers who wish to implement conservation on land currently in production. Half of the program funds must be used to address livestock-related concerns. Illinois only received \$2.5 million in EQIP dollars in 1998, 1999, and 2000 respectively. There were shortfalls of \$2.5 million in fiscal year 1999, and \$4.7 million in fiscal year 2000. In 1999, over 160 landowners could not participate in the program because there was a shortfall of \$1.8 million for projects.

Wildlife Habitat Incentives Program (WHIP)

Request. Dedicate \$100,000 in fiscal year 2002 to the Wildlife Habitat Incentives Program (WHIP) for the Illinois River Basin.

WHIP offers cost-share assistance for up to 75 percent of the habitat restoration expenses and technical assistance for farmers, ranchers and other landowners who wish to implement wildlife habitat practices. Eligible practices include native grass restoration, riparian area restoration, and aquatic habitat establishment.

Conservation Reserve Program (CRP)

Request. Designate 200,000 acres of Conservation Reserve Program acres to the Illinois River Basin for fiscal year 2002.

The CRP provides farmers with technical and financial assistance, including annual rental payments, in exchange for removing environmentally sensitive land from production and implementing conservation practices such as wildlife habitat restoration and field windbreaks. This expansion of acreage would bring an estimated \$909 million in new Federal funding to Illinois for restoration over 15 years of the CRP contract lifetime.

Wetlands Reserve Program (WRP)

Request. Dedicate 1,000 acres of Wetland Reserve Program to the Illinois River Basin for permanent easements.

The WRP offers technical and financial assistance to farmers who wish to restore and protect agricultural wetlands. The USDA provides up to 100 percent of the wetland restoration costs and up to 100 percent of the fair market agricultural value of the land in return for permanent or 30-year easements or wetlands restoration cost-share agreements. The allotment of this acreage would bring an estimated \$1.5 million in new Federal funding to Illinois for wetland restorations.

Conservation Reserve Enhancement Program

Request. Expand the CREP in Illinois from 100,000 acres to 232,000 acres.

Currently, the State of Illinois has in place a 4-year CREP agreement, which began in State fiscal year 99 to enroll 100,000 acres. The State of Illinois has dedicated \$18 million to fulfill the last two years of the agreement, which expires in fiscal year 2002.

To date, Illinois leads the nation in the number of acres that have been enrolled with 66,000 (9,000 acres pending approval), which is three-quarters of the state's goal. This enrollment of acres outpaces the other states by 3 to 1. Expansion of the number of acres allotted to Illinois from 100,000 to 232,000 will enable the state and its partners to enroll the most crucial areas of land in the floodplains within the Illinois River Basin. These additional 132,000 acres will have the greatest impact to the full restoration of the basin.

Technical assistance for Farm Bill Program implementation is a \$345 M nationwide deficit. In Illinois specifically, that deficit is over \$9 M. Increases in technical assistance funding is needed to properly implement the Farm Bill programs associated with the Illinois River Restoration Program.

Mahomet Aquifer Consortium

Request. A total of \$10 million for an extensive study of the Mahomet Aquifer in Central Illinois over ten years.

The Mahomet Aquifer Consortium is proposing a study of the Mahomet Aquifer in Central Illinois. The Study will identify and resolve water quality and quantity issues, help ensure a water supply for the future, optimize future water costs, and promote planned economic development for the communities affected by the aquifer. The project is broken down into 2 phases with phase one taking 3 years and an estimated cost of \$4 million. Phase two will cost \$6 million and take 6 years to complete.

Illinois Groundwater Initiative at Southern Illinois University Carbondale

Request. \$1 million to establish a small outreach center in southern Illinois, plus \$600,000 annually for three years to continue research funding for publications and data to be used by farmers, educational institutions, and management agencies. Funding is sought from the Agriculture Appropriations bill through USDA's Cooperative State Research, Education, and Extension Service.

The Illinois Groundwater Consortium (IGC), established in 1990, has been funded by Congressional appropriations to investigate short- and long-term effects of agricultural chemical contamination on groundwater, the environment, and ultimately, human health and welfare. Consortium members—the Illinois State Geological Survey (ISGS), the Illinois State Water Survey (ISWS), Southern Illinois University Carbondale (SIUC), Southern Illinois University Edwardsville (SIUE), the University of Illinois (UIUC) Agricultural Experiment Station, and the University of Illinois Cooperative Extension Service—have been working together to provide a scientifically valid bases for agricultural chemical management and regulatory decisions affecting groundwater.

During its first years, the IGC focused on issues of agricultural contamination of groundwater resources. Between 1996 and 1999, IGC-funded research was directed to the effects of and recovery from the extensive flooding that occurred in 1993–94 along the Mississippi, Missouri, and Illinois Rivers and their tributaries. In the fiscal year 2000–2001 funding interval, research is focusing on the effects of land-use practices and changes in land-use practices on groundwater quality and quantity, with an emphasis on long-term (past and future) assessments and consideration of cultural (social, political) contexts of decision-making. During the fiscal year 2001–2003 funding period, research will continue to focus on the above but with greater emphasis on water quantity issues and educational outreach to management agencies, education institutions, and farmers in the form of “user friendly” publications.

Economic Assistance for Agriculture

Request. Plan for the possible need of farm income assistance in fiscal year 2002, including the doubling of the AMTA payment to farmers and producers.

Unless market conditions improve for the 2001 crop year, support for farmers and ranchers will be needed. In the fiscal year that ended September 30, 2000, USDA made a record \$28 billion in direct payments to farmers and ranchers to help them weather these low commodity prices. In the coming months USDA will be distributing more than \$4 billion in additional emergency funds. Similar funds will be needed in fiscal year 2002.

Farmers and ranchers continue to experience very difficult market conditions, with many commodities at or near their price lows. Under the 1996 Farm Bill's formula, marketing assistance loan rates could fall from the current levels if directed by the USDA Secretary. Based on current projections, for example, the corn loan rate would fall from \$1.89 per bushel to \$1.76; the wheat loan rate would fall from \$2.58 per bushel to \$2.43; and the soybean loan rate would fall from \$5.26 per bushel to \$4.92. A change in loan rates or a decrease in farm and ranch income will be detrimental to the rural economy.

Federal-State Cooperation in Warehouse Examination Agreements

Request. \$400,000 Federal reimbursement for state examinations used by the Commodity Credit Corporation (CCC). This would be a new program requirement for USDA.

In 1997, USDA terminated its cooperative agreement with states to reimburse them for grain elevator examinations performed by state inspectors. Illinois' inspectors continue to inspect and share this same information with CCC, but receive no Federal reimbursements for their efforts. Given the fact that today's corn and soybean crop prices are near their record lows and participation in CCC's programs are at record highs either in LDP's or CCC loans, the Department is asking USDA to again cost share the additional expense of time spent on warehouse examinations by Department staff.

Prior to 1985, Federal policies dictated that commodities would be isolated from market prices and forces until prices rose to specified levels. As a result, large inventories and U.S. government owned commodities and commodities pledged as collateral for price support loans accumulated and the facilities in which these commodities were stored had to be examined to adequately protect the Commodity Credit Corporation's (CCC) interests.

This led to CCC relying heavily on cooperative agreement with the Department because the volume of workload associated with these high stock levels did not make it feasible for CCC to hire and train a workforce that would be adequate to conduct all the necessary examinations. USDA terminated this program in 1997 after the enactment of the farm bill and the low amount of commodities under loan and CCC control. Illinois' storage share and Federal reimbursements were: In 1993/4, 7.78 million bushels of grain stored—\$364,920 reimbursed; in 1994/5, 7.87 million bushels—\$364,820 reimbursed, in 1995/6, 8.04 million bushels of grain—\$379,487 reimbursed.

Agricultural Research Funding

Request. Increase USDA ARS Research funding by \$1 billion a year, which would provide approximately \$60 million to Illinois.

Food and fiber are fundamental to life and health. Federal spending on health research has more than doubled. Today, Federal spending for the National Institutes of Health is nearly \$18 billion, 10 times that of food and agricultural research, extension and education at USDA. By any comparison, whether in terms of payback, future potential, or importance to the average family, Federal investment in food and agricultural research is woefully inadequate.

Publicly supported food and agricultural research and education were major contributors to the ascension of the U.S. during the "American Century." U.S. food and agriculture researchers and educators contributed to the Green Revolution that saved a billion people from starvation. Promising research breakthroughs in genetics, nutrition, information technology, food production and safety and ecosystem management hold great potential for even greater strides in the 21st century.

Despite being the best-fed nation with the lowest share of income spent on food, many critical national food, agricultural and natural resource challenges remain. Some \$100 billion of annual health costs are linked to poor diets and food-borne pathogens. Agriculture's continued viability and competitiveness in the global food system depends on technological, management and policy advancements based on

the most sophisticated cutting-edge research and education. The public has rising expectations for a clean and healthy environment and a safe, nutritious and health enhancing food supply.

Scientific studies document that each taxpayer dollar spent on agricultural research, extension and education pays back \$8 in public benefits. These benefits are proportionately greater for low income and disadvantaged, who spend a much larger proportion of their incomes on food. Yet, after adjusting for inflation, federal investment in food and agricultural research has been flat for two decades.

Create a Joint USDA-Illinois DNR Invasive Species Program

Request. Direct \$5 million per year through USDA-ARS to Illinois to create, on the campus of the University of Illinois, a unified, collaborative USDA-IDNR Invasive Species Laboratory and program on research, implementation and outreach against invasive species affecting Illinois.

Invasive species cost Illinois citizens millions of dollars annually for control and loss of value of crop and natural lands. While some control efforts are well coordinated among State, local and Federal partners it is not true for control of many exotic species. Creating a collaborative program to develop and implement solutions to invasive plant and animal species in agricultural, forest, waterway and natural areas will benefit all the State's citizens and businesses. Research and outreach efforts require surveying for new invasives, developing novel management strategies, preventing new invasions, and educating Illinois' citizens about invasive threats and the potential benefits from these solutions.

Invasive species affect every Congressional district in Illinois. Species affecting Illinois include kudzu, Chinese soybean aphid, Asian longhorned beetle, gypsy moth and zebra mussel. Illinois is fighting invasive species, but efforts to find solutions are limited by lack of funds for research and implementation. The Illinois Natural History Survey in Champaign has a research and outreach program addressing Illinois' invasives. USDA-ARS has an Invasive Weed Management Research Unit on the UI campus. Creating and funding a joint program on the UI campus reduces redundancy, builds on strengths of each program, and unifies efforts by USDA, IDNR, and IDA, making Illinois a leader in the fight against invasive species. Funding to assess new and current invasives, develop and implement novel long-term solutions, and produce high-quality materials for the public and schools throughout Illinois will benefit the entire State.

Value-Added Agriculture

Request. Increase overall funding to USDA programs like Rural Business Cooperative Services Agency, Rural Business Programs, Cooperative Development Grant Programs, Value Added Grant Programs, Rural Business Enterprise Grant Programs, and Rural Business Cooperative Services Programs/Rural Development Mission statement areas and in the areas of biotechnology, biofuels, and biomass research and developments.

Each part of the U.S. is unique in terms of agronomic conditions, on-farm resources, access to markets, the price basis, transportation systems, and other factors. These factors all affect the types of specialty crop and livestock that can be profitably produced as well as the potential for value-add processing in each ecoregion.

To maintain the diversity of U.S. agriculture, agribusinesses and food processing and manufacturing industry, to create a unique opportunity for farm families and rural communities in the global food economy, and to create an agriculture and food system that uses natural resources wisely, a major commitment is needed now to develop policies and make critical investments that will advantage the U.S. economically in the high tech competition of the 21st century global food and agriculture system.

There is significant potential for collaboration in innovations to create the new economy food and agriculture sector with major private sector partners such as DuPont, Monsanto, Rennessen, Syngenta, Protein Technologies International, ADM, Kraft Foods and others, as well as new era producer cooperatives and producer alliances.

The "first wave" of agribiotechnology has been dominated by designer input traits that improved yields and lowered costs by incorporating herbicide, disease and insect resistance into corn and soybeans. Bt corn and Roundup Ready soybeans are examples. Rootworm resistant corn is on the horizon. First wave advancements will continue and will accelerate.

The "second wave" of agribiotechnology is rapidly approaching. It focuses on value-enhanced traits, bioproducts and functional food and pharming. Examples include: unique traits in corn, soybeans, and wheat that create value for livestock

feeders and food companies; in improved processing efficiency and for energy, industrial, and human health applications.

Bioengineering plants and animals to produce nutraceuticals and pharmaceuticals, such as cancer preventing agents, will change the health care industry and bring integration with agriculture. Edible vaccines delivered through fresh foods like apples or potatoes will change the landscape of drug production and delivery. Corn modified to fight osteoporosis; and soybeans, with unique human disease resistance qualities and health improvement attributes, will turn commodities into functional food products.

On "Pharms," herds of novel transgenic animals will serve as "bio-pharmaceutical factories" to produce drugs, medicines and even organ donors for human transplants. A genetically engineered dairy cow, goat and/or sheep herd will produce medicines deposited in milk at a fraction of the cost of traditional methods of production.

Bioproducts and biochemicals bioengineered from plants will support biobased value-added products and fuels for domestic use and export replacing petrochemical feedstocks with biomass materials. Biobased fuels, such as ethanol, produced from customized plant biomass technologies using cost competitive bioprocesses will dramatically reduce dependence on imported oil.

Federal policies must be responsible, support these new ventures, and regulate with sound science principles.

Environmental Research and Outreach Programs at the University of Illinois (At Urbana/Champaign)

Request. \$130,000 for the Illinois Water Resources Center; \$1.1 million for the Illinois-Indiana Sea Grant College Program; and \$700,000 for the Midwest Technology Assistance Center.

The concept of this proposal is to build on existing Federal/State partnerships to help Illinois communities and agencies address issues of natural resource development and protection. The proposed program draws on three statutory programs for research and outreach on natural resources and the environment: (1.) In partnership with the U.S. Geological Survey, the Illinois Water Resources Center receives federal matching funds to conduct university-based research and outreach on water resources issues. (2.) In partnership with the National Oceanic and Atmospheric Administration, the University of Illinois and Purdue University jointly conduct the Illinois-Indiana Sea Grant College Program. Sea Grant conducts research and outreach to help citizens and communities understand and manage coastal resources. (3.) In partnership with the U.S. Environmental Protection Agency, in 1998, the Midwest Technology Assistance Center (MTAC) was formed at the University of Illinois to help small communities solve problems of safe drinking water supply. By strengthening these partnership programs, the proposed research and outreach will improve knowledge of Illinois' natural resources and their wise use in economic development.

Illinois-Missouri Biotechnology Alliance

Request. \$3 million in funding for the Illinois-Missouri Biotechnology Alliance.

The State of Illinois supports funding for the Illinois-Missouri Biotechnology Alliance to continue research at the Universities of Illinois and Missouri on biotechnology. Congress appropriated \$1.184 million in funds for this project in fiscal year 2000. The Illinois-Missouri Biotechnology Alliance is a competitive grants program focused on biotechnology issues related to the production and utilization of corn and soybeans as they are produced in the mid-western U.S.

Soybean Disease Biotechnology Research Center

Request. Request \$3.5 million for fiscal year 2002

It would be established within the National Soybean Research Laboratory (NSRL) at the University of Illinois, the Center will be the first line of defense against major soybean diseases that threaten the most important "biofactory" of new foods and uses in the future, namely, the soybean crop. Scientists in the Center will employ cutting edge biotechnology research to provide soybeans with new and improved mechanisms of escape from, tolerance of, and resistance to major pathogens, including soybean cyst nematode (SCN) and other soy diseases that threaten the profitability of the soybean industry. The Center will draw on the 17,000 lines in the National Soybean Germplasm Collection at the NSRL and apply the power of structural, comparative, and functional genomics and genetic transformation. The Illinois soybean industry will provide funds to help establish the Center and support its research program.

Center for Alternative Agriculture Crops and Products

Request. \$1.95 million for the Center for Alternative Agriculture Crops and Products at SIU-Carbondale.

This center synergizes various corporations, agencies, and regional universities of the heartland and midsouth to explore alternative income crops and products for Southern Illinois, Illinois, and the region. Emphasis would be on increased farm income and increased rural development through added production, processing, and employment. The plan calls for \$1.95 million for renovation and expansion of a 13,000sq. ft. building on SIU-Carbondale campus.

SIU Soybean Genomics Lab

Request. Seek 189,000 for the Soybeans Genomics Lab at SIU.

Expand the current laboratory to accommodate four added faculty researchers in soybean genomics and transformation.

Renewables Bioprocessing Research Program

Request. Seek \$20 million for the Renewables Bioprocessing Research Program at the University of Illinois.

The Renewables Bioprocessing Research Program (RBRP) is an effort by the University in collaboration with other agencies and institutions to provide "plant to product" research information for the production and processing of corn, soybeans, and wheat. Objectives of the RBRP program are: (1.) Establish an interdisciplinary collaborative research effort in the production and development of new food and industrial products from corn, soybeans, and wheat coproducts; (2.) Establish an interdisciplinary collaborative research effort to improve the overall efficiency of converting renewable corn, soybean and wheat coproducts into saleable products; (3.) Enhance the development of small-scale laboratory procedures to accurately predict the genetic capabilities of different genotypes, phenotypes, and varieties to make desired end use products; and, (4.) Provide commercial companies with a single integrated program of contract research.

EDUCATION AND TRAINING

SIU/U of I Outreach Center

Request. Seek \$1.8 million for a joint SIU/U of I outreach center. Located on the Carbondale, IL Campus, University of Illinois Extension Service and SIU College of Agriculture Agribusiness Economics Department will partner to serve Southern Illinois constituents via on-site classroom instruction, digital television delivery, and web-based access. Building 103 on the Carbondale campus would be renovated, expanded, and rewired. Estimated cost is \$1.8 million.

SIU Plant and Alternative Crop Training Center—Belleville, IL

Request. Seek \$2.5 million for a Plant and Alternative Crop Training Center at Southern Illinois University Belleville Research Station.

Add a 10,000-sq. ft. facility for university and industrial training on the SIU Belleville Research Station site near the Mid-America airport. The facility would allow agricultural industries of the Metro-East (St. Louis) area to have access to an indoor multimedia training/meeting facility. This plan allows for synergy with Donald Danforth Plant Science Center shared use of land and 1,200-sq. ft. of wet-laboratory space. Construction cost is estimated to be \$2.5 million.

FOOD SAFETY AND INSPECTION SERVICE

Wholesome Meat Inspection Program Cost Share

Request. Increase USDA support of Illinois' Wholesome Meat Inspection Program to cover 50 percent of the total program cost as required in the joint State/Federal cooperative agreement. The Federal allocation required in fiscal year 2002 is \$5,224,155 (an additional \$638,155 over the fiscal year 2000 allotment).

The State of Illinois maintains a Wholesome Meat Inspection program as part of a cooperative agreement with the Federal government's Cooperative Inspection Program of the United States Department of Agriculture's Food Safety and Inspection Service. The cost of the state Wholesome Meat Inspection program is designed to be shared evenly (50/50) with the Federal government. However, the Federal government is not meeting its commitment to fund 50 percent of the state program costs. Federal program officials indicate that meeting 50 percent of program costs is a goal that they have been unable to reach as the Federal appropriations have been relatively flat over the last several years and new states have joined the program (most recently Minnesota).

Federal officials appear to have considerable leeway in determining the distribution of funds among the states, considering each state's budget request to determine the most equitable distribution of limited available resources. The Federal government should increase the total Federal appropriation so that all states can be funded at 50 percent of program costs.

National Center for Food Safety & Technology at IIT

Request. \$3 million through Agriculture Appropriations bill for the National Center for Food Safety & Technology at the Illinois Institute of Technology.

IIT seeks continuation of the \$3 million received annually by its National Center for Food Safety & Technology. Through the leadership of Senator Durbin and Congressman Lipinski, the Center received \$3 million in both the fiscal year 2000 and 2001 Agriculture Appropriations bills. The Center needs the funding to continue its progress in fighting the growing incidence of food borne illness. The Center will continue developing its pilot plant into a state of the art food processing-pathogen laboratory. The Center's goal is to be able to stage multiple full-size trials and then transfer the technology to food production facilities. Another goal is expanding the Center's collaboration with the food industry. The Federal funding has improved the Center's programs so that more food companies want to join the Center for help in protecting their processes. Over the last two years, food company membership has grown from 43 to 75.

Quality Assurance Pilot Certification Program for Small Meat Processors

Request. Seek \$250,000 a year for three years to establish a Quality Assurance Certification Program under the IL Dept. of Agriculture for small meat processors.

This Pilot Program is an effort by the Department to establish a Quality Assurance Certification Program for small meat and poultry slaughter and processing plants. Under this certification program, the Department will contract with food safety experts to provide education and HACCP compliance training to plant management and employees. After completion of the project, material can be used by other states.

National Food Testing Center at the University of Illinois

Request. Seek \$25 million to create a state of the art National Food Testing Center at the University of Illinois.

To create a state-of-the-art facility for conducting safety and efficacy research on new, improved, and functional foods, including health-related, genetically enhanced foods. The National Food Testing Center will support and expedite the most important experiments on foods, that is, tests to assure that they are safe and effective. Through these experiments, hundreds of new and improved foods and related products will be tested and approved for human use, resulting in greatly improved human health, quality of life, and longevity. This will enable the U.S. to capture proprietary benefits from its investment in agricultural and biomedical research. In addition, consumers of these products will be fully confident that these products will be safe and effective.

ANIMAL RESEARCH

Transgenic Animal Research Center at Southern Illinois University Carbondale

Request. \$370,000 for the Transgenic Animal Research Center at Southern Illinois University Carbondale (SIUC).

Both the SIUC College of Agriculture and the SIU School of Medicine are in an excellent position to move forward with new and intensive technology research and education initiatives in transgenic livestock research, including cloning, gene, and disease research. It is necessary, however, in order to renovate and expand existing facilities at the SIUC livestock production units and to create two laboratories at the School of Medicine in order to meet NIH guidelines for containment and confinement of transgenic animal, provide laboratory and surgical space, and veterinarian office space.

At the School of Medicine, SIU proposes to develop a core facility in the animal laboratories at SIU School of Medicine. This core facility will enhance ongoing and proposed genetics research and allow faculty of the SIU School of Medicine to study the gene/disease relationships. This facility will permit the genetic construction of mice that either express or do not express the genes that have been identified as important in the development of a particular disease.

Livestock Genome Sequencing Initiative at University of Illinois (Urbana/Champaign)

Request. \$1.6 million in Federal funding is requested through the USDA-ARS to the University of Illinois for this initiative.

International participants in a Livestock Genome Sequencing Initiative (LGS) will create an ordered map of large insert DNA clones covering the entire DNA in major species of food animals (i.e. cattle and pigs) and will sequence all the DNA in those clones, so that every gene in each of those species is identified. The resulting map and sequence information will be placed in databases that can be accessed by scientists using bioinformatics to help establish the function of genes, thus leading to valuable practical applications. In order to obtain timely access to the resulting information, it is especially important for the University of Illinois to be involved in leading the effort to map and sequence the cattle and swine genomes.

National Food Animal Institute

Request. \$1 million a year for three years.

The Institute would be established by the Department of Agriculture in Illinois to review research through peer review and to publish and disseminate unbiased information about all the aspects of the food animal industry. It would maintain comprehensive information systems for the improvement and enhancement of the food animal industry for use by the public, government agencies, other interested parties. The Institute must fulfill its purpose with unbiased integrity.

Johne's Disease Pilot Program

Request. Seek \$1 million over a three year period to start a pilot program in IL under the IL Dept. of Agriculture.

Johne's disease is a wasting disease of cattle, sheep, goats and cervidae. This disease is contracted through direct contact with infected animals, which are generally infected at a young age, but may not exhibit signs of the disease until they are four or five years of age. There is no cure for Johne's disease. It has been estimated that economic losses can amount to \$227 per cow. A recent National Animal Health Monitoring System (NAHMS) sampling of Illinois dairy cows, indicated a prevalence of at least 10 percent in the cull cows from the dairy herds tested. Illinois would like to start a pilot program that could be used as a model for the U.S.

ANIMAL PLANT HEALTH INSPECTION SERVICE (APHIS)

National Coolwater Broodfish Center at Southern Illinois University Carbondale

Request. \$1.25 million for the National Coolwater Broodfish Center at SIUC.

A crucial need exists for selectively bred coolwater broodfish (sexually mature fish that are used to produce offspring for stocking) such as hybrid striped bass, largemouth bass, sunfish, walleye, yellow perch, as well as coolwater strains of trout and catfish. Domestication and selectively breeding are necessarily long-term activities that cannot be expected to be supported by traditional granting programs that are almost universally limited to time horizons of just a few years.

The objectives will be to domesticate suitable strains of coolwater species for commercial foodfish production, selectively breed coolwater fishes for desirable traits (rapid growth, disease resistance, better dress-out, etc.), maintain genetic histories of coolwater broodfishes, and provide selectively bred coolwater broodfishes to the aquaculture industry. The National Coolwater Broodfish Center, in conjunction SIUC's other programs, will serve as a powerful catalyst for aquaculture development in the U.S.

Should you need additional information, please do not hesitate to contact Derek Persico in my Washington, DC office at (202) 624-7762. Thank you for your consideration of these requests and for your leadership on this most important legislation.

PREPARED STATEMENT OF THE INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

The Natural Resources Conservation Service has immense responsibilities for implementing the conservation provisions of the 1985 Food Security Act (FSA), the 1990 Food, Agriculture, Conservation and Trade (FACT) Act, and the Federal Agricultural Improvement and Reform (FAIR) Act of 1996.

WRP, WHIP, FPP and EQIP.—The Wetlands Reserve Program (WRP), Wildlife Habitat Incentives Program (WHIP) and Farmland Protection Program (FPP) have reached their authorized acreage or appropriation caps and USDA characterizes

them as “completed”. This is particularly perplexing since these are all voluntary, incentive based programs that are currently well over-subscribed. These programs not only provide income support for agricultural landowners, but they also help landowners meet their natural resources conservation objectives in ways that are alternative to regulatory controls.

Wetland conversions continue and wetland resources cannot be sustained without a proactive program like WRP that compensates landowners for voluntary restoration of wetlands. WRP is currently over-subscribed by a factor of 5, with many eligible landowners already qualified but unable to enter the program since it has bumped up against its statutory acreage enrollment cap.

Similarly, many wildlife species reside on agricultural landscapes and have nowhere else to go—they must survive on those landscapes if they are to survive at all. WHIP has helped many landowners make meaningful contributions to conservation of imperiled species of wildlife and landowner interest in this program has far exceeded available funding.

In a like manner, the FPP has been important in places where urban encroachment diminishes the long-term viability of the local farming economy and interest in the program far exceeds acreage availability.

While the program caps for WRP, WHIP and FPP have been reached, these caps are arbitrary in the sense of natural resource sustainability and should not be viewed as reasons for ending the programs. To the contrary, none of these programs (WRP, WHIP or FPP) have outlived their critical and key role in conservation.

In addition, funding for the Environmental Quality Incentives Program (EQIP) has been insufficient to meet landowner interest and needs. The EQIP program can help agricultural landowners achieve remediation of non-point source runoff via a voluntary, incentives-based program, as opposed to the strict imposition of regulatory controls on a farm-by-farm basis.

All four of these programs have all been tremendously popular and successful. Due to the overwhelming success, customer acceptance and public benefits of these programs, the Association strongly encourages Congress to reauthorize and fund WHIP at \$100 million, FPP at \$65 million, EQIP at \$300 million and WRP at \$286 million, which will support an increase in the enrollment cap for WRP by 250,000 acres in fiscal year 2002.

Technical Assistance.—The NRCS Strategic Plan for 2000–2005 establishes natural resource priorities in support of agriculture and identifies staffing levels needed to achieve success. The Strategic Plan projects a steadily increasing need for technical assistance through 2005. Adequate technical assistance will be essential to ensure private landowners can deliver the conservation of natural resources while also providing affordable food for our citizens. However, despite increased workloads and increased societal demands on land and natural resources, NRCS staffing levels have been flat in recent years and the fiscal year 2002 budget proposal actually reflects a decrease of 301 staff years. The rationale for the 301 staff year reduction is tied to loss of emergency funding to support the Emergency Watershed Protection Program and, thereby, reduces the ability of NRCS to respond to emergencies. This reduction is inconsistent within the overall USDA budget proposal in that the FSA budget proposal reflects an increase of \$120 million for increased staffing to better respond to agricultural emergencies even though emergency funding has been eliminated there as well.

It seems prudent for both NRCS and FSA to be adequately staffed to ensure quick response to emergency situations. In addition, the Conservation Reserve Program (CRP), WRP, WHIP and EQIP all reflect long-term contracts that necessitate continuous technical support to participants, whether or not there is new sign-up. Notably, \$44 million of the \$58.4 million CTA increase shown in the fiscal year 2002 budget proposal is actually a budgetary shift from CCC funds (for CRP technical assistance) that allows NRCS to stay even in regard to supporting CRP, rather than an actual increase in CTA. The Association strongly encourages Congress to restore the 301 staff year reduction reflected in the fiscal year 2002 budget proposal as well as providing the addition of sufficient staff years to begin to address the nearly 24,000 staff years (compared with 11,200 staff years in the fiscal year 2002 budget proposal) identified for 2002 in the NRCS Strategic Plan for 2000–2005.

Increasingly, State fish and wildlife agencies are contributing staff time to help NRCS field offices service fish and wildlife aspects of USDA assistance to private landowners. Such partnerships can help NRCS deliver specialized technical expertise to private landowners at less cost than adding staff with this expertise. The Association strongly encourages the Administration and Congress to emphasize partnering arrangements, between NRCS and State fish and wildlife agencies and others, that result in cost-efficiencies through a challenge-grant program initially funded at \$5 million in the fiscal year 2002 budget.

Wetland Determination.—We believe the need for wetland determination, certification, and mapping is great and urge NRCS to proceed as soon as possible, under the guidance of the FAIR Act of 1996. The Association urges expeditious completion of the wetland determinations required to implement the Swampbuster provisions of the 1985 FSA, 1990 FACT Act, and the 1996 FAIR Act as well as the FAIR Act directed interagency cooperation, whereby NRCS assumed responsibility for wetland designation for Section 404 (Clean Water Act) purposes on farmland, including tree farms, rangelands, native pasture, and other private lands used to produce or support the production of livestock. The Association and individual State fish and wildlife agencies will continue to work with NRCS to help achieve these goals.

Public Law 566.—The Association generally supports small watershed (Public Law 566) projects. Support is based upon continued emphasis on updated watershed planning and management. Such efforts could utilize and expand upon existing Public Law 566 plans in light of present day issues of wetland protection, water quality enhancement and fish and wildlife habitat. The greatest potential for these programs is for land treatment measures that retain the water on the land in concert with stream flow that is adequate to sustain diverse aquatic life, improve infiltration, improve water quantity and quality, and provide fish and wildlife habitat. Structural and non-structural land treatments require state and local matching funds to leverage greater conservation benefits for each Federal dollar spent while promoting valuable partnerships among states, local agencies, and other organizations. The Association supports the level of funding for Public Law 566 that is reflected in the fiscal year 2002 Budget.

National Buffer Initiative.—NRCS has implemented this initiative in cooperation with industry and other partners. The National Academy of Sciences has found that buffer strips can reduce off-field pollution by 70 percent, thus also contributing to meeting non-point source remediation goals under the Clean Water Act. Unfortunately, the level of sign-up by producers remains very low. NRCS has committed special emphasis and a major effort to use the buffer strip practices covered by the continuous CRP sign-up in a more targeted fashion. However, there is no mention of the National Buffer Initiative in the fiscal year 2002 budget narrative. Unlike the large or whole field CRP retirements, buffer strips will require extensive outreach and specialized incentives that fairly compensate landowners. The Association encourages NRCS to continue the National Buffer Initiative as a high priority effort.

Forestry Incentives Program (FIP).—The Forestry Incentives Programs (FIP) has multiple resource values for fish, forests, wildlife, clean water and erosion control. Many farms contain forest resources that are as in need of conservation treatment as cropland and grassland. The Association opposes the NRCS proposed intention to zero out FIP funding and strongly recommends that the fiscal year 1999 level of \$16.325 million be restored in the fiscal year 2002 budget.

PREPARED STATEMENT OF THE JOSLIN DIABETES CENTER

INTRODUCTION

Mr. Chairman, thank you for this opportunity to submit a statement for the public witness hearing record. The subject of this short statement is the continued funding in fiscal year 2002 for the Diabetes Project in the Extension Service of CREES. We have developed a plan for fiscal year 2002 that will require continued funding at the current year's level of \$926,000. This includes costs of Federal Administration, participation expenses of the states of Washington, New Mexico and Hawaii, and the personnel, equipment and associated costs of Joslin Diabetes Center within the total cost of the program.

FISCAL YEAR 2001 BACKGROUND

I would like to express Joslin Diabetes Center's sincere appreciation to Representative Nethercutt and the Subcommittee for actions in the fiscal year 2001 process in providing \$926,000 for the third year of the Diabetes Project. We know you faced difficult decisions concerning funding priorities. We feel that the allocation of these funds indicates support for the growing community role and organizational flexibility of the Extension Service.

Recently Joslin, Washington State, Hawaii, and Federal Extension personnel attended an all day planning session for the current year and reviewed accomplishments to date on this project. A summary of each of these segments will be forwarded to the committee staff when available.

Through fiscal year 2001 funding retinal imaging equipment will be installed in all three states, with image acquisition and training, and image reading procedure

in place. At a rate of 30 patients per day per site, the three units will have the capacity to screen 18000 patients annually. This actually involves the examination of 36,000 eyes, because a patient can develop diabetes retinopathy in only one eye.

All participants remain committed to goals and objectives of the original project and are planning cooperatively for this and the coming fiscal year.

FISCAL YEAR 2002 PLAN

For fiscal year 2002, the mission and objectives for the three state pilot programs will be implemented on two levels:

- Continuation of distribution of educational materials for diabetes awareness and dieting/health guidelines;
- Retinal screening for diabetes mellitus in all three states.
- Assessment of progress and revision of materials and internal processes within each state will be conducted for refinement for each state's target population.

Joslin Diabetes Center would welcome additional participation within the three states of the pilot project to better educate consumers about diabetes and the most effective methods to address diabetes and its complications.

Mr. Chairman, this concludes my brief statement. We are submitting a detailed budget for the fiscal year 2002 funds of \$926,000 to the Committee for continuation of this project with the Extension Service. If you or the Committee staff have any questions we may answer concerning this project, we would be pleased to meet and discuss the details in more detail.

The Extension Service and Joslin Diabetes Center appreciate your confidence in our capabilities and your focus on the improvement of quality of life in rural America. We respectfully request continued funding of \$926,000 in fiscal year 2002 to fully demonstrate the benefits and potential national returns that can be derived from this pilot effort.

PREPARED STATEMENT OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

Chairman Cochran and Members of the Subcommittee: The Metropolitan Water District of Southern California (MWD) appreciates the opportunity to submit testimony regarding the U.S. Department of Agriculture's (USDA) fiscal year 2002 budget, for the Hearing on Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations. MWD is a public agency created in 1928 to meet supplemental water demands of those people living in what is now portions of a six-county region of southern California. Today, the region served by MWD includes 17 million people living on the coastal plain between Ventura and the international boundary with Mexico. It is an area larger than the State of Connecticut and, if it were a separate nation, would rank in the top ten economies of the world.

Included in our region are more than 225 cities and unincorporated areas in the counties of Los Angeles, Orange, San Diego, Riverside, San Bernardino, and Ventura. We provide nearly 60 percent of the water used in our 5,200-square-mile service area. MWD's water supplies come from the Colorado River via the district's Colorado River Aqueduct and from northern California via the State Water Project's California Aqueduct.

INTRODUCTION

MWD continues to favor USDA implementation of conservation programs. MWD firmly believes that interagency coordination along with cooperative conservation programs, that are incentive-based and facilitate the development of partnerships are critical to addressing natural resources concerns, such as water quality degradation, wetlands loss and wildlife habitat destruction. It is vital that Congress provide USDA with the funding necessary to successfully carry out its commitment to natural resources conservation.

Our testimony focuses on USDA's conservation programs that are of major importance to MWD. In particular, MWD urges your full support for funding for USDA's Environmental Quality Incentives Program (EQIP). Funding for this program is essential for achieving Colorado River Basin salinity control objectives through the implementation of salinity control measures as part of EQIP. Sufficient Federal funding for USDA programs is necessary to achieve source water quality protection objectives in the Colorado River Basin.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

EQIP provides cost-sharing and incentive payments, technical assistance and educational assistance to farmers and ranchers for the implementation of structural practices (e.g., animal waste management facilities, filterstrips) and land management practices (e.g., nutrient management, grazing management) that address the most serious threats to soil, water and related natural resources. EQIP is to be carried out in a manner that maximizes environmental benefits per dollar expended. This assistance has been focused in conservation priority areas identified by the Natural Resources Conservation Service's (NRCS) State Conservationists, in conjunction with state technical committees and Farm Service Agency personnel.

In Public Law 104-127, Congress amended the Colorado River Basin Salinity Control Act to direct the Secretary of Agriculture to carry out salinity control measures in the Colorado River Basin as part of EQIP. Beginning with the first full year of EQIP funding in 1997, USDA's participation in the Colorado River Salinity Control Program (Salinity Control Program) has significantly diminished. The mechanism by which funding had been allocated by USDA inherently masked projects for which benefits are interstate and international in nature. After requests had been made by the Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin states' salinity control efforts, and others, and directives from the Congress, USDA has concluded that the Salinity Control Program warranted a multi-state river basin approach. The Forum is composed of Gubernatorial appointees from Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming. Clearly, Colorado River salinity control has benefits that are not merely local or intrastate in nature, but continue downstream. Federal funding in an amount greater than \$200 million through financing provided by the Commodity Credit Corporation is critical for implementation of EQIP in order to achieve nationwide EQIP objectives. This would allow acceptance and funding of additional EQIP proposals nationwide. USDA staff have indicated that a more adequately funded EQIP would result in the availability of more funding for the Salinity Control Program.

The Colorado River is a large component of Southern California's regional water supply and its relatively high salinity causes significant economic impacts on water customers in MWD's service area, as well as throughout the Lower Colorado River Basin (Lower Basin). MWD and the Bureau of Reclamation (Reclamation) completed a Salinity Management Study for Southern California in June 1999. The first phase of the study (completed in February 1997) updated the findings of previous studies and concluded that the high salinity from the Colorado River continues to cause significant impacts to residential, industrial and agricultural water users. Furthermore, high salinity adversely affects the region's progressive water recycling programs, and is contributing to an adverse salt buildup through infiltration into Southern California's irreplaceable groundwater basins. In April 1999, MWD's Board of Directors authorized implementation of a comprehensive Action Plan to carry out MWD's policy for management of salinity. The Action Plan focuses on reducing salinity concentrations in Southern California's water supplies through collaborative actions with pertinent agencies, recognizing that an effective solution requires a regional commitment. MWD, the Association of Groundwater Agencies, the Southern California Association of Publicly Owned Treatment Works, and the WaterReuse Association of California have formed a Salinity Management Coalition which will be holding a Salinity Summit next month.

Reclamation estimates that water users in the Lower Basin are experiencing hundreds of millions of dollars in annual impacts from salinity levels in the river, and that impacts would progressively increase with continued agricultural and urban development upstream of California's points of diversion. Droughts will cause spikes in salinity levels that will be highly disruptive to Southern California water management and commerce. The Salinity Control Program has proven to be a very cost-effective approach to help mitigate the impacts of higher salinity. Adequate Federal funding of the Salinity Control Program is essential.

The Forum issued its 1999 Review, Water Quality Standards for Salinity, Colorado River System (1999 Review) in June 1999. The 1999 Review found that additional salinity control was necessary with normal water supply conditions beginning in 1994 to meet the numeric criteria in the water quality standards adopted by the seven Colorado River Basin states and approved by the U.S. Environmental Protection Agency (USEPA). For the last eight fiscal years (1994-2001), funding for USDA's salinity control program has not equaled the Forum-identified funding need for the portion of the program the Federal Government has the responsibility to implement. While NRCS has designated Colorado River Basin salinity control as an area of special interest and allocated about \$4.5 million in fiscal year 2001, with

states and local cost-sharing adding about \$3.5 million, it is essential that implementation of salinity control efforts through EQIP be accelerated to reduce economic impacts. The Basin states and farmers continue to stand ready to pay their share of the implementation costs of EQIP.

The Forum has determined that allocation of \$12 million in EQIP funds in fiscal year 2002 is needed for on-farm measures to control Colorado River salinity. This level of funding is necessary to meet the salinity control activities' schedule to maintain the state adopted and USEPA approved water quality standards. With this level of Federal funding, an additional \$9.3 million in states and local cost-sharing could be committed.

CONSERVATION TECHNICAL ASSISTANCE

MWD also supports adequate funding for Conservation Technical Assistance (CTA) within the NRCS Conservation Operations Program. Conservation technical assistance provides the foundation for implementation of EQIP and other conservation programs. While USDA has determined that 19 percent of the EQIP funds will be available for technical assistance, adequate funding for technical assistance and educational activities should be provided through the Conservation Operations Program, permitting these EQIP funds to be utilized for contracts with agricultural producers. USDA staff has indicated that the percentage of EQIP funds available for technical assistance is inadequate. Consequently, the Basin states have agreed that 40 percent of the states' cost sharing funds be utilized for technical assistance and educational activities. However, only through adequate Federal funding as well for technical assistance and educational activities can advance planning, proposal preparation assistance, comprehensive proposal review, and periodic verification of contract implementation occur.

CONCLUSION

MWD urges you and your Subcommittee to support funding of greater than \$200 million for EQIP and adequate funding for NRCS CTA, and advise USDA that \$12 million in EQIP funds be designated for the Salinity Control Program. Thank you for your consideration of our testimony. USDA's conservation programs are critical for achieving Colorado River Basin salinity control objectives, as well as broader source water quality protection objectives in the Colorado River Basin.

PREPARED STATEMENT OF THE MULTI-CROP AFLATOXIN WORKING GROUP

Mr. Chairman: This is to transmit the Multi-Crop Aflatoxin Working Group's request for fiscal year 2002 increased funding for aflatoxin research under the jurisdiction of the Subcommittee on Agriculture, Rural Development, and Related Agencies. The Multi-Crop Aflatoxin Working Group appreciates your assistance in making this part of the hearing records related to the fiscal year 2002 appropriations bill.

The Multi-Crop Aflatoxin Working Group, with representatives from corn, cotton, peanuts and tree nuts, was formed in 1989 to pursue the goal of eliminating or preventing the formation of aflatoxin in field crops and serves as a liaison committee to assist the USDA on aflatoxin research. Aflatoxin, a by-product of several naturally occurring fungi, is recognized internationally as a serious food safety hazard. It causes millions of dollars of crop losses to American agriculture each year. A new factor causing reduction in U.S. exports is that international food safety organizations have lowered acceptable aflatoxin levels in foods and feeds to near zero levels. Development of procedures to produce food free of aflatoxin requires a coordinated national effort by both government and industry. The elimination of aflatoxin would greatly improve the competitiveness of U.S. agricultural products.

Since the Multi-Crop Aflatoxin Working Group was formed it has strongly supported increasing the budget of the USDA Agricultural Research Service for aflatoxin research to help maintain this food safety research at an appropriate and productive level and worked with USDA to keep a focused and integrated aflatoxin research program. About \$800,000 of the total USDA research budget for aflatoxin of about \$9.1 million goes for these grants given on a competitive basis. A blue-ribbon panel of industry representatives assists in reviewing the projects that are funded and works with USDA to assure that they represent an integrated approach to the problem. Since the beginning of this program, over 200 important projects have been initiated. These include projects that address the major research objectives thought useful in reaching the goal of eliminating aflatoxin problems in the U.S. There are projects on (1) breeding and genetically engineered crop varieties with en-

hanced resistance to contamination, (2) development of bio-competitive agents to remove aflatoxin-producing fungi from crops, and (3) improving our understanding of the genetics and chemistry of how the fungi produce aflatoxin. These projects are being conducted through grants to ARS laboratories and state universities in about 20 states.

The combination of ARS projects, grants and the significant research efforts underway by U.S. producer and processor groups demonstrate the commitment of Congress, the Department of Agriculture, and the nation's food and fiber producers and processors to eliminate aflatoxin from the food supply, improve food safety, and increase the competitiveness of U.S. producers.

Much has been learned from the research conducted since 1990. But much more needs to be learned about managing and eliminating the serious aflatoxin problems. This is evidenced by the devastating occurrence of aflatoxin in crops in some of the south, mid-south and southwest in 1998 and 1999.

FUNDING REQUEST

For fiscal year 2002, the Multi-Crop Aflatoxin Working Group is requesting that the funds added by the Congress in the fiscal year 2001 appropriations that are proposed to be terminated be restored. The Working Group also requests that the USDA, ARS base budget for aflatoxin research in fiscal year 2002 be increased by \$2.5 million for grants to translate our base of knowledge into practical systems to help farmers regain and increase export markets lost due to new more restrictive international standards. The funds are specifically earmarked for:

- research and development of the biology and ecology of *Aspergillus flavus* and the use of non-aflatoxin producing strains to prevent aflatoxin contamination;
- research and development to extend and commercialize this and other control technology in other affected crops; and
- research for the four affected crops that was outlined earlier.

Thank you for consideration of our recommendations. If there are questions please contact Sherri Lehman (Corn Refiners Assoc., 202-331-1634) or Phil Wakelyn (National Cotton Council, 202-745-7805).

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF FSA COUNTY OFFICE EMPLOYEES

Thank you for the opportunity to provide testimony concerning the agricultural appropriations for the Farm Service Agency. The Farm Service Agency (FSA) improves the economic stability of agriculture, rural America, and the environment through commodity programs; farm ownership, operating, and emergency loans; conservation programs; domestic and overseas food assistance programs; and disaster programs. These programs provide a safety net to help farmers produce an adequate food supply, maintain viable operations, compete for export sales of commodities in the world marketplace, and contribute to the year-round availability of low-cost, safe, and nutritious foods. FSA considers environmental impacts in the development and implementation of program operations to ensure adequate protection of natural, cultural, and historical resources.

Currently, FSA's programs are delivered in nearly 2,250 USDA Service Centers and 51 State Offices, including Puerto Rico. This network enables FSA to maintain close relationships with Agency customers and successfully address customer needs in an effort to continually improve the delivery of FSA programs. For the past seven years, FSA has been addressing historic shifts in the Federal Government's role in production agriculture. Rural communities and agriculture producers still rely heavily on the programs administered by the FSA field employees during periods of economic decline. Per the conferees report of the 2001 Ag Appropriations, ". . . the economic crisis and FSA workload are not expected to decline in the near future; the conferees expect that future funding requests by USDA to fully support the workload needs of the employees."

During the past four years Congress has recognized the need for additional salary and expenses for FSA, approving eight supplemental appropriations. In as much as FSA employees appreciate the supplemental process, they also recognize that the supplemental process is not a fundamentally sound method of budgeting for the agency. It has resulted in fluctuating staffing levels in the county office and inability to retain staff when critically needed. It causes turmoil with delayed payments and disrupted service to producers.

According to the "Government Performance and Results Act of 1993" FSA Administrator must prepare and submit an annual Performance Plan for the agency identifying staffing and funding necessary to carry out program goals. OMB utilizes this

plan for budget. NASCOE believes the 2001 Performance Plan, prepared by the previous administration, does not adequately address FSA county office employee FTE positions and funding. This is indicated in the referenced 1999 and 2000 staffing reports. This is also evident in the fact there has been a funded supplemental appropriation request for temporary employees for the Farm Service Agency in 1998, 1999, 2000, and 2001.

In Section 7 of the "Government Performance and Results Act of 1993 it is stated, "Nothing in this Act shall be construed as limiting the ability of the Congress to establish, amend, suspend, or revise an annual performance goal. Any such action shall have the effect of superseding that goal in the plan." NASCOE believes USDA must amend the performance goals of the previous administration for FSA to assure adequate PERMANENT staffing and funding for FSA county office employees. NASCOE stresses we can, and must, achieve a turn-around in the abuses and stresses affecting FSA county office employees.

The previous budget shortfalls illustrate the need for salary and expense finding to be commensurate with program delivery requirements. In 2001 and 2000, program outlays for Farm Service Agency salary and expenses accounted for only 2.8 percent of the total program level budget. When analyzing past historical budgets from the period of 1996 through 2001, as well as analyzing the workload system performed by the Farm Service Agency, a 4.5 percent program level for salary and expenses is supported. In other words, for every dollar of program funds appropriated by Congress, it is demonstrated that approximately 4½ cents needs to be appropriated for related salaries and operating expenses of the agency.

In order to retain the security and accountability of the farm programs, investments and improvements in the infrastructure is mandatory. Wherever possible, USDA has streamlined its administrative structure to ensure that maximum resources are devoted to programs. Agencies have been consolidated, offices closed, and staffing levels reduced. More than one-third of the county field offices that existed in 1994 have been closed, and Farm Service Agency CO staffing levels have declined by nearly 40 percent between 1993 and 2001. At this same time, Farm Service Agency has been expected to complete significantly more work. We have seen greater than 250 percent increase in program outlays, and the percent of farm program participation is at its highest level in USDA history. The Farm Service Agency performs an actual count of work completed in each field office, and can determine based on this workload the total number of employees needed. In 1999, the most recent year for which data is available, FSA report 14 indicates the total number of employees required to adequately staff the field FSA offices were 11,424.3 employees. The current staffing in county offices is 9160 permanent employees, taken from information provided by the Department. County offices are under-staffed by 2,284 employees, and this disparity currently continues for 2001. We need USDA to recognize this crisis and correct the disproportionate staffing of employees. It is important to realize that permanent staffing at the Field Office level has decreased by 5,793 employees since 1993. This is nearly a 40 percent cut in permanent CO staffing and indicates a cut of 2.5 employees per county office (there are approximately 2250 field offices nationwide).

A major workload component facing FSA in the 2001 fiscal year is implementation of the Agriculture Risk Protection Act (ARPA). In this bill FSA was assigned the task of providing compliance oversight on Crop Insurance. Per a report released by the crop insurance industry in January 2001, "Because FSA has an extensive field office structure and RMA does not, the act authorizes RMA to utilize FSA in its compliance efforts. Fraud and abuse are best addressed immediately in the area where it is suspected. FSA's presence in the local area should help RMA attain information regarding a suspect situation in a timely manner." In addition, in the same law, the Non-Insured Crop Disaster Assistance Program was dramatically changed to provide coverage to producers on a fee basis. Therefore the program will mirror crop insurance in many aspects and will require considerable staff time for County Offices. The time involved is unknown since this is new approach to a program FSA has delivered on a limited basis over the past 5 years. The Farm Service Agency indicates in their fiscal year 2000 and 2001 Annual Performance Plan that NAP is a very labor-intensive process and the NAP participation is expected to increase in the coming years. It is estimated these two new requirements will add staffing workload of 1 to 1½ persons per office depending on the size of the Counties. NASCOE is concerned that a projection for this increased workload be included in the budget request.

If USDA is to leverage the power of technology to deliver a range of services, its employees must be highly skilled. Unfortunately, USDA is facing an aging workforce, which has one of the highest retirement eligibility rates in the Federal Government. As FSA jobs become increasingly technical, skill gaps are emerging in key

areas, such as information technology. Adequate funds for program and computer training are essential. As current workers retire and new workers are hired, FSA must ensure that it maintains and builds a talented, flexible and diverse workforce.

USDA's budget request for 2002 increases FSA's salary and expense baseline by \$120 million. This is the first time the Department has requested an increase in several years for FSA. The proposed budget reflects a net increase after inflation of approximately \$70 million. NASCOE believes it is critical FSA considers allocating this increase to permanent staffing to take care of the increased workload generated by the current economic situation, the Agriculture Risk Protection Act, and the Freedom to E-File Act. Additional concern, as supported by recent GAO reports, is recognizing the crisis in human capital affecting USDA and the Farm Service Agency. With a majority of the workforce eligible to retire in the next six years, recruitment and adequate training of employees must occur. Considering a net cost per employee of \$55,000, FSA could hire 1,273 permanent employees. Although the immense use of temporary employees by FSA has continued for the past three years, the skill and program expertise of these employees is minimal, and is no substitute for institutional knowledge. Due to past intermittent hiring and reductions of temporary employees, retention of these employees is often non-existent and leads to loss of real dollars in training of these employees only to have them exit the FSA workforce for more secure employment, and benefits.

It is imperative that Farm Service Agency future budgets allow for the hiring and recruitment of permanent employees. The current workload and historic trends in agricultural policy and rural economics support a need for increased permanent staffing in the short-term. Responsible planning and awareness of the crisis in human capital being faced by USDA and the Farm Service Agency support the need for permanent hiring for long-term stability. The ability to meet the needs of rural America and our nation's farmers and ranchers is dependent upon the recognition that infrastructure needs are becoming more pronounced, and must be addressed with adequate funding and effective leadership.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

The National Association of Conservation Districts is the nonprofit, nongovernment organization that represents the nation's 3,000 conservation districts and more than 16,000 men and women who serve on their governing boards. Established under state law, conservation districts are local units of state government charged with carrying out programs for the protection and management of natural resources at the local level. They work with nearly two-and-half million cooperating landowners and operators—many of them farmers and ranchers—to provide technical and other assistance to help them manage and protect nearly 70 percent of the private land in the contiguous United States. In carrying their mission to coordinate and carry out all levels of conservation programs, districts work closely with USDA's Natural Resources Conservation Service (NRCS) through its Conservation Technical Assistance (CTA) program to provide the technical and other help farmers and ranchers need to plan and apply complex conservation treatments.

On behalf of America's conservation districts, I am pleased to provide our recommendations on selected conservation programs carried out through the US Department of Agriculture, especially those of the Natural Resources Conservation Service. Our request includes an additional \$60 million for the NRCS Conservation Technical Assistance account, and another \$190 million for specific conservation needs if the available funds permit. We are requesting an additional \$350 million for the Environmental Quality Incentives Program. We also request an additional \$150 million for the Watershed Protection and Flood Prevention Program. And lastly, we request \$60 million to provide NRCS technical and financial assistance to address watershed infrastructure issues, in concert with local sponsors, identified in the Small Watershed Rehabilitation Amendments of 2000.

Farmers and ranchers can and do provide more than just food and fiber. They protect and improve the quantity and quality of our soil resources. They provide clean water and air, as well as wildlife habitat and open space. Many of the conservation practices producers apply on their land also take carbon out of the atmosphere and store it in the soil, providing a hedge against global climate change. As stewards of the nation's working lands, farmers and ranchers manage the vast majority of America's private lands and provide tremendous environmental benefits to the country.

In 1985, Congress recognized the important role that farmers and ranchers play in environmental protection. It enacted the first Farm Bill conservation title, requiring producers to incorporate conservation into their operations if they wanted to

continue receiving USDA farm program benefits. The title also included an incentives program—the CRP—to give farmers financial incentives to protect sensitive lands. In subsequent Farm Bills, lawmakers added more incentives programs—WRP, EQIP, Farmland Protection Program, WHIP—to encourage good stewardship behavior.

The number and complexity of Federal conservation programs has grown considerably over the past one-and-a-half decades, but the Federal component of the infrastructure needed to implement them hasn't. In fact, it has gone down. In the meantime, the workload continues to grow.

Two years ago, NACD and several of its partners collected extensive data on the challenges facing private lands conservation through its National Field Workload Analysis (WLA). The purpose of that analysis was to examine the staff years of technical support needed at the field level to carry out 29 core work elements each year. Some of these core work elements encompass Farm Bill program objectives, but many do not.

The national data collected through the WLA painted a stunning picture of the workload needs across the countryside. To effectively address the total resource needs on America's private lands would require 359,734 staff years of technical assistance from all sources. If stretched over a 10-year period, this would equate to 35,974 staff years per year, at a cost of nearly \$2.4 billion per year for technical assistance alone. We are just now completing a 2001 WLA and early indications are that the need has not gone down but has increased by 15 percent.

Earlier this month, the Senate Budget Committee indicated recognition of the shortfall in funding and staffing needed to address agriculture's environmental needs by adding \$1.65 billion to USDA's budget for conservation in fiscal year 1902. America's conservation districts applaud this action and, if realized, urge you to provide a substantial increase in NRCS's CTA and other important conservation programs as part of that package. Our specific recommendations for how additional funds should be appropriated follow.

DISCRETIONARY PROGRAMS

It is critical that the basic CTA account at least remains intact at its current level to address as many of the nation's resource conservation needs as possible. In order to cover inflation, increased pay costs and the loss of reimbursements from mandatory programs like the Conservation Reserve Program (CRP), we estimate that it will take an additional \$60 million in fiscal year 1902 to keep NRCS field staff at its current level and not lose ground. This is the basis for our CTA request.

Our request is consistent with the President's budget request, which proposes an overall \$59 million boost in CTA funding for fiscal year 1902. While we welcome and applaud this requested increase, we are concerned that his budget directs up to \$44 million in the CTA program to pay for any technical assistance costs associated with enrolling 2.24 million acres into the CRP in 2002, as is optimistically projected in the President's budget request. We strongly urge Congress to ensure that conservation programs such as the CRP that are funded by the mandatory spending of the Commodity Credit Corporation pay their own technical assistance costs from mandatory funds.

The bottom line is that whether CRP enrollments in 2002 are 2.24 million acres or less, the CRP should pay for its own technical assistance costs, and that CTA should be funded at a level necessary to maintain current field staffing levels.

When considering funding for NRCS fiscal year 1902, it is important to keep in mind that CTA is a program, and it was not created by Congress to serve as a salary and expense account to support a limited number of Federal tools. It was intended as a program in and of itself the purpose of which was to help the nation's farmers and ranchers and other landowners address their resource conservation needs by providing technical support at the local level, including non-HEL lands that are nonetheless eroding at unacceptable levels. It is critical that the basic CTA account at least remains intact at its current level to address this and myriad other resource needs.

Waste from animal feeding operations (AFOs) has become a significant issue over the past several years. USDA's most recent estimate indicates that more than roughly 275,000 comprehensive nutrient management plans will be needed over the next several years to control runoff from AFOs. The President's proposal would redirect \$70 million of CTA to begin to address those AFO plans. Conservation districts strongly support providing resources to help farmers and ranchers address AFO problems, but re-directing an already seriously oversubscribed CTA account for this purpose would be a mistake. If we seriously want to address AFO issues, Con-

gress needs to provide an additional \$70 million for technical assistance in fiscal year 2002 to do so.

Another important national priority is the growing problem in many areas of the deteriorating condition of our nation's grazing and pasturelands. Resource problems such as brush, weeds and accelerated water or wind erosion threaten the capacity of nearly 300 million acres—more than 50 percent—of these lands to satisfy production needs and meet natural resource values. Working with partners such as the National Grazing Lands Conservation Initiative, conservation districts and their partners have determined that at least \$60 million is needed to fund the Farm Bill's Conservation of Private Grazing Land (CPGL) Program to begin reversing the negative trends that affect both production and environmental concerns on these lands. Conservation districts urge Congress to appropriate \$60 million to begin funding the CPGL in fiscal year 2002.

Since 1985 significant advances have been made in reducing soil erosion and increasing productivity. Much of the gain in controlling soil erosion is a result of conservation compliance, the adoption of conservation tillage and the enrollment of land in the CRP. Since 1996, however, rates of erosion reduction have leveled off, as there were fewer incentives to reduce erosion on non-highly erodible land that is nonetheless eroding at unacceptable levels: There is still excessive soil erosion on 112 million acres of cropland, with a total of 1.3 billion tons eroding per year. Leaching and runoff of soil and chemical components continue to be concerns. Conservation districts support appropriating an additional \$60 million to address erosion control on non-HEL in fiscal year 2002.

Through its Watershed Protection and Flood Prevention Program NRCS and local sponsors address numerous water-related and other natural resource issues, conduct studies, develop watershed plans and implement resource management systems. Projects are carried out primarily under the authority of Public Law 83-566 and Public Law 78-534. More than 500 active watershed projects primarily target land treatment measures for water supply management and flood prevention. The most recent program evaluation by NRCS showed a 2.2:1 benefits to cost ratio for this program. Conservation districts support funding the Watershed Protection and Flood Prevention program at \$250 million to complete ongoing projects and to address the backlog of project requests.

A related priority facing private lands conservation is the rehabilitation needs of the nation's aging watershed infrastructure—many of them built under the authority of the above programs. NRCS estimates that approximately 2,200 watershed structures, including dams, are in immediate need of rehabilitation and that more than 650 of these dams pose potential threats to public health and safety. Unless these issues are addressed, the magnitude of the problems will only increase as the infrastructure continues to age.

The Small Watershed Rehabilitation Amendments (SWRA) of 2000, enacted last year, authorizes \$90 million over the next five years to provide NRCS technical and financial assistance to address these watershed infrastructure issues in concert with local sponsors. Project sponsors in the 500 active watersheds need technical and financial assistance to implement rehabilitation plans to meet current environmental, economic and safety needs. Conservation districts urge you to begin addressing these needs through that statute by appropriating \$60 million for watershed infrastructure rehabilitation projects in fiscal year 2002. Resource Conservation and Development Councils play an important role in rural development and natural resource conservation. USDA has indicated that it takes \$161,000 to fully support an RC&D council. There are 348 existing councils and 27 pending applications. Conservation districts recommend that Congress appropriate \$60 million to fully support all existing councils and additional applicant areas.

MANDATORY PROGRAMS

The Environmental Quality Incentives Program (EQIP) is an ideal vehicle through which to address livestock water quality and other resource issues. However, this program, too, is tremendously oversubscribed and unavailable to fund three out of four producers who would otherwise qualify. And, many of those turned away are livestock producers not currently subject to NPDES regulation. The Senate's resolution acknowledges EQIP's potential and its lack of adequate funding by adding an additional \$350 million annually for assistance through the program. Conservation districts support funding EQIP at \$550 million in fiscal year 2002.

If additional funds become available, the nation's conservation districts also support expanding and funding the Conservation Reserve Program, the Wetlands Reserve Program, the Wildlife Habitat Incentives Program and the Farmland Protection Program in fiscal year 2002.

As you continue your work on providing funding for critical NRCS programs, we again urge you to keep in mind that NRCS is the only Federal agency whose primary role is to provide conservation assistance on the nation's private lands. There are a few other agencies with narrowly targeted purposes, but no other agency even comes close to touching 70 percent of America's private lands as do NRCS and conservation districts. It is critical, therefore, that we strengthen the nation's commitment to providing adequate resources to help these land managers conserve and protect natural resources on America's private lands.

On behalf of the nation's 3,000 conservation districts, we appreciate the opportunity to provide our views on fiscal year 2002 funding recommendations for select USDA conservation programs. We look forward to working with you over the next few months in finalizing your proposals.

Fiscal Year 2002 Recommended Appropriations for NRCS Conservation Programs

| <i>April 2001</i> | | | | | |
|---|-------------------|-----------------|-----------------------|-----------------|---------------------|
| Figures Represent Millions of Dollars | FY 2001 Admin. | FY 2001 NACD | FY 2001 Estimate | FY 2002 Admin | FY 2002 NACD |

| Conservation Reserve Program | | | 63.000 ⁵ | 0.000 | 44.000 ⁶ |
| Total NRCS | 1803.441 | 2161.550 | 1459.336 | 1101.000 | 2321.550 |

¹ NRCS earmarked \$18 million of CTA for the Grazing Lands Conservation Initiative in '01 and intends to do the same in '02. NACD supports a separate Grazing Lands line item.

² Reflects an additional \$26 million for EQIP included in the FY2001 Labor-HHS omnibus spending package.

³ NACD policy supports annual enrollment of 250,000 acres in the WRP.

⁴ Reflects \$40 million in cost-share funding authorized in the Agricultural Risk Protection Act (ARPA), passed in the spring of 2000. USDA designated \$20 million for WHIP and \$20 million for the Farmland Protection Program (FPP). The ARPA also included a separate authorization for FPP at \$10 million.

⁵ Technical assistance funding provided for CRP and WRP in two '01 emergency spending measures.

⁶ Technical assistance funds needed to enroll 2.24 million acres in the CRP in '02.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF PROFESSIONAL FORESTRY SCHOOLS AND COLLEGES

The National Association of Professional Forestry Schools and Colleges (NAPFSC) is comprised of the 67 universities that conduct the Nation's research, teaching, and extension programs in forestry and related areas of environmental and natural re-

source management. NAPFSC strongly supports increased funding for Federal forestry research programs, including those operated by the USDA's Cooperative State Research Education and Extension Service (CSREES).

The management of nonfederal forestlands has become a critical economic and environmental issue. Owners and managers of nonfederal forestlands are simply not equipped to deal with the tremendous changes in forest land use and management that have occurred in the last decade nor the pressures of the 21st century. The programs outlined below are key to addressing the stewardship of these lands. These programs are: the McIntire-Stennis Cooperative Forestry Research Program (McIntire-Stennis), the Renewable Resources Extension Act (RREA), the National Research Initiative (NRI), and the Initiative for Future Agriculture and Food Systems (IFAFS). The first three of these programs have stimulated the development of vital partnerships involving universities, Federal agencies, non-governmental organizations and private industry, and the newest program—IFAFS—a competitive grants program, offers great potential for developing new uses for forest products, improving natural resource management, and building multi-state and multi-university partnerships for research and outreach activities.

| | Fiscal Year 2000 Enacted | Fiscal Year 2001 Enacted | Fiscal Year 2002 Bush Budget | Fiscal Year 2002 NAPFSC Rec- ommendation |
|------------------------|-----------------------------|-----------------------------|---------------------------------|--|
| McIntire-Stennis | \$21,932,000 | \$21,932,000 | \$21,884,000 | \$30,000,000 |
| RREA | 3,192,000 | 3,192,000 | 3,185,000 | 15,000,000 |
| NRI | 119,300,000 | 106,000,000 | 105,767,000 | 150,000,000 |
| IFAFS | 120,000,000 | 113,400,000 | 120,000,000 | 120,000,000 |

THE CASE FOR ENHANCED FORESTRY RESEARCH FUNDING

The past, present, and future success of forestry research and extension activities arising from the NAPFSC member institutions results from a unique partnership involving Federal, State, and private cooperators. Federal agencies have concentrated on large-scale national issues while state funding has emphasized applied problems and state-specific opportunities. University research in contrast, with the assistance of Federal, State and private support, has been able to address a broad array of applied problems related to technology development and fundamental biophysical and socioeconomic issues and problems that cross ownership, state, region, and national boundaries.

The 1998 Farm Bill and various subsequent reports and conference proceedings have identified the need for greater attention on the emerging issues confronting non-Federal forest landowners. NAPFSC is pleased to be one of the cofounders of the National Coalition for Sustaining America's Nonfederal Forests. The founding of the Coalition and its subsequent report emerged from a Forestry Summit held in 1999 that brought together key forestry leaders and landowners from across the nation. The outcome of the Summit confirmed the need for increases in forestry research funding focused on non-Federal lands and for an increase in collaborative efforts between university-based research and the Federal agencies.

The forests and other renewable natural resources of this country are primary contributors to the economic health of the nation; are reservoirs of biodiversity important to the well-being of our citizens; are significant to the maintenance of environmental quality of our atmosphere, water, and soil resources and provide diverse recreational and spiritual renewal opportunities for a growing population. Tremendous strains are being placed upon the nation's private forest lands by the combination of increasing demands for forest products coupled with dramatic changes in timber policies concerning our National Forests. Because of the changes in Federal forest policy, private forest lands in the United States are now being harvested at rates not seen since the beginning of the 20th century.

For example, in the East, NIPFs are projected to increase their timber harvests almost 30 percent from the 1986 levels until 2010. Hardwood timber harvests on NIPF lands in the South are actually projected to increase more than 60 percent from 1986 to 2010. These spectacular increases will require larger investments and enhanced public educational programs—and hopefully much more regeneration and intensive timber management—at a scale never before realized on NIPF lands in the U.S.

To meet this challenge, research priorities must be adjusted to better address the needs of private landowners, and to specifically enhance the productivity of such lands through economically efficient and environmentally sound means. These chal-

allenges can be substantially addressed by the university community through the building of integrated research and extension programs assisted by McIntire-Stennis, RREA, and NRI.

There are currently approximately 10 million private forestland owners in the U.S. These landowners control nearly 60 percent of all forestland in the country. And it has been to the universities, with strong support from CSREES, that landowners traditionally look for new information about managing their lands. The overwhelming majority of the 10 million private landowners are not currently equipped to practice the sustained forest management that is critical to the health of our environment and economy. The combination of research conducted by the forestry schools, combined with the dissemination of that research through the cooperative extension network, has never been more essential.

MCINTIRE-STENNIS COOPERATIVE FORESTRY RESEARCH

The Cooperative Forestry Research Program (McIntire-Stennis Act), is the lead forestry effort administered by the USDA Cooperative State Research, Education, and Extension Service (CSREES). This program is the foundation of forestry research and scientist training efforts at universities. Funding this program provides for cutting-edge research on productivity, technologies for monitoring and extending the resource base, and environmental quality. The program is critically important today since universities provide a large share of the nation's research. Additionally, universities train nearly all of the nation's scientists in forestry. The main categories of need are:

- Significantly enhance sustainability and productivity of nonfederal forests;
- Increase the financial contributions of nonfederal forests to benefit landowners, the rural community, state and national economies, and environmental values; and
- Conserve and sustain the nonfederal forests and other natural resources for future generations.

The Cooperative Forestry Research Program is currently funded at \$21.932 million and matched more than three times by universities with state and nonfederal funds. The program is currently funded at little more than one-fifth its authorized level. We recommended funding McIntire-Stennis at a level of \$30,000,000 for fiscal year 2002. The requested additional funding would be targeted at:

- sustainable and productive forest management on private lands to address issues of competitiveness and economic growth (\$3.0 million);
- forest inventory, monitoring, and assessment with emphasis on new technologies (\$2.1 million);
- new products, improved processing technologies, and utilization of small trees to extend the forest resource and improve environmental quality (\$1.1 million); and
- assessing social values and tradeoffs to facilitate the understanding of policy options, economic impacts, and informed decisions at all levels of government (\$1.9 million).

The NAPFSC schools further recommend that CSREES provide this support to universities with direction to focus on new or existing approved projects for the explicit purpose of near term progress in addressing one or more of these research targets in each school's state or region. It is recognized that progress will be dependent on a critical mass of scientific effort, and collaboration among schools is thus encouraged. Additionally stakeholder advisory mechanisms should be a part of the funding allocation process. In the process of funding these projects, NAPFSC would also recommend that portions of this funding be used to build research capacity, including a provision calling for training of much needed new forestry scientists.

RENEWABLE RESOURCES EXTENSION ACT

The Renewable Resources Extension Act (RREA) is the lead forestry extension effort administered by the USDA Cooperative State Research, Education, and Extension Service (CSREES). This program is the foundation of outreach and extension efforts at universities. Funding for this program addresses critical forestry and related natural resources extension and stewardship needs in states, and would address the critical issues of forest management for productivity and environmental quality on non-Federal lands brought about by diminished harvest levels on Federal lands.

Audiences for the products of outreach and extension are as diverse as are the stakeholders. Of highest priority are the owners of nonfederal forestlands and those involved in implementing forest management. These groups would be best served by outreach programs that (1) solve immediate problems; (2) transfer research tech-

nologies and new knowledge; and (3) increase their awareness of the benefits of active management.

It is vital that Congress increase funding for this important program for distributing the knowledge gained through our research institutions to the private landowners. NAPFSC recommends funding RREA at a level of \$15 million for fiscal year 2002. This increase would take RREA to its full authorization level.

With nearly ten million nonfederal forest landowners, the most compelling priority areas for extension and outreach are:

- Develop databases of landowner information to customize educational efforts and their delivery to address owner values and goals (\$2.5 million);
- Increase landowner awareness through new communication technologies, volunteer leadership, and localized programming (\$2.5 million);
- Identify management alternatives with readily accessible new information on programs, services, and benefits of management and planning to integrate water, fish, wildlife, timber and other products and services (\$3.0 million);
- Address local issues and needs within the framework of landowner's objectives using special forums, experts, and case study approaches to sustainable forestry (\$2.0 million); and
- Identify and follow up on organizational opportunities including the establishment of landowner organizations linked to professional services, price reporting systems, and cooperative marketing (\$1.8 million).

The NAPFSC schools further recommend that CSREES provide this support to universities with direction to focus on new or existing approved projects for the explicit purpose of near term progress in addressing one or more of these outreach/extension targets in each school's state, region, or nationally. It is recognized that progress will be dependent on a critical mass of extension educator effort, and cooperation among schools is thus encouraged. Additionally stakeholder advisory mechanisms should be a part of the funding allocation process. In the process of funding these projects, NAPFSC would also recommend that portions of this funding be used to build outreach/extension capacity, including a provision calling for training of much needed new extension educators and associated technical support staff.

NATIONAL RESEARCH INITIATIVE COMPETITIVE GRANTS

The National Research Initiative Competitive Grants program (NRICGP) is a significant source of funding for basic cutting-edge and applied research in categories important to sustainable forest management. Among these categories are (1) natural resources and the environment, (2) plants, (3) markets, trade and rural development, and (4) processing for value added/new products. This program is administered by the USDA Cooperative State Research, Education, and Extension Service (CSREES).

This program is currently funded at \$106 million of which approximately ten percent goes to successful forestry research proposals. Building to address the full set of research needs of nonfederal forests will take several years and steps as described in the Coalition's planning document. However, we urge a significant step in the first part of this new century. NAPFSC recommends this program be funded at \$150 million for fiscal year 2002 with at least \$20 million directed to forestry and forest products research priorities in categories (1)–(4) above under existing and/or new research opportunity areas. We further urge the targeting of funding of research on the most compelling needs.

INITIATIVE FOR FUTURE AGRICULTURE AND FOOD SYSTEMS

The Initiative for future Agriculture and Food Systems (IFAFS) is a new research, extension, and education competitive grants program designed to address a number of critical emerging issues in the broad area of agricultural. These issues encompass future food production, food safety, environmental quality, natural resource management, and farm income. Priority program areas include (1) the agriculture genome; (2) new and alternative uses and production of commodities and products; (3) biotechnology; and (4) and natural resource management, including precision agriculture. Priority for funding is for those proposals that were multi-state, multi-institutional, or multi-disciplinary, or that integrated research, extension, and/or education. This program, administered by CSREES, was funded at \$113.4 million in fiscal year 2001. NAPFSC strongly supports this new competitive grants program and urges your Subcommittee to provide the full \$120 million for fiscal year 2002.

CONCLUSION

The needed investment for these programs is substantial, but the potential returns are enormous and crucial to our society's future. Disciplined and rigorous im-

plementation of research on forestry issues will contribute greatly to attaining our vision for America's nonfederal forests for the future. NAPFSC urges cooperation at Federal, State, and University's levels to make this research and the vision it will support a reality.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND
LAND-GRANT COLLEGES

Mr. Chairman, I would like to extend my thanks to you and the Committee for the opportunity to submit testimony regarding funding for USDA's Cooperative State Research, Education and Extension Service in fiscal year 2002. I am Gale Buchanan, Dean of the College of Agricultural and Environmental Sciences at the University of Georgia. I serve as Chair of the Board on Agriculture Budget Committee of the National Association of State Universities and Land Grant Colleges (NASULGC). Founded in 1887, NASULGC is the nation's oldest higher education association. A voluntary association of public universities, land-grant institutions and many of the nation's public university systems, NASULGC campuses are located in all 50 states, the U.S. territories and the District of Columbia. As of October 2000, the association's membership stood at 212 institutions. This includes 75 land-grant universities (of which 18 are the historically black public institutions created by the Second Morrill Act of 1890) and 28 public higher education systems. In addition, tribal colleges became land-grant institutions in 1994 and 30 are represented in NASULGC through the membership of the American Indian Higher Education Consortium (AIHEC).

THE BOTTOM-LINE

The Land Grant Colleges and State Universities support doubling the investment in agricultural research, extension and teaching over the next five years. To accomplish this goal,

We recommend increasing funding for USDA/CSREES by \$200 million in fiscal year 2002.

We recommend that these increases be accomplished through a balanced portfolio of investments, which are listed in the attached table. We recommend that these increases be targeted to investments in five priority areas: An Educated Workforce, Dependable Food Supply, Revitalizing Communities, Environmental Balance, and Capacity Building. The Capacity Building category allows for critically needed investments in our minority-serving institutions, which will enable them to more effectively address the other priority areas and the unique needs of the communities that they serve.

INVEST IN AN EDUCATED WORKFORCE

The entire traditional education system is due for an overhaul and expansion. It must be transformed through technology, electronic-based learning and globalization of the curriculum. And there's no time to spare. In a very few years, today's students will run a food and agricultural system with assets exceeding a trillion dollars. Almost 20 percent of the workforce in this country is involved in the production, processing, packing and distribution of nutritious and safe food and fiber. All the new technology and knowledge in the world are useless without the well-trained mind of someone to learn from it, apply it and expand it. Yet undergraduate and graduate education in colleges of agriculture and life sciences is largely neglected in Federal funding. More investment is needed to make the higher education system a more global one through electronic-based learning. We need to equip our college students, especially minorities, with skills and opportunities to become leaders in our nation's workforce. And we need to ensure that the state and land-grant university system continues to provide unbiased information, continuing education and workforce preparation to help people prosper in today's ever-changing world. Our state and land-grant institutions educate future scientists and employees who serve one of the largest sectors of the American economy. Their future is key to our nation's future.

We are proposing that an investment of \$19.7 million be targeted towards workforce education.—The specific funding mechanisms that we think can best address this issue are listed in the Table. We recommend increased funding for Graduate Fellowship Grants, Institution Challenge Grants, Multicultural Scholars, and Secondary/2-year Post Secondary grants. As part of this mix of funding mechanisms, we propose that \$3 million be identified for workforce preparation within the integrated Sec. 406 accounts. This new program would integrate research, teaching, and

extension elements into workforce preparation, fostering innovation in our agricultural teaching and extension outreach programs.

INVEST IN A DEPENDABLE FOOD SUPPLY

As agricultural markets rapidly move into the world arena, American farmers go head to head with farmers from other countries who rely on high government supports, work under less stringent environmental protection rules and safety standards, or pay far less for labor and other expenses. Yet American farmers must compete internationally to stay in business. Their best hope is science, conducted through state and land-grant universities. New biotechnology tools and the science of genomics will open new horizons and challenges for food production, processing and international trade. Advancements in health and agricultural sciences will help us better understand the interactions between diet and health. It can learn how foods may contribute to allergies or stave off chronic diseases. It can fight insects, weeds and diseases in the field; create new crops and economic opportunities; develop new foods and processing techniques, and keep pathogens and other dangers out of the food supply.

When it comes to food, everyone—consumers, growers, processors and authorities—all demand safety, and for good reason. The Centers for Disease Control and Prevention says 76 million illnesses can be attributed in this country to food-borne diseases. Economic losses attributed to meat and poultry risks alone may top \$28 billion annually. Many of the causes of greatest concern were not even recognized 20 years ago. Recent news about “Mad Cow” and “hoof-and-mouth” diseases are immediate examples of the need to invest in assessment and treatment research, as well as producer training and public education programs. Biotechnology, genomics and other yet-undiscovered sciences must undergo rigorous reviews to keep a close eye on these promising advancements. They may offer the key to developing foods to combat diseases and chronic health problems, and improving nutrition.

To address the production needs of farmers and ranchers and the safety and health concerns of consumers, we request a total budget increase in this category of \$35.404 million.—The mix of funding mechanisms that can best target these issues are shown in the Table. We have proposed increasing Hatch research funds by \$7.587 million, to be targeted to these issues. We’ve targeted all of our proposed increases in Animal Health to these issues. We urge enhancing the Expanded Food and Nutrition Education Program (EFNEP). We recommend a doubling of the Ag in the Classroom program. We recommend creating two new categories in Sec. 406. We recommend creating an category addressing biobased products, both to develop alternative renewable energy sources and to develop new and value added products. We recommend a second category to address biotechnology and health issues, which should be targeted towards addressing research and education efforts to address public concerns regarding emerging new technologies, such as genetically modified organisms. We also recommend funding a Small Farms Initiative to meet the special challenges facing smaller producers.

INVEST TO RENEW COMMUNITIES

Community leadership, sound public policy, portfolio diversity for the tax base, well-managed and envisioned community services, active public involvement, strong schools and medical facilities, a healthy population: these are the characteristics of a healthy, growing community. Both rural and urban communities will face special challenges in the next decade. Local communities will be required to make complex decisions about health care, education, telecommunications, economic development, and the delivery of social services. The land-grant system is the only dependable source of information for many struggling communities. It can arm them with the necessary tools to succeed. Researchers and educators can help them develop participatory citizens, involve youth through 4-H in life-long learning, promote economic vitality, and strengthen the agricultural and agribusiness sector. They can tackle community health issues, enhance private forestland production while sustaining environmental quality and train potential community leaders. The Extension Service educates community leaders, coordinates projects across states and regions to help communities learn from each other, and develops local solutions to local challenges. The land-grant system can help bridge the widening gap in acquiring and applying technology in communities in danger of being left behind in the technology revolution.

We request a total budget increase of \$30.646 million to help our communities.—All of the proposed increase of \$23.178 million for Extension formula funds (Smith-Lever) is targeted to developing community opportunities. We recommend strengthening the Extension investment in our Rural Development Centers and we rec-

ommend reestablishing the research component of these Centers. We recommend increased funding for our Children, Youth and Families at Risk programs. We also propose developing a new designation within the Sec. 406 account to be targeted to rural economic development.

INVEST IN ENVIRONMENTAL BALANCE

Production of food and fiber also means conserving scarce natural resources, private forests and open spaces. Research, extension and education efforts at state universities and land-grant colleges are providing farmers and ranchers with the tools and technologies that they must have to conserve their natural resource base and protect the environment, while staying economically healthy and competitive. Our programs provide science-based management alternatives that help prevent the need for regulatory solutions. Environmental research at schools of agriculture is playing a part in devising new technologies to reduce or reuse animal wastes and crop byproducts. Novel studies in animal diets, air quality and animal production systems will help keep agricultural odors away from the non-farmers. The use of global positioning system precision farming sensors can reduce runoff of farm chemicals and land-applied animal waste. Scientists are looking at crops that could trap carbon to slow climate change. Complex biochemistry could change plant oils into petroleum-like materials. With increased investment, scientists can increase their discoveries of new ways to control pests naturally, maintain biodiversity, and tackle environmental problems.

Research and education efforts at the land-grant universities created Integrated Pest Management (IPM), a well-known system that melds management and technology to reduce the use of expensive and potentially harmful pesticides in and around farms, businesses and public buildings. The next generation of integration, called Environmental Management Systems looks at the entire system of agricultural production and how strategies and methods can improve conditions for farm workers, children, consumers, wildlife and the environment as a whole.

We recommend increased funding of \$46.404 million to address natural resource and environmental issues.—We propose an increase of \$7.587 million in research formula funds (Hatch) to be targeted to helping farmers and ranchers address environmental issues. All of our proposed increase in forestry research (McIntire-Stennis) is targeted to addressing these issues. We propose a mix of additional funding mechanisms, as shown in the table, ranging from Integrated Pest Management through Water Quality and Pesticide Applicator Training. We propose substantial increases in the Renewable Resources Extension Act. We recommend establishing a new, integrated program to manage animal waste through Sec. 406.

CAPACITY BUILDING

Land-grant colleges serving minority communities, including the 1890s and Tribal Colleges, have historically struggled with inadequate funding resources to meet the especially challenging needs of under-served communities. Their challenge is twofold. Limited resources have taken their toll on the quality of facilities that enable these institutions to effectively compete for other funding sources. In turn, they slip behind in their ability to connect university research, teaching, and extension services with the minority communities that so vitally need their services. Capacity building at these institutions is the foundation for not only providing better research and teaching facilities, but also leveraging additional dollars for community based programs working in some of our nation's poorest communities. Land-grant institutions serving minority communities have dramatically increased the economic viability of small and limited resource farmers. In spite of years of neglect and under funding, the 1890s have been able to make contributions of high quality and relevance to the agricultural sciences and their stakeholders; their continued success and future growth (and that of the 1994s) depends on solid investments in capacity building programs.

NASULGC proposes a budget increase of \$35.846 million to build capacity at minority serving institutions.—The Capacity Building portfolio provides for facilities rehabilitation, research grants, teaching programs, minority recruitment, and extension activities. The mix of mechanisms we recommend for investment is provided in the Table. These funding lines target the specific needs of our historically black 1890 institutions, the Tribal Colleges and Hispanic Serving Institutions. Included in this mix is our proposed increase of \$3.521 million for 1890 research formula funds (Evans-Allen) and \$4.757 million for 1890 extension formula funds.

CROSS CUTTING FUNDING

The proposed increases in capacity building for minority serving intuitions will enable them to more effectively address the priority issue areas addressed previously. In addition, there are two funding mechanisms that can be used to effectively address each of these priority issues: the NRI and the International Science and Education Grant Program. We strongly recommend restoring the National Research Initiative and increasing its funding to a minimum level of \$130 million. We recommend that the earmarking of funds to address food safety concerns be lifted, or far better, that the funding targeted to food safety be added to the total amount of funding available through the NRI. We also recommend establishing the International Science and Education Grant Program at \$8 million. This program was established as Sec. 1458 in the 1998 Agricultural Research, Extension and Education Reform Act. This program is designed to internationalize the curriculum of our agricultural courses and to better prepare students and faculty to compete and prosper in today's increasingly global industries and markets. This program address each of the priority areas addressed previously, but from an international perspective.

Why should food and agricultural science and education receive new funding in the 2002 USDA/CSREES budget?

The decades of investment in both base programming and competitive grant funding for state and land-grant institutions have revolutionized agricultural production, ensuring a safe, affordable food supply. But agriculture does not live on bread alone. It takes a strong network of agribusinesses to supply equipment and other inputs, process agricultural products and connect the producer to the market. It takes communities with trained and visionary leaders who can anticipate development. It takes respect and understanding for the environment, and the ramifications of agricultural production within that realm. And it takes the education of students of all ages—whether through 4-H for youngsters, degree work in the agricultural and life sciences or continuing education for producers and consumers alike.

What are the new investments needed now?

Tomorrow's science comes with a high price tag as scientists delve into biotechnology, genetics, satellite imagery and many other highly technical fields. Tomorrow's scientists must be educated today, even as the fields of science advance each day. A balanced portfolio of funding mechanisms must be used to address these critical issue areas, drawing on base funding to sustain programs and competitive grants to target specific projects.

What scientific progress has resulted from this work?

Integrated pest management to cut production costs and protect the environment, constant vigilance in testing for and detecting food safety problems, genetic improvements among livestock species to breed leaner animals for healthier products, advances in crop breeding through biotechnology that assures more affordable food throughout the world, variety testing and field work to take the guesswork out of farming . . . the list is endless. And beyond production agriculture, the community development work and educational advances happen every day in communities and classrooms throughout the country. The state and land-grant institutions stretch out their research, extension and education arms with one mission in mind: to support the nation's prosperity and our quality of life.

Will progress continue?

Even with a generous infusion of funds to support food and agricultural sciences and education, it's only a beginning. New scientific investigation can build production efficiency and profitability through biotechnology without harming the environment, attract minority and other students into the exciting fields of science and design marketing strategies and economic alternatives for struggling communities. But one year's work can only be the beginning. The science and education community in the food and agricultural sciences welcomes this challenge and responsibility. The future belongs to those with the vision to see it.

NASULGC Board on Agriculture Budget Committee

Recommended Increases for USDA/CSREES in FY 2002

| Funding Lines (amounts in \$000) | \$ Change over FY 2001 |
|--|---------------------------|
| Invest in an Educated Workforce | |
| T Graduate Fellowships Grants | \$5,500 |
| T Institution Challenge Grants | \$6,000 |
| T Multicultural Scholars | \$4,000 |
| T Secondary/ 2-year Post Secondary | \$1,200 |
| I * Workforce preparation | \$3,000 |
| Workforce Subtotal | 19,700 |
| Invest in a Dependable Food Supply | |
| R Hatch Act** | \$7,587 |
| R Animal Health | \$421 |
| R Grazing Lands | \$2,000 |
| E Expanded Food and Nutrition Education Program | \$2,348 |
| T Ag in the Classroom (AITC) | \$548 |
| I * Biobased products | \$9,000 |
| I * Biotechnology and health | \$9,500 |
| I Small Farms Initiative | \$4,000 |
| Food Supply Subtotal | \$35,404 |
| Invest in Community Opportunities | |
| E Smith-Lever Formula 3(b) & (c)** | \$23,177 |
| R Rural Development Centers | \$677 |
| E Rural Development Centers | \$292 |
| E Children, Youth & Families at Risk | \$1,500 |
| I * Rural economic development | \$5,000 |
| Communities Subtotal | 30,646 |
| Invest in Environmental Balance | |
| R Hatch Act** | \$7,587 |
| R McIntire-Stennis** | \$1,809 |
| R Global Change, UV-B Monitoring | \$133 |
| R Integrated Pest Management & Biological Control | \$2,269 |
| R Minor Crop Pest Management: IR4 | \$1,721 |
| R Pest Management Alternatives | \$2,577 |
| E Pesticide Applicator Training | \$1,500 |
| E Renewable Resources Extension Act | \$11,808 |
| I Water Quality | \$2,000 |
| I * Waste Management | \$15,000 |
| Environment Subtotal | 46,404 |
| Invest in Capacity Building | |
| R Evans-Alen (1890) | \$3,521 |
| E 1890 Colleges & Tuskegee | \$4,757 |
| E 1890 Facilities (Sec. 1447) | \$2,800 |
| T 1890 Institution Capacity Building Grants | \$5,500 |
| E 1994 Institution Facilities | \$1,700 |
| R 1994 Research Grants | \$2,000 |
| E Extension Indian Reservation Grants (EIRP) | \$3,000 |
| E Extension Services at the 1994 Institutions | \$1,720 |
| T Tribal Colleges Education Equity Grants Program | \$1,448 |
| T Tribal Colleges Endowment Fund | \$4,900 |
| T Tribal College Research | \$3,000 |
| T Hispanic Serving Institutions Education Grants Program | 1500 |
| Capacity Building Subtotal | 35,846 |
| Cross-Cutting Funding Mechanisms | |
| R National Research Initiative | \$24,000 |
| I International Science and Education Grant Program | \$8,000 |
| Cross-Cutting Total | \$32,000 |
| TOTALS | 200,000 |

R = Research, E = Extension, T = Teaching, I = Integrated, * = Proposed new programs in Sec. 406, ** The proposed increases in these base formula funds would be targeted to these priority issues.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF WIC DIRECTORS

On behalf of the National Association of WIC Directors, NAWD, we appreciate the opportunity to submit this written statement to the Committee on the President's Fiscal year 2002 Budget Request for the Special Supplemental Nutrition Program for Women, Infants and Children, known as WIC.

WIC has an extraordinary 27 year record of preventing children's health problems and improving their long-term health, growth and development. WIC children enter school Ready To Learn and demonstrate better cognitive performance. Research shows:

- four and five-year-olds whose mothers participated in WIC during pregnancy had better vocabulary test scores than children whose mothers had not received WIC benefits.
- children participating in WIC after their first birthday had better digit memory test scores than children not participating in WIC.

WIC gives children a solid foundation for learning. Quality nutrition services is the centerpiece of WIC: nutrition and breastfeeding education, nutritious foods, and improved healthcare access for low and moderate income women and children with, or at risk of developing, nutrition related health problems. Committed, results oriented, entrepreneurial staff stretch resources to serve all eligible women and children and ensure program effectiveness and integrity.

As the nation's premier public health nutrition program, WIC is a cost-effective, sound investment—laying the foundation for America's children to learn.

The WIC Program's well-documented successes have earned WIC strong bipartisan support. Successive Congresses have demonstrated their commitment to moving the WIC Program toward full funding. The level of funding included in the fiscal year 2002 budget proposal, threatens the states' ability to maintain services to participants served in fiscal year 2001.

The Administration has proposed a \$94 million increase in the WIC appropriation for fiscal year 2002 bringing WIC funding to a level of \$4.137 billion over last year's appropriation level (minus the rescission amount included in Section 1 (a)(4) of Public Law 106-554) of 4.043 billion. NAWD applauds the Administration for identifying WIC as a Child Nutrition priority. NAWD urges the Committee to consider the following:

WIC PARTICIPATION

January data sets WIC caseload at 7.259 million participants. This means that WIC has exceeded the Administration's caseload projections for fiscal year 2002 of 7.25 million participants;

Should the economy continue to decline and workers experience more layoffs as industry attempts to cut costs to improve profits, it is reasonable to expect that WIC caseload will grow;

The Administration projects an unemployment rate of 4.6 percent for the fiscal year 2002. In 1998, the last time the US experienced such an unemployment rate, WIC caseload averaged 7.37 million participants;

Some financial experts are projecting unemployment to reach as much as 5 percent;

This leads one to the inevitable conclusion that the level identified in the Administration's WIC funding request will be inadequate to meet a caseload which could well exceed 7.35 million participants.

WIC CARRYOVER OR RECOVERED FUNDS

The Administration estimates 2001 recoveries at a level of \$180 million. Based upon state reallocation draws, a more reasonable estimate would be \$170-\$175 million;

The Administration estimates 2002 recoveries at a level of \$136 million. If states continue to draw down recoveries at their current rate, this level too can be expected to decline to between \$125-\$130 million.

The existence of recovered food funds leads to the erroneous perception that WIC is over-funded. Financial estimates require resource margins that will protect states should food costs exceed available WIC funds. Voucher and rebate transactions occurring late in a fiscal year do not accrue to a state until early in the next fiscal year thereby contributing to the situation. On average, states will expend roughly 97 percent of their grant to ensure a sufficient margin of management safety and prevent caseload disruptions. It is neither possible nor prudent for WIC Directors to expend all of their grant resources in a fiscal year.

State Fiscal Managers would penalize Directors who overspend their grant as options are generally not available to provide state support.

States have moved to reduce the Program's level of carryover funds—advising USDA of available recoveries, and rendering resources available for reallocation to those states most in need of resources.

NUTRITION SERVICES AND ADMINISTRATIVE GRANT

While the Program's funding formula directs the percentage share of the overall grant which accrues to each component of the WIC grant—(1) Food and (2) Nutrition Services and Administrative—the percentage increase provided in the Administration's request for Food is 2.53 percent while the increase for NSA is 0.7 percent.

The NSA request is inadequate to support funded participation levels, cover cost of living raises for WIC staff, or inflation on equipment, supplies, materials, rents and utilities.

INFRASTRUCTURE GRANTS

The Administration provides no increase for infrastructure needs and directs that 43 percent of the requested \$14 million be dedicated to electronic benefit transfer (EBT) development.

The joint NAWD/USDA Management Information Systems (MIS) Strategic Plan has identified a crisis in the status of WIC MIS systems. Fully $\frac{1}{3}$ of the states' MIS systems are at least 7 years old. These systems are incapable of providing the data services that the nation's public health system needs to track client participation, health and nutrition records, avoid fraud and abuse, process vendor claims and track rebates.

The remaining \$7 million in the Administration's request cannot possibly address the crisis WIC is facing with obsolete MIS systems. The joint NAWD/USDA MIS Task Force observed that it would require a commitment of \$110 million—\$150 million over three years to implement core functions, upgrade WIC technology, and maintain MIS and electronic services.

WIC FARMERS' MARKET NUTRITION PROGRAM & WIC SENIOR FARMERS' MARKET PROGRAM

While WIC has partnered with the Farmers' Market Nutrition Program (FMNP) since its inception, NAWD continues to believe that the FMNP should not be funded at the risk of turning away eligible individuals who seek WIC benefits.

Similarly, NAWD believes that WIC Senior Farmers' Market Program (SFMP) funding must not adversely impact WIC caseload. While NAWD regrets that the SFMP was not included in the Administration's budget, NAWD is pleased that the Administration recognizes the importance of protecting caseload.

WHAT SHOULD THE WIC BUDGET NUMBER BE?

To meet projected participation levels, given the Administration's unemployment projections and other factors, NAWD believes that the WIC funding level should provide for an increase to the Program of \$214 million setting the Budget proposal at \$4.248 billion. This represents an increase of \$110 million above the Administration's request.

WIC is a short-term intervention program designed to influence lifetime nutrition and health behaviors in a targeted, high-risk population. WIC is the "Gateway to Good Health," providing quality nutrition education and services, breast-feeding promotion and education, access to prenatal and pediatric health care services, drug, alcohol and tobacco abuse information, and other services in 10,000 clinics administered by 2000 Local Agencies in 87 State WIC Programs.

WIC's monthly food prescription (package), tailored to meet the specific nutritional needs of clients, was provided to over 7.259 million participants last January, including 1.8 million pregnant, breast-feeding and postpartum women, over 1.9 million infants, and over 3.5 million children. To participate WIC requires that clients have one or more documented nutritional risks and incomes less than or equal to 185 percent of the poverty level. In fact, 92 percent of all WIC participants are at income levels below 150 percent of the poverty level.

Approximately 37 percent of all pregnant women in the United States are enrolled in WIC. Of these, roughly 46 percent enroll in WIC during their first trimester of pregnancy. At certification, 50 percent of pregnant women have three or more nutrition risk factors. Numerous studies have shown that pregnant women who participate in WIC have longer pregnancies leading to fewer premature births; have less low and very low birth-weight babies; experience fewer fetal and infant deaths; seek

prenatal care earlier in pregnancy and consume more of such key nutrients as iron, protein, calcium and Vitamin C.

It costs \$601 a year for a pregnant woman to participate in WIC. By contrast, it costs \$28,000 per pound to raise a low (less than 5.5 pounds) and very low (less than 3.25 pounds) birth-weight baby to normal weight (7 pounds). WIC prenatal care benefits reduce the rate of very low birth-weight babies by 44 percent. Medicaid costs are reduced by WIC on average between \$12,000 and \$15,000 per infant for every very low birth-weight prevented.

WIC promotes breast-feeding as the preferred method of infant feeding. Breastfeeding helps mothers feel close to their baby. Breast milk contains all the nutrients infants need to grow and develop. Breastfed infants tend to be healthier since they receive antibodies from the breast milk, which protects them against infection. In spite of an environment that generally does not support a woman's choice to breastfeed, WIC mothers have continued to increase their breast-feeding initiation rates. Better than 40 percent of WIC infants between the ages of 7–11 months are breastfed.

WIC helps to assure children's normal growth, reducing levels of anemia, increasing immunization rates, improving access to regular health care and improving diets. Fortyseven percent of all infants born in the United States are on WIC. Nearly twenty percent of all children in the United States are on WIC. Children are eligible for WIC up until they reach their fifth birthday. At certification, 48 percent of all children have more than one nutrition risk factor.

Four and Five-year-olds whose mothers participated in WIC during pregnancy had better vocabulary test scores than children whose eligible mothers had not received WIC benefits. Children who participated in WIC after their first birthday had better digit memory test scores than children who did not participate in WIC.

Of the Federal appropriation, only 9 percent of the WIC grant to states is allocated for program administration; 16 percent is allocated for direct care activities needed to assess eligibility, provide nutrition education, breast-feeding support and promotion, screen immunization status, issue food benefits, register voters and provide other mandated or necessary client services. The remaining 75 percent of the WIC grant is allocated for food benefits.

States continue to stretch available WIC funds through rebates on foods and other cost saving initiatives—including adjustments in food benefits. In 1986, State WIC agencies began using their infant formula buying power (40 percent of national infant formula sales) to achieve bulk purchaser savings, in the form of monthly rebates paid by infant formula manufacturers. These state-initiated and operated rebate programs currently function in all state and most Indian Nation WIC Programs.

Rebates save over \$1.4 billion for Federal tax payers—34 percent of the program's total appropriation—and fund services for 1.8 million women and children. WIC's cost 4 containment measures are among the most effective cost containment measures to be found.

States need to be allowed to use cost-saving revenues in the same way as grant funds or other program income. Identifiable and predictable food cost savings could be considered as funds returned to the entire WIC grant and not just the food grant; each state would then be able to direct a portion of these funds to NSA services, capping at a preset rate such as the current NSA grant ratio.

Again, Mr. Chairman and Members of the Committee, we thank you for this opportunity to present this statement on behalf of the National Association of WIC Directors, NAWD. Should you have any questions, please feel free to contact Douglas A. Greenaway at 202/232-5492.

PREPARED STATEMENT OF THE NATIONAL BEEF CATTLE EVALUATION CONSORTIUM

Mr. Chairman, Members of the Subcommittee, this testimony is for the record of proceedings on the fiscal year 2002 Department of Agriculture Budget. The testimony is presented on behalf of the National Beef Cattle Evaluation Consortium, which consists of four universities, Colorado State University, Cornell University, Iowa State University, and The University of Georgia. This consortium was created in response to requests from beef industry leadership groups to create a sustainable research and development program in genetics for that industry. We are happy for this opportunity to thank you for your support during last year's budget proceedings. We would like to take this opportunity to update you on this program as well as issues we are currently addressing and those we are planning to address.

As you know, this Committee provided Federal funds (\$265,000) last year to support the creation of the consortium. The reason for creating this consortium was to

address the lack of organization in research programs for genetic evaluation of beef cattle for improvement of the national cow herd resource through selection. This consortium will serve in a capacity much like the USDA Animal Improvement Production Lab, Beltsville, MD does for the dairy industry, a model that has positioned the U.S. dairy cow among the elite production animals in the world. Through these Federal dollars, with support from the four universities and various segments of the beef industry, we have established the infrastructure of the consortium and have begun research in several important areas.

The mission of the consortium is to develop and implement improved methodologies and technologies for genetic evaluation of beef cattle for the purpose of maximizing the impact genetic programs have on the economic viability, international competitiveness, and sustainability of U.S. beef cattle producers and to provide consumers with affordable and healthy beef products. To achieve the goal intrinsic to this mission statement, we have created the following objectives:

- Establish and coordinate priorities for genetic evaluation of U.S. beef cattle with the goal of positioning the U.S. as a leader in this area thereby increasing the global competitiveness of the U.S. beef industry.
- Consolidate efforts among the four land-grant institutions to conduct research to meet these priorities with the goals of reducing duplication of effort and maximizing the return of useable information to the beef industry.
- Streamline the process between the development and adoption of new genetic evaluation methodologies by the industry with the goal of ensuring the economic viability and sustainability of producers in the U.S. beef industry.
- Identify new traits and technologies for inclusion in genetic programs with the goals of reducing the costs of beef production and providing consumers with a high value, healthy, affordable protein source.
- Create decision-making tools that incorporate the increasing number of traits being evaluated and the increasing amount of information from DNA biotechnology into genetic improvement programs with the goal of optimizing the overall efficiency, product quality/safety, and health of the national cattle herd resource.

The U.S. cattle industry is comprised of more than one million individual farms and ranches operating in all 50 states. Total sales of cattle and calves have exceeded 30 billion dollars per year in recent years. Beef is the most popular meat in America. In 1997, U.S. cattle ranchers produced beef with a total retail value of \$50.6 billion, and American consumers spent an average of \$186.03 per person on beef. Nearly 8 percent of U.S. beef is produced for export, with a total value greater than \$4.5 billion.

The continued production of high-quality, healthy and affordable beef is dependent on the availability of information upon which to make prudent selection decisions. The most important tool for selective breeding is expected progeny differences (EPD). An EPD is a prediction of the genetic merit of an animal and as such the potential impact of that animal as a parent. The investment in EPD production and research made by the U.S. beef industry since 1990 is approximately \$350,000 per year, with no direct Federal support.

The ability to influence the genetics of U.S. beef cattle has greatly enhanced U.S. competitiveness in the world marketplace. However, current research and outreach efforts are fragmented and rely on the expertise of just a few scientists. Other countries, most notably Brazil and Australia, have made large public investments in beef breeding stock genetic evaluation and are threatening to diminish America's edge in the export market.

With the appropriation received thus far, we have established the infrastructure of the consortium to include creating a board of directors and industry advisory committee. We have met with allied industries and producer groups to prioritize our programs and to establish channels of communications between the industry and the consortium. We have also begun research efforts in the following focus areas:

- Developing predictions for new traits such as reproductive efficiency, carcass composition and quality that are important to the efficiency and profitability of beef production. A high priority is the identification of economically relevant traits (ERT) and systems to evaluate potential breeding stock for these ERT's.
- Including DNA information in genetic evaluation programs to enhance the accuracy of predictions of genetic merit. We are in the midst of a genetic revolution fueled by discoveries in molecular genetics that is overwhelming science and field applications of technology with data. Research into the inclusion of data from DNA technology into systems that assess genetic merit is necessary to convert that data into useable information.
- Creating selection decision tools to improve production efficiency, product quality/safety and herd health. Selection for species with diverse and dynamic pro-

duction criteria is a challenging task. Animals in a production system must be reproductively sound, efficient, and produce healthy products. Selection decision tools will be necessary to afford producers the opportunity to identify individuals that bring the best balance of all these required characteristics and do so in a cost effective manner.

—Developing new methodologies to enhance the accuracy, reliability and productivity of the EPD production systems.

Future appropriations will enable the consortium to continue research efforts in the initial focus areas, draw in researchers from other institutions to broaden the areas of expertise within the consortium, and, in doing so, allow us to establish new focus areas of research. One important area of research that needs to be established with new funding and moved forward quickly is the area of the genetics of animal health. There are currently no genetic programs in place that allow producers to address selection for improved animal health and disease resistance. The emphasis on disease in cattle and how those diseases impact the beef products is receiving considerable attention in the public today. Establishing best breeding practices for animals going into the food production system is becoming an increasingly important requirement to reduce the reliance of animal industries on antibiotics and to increase consumer confidence in the products from those industries.

Once again, we thank you for the financial investment you have made in the consortium. We feel the foundation has been laid for an effective program in beef cattle evaluation and the industry is already working with the consortium leadership to establish mechanisms for technology transfer as discovery occurs. We are confident that the creation of the consortium will revolutionize the selection programs for this industry and, in doing so, keep that industry positioned to provide a quality source of protein to U.S. consumers and to compete in the global market. Thank you.

PREPARED STATEMENT OF THE NATIONAL COALITION FOR FOOD AND AGRICULTURAL RESEARCH

INTRODUCTION

The National Coalition for Food and Agricultural Research (National C-FAR) appreciates very much this opportunity to submit its views regarding the fiscal year 2002 agriculture appropriations bill and respectfully requests that this statement be included as part of the official hearing record.

NATIONAL C-FAR

National C-FAR, is a newly organized broad-based stakeholder coalition of food, agriculture, nutrition, conservation and natural resource organizations. It is a non-profit, nonpartisan, stakeholder-driven, and consensus-based coalition focused on food and agricultural research funding and priority setting. It is dedicated to fostering public confidence in food, agricultural, nutritional and natural resource research through public participation in planning and evaluating the process and impact of research activities. Membership is open to those who support the objectives of (1) enhancing Federal investments in U.S. food and agricultural research and extension and (2) expanding stakeholder participation in identifying funding needs and opportunities.

The mission of National C-FAR is to double Federal funding of food, nutrition, agriculture, natural resource, and fiber research, extension and education programs during the next five years. This is to be net additional funding on a continuing basis that will complement, not compete with or displace the existing portfolio of Federal programs of research and education.

OVERVIEW

There are many challenges facing agriculture both near and long term. These include dealing with continued low commodity prices and reduced farm income, safeguarding our borders against the introduction of the devastating BSE ("mad cow" disease) and foot-and-mouth diseases, addressing concerns over biotechnology, as well as a number of other challenges. While Congress has been very supportive of a number of near term actions, it is equally important to focus on policies and programs needed to promote the long term economic well being and profitability of agriculture for the benefit of producers and consumers alike. To help achieve this objective, we believe, a key component of any long-term strategy should include increased support for food and agricultural research and education.

To paraphrase the old adage, an ounce of prevention is worth a pound of cure. We believe one dollar of funds invested in research now will pay back eight or more

dollars of public benefits in the future. Investments in U.S. food and agricultural research and education have already paid huge dividends to the United States and the world, especially in the latter part of the 20th century. Research based technological advances, such as the ability to produce higher yielding crops and animals with improved human nutritional qualities, have allowed for a more abundant, safe, efficient and environmentally friendly food supply, improved human health and well-being, and yes, longer lives and lower health costs. New discoveries are advancing our understanding of the relationship between food and health—another rationale for investment in research. Only research can provide the answers and identify the types of changes that need to be made to effectively provide the food supply with optimal nutrition for the future.

We want to thank the leadership and members of this committee for supporting programs and funding that have helped make these accomplishments possible. Yet, despite the best efforts of this committee and the world-renowned success of U.S. food and agricultural research, Federal funding has not kept pace with inflation.

In real terms, we now spend less on food and agricultural research than we did in 1978. We believe this statistic suggests that Federal support could be as much as a quarter century behind. Today we spend only \$1 of Federal food and agricultural research in the USDA for each \$500 consumers spend on food and fiber. There is a very real concern this less than optimal investment in food and agricultural research will unintentionally restrict our nation's competitiveness, living standard and general economic growth and development.

While our coalition is initially directing our collective efforts on securing a doubling of Federal food and agricultural research funding, our ultimate goal is not budgetary, but the many benefits that will accrue to each American that a doubling of funding will bring about. We believe increased funding of food and agricultural research will result in:

- Safer, more nutritious, convenient and affordable foods
- More efficient and environmentally friendly food, fiber and forest production
- Improved water quality, land conservation and environment
- Less dependence on non-renewable sources of energy
- Expanded global markets and improved balance of trade
- More jobs and sustainable rural economic development

At National C-FAR's inaugural meeting less than two months ago on January 31, 2001, in Washington, DC, 100 leaders in the food, agriculture, natural resource organizations and key Federal officials heard a speech by Dr. Norman Borlaug, the Nobel Peace Prize award winner, who started the "Green Revolution." The Green Revolution expanded food and agricultural production and saved one billion people from starvation. Dr. Borlaug noted: "Few industries have been as productive and innovative as agriculture during the 20th century." Yet he cautioned, "Despite the successes of the Green Revolution, the battle to ensure food security for hundreds of millions of miserably poor people is far from won. . . . Continuing research breakthroughs will be needed." Borlaug also noted "Agricultural productivity increases, made possible through research and new technology development, spared an area slightly greater than all the land in 25 states east of the Mississippi River for other uses."

Dr. Johanna Dwyer, Director of Frances Stern Nutrition Center and New England Medical Center and Tufts University School of Nutrition Science and Policy, also spoke during the inaugural meeting. Dr. Dwyer emphasized the connections between the entire system of agriculture, food and nutrition for our nation and the importance of food and agricultural research as it contributes to the nation's health by discovering ways to improve the nation's nutritional status. Strong connections were illustrated between nutrition and agricultural yield, efficiency, sustainability and safety and quality. Dr. Dwyer highlighted the need for research that will improve the nation's dietary diversity, nutrition profiles, decrease malnutrition, and ensure sound nutrition over the long term through improved efficiency of plants and animals.

HOW SHOULD THE ADDITIONAL FUNDS BE SPENT?

While National C-FAR does not have a list of research project recommendations, through our members and their association with other related coalitions, we are well aware of urgent research needs to address and opportunities to explore. Several coalitions, committees and scientific societies, including those listed below, have identified these needs and opportunities:

- Coalition for Research on Plant Systems—CROPS 1999
- Food Animal Integrated Research for 2002—FAIR 2002
- Institute of Food Technologists—Food for Health Research Needs

- Council on Food, Agricultural, and Resource Economics—Economics and Research Priorities for an Efficient and Sustainable Food System
- American Society for Nutritional Sciences
- National Agricultural Research, Extension, Education, and Economics Advisory Board
- American Dietetic Association

Members of our Research Committee have presented to our Board a compilation of these studies. While several emerging needs and opportunities have been identified, we also want to stress the continuing need to build the capacity to do quality research and education, including human resources, infrastructure support, formula funds, and core programs. It is important to maintain a balanced portfolio of Federal research and education programs, including competitive grants, formula funds and intramural programs. Agriculture is a biologically based industry and many of the problems are site specific. Hence, we need to maintain a diversified research and education system. Major areas of research that have been commonly identified by most, if not all, of the related coalitions that are in need of additional funding include:

- Food security, safety, fortification, enrichment and allergens
- Nutrition and public health
- Production quantity and quality; nutrient adequacy; global competitiveness; and new market opportunities
- Environmental stewardship and resource conservation and the scientific basis for public policies relating to the environment, plants and animals
- Increasing knowledge, skills, and expertise
- Emergency preparedness for emerging plant and animal diseases and bio-terrorism
- Product pioneering for food, nutrition, biobased materials and biofuels
- Genetic resources, genetic knowledge, and biotechnology
- Jobs and rural community economic vitality
- Education and outreach to producers, processors and consumers including food safety, sound nutrition, conservation, management, and new technology

Our coalition arose from a shared mutual concern about the capacity of our agricultural research system as a whole to meet the future demands and capitalize on emerging opportunities. We will need a research system that simultaneously satisfies needs for food quality and quantity, resource preservation, producer profitability and social acceptability. This coalition will be working on ways to help assure that these needs are met.

CONCLUSION

For all these reasons, the National Coalition for Food and Agricultural Research recommends that Federal investments in food and agricultural research be doubled over the next 5 years. This objective translates into roughly an increase of 15 percent per year of the research, extension and education in USDA and other Federal agencies or about \$500 million increase per year for 5 years.

This is a small investment compared to the \$1 trillion dollar size of our food and agricultural sector. However, we believe it is a strategic and wise investment that would: (1) benefit producers and consumers of all commodities and all states; (2) improve income opportunities for farmers; (3) contribute to the United States remaining the best fed country with the lowest share of income spent on food; (4) strengthen our competitiveness in the global marketplace, while achieving the proper balance with human and environmental needs; (5) enable producers to produce safer, healthier foods; (6) find new uses for agricultural products; and (7) enhance the protection of our natural resources.

Again, we appreciate the opportunity to share our views. We look forward to working with you and the members of this Subcommittee in support of these important long-term objectives.

PREPARED STATEMENT OF THE NATIONAL CONSORTIUM FOR RURAL GEOSPATIAL INNOVATIONS IN AMERICA

As your subcommittee prepares the fiscal year 2001 Agriculture, Rural Development and Related Agencies appropriations, we are requesting that you provide \$1.6 million to support the Geographic System Information Program (GISP). We appreciate the support your subcommittee has provided our Program in the past. This Program has received funding from the Research and Education account of USDA's Cooperative State, Research, Education, and Extension Service (CSREES).

The National Consortium for Rural Geospatial InnovationS (RGIS) is a group of eight university and non-profit sites distributed across the U.S. With the support of the Geographic System Information Program, RGIS sites assist state, tribal, regional and local governments and non- and for-profit organizations in implementing advanced geospatial information technologies. The last decade has seen an explosion of computer-based technologies for the creation and management and distribution of information about natural resources, property records, infrastructure, transportation, and other land use arenas. These technologies include geographic information systems (GIS), remote sensing image processing, global positioning systems (GPS) and other related information technologies. RGIS uses a variety of approaches to make these technologies understandable, affordable and useful. (See enclosure, National Consortium for Rural Geospatial Innovations in America, Summer 2000)

The mission of RGIS is to increase access to digital technology in rural America. We promote the transfer of geospatial technologies by:

- Providing geospatial tools, technologies, and training to empower local governments, organizations, and citizens to understand and participate in decisions that affect their economy, quality of life, and environment;
- Educating and training a cadre of people to apply geospatial technologies to rural issues;
- Supporting the development of appropriate local land information systems, as well as linkage to and cooperation with regional, state, and national land information systems.
- The goal of the program is to improve the quality of life, environmental health, and economic competitiveness in rural communities.

RGIS members have proved that geospatial technologies are efficient and cost-effective tools to improve local decision-making and local governmental processes. RGIS members have enabled local communities to develop better information, which has allowed local communities to make better decisions on a variety of issues including farmland preservation, emergency services, watershed management, land records modernization, and environmental protection. Continued funding of the Program will allow the organization to continue these benefits and leverage other resources to improve the quality of life in rural America and insure these communities have access to cutting-edge technologies.

The eight existing sites are contributing the following:

- Wilkes University and Kings College in Pennsylvania bring expertise in how to implement geospatial technologies among rural local governments and engineering mapping skills for comprehensive watershed planning. (See Tackling Environmental Clean-up with GIS, February 2001)
- Pennsylvania State University brings expertise in how to apply geospatial technologies to assess agricultural quality for rural land use planning and management and spatial analytic methods for assessing the environment. (See Farmland Protection and GIS, December, 2000)
- University of Wisconsin-Madison continues its extensive set of geospatial outreach training programs, including hands-on land use planning and management program for county and town level planners. Selection by the Federal Geographic Data Committee (FGDC) Community Demonstration Program has provided an opportunity to assist local citizen planners in accessing new land use planning and management tools. (See On Solid Ground, June 2000)
- University of North Dakota continues to respond to the expanding interest in geospatial technology by local governments. One of the most rewarding developments has been the assistance provided to the City of Grand Forks in the aftermath of the 1997 devastating flooding of the Red River. (See Making Road Travel Safer, November 2000)
- University of Arkansas continues to provide local, state and national leadership. Examples include providing geospatial expertise to the Arkansas Land Records Modernization Board, GIS training camps for local high schools, and assisting the NRCS in developing the capacity to transfer soils and orthophotography information over the Web. (See Finding the Lay of the Land on the World Wide Web, November, 2000)
- Central Washington University continues to support the modernization of irrigation records used by water management boards to insure equitable distribution of hydraulic resources and continues to assist tribal and local rural communities assess the role and use of geospatial technologies. (See GIS Transforms Irrigation Management in Kittitas Reclamation District, September, 2000)
- South Georgia Regional Development Center continues to assist local governments to modernize land record systems such as parcel records for various applications including economic development and infrastructure management.

(See Ben Hill County, Georgia Reaps Benefits From GIS and Damping High Fire Insurance Rates, March, 2001)

—Southwestern Indian Polytechnic Institute (SIPI), in its inaugural Program year, started a program to assist tribal communities utilize GIS and GPS technologies for agricultural and local land management applications. Also SIPI hosted a satellite distance education geospatial program for 29 tribal colleges across the U.S. Each RGIS Program Site participated by providing a 15-minute technical segment to the two-hour satellite program.

PREPARED STATEMENT OF THE NATIONAL COTTON COUNCIL OF AMERICA

This is to transmit the cotton industry's request for fiscal year 2002 funding for selected programs under the jurisdiction of Subcommittee on Agriculture, Rural Development and Related Agencies. The National Cotton Council appreciates your assistance in making this statement a part of the hearing records related to the fiscal year 2002 appropriations bill.

The National Cotton Council of America (NCC) is the central organization of the U.S. cotton industry representing growers, ginners, warehousemen, cottonseed crushers, merchants, cooperatives and manufacturers whose primary business operations are located in 16 cotton producing states. Cotton Council International (CCI) is the overseas promotion arm of the cotton industry. The annual average farm gate value of U.S. cotton production is about \$5 billion and its retail value averages approximately \$60 billion. U.S. raw cotton exports normally account for approximately 40 percent of annual production and are valued at approximately \$4 billion. U.S. textile manufacturers continue to be the U.S. cotton producer's most important customers. In addition to the fiber, cottonseed products are used for livestock feed, and cottonseed oil is used for food products ranging from margarine to salad dressing. Cottonseed and cottonseed products generally account for about 3 percent of the annual revenue generated from U.S. cotton production. Cottonseed contributes about 17 percent of the value of the crop at the farm gate.

Cotton and cottonseed prices remain at historic lows and market observers predict low prices could continue for the foreseeable future. Asia's slow economic recovery; changes in China's cotton import policy; and an excess supply of cotton have all effected demand for U.S. raw cotton. The strong U.S. dollar relative to other currencies has made exporting bulk commodities difficult and spurred alarming increases in textile and apparel imports into the U.S. Excess production and cheap prices for synthetic fibers also contribute to a situation that has cotton farmers and their customers deeply concerned by shrinking operating margins.

The financial assistance Congress provided for economic and weather related losses for the last 3 crop years has been critically important for farmers and the industry infrastructure. Unfortunately, as was noted in a recent letter sent by 25 Senators to Chairman Domenici, the combination of chronically low prices, escalating input costs and sluggish demand will result in continued low farm income and the need for an emergency economic assistance package in 2001 to provide at least the same level of economic assistance as was provided for the 2000 crop.

In the long-term, cotton farmers will benefit from federally funded programs and activities designed to reduce production costs and build demand. Successful completion of the boll weevil eradication program, control of the pink bollworm, new technology developed through research, and demand building export programs including MAP, FMD and GSM credit are all essential to our industry.

The cotton industry's long-term viability depends on: an effective farm policy without unreasonable eligibility restrictions or limitations on benefits, including a marketing loan and adequately funded 3-step competitiveness provisions; an investment in the development and application of scientific principles; and, aggressive market development activities. The National Cotton Council welcomes the opportunity to provide the following recommendations and requests for fiscal year 2002 appropriations for programs which make important contributions to our industry's ability to compete and prosper.

FUNDING PRIORITIES

Pink Bollworm Programs (APHIS).—\$6 million to continue the San Joaquin Valley (SJV) containment program and to begin sterile moth release phase of the pink bollworm eradication program initiated in 2001 in the Trans Pecos/El Paso Valley of Far West Texas (in combination with the Boll Weevil Eradication Program). The pink bollworm is a serious cotton pest in Texas, Arizona, New Mexico and California with costs of prevention, control and yield loss exceeding \$21 million annually. Sterile moth releases, pheromone traps and cultural methods have proven successful in

preventing establishment of the pink bollworm. Growers in the SJV provide a significant portion of containment program costs through a self-assessment. Sterile moths are reared in a facility in Phoenix, financed by California growers. Management equipment, methods and partial support for rearing and operations are furnished by APHIS. The Far West Texas eradication program will initiate the three-phase program to eliminate the pink bollworm as a pest in Texas, New Mexico, Arizona, California and adjacent cotton areas in Northern Mexico. Program will employ Bt cotton, pheromones for mating disruption and sterile insect releases as eradication technologies. Increased funding in fiscal year 2000 and fiscal year 2001 allowed APHIS to prepare for demands of the Texas program. The significant increase in funding for fiscal year 2002 will allow the Phoenix facility to produce sufficient quantities of sterile moths to supply the SJV program and the new area wide program in Far West Texas.

Boll Weevil Eradication (FSA).—Sufficient funding to allow FSA to make at least \$100 million in loans to eligible Boll Weevil Eradication Foundations. To the extent Federal cost-share funds are insufficient for a 30 percent contribution and to assist producers in areas where farm income is extraordinarily low, loan funds are critical to successful operation and completion of the eradication program. There may also be an interest in expanding eligibility to include the pink bollworm eradication program to ensure it is adequately funded.

Boll Weevil Eradication (APHIS).—\$82.2 million for APHIS to maintain the Federal cost share at approximately 30 percent. More than 10 million acres in Alabama, Mississippi, Tennessee, Arkansas, Louisiana, Texas, Oklahoma, Missouri and New Mexico will be under active eradication in 2001 and 2002 with a projected total program cost of \$274 million. Approximately 4.5 million acres in Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Texas, Tennessee, Arizona and California will be in post-eradication having been declared weevil-free. The program has achieved documented economic and environmental benefits. Adequate Federal cost-share funds are critical to timely completion. APHIS should also be directed to make every effort to minimize overhead and administrative expenses for boll weevil eradication to ensure maximum funding reaches field operations.

Market Access Program (MAP).—\$90 million is currently authorized by 1996 farm law. Cotton Council International actively promotes exports of U.S. cotton and cotton products in Asia, Europe and Central and South America. Activities carried out using MAP (and FMD) have been responsible for increased export sales of raw cotton and value-added cotton products. Exports of value-added cotton products add more than \$6 billion to the overall value of cotton exports. For every \$1 in MAP and FMD funds, CCI has generated matching contributions of over \$9.00. The industry also supports funding to ensure FAS is adequately staffed to carry out important market development and trade enhancing functions in headquarters and abroad.

Foreign Market Development (FMD).—The fiscal year 2000 appropriations measure included a provision resulting in funding for the FMD Cooperator Program being provided through CCC rather than as part of the annual FAS appropriation. The industry requests the subcommittee to urge FAS to support FMD activities by programming not less than \$33.5 million for fiscal year 2002, the absolute minimum amount necessary to sustain current levels of market development activities.

GSM-102 Credit Guarantee (FAS).—Maintain authority to make at least \$5.9 billion in GSM-102 guaranteed export credit available for use by U.S. exporters and customers. Urge U.S. negotiators at the DECD not to agree to modifications in the terms and conditions of the program, which render it unworkable for U.S. exporters and their customers. An ineffective GSM-102 program would reduce U.S. cotton exports by up to 500,000 bales and reduce prices by as much as 3 cents per pound. Consider modifications to the rules governing the program to include authority to accept repayment in foreign currencies, to allow the guarantee to cover cost of shipping and other regulatory adjustments to improve the value of the program for U.S. exporters and their customers.

Aflatoxin (ARS).—The cotton industry strongly supports the funding recommendations of the Multi-Crop Aflatoxin Working Group and particularly the work by Dr. Peter Coty with AF-36 in Arizona.

Ginning Research (ARS).—Urge ARS to continue to provide funding at not less than fiscal year 2001 levels for operations and research activities conducted at the regional ginning labs at Stoneville, MS; Lubbock, TX; and Mesilla Park, NM.

Ginning Specialist (CSREES).—Urge ARS/CSREES to fill the vacant position and continue full funding of the Cotton Technology Transfer and Education Coordinator with headquarters in Stoneville, MS.

Precision Agriculture (CSREES).—Request that priority be given to funding for precision agriculture applications research and that USDA be provided funds for use in matching NASA/Earth Sciences Enterprises allocations to precision agriculture.

Shafter Cotton Research Station (ARS).—Urge ARS to maintain funding for cotton research conducted at the Station and not to shift funds or staffing resources from Shafter.

Agricultural Genetic Resources.—Urge an increase of \$10,000,000 for USDA's National Plant Germplasm System (NPGS). An increase for the NPGS would provide funds for acquisitions of specific cotton germplasm from Russia, Uzbekistan and Latin America. Funds will also enhance winter nursery capabilities in Mexico, intensify cotton germplasm regeneration program and develop methods for precise description of cotton genomic viability. Work will be done at College Station and Lubbock, Texas. It would also provide funds to Phoenix, AZ for broadening the relatively narrow genetic base for upland and pima cotton varieties in Western and Southwestern U.S. by incorporating genes from wild relatives.

Farm Service Agency.—Provide adequate funding so the agency can deliver essential programs and services.

Other.—Support funding for value-added textile research at New Orleans ARS/SRRC and ARS/Clemson, SC; PM10 air quality research by CSREES; silverleaf whitefly control programs; conservation programs including CRP, WRP and WHIP; the Office of Pest Management Programs which continues to provide important assistance to growers during EPA's review of critical crop protection products; and the Aerial Application Technology Program at College Station.

Research & Extension.—Support formula funding for Research and Extension; National Extension Priorities including water quality, food safety, and pesticide assessment program, and, funds for National Research Initiative.

Cotton Classing Services (AMS).—The cotton classing services provided by USDA's AMS Cotton Division are critically important to marketing U.S. cotton. Cotton must be classed to be eligible for the CCC loan. AMS has successfully held classing fees at current levels for several years. For 2001, the agency is anticipating a significant increase in energy expenses and qualified seasonal employees are in short supply at most classing office locations. Yet in recognition of the severe economic stress in the industry, the agency has elected to hold fees at 2000 crop levels. Over the next 3 years, significant capitol investment will be required to install new automated classing equipment which will improve accuracy and reduce labor costs. The industry urges the Committee to consider providing appropriated funds for fiscal year 2002 and fiscal year 2003 to be used for the purchase of new automated equipment as reliable equipment becomes available.

PREPARED STATEMENT OF THE NATIONAL COUNCIL OF FARMER COOPERATIVES

The National Council of Farmer Cooperatives (NCFC) appreciates very much this opportunity to share its views regarding the fiscal year 2002 agriculture appropriations bill, and respectfully requests this statement be made a part of the official hearing record.

OVERVIEW OF NCFC AND FARMER COOPERATIVES

The National Council of Farmer Cooperatives (NCFC) is a national trade association representing nearly 100 regional marketing, supply and credit cooperatives, and state councils. Included among these regional cooperatives are over 3,500 local cooperatives whose farmer owners represent a majority of America's 2 million individual farmers. With approximately 300,000 full-time and seasonal employees, farmer cooperatives also represent a significant source of employment in many rural communities.

Farmer cooperatives are farmer owned and controlled. They exist for the mutual benefit of their farmer members. As farmer-owned businesses, they handle, process and market virtually every type of commodity produced in the U.S.; manufacture and sell farm supplies; and provide credit and related financial services for and on behalf of their member owners. Earnings from such activities are returned to their member owners on a patronage basis, thereby helping improve the income of farmers and contributing significantly to the economic and tax base of local communities.

NEAR AND LONG TERM ACTION NEEDED

The experience of the last three years has demonstrated again how farm income can be highly variable due to the inherent risk associated with production agriculture and the volatile nature of commodity markets. Today, without continued

government assistance, farm income will again be down significantly due to continued low commodity prices and rising production costs.

Congress has been very generous in its response and we strongly support continued assistance to help meet the immediate income challenges facing agriculture. However, action is also needed to promote a more lasting economic recovery with regard to agriculture.

FARMER'S SHARE OF THE CONSUMER DOLLAR DECLINING

The farmer's share of the consumer food dollar has steadily declined to where it now represents just 20 cents, its lowest level ever. Reversing this decline would substantially improve net farm income and reduce the need for direct emergency economic assistance long term. For example, increasing the farmer's share of the consumer food dollar by just one cent to 21 cents would have added over \$6.2 billion to farm income in 1999 and potentially reduced dependence on direct government payments.

GLOBALIZATION CONTINUES TO DRIVE CHANGES IN FOOD AND AGRICULTURE INDUSTRY

Globalization continues to drive changes throughout the economy, including continued consolidation in the food and retail sectors, as individuals and businesses look to gain the size and scale needed to become more efficient and competitive in a global economy. This has renewed concerns over the impact of such changes on farmers and their ability to remain competitive and obtain a fair return on what they produce.

INTERNATIONAL MARKETS CHARACTERIZED BY FOREIGN SUBSIDIES

According to a recent analysis by USDA, the European Union (EU) and other foreign competitors are now outspending the U.S. by a factor of 20 to 1 with regard to the use of export subsidies and other expenditures for export promotion.

The same study shows that such countries are spending over \$100 million just to promote sales of their products in the United States. In other words, they are spending more to promote their agricultural exports to the United States, than the U.S. is currently spending (\$90 million) to promote American agricultural exports worldwide!

RECOMMENDATION OF NCFC TASK FORCE

In an effort to help identify and recommend specific actions needed to help meet the challenges facing farmers, NCFC established a special Task Force comprised of both farmer owners and managers of farmer cooperatives across the U.S. According to the task force, a key component of any strategy aimed at addressing the challenges facing agriculture should include action to strengthen the ability of farmers to join together in cooperative self-help efforts to improve their income from the marketplace, manage their risk, capitalize on potential market opportunities, compete more effectively in a rapidly changing global economy, and enhance their economic well being and profitability long term.

USDA FARMER COOPERATIVE PROGRAMS

Programs to help foster and promote such cooperative self-help efforts by farmers need to be revitalized and given a high priority. To help achieve this objective, we recommend that a separate agency be established within USDA, along with specific funding of not less than \$6 million for fiscal year 2002, to carry out programs relating to farmer cooperatives.

FARMER COOPERATIVE RESEARCH, EDUCATION AND TECHNICAL ASSISTANCE

Funding for USDA research, education and technical assistance in support of cooperative self-help efforts by farmers should also be strengthened. Accordingly, not less than \$6 million should be provided for programs relating to farmer cooperatives. This would include not less than \$3 million for cooperative research agreements and not less than \$3 million for cooperative education grants.

Provisions should also be included to require such programs be carried out by public private partnerships with organizations with proven and demonstrated expertise to improve coordination and delivery of such programs, and to maximize available resources. We also recommend that not less than \$1 million of available funds for cooperative education grants be utilized to help expand existing national cooperative education programs to provide farmers with greater access to the information

and technical assistance needed for organizing and operating a farmer owned cooperative business.

Funding for value-added technical assistance grants should also be maintained at not less than \$25 million for fiscal year 2002 to further encourage and promote cooperative self-help efforts by farmers.

USDA'S B&I LOAN GUARANTEE PROGRAM AND FARMER COOPERATIVES

USDA's Business and Industry (B&I) guaranteed loan program should be modified and strengthened to provide farmer cooperatives and their farmer owners with access to capital on a similar basis as currently available under related programs for rural electric and other types of cooperatives. This would include eliminating the current limitation on the amount of a guaranteed loan that may be made to a farmer cooperative, among other changes needed to provide greater program flexibility consistent with other types of cooperative lending programs. Farmers and their cooperatives need improved access to capital to modernize and expand, invest new plant and equipment, meet costly environmental and other regulatory requirements, capitalize on potential market opportunities, and to compete effectively in a rapidly changing global economy. In addition, funding for USDA's B&I guaranteed loan program should be increased to provide up to \$10 billion in guaranteed loan authority for such purposes.

USDA COMMODITY PURCHASE PROGRAMS

We strongly urge that statutory and report language included in the fiscal year 2001 agriculture appropriations bill be included in the fiscal year 2002 bill to ensure that farmer cooperatives are fully eligible to participate in USDA's commodity purchase programs. Such programs serve two important purposes. One, they help meet the food and nutrition needs of consumers. Second, they provide an important market outlet for farmers, especially during periods of surplus production, thereby helping strengthen farm income and promoting orderly marketing.

However, under previous guidelines established by USDA, this important market was eliminated for many farmers choosing to cooperatively market their products. The fiscal year 2001 agriculture appropriations bill addressed this by clearly providing that farmer cooperatives are fully eligible to participate in such programs for and on behalf of their farmer owners. In doing so, it preserves an important market outlet for many farmers, promotes orderly marketing, encourages cooperative self-help efforts, and helps maintain and strengthen farm income—since proceeds from the sale of commodities and related products are returned to the cooperatives' farmer owners as patronage income. It also serves to increase the potential quantity and quality of commodities and related products available for purchase and use under such programs, and provides for more competitive bidding among participants. Finally, it helps contribute to stronger rural communities where farmer cooperatives and their farmer owners are located. For all these reasons, we again urge such provision be included in the fiscal year 2002 agriculture appropriations bill.

EXPORT PROGRAMS

We also believe it important to maintain and strengthen funding for USDA's export programs, including the Market Access Program (MAP) and Foreign Market Development (FMD) Cooperator Program, and we endorse the recommendations of the Coalition to Promote U.S. Agricultural Exports of which NCFC is a member. Such programs have been tremendously successful and extremely cost-effective in helping maintain and expand U.S. agricultural exports, countering subsidized foreign competition, protecting American jobs and strengthening farm income.

Programs such as MAP and FMD have also helped encourage and strengthen the ability of farmers to join together in cooperative efforts to promote their products in overseas markets and improve their income. Administered on a cost-share basis, they remain one of the few tools specifically allowed under the Uruguay Round Agreement to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition.

We also urge continued funding for other related USDA export programs, including the Export Enhancement Program (EEP), Dairy Export Incentive Program (DEIP), GSM Export Credit Guarantee Program, and Public Law 480. All of these programs continue to be essential to help encourage U.S. agriculture exports, counter subsidized foreign competition, protect American jobs, and strengthen farm income.

AGRICULTURAL RESEARCH

Another important area of emphasis when it comes to enhancing the global competitiveness of farmer cooperatives and American agriculture is research. It is equally important to help ensure that farmer cooperatives and American agriculture can continue to help provide consumers at home and abroad with a dependable supply of safe, high quality food and fiber at reasonable prices, while meeting important environmental and food safety objectives.

NCFC endorses the statement by the National Coalition for Food and Agricultural Research of which NCFC is a member, which has set an objective of doubling Federal funding of food, nutrition, agricultural, natural resource, and fiber research, extension and education programs during the next 5 years.

CONSERVATION/EQIP

We strongly support continued funding for the Conservation Reserve Program (CRP), as well as restoring funding for the Environmental Quality Incentives Program (EQIP), as recommended in the Administration's budget. Such programs are necessary to help achieve and maximize water quality and other environmental benefits.

The CRP and EQIP programs in particular are critical to empowering farmers to continue voluntary efforts to sustain the natural resource base and to respond to societal expectations and demands with regard to water quality and protecting our natural resource base.

MEAT INSPECTION/USER FEES

We continue to be opposed to user fees relating to Food Safety and Inspection Service (FSIS) for meat inspection. Such inspection programs provide important public benefits relating to food safety and quality and should continue to be publicly funded.

CONCLUSION

Mr. Chairman, on behalf of NCFC and its members, we want to again thank you for the opportunity to share our views with regard to the fiscal year 2002 agriculture appropriations bill. We also wish to take this opportunity to express our appreciation to you and the members of the Subcommittee for your interest and support of farmer cooperatives and American agriculture.

PREPARED STATEMENT OF THE NATIONAL CORN GROWERS ASSOCIATION

The National Corn Growers Association (NCGA) appreciates the opportunity to provide the Subcommittee with our recommendations for fiscal year 2002 appropriations for key programs administered by the U.S. Department of Agriculture. The NCGA represents 30,000 corn growers in 48 states and the association's mission is to create and increase opportunities for corn growers in a changing world and to enhance corn utilization and profitability.

The NCGA, strongly, urges the Subcommittee to:

- Increase the ARS plant, animal, and microbial genomics programs by \$5.0 million;
- Increase funding for the National Plant Germplasm System by \$10 million; and
- Maintain \$120 million in funding for the Initiative for Future Agriculture and Food Systems.

While many Federal agricultural programs are important to the nation's corn growers, the NCGA believes that the future of the corn industry is written in corn's genetic code and that plant genomics will give us the fundamental information necessary to revolutionize American agriculture. Plant genomics research advances our understanding of the structure, organization and function of plant genomes.

Since 1996, funding for plant genomics has been the number one appropriations issue for the NCGA. The Plant Genome Initiative (PGI), a multi-agency program

Focused on structural and functional genomics, will help scientists, geneticists, and plant breeders identify and utilize genes (from corn and other plants) that control important traits, such as nutritional value, stress tolerance, and resistance to pests. In a recently published report, the Interagency Working Group on Plant Genomes, estimated that \$600 million, over three years (fiscal year 2001–2003) was needed for the National PGI. While the NSF will provide a significant level of funding for the PGI, USDA must increase its plant genomics funding, substantially, if

we are to meet the minimum level of need. Further, USDA must begin a concerted effort in animal and microbial genomics.

For the fiscal year 2002 agricultural appropriations bill, the NCGA requests an increase of \$5.0 million for plant, animal, microbial genomics at the Agricultural Research Service (ARS). We support the Administration's requested increase of \$4.5 million increase for bioinformatics research at ARS and urge the Subcommittee to provide an additional \$500,000 for additional ARS genomics efforts. The NCGA, also, urges the Subcommittee to allow full funding to continue for the Initiative for Future Agriculture and Food Systems as a significant portion of the funds are supporting plant, animal, and microbial genomics research.

To take full advantage of the plant genomics revolution, diverse plant germplasm must be available for crop breeders to develop the varieties necessary to meet the changing circumstances and needs of the future. The USDA National Plant Germplasm System (NPGS)—

- Acquires germplasm;
- Develops and documents information on the germplasm;
- Preserves and distributes germplasm upon request; and
- Maintains quarantine facilities for testing imported germplasm.

Funding for the NPGS has declined significantly, in constant dollars, since 1992, while demands on the system have increased. The NSF-funded plant genome research program has increased, tremendously, the amount of genetic stocks for the NPGS to manage. For example, one maize grant will generate, at least, 50,000 new maize genetic stocks, doubling the size of the NPGS maize stock center. Comparable situations will exist for several other economically important crops as well. Without a significant increase in funding, the NPGS will not be able to manage current stocks, much less the increased stocks generated through genomics research. It is critical that these resources remain in the public domain to ensure continued accessibility to all scientists and breeders. The NCGA believes that the NPGS is a fundamental, strategic resource, and urges the Subcommittee to provide a \$10 million increase for the NPGS.

Advances in basic plant science that result from a vigorous plant genomics program and a strong, viable National Plant Germplasm System will allow us to create new hybrids and varieties that will—

- Improve human and animal health;
- Reduce medical costs due to more nutritious, healthier, food for individuals;
- Reduce worldwide malnutrition through higher yielding and more nutritious crops;
- Reduce environmental problems for crop and livestock growers;
- Expand plant-based renewable resources for chemicals and energy; and
- Allow growers to get more income from the market and reduce grower reliance on Federal farm programs.

The National Plant Genome Initiative, the National Plant Germplasm System, and the competitive USDA programs that support genomics research are critical to the long-term viability of U.S. agriculture as they will provide our growers with the tools to meet the challenges and demands of the 21st century. The NCGA, strongly, urges Congress to provide a \$5 million increase in ARS funding for plant, animal, and microbial genomics research and a \$10 million increase for the USDA National Plant Germplasm System.

Thank you for your consideration of our views.

PREPARED STATEMENT OF THE NATIONAL CONGRESS OF AMERICAN INDIANS

INTRODUCTION

My name is Susan Masten, and I am Chair of the Yurok Tribe of Northern California and President of the National Congress of American Indians (NCAI). I am pleased to have the opportunity to present a written statement regarding the President's budget request for fiscal year 2002 Indian programs and services within the Department of Agriculture.

Since the 1970's, the high population growth rate of Indian reservations has put great strains on an already inadequate infrastructure. Education, law enforcement, transportation, health care, jobs, housing, technology, water and sewer systems—each of these basic governmental services all too often falls victim to resources that are spread far too thin. While fiscal year 2001 funding levels for Indian programs certainly made great strides toward meeting the basic programmatic needs of tribes, our work is not yet done. In order to fully support tribal self-government and eco-

conomic self-sufficiency, Congress must not turn back the clock on last year's gains and in fact should consider increases for key programs that serve Indian Country.

Last year, Congress enacted a final fiscal year 2001 budget that included a total of \$9.4 billion for critical Indian programs. This total, a \$1.1 billion increase over fiscal year 2000, represented the largest increase ever for Indian programs and brought together over a dozen agencies to help address the needs of Indian nations.

The last time the Federal government enacted an increase of a similar scope was in the mid-1970's as part of President Nixon's self-determination policy. Self-determination has been and continues to be the most successful Federal policy toward Indian Nations. Under it, tribal governments have local control over programs and are able to fulfill needs and solve problems more quickly and efficiently than through a "top-down" Federal approach.

For fiscal year 2002, the President has proposed \$1.96 trillion in fiscal year 2002 spending, including a four percent increase in discretionary spending over fiscal year 2001. While this increase—which is slightly higher than inflation—seems positive, it is important to note that it is only half the 8.5 percent gain enacted last year. Furthermore, proposed budget for the Department of Interior is four percent less than the fiscal year 2001 enacted level.

The President's "Blueprint for New Beginnings" fails to provide many substantive, agency-level details about the fiscal year 2002 budget request. Until these details become available through the release of more comprehensive agency budgets, it is extremely difficult to gauge the impact of the proposed fiscal year 2002 budget on programs that serve American Indians and Alaska Natives.

I will address the proposed funding levels that are available and to highlight those programs that we believe are critically important to Indian nations. Much of the information and recommendations contained in my testimony was provided by our member tribes and by national and regional Indian organizations, such as the National Indian Education Association, the National Indian Health Board, the National American Indian Housing Council, the Northwest Portland Area Indian Health Board, and others.

DEPARTMENT OF AGRICULTURE

Being the most rural of any minority group, American Indians residing on reservations are for the most part, geographically isolated, resource-limited, and the least likely of any farm group to receive loans from the United States. Of the some 55 million acres of Indian lands, 47 million acres are used for the production of crops, livestock, or both. Those individual operators and farming tribes who produce these resources are in need of capital, more efficient administration of existing Federal programs, and technical assistance. This need extends over all farming tribes even those who may have an abundance of natural resources. In addition, development assistance provided through USDA helps non-farming tribes to develop more sustainable economies.

For fiscal year 2002, the President has proposed cutting USDA funding from its current level of \$19.4 billion to \$17.9 billion, a 1.6 percent reduction. NCAI is particularly concerned about the proposed elimination of \$235 million in rural development assistance. Furthermore, we recommend the following funding levels for Indian-specific programs:

Extension Indian Reservations Program

In fiscal year 2001, \$2 million was provided for extension agents on Indian reservations, a slight increase over the fiscal year 2000 enacted level of \$1.7 million. Since 1990, the Extension Indian Reservation Program, authorized under the Food, Agriculture, Conservation and Trade Act, has provided services to Indian Country on issues ranging from crop and animal production practices to farm business management. It also has furnished extension agents, employees of the State Cooperative Extension System, who work with tribal advisory committees to develop educational programs in agriculture or agriculture-related youth programs that respond to tribal priorities. NCAI strongly supports an increase to \$5 million for fiscal year 2002 in order for the program to hire additional extension agents on large Indian reservations to help Indian Country promote productive and efficient land use.

Rural Development Native American Program

In fiscal year 2001, \$24 million was provided for Indian Rural Community Advancement Programs (RCAP). While this funding level was welcome, NCAI further recommends that this funding be allocated as follows: \$1 million for Rural Business Opportunity Grants to Tribes; \$5 million for Community Facilities Grants for Tribal College Improvements; \$16 million for Drinking Water and Waste Disposal Systems for Tribes; and \$3 million for Rural Business Enterprise Grants to Tribes.

Food Distribution Program on Indian Reservations

The Food Distribution Program on Indian Reservations (FDPIR) is administered at the Federal level by the Food and Nutrition Service (FNS) in cooperation with 98 tribal organizations and six state agencies. Many Native Americans actually participate in the FDPIR, rather than the Food Stamp Program because of rural isolation and the lack of easy access to food stores.

fiscal year 2001 funding for the FDPIR was \$76.5 million, an increase of \$1.5 million over the fiscal year 2000 enacted level. Maintaining this increase is crucial in order to provide commodity foods to low-income households on reservations and to Native American families residing in designated areas near reservations.

CONCLUSION

We urge the Congress to fulfill its fiduciary duty to American Indians and Alaska Native people and to preserve the government-to-government relationship, which includes the fulfillment of health, education and welfare needs of all Indian tribes in the United States. This responsibility should never be compromised or diminished because of any political agenda or budget cut scenario. Tribes throughout the nation relinquished their lands as well as their rights to liberty and property, and we ask that the Congress maintain the Federal trust responsibility to Indian Country and continue to assist tribes on the road toward self-sufficiency. Thank you.

PREPARED STATEMENT OF THE NATIONAL FOOD PROCESSORS ASSOCIATION

Mr. Chairman, my name is John Cady, Chairman and CEO of the National Food Processors Association (NFPA), and today I am submitting testimony on behalf of NFPA. NFPA is the nation's largest food trade association representing a \$460 billion industry that employs over 1.5 million Americans. With three laboratory centers, NFPA is the leading authority on scientific and public policy issues involving food science and safety for the food industry. For more than 90 years, the food industry has relied on NFPA for government and regulatory affairs representation, scientific research, technical services, education, communications, and crisis management.

NFPA was formed at a time when it was necessary to enhance public confidence in food safety, and we are proud of our contributions to further improve the safety of our nation's food supply. The U.S. food supply is the safest in the world. However, NFPA remains committed to working to make it even better. That is why NFPA advocates oversight and regulation that is appropriate. Our association is particularly supportive of providing an adequate level of funding for the Food and Drug Administration (FDA) and the Department of Agriculture's Food Safety and Inspection Service (FSIS). While several Federal agencies have responsibility for food safety and quality programs, the FDA and FSIS share the primary responsibility for food regulation. NFPA, on behalf of our members, is making an enhanced commitment to focus on increasing the resources and productivity of these authorities.

This year NFPA has launched a long-term effort, along with other leading food trade associations, to seek additional funding for FDA's Center for Food Safety and Applied Nutrition (CFSAN), which in real dollars, has had a steadily declining budget since 1973. While funding for CFSAN has risen by \$100 million over the past four years, CFSAN must continue to enhance efficiency and productivity. Only by enhancing efficiency and productivity will the Center be able to stretch resource dollars further to meet the demands in areas such as food safety research, risk-based inspections and premarket reviews, including biotechnology and food additives. NFPA is committed also to adequate resources for the Agriculture Research Service (ARS) at the Department of Agriculture, specifically to fulfill its mission to generate technical information on providing an adequate supply of food products by practices that maintain a permanent and effective agriculture and to improve the nutrition and well being of the American people.

USER FEES

The Administration's fiscal year 2002 Budget proposes new user fees—more appropriately described as regulatory taxes—that require food companies to pay for the privilege of being regulated. Though NFPA applauds the Administration for not proposing new user fees for FSIS, the fiscal year 2002 request does include \$13.4 million in new, unauthorized user fees. This includes \$8.1 million for new, unauthorized user fees for import inspections and \$5.3 million export certifications. NFPA appreciates that the Committee repeatedly has rejected these proposals in past Administration budget requests, and recommends again that funding of food

safety and regulatory programs should be borne through appropriated funds. The proposed FDA user fees would be collected to provide food companies with certification documents for exporting products. Amounting to a tax on food trade, this would discourage the export of U.S. food and agriculture products at a time of already declining agriculture exports. Proposed user fees on the food industry are hidden taxes whose costs would be borne both by producers and eventually consumers in higher food prices. NFPA does support the Administration's focus on FDA's export certification system, which needs reform to prevent the continuing backlog of document requests. However, establishing a user fee system would simply camouflage the deficiencies of the existing system. Furthermore, funding regulatory programs through taxes raised from the industry would only serve to undermine global public confidence in the independent judgment of FDA. We urge the Committee to reject this user fee proposal.

FOOD AND DRUG ADMINISTRATION'S FOOD REGULATORY PROGRAMS

NFPA supports the requested level of funding for FDA's food regulation activities, but recommends that priority be given to the areas of research, risk assessment, education and surveillance. Such priority setting will ensure that limited resources will be targeted toward reducing risk associated with food borne illness. In addition, we support FDA's infrastructure request for funding to administer the transfer of the CFSAN staff and facilities to College Park, Maryland and to construct a new regional laboratory in Los Angeles, California.

We also urge the Committee to protect funding for science-based food activities at CFSAN. Recent increases to CFSAN's budget have been absorbed by a combination of dedicated funding for regulatory initiatives and staff salary increases and cost-of-living adjustments. This "crowding out" effect appears to have contributed to a slow, but steady, erosion in FDA's ability to preserve its food science base. The continued decline of FDA's scientific base can only imperil FDA's long-term capabilities to respond rapidly and authoritatively to emerging scientific and policy challenges that grow increasingly complex. We urge the Committee to explore with FDA opportunities to support the integrity of CFSAN's scientific capabilities.

BIOTECHNOLOGY

NFPA recognizes the leading role FDA plays in ensuring public acceptance of emerging food technologies including biotechnology. NFPA strongly supports the proposed fiscal year 2002 increase of \$1 million to strengthen CFSAN's scientific capabilities and requests the Committee provide an even higher level of funding for this important function. In January, FDA released a draft guidance on labeling for food derived from biotechnology and a proposed rule on premarket notification. FDA should expeditiously publish a final version of the guidance and rule to ensure the review process is thorough, rigorous, and scientifically based.

EXTENDING THE FOOD SAFETY INITIATIVE

NFPA appreciates the continued emphasis that Congress has placed on food safety through its funding for the Food Safety Initiative for FDA, USDA, and the Centers for Disease Control and Prevention (CDC) in fiscal years fiscal year 1998 through 2001. The fiscal year 2002 request represents the new Administration's commitment to enhance efforts to prevent the spread of mad cow disease to the U.S., and to expand successful food safety activities. We endorse most aspects of the Administration's request to increase funding to reduce the prevalence of pathogens, and expand coverage to pesticides and chemical contaminants, particularly in those areas that emphasize research, risk assessment, education and surveillance. Our concern remains that FDA use resources efficiently and effectively. FDA should fully implement on-going monitoring and risk evaluations, and expand current laboratory capabilities in order to increase timely risk assessments and scientific analysis before premature regulatory steps are taken. We request that the Committee remain vigilant in its oversight to ensure that appropriated funds for food safety programs are deployed in a manner commensurate with relative food safety risks.

FURTHER REFORMS NEEDED AT FOOD SAFETY AND INSPECTION SERVICE

NFPA supports adequate resources for the FSIS, but is concerned with reports of personnel management practices that have led to inspector shortages and resulting plant slowdowns or work stoppages in meat and poultry establishments. We urge the Committee to review this problem to ensure the availability of inspection personnel either through additional resources or management reforms, including alternative inspection procedures.

NFPA supports the transition to a HACCP-based inspection system, but notes that FSIS has not fulfilled its past pledges to remove inspection regulations that are inconsistent with HACCP. We urge the Committee to ensure that unnecessary layers of regulation are promptly removed to speed HACCP implementation.

For example, NFPA is disappointed that FSIS reported to Congress in March 2001 that it would not follow through with an announced plan to move toward daily, unscheduled processing inspection in 2001. FSIS estimated that this would save an estimated \$19 million. NFPA agreed that the FSIS plan put forward in the fiscal year 2001 budget would free up appropriated funds to address inspection shortages and other significant food safety risks. NFPA believes unscheduled inspection in processing establishments could yield even greater benefits by allocating resources based on a public health risk allocation of resources. We urge the Committee to direct FSIS to explore methods of further maximizing this flexible approach.

NFPA also recognizes the lead role that FSIS plays in overseeing the work of the U.S. Manager for Codex Alimentarius. NFPA strongly supports the fiscal year 2002 requested increase for FSIS Codex activities, and recommends that the Committee provide an even higher level of funding for this important function. Codex remains a critically important forum for ensuring U.S. leadership in international trade and food safety activities.

ADEQUATE FUNDING NEEDED FOR FOOD RESEARCH

The National Nutrition Monitoring and Related Research Act of 1990 directed the USDA's Agriculture Research Service to coordinate the Continuing Survey for Food Intake by Individuals (CSFII) with the National Health and Nutrition Examination Survey (NHANES) conducted by the Department of Health and Human Services (DHHS). Though USDA is working diligently with DHHS to coordinate the two survey systems and methodology, USDA has failed to conduct the CSFII in 2000 and has no plans to conduct the survey in 2001. Congress has requested USDA report on how the Department plans to integrate the two surveys without losing the vital data collected by both programs. The recently released USDA report failed to appropriately address the concerns of the Congress as the language of the report appears to indicate plans to rely only on the data collected through NHANES. The CSFII is at the core of America's national nutrition monitoring system and is vital to understanding the growing problem of childhood obesity, conducting food safety risk assessments, refining objectives of Federal food assistance programs, and monitoring the nutritional health of various at-risk populations. NFPA urges the Committee to direct the ARS to continue to conduct the CSFII as the Service develops a coordinated plan with DHHS for both surveys.

The ARS also performs the essential function of compiling and communicating agriculture and food industry data and information on the evaluations and decisions that impact the future capacity of production agriculture in the U.S., made by the Environmental Protection Agency. NFPA recommends the Committee increase the budget allocation for continuing implementation of the Food Quality Protection Act to ensure the Office of Pest Management Policy at ARS has adequate funding to support tolerance reviews and determinations of the cumulative risk assessments needed to ensure a safe food supply.

CONCLUSION

In conclusion, NFPA is grateful for the important funding oversight that the Committee provides to ensure the integrity of U.S. food safety regulation. The food industry endeavors to produce the safest and highest quality food products in the world. As a result, NFPA understands that adequate funding for our nation's food safety regulators through direct appropriations and enhanced productivity by the agency is fundamental to good public health, and to maintaining the confidence of consumers in the safety of the food supply. NFPA appreciates the opportunity to submit testimony on the President's fiscal year 2002 food safety budget request.

PREPARED STATEMENT OF THE NATIONAL ORGANIZATION FOR RARE DISORDERS, INC.

Mr. Chairman and members of the Senate Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies, the National Organization for Rare Disorders (NORD), wishes to express its views regarding appropriations for the Orphan Products Research Grant Program administered by the Office of Orphan Product Development (OOPD) at the Food and Drug Administration (FDA).

NORD is a federation of approximately 140 voluntary health organizations and over 70,000 individual patients, healthcare providers and clinical researchers dedi-

cated to helping the 25 million people in the United States suffering with rare "orphan" diseases. An orphan disease is defined by statute as any disease or condition impacting less than 200,000 Americans.¹ It makes no difference whether you are male or female, rich or poor, young or old, white, African-American, Latino, Asian or American Indian. These diseases affect everyone.

On behalf of the rare disease community, we are respectfully requesting that just one dollar for each and every person suffering with a rare disease be appropriated by this Subcommittee for the FDA'S Orphan Products Research Grant Program. Twenty-five million would represent a minimal investment by the Federal government in the development of lifesaving treatments that the private sector is not interested in. But the return on investment could be phenomenal if only a few new orphan drugs or devices are developed to reduce the burden of disease and death for thousands of patients with rare disorders.

As you can imagine, appropriating just one dollar for each rare disease patient in America, rather than the current funding level of a mere fifty cents per patient, is a win-win situation. Patients win when their symptoms are alleviated or cured. Families win when their loved ones no longer suffer. Society, as a whole, wins when patients are able to return to school or work to become productive tax-paying citizens. Pharmaceutical and biotechnology companies win when they are able to market new therapeutic products when part of the development costs are subsidized. The scientific community wins when the knowledge they gain can be applied to more prevalent diseases. And, finally, the government wins when the drain on healthcare dollars is minimized.

FDA ORPHAN PRODUCTS RESEARCH GRANTS PROGRAM

Congress created the research grants program in fiscal year 1983 to provide funding for pivotal clinical trials on new orphan drugs, medical devices, and medical foods for rare diseases. The funds have been made available to academic scientists and small companies. By definition, "orphan products" are treatments for rare conditions that have small potential markets and thus are not attractive to the commercial sector. Such treatments were not being developed for "orphan" diseases by the private sector until the Orphan Drug Act was enacted in 1983.

Since then, the FDA has approved over 218 orphan drugs for marketing, and more than 800 additional drugs are in the research pipeline. Of those products approved for marketing, 27 (23 drugs and 4 medical devices) were developed with funding from the orphan product grants. These 27 treatments would not be on the American market today saving the lives of thousands of Americans, enabling them to return to school or work, if Congress had not created this small but critically important pool of research funds.

Most of FDA's Orphan Products Research Grants support small clinical trials at academic institutions throughout the nation to develop the preliminary evidence that is necessary to attract commercial sponsors. It is the quintessential model for a successful government/industry partnership. There is no more appropriate program deserving of Federal support because it fills a major gap between academic research and the private sector, and it creates lifesaving products that are needed throughout the world.

For example, children with Severe Combined Immune Deficiency (the "Bubble Boy Disease") no longer have to live in a plastic bubble because now their immune systems can fight off germs, thanks to an orphan drug developed with these grant funds. Children with urea cycle disorders no longer slip into a coma and die because an orphan drug enables their bodies to eliminate toxic levels of ammonia. Babies born without ribs no longer suffocate in infancy because an artificial rib (an orphan medical device) is being developed now with funds from the Orphan Products Research Grants Program that allows the children's lungs to expand and breathe. Cystic fibrosis, Crohn's disease, and multiple sclerosis drugs are on the market today only because these grants supported some of their research.

Unfortunately, there are many diseases and conditions that are too rare to attract private investment because the commercial sector is simply not interested in developing treatments for small markets. The investment necessary for research and development of new drugs and devices is too large in comparison to the size of the potential market for a rare disease. Case in point, there are only about 125 patients in the United States suffering with an orphan disease called fibrodysplasia ossificans progressiva (FOP), Only 15,000 with Huntington's disease or Duchenne Muscular Dystrophy, and only 30,000 with cystic fibrosis. Many of the genetic diseases each impact no more than 40,000 Americans. Whereas, drugs for cancer, ar-

¹Orphan Drug Act of 1983.

thritis or hypertension, for example, each affect many millions of Americans, representing several billion dollars in potential sales each year.

Given the fact that the Orphan Products Research Grant Program is attracting greater attention, more researchers are eager to participate each year. Therefore, it is very unfortunate that the annual appropriation for this program cannot begin to cover all of the meritorious grant requests for promising research projects. Today, about 100 grant applications are received annually, but many scientifically important applications are never funded simply because the appropriation is too small to meet the needs of the program. In fact, the appropriation now is less than it was in fiscal year 1995, and has remained between \$10 to \$12 million for many years.

Mr. Chairman, if the government does not fund this research, who will? The private sector is simply not interested in rare diseases. If this Subcommittee does not meet the need of this unique sector of scientific research, people with rare diseases will be further victimized by the injustice of the supply and demand marketplace. For these diseases, no company wants to supply a treatment when the market demand is small.

CONCLUSION

In 1989 the HHS National Commission on Orphan Diseases estimated that only 30 percent of the 25 million patients suffering with rare diseases receive a diagnosis in three to five years after the onset of symptoms. That works out to about 7.5 million patients who are shuffled from specialist to specialist, year after year. Fifteen percent, or 3.7 million people, wait seven years or more. And even after diagnosis, they can only hope that someone, somewhere, will conduct research to develop a treatment for their disease.

And so, on behalf of those medically disenfranchised Americans and their families, we respectfully request that the members of this Subcommittee appropriate no less than \$25 million dollars to the FDA Orphan Products Research Grant Program for fiscal year 2002. We are relying on the members of this Subcommittee to fill the void between government and the private sector, and propel these treatments forward from academic laboratories to our local pharmacies. Ultimately, your compassion and insight will put new orphan drugs and devices into the waiting hands of critically ill patients. If you don't provide adequate resources for the Orphan Products Research Grants Program, unfortunately no one else will.

Thank you.

PREPARED STATEMENT OF THE NATIONAL POTATO COUNCIL

My name is Todd Michael. I am a potato farmer from Ohio and current Vice President, Legislative/Government Affairs for the National Potato Council (NPC). On behalf of the NPC, we thank you for your attention to the needs of our potato growers.

The NPC is the only trade association representing commercial growers in 50 states. Our growers produce both seed potatoes and potatoes for consumption in a variety of forms. Annual production in 2000 was 500,000,000 cwt. with a farm value of \$2,800,000,000. Total value is substantially increased through processing. The potato crop clearly has a positive impact on the U.S. economy.

The potato is the most popular of all vegetables grown and consumed in the United States and one of the most popular in the world. Annual per capita consumption was 147 pounds in 2000 up from 107 pounds in 1962 and is increasing due to the advent of new products and heightened public awareness of the potato's excellent nutritional value. Potatoes are considered a stable consumer commodity and an integral, delicious component of the American diet.

The National Potato Council's fiscal year 2002 appropriations priorities are as follows:

Cooperative Research Education and Extension Service (CSREES)

Potato Special Grant Program.—The NPC urges that \$1.6 million be appropriated for the special research grant program. The Congress increased the level in fiscal year 2001 by \$150,000 to \$1.45 million and should the Administration delete these funds from its budget we urge that Congress restore the fiscal year 2001 appropriated level as well as increase the funding to \$1.6 million. The program had once been at \$1.4 million but had been reduced due to various across the board cuts. This has been a highly successful program and the number of funding requests is increasing.

The NPC also urges that the Congress, once again, include Committee report language as follows: "*Potato research.*—The Committee expects the Department to en-

sure that funds provided to CSREES for potato research are utilized for varietal development testing. Further, these funds are to be awarded competitively after review by the Potato Industry Working Group.”

Agricultural Research Service (ARS)

The NPC urges that the Congress once again add Committee report language urging the ARS to work with the NPC on how overall research funds can best be utilized for grower priorities.

Should the Administration’s fiscal year 2002 budget delete the \$250,000 for Prosser, Washington and the \$300,000 for the Northeast Plant, Soil and Water Laboratory at Onono, Maine, added by the Congress in fiscal year 2001, the NPC urges that the Congress restore these funds.

Grand Forks and East Grand Forks

Appropriate \$350,000 for a new scientist to be located at the Potato Research worksite in East Grand Forks, Minnesota. The scientist would address the effects of postharvest storage and treatments on potato market quality and value added traits. Since over 70 percent of the U.S. fall potato crop is placed into storage for year around sale, this research will benefit potato growers throughout the country.

Fort Collins, Colorado

Appropriate \$300,000 for the Soil, Plant, and Nutrient Research Program at Fort Collins to conduct research to enhance water and soil quality with precision conservation farming.

Aberdeen, Idaho

Appropriate \$150,000 for additional work by the potato breeder at Aberdeen. Since an estimated 96 percent of the current budget is committed to salaries and fixed costs, this additional funding is needed to provide for the development of a strong molecular biology program component to speed the incorporation of disease resistance from wild potato species into the cultivated potato.

Appropriate \$400,000 for planning and design for the construction of an advanced molecular genetics laboratory at the National Small Grains Germplasm Research Facility. This facility at Aberdeen is needed to assure the continuation of advanced molecular genetics research for potatoes and small grains. It is estimated that total construction costs will be \$3.9 million.

Albany, California

ARS has funded Dr. William Belknap in Albany, with the support of the NPC, to develop genetic constructs for potato transformation that will be publicly available without patent restrictions on their use. His laboratory should serve as a source of reagents for use by ARS scientists and others who work in the public sector. Estimated cost of providing this service is an additional \$100,000 in fiscal year 2002 for Dr. Belknap’s base budget to carry out the potato research.

Beltsville, Maryland

Improving the nutritional value of potatoes is a high priority of the NPC. Research should also be initiated at the Beltsville Vegetable Laboratory that combines traditional breeding and plant biotechnology to increase the nutritional value of the potato and add value to the crop. Estimated cost would be \$300,000 for fiscal year 2002.

National Agricultural Statistics Service (MASS)

The NPC urges that the Congress appropriate \$125,000 to the National Agricultural Statistics Service to conduct a Potato Objective Yield Size and Grade Survey. It is important that potato growers not only have objective yield surveys carried out by NASS in the major potato producing states, but also have a size and grade survey completed that estimates the marketable quality of those potatoes.

Plant Protection and Quarantine Service (APHIS-USDA)

The NPC urges that the Congress appropriate \$610,000 for the Golden Nematode Quarantine Program. The National Potato Council also supports the appropriation of \$100 million for the Agriculture Quarantine Inspection (AQI) user fee account; \$52 million for the AQI appropriated fund account and \$45 million for pest detection. As new trade agreements are negotiated, the agency must have the necessary staff and technology to deal with the threat of pests and diseases.

FQPA Funding

The NPC also supports the appropriation of \$106 million for USDA to meet the data requirements of the new Food Quality Protection Act (FQPA). This would in-

clude \$2.6 million for the USDA Office of Pest Management. The NPC has devoted considerable time and resources to the evaluation of pesticides required by the FQPA. However, it is essential that the USDA have adequate resources to assist in this effort. Otherwise, given the tight time frame for these assessments, the EPA will rely on default assumptions in the absence of actual data.

PREPARED STATEMENT OF THE PARTNERS FOR RURAL AMERICA

Mr. Chairman and members of the Subcommittee, I am Bob Swanson. I am the Executive Director of the Washington State Association of Community Action Agencies and serve as Chair of the Washington State Rural Development Council. I also serve as Chair of the Board of Directors of Partners for Rural America (PRA), which is the national service organization of the America's 40 state rural development councils (SRDCs).

THE CONTRIBUTIONS OF THE NRDP AND SRDCS TO RURAL AMERICA

SRDCs are unique entities. They do not administer programs or make grants. Although they influence the making of policies that affect rural America, they, themselves, do not make policy.

SRDCs are composed of officials of Federal, state, local, and tribal governments and representatives of the private and non-profit sectors. These SRDCs promote:

- Greater coordination among Federal agencies in the development and delivery of Federal programs that affect rural areas;
- Greater collaboration between the Federal government and others working for an improved future for rural America;
- Leveraging of limited financial resources that are available to rural communities;
- Identification and elimination of program and regulatory impediments; and
- Development of local solutions by local people to address the challenges and opportunities facing rural communities.

OUR FISCAL YEAR 2002 APPROPRIATIONS REQUEST

On behalf of the NRDP and SRDCs, we respectfully request that the Subcommittee include an appropriation of \$7.542 million in the fiscal year 2002 appropriations bill for the US Department of Agriculture (USDA) to support the operations and activities of the Partnership and SRDCs.

Of this amount:

- Slightly more than 90 percent (\$6,820,000) would provide direct support for SRDCs.
- 80.22 percent of the request (\$6,050,000) would flow directly to the SRDCs in the form of cooperative agreements or grants or both.
- 10.21 percent of the request (\$475,000) would underwrite direct services to the SRDCs.
- Just under 8 percent (\$600,000) would underwrite program support for the SRDCs.
- And 1.62 percent (\$122,000) would cover administrative costs.

Of the funds that go to SRDCs, roughly two-thirds is used for personnel costs, with the remainder used to underwrite operating costs. Each SRDC is typically a one-or-two person operation, although a few Councils have larger staffs. SRDCs are required to provide a 33 percent non-federal match (cash or in-kind), although some Councils have been able to leverage the Federal funds they receive by a factor of two or three. During the last five years, the match provided by SRDCs has exceeded \$10.5 million.

Because the issues on which the NRDP and SRDCs focus extend well beyond the responsibilities of the USDA/Rural Development Mission Area (USDA/RD) and—indeed, beyond the responsibilities of USDA—it is our position that support for the Partnership should come from funds generally available to USDA. Ultimately, we would support a strategy which provides support for the Partnership from across the Federal government, but—until a system can be devised that is stable and predictable—we must rely on USDA for core support for the NRDP and SRDCs. It is our strong desire that any funds provided to the NRDP and SRDCs through the Agricultural Appropriations Bill be “new money;” that is, funds that are added to the Appropriations Bill rather than money that is transferred from other programs within USDA, many of which are already oversubscribed.

PAST FEDERAL SUPPORT FOR THE NRDP AND SRDCS

This request for an fiscal year 2002 appropriation marks the first time Appropriators have been asked to directly support the Partnership and SRDCs. This request is being made because the past system for funding the NRDP and SRDCs has been inadequate.

From its beginning in the early 1990s, the Partnership has never had a dedicated, predictable source of funding. Instead, it has depended upon voluntary contributions of discretionary funds from USDA and the Federal Departments of Labor, Transportation (DOT), Veterans Affairs, and Health & Human Services. Without the financial contributions and—more importantly—the dedicated participation of these agencies, the Partnership would never have achieved the many successes it has.

Although we have decided to seek core funding for the Partnership through the Agricultural Appropriations Bill, it is our sincere hope the non-USDA agencies that have worked with us in the past will remain engaged in the Partnership and that they will be joined by many other Federal agencies. Participation by the greatest possible number of Federal agencies in the Partnership is essential in order to facilitate broad-based interagency collaboration. Providing core funding from the Agricultural Appropriations Bill will greatly increase administrative and logistical convenience, as well as significantly increasing the predictability of funding for the SRDCs. However, continued financial support from agencies beyond USDA can help to strengthen and expand the Partnership.

Since fiscal year 1993, revenue available from these five agencies has decreased precipitously while the program's obligations have increased. In fiscal year 1993, when there were 26 SRDCs, program revenue totaled \$5.250 million; in fiscal year 2000, when there were 37 SRDCs, program revenue had decreased to \$3.193 million. Support from USDA/RD decreased from a high of \$4 million in fiscal year 1993 to just under \$2 million in fiscal year 2000. Language in the fiscal year 1999, fiscal year 2000, and fiscal year 2001 DOT appropriations bills limiting the use of Federal Highway Administration funds resulted in DOT's contribution to the Partnership being reduced from \$500,000 annually to \$50,000.

SRDCs became aware of a likely funding shortfall in fiscal year 2001 funding for the Partnership in the spring of 2000. Despite strong support for the Partnership from many members of Congress, including members of this Subcommittee, SRDCs' efforts to win inclusion of funds for the Partnership in the fiscal year 2001 Agricultural Appropriations Bill were initiated too late to be successful. During Senate consideration of the Conference Committee Report on the fiscal year 2001 Agricultural Appropriations Bill, a number of Senators entered into a colloquy with Chairman Cochran in which the Chairman said, "I want to assure the gentlemen that it is the Committee's belief that the Secretary of Agriculture should continue to provide funding from discretionary amounts for this program." (Congressional Record, October 18, 2000, pages S10680 and S10681.) Fortunately, USDA Secretary Ann Veneman has allocated recently additional funds to the Partnership to carry it through the end of fiscal year 2001.

It is important that we be extremely clear why it was necessary for Secretary Veneman to allocate additional funds to the Partnership for fiscal year 2001. As noted above, we became aware of a likely fiscal year 2001 funding shortfall in the spring of 2000. Funds available at the beginning of fiscal year 2001 were adequate to only carry the Partnership through the end of the second quarter of fiscal year 2001. The previous Administration neither provided additional funds to the Partnership nor did it put forward a plan to deal with the funding shortfall. Had Secretary Veneman not allocated additional funds to the Partnership, Federal financial support to SRDCs would have ended on March 31, 2001, thereby threatening the financial and operational viability of most SRDCs.

ADMINISTRATIVE SUPPORT FROM USDA

From the beginning of the Partnership, USDA has provided administrative support for the NRDP and SRDCs through the National Partnership Office (NPO), an agency located within USDA/RD and now attached to the Office of Community Development. NPO staff salaries and general administrative expenses are paid by USDA/RD and are not included in this request.

During the NPO's period of greatest staffing (when there were 36 SRDCs), 7.5 FTEs were assigned to it. Currently, 4.5 FTEs are assigned to the NPO. We strongly believe that this level of staffing is inadequate to support this 40-state program and to provide appropriate oversight of SRDCs' operations on behalf of the Federal government. Accordingly, we urge that the staffing allocation for the NPO be restored to a minimum of 9 FTEs.

HISTORY OF THE NRDP AND SRDCS

The basis of the NRDP and SRDCs can be found in the Rural Development Policy Act of 1980 (94 Stat. 1171), which called on the USDA Secretary to:

“ . . . provide leadership within the executive branch for, and shall assume responsibility for coordinating, a nationwide rural development program using the services of executive branch departments and agencies, including, but not limited to, the agencies bureaus, offices, and services of the Department of Agriculture, in coordination with rural development programs of State and local governments.”

“ . . . conduct a systematic review of Federal programs affecting rural areas to (A) determine whether such areas are benefiting from such programs in an equitable proportion to the benefits received by urban areas and (B) identify any factors that may restrict accessibility to such programs in rural areas or limit participation in such programs.”

“ . . . develop a process through which multi-state, State, substate, and local rural development needs, goals, objectives, plans, and recommendations can be received and assessed on a continuing basis.”

“ . . . undertake cooperative efforts with other Federal departments and agencies to improve the coordination and effectiveness of Federal programs, services, and actions affecting rural areas.”

The actual establishment of SRDCs was called for in the January 1990 report of the White House Economic Policy Council Working Group on Rural Development, Rural Economic Development for the 90s: A Presidential Initiative. The Presidential Initiative called for SRDCs to fill four principal missions:

- To serve as the coordinating vehicle for delivery of Federal rural development programs;
- To identify, assess, and address current local rural development needs;
- To serve as the focal point for localizing and implementing Federal rural development initiatives; and
- To provide personalized leadership and assistance to local community leaders desiring Federal rural development assistance.

Eight states were chosen to host pilot SRDCs. With the success of these initial SRDCs, additional states were added to the program to the point where SRDCs operate in 40 states today. The value of SRDCs was recognized in the 1992 report of the President's Council on Rural America. Members of the Commission “urge[d] that continuing support be given to the creation and maintenance of State Rural Development Councils in all states as a means of promoting cooperation between the Federal and state levels of government, local governments, and the private sector.”

The 1996 Farm Bill also recognized the contribution the NRDP and SRDCs could make to rural America and, as a result, laid out specific expectations and responsibilities for the Partnership.

As a result of a March 8, 2000, hearing on the structure and operations of the NRDP and SRDCs before the Senate Subcommittee on Agriculture, Nutrition, and Forestry, Senators Larry Craig and Kent Conrad introduced legislation to formally recognize the Partnership and to authorize it to receive appropriations (106th Congress, S. 3175, the National Rural Development Partnership Act). Twenty-eight Senators joined as co-sponsors of the bill, with co-sponsors equally divided between the two political parties. This legislation will soon be reintroduced in the Senate and will also be introduced in the House of Representatives.

The enactment of the National Rural Development Partnership Act will represent an important milestone for the NRDP and SRDCs. During the last decade, SRDCs have made important contributions to their states as they have evolved. Although they typically do not administer programs or promulgate regulations, SRDCs' roles as facilitators and coordinators have proven invaluable to the communities they have served. Hopefully, a renewed focus on rural development policy and program coordination by Congress, the Bush Administration, and rural development practitioners will lead to advances toward the goals set forth in the Rural Development Policy Act of 1980 and the 1990 Presidential Initiative.

PREPARED STATEMENT OF THE NATIONAL RURAL HOUSING COALITION

Mr. Chairman and members of the Senate Subcommittee on Agriculture, my name is Robert Rapoza and I wish to testify on behalf of the National Rural Housing Coalition.

I wish thank you for the Subcommittee's support of the Rural Development programs of the United States Department of Agriculture and to urge you to support an increase in its budget for fiscal year 2002.

As you may know, the National Rural Housing Coalition (the Coalition) has been a national voice for rural low-income housing and community development programs since 1969. Through direct advocacy and policy research, the Coalition has worked with Congress and the Department of Agriculture to design new programs and improve existing programs serving the rural poor. The Coalition also promotes a non-profit delivery system for these programs, encouraging support for rural community assistance programs, farm labor housing grants, self-help housing grants, and rural capacity building funding.

The Coalition is comprised of approximately 300 members nationwide. We hope to work with you to assure that the voices of rural America are heard and its needs met. Our concerns are focused on rural housing and rural water and sewer systems.

THE NEED FOR AFFORDABLE RURAL HOUSING

A disproportionate amount of the nation's substandard housing is in rural areas. Rural households are poorer than urban households, pay more of their income for housing than their urban counterparts, and are less likely to receive government-assisted mortgages. They also have limited access to mortgage credit and the secondary mortgage market, making them prime targets for predatory lending. Rural America needs programs which focus on the issues facing it. The Rural Housing Service of Rural Development provides many of these needed programs.

Homeownership is the principal form of housing in rural America. However, there are a number of obstacles to improving homeownership in rural areas including high rates of poverty and poor quality of housing. According to a 1999 Economic Research Service report, the poverty rate in rural America was 15.9 percent, compared to 13.2 percent in urban areas. Minorities in rural areas have much higher rates of poverty with an average of 34.1 percent compared to urban minorities at 28.1 percent. More than 1.6 million low-income rural households live in moderately to severely inadequate housing. These are units without hot or cold piped water, and/or have leaking roofs, walls, rodent problems, inadequate heating systems, and peeling paint, often lead-based.

Rural residents also have limited access to mortgage credit. The consolidation of the banking industry that accelerated throughout the 1990s has had a significant impact on rural communities. Mergers among lending institutions have replaced local community lenders with large centralized institutions located in urban areas. Aside from shifting the locus of loan-making, this has resulted in the diminishment of a competitive environment which, in the past, encouraged rural lenders to offer terms and conditions that were attractive to borrowers.

Because of the gap left by traditional lenders, rural households are often prime targets for predatory lenders. Predatory lending practices include excessive fees, prepayment penalties, and loan flipping into high cost subprime loans. Participants told about their borrowers' being convinced to convert their mortgages to high cost subprime loans, unaware of the higher interest rates. Even RHS borrowers paying a one percent interest rate were approached and convinced to switch.

Renters in rural areas also live in difficult situations. Thirty-three percent of rural renters are cost-burdened, paying more than 30 percent of their income for housing costs. Almost one million rural renter households suffer from multiple housing problems, 60 percent of whom pay more than 70 percent of their income for housing.

USDA'S RURAL HOUSING SERVICE

USDA's Section 502 single family direct loan program and Section 515 rural rental housing program address many of these issues.

Section 502 single family direct loan program

To qualify for the direct loan program, borrowers must have very low or low incomes but be able to afford mortgage payments. Also, applicants must be unable to obtain credit elsewhere, yet have reasonable credit histories. The average income of households assisted under Section 502 is \$18,500. About nine percent of households have annual incomes of less than \$10,000. Since its inception, Section 502 has provided loans to almost two million families.

Section 515 rental housing program

To qualify for the rental housing program, tenants must have low or very low incomes. Over more than 30 years, Section 515 has helped to produce over 500,000 homes. Under Section 515, USDA makes direct loans to non-profit and for-profit developers to build rural rental housing. The average tenant income is just over

\$7,500, approximately 26 percent of median, and more than half of tenants are elderly, disabled, or handicapped.

Despite these conditions, Federal rural housing has received severe cuts in recent years. The USDA's Section 502 single family direct loan program, which funded 132,000 units in 1976, has dropped its production by 89 percent to fewer than 15,600 units. Spending for Section 515 rental subsidized housing has been cut by 73 percent since 1994. And rural rental housing unit production by the Federal government has been reduced by 88 percent since 1990.

With these dramatic reductions and new opportunities presented by a good economy for building higher end housing, the private sector delivery system is no longer dominant as it was when funding levels were higher, and in many rural communities does not exist. In some rural areas, non-profits have picked up the slack and pursued a multiple funding strategy. Skilled local organizations meld Federal, state, local and private resources together to provide affordable financing packages to low-income families. But there is not a dedicated source of Federal support to promote a non-profit delivery system for rural housing.

As one way to improve its programs, USDA has expanded its cooperation with non-profit housing and community development organizations. Two successful programs are Mutual and Self-Help Housing and the Rural Home Loan Partnership.

Under Mutual and Self-Help Housing, with the assistance of local housing agencies, groups of families eligible for Section 502 loans perform approximately 65 percent of the construction labor on each other's homes under qualified supervision. This program, which has received growing support because of its proven model, has existed since 1961. The average number of homes built each year over the past 3 years has been approximately 1,500.

The Rural Home Loan Partnership is a leveraged loan program. USDA provides a set-aside of Section 502 funds which are distributed to local partnerships of organizations. The Rural Home Loan Partnership has partnered with 177 non-profits and developed and financed close to 1,350 homes.

Section 514 loan and Section 516 grant farm labor housing programs

Two additional rental housing programs address the needs of farm laborers. Migrant and seasonal farmworkers are some of the nation's most poorly housed populations. The last documented national study indicated a shortage of some 800,000 units of affordable housing for farmworkers.

Farmworker households are also some of the least assisted households in the nation. Some 52 percent of farmworker households' incomes are below the poverty threshold, four times the national household poverty rate, and 75 percent of migrant farmworkers have incomes below the poverty line. Yet little more than 20 percent of farmworker households receive public assistance; most commonly food stamps, rarely public or subsidized housing.

There are only two Federal housing programs that specifically target farmworkers and their housing needs: Sections 514 and 516 of the Housing Act of 1949 (as amended). Borrowers and grantees under Rural Housing Service Sections 514 and 516 receive financing to develop housing for farmworkers. Section 514 authorizes the Rural Housing Service to make loans with terms of up to 33 years and interest rates as low as one percent. Section 516 authorizes RHS to provide grant funding when the applicant will provide at least 10 percent of the total development cost from its own resources or through a 514 loan.

Non-profit housing organizations and public bodies use the loan and grant funds, along with RHS rural rental assistance, to provide units affordable to eligible farmworkers. These funds are used to plan and develop housing and related facilities for migrant and seasonal farmworkers. Current funding for Sections 514/516 totals \$34 million in program authority. This amount provides about 700 units of housing. The waiting list of applications for Section 514/516 is two to three times the appropriated level. USDA limits applications as there is little prospect of funding all the demand for assistance.

THE NEED FOR RURAL WATER AND SEWER SYSTEMS

Hundreds of rural communities nationwide do not have access to clean drinking water and safe waste disposal systems. A 1995 USDA needs assessment of rural areas showed that more than one million households had no indoor plumbing, and 2.4 million households had critical drinking water needs. In its 1997 Drinking Water Infrastructure Needs Survey, the Environmental Protection Agency estimated that over the next 20 years, water systems serving communities of less than 10,000 people will require \$37.2 billion in funding for water systems improvements and upgrades. And regarding wastewater, a 1996 EPA Survey demonstrated that small communities with up to 10,000 residents will need 21,000 wastewater treatment fa-

ILITIES by 2016 at a cost of approximately \$14 billion. According to EPA's numbers, approximately \$51.2 billion will be needed to address the basic water and wastewater needs of small communities.

Many projects that RUS funds are under consent order from the state EPA office for immediate action. The problems that the agency deals with range from communities and systems that are out of compliance with health and pollution standards, to communities without sewer systems where raw sewage runs in ditches after a heavy rainfall. Because so much time and money are spent on critical needs, the state offices spend less time on prevention. The programs and communities do not have enough resources to address issues before they become larger problems.

The issue of affordability moves to the forefront with waste disposal systems, which are generally more expensive than water systems. Waste systems naturally succeed water systems—with central water comes indoor plumbing, washing machines, dishwashers, etc., all of which eventually require an efficient wastewater disposal system. Low-income communities often already pay as much as they can afford for water service alone and are unable to manage the combined user fees for water and waste. In some extreme situations, some households are being forced out of homeownership because they cannot afford rising user costs.

As I mentioned earlier, rural communities have limited access to much-needed debt and equity capital, and small water and wastewater systems lack the economies of scale needed to reduce costs on their own. In order for communities to cut back on project costs and have affordable rates, operation and maintenance are typically underestimated in the budgets for many new systems. This often results in limited or no capital improvement accounts for future upgrades and expansions needed for community development including stabilization of local small business, affordable housing development, and other needed industrial development.

USDA'S RURAL UTILITIES SERVICE

USDA's Rural Utilities Service (RUS) is the primary Federal force in rural water and waste development, providing loans and grants to low-income communities in rural areas. The agency assists low-income rural communities that would not otherwise be able to afford such services. Approximately one-fifth of the communities served live below the national poverty line.

In providing these important services, the program also protects public health and promotes community stabilization and development. Aging municipal sewage systems alone are responsible for 40,000 overflows of raw sewage each year. The overflows cause health hazards including gastrointestinal problems and nausea, as well as long-term damage to the environment. Businesses and industries are unable or reluctant to locate in areas without functioning water and sewer systems. But with the assistance of RUS, communities are able to have the services they need so that their health and economies may benefit.

Although the need for RUS services continues, the level of available funds has decreased annually due to decreasing appropriations and increasing interest rates. In fiscal year 1995, \$1.35 billion was obligated by the Federal program to the states. Since that time, due to decreasing appropriations and increasing interest rates, the obligations have decreased. Fiscal year 2000 funding, at \$1.24 billion—a decrease of over \$100 million—was only 92 percent of its fiscal year 1995 level.

Through Federal and state initiatives, RUS is working to confront the challenges faced by rural communities. With increasingly restricted time and money, state offices are using other resources such as leveraged funds and technical assistance from the Rural Community Assistance Program (RCAP). Funds are being leveraged through HUD's Community Development Block Grant program and the EPA's State Revolving Loan Funds, as well as some private lenders. Through the RCAP technical assistance program, more than 4,000 communities in 49 states have received assistance to identify solutions to water problems, improve and protect water quality, and construct and operate facilities.

Mr. Chairman and members of the Committee, we look to you for continued support of the efforts of Rural Development. These programs are vital to the survival of our small communities nationwide. They address the most basic needs of affordable housing and clean water that still exist all over the country. Because of the overwhelming need, we wish to submit the following proposals for increases to Rural Development funding:

RURAL HOUSING AND COMMUNITY DEVELOPMENT APPROPRIATIONS—FISCAL YEAR 2001 FINAL
AND FISCAL 2002 PROPOSED

[In millions of dollars]

| Program | Fiscal year 2001 final | Fiscal year 2002 Proposed |
|-----------------------------------|---------------------------|------------------------------|
| USDA Programs: | | |
| 502 direct | 1,100 | 1,700 |
| 502 guarantee | 3,700 | 3,700 |
| 504 grants | 30 | 50 |
| 504 loans | 32.39 | 50 |
| 514 loans | 32 | 100 |
| 516 grants | 15 | 50 |
| 515 loans | 114.3 | 250 |
| 521 rental assistance | 680 | ¹ 800 |
| 523 self-help grants | 34 | 50 |
| 538 multi guarantee | 100 | |
| Farm Labor Program | ² (47) | ² (100) |
| Water sewer loans | 1,032 | 1,050 |
| Water sewer grants | 588 | 700 |
| Community facilities | 250 | 250 |
| Community facilities grants | 23 | 50 |
| RCDI | 6 | 25 |

¹Includes \$50 million for new construction or preservation.

²Non-add includes funding for Sections 514 and 516.

Thank you for your time and attention.

PREPARED STATEMENT OF NATIONAL RURAL TELECOM ASSOCIATION

SUMMARY OF TESTIMONY REQUESTS

Project involved

Telecommunications lending programs administered by the Rural Utilities Service of the U.S. Department of Agriculture

Actions proposed

- Supporting loan levels for fiscal year 2002 in the same amounts as those contained in the fiscal year 2001 Agriculture Appropriations Act for hardship, cost-of-money, Rural Telephone Bank and guaranteed loan programs and the associated subsidy to fund those programs at the existing level. Opposing the recommendation by the administration contained in A Blueprint for New Beginnings to not fund new Rural Telephone Bank loans in fiscal year 2002.
- Supporting continued funding in the amount of \$27 million in loan and grant authority designated for distance learning and telemedicine purposes, \$2 million of which to continue to be made available for a pilot program to finance broadband transmission and dial-up Internet service in rural areas.
- Supporting an extension of the language removing the 7 percent interest rate ceiling on cost-of-money loans.
- Supporting continuation of the restriction on retirement of Rural Telephone Bank class A stock at the level contained in the fiscal year 2001 Agriculture Appropriations Act and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund.

Mr. Chairman, Members of the Committee: My name is John F. O'Neal. I am General Counsel of the National Rural Telecom Association. NRTA is comprised primarily of commercial telephone companies which borrow their capital needs from the Rural Utilities Service of the U.S. Department of Agriculture (RUS) to furnish and improve telephone service in rural areas. Approximately 1000, or 71 percent of the nation's local telephone systems borrow from RUS. About three-fourths of these are commercial telephone companies. RUS borrowers serve almost 6 million subscribers in 46 states and employ over 22,000 people. In accepting loan funds, borrowers assume an obligation under the act to serve the widest practical number of rural users within their service area.

PROGRAM BACKGROUND

Rural telephone systems have an ongoing need for long-term, fixed rate capital at affordable interest rates. Since 1949, that capital has been provided through telecommunications lending programs administered by the Rural Utilities Service and its predecessor, the Rural Electrification Agency (REA).

RUS loans are made exclusively for capital improvements and loan funds are segregated from borrower operating revenues. Loans are not made to fund operating revenues or profits of the borrower system. There is a proscription in the Act against loans which would duplicate existing facilities providing adequate service and state authority to regulate telephone service is expressly preserved under the Rural Electrification Act.

Rural telephone systems operate at a severe geographical handicap when compared with other telephone companies. While almost 6 million rural telephone subscribers receive telephone service from RUS borrower systems, they account for only four percent of total U.S. subscribers. On the other hand, borrower service territories total 37 percent of the land area—nearly 1½ million squares miles. RUS borrowers average about six subscribers per mile of telephone line and have an average of more than 1,000 route miles of lines in their systems.

Because of low-density and the inherent high cost of serving these areas, Congress made long-term, fixed rate loans available at reasonable rates of interest to assure that rural telephone subscribers, the ultimate beneficiaries of these programs, have comparable telephone service with their urban counterparts at affordable subscriber rates. This principle is especially valid today as the United States endeavors to deploy telecommunications “information superhighway” technology and as customers and regulators constantly demand improved and enhanced services.

At the same time, the underlying statutory authority which governs the current program has undergone significant change. In 1993, telecommunications lending was refocused toward facilities modernization. Much of the subsidy cost has been eliminated from the program. The subsidy that remains has been targeted to the highest cost, lowest density systems. Other loans are made at Treasury’s cost-of-money or greater, and, in fact, involve negative subsidies.

We are proud to state once again for the record that there has never been a default in the RUS/REA telephone program! All loans have been repaid in accordance with their terms with interest!

NEED FOR RUS TELECOMMUNICATIONS LENDING CONTINUES

The need for rural telecommunications lending is great today, possibly even greater than in the past. Technological advances make it imperative that rural telephone companies upgrade their systems to keep pace with improvements and provide the latest available technology to their subscribers.

These rapid technological changes and Federal policies of competition and deregulation in the telephone industry, as evidenced by passage of the “Telecommunications Act of 1996”, underscore the continuing need for targeted assistance to rural areas. The inherently higher costs to serve these areas have not abated. Regulatory trends encouraging competition among telephone systems increase pressures to shift more costs onto rural ratepayers. Interstate subscriber line charges continue to shift substantial costs to local exchange customers. Pressures to recover more and more of the higher costs of rural service from rural customers to foster urban competitive responses will further burden rural consumers.

1996 TELECOMMUNICATIONS ACT EFFECT ON RURAL AMERICA

Congress passed the Telecommunications Act of 1996 as the culmination of more than a decade of debating national telecommunications policy and balancing many diverse needs and interests. The 1996 Act responded to a number of rural needs and differences with a series of safeguards to ensure that rates, services and network development in rural America will be reasonably comparable to urban telecommunications opportunities.

The process of implementing the new law continues to raise troubling uncertainties and concerns about whether the FCC and the states will honor the balance Congress achieved in its policy, as regulators (a) radically revise the mechanisms for preserving and advancing “universal service,” (b) adjust the cost recovery responsibilities and allocations of authority between Federal and state regulation, (c) effectuate the Act’s somewhat different urban and rural ground rules for how new companies and incumbent universal service providers connect their networks and compensate each other and (d) peel back layers of regulation developed over a century. So far, the FCC has been overzealous in expanding the Act’s market-opening provi-

sions to give new entrants a regulatory head start and advantage at the expense of the Act's rural development and universal service provisions. The FCC is trying to usurp the role of competition by dictating a whole new—and wholly inadequate—way to measure the costs of modern, nationwide telecommunications access to information. The FCC needs to reorder the sequence of its proceedings to ensure that rural Americans are not denied the ongoing network development and new services the Act requires. Rural telephone systems with universal service obligations must not be thwarted in their efforts to upgrade and provide rates and services reasonably comparable to urban offerings.

EXPANDED CONGRESSIONAL MANDATES FOR RURAL TELECOMMUNICATIONS

Considerable loan demand is being generated because of additional mandates for enhanced rural telecommunications standards contained in the authorizing legislation enacted in 1993 by Congress in Public Law 103-129. These mandates coupled with the need for stable financing sources to meet the infrastructure demands envisioned for rural areas by the 1996 telecommunications act amply demonstrate the continuing need for this important program at the following levels:

| | |
|----------------------------------|--------------|
| 5 percent Hardship Loans | \$75,000,000 |
| Cost-of-Money Loans | 300,000,000 |
| Guaranteed Loans | 120,000,000 |
| Rural Telephone Bank Loans | 175,000,000 |
| Total | 670,000,000 |

These are the same levels established in the fiscal year 2001 appropriations act for the hardship, cost-of-money, Rural Telephone Bank and guaranteed loan programs. The authorized levels of loans in all programs were fully obligated in fiscal year 2000 and we expect these levels to be met in fiscal year 2001. We believe that the needs of this program balanced with the minimal cost to the taxpayer argue for its continuation at enacted levels.

RURAL TELEPHONE BANK LOANS

In the Blueprint for New Beginnings, the administration proposes to not fund new Rural Telephone Bank (RTB) loans in fiscal year 2002, stating that “the RTB has accomplished its mission” and that not funding new loans should generate increased support for statutorily authorized privatization.

The Rural Telephone Bank was established by Congress in 1971 to provide supplemental financing for rural telephone systems with the objective that the bank ultimately would be owned and operated by its private shareholders. The bank's mission is not complete—far from it! Loans made today provide state of the art telecommunications technology in rural areas including the deployment of broadband technology. If Rural Americans are to be full participants with their urban neighbors in the Information Age, that job is just beginning! Economists agree that modern telecom infrastructure is the key to rural economic development which generates jobs and tax revenues for the government. Also, the RTB was one of only three USDA agencies to receive an unqualified financial opinion from USDA's Inspector General in fiscal year 2000!

The administration proposal will not “generate increased member and borrower support for statutorily authorized privatization”. That already exists! Privatization of the RTB began in 1995 under the current law and is proceeding annually at the rate of approximately \$25 million per year. The Bank has now retired \$115.4 million, or almost 20 percent, of the government's \$592 million investment. Not funding new loans in fiscal year 2002 could actually impede privatization of the Bank since the law requires that the Bank annually retire government stock at the rate of at least 5 percent of the amount of new loans. If no new loans were made, there would be no minimum requirement for retirement of additional government stock.

The current loan level of \$175 million has remained the same for many years. As a matter of fact, after factoring in the eroding effect of inflation, loan levels over the years have actually been reduced systematically. Despite this fact, we believe that the \$175 million level is adequate to meet current program needs and strikes a cost effective balance for the taxpayer. This amount was fully obligated in fiscal year 2000 and we expect it to be met again this year. If no bank loans were made in fiscal year 2002, at current loan levels, the budgetary outlay savings would amount to less than \$26,000 not the \$3 million quoted by the administration because RTB loans are funded over a multi-year period. Therefore, continuing to fund \$175 million of infrastructure investment will cost less than \$26,000 in fiscal year 2002! Moreover, if administration interest rate predictions are accurate, RTB loans

could actually generate a profit for the government because of the minimum statutory interest rate of 5 percent!

SPECIFIC ADDITIONAL REQUESTS

Continue the Removal of the 7 percent Cap on Cost-of-Money Loans

Again this year we are supporting removal of the 7 percent ceiling on cost-of-money loans even though long-term Treasury rates are currently below this level.

Continue the Restriction on Retirement of Class A Government Stock in the Rural Telephone Bank (RTB) and also Continue the Prohibition Against Transfer of RTB Funds to the General Fund and Require the Payment of Interest

The Committee should continue the restriction on retirement of the amount of class A stock by the Rural Telephone Bank in fiscal year 2002. The Bank is currently in the process of retiring the government's stock as required under current law. We believe that this process which began in fiscal year 1996 should continue to be an orderly one as contemplated by the retirement schedule enacted six years ago and continued in last year's bill to retire no more than 5 percent of the total class A stock in one year. We also urge the Committee to continue the prohibition against the transfer of any unobligated balance in the bank's liquidating account which is in excess of current requirements to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private Class B and C stockholders of the Rural Telephone Bank have a vested ownership interest in the assets of the bank including its funds and their rights should be protected. Previous appropriations acts (fiscal year 1997 through 2001) have recognized the ownership rights of the private class B and C stockholders of the bank by prohibiting a similar transfer of the bank's excess unobligated balances which otherwise would have been required under the Federal credit reform act.

Loans and Grants for Telemedicine, Distance Learning and Internet Access

We support the continuation in fiscal year 2002 of the \$27 million in loan and grant authority provided in fiscal year 2001 for telemedicine and distance learning purposes. Loans are made at the government's cost-of-money. The purpose is to accelerate deployment of telemedicine and distance learning technologies in rural areas through the use of telecommunications, computer networks, and related advanced technologies by students, teachers, medical professionals, and rural residents.

We also support making available \$2 million of the above amount for continuation of the pilot program to finance broadband transmission and local dial-up access to the Internet in rural areas. This \$2 million allocation is providing \$100 million in rural infrastructure improvements in fiscal year 2001.

CONCLUSION

Thank you for the opportunity to present the association's views concerning this vital program. The telecommunications lending programs of RUS continue to work effectively and accomplish the objectives established by Congress at a minimal cost to the taxpayer.

At the time of this filing, the administration has not submitted to the Congress its comprehensive budget request for fiscal year 2002. A Blueprint for New Beginnings is all that has been made publically available. If the final budget submission contains additional recommendations concerning the RUS telecommunications lending programs, we respectfully request the opportunity to file additional testimony with the Committee in response to such initiatives.

PREPARED STATEMENT OF THE NATIONAL TELEPHONE COOPERATIVE ASSOCIATION

SUMMARY

NTCA makes the following fiscal year 2002 funding recommendations with regard to the Rural Utilities Service Telecommunications Loan Program and related programs.

- Support the provisions of the president's budget proposal calling for the required subsidy to fully fund the RUS Telecommunications Loan Program's Hardship Account at a \$75 million level, Cost of Money Account at a \$300 million level, and Guaranteed Account at a \$120 million level, and administrative expenses of \$35.6 million.
- Reject the provisions of the president's budget proposal calling for zero funding for the Rural Telephone Bank (RTB). Instead, provide the required subsidy to

- fully fund the bank at last fiscal year's \$175 million level. Also, provide a new line item appropriation of \$500,000, over and above and separate from the regular administrative expenses of the RTB and the RUS for use by the RTB's elected directors to secure independent counsel and other professional services to help them properly perform their fiduciary responsibilities.
- Support an extension of language that temporarily sets aside the 7 percent interest rate cap on loans made through the RUS Cost of Money fund.
 - Support an extension of the restriction against RTB Liquidating Account funds from being swept to the general Treasury.
 - Support an extension of language prohibiting the expenditure of RTB Liquidating Account funds to provide for the subsidy or operational expenses of the bank.

BACKGROUND

NTCA is a national association representing more than 540 small, rural, cooperative and commercial, community-based local exchange carriers (LECS) located throughout the nation. These locally owned and operated LECS provide local exchange service to more than 2.5 million rural Americans. Through the 51-year history of the RUS Telecommunications Loan Program, more than 80 percent of NTCA's member systems have been able to utilize the Federal program to one degree or another.

NTCA's members, like most of the country's independent LECs, evolved to serve high-cost rural areas of the nation that were overlooked by the industry's giants as unprofitable. On average, NTCA members have approximately 6 subscribers per mile of infrastructure line, compared with 130 for the larger urban-oriented LECs. This results in an average plant investment per subscriber that for NTCA members is 38 percent higher than for most other systems.

Congress recognized the unique financing dilemma confronting America's small rural LECs as early as 1949. It was in that year that it amended the Rural Electrification Act (RE Act) to create the Rural Electrification Administration (REA) Telephone Loan Program, today known as the RUS Telecommunications Loan Program. Through the years Congress has periodically amended the RE Act to ensure that original mission—to furnish and improve rural telephone service—was met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the RUS was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. In 1993, Congress established a fourth program lending facet, the Treasury Cost of Money account.

RUS HELPS MEET INFRASTRUCTURE DEMANDS

While the RUS has helped the subscribers of NTCA's member systems receive service that is comparable or superior to that available anywhere in the nation, their work is far from complete. As Federal policies such as the Telecommunications Act of 1996 continue to evolve, and as policymakers and the public alike continue to clamor for the ubiquitous deployment of advanced services, the high costs associated with providing modern telecommunications services in rural areas will not diminish.

RUS telecommunications lending has stimulated billions of dollars in private capital investment in rural communications infrastructure. In recent years, on average, less than \$13 million in Federal subsidy has effectively generated \$670 million in Federal loans and loan guarantees. For every \$1 in Federal funds that were invested in rural communications infrastructure, \$4.50 in private funds were invested. The RUS is also making a difference in our rural schools, libraries, and hospitals. Since 1993, the RUS Distance Learning and Telemedicine Grant and Loan program has funded hundreds of projects throughout the nation for interactive technology in rural schools, libraries, hospitals, and health clinics.

In addition, two other RUS-related programs are making a difference in rural America. Formerly under the RUS, and known as the Zero Interest Loan and Grant Program, the Rural Economic Development Grants Program, and the Rural Economic Development Loans Program are now managed by the Rural Business Cooperative Service. The two programs provide funds for the purpose of promoting rural economic development and job creation projects, including funding for project feasibility studies, start-up costs, incubator projects and other expenses tied to rural development.

NTCA'S FISCAL YEAR 2002 APPROPRIATIONS RECOMMENDATIONS

Fully Fund The Entire RUS Telecommunications Loan Program.—With respect to the discussion above, it is imperative that the entire RUS Telecommunications Loan Program be funded at the following levels:

| | |
|------------------------------------|--------------|
| Hardship Account | \$75,000,000 |
| Treasury-rate Account | 300,000,000 |
| Guaranteed Account | 120,000,000 |
| Rural Telephone Bank Account | 175,000,000 |
| Total | 670,000,000 |

Additionally, to support the operations of the RUS, it is critical that Congress provide at least the \$35.6 million in administrative appropriations the president's budget proposal envisions.

Reject President's Proposal To Provide Zero RTB Funding.—The president's budget proposal contains a proposal that suggests the Rural Telephone Bank should not be funded in fiscal year 2002 which the administration insinuates may push private stockholders to move to the bargaining table regarding the potential accelerated privatization of the bank. The proposal is completely unfounded and unnecessary. Congress, RTB Stockholders, and the rural telecommunications industry deserve the benefit of having RTB privatization reviewed thoroughly, and not in the vacuum of the budgetary process.

The bank is already privatizing at an annual minimum pace as is mandated by the Rural Electrification Act. Indeed, were Congress to go along with the president's fiscal year 2002 RTB proposal, it would effectively be halting this minimum statutory pace which is tied to the amount of loan making that is conducted in any given fiscal year. In light of these facts as well as that which clearly shows this proposal is out of step with the desire of policymakers and the public alike to quickly deploy advanced services throughout America, we urge Congress to reject this ill-conceived proposal and instead fully fund the bank at its regular \$175 million annual level.

With regard to privatization specifically, it is important to note that parties within the Office of Management and Budget, the Federal Treasury, the Rural Utilities Service, and indeed the industry itself, continue to look at the various issues associated with doing so on an accelerated basis. While NTCA does not reject such discussions out of hand, it does continue to believe such discussions may be premature as long as the bank is not provided with an absolute legal determination as to the status of its assets now and at the time of partial or complete privatization. Additionally, NTCA believes any accelerated privatization should never be commenced without first conducting the appropriate due diligence to determine whether the entity would be viable were it to privatize on such a basis.

In order to help make such determinations, the bank's industry directors should be provided with adequate resources to both hire independent counsel as well as to secure other resources to assist them in making such determinations, and in effect, meeting their fiduciary responsibilities. With this in mind NTCA recommends that Congress appropriate an additional specific line item of \$500,000 over and above, and separate from the regularly appropriated administrative amounts that are appropriated for RUS and RTB administrative and operational activities.

Prohibit The Transfer Of Unobligated RTB Liquidating Account Balances.—NTCA also recommends that Congress continue the prohibition against the transfer of any unobligated balances of the Rural Telephone Bank liquidating account to the general fund of the Treasury. This language has routinely been included in annual appropriations measures since the enactment of the Federal Credit Reform Act (FCRA), Public Law 101-508 that allows such sweeping to potentially occur. Re-statement of this language will again ensure that the RTB's private class B & class C stockholder are not stripped of the value of their statutorily mandated investment in the Bank.

Prohibit RTB From Self Funding Subsidy And Administrative Costs.—NTCA urges Congress to maintain its prohibition against unobligated RTB Liquidating Account Balances being used to cover the banks administrative and operational expenses for the following reasons: (1) such action would require amendment of the RE Act, (2) the proposal appears to be in conflict with the intent of the FCRA, (3) the proposal will not result in Federal budgetary savings, (4) it is unnecessary to the determination of whether the bank could operate independently, and thus would amount to wasting the resources of the bank which could be put to better use upon its complete privatization.

Extend Removal Of The Interest Rate Cap On Treasury-Rate Loans.—NTCA is also requesting that Congress again include language removing the 7 percent inter-

est rate cap on Treasury-rate loans. This provision has been included in recent appropriations measures to prevent the potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized lending levels.

Continue Distance Learning and Telemedicine Loan and Grant Program.—The RUS Distance Learning and Telemedicine Loan and Grant program has proven to be an indispensable tool for rural development. In this regard, NTCA urges Congress to provide adequate funding for this critical program. NTCA supports the recommendations for this program that are contained in the president's budget proposal.

Preserve RBCS Rural Development Grant and Loan Programs.—Likewise, NTCA has witnessed the good these programs have done for rural communities. NTCA urges Congress to ensure funding is at levels that are adequate to meet current demand for the programs.

CONCLUSION

The RUS Telecommunications Loan Program bears a proud 51-year record of commitment, service, and achievement to rural America. Never in its entire history has the program lost even a dollar to abuse or default—an unparalleled feat for any government-sponsored lending program. Clearly such a successful program should remain in place to continue to ensure rural Americans have the opportunity to play a leading role in the information age in which we live. After all, an operational and advanced rural segment of the nation's telecommunications infrastructure is critical to truly ensuring that the national objective of universal telecommunications service is fulfilled. Please help us accomplish that objective.

PREPARED STATEMENT OF THE NATIONAL TREASURY EMPLOYEES UNION

Chairman Cochran, Ranking Member Kohl, and distinguished members of this Subcommittee, my name is Colleen Kelley and I am the National President of the National Treasury Employees Union. NTEU represents more than 155,000 Federal employees across the Federal government, including the employees who work at the Food and Drug Administration. I want to thank you for giving me the opportunity to present testimony on behalf of these dedicated men and women who work to ensure the safety of our food, drugs, cosmetics, and medical devices.

It is unfortunate that even at this late date, the Bush Administration still has not released details of its budget for the FDA or any other agency for fiscal year 2002. While I can only speculate about Congressional concerns about not knowing the new Administration's budget priorities, I know for certain that the men and women who work at the FDA are very frustrated that they still do not know what President Bush has in store for their agency.

Without question, the Food and Drug Administration (FDA) is one of the most important agencies in our government. The FDA regulates more than \$1 trillion worth of products that account for about 25 cents out of every dollar of American consumer spending. The FDA is staffed with experts in an extraordinary range of fields. Microbiologists, chemists, consumer safety officers, and others are working around the clock testing, approving, and regulating new drugs, robotics, and other medical devices, that will not only improve the quality of life for millions of Americans, but in many cases actually save lives. They are working to ensure the food we eat is safe and free of disease-causing contaminants. They approve new food products, food additives, and dietary supplements, and work to ensure these new products pose no threat to our health.

FDA employees who work in the field offices and laboratories located throughout the country have developed valuable working relationships with top scientists, health officials, and local industries. These employees are on the front lines in protecting consumers from mislabeled foods, food borne diseases, defective medical devices, or unsafe cosmetics or drugs. And they work very closely with Customs, USDA, and others at our borders and ports, to inspect and test imported foods and drugs.

While FDA employees continue to respond to the call of the American people for ensuring our food supply is safe and more effective drugs and medical products are brought to consumers more quickly, the demands placed on the FDA workforce have increased significantly over the past decade, and will continue to grow. Research dollars invested by the pharmaceutical and food industries have been skyrocketing. And since the implementation of NAFTA, GATT, and other international trade agreements, there has been a dramatic increase in the quantity and complexity of imports of FDA-regulated products across our borders and into our ports. But while

there are more products on the market to regulate, more imports of food and drugs to inspect, and more new product applications to approve, the FDA is being given fewer resources. The workload has increased while the budget for the FDA has remained flat.

Unless President Bush and Congress agree to provide the FDA with more funding for staffing and resources, the agency will not be able to respond to the constantly changing and more complex public health threats facing our nation. Last year, Congress approved \$1.217 billion for salaries and expenses at the FDA. Unfortunately, the amount provided was \$89 million less than what President Clinton requested for the FDA. Meanwhile, Congress continued with its plans to double the NIH budget over the next five years. \$20.3 billion was provided for NIH for fiscal year 2001, an increase of \$1.5 billion over the President's request, and \$2.5 billion more than the previous year. And the pharmaceutical industry and academic community invested billions more in medical research.

If we want Americans to be able to reap the benefits as quickly as possible from medical breakthroughs resulting from our investments in medical research, then President Bush and Congress must ensure the FDA—the agency charged with regulating these new drugs and medical technologies—receives, at a minimum, funding increases proportionate to the increases for the NIH. NTEU is hopeful that President Bush and Congress will work to provide the FDA with the staffing and resources necessary to protect and improve the health of the American public. Funding shortfalls in the future will significantly hamper FDA's ability to identify and respond to current health threats, and take pro-active measures to approve drugs and other products aimed at preventing future health problems. I also want to highlight the need for Congress to pay special attention to not only maintain, but to expand, the current FDA laboratory and field structure. While most of the FDA's workforce is employed in the Washington, DC region, almost a third of the workforce is located outside of the Beltway. The FDA is beginning to implement a plan to close many of its field laboratories and consolidate them into a handful of locations. Shutting down most of these FDA labs across the country will lead to delays in getting potentially harmful market products to FDA laboratories for sampling and analysis. Furthermore, with increased trade into, and out of, our airports and seaports, and the growth of food and drug industries, FDA's lab infrastructure—both in terms of people and technology—is that much more critical for consumers and for industry.

NTEU also has serious misgivings about FDA plans to change its program of voluntary Saturday work for employees in the field performing laboratory or lab-related functions to make such work mandatory. The agency is proposing this despite the fact that, around the country, it has encountered virtually no problems using its present program to secure volunteers for weekend work. Employees who work at the FDA laboratory understand that FDA needs to have its laboratories staffed on Saturdays, and we would be pleased to work with the agency to fix any real or perceived problems in the voluntary weekend work program. However, making weekend work mandatory for FDA employees—many of whom have worked Monday through Friday schedules for more than twenty years—is the wrong approach.

The FDA proposals to close laboratories and force employees to dramatically change their work and family schedules are not only unnecessary, they are unwise. NTEU believes these plans are shortsighted and will force hundreds of experienced professionals to leave the agency at a time when competition for their services by private sector companies is intense. The American public cannot afford the risk of losing these valuable resources.

It is ironic that at a time when many in Congress are increasingly concerned about the government's inability to retain and recruit highly qualified individuals into public service, FDA would seek to roll the dice with their own workforce. As it stands now, the FDA is struggling to retain and recruit qualified individuals to serve this Agency. And it has been widely documented that the Federal government is expected to lose nearly half of our experienced scientists in the next four years due to retirement. The FDA can only continue to maintain its competence and credibility by strengthening the agency's science base, not tearing it apart. With adequate funding for staffing and equipment, it would be NTEU's hope that FDA would abandon these risky plans. Therefore, it is incumbent upon the President and Congress to provide FDA with the resources necessary to retain those currently employed at the FDA and recruit more qualified individuals to ensure an efficient and effective FDA in the future.

I am very proud of the work the men and women at the FDA do to protect consumers and improve our public health. Yet, our global leadership in this area will be jeopardized if we do not provide the FDA with the staffing and tools required

to carry out its mission. The American people rightly demand and expect that their food, drugs, cosmetics, and medical devices are safe—and they deserve no less.

Whether it is testing a new vaccine, approving the application for a new dialysis machine, or increasing the safety of our food supply by identifying deadly food pathogens, the men and women at the FDA are working for you, working for America. Congress needs to approve an FDA budget that works for them.

PREPARED STATEMENT OF THE NATIONAL TURFGRASS EVALUATION PROGRAM

Mr. Chairman and Members of the Subcommittee: On behalf of the National Turfgrass Evaluation Program (NTEP), I appreciate this opportunity to provide the Subcommittee with the turfgrass industry's perspective in support of restoration of the \$55,000 appropriation for the National Turfgrass Evaluation Program (NTEP) deleted in the President's fiscal year 2002 budget request for the Agricultural Research Service (ARS). Also, I appreciate the opportunity to present to you the turfgrass industry's need and justification for continuation of the \$250,000 appropriated in the President's fiscal year 2001 budget for a full-time turfgrass scientist position within ARS. In addition, I appreciate the consideration of an additional appropriation of \$1,050,000 for the establishment of a national turfgrass research laboratory, as proposed by ARS, with three new research scientist positions at Beltsville, Maryland.

Justification of \$55,000 Appropriation Request for Program Support.—Once again, NTEP and the turfgrass industry come to the appropriations process to request that \$55,000 be restored to the ARS budget to provide basic and minimal support for NTEP's activities at Beltsville. We appreciate the Subcommittee's restoration of this amount in previous fiscal years, and hope that you will agree with us that this request is justified for the ensuing fiscal year.

The National Turfgrass Evaluation Program (NTEP) is unique in that it provides a working partnership that links the Federal government, turfgrass industry and land grant universities together in their common interest of turfgrass cultivar development, improvement and evaluation. The National Turfgrass Evaluation Program is the primary means by which cultivated varieties of turfgrass are evaluated in this country. It provides unbiased information on turfgrass cultivar adaptations, disease and insect resistance and environmental stress tolerance. The public and private sectors of the turfgrass industry use this information to develop cultivar recommendations for home owners, sod producers, sports turf and parks managers, golf course superintendents and highway vegetation managers.

Our nation's awareness of safety is at an all-time high. Turfgrass provides multiple benefits to society including child safety on athletic fields, environmental protection of groundwater, reduction of silt and other contaminants in runoff, green space in home lawns, parks, golf courses, etc. With the advancements being made to turfgrasses that require less pesticides, water and other inputs as well as other efforts to improve integrated pest management programs, recycling, etc., the USDA has a unique opportunity to take positive action in support of the turfgrass industry. With a minuscule investment of Department funds, in relative terms within USDA's budget, a tremendous return can be gained for society and the turfgrass industry.

While the vast majority of the USDA's funds have been and will continue to be directed toward traditional "food and fiber" segments of U.S. agriculture, it is important to note that turfgrasses (e.g., sod production) are defined as agriculture in the Farm Bill and by many other departments and agencies. Further, it is estimated by the Economic Research Service that the turfgrass industry, in all its forms, is a \$30–35 billion industry. It should also be noted that the turfgrass industry is the fastest growing segment of U.S. agriculture, while it receives essentially no Federal support. There are no subsidy programs for turfgrass, nor are any desired.

For the past seventy years, the USDA's support for the turfgrass industry has been modest at best. The turfgrass industry's rapid growth, importance to our urban environments, and impact on our daily lives warrant more commitment and support from USDA. Failing to support the National Turfgrass Evaluation Program, would be a tremendous oversight of a major opportunity. USDA's support of NTEP at the \$55,000 level does not cover all costs. In fact, NTEP represents an ideal partnership of the public and private sectors in terms of program cost sharing. The NTEP relies most heavily on turfgrass industry (i.e., public sectors, end-users) support. However, it is essential that the USDA maintain its modest financial support and work closely with NTEP. The turfgrass industry relies heavily on NTEP for unbiased information. Discounting this support will also eliminate a highly reliable and credible level of objectivity that is associated with the NTEP program.

Justification of \$250,000 Appropriation Request for ARS Scientist Position as well as \$1,050,000 Appropriation Request for the Establishment of a National Turfgrass Research Laboratory.—NTEP and the turfgrass industry are requesting the Subcommittee's support for \$250,000 continuing funding for the full-time scientist staff position at ARS, focusing on turfgrass research, that was appropriated in the fiscal year 2001 budget. We also request that the Subcommittee appropriate an additional \$1,050,000 for establishment of a national turfgrass research laboratory within USDA, ARS for the specific purpose of collecting, evaluating and enhancing turfgrass germplasm. We ask that three new scientist positions be created and located at the Beltsville Agricultural Research Center in Beltsville, MD.

Our society is becoming increasingly more urbanized. Currently, turfgrasses impact more than 90 percent of all people in the U.S. through exposure to home lawns, business landscapes, roadsides, parks, or recreational turf on a daily basis. As more and more cropland is converted to houses, office parks, shopping centers, etc., the acreage of turfgrass is increasing exponentially. However, with the increasing urbanization comes a greater demand on resources, such as potable water. Also, with the general public experiencing heightened awareness of the environment and its protection, use of inputs such as fertilizer, pesticides and water on turfgrass areas is coming under greater scrutiny. In some jurisdictions, use of these inputs will either be banned or severely restricted for turfgrass use. In addition, the urbanization of America is leading to an overuse of current recreational facilities such as parks, athletic fields and golf courses. New facilities are being considered or constructed, many on abandoned sites such as landfills, industrial wastelands, gravel pits or mine spoils. Turfgrasses in these areas will play an important role in reclamation vegetation, recreational turf or both.

The USDA needs to initiate and maintain ongoing research on turfgrass development and improvement for the following reasons:

—The value of the turfgrass industry in the U.S. is \$30–\$35 billion annually.

Turfgrass is the number one or two agricultural crop in value and acreage in many states (i.e. MD, PA, FL, NJ, NC).

—As our society becomes less rural and more urbanized, the acreage of turfgrass will increase significantly. Consequently, state and local municipalities will require the utilization of other water sources (i.e. effluent, reclaimed, sea water), reduction of pesticide use and elimination of nutrient runoff from turfgrass areas. However, demand on recreational facilities will increase while these facilities, for safety reasons, will still be required to provide safe, attractive athletic fields, parks and grounds.

—Private and university research programs are working to develop improved turfgrasses, but they do not have the time nor resources to identify completely new sources of beneficial genes in commonly used species or the usefulness of potential new species. In addition, new plant materials collected by these institutions most often are not placed in the National Plant Germplasm System for use by all interested parties. Additionally, long-term research to identify and transfer desirable genes from other species (turfgrass or other crop species) is not being undertaken by public and private interests. ARS scientists working with turfgrass will enhance the ongoing research and development currently underway within the public and private sectors of the turfgrass industry. They will provide linkages between public and private research efforts and enhance the development of stress-tolerant and pest-resistant germplasm for the turfgrass industry. Furthermore, this research will not inhibit or compete with, nor will it duplicate, current efforts by public and private plant breeders, universities and development companies as germplasm (improved genetic stocks) developed will be released to the general public for further refinement.

—USDA conducted significant turfgrass research from 1920–1988. The United States Golf Association (USGA) Green Section was initially a cooperative program between the USGA and USDA. However, since 1988, no full-time scientist has been employed by USDA, Agricultural Research Service (ARS) to conduct turfgrass research specifically.

—Research on florist, nursery and ornamental crops is significant within USDA, ARS with new funding and programs being added virtually every year—industries with far less public and commercial value than turfgrass.

A new turfgrass research scientist position within USDA, ARS was created by Congress in the fiscal year 2001 budget. Accordingly, in January 2001, the turfgrass industry met with USDA, ARS officials to discuss the position description, hiring process, facilities needed, etc. for the new position. ARS welcomed the new position but felt strongly that the position description was too broad in scope. Also, they were concerned that just one person working in turfgrass research would be ineffective in addressing the needs and concerns of the industry. They felt the duties de-

scribed in the earlier funding request warranted several scientists working in a team effort. To accomplish this, ARS proposed the following:

A NATIONAL STRATEGY FOR ARS TURFGRASS RESEARCH

Research Objectives.—Conduct long-term basic and applied research to provide knowledge, decision-support tools and plant materials to aid in designing, implementing, monitoring and managing economically and environmentally sustainable turfgrass systems including providing sound scientifically based information for use in the regulatory process.

Research Focus.—To make a significant contribution in developing and evaluating sustainable turfgrass systems, ARS would need to conduct research in two major areas:

- The collection, evaluation, protection and enhancement of germplasm, primarily through molecular techniques, to improve establishment, persistence and care of turfgrasses for a variety of uses. This research would include a plant physiology component to identify, understand and manage plant mechanisms that adapt to environmental stresses.
- Long-term applied research to design and evaluate sustainable turfgrass management systems for a variety of environmental conditions with the objective of economically optimizing inputs and outputs to meet performance and environmental standards. This research would include “turfgrass ecological systems” management that would look at such issues as water quality and watershed-level analysis, energy balances including carbon sequestration and management energy inputs, and impacts on wildlife in an urban environment.

ARS will conduct a stakeholder workshop in fall 2001, as they have done with other commodities, to gain valuable input from turfgrass researchers, golf course superintendents, sod producers, lawn care operators, gardeners, regulatory personnel, etc. These discussions will allow ARS to refine the proposal to meet the specific needs of the industry. ARS plans to include this updated proposal in their fiscal year 2003 budget proposal which would include establishment of a national laboratory with four to five scientists initially. More funding for additional scientists would be requested in future ARS budget requests, in accordance with industry needs and possible redirection of current personnel.

The turfgrass industry is very excited about this new proposal and wholeheartedly supports the efforts of ARS. However, the needs are so great, the turfgrass industry cannot wait an additional year to establish the national laboratory. Therefore, for fiscal year 2002, the turfgrass industry requests that the following unit be established within USDA, ARS:

A turfgrass genomics unit that includes the following:

- Plant Germplasm Collection and Evaluation.*—This person will identify new genetic sources of commonly used and potential turfgrass species in natural habitats. Also, they will collect specimen plants as a vital first step in conserving resources and maintaining bio-diversity. Additionally, they will conduct germplasm evaluations to identify important traits that provide improved resistance to various environmental stresses and extreme conditions relating to soils, pests, etc. The new position created in the fiscal year 2001 budget will fulfill these duties.
- Genomics/Genetics Studies.*—A molecular geneticist or cytogeneticist is needed to better understand the genomics of various turfgrass species, collected wild germplasm and their evolution. Also needed is an understanding of how desirable genes and traits may be transferred from wild related plants to improved turfgrass species. This research will allow improved drought, salt and wear tolerance, along with disease and insect resistance, to be incorporated into species not currently possessing these traits.
- Transfer of Desirable Genes.*—A molecular geneticist will work to identify desirable genes and how they may be transferred to current turfgrass species. This person will work to better understand the molecular/cellular aspects of current and potential turfgrass species and using molecular techniques, will transfer desirable genes and traits within species and between species.
- Evaluation and Enhancement of Genetically Altered Grasses.*—A turfgrass breeder will evaluate and enhance the genetically altered plants from the program using recurrent genetic recombination techniques and selection of superior turfgrass plants. This person will also conduct genetic studies to confirm the presence of these genes and their stability within the genome. This work will produce germplasm with desirable turfgrass characteristics as well as new genes for stress tolerance, disease and insect resistance, etc. This enhanced

germplasm will be easily accessible to breeders in the public and private sectors; i.e. released through the National Plant Germplasm System (NPGS).

In conclusion, on behalf of the National Turfgrass Evaluation Program and the turfgrass industry across America, I respectfully request that the Subcommittee restore the vital \$55,000 appropriation for the National Turfgrass Evaluation Program (NTEP) as well as the \$250,000 appropriated in fiscal year 2001 for the new turfgrass scientist position in the fiscal year 2002 budget for the Agricultural Research Service. I also request that the Subcommittee appropriate an additional \$1,050,000 for the establishment of a national turfgrass research laboratory at Beltsville, Maryland with three new full-time scientist positions within USDA, ARS for the specific purpose of collecting germplasm, conducting genetics/genomics studies and producing improved, genetically-enhanced turfgrasses for the public good.

Thank you very much for your assistance and support.

PREPARED STATEMENT OF THE NATIONAL UTILITY CONTRACTORS ASSOCIATION

Mr. Chairman and Members of the Subcommittee, my name is Angelo Di Paolo. I am President of the National Utility Contractors Association (NUCA) and President of Di Paolo Company in Glenview, Illinois. I see firsthand everyday the dire water and wastewater infrastructure needs our country faces, so I sincerely appreciate your interest in preventing public health and environmental disasters in rural communities by adequately funding the U.S. Department of Agriculture (USDA) Rural Utilities Service (RUS) Water and Waste Disposal infrastructure program for fiscal 2001.

FISCAL 2001 RECOMMENDATION

On behalf of NUCA's nearly 2,000 members and the citizens of rural America who endure daily life without the basic wastewater infrastructure that ensures clean drinking water and appropriate disposal of waste, I respectfully request that the Subcommittee appropriate a minimum of \$700 million in budget authority for the RUS Water and Waste Disposal Program. Further, I respectfully ask that Congress allow the RUS to determine the most appropriate allocation of the budget authority to loans and grants as it is in the best position to target the grants toward the very poor while providing loans for the relatively more well-healed communities.

RURAL WATER AND WASTE DISPOSAL NEEDS AND THE RUS CURE

Imagine waking up, sleepily walking into the bathroom, turning the shower faucet, and being greeted by stinky, murky water. Imagine being unable to quench your thirst because only unfiltered water comes to your house. Comparatively speaking, these are mild pictures of the horrible circumstances that almost a million rural residents endure daily. These Americans do not have potable water or effective waste disposal systems. Moreover, the citizens facing these problems are those least able to afford bottled water services. Generally, the affected families live below the poverty level, \$16,700. So even if they aren't drinking contaminated water, they have no choice but to wash and cook with it. Ironically, in the town serving as the namesake for Deer Park bottled water, the locals were drinking unfiltered water from shallow wells until the RUS funded a \$1.7 million water system in 1998. RUS Water and Waste Disposal loan and grant programs provide such funds for small communities with 10,000 or fewer residents that cannot secure reasonable financing for drinking water and wastewater infrastructure improvements. The majority of the residents are low-income and cannot afford even the smallest ratepayer increases, increases that would be certainties with other infrastructure funding sources.

Currently, there is a \$3.8 billion backlog of applications from needy communities that simply cannot afford to build their infrastructure through other funding sources. At this time last year, the backlog was only \$3.2 billion. Today, communities must wait an average of approximately three years from the start of an application process to the time that RUS commits funds. During the three-year wait, children and the elderly continue to be exposed to waterborne diseases that have life-long or terminal effects on their health. No state is immune from this problem. According to the USDA's recent best estimates, at least 260,000 American homes still do not have complete plumbing. Another 715,000 homes have critical problems with drinking water quality, quantity, and availability. At least 1.1 million homes have inadequate wastewater disposal systems that threaten human and environmental health.

The U.S. Environmental Protection Agency (EPA) estimated in 1997 that some 15 million households use private wells and another 1 million homes rely on untreated water sources that include cisterns and water hauled from springs, rivers, and lakes. In 1996, the EPA estimated that small communities with 10,000 or fewer residents face more than \$13.8 billion in capital costs over the next two decades for sewage collection and treatment works. That figure does not include an estimation of septic system needs. These figures are considered by most within EPA to be conservative estimates. Regardless how you look at the needs, a \$700 million investment would be worth every penny.

Despite their inability to afford other funding sources, the communities historically do not default on RUS loans. Year after year, the USDA maintains an unrivaled loan delinquency rate of just over one percent and a long-term loss rate of one-tenth of one percent on the wastewater loan program.

CONCLUSION

We, the members of NUCA, urge you to fund the RUS Water and Waste Disposal loans and grants program at a minimum \$700 million for fiscal 2001. Thank you for considering our recommendation.

PREPARED STATEMENT OF THE NATIONAL WATERSHED COALITION

Mr. Chairman and members of the Subcommittee, I am Bill Hamm from Walton, Kansas, and I am pleased to represent the National Watershed Coalition (NWC) as its Chairman. The National Watershed Coalition is privileged to present this testimony in support of the most beneficial water resource conservation programs ever developed in the United States. The Coalition recognizes full well the need to use our tax dollars wisely. That makes the work of this Subcommittee very important. It also makes it imperative that the Federal programs we continue, are those that provide real benefit to society, and are not programs that would be nice to have if funds were unlimited. We believe that the Small Watershed Program (Public Law 83-566) and the Flood Prevention Operations Program (Public Law 78-534) are examples of those rare programs that address our nation's vital natural resources which are critical to our very survival, do so in a way that provide benefits in excess of costs, and are programs that serve as models for the way all Federal programs should work.

The watershed as the logical unit for dealing with natural resource problems has long been recognized. Public Law 566 offers a complete watershed management approach, and should have a prominent place in our current Federal policy emphasizing watersheds and total resource management based planning. Proper watershed management improves water quality. Why should the Federal government be involved with these watershed programs?

- They are programs whose objectives are the sustaining of our nation's precious natural resources for generations to come.
- They are not Federal, but federally assisted, locally sponsored and owned. They do not represent the continued growth of the Federal government.
- They are locally initiated and driven. Decisions are made by people affected, and respect private property rights.
- They share costs between the Federal government and local people. Local sponsors pay between 30-40 percent of the total costs of Public Law 566 projects.
- They produce net benefits to society. The most recent program evaluation demonstrated the actual ratio of benefits to costs was approximately 2.2:1. The actual adjusted economic benefits exceeded the planned benefits by 34 percent. How many other Federal programs do so well?
- They consider and enhance environmental values. Projects are subject to the discipline of being planned following the National Environmental Policy Act (NEPA), and the Federal "Principles and Guidelines" for land and water projects. That is public scrutiny!
- They are flexible programs that can adapt to changing needs and priorities. Objectives that can be addressed are flood damage reduction, watershed protection (erosion and sediment control), water quality improvement, rural water supply, water conservation, fish and wildlife habitat improvement, recreation, irrigation and water management, etc. That is flexibility emphasizing multiple use.
- They are programs that encourage all citizens to participate.
- They can address the needs of low income and minority communities.
- And best of all—they are programs the people like!

The National Watershed Coalition is concerned with the recent Congressional lack of support for these watershed programs, with the exception of the recent watershed

rehabilitation legislative efforts, and hopes the outcome of the fiscal year 2002 appropriations process will enable this vital work to continue and expand as we seek to preserve, protect and better manage our nation's water and land resources. Every State in the United States has benefited from the Small Watershed Program.

In order to continue this high priority work in partnership with states and local governments, the Coalition recommends a fiscal year 2002 funding level of \$250 million for Watersheds and Flood Prevention Operations, Public Law 83-566 and Public Law 78-534. We recommend that \$30 million of this amount be for Public Law 78-534 projects. For some years now, the Federal budget has eliminated the separate line items for the Public Law 534 and Public Law 566 watershed projects, and just lumped a total figure under Public Law 566 with a note that some amount "may be available" for Public Law 534 projects. This is an entirely unsatisfactory way of doing business. Public Law 534 still exists in law; it has not been repealed. It should be funded as a separate program. The current situation really penalizes both Public Law 534 and 566, as 534 has no funds at the outset, and in order to provide a little something to the Public Law 534 watershed projects, NRCS has to take some money from the Public Law 566 accounts which are already very underfunded. Please restore funding for Public Law 534 watershed projects to \$30 million in fiscal year 2002. We also recommend that watershed surveys and planning be funded at \$25 million, which represents the true need.

We would also suggest that \$55 million be used for structural rehabilitation and replacement, in accordance with Public Law 106-472, the Small watershed Rehabilitation Amendments of 2000, passed by the Congress and signed into law on November 9th, 2000, and that another \$5 million be available for a thorough assessment of rehabilitation needs. The condition of our nation's dams, and the need for watershed structure rehabilitation, is a national priority we believe. There is also a research and development (R&D) need as we get the structural rehabilitation process underway. In USDA, that work is undertaken by the Agricultural Research Service (ARS). That need is estimated at \$1.5 million, and we ask that it be included in the ARS budget. It would be used for evaluation of upstream and downstream changes to the stream channel systems in cases of decommissioning, evaluation of the water quality impact of stored sediment releases, and the evaluation of impacts of the loss of flood protection, among other things.

We recognize Congress may be thinking of lesser amounts for these programs. But we are not playing a responsible role if we do not help you recognize the true need if we continually recommend the Federal share of these needed funds be less. We hope that everyone understand these funds are only a part of the total that are committed to this vital purpose. The local project sponsors in these "federally assisted" endeavors have a tremendous investment also. We also suggest that the Emergency Watershed Program (EWP) be provided with \$20 million to allow the NRCS to provide rapid response in time of natural disaster. Congress increasingly talks of wanting to fund those investments in our nation's infrastructure that will sustain us in the future. Yet past budgets have regularly cut funding for the best of these programs. This makes absolutely no sense! We continue to read that we are in a period of budget surpluses, almost as if the Federal coffers were overflowing with cash, yet there is next to nothing for watershed protection and improvement. In this period of surplus (tax overpayments) and relative prosperity we can't seem to invest and re-invest in our vital watershed infrastructure. That is simply unconscionable. Isn't water quality and watershed management a national priority? We believe it is.

The issue of the current condition of those improvements constructed over the last fifty years with these watershed programs is a matter of great concern. Many of the nearly 10,500 dams that NRCS assisted sponsors build throughout the United States no longer meet current dam safety standards largely as a result of development, and need to be upgraded to current standards. A USDA study published in 1991 estimated that in the next ten years, \$590 million would be needed to protect the installed works. Of that amount, \$100 million would come from local sponsors as their operation and maintenance contributions. NRCS also conducted a more recent survey, and in just 22 states, about \$540 million in rehabilitation needs were identified. That is the reason we are recommending starting with \$60 million (\$55 million for rehabilitation work and \$5 million to start a more precise assessment of needs) for the work necessary to protect these installed structures, and commend Congress for their leadership in passing Public Law 106-472. Watershed project sponsors throughout the U.S. appreciate your leadership on this vital issue. We now have the authorization, and need the appropriations. If we don't start to pay attention to our rural infrastructure needs, the ultimate cost to society will only increase, and project benefits will be lost. This is a serious national issue. Page 5 of our testimony provides a summary of the structures constructed in each state using these federally assisted USDA programs. Since most of these were constructed in the

1950's, 60's, and 70's, and were originally designed for a 50-year life, it is apparent we need to look at their current condition. If we do some rehabilitation work to bring many of these older structures up to current health and safety standards, they will continue to provide benefits far into the future.

In addition to offering our thoughts on needed conservation program budget levels, we would like to express what we think will be concern with what the Administration's budget will propose in regard to watershed program funding in fiscal year 2002. While the President's budget will not be released until April 9th, we have read and heard enough in the news to make us believe watershed conservation programs are once again to be subject to reductions. If true, this is disturbing. We will analyze the President's budget when it is available, and provide your Subcommittee with our thoughts. Congress and the Administration need to recognize watershed natural resources conservation as a high national priority. It's only common sense.

There are a number of suggestions we would like to make concerning this very important legislation that we will be making to other committees. They will have budget implications. We believe the objectives of this legislation should be expanded to include more non-structural water quality practices, allow the law to provide assistance in developing rural water supplies (without water there is no rural development), and eliminate the current requirement that mandates that twenty percent of the total projects benefits be "directly related to agriculture" which can be very subjective and has the unintended effect of penalizing poor, small, rural communities many of which are minority communities.

The Coalition appreciates the opportunity to offer these comments regarding fiscal year 2002 funding for the water resource programs administered by USDA's Natural Resources Conservation Service (NRCS). With the "downsizing" the NRCS has experienced, we would be remiss if we did not again express some concern as to their ability to provide adequate technical support in these watershed program areas. NRCS technical staff has been significantly reduced and budget constraints have not allowed that expertise to be replaced. Traditional fields of engineering and economics are but two examples. We see many states where NRCS capability to support their responsibilities is seriously diminished. This is a disturbing trend that needs to be halted. This downsizing has a very serious effect on state and local conservation programs. Local Watershed and Conservation Districts and the NRCS combine to make a very effective delivery system for providing the technical assistance to local people—farmers, ranchers and rural communities—in applying needed conservation practices. But that delivery system is currently very strained! Many states and local units of government also have complementary programs that provide financial assistance to land owners and operators for installing measures that reduce erosion, improve water quality, and maintain environmental quality. The NRCS provides, through agreement with the USDA Secretary of Agriculture, "on the land" technical assistance for applying these measures. The delivery system currently is in place, and by downsizing NRCS, we are eroding the most effective and efficient coordinated means of working with local people to solve environmental problems that has ever been developed. Our system and its ability to produce food and fiber is the envy of the entire world. In our view, these programs are the most important in terms of national priorities.

We are also disappointed that the subcommittee has a practice of not accepting oral testimony from organizations such as the National Watershed Coalition. When we were allowed to make an oral presentation in the House, we were able to talk to subcommittee members who could ask us questions. It was a chance for them to actually talk with people doing the work on the land. That personal contact in both houses is now missing, and it would be easy to think that our written testimony may not be seriously considered. We hope you will reconsider this practice in future years, and again allow oral testimony.

The Coalition pledges its full support to you as you continue your most important work. Our Executive Director, Mr. John W. Peterson, who has over forty years experience in natural resource watershed conservation, is located in the Washington, DC area, and would be pleased to serve as a resource as needed. John's address is 9304 Lundy Court, Burke, VA 22015-3431, phone 703-455-6886 or 4387, Fax; 703-455-6888, email; jwpeterson@erols.com.

Thank you for allowing the National Watershed Coalition (NWC) this opportunity.

PREPARED STATEMENT OF THE NEW MEXICO INTERSTATE STREAM COMMISSION

SUMMARY

This Statement is submitted in support of appropriations for the Department of Agriculture's Colorado River Basin salinity control program. The salinity control program has not been funded at the level necessary to control salinity with respect to water quality standards of the basin states. Also, this failure to provide adequate funding negatively impacts the quality of water delivered to Mexico pursuant to Minute 242 of the International Boundary and Water Commission. Funding for the Environmental Quality Incentives Program (EQIP), from which the Department of Agriculture funds the salinity program, has been insufficient to fund needed salinity control measures. I urge that funding of more than \$200,000,000 be appropriated for EQIP, with at least \$12,000,000 designated to the Colorado River Basin salinity control program.

STATEMENT

The seven Colorado River Basin states, in response to the salinity issues addressed by Clean Water Act of 1972, formed the Colorado River Basin Salinity Control Forum. Comprised of gubernatorial appointees from the seven Basin states, the Forum was created to provide for interstate cooperation in response to the Clean Water Act, and to provide the states with information necessary to comply with Sections 303 (a) and (b) of the Act. I am New Mexico's representative to the Forum. The Forum has become the primary means for the seven Basin states to coordinate with Federal agencies and Congress to support the implementation of the salinity control program.

The Colorado River Basin salinity control program was authorized by Congress in the Colorado River Basin Salinity Control Act of 1974. Congress amended the Act in 1984 to give new responsibilities to the Department of Agriculture. While retaining the Department of the Interior as the lead coordinator for the salinity control program, the amended Act recognized the importance of the Department of Agriculture operating under its authorities in meeting the objectives of the salinity control program. Many of the most cost-effective projects undertaken by the salinity control program have occurred since implementation of Department of Agriculture's authorization for the program.

The Bureau of Reclamation is currently completing studies on the economic impacts of the salinity of the Colorado River in the United States. Reclamation's study indicates that damages in the United States may soon be approaching \$1 billion per year. It is essential to the cost-effectiveness of the salinity control program that Department of Agriculture salinity control projects be funded for timely implementation to protect the quality of Colorado River Basin water delivered to the Lower Basin States and Mexico.

Congress concluded, with the enactment of the Federal Agriculture Improvement and Reform Act of 1996 (FAIRA), that the salinity control program could be most effectively implemented as one of the components of the Environmental Quality Incentives Program (EQIP). The salinity control program has not been funded since the enactment of FAIRA at a level adequate to ensure that the Basin State-adopted and Environmental Protection Agency approved water quality standards in the Colorado River will be honored with respect to total dissolved solids (i.e., salinity). Appropriations for EQIP have not been sufficient to prevent salt loading by irrigated agriculture in the Upper Colorado River Basin from impacting the quality of water delivered to the downstream states, nor to Mexico pursuant to Minute No. 242 of the International Boundary and Water Commission, United States and Mexico.

EQIP subsumed the salinity control program without giving adequate recognition to the responsibilities of the Department of Agriculture to implement salinity control measures per Section 202 (c) of the Colorado River Basin Salinity Control Act. The EQIP evaluation and project ranking criteria target small watershed improvements that do not recognize that water users hundreds of miles downstream are significant beneficiaries of the salinity control program. Proposals for EQIP funding are ranked in the states of Utah, Wyoming and Colorado under the direction of the respective State Conservationists without consideration of those downstream, particularly out-of-state, benefits. Irrigated agriculture in the Upper Basin realizes significant local benefits of the salinity control program and agricultural producers have succeeded in submitting cost-effective proposals to the State Conservationists. However, funding for needed salinity control projects has been limited because the full measure of the salinity control program benefits has not been considered when prioritizing funding allocated to salinity control projects and to all other programs administered by each state's autonomous office.

The Department of Agriculture's Natural Resources Conservation Service (NRCS), following protracted urging by the Basin states, has concluded as a result that the salinity control program is different than the small watershed approach of the EQIP program. The watershed for the salinity control program stretches almost 1200 miles, from the headwaters of the river through the salt-laden soils of the Upper Basin to the river's termination at the Gulf of California in Mexico. NRCS is to be commended for its efforts to appoint a salinity program coordinator to work with each NRCS state office and to designate the Colorado River Basin an "area of special interest" including a special fund designation for the salinity control program.

The Basin states were led to believe by Congressional staff when the EQIP program was created that the \$200,000,000 annual Commodity Credit Corporation (CCC) borrowing authority given to the Secretary would ensure that through the year 2002 at least the requested amount of salinity control funding would be expended through the EQIP program. The Basin states, including New Mexico, have been very dismayed that funding for EQIP has been inadequate for this most important nationwide program. Several years of inadequate Federal funding for the Department of Agriculture have resulted in the Forum finding that the salinity control program needs to be accelerated to protect the Colorado River water quality standards for salinity and to maintain the water quality criteria of those standards. Since the designation by the Department of Agriculture of the Colorado River salinity control program as an area of special interest, about \$4.5 million annually has been earmarked for the program. This amount is in sharp contrast to the \$12 million annual funding required for the USDA portion of the plan of implementation of the Colorado River water quality standards for salinity, as adopted by the Basin States and approved by EPA.

The Basin States added about \$1.5 million in up-front cost sharing and local farms contributed an estimated \$2 million to match the NRCS funds in the previous Federal fiscal year. State and local cost sharing is triggered by the Federal appropriation. The entire effort last year was funded at only about 40 percent of program needs. The requested funding of \$12 million for fiscal year 2002 will continue to be needed each year for at least the next few fiscal years.

The Department of Agriculture has indicated that a more adequately funded EQIP program would result in more funds being allocated to the salinity program. The Basin states have cost sharing dollars available to participate in on-farm salinity control efforts. The agricultural producers in the Upper Basin are willing to cost-share their portion and waiting for adequate funding for their applications to be considered. The Department of Agriculture projects have proven to be the most cost-effective component of the salinity control program. However, the prior Administration and Congressional funding support has dramatically declined despite increasing damages from the salinity of the Colorado River.

I urge the Congress to appropriate at least \$200,000,000 from the CCC in fiscal year 2002 for EQIP. Also, I request that Congress advise the Administration that \$12,000,000 of the appropriation is to be designated for the Colorado River Basin salinity control program.

Finally, I request that adequate funds be appropriated for technical assistance and education activities at the local level, rather than requiring the NRCS to borrow funds from CCC for the direly needed support functions. Recent history has shown that inadequate funding for technical assistance and education activities of the NRCS has been a severe impediment to successful implementation of the salinity control program. The Basin States parallel funding program, implemented as a means of cost sharing with NRCS, expends 40 percent of the states' funds available to meet the needs of NRCS for technical assistance and education activities. I urge the appropriation of adequate funds for these essential activities, and that the NRCS not be directed to borrow funds for these uses from the CCC.

PREPARED STATEMENT OF THE NEZ PERCE TRIBAL EXECUTIVE COMMITTEE

The Nez Perce Tribe requests the following funding amounts for fiscal year 2002, which are specific to the Nez Perce Tribe:

—\$221,575 through the United States Department of Agriculture, Animal and Plant Health Inspection Service for the biological control of noxious weeds for implementation and monitoring.

The Tribe urges support for the full and adequate funding of Tribal programs through the Department of the Interior fiscal year 2002 budget, with the specific request discussed below.

NEZ PERCE BIOLOGICAL CONTROL CENTER FUNDING: USDA, \$221,575

The Nez Perce Tribe established the Bio-Control Center in 1999 thanks to grant funds from the USDA-Business Cooperative Services program. Since its inception, the Center has developed partnerships and networks to coordinate the biological control of weeds through the State of Idaho and worked collaboratively with the USDA to develop and implement monitoring protocols. The Center has been instrumental in providing biological control agent releases and monitoring under contractual agreements with private landowners and Agencies throughout the region.

The biological control of weeds uses the weeds' natural enemies to reduce the weeds' ability to compete with the desired vegetation. Biological control techniques have been used in the West since 1940 to reduce weed density on range and wildlands where cultural and chemical control methods are not economically feasible or practical. This allocation would enable the Tribe to rear and provide biological control organisms to private and public entities at no cost, to monitor the impacts, develop technology transfer materials, and host seminars for all interested parties.

For fiscal year 2002, the Nez Perce Tribe requests that Congress earmark \$221,575 from the USDA Animal Plant Health Inspection Service to establish nurseries to increase biological control availability, distribute biological control organisms throughout weed infestation areas, monitor the impacts, and provide annual technology transfer seminars to Cooperative Weed Management Area partners. This program will be developed in coordination with USDA, local universities, and regional experts.

 PREPARED STATEMENT OF THE NORTHWEST INDIAN FISHERIES COMMISSION

Mr. Chairman and Members of the Committee, I am Billy Frank, Jr., Chairman of the Northwest Indian Fisheries Commission (NWIFC), and on behalf of the twenty-Western Washington member Tribes, I submit this request for appropriations to support the research, sanitation and marketing of Tribal shellfish products. We request the following:

- \$500,000 to support commercial harvests costs which will assist the tribes in fulfilling the demands for their shellfish products both domestically and abroad;
- \$1,000,000 to support water and pollution sampling, sampling and research for paralytic shellfish poisoning and coordination of research projects with State agencies; and,
- \$1,000,000 to support data gathering at the reservation level for the conduct of shellfish population surveys and estimates.

TREATY SHELLFISH RIGHTS

As with salmon, the tribes' guarantees to harvest shellfish lie within a series of treaties signed with representatives of the Federal government in the mid-1850s. In exchange for the peaceful settlement of what is today most of Western Washington, the tribes reserved the right to continue to harvest finfish and shellfish at their usual and accustomed grounds and stations. The tribes were specifically excluded from harvesting shellfish from areas "staked or cultivated" by non-Indian citizens. Soon after they were signed, the treaties were forgotten or ignored.

The declining salmon resource in the Pacific Northwest negates the legacy Indian people in Western Washington have lived by for thousands of years. We were taught to care for the land and take from it only what we needed and to use all that we took.

We depended on the gifts of nature for food, trade, culture and survival. We knew when the tide was out, it was time to set the table because we live in the land of plenty; a paradise complete. Yet, because of the loss of salmon habitat which is attributable to overwhelming growth in the human population, a major pacific coastal salmon recovery effort ensues. Our shellfish resource is our major remaining fishery.

At least ninety types of shellfish have been traditionally harvested by the Tribes in Western Washington and across the continent Indian people have called us the fishing Tribes because of our rich history of harvesting and caring for finfish and shellfish. Our shellfish was abundant and constituted a principal resource of export, as well as provided food to the Indians and the settlers which greatly reduced the living expenses.

Clams, crab, oysters, shrimp, and many other species were readily available year round. The relative ease with which large amounts could be harvested, cured, and stored for later consumption made shell fish an important source of nutrition.

Shellfish remain important for subsistence, economic, and ceremonial purposes. With the rapid decline of many salmon stocks, due to habitat loss from western

Washington's unrelenting populous growth, shellfish harvesting has become a major factor in tribal economies.

The tribes have used shellfish in trade with the non-Indian population since the first white settlers came into the region a century and a half ago. Newspaper accounts from the earliest days of the Washington Territory tell of Indians selling or trading fresh shellfish with settlers. Shellfish harvested by members of western Washington's Indian tribes is highly sought after throughout the United States and the Far East. Tribal representatives have gone on trade missions to China and other Pacific Rim nations where Pacific Northwest shellfish—particularly geoduck—is in great demand. Trade with the Far East is growing in importance as the tribes struggle to achieve financial security through a natural resources-based economy.

Treaty language pertaining to tribal shellfish harvesting included this section:

"The right of taking fish at usual and accustomed grounds and stations is further secured to said Indians, in common with all citizens of the United States; and of erecting temporary houses for the purposes of curing; together with the privilege of hunting and gathering roots and berries on open and unclaimed lands. Provided, however, that they not take shell-fish from any beds staked or cultivated by citizens."

TREATY WITH THE S'KLALLAM, JANUARY 26, 1855

In exchange for the peaceful settlement of what is today most of western Washington, the tribes reserved the right to continue to harvest finfish and shellfish at all of their usual and accustomed grounds and stations. The tribes were specifically excluded from harvesting shellfish from areas "staked or cultivated" by non-Indian citizens.

Tribal efforts to have the Federal government's treaty promises kept began in the first years of the 20th Century when the United States Supreme Court ruled in *U.S. v. Winans*, that where a treaty reserves the right to fish at all usual and accustomed places, a state may not preclude tribal access to those places.

Sixty years later, the tribes were again preparing for battle in court. After many years of harassment, beatings and arrests for exercising their treaty-reserved rights, western Washington tribes took the State of Washington to Federal court to have their rights legally re-affirmed. In 1974, U.S. District Court Judge George Boldt ruled that the tribes had reserved the right to half of the harvestable salmon and steelhead in western Washington.

The "Boldt Decision," which was upheld by the U.S. Supreme Court, also re-established the tribes as co-managers of the salmon and steelhead resources in western Washington.

As a result of this ruling, the tribes became responsible for establishing fishing seasons, setting harvest limits, and enforcing tribal fishing regulations. Professional biological staffs, enforcement officers, and managerial staff were assembled to ensure orderly, biologically-sound fisheries.

Beginning in the late 1970s, tribal and state staff worked together to develop comprehensive fisheries that ensured harvest opportunities for Indian and non-Indian alike, and also preserved the resource for generations to come.

It was within this new atmosphere of cooperative management that the tribes sought to restore their treaty-reserved rights to manage and harvest shellfish from all usual and accustomed areas. Talks with their state counterparts began in the mid-1980s, but were unsuccessful. The tribes filed suit in Federal court in May 1989 to have their shellfish harvest rights restored.

The filing of the lawsuit brought about years of additional negotiations between the tribes and the state. Despite many serious attempts at reaching a negotiated settlement, the issue went to trial in May 1994.

In 1994, District Court Judge Edward Rafeedie upheld the right of the treaty tribes to harvest 50 percent of all shellfish species in their Usual and Accustomed fishing areas. Judge Rafeedie also ordered a shellfish Management Implementation Plan that governs tribal/state co-management activities.

After a number of appeals, the U.S. 9th Circuit Court of Appeals let stand Rafeedie's ruling in 1998. Finally, in June 1999, the U.S. Supreme Court denied review of the District court ruling, effectively confirming the treaty shellfish harvest right.

ASSIST THE TRIBES IN FULFILLING THE DEMANDS FOR THEIR SHELLFISH PRODUCTS,
\$500,000

Shellfish harvested by members of Western Washington's Indian tribes is highly sought after throughout the United States and the Far East. We request \$500,000 which will assist Tribes in promoting our shellfish products, in both domestic and

international markets. We are now at a point in time when telecommunicating is both cost effective and timely when marketing products. Tribal fishers are not capable of supporting such an effort individually, but, could collectively benefit if such a network could be developed through the Northwest Indian Fisheries Commission and the Northwest Indian College in Bellingham, Washington. This institution is capable of providing the technology needed to implement such a marketing program for Tribal shellfish products.

WATER AND POLLUTION SAMPLING, SAMPLING AND RESEARCH FOR PARALYTIC SHELLFISH POISONING AND COORDINATION OF RESEARCH PROJECTS WITH STATE AGENCIES, \$1,000,000

Shellfish growing areas are routinely surveyed for current or potential pollution impacts and are classified based on the results of frequent survey information. No shellfish harvest is conducted on beaches that have not been certified by the tribes and the Washington Department of Health. Growing areas are regularly monitored for water quality status and naturally-occurring biotoxins to protect the public health.

However, both Tribal and non-Indian fisheries have been threatened due to the lack of understanding about the nature of biotoxins, especially in subtidal geoduck clams. Research targeted to better understand the nature of biotoxins could prevent unnecessary illness and death that may result from consuming toxic shellfish, and could prevent unnecessary closure of tribal and non-Indian fisheries.

DATA GATHERING AT THE RESERVATION LEVEL FOR THE CONDUCT OF SHELLFISH POPULATION SURVEYS AND ESTIMATES, \$1,000,000

Very little current data and technical information exists for many of the shellfish fisheries now being jointly managed by state and Tribal managers. This is particularly true for many free-swimming and deep-water species. This lack of information can not only impact fisheries and the resource as a whole, but makes it difficult to assess 50/50 treaty sharing arrangements. Additionally, intertidal assessment methodologies differ between state and tribal programs, and can lead to conflicts in management planning.

Existing data systems must be enhanced for catch reporting, population assessment and to assist enhancement efforts. Research on methodology for population assessment and techniques also is critical to effective management.

Onsite beach surveys are required to identify harvestable populations of shellfish. Regular monitoring of beaches also is necessary to ensure the beaches remain safe for harvest. Additional and more accurate population survey and health certification data is needed to maintain these fisheries and open new harvest areas. This information will help protect current and future resources and provide additional harvest opportunities.

CONCLUSION

We ask that you give serious consideration to our needs. We are available to discuss these requests with committee members or staff at your convenience. Thank you.

PREPARED STATEMENT OF THE NATIONAL FIRE ANT TASK FORCE AND THE OKLAHOMA FIRE ANT RESEARCH AND MANAGEMENT ADVISORY COMMITTEE TASK FORCE

I am an agriculture producer, serve as a member of the National Fire Ant Task Force and the Oklahoma Fire Ant Research and Management Advisory Committee task force. Our national purpose is to develop and promote research that can be flexible, adaptable to different climatic regions of the country, sustainable but not chemical discouraging, but hopefully results in the use of less chemicals and less expense to the property owner while accomplishing the task at hand.

From a state perspective, our purpose is to determine what can be done to address the continued growth of fire ants in our state with state resources and how that we might cooperate with other multi-state and national ventures to address the problem. This testimony is on behalf of the committee and myself as an impacted agriculture producer and how the research funding or lack thereof impacts locally within the states. I would like to discuss briefly the continued expansion of the range of imported fire ants in this country, the continued economic and social impact of such expansion and the resulting need for research funding.

It is an exciting time for fire ant research because for the first time since the pest entered the United States, we have hope for stopping the spread and controlling its

march across the south and soon to reach middle America. Our hope lies with bio-control methods coupled with other methods of control. But, without significant research funds to the basic research effort all efforts may soon be lost. The USDA-Agricultural Research Service charged with the mission of fire ant research has not seen a congressional increase in 30 years for this effort. Our request is that you increase the research base of the Imported Fire Ant Unit at the Center for Medical, Agricultural & Veterinary Entomology in Gainesville, Florida by a total of \$900,000. The proposed Florida allocation would be \$600,000 above the current level which would just return the location to where it was 14 months ago restoring two FTE's. The remaining \$300,000 would be directed to the Mississippi location to further develop efforts there that tie back to the Gainesville activity.

We appreciate the final conference committee funding of \$325,000 already included by Senate leadership for the last two years that was directed to Mississippi. However, the available base in the Agricultural Research Service for this research mission has actually been dropping steadily and we are in a position today where the critical mass of the few experienced scientists headquartered at Gainesville, currently only 4.5 FTE's, now available is about to be even further reduced. We believe investing in the basic applied research with ARS will compliment and enhance the specially directed funds.

Why is Oklahoma so interested in seeing funding to a Florida location? As an emerging state with fire ant populations growth, we are interested in stopping the number of counties that are impacted each year. We have worked with cooperative research in Oklahoma with ARS and are working toward an area wide research effort to be conducted in Florida, Oklahoma, Texas and Mississippi. We are tired of losing livestock, other economic impacts and most importantly our elderly and children being attacked. With the rapid rate of expansion and the proven ability to survive in northern reaches of the projected expansion area, in just a short time they will most likely be in the District of Columbia—on the Capitol grounds, the White House lawn, other government buildings and private properties. For seven consecutive years, ants have been found north of Washington in the Bowie, Maryland area.

While fire ants have been around for decades as a result of importation into Alabama from South America, this non-native pest has spread further and caused far more destructive damage than ever envisioned. Just a few decades ago, it was never anticipated that these pests would expand so far north and encompass so many states and such a great population. Yet, today there are no signs of any slow-down and the impacted constituencies continue to grow. The red imported fire ant now infests and requires APHIS quarantine in over 318 million acres in 12 contiguous states plus counties with firm establishment in California and New Mexico—now under quarantine—Maryland, and occasional occurrences in Arizona, Nevada, West Virginia, and Kentucky.

In 1985, Oklahoma's experience with fire ants began with the first mounds discovered in the Oklahoma-Arkansas border county of Leflore. Since that time twelve Oklahoma Counties now are classified as "Red Imported Fire Ant Established." Another 15 counties have fire ant activity but that are not yet fully established. Some predicted that fire ants would never expand further than the southern Oklahoma border of the Red River, yet today Tulsa and Payne Counties in northern Oklahoma have recorded finding fire ants—the same latitude as the U.S. Capitol. Both counties are one and two counties south of the Kansas border. In the State of Arkansas they are near the Missouri border and in Tennessee they have been found near the Kentucky border.

My interest in addressing the imported fire ant issue is not only from a professional point of representing the farm and rural membership of Oklahoma Farmers Union but also a very personal one. My family and I farm and ranch along the Red River in the southern Oklahoma counties of Love and Jefferson. In the last two years we have seen a literal proliferation of this pest to the point of destroying pasture land and harming farm equipment with their huge mounds.

It even becomes more personal when my 5 year-old daughter is simply playing and the fire ants attack her—inside the house. Just two counties over a child in his own bed was attacked hundreds of time while he lay sleeping. Producers and other citizens alike experience the loss of electrical water heaters, air conditioning and heating units when fire ants gather in such numbers that they cause electrical shorts resulting in property loss. It is quite common for the local Rural Electric Cooperatives to experience losses on their supply lines because of the pests.

From an agricultural economic standpoint, fire ants pose an immediate and present danger to our family farm and others just like us who are in the hay production business. Because our county is quarantined, we must sell our hay only to other counties where fire ants are established. This limits our available markets. We have just come through three of the worst droughts in U.S. history. Three years

ago, many producers in Oklahoma received hay from Kansas, Colorado, Missouri and Arkansas. Imagine if the drought had been to the north and farmers depended on southern producers for their supply. Although we would have had hay, we would have been unable to provide a hay supply to our neighbors to the north because of fire ant quarantines. God forbid that such should ever happen. This has occurred when hay from North Carolina was shipped to drought areas of West Virginia and infestation resulted. Our own state department of agriculture is now aggressively working to check the border to ensure that product will not cross the border that is infested. Each load must be fire ant free. We applaud this effort but realize that research provides the only real answer to our plight.

I would point out that the Southern United States, which so far has been greatest impacted, also has some of the most vulnerable citizens to fire ant stings. Since the South attracts more retirees than most parts of the country, the numbers alone make the elderly a prime target of fire ants. Attacks on the elderly, with weakened immune systems, in nursing homes and hospitals is coming far too often. Last year an incapacitated lady in Florida died from 1,600 stings while in a nursing home. Another of the most vulnerable—our children—have increasingly been evacuated from schools so the properties can be treated for fire ants. Other public properties around the United States such as parks, lakes and zoos are becoming inundated. Peanut farmers in Southern Oklahoma now think twice before they reach to repair a digger or combine that can be covered with fire ants that thrive in the sandy peanut soils. Three years ago, over 500 farmers in Bryan County gathered to talk about fire ants because they had been impacted by the rapid expansion of the fire ant. Producers want answers and quickly.

While there has been extensive research work on baits and other chemical applications dealing with fire ants, it appears that these solutions only will help curtail and not eradicate or bring under control this pest. These options are also very expensive and for the chemical application process to work everyone must be willing to apply the solution repeatedly. We know that this is an unrealistic and expensive solution for either the private or government sector.

What has shown the most promise in the last four years are biological control methods that can be applied in conjunction with chemical applications for what could be an effective permanent management solution. I am particularly excited about the development of a national strategy that will for the first time strategically address this pest since it first came to the shores of Alabama in the 1920's. Such a strategy has been set forth by the Southern Legislative Conference, comprised of state legislators across the south, and the scientists and research leaders of the United States Department of Agriculture's Agricultural Research Service. I am pleased to have had the opportunity to have participated in the development of this initial plan.

USDA-ARS research in Gainesville, Florida, on the development and release of candidate self-sustaining bio-control agents, resulted in an Agreement in 1998 with the Southern Legislative Conference, representing the elected state officials in the southern 15 states. Based on the successful survival of the early releases of the two bio-control agents in Gainesville, a formal agreement with the SLC was established. Participating states provided limited state resources to assist the Gainesville laboratory in increasing production of bio-control agents for limited field trials in their states. By 2000, participating states included Oklahoma, Texas, Alabama, Georgia, South Carolina, North Carolina, and Louisiana. Other existing collaborations provided release opportunities in Arkansas, Mississippi, Florida and Tennessee. From 1998-2000, phorid flies were released and established in Florida, Mississippi, Louisiana, Texas, Alabama, North Carolina, and South Carolina. In Florida, where releases began in 1997, populations expanded from 5 mound locations (1997-98) to 50 square miles by 1999, and to 1,000 square miles by December, 2000. Concurrent paired field studies (72 sites total) examining the impact on fire ant populations will continue through 2002.

Also from 1998-2000, the disease agent of fire ants was released at selected sites (5 mounds each) in Florida, Oklahoma, Arkansas, Alabama, Tennessee, North Carolina, South Carolina, Mississippi, and Louisiana. Subsequent infections was detected in Florida, Oklahoma, Arkansas, Alabama, North Carolina, South Carolina, Georgia, Mississippi, and Louisiana. In Florida, infections spread among mounds at the initial release site, and resulted in a 40-60 percent reduction in fire ant populations in the affected area.

In 2000, the first field test of an integrated management strategy for fire ants was initiated at a military installation in South Carolina. With supplemental temporary funding to ARS from EPA, and commitment of in-kind resources from the U.S. Army, the South Carolina National Guard and Clemson University, a central "near-zero tolerance" area was treated with traditional pesticide applications while sur-

rounding areas were inoculated with phorid flies and the disease agent of fire ants. At 16 weeks, assessments indicated a 96 percent reduction in the near-zero tolerance area, and the successful establishment of both bio-control agents. Assessments continue.

Also in 2000, USDA-APHIS and the National Biological Control Institute, canvassed state departments of agriculture, and found that bio-control of fire ants was the single highest priority for invasive insect species. Subsequently, APHIS and ARS partnered with the State of Florida Department of Agriculture and Consumer Services to initiate mass-rearing of phorid flies at state facilities in Gainesville, Florida, for subsequent release in the infested states. The agreement was finalized in February, 2001. Releases will begin by late summer.

As a result of the outcome of the ARS, DOD and SLC leadership in the South Carolina IPM project and based on the merits of the proposal, a new peer reviewed proposal funded internally will expand such tests to Oklahoma, Texas and Florida initially. This 4–5 year temporary project will focus on cattle and improved pasture regions. Of ten projects reviewed this was the one funded in fiscal year 2001. I stress this to demonstrate the confidence placed in the research through peer review. However exciting this funded project may be, it has no impact on the base funds to maintain—let alone increase—much needed basic research.

The bottom line is to develop self-sustaining biological control agents for the imported fire ant. Farmers, and particularly disadvantaged farmers in the southern and western states, need relief from fire ants, but traditional baits and pesticides are too costly and require frequent application to manage the invader. In a survey of Texas cattle producers, an estimated \$67 million per year in losses was due to fire ants. The ant also will kill chicks and adversely affects the yields of several important agricultural crops. The need for self-sustaining bio-control and a pesticide-reduced integrated pest management approach is critical. Besides being expensive, traditional chemical pest management strategies fail to provide sustained management of the pest without continuous re-applications of insecticides, which not only kill the imported fire ant but basically sterilize the sites of all living invertebrates, continuing the disruption of ecological balance originally upset by the invading fire ant. Because of wide-spectrum toxicity, adverse environmental impact and economic cost, chemical treatment strategies are not suitable for large tracts of land such as pastures in sustained management.

The goal of the National Fire Ant Strategy is to develop customized regional management strategies to reduce the imported fire ant infestations to levels below economic thresholds on agricultural lands and large acreage tracts. Such is the case in South America, the native range of fire ants where populations are only 20 percent of those in the U.S. In fact, fire ants in that country are not generally considered a pest. A second purpose is to eliminate fire ants as a nuisance or health threat in local urban high-risk environments. Biologically-based technologies are a major component. A systematic approach will be developed to optimize integrated management strategies with biologically-based technologies as a major component. Coordination has occurred among Federal, State and private sectors to ensure that current and emerging technologies are evaluated for regional effectiveness, and that they are rapidly implemented.

Through coordinated Federal, State and private sector efforts, the strategy includes the release and monitoring of candidate biocontrol organisms for regional comparisons, development of new biologically-based technologies and the subsequent “fast tracking” of the implementation of successful tools. With the use of the latest technology applications, customized regional, biologically based strategies will be developed. Precision targeting for maximum local elimination in high risk and high priority areas with existing bait or chemical technologies will be redefined. The final direction of the work plan strategy in accomplishing the objectives is to package the technologies and strategies for optimized integrated pest management.

Biological methods for treatment of fire ants appears to be working! Two bio-control agents are now available with 25 remaining in South America with potential for reducing populations in the U.S. While it is exciting that we are finally making more progress on fire ants in the last few years than we have for the entire time that fire ants has plagued this country—it requires one key ingredient—adequate funding. Three years ago we began an effort to see increased funding. Based on the national strategy as developed, funding of \$2 million would be needed on an annual basis to apply the strategy that shows so much promise and to “fast track” the results and technologically transfer that information to the private sector for application. The proposed increase of \$900,000 above the current base restores lost positions and strengthens the program.

We would strongly encourage you to provide the appropriate funding of \$2 million annually to Gainesville by adding \$900,00 to the ARS budget base for such a nation-

ally biologically-based integrated management strategy that includes a partnership of both USDA-ARS, state land-grant universities, state legislatures and the private sector.

Thank you again for this opportunity to submit testimony regarding the need for additional appropriations for fire ant research.

PREPARED STATEMENT OF THE ORGANIZATION FOR THE PROMOTION AND
ADVANCEMENT OF SMALL TELECOMMUNICATIONS COMPANIES

SUMMARY OF REQUEST

The Organization for the Promotion and Advancement of Small Telecommunications Companies (OPASTCO) seeks the Subcommittee's support for fiscal year 2002 loan levels for the telecommunications loans program and Rural Telephone Bank (RTB) program administered by the Rural Utilities Service (RUS) in the following amounts:

| | | |
|--------------------------------|--------------------------|-----|
| | [In millions of dollars] | |
| 5 percent hardship loans | | 75 |
| Treasury rate loans | | 300 |
| Guaranteed loans | | 120 |
| RTB loans | | 175 |

In addition, OPASTCO requests the following action by the Subcommittee: (1) removal of the statutory 7 percent cap on Treasury rate loans for fiscal year 2002; (2) removal of previous appropriations act language limiting the retirement of Class A stock of the RTB to 5 percent; (3) a prohibition on the transfer of unobligated RTB funds to the general fund of the Treasury; and (4) funding of the distance learning and telemedicine grant and loan program at sufficient levels.

GENERAL

OPASTCO is a national trade association of more than 500 independently owned and operated telecommunications carriers serving rural areas of the United States. Its members, which include both commercial companies and cooperatives, together serve over 2.5 million customers in 42 states. Approximately half of OPASTCO's members are RUS or RTB borrowers.

Perhaps at no time since the inception of the RUS (formerly the REA) has the telecommunications loans and RTB programs been so vital to the future of rural America. The telecommunications industry is at a crossroads, both in terms of technology and public policy. Advances in telecommunications technology in recent years will deliver on the promise of a new "information age." The Federal Communications Commission's (FCC) ongoing implementation of the landmark Telecommunications Act of 1996, as well as modernization resulting from prior statutory changes to RUS's lending program, will expedite this transformation. However, without continued support of the telecommunications loans and RTB programs, rural telephone companies will be hard pressed to build the infrastructure necessary to bring their communities into this new age, creating a bifurcated society of information "haves" and "have-nots."

Contrary to the belief of some critics, RUS's job is not finished. Actually, in a sense, it has just begun. We have entered a time when advanced services and technology—such as broadband fiber optics, high-speed packet and digital switching equipment, and digital subscriber line technology—are expected by customers in all areas of the country, both urban and rural. Unfortunately, the inherently higher costs of upgrading rural networks, both for voice and data communications, has not abated. Rural telecommunications continues to be more capital intensive and involves fewer paying customers than its urban counterpart. RUS borrowers average only 6.3 subscribers per route mile versus 130 subscribers per route mile for large local exchange carriers. In order for rural telephone companies to modernize their networks and provide their customers with advanced services at reasonable rates, they must have access to reliable low-cost financing.

The relative isolation of rural areas increases the value of telecommunications services for these citizens. Telecommunications enables applications such as distance learning, telemedicine, and high-speed Internet connectivity that can alleviate or eliminate some rural disadvantages. Telecommunications can also make rural areas attractive for some businesses and result in revitalization of the rural economy. For example, businesses such as telemarketing and tourism can thrive in rural areas, and telecommuting can become a realistic employment option.

While it has been said many times before, it bears repeating that RUS's telecommunications loans and RTB programs are not grant programs. The funds loaned by RUS are used to leverage substantial private capital, creating public/private partnerships. For a very small cost, the government is encouraging tremendous amounts of private investment in rural telecommunications infrastructure.

Most importantly, the programs are tremendously successful. Borrowers actually build the infrastructure and the government gets paid back with interest. There has never been a default in the history of the telecommunications lending programs.

THE TELECOMMUNICATIONS ACT OF 1996 HAS HEIGHTENED THE NEED FOR THE
TELECOMMUNICATIONS LOANS AND RTB PROGRAMS

The FCC's implementation of the Telecommunications Act of 1996 will only increase rural telecommunications carriers' need for RUS assistance in the future. The forward-looking Act defines universal service as an evolving level of telecommunications services that the FCC must establish periodically, taking into account advances in telecommunications and information technologies and services. As anticipated, in December 2000, the FCC convened a Federal-State Joint Board to begin reviewing the definition of the services supported by the universal service mechanism. While the competitive environment engendered by the 1996 Act may offer the means of meeting this evolving definition in urban areas, rural and high-cost areas have less potential for economically sound competitive alternatives. RUS has an essential role to play in the implementation of the law, as it will compliment new funding mechanisms established by the FCC and enable rural America to move closer to achieving the federally mandated goal of rural/urban service and rate comparability.

At present, considerable regulatory uncertainty exists for rural telecommunications carriers as several critical FCC proceedings implementing the 1996 Act remain unresolved. These include fundamental changes to the universal service and access charge systems and the procedures incumbent carriers use to separate their costs between the Federal and State jurisdictions. In addition, uncertainty exists as to whether rural incumbent carriers will be able to recover the costs of the extensive additional regulatory obligations and potential broadband deployment demands placed on them. If these outstanding issues are resolved in a piecemeal fashion and/or with a strong bias toward new entrants, rural incumbent carriers with universal service obligations could be hampered in their ability to modernize their networks and provide quality, affordable service to all of their customers. Managed coordination of existing proceedings, as proposed in the Petition for Rulemaking of the LEC Multi-Association Group (MAG Plan, filed with the FCC Oct. 20, 2000), is necessary if the Commission is to preserve Congress's public policy goals of affordable rates and access to an evolving telecommunications network for all Americans. Adoption of the MAG Plan would ensure that all of the goals of the 1996 Act—including universal service, an even playing field for competition, and deregulation—are realized in rural areas.

A \$75 MILLION LOAN LEVEL SHOULD BE MAINTAINED FOR THE 5 PERCENT HARDSHIP
LOAN PROGRAM

One of the most vital components of RUS's telecommunications loans program is the 5 percent hardship loan program. These loans are referred to as hardship loans for good reason: They provide below-Treasury rate financing to telephone companies serving some of the most sparsely populated, highest cost areas in the country. The commitment these companies have to providing modern telecommunications service to everyone in their communities has made our nation's policy of universal service a reality and, in many cases, would not have been possible without RUS's hardship loan program. Companies applying for hardship loans must meet a stringent set of eligibility requirements and the projects to be financed are rated on a point system to ensure that the loans are targeted to the most needy and deserving. In fiscal year 2001, the government subsidy needed to support a \$75 million loan level was under \$7.8 million. Given the necessity of this indispensable program, it is critical that the loan level be maintained at \$75 million for fiscal year 2002.

REMOVAL OF THE 7 PERCENT CAP ON TREASURY RATE LOANS SHOULD BE CONTINUED

With regard to RUS's Treasury rate loan program, OPASTCO supports the removal of the 7 percent ceiling on these loans for fiscal year 2002. This Subcommittee appropriately supported language in the fiscal year 1996 Agriculture Appropriations Act to permit Treasury rate loans to exceed the 7 percent per year ceiling contained in the authorizing act. The language has been continued in each subsequent year. Were long-term interest rates to exceed 7 percent, adequate subsidy would not be

available to support the Treasury rate loan program at the authorized levels. Accordingly, OPASTCO supports the continuation of this language in the fiscal year 2002 appropriations bill in order to prevent potential disruption to this important program.

A \$175 MILLION LOAN LEVEL SHOULD BE MAINTAINED FOR THE RTB PROGRAM

As previously discussed, the RTB's mission has not been completed as rural carriers continue to rely on this important source of supplemental financing in order to provide their communities with access to the next generation of telecommunications services that are essential for their survival. In fiscal year 2001, the government subsidy necessary to fund a \$175 million loan level was only \$2.59 million, or 1.48 percent of the capital that the program generates. The ongoing need for the RTB program makes it essential that a \$175 million loan level be maintained for fiscal year 2002.

THE 5 PERCENT LIMITATION ON THE AMOUNT OF CLASS A STOCK OF THE RTB THAT CAN BE RETIRED SHOULD BE REMOVED

OPASTCO believes it would be appropriate to remove or change the language contained in previous agriculture appropriations acts restricting the retirement of Class A stock of the RTB to 5 percent. This restriction is an impediment to the timely privatization of the RTB, as envisioned by the Rural Electrification Act of 1936. OPASTCO further suggests that Congress, the Administration, and the RTB Board of Directors develop a schedule and plan for privatizing the bank in a timely manner. OPASTCO believes that the timely privatization of the RTB is of great importance to rural telecommunications carriers as they seek to upgrade their networks for the provision of advanced services to their customers.

THE PROHIBITION ON THE TRANSFER OF ANY UNOBLIGATED BALANCE OF THE RTB LIQUIDATING ACCOUNT TO THE TREASURY AND REQUIRING THE PAYMENT OF INTEREST ON THESE FUNDS SHOULD BE CONTINUED

OPASTCO urges the Subcommittee to reinstate the language introduced in the fiscal year 1997 Agriculture Appropriations Act, and continued in the years following, prohibiting the transfer of any unobligated balance of the RTB liquidating account to the Treasury or the Federal Financing Bank which is in excess of current requirements and requiring the payment of interest on these funds. As a condition of borrowing, the statutory language establishing the RTB requires telephone companies to purchase Class B stock in the bank. Once all loans are completely repaid, a borrower may then convert its Class B stock into Class C stock. Thus, all current and former borrowers maintain an ownership interest in the RTB. As with stockholders of any concern, these owners have rights which may not be abrogated. The Subcommittee's inclusion of the aforementioned language into the fiscal year 2002 appropriations bill will ensure that RTB borrowers are not stripped of the value of this required investment.

THE DISTANCE LEARNING AND TELEMEDICINE PROGRAM SHOULD CONTINUE TO BE FUNDED AT ADEQUATE LEVELS

In addition to RUS's telecommunications loans and RTB programs, OPASTCO supports adequate funding of the distance learning and telemedicine grant and loan program. This sensible investment allows rural students to gain access to advanced classes which will help them prepare for college and jobs of the future. Also, rural residents will gain access to quality health care services without traveling great distances to urban hospitals. Loans are made at the government's cost-of-money, which should help to meet demand for the program in the most cost effective way. In light of the Telecommunications Act's requirement that schools, health care providers, and libraries have access to advanced telecommunications services, sufficient targeted funding for these purposes is essential in fiscal year 2002.

CONCLUSION

The development of the nationwide telecommunications network into an information superhighway, as envisioned by policymakers, will help rural America survive and prosper in any market—whether local, regional, national, or global. However, without the availability of low-cost RUS funds, building the information superhighway in communities that are isolated and thinly populated will be untenable. By supporting the RUS telecommunications programs at the requested levels, the Subcommittee will be making a significant contribution to the future of rural America at a negligible cost to the taxpayer.

PREPARED STATEMENT OF THE RED RIVER VALLEY ASSOCIATION

Mr. Chairman and members of the Committee, I am Wayne Dowd, and I am pleased to represent the Red River Valley Association as its President. Our organization was founded in 1925 with the express purpose of uniting the citizens of Arkansas, Louisiana, Oklahoma and Texas to develop the land and water resources of the Red River Basin.

As an organization that knows the value of our precious water resources we support the most beneficial water and land conservation programs administered through the Natural Resources Conservation Service (NRCS). We understand how important a balanced budget is to our nation; however, we cannot sacrifice what has been accomplished. NRCS programs are a model of how conservation programs should be administered and our testimony will address the needs of the nation as well as our region. We strongly believe that this national program must be preserved.

The President's fiscal year 2002 budget guideline for USDA indicates a reduction of 8¼ percent from fiscal year 2001. If you do not consider the emergency funds for fiscal year then the fiscal year 2002 appropriation is approximately a 3 percent increase; however, even this does not cover cost of living and inflation increases. This could mean NRCS programs will not be adequately funded, to the detriment of the agency and our natural resources. We would like to address several of the programs administered by NRCS. Failure to adequately fund these initiatives would reduce assistance to those who want it and the resources that need it.

Conservation Operations Budget.—This has been in steady decline, in real dollars, over the past several years. It has occurred partly as a result of funds being reduced from Conservation Operations to balance increases in other conservation financial assistance programs. Approximately \$620 million was allocated for this account in fiscal year 2001. This is far short of what is required to serve the needs of our nation's private lands. We request a total of \$965 million be appropriated for Conservation Technical Assistance.

Conservation Technical Assistance is the foundation of technical support and a sound, scientific delivery system for voluntary conservation to the private users and owners of lands in the United States. It is imperative that we provide assistance to all "working lands" not just those fortunate few who are able to get enrolled in programs. Working lands are not just crops and pasture (commodity staples) but includes forests, wildlife habitat and coastal marshes. The problem is that personnel funded from "programs" can only provide technical assistance to those enrolled in these cost share programs, leaving the majority of the agricultural community without technical assistance. We recommend that this funding for technical assistance be placed in "Conservation Technical Assistance", and allow NRCS to provide assistance to everyone.

It also appears the emphasis has been to increase 'command and control' enforcement and reduce voluntary, science based assistance. This is the wrong way to go. We encourage you to reverse this trend and allow our agricultural community to have access to technology for voluntary conservation, rather than be harassed by the constant threat of regulations and penalties for noncompliance.

Section 11 Caps.—Another factor that seriously reduces the ability of NRCS to meet the considerable public demand for technical assistance, is the Section 11 cap and the transfer of funds from the Community Credit Corporation (CCC). The CCC funds NRCS technical assistance for several programs, including EQIP and CRP. Currently, this cap prevents NRCS from covering its staff costs for these crucial programs. We support the removal of the Section 11 Cap on technical assistance, which was established before EQIP, CRP and VW were created. We will also be addressing this issue in the "Farm Bill", as it develops.

Watershed and Flood Prevention Operations (Public Law 566 & 534).—More than 10,400 individual watershed structures have been installed nationally. They have contributed greatly to conservation, environmental protection and enhancement, economic development and the social well being of our communities. More than half of these structures are over 30 years old and several hundred are approaching their 50-year life expectancy.

Today you hear a lot about the watershed approach to resource management. These programs offer a complete watershed management approach and should continue for the following reasons:

- They protect people and communities from flooding.
- Their objectives and functions sustain our nation's natural resources for future operations.
- They are required to have local partners and be cost shared.
- The communities and NRCS share initiatives and decisions.

- They follow NEPA guidelines and enhance the environment.
- They often address the need of low income and minority communities.
- The benefit to cost ratio for this program has been evaluated to be 2.2:1.

What other Federal programs can claim such success?

There is no questioning the value of this program. The cost of losing this infrastructure exceeds the cost to reinvest in our existing watersheds. Without repairing and upgrading the safety of existing structures, we miss the opportunity to keep our communities alive and prosperous. It would be irresponsible to dismantle a program that has demonstrated such great return and is supported by our citizens.

It was a great step forward to have the "Lucas Bill" passed last year, now adequate appropriations must be provided. A 1999 survey, conducted in 22 states, showed that 2,200 structures are in need of immediate rehabilitation at an estimated cost of \$543 million. The funding level authorized in the bill is far short of this realistic need. We request that \$5 million be appropriated for NRCS to conduct assessments of the rehabilitation needs nationwide. We request that 60 million be appropriated to provide financial and technical assistance to those watershed projects where sponsors are prepared to commence rehabilitation measures.

In addition to the needs for reinvesting in existing infrastructure there are many new projects, which are awaiting funds for construction. We strongly recommend that a funding level of 250 million be appropriated for the Public Law 534 (\$30 million) and Public Law 566 (\$220 million) programs. This is realistic and comparable to appropriations in years prior to 1994.

Emergency Watershed Protection Program.—This program comes under Watershed and Flood Prevention Operations, but is a separate line item. It has traditionally been a zero budget line item; however, there will always be emergency needs.

As our land use expands to include sensitive environmental ecosystems, major weather events will have an adverse impact requiring NRCS assistance; therefore, it should be funded up front. It is important that NRCS is prepared for a rapid response, not waiting for legislative action. With funds available, they can respond immediately to an emergency when it occurs.

We request that a minimum of \$100 million be appropriated for this program in fiscal year 2002 and are not taken from elsewhere in the NRCS budget. In fiscal year 2000 \$80 million was added and in fiscal year 2001 \$110 million. It is inevitable that emergency funds will be required, so this should be included.

Conservation Reserve Program (CRP).—This program, administered by Farm Services Agency, impacts NRCS the most. NRCS is reimbursed for providing technical assistance for this program. We understand the Administration is considering termination of this program since the original goals have been met. It restores the land to a higher and better use until such time as the nation may need it for food and fiber production. The environmental values gained from CRP should obviate the need and justify the investment of raising the CRP cap.

We ask Congress to take the initiative to increase the CRP enrollment cap to a minimum of 45 million acres. This is an extremely beneficial program to both our nation and the Red River Valley, and should not be allowed to expire. It provides a safety net to those farmers trying to make a living on the marginal lands most suited for this program.

Watershed Survey and Planning.—In fiscal year 2001 \$11 million was appropriated to support this extremely important community program. NRCS has become a facilitator for the different community interest groups, state and Federal agencies. In our states such studies are helping identify resource needs and solutions where populations are encroaching into rural areas.

As our municipalities expand, the water resource issue tends to be neglected until a serious problem occurs. Proper planning and cooperative efforts can prevent problems and insure that water resource issues are addressed. We request this program be funded at a level of \$25 million.

Forestry Incentives Program.—Congress transferred this program to NRCS from the Farm Service Agency as a restructuring in the Federal Agricultural Improvement and Reform Act of 1996. Forestry on small, privately owned lands is recognized as a farming activity. NRCS is the best agency to administer this program, which assists farmers in production agriculture. It is more than just a timber production program. Forests are the most effective use of land as they relate to water quality, non-point source pollution, air quality, greenhouse gas reduction and wild-life habitat.

We request Congress fund the Forestry Incentives Program at a level of \$6.5 million for fiscal year 2002.

Environmental Quality Incentives Program (EQIP).—Request for assistance through the EQIP program has been overwhelming. Requests far exceed the available funds and place an additional workload on NRCS's delivery system. Addition-

ally, adequate funding for technical assistance must be provided to administer the program at a minimum of 19 percent of total program cost.

The EQIP program for fiscal year 2002 should be appropriated \$300 million and the technical assistance budgeted at \$57 million to meet the 19 percent TA level.

Wetlands Reserve Program (WRP).—This is a very popular and important program. It serves as a safety net to those farmers trying to make a living on marginal lands. It also addresses a variety of conservation needs, from water quality to global warming.

We strongly recommend that the cap be raised by 250,000 acres for fiscal year 2002. This will allow the program to continue until fiscal year 2003 when a reauthorization for the program can be made.

“Red Bayou Irrigation Demonstration Project”.—Findings in the Natural Resources Inventory (NRI) have concluded that irrigated agriculture is moving from western states to the east. A prime example of this is the interest to irrigate along the Red River in Arkansas and Louisiana. The recent drought conditions have accelerated the efforts of different regions to form irrigation districts and start the process to install systems. The farmers along Red Bayou, Caddo Parish, Louisiana, have been very aggressive in their attempts to become operational. We request that this project be “earmarked” as a demonstration project to be used as a model throughout the Red River Valley. When the cost for this irrigation system has been determined and the irrigation district formed, we will request maximum Federal participation for the funding of this endeavor.

Over 70 percent of our land is privately owned. This is important in order to understand the need for NRCS programs and technical assistance. Their presence is vital to ensuring sound technical standards are met in conservation. These programs not only address agricultural production, but sound natural resource management. Without these programs and NRCS properly staffed to implement them, many private landowners will not apply conservation measures needed to sustain our natural resources for future generations.

There have been new clean water initiatives, but why do we ignore the agency that has a proven record for implementing watershed conservation programs? Congress must decide: will NRCS continue to provide the leadership within our communities to build upon the partnerships already established? It is up to Congress to insure NRCS is properly funded and staffed to provide the needed assistance to our taxpayers for conservation programs. Funding Conservation Technical Assistance at \$965 million and eliminating the Section 11 Caps will go a long way in accomplishing this.

All these programs apply to the citizens in the Red River Valley and their future is our concern. The RRVA is dedicated to work toward the programs that will benefit our citizens and provide for high quality of life standards. We therefore request that you appropriate the requested funding within these individual programs, to insure our nation’s conservation needs are met.

I thank you for the opportunity to present this testimony on behalf of the members of the Red River Valley Association and we pledge our support to assist you in the appropriation process.

Grant Disclosure.—The Red River Valley Association has not received any Federal grant, sub-grant or contract during the current fiscal year or either of the two previous fiscal years.

PREPARED STATEMENT OF THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe of Florida is pleased to submit this statement regarding the fiscal year 2002 budget for the Natural Resources Conservation Service (NRCS) in the Department of Agriculture.

The Seminole Tribe of Florida asks that Congress earmark a total of \$400,000 in the Natural Resources Conservation Service’s (NRCS) account that funds the Small Watershed Program, as authorized by Public Law 83-566, for design and construction of a portion of the Tribe’s Water Conservation Plan on the Big Cypress Reservation. The Tribe requests \$300,000 for financial assistance for construction and \$100,000 for technical assistance (08 funds) for operational planning. The Tribe has worked with the NRCS in Florida for five years to develop this small watershed project as a part of the Tribe’s overall Everglades Restoration Initiative. The results of this small watershed project will complement the joint effort of the Tribe and the Corps of Engineers to complete the Initiative. This is the first year in which the Tribe has requested funding for this project.

In addition, the Tribe supports full funding for NRCS’s Conservation Operations—01 Partnership. The Seminole Tribe’s agricultural enterprises and environmental

programs benefit from the technical assistance the NRCS provides through its Conservation Operations Partnership. The Tribe works closely with the Florida State Conservationists on a number of 1996 Farm Bill programs and anticipates increased technical assistance needs in the coming fiscal year.

THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe lives in the Florida Everglades. The Big Cypress Reservation is located in the western basins, directly north of the Big Cypress National Preserve. The Everglades provide many Seminole Tribal members with their livelihood. Our traditional Seminole cultural, religious, and recreational activities, as well as commercial endeavors, are dependent on a healthy Everglades ecosystem. In fact, the Tribe's identity is so closely linked to the land that Tribal members believe that if the land dies, so will the Tribe.

During the Seminole Wars of the 19th Century, our Tribe found protection in the hostile Everglades. But for this harsh environment filled with sawgrass and alligators, the Seminole Tribe of Florida would not exist today. Once in the Everglades, we learned how to use the natural system for support without harm to the environment that sustained us. For example, our native dwelling, the chickee, is made of cypress logs and palmetto fronds and protects its inhabitants from the sun and rain, while allowing maximum circulation for cooling. When a chickee has outlived its useful life, the cypress and palmetto return to the earth to nourish the soil.

In response to social challenges within the Tribe, we looked to our Tribal elders for guidance. Our elders taught us to look to the land, for when the land was ill, the Tribe would soon be ill as well. When we looked at the land, we saw the Everglades in decline and recognized that we had to help mitigate the impacts of man on this natural system. At the same time, we acknowledged that this land must sustain our people, and thereby our culture. The clear message we heard from our elders and the land was that we must design a way of life to preserve the land and the Tribe. Tribal members must be able to work and sustain themselves. We need to protect the land and the animals, but we must also protect our Tribal farmers and ranchers.

Recognizing the needs of our land and our people, the Tribe, along with our consultants, designed a plan to mitigate the harm to the land and water systems within the Reservation while ensuring a sustainable future for the Seminole Tribe of Florida. The restoration plan will allow Tribal members to continue their farming and ranching activities while improving water quality and restoring natural hydroperiod to large portions of the native lands on the Reservation and ultimately, positively affecting the Big Cypress National Preserve and Everglades National Park.

The Seminole Tribe's Big Cypress Initiative addresses the environmental degradation wrought by decades of Federal flood control construction and polluted urban and agricultural runoff. The interrupted sheet flow and hydroperiod have stressed native species and encouraged the spread of exotic species. Nutrient-laden runoff has supported the rapid spread of cattails, which choke out the periphyton algae mat and sawgrass necessary for the success of the wet/dry cycle that supports the wildlife of the Everglades.

The Seminole Tribe designed an Everglades Restoration Initiative to allow the Tribe to sustain ourselves while reducing impacts on the ecosystem. The Seminole Tribe is committed to improving the water quality and flows on the Big Cypress Reservation. We have already committed significant resources to the design of the projects and to our water quality data collection and monitoring system. Within the next few months, the Tribe will begin construction on the conveyance system that will serve as the backbone to Big Cypress water control system. We are willing to continue our efforts and commitment of resources, for our cultural survival is at stake.

SMALL WATERSHED PROJECT ON BIG CYPRESS

As a part of the Tribe's Everglades Restoration Initiative, the Tribe completed a water conservation plan for the design and construction of surface water management systems to remove phosphorus, convey and store irrigation water, improve flood control, and rehydrate the Big Cypress National Preserve. This water conservation plan has been permitted for construction under the Clean Water Act Section 404 program.

Through the Corps of Engineers (COE) critical project program authorized by the Water Resources Development Act of 1996, the Tribe is building part of that water conservation plan. The first phase of the critical project is to construct a conveyance canal system that will supplement and improve the existing system. The balance

of the critical project will construct water storage and treatment areas on the east-side of the Reservation.

Over the last five years, the Tribe has enjoyed the support of the Florida State Conservationist and the Florida staff of the NRCS in the development of a small watershed project to address some needs identified in the water conservation plan. While some preliminary planning has been completed, an existing funding commitment prevented commencement of the small watershed project until fiscal year 2002. In fiscal year 2002, both the Tribe and the NRCS in Florida are prepared to begin design and construction of water storage and treatment areas on the west-side of the Reservation. To do so, Congress must appropriate the initial funding.

While all the project component options have not been fully vetted, the cost estimates range from downward from \$34.6 million. This project is approved to operate with a 75 percent Federal and 25 percent Tribal cost share. The timing of the design and construction are dependent on the funding stream.

CONCLUSION

Everglades restoration is a well-recognized national priority. The Tribe's goal of sustainable agriculture is consistent with the goals of the NRCS. The NRCS's support of the Tribe's conservation measures in the past, along with the implementation of future programs, will make a significant impact on the Big Cypress Reservation and the South Florida Ecosystem.

Through its assistance to the Tribe, NRCS has provided valuable technical assistance to date. Beginning in fiscal year 1999, NRCS has provided programmatic support through EQIP and WRP, which is anticipated to continue. Additional programmatic assistance through the small watershed program will provide the needed design and construction to complete the water conservation plan. None of the joint objectives of the Tribe and the NRCS can be accomplished, however, without sufficient funding.

The Tribe has demonstrated its economic commitment to the Everglades Restoration effort; the Tribe is asking the Federal government to also participate in that effort. This effort benefits not just the Seminole Tribe, but all Floridians who depend on a reliable supply of clean, fresh water flowing out of the Everglades, and all Americans whose lives are enriched by this unique national treasure.

Thank you for the opportunity to present the request of the Seminole Tribe of Florida. The Tribe will provide additional information upon request.

PREPARED STATEMENT OF THE SOCIETY FOR ANIMAL PROTECTIVE LEGISLATION

We appreciate the support this Subcommittee has provided to these programs of the United States Department of Agriculture (USDA) and respectfully request the following modest appropriations to ensure the protection of animals and people and that the laws passed by Congress are being carried out effectively.

A \$14.5 Million Appropriation is Needed for APHIS/Animal Care's Enforcement of the Animal Welfare Act

A coalition of organizations including the American Veterinary Medical Association, the American Zoo and Aquarium Association and the Society for Animal Protective Legislation has joined together seeking adequate funds for enforcement of the Animal Welfare Act (AWA). This represents a unique meeting of the minds between the regulated community and the animal welfare community, who recognize the desperate need for increased funding for this vital program.

The AWA is the chief Federal law for the protection of animals. The USDA seeks compliance with its minimum standards for the care and treatment of animals during transportation and at the approximately 10,000 sites of dealers, research, testing and teaching facilities, zoos, circuses, carriers (airlines, motor freight lines and other shipping businesses) and handlers (ground freight handlers).

Forty-two percent of the facilities that are inspected by USDA are found to be noncompliant. Facilities with serious deficiencies require reinspections to ensure that corrective action is taken, but lack of funds has prevented USDA from conducting this much-needed follow-up.

In 1966 the Laboratory Animal Welfare Act (later renamed the Animal Welfare Act) was adopted in an effort to prevent the sale of lost or stolen pets into research. Nevertheless, this has continued to be a serious problem. In an attempt to address this problem in the 1990s, APHIS Animal Care (AC) instituted a policy of conducting quarterly inspections of random source dealers. Since stepping up its enforcement in this area (which has come at the expense of inspections conducted elsewhere), USDA has revoked 11 dealer licenses and imposed more than \$500,000 in

finer. The number of random source (USDA licensed Class B) dealers supply dogs and cats to research has dropped from 104 to 23.

This example illustrates the value of frequent, unannounced inspection of licensees and registrants. Increasing the number of inspections will ensure effective compliance with the law. Facilities need to comply with the minimum standards under the law, or they should not be operating businesses that involve the use of animals under the AWA.

The 1985 amendment to the AWA mandates at least one inspection per year of all registered research facilities. A vigorous inspection program is critical to maintaining public confidence in the quality of research and ensuring the humane treatment of experimental animals. With the need to evaluate performance, as well as engineering standards, each inspection is timeconsuming and necessitates skilled veterinary inspectors.

Increased funding will permit AC to hire and equip more inspectors, and thereby increase the number of facilities that are inspected. Additional training of inspectors to improve the quality of their inspections will be possible, too. AC will be able to increase its searches for unlicensed facilities, an important effort because failure to obtain licensure is a widespread problem with many entities purposefully evading AC and the requirements of the AWA. An area frequently ignored for lack of sufficient funds has been inspection of airlines. Increased funding will permit AC to conduct an adequate number of inspections of airlines in an effort to protect against the injury, loss or death of animals being transported by air and to help meet the requirements of the recently adopted Federal Aviation Administration amendment for safe transport of animals by air.

An Appropriation of \$7.263 is needed for APHIS' Investigative and Enforcement Services.

Investigative and Enforcement Services (IES), the enforcement arm within APHIS, is responsible for conducting investigations, tracking unresolved cases, coordinating investigations within APHIS and between APHIS and other Federal and/or state agencies and train APHIS inspectors in the collection of evidence and documentation of violations. IES provides support to AC and to three other APHIS programs.

An increased appropriation is needed for IES to provide timely and complete investigations of alleged AWA violations. A \$1 million increase will enable IES to fill a critical vacancy for an enforcement specialist and to continue to support four field investigators, now temporarily funded by the APHIS Administrator. IES would also fill four new field positions strategically located in the states with the greatest need. Additional funds to IES will: permit deployment of "quickresponse" teams to address high-priority/visibility violations, permit implementation of an electronic case report format to accelerate case routing and processing, reduce the time to complete investigations, and allow investigators to accompany AC inspectors to noncompliant facilities when necessary.

A \$1 Million Appropriation is needed for the Animal Welfare Information Center with a cap of 5 percent to Agriculture Research Services and/or the National Agricultural Library.

The Animal Welfare Information Center (AWIC) was established by the 1985 amendment to the Animal Welfare Act, the Improved Standards for Laboratory Animals Act, to serve as a clearinghouse and educational resource of information on alleviating or reducing pain and distress in experimental animals (including anesthetic and analgesic procedures), reducing the number of animals who must be used for research and identifying alternatives to the use of animals for specific research projects.

AWIC is the single most important resource for educating research facility personnel on their responsibilities under the AWA. There are more than 1,200 registered research facilities nationwide, and the services of the AWIC are available to all individuals at these institutions including the members of the Institutional Animal Care and Use Committees.

The AWIC staff, four full-time professionals, one technician and two part-time professionals, respond to requests for information on topics covered by the AWA including alternatives to painful procedures, unproved methodologies, training, environmental enrichment for nonhuman primates, and checking for unintended duplication. The staff conducts training, present at meetings, exhibit at conferences, produce documents, maintain a website and work on special projects.

The AWIC website (<http://www.nal.usda.gov/awic>), which receives approximately 45,000 hits per month, is a growing medium of information dissemination that needs to be expanded and updated. Annually the AWIC staff fills about 20,000 requests for specific publications and has provided reference services in response to more than 1,500 requests.

The AWIC appropriation has remained at \$750,000 since its establishment 15 years ago, and over time this has increasingly restricted the services that AWIC is able to provide. In addition, the National Agricultural Library (NAL) and the Agriculture Research Service (ARS) have been collecting "overhead" from AWIC, leaving the Center with a mere \$365,000 to operate—less than half of their appropriation! This siphoning off of AWIC's resources warrants an inquiry. A cap on monies provided to ARS and NAL is needed.

Additional funds will permit AWIC to sponsor workshops in different regions of the country and to develop web-based interactive training modules to educate the regulated community and thereby increase compliance with the Animal Welfare Act. The website would be expanded with additional material and an updated search engine to maximize the data available and the efficiency of obtaining it.

A \$500 thousand Appropriation is needed for APHIS/Animal Care's Enforcement of the Horse Protection Act

Congress adopted the Horse Protection Act (HPA) more than 30 years ago yet soring of Tennessee Walking Horses continues to be a widespread problem. Soring is defined by APHIS as "the application of any chemical or mechanical agent used on any limb of a horse or any practice inflicted upon the horse that can be expected to cause it physical pain or distress when moving." Horses are sored to produce an exaggerated gait.

The most effective method of reducing the showing of horses who have been sored is to have Animal Care (AC) inspectors present at the shows. AC has been restricted to attending about 10 percent of horse shows because of insufficient funds. Unless funding is provided to enable AC to attend more events, the industry will continue to defy the law with impunity. Certain members of the Walking Horse industry with a careless disregard for the HPA have utilized a variety of strategies to prevent fair and proper enforcement of this law. The current effort to undermine the law is to deny inspectors the ability to use digital palpation of the pastern to determine soreness in horses. Use of digital palpation, an accepted veterinary diagnostic technique, is vital to AC's ability to enforce the law.

Lack of financial support has made it necessary for AC to rely heavily on the industry to assume responsibility for enforcement of the law. This is the same industry that has turned a blind eye to compliance with the law since 1970! "Designated Qualified Persons" (DQPs) are the "inspectors" from industry who are supposed to assist AC in identifying sore horses and pursuing action against the individuals who are responsible. The history of DQPs reveals their failure to achieve the level of enforcement of the unbiased, well-trained, professional AC inspectors. The gap is widening between the enforcement when AC inspectors are present versus the level of enforcement by unsupervised DQPs, clearly demonstrating the abysmal failure of the industry to regulate itself. For example, in fiscal year 1999 the rate at which DQPs turned down horses for soring was .44 percent. The turndown rate more than tripled to 1.49 percent when government inspectors were present to oversee the activities of the DQPs. The record was still worse for certain Horse Industry Organizations like the Kentucky Walking Horse Association; there was a nearly 12-fold increase in horses who were turned down for soring when AC inspectors were present as compared to when DQPs were unsupervised!

We respectfully request that the Subcommittee resist all efforts by the industry to restrict AC's ability to enforce the Horse Protection Act. An increase in appropriations to \$500,000 would permit AC to attend a greater percentage of horse shows, thereby ensuring significantly stronger compliance with the HPA.

A \$16.2 Million Appropriation is needed for Wildlife Services' Oral Vaccine Effort Against Rabies.

Wildlife Services (WS) has been involved in a wildlife rabies vaccine program which uses treated baits in an effort to curb the spread of rabies. An appropriation of \$16.2 million is needed to continue the expansion of regional barriers. Resources should be maximized to address the rabies threat. We encourage that full funding be provided for this critical effort: \$7.8 million through legislative appropriations and \$8.4 million through the Commodity Credit Corporation. These funds will be used to assist participating states by: (1) continuing the vaccination program in Texas to control and eliminate gray fox rabies, while maintaining an effective barrier to prevent the reintroduction of canine rabies in coyotes, (2) maintaining the vaccination barrier in Ohio and West Virginia to keep raccoon rabies from advancing along the Ohio River Valley, (3) increasing existing vaccination barrier zones and establishing new critical barriers in the New England States and New York State to contain raccoon rabies and to establish raccoon rabies-free areas in the northeastern United States, with the ultimate goal of merging regional programs in Ohio and New York State, and (4) establishing a regional vaccination barrier pro-

gram in the Southeastern United States to prevent the westward spread of raccoon rabies through Alabama and Louisiana.

Congress needs to provide increased Oversight of Wildlife Services' Operations and Research.

Wildlife Services (WS) needs to utilize a variety of tools for management of wildlife under its purview. However, it is essential that these tools are effective and publicly acceptable.

WS needs to begin a phase out of steel jaw leghold traps. Leghold traps slam shut with bonecrushing force on the limbs of their victims, tearing ligaments and tendons, severing toes and causing excruciating pain. These traps, opposed by the vast majority of Americans, have been condemned as "inhumane" by the American Veterinary Medical Association, the American Animal Hospital Association and the World Veterinary Association. On December 11, 1997, the U.S. Government reached an "understanding" with the European Union in which the U.S. agreed to phase out use of "conventional steel jawed leghold restraining traps." WS has the responsibility of complying with the U.S. obligation by ending its use of these barbaric devices.

WS should begin by immediately prohibiting use of leghold traps for 3 species for which there is extensive documentation that effective, publicly acceptable, less cruel alternatives exist. These species are raccoon, beaver and opossum. While we believe that this policy should extend to all species, there is no justification for refusing to implement this modest step in alleviating unnecessary animal suffering at once.

WS should pursue no further testing of leghold traps as this would be an extremely wasteful use of taxpayer money and cause unnecessary animal cruelty. Previously, funds designated for trap research were merely passed on to a nongovernmental organization to utilize as it saw fit, without involvement and oversight from WS. If funds are allocated for trap testing, WS should conduct the research since the agency has the appropriate technical expertise.

Further, WS should adopt a policy of checking all restraining traps within a 24-hour period. A wealth of scientific studies documents the fact that the longer an animal is in a restraining trap, the greater the injury. For this reason, the majority of states have a daily trap check requirement. Animals should not be subjected to long-drawn out pain because of a failure to assume the responsibility of carefully checking traps every day. This policy will help reduce the trauma experienced by non-target animals, too, ensuring that more of these animals will be able to be released alive.

PREPARED STATEMENT OF THE TEXAS A&M UNIVERSITY SYSTEM

Mr. Chairman and members of the Committee, I am Ed Hiler, Vice Chancellor for Agriculture and Life Sciences in The Texas A&M University System. I appreciate the opportunity to describe a few exciting research projects we have underway, and to ask for your support for continued Federal funding. New technology is the life blood of American agriculture. With the 1996 Farm Bill and resulting phase down in Federal farm programs, it is imperative that research continues providing a technological underpinning for agriculture. Today, I will briefly describe several examples of how we can provide this underpinning to benefit both agriculture and consumers.

DEVELOPING FRUITS, VEGETABLES AND OTHER FOOD PLANTS FOR PREVENTION OF LIFE-THREATENING DISEASES

I want to begin by describing an exciting research area that is joint between agriculture and medicine. Diet-related diseases—certain kinds of cancer, heart disease, stroke, atherosclerosis, and diabetes mellitus—are leading causes of two-thirds of the 2 million deaths that occur in the United States each year. These diseases also have long term costs associated with lost productivity and disease treatment. Scientists are identifying plant "phytochemicals" in food plants that prevent these diseases. Plant breeders, biochemists, and biotechnologists are working to increase levels of the compounds through conventional breeding and new molecular techniques. Our objectives seek to reduce the risk of, or to slow or even prevent diseases such as cancer, heart disease, stroke, and atherosclerosis. Researchers at the Texas A&M Vegetable and Fruit Improvement Center, Institute of Food Science and Engineering, and the Borlaug Crop Biotechnology Center will work with fruit and vegetable producers, seeds producers, and food processors to develop commercially viable products available for all Americans. Scientists at the Texas A&M University-Kingsville Citrus Center, University of Texas Southwest Medical Center in Dallas, Texas A&M University Health Science Center, Baylor College of Dentistry, and South Carolina

Cancer Center within the University of South Carolina will cooperate in designing improved food crops for prevention of diseases. Consumers, health care providers, farmers, and government will benefit from the production, consumption, and health effects of producing and consuming these improved plants. We are requesting increased funding for this important continuing project at \$2,000,000 for fiscal year 2002.

POLLUTANTS, ODOR, AND DUST FROM CONCENTRATED ANIMAL FEEDING OPERATIONS IN THE SOUTHERN HIGH PLAINS

The semiarid western United States of Texas, Kansas, Oklahoma and New Mexico produce over one-third nationally of beef and dairy cattle fed in confinement. The region likewise has experienced explosive growth of the dairy industry and large scale, multiple-site swine feeding operations. This industry growth has intensified public concern about effects of air pollution (noxious gases, odors and dust events) from these Concentrated Animal Feeding Operations, or CAFOs. To address public concern, the Texas A&M University System and Kansas State University propose to establish a national program for research and technology transfer of methodologies that agricultural producers, processors, and managers of CAFOs can use to economically comply with air pollution regulations mandated by the Federal Clean Air Act (FCAA) and required by State Air Pollution Regulatory Agencies (SAPRAs). The goal of this initiative will be a reduction of public exposure of pollutants from agricultural operations while minimizing the economic burden on managers of agricultural operations. We are requesting funding for this project at \$1,000,000 for fiscal year 2002.

INCREASING FOOD SAFETY THROUGH ADVANCED MOLECULAR TECHNOLOGIES]

Food safety is among the greatest concerns of the public, particularly safety of the nation's supply of meats, fruits, and vegetables. Foods contaminated with animal wastes and other sources of bacterial pathogens annually cause millions of illnesses and thousands of deaths. In this initiative, we are seeking appropriations to develop and test the application of advanced molecular technologies for enhancing the safety of the nation's food supply. New and rapidly advancing molecular technologies promise to make possible the early and economical tracking and investigation of such pathogens. They also will significantly increase our ability to determine sources of outbreaks and to anticipate the effects of food production and processing practices on the ability of these organisms to cause disease. The Texas and Iowa Agricultural Experiment Stations and Texas Tech University propose cooperative public-private research needed to put such technologies in place throughout the nation and the world. The requested resources will strengthen coordination among Iowa State University, the Institute of Food Science and Engineering at Texas A&M University, and The Center for Research on Animal Production Issues at Texas Tech University. We estimate that implementing this initiative will begin a process that reduces numbers of medical cases associated with food borne pathogens by 210,000 and the numbers of deaths by 380. We are requesting funding for this project at \$1,250,000 for fiscal year 2002.

PROTECTING U.S. AGRICULTURE FROM BIO-TERRORISM AND EXOTIC BIO-INVASERS

Bio-terrorism is a significant threat to the U.S. agricultural system and the U.S. food supply. The threat of biological weapons during the Gulf War, the planned use of chemical and biological agents by terrorists in Japan's subways, and a deeper understanding of the former USSR's bio-weapons program, underscores the potential threat of bio-terrorism to the U.S. population, its food supply, and the entire U.S. agricultural system. Genetically engineered bio-agents greatly expands the list of naturally occurring biological invaders and underscores the importance of early detection of bio-agents introduced into the U.S. from other parts of the world. An integrated system for protecting U.S. agriculture and its food supply against the threat of bioterrorism is recognized as an increasingly high priority addition to similar systems for protecting humans and cyberspace. The system will also work for natural or accidental outbreaks of animal and plant disease resulting from introduction of exotic bio-agents. The proposed agricultural bio-security system will include a surveillance network using GPS and satellite imaging technology, field and laboratory based diagnostic capacity deploying DNA-chip technology to identify and characterize bio-agents, and a geo-referenced information system for predicting and tracking the spread of bio-agent after introduction. The system will include means to support intervention and mitigation following attack. We will develop the system in partnership with the USDA's Agricultural Research Service, other universities, and

the private sector. We are requesting funding for this project at \$7,000,000 for fiscal year 2002.

The next few initiatives are collaborative efforts that are currently funded. This funding is greatly appreciated. My purpose in commenting on each initiative is to urge their continued funding in this next fiscal year.

EFFICIENT IRRIGATION FOR WATER CONSERVATION IN THE RIO GRANDE BASIN

Recent drought conditions in the border region of the Rio Grande Basin highlight the importance of ample water resources for the region's economy and environment. More efficient agricultural and urban irrigation systems can conserve large amounts of water that can be used for other purposes. The objective of this two-state initiative is to increase the efficiency of agricultural and urban landscape irrigation and encourage development of efficient water markets in the basin. We are requesting continued funding for this project at \$3,750,000 for fiscal year 2002.

ANIMAL FIBER RESEARCH

We seek appropriations to continue wool, mohair and cashmere research that will stabilize and increase the profitability of the sheep, Angora, and cashmere goat industries in the United States and Texas while providing U.S. consumers with high quality animal fibers at internationally competitive prices. In this three-state initiative, emphasis will be placed on the development and expanded use of objective fiber measurements in the areas of nutrition, management, selection, harvesting, and marketing. We are requesting funding for this project at \$300,000 for fiscal year 2002.

FARM-LEVEL IMPACTS OF AGRICULTURAL POLICY

We need continued funding to conduct agricultural policy research that directly supports congressional committees involved in setting agricultural policy. This two-state research activity emphasizes the regional and farm-level effects of alternative agricultural policies on crop producers. Monitoring performance at the farm level continues to be particularly critical as government explores its role in providing an income safety net for American agriculture. We are requesting funding for this project at \$750,000 for fiscal year 2002.

LIVESTOCK AND DAIRY POLICY ANALYSIS

We need funds to allow Texas A&M University and Cornell University to conduct agricultural policy research on the livestock and dairy industries that will assist congressional committees in developing new legislation for agricultural programs. We will analyze legislative options to determine policy impacts on various sectors of the agricultural economy, markets and land prices. Monitoring the performance of the dairy sector at the farm level will be particularly critical at a time of regulatory dairy policy reform mandated by the 1996 Farm Bill and government roles in providing an income safety net for American agriculture. We are requesting funding for this project at \$925,000 for fiscal year 2002.

CENTER FOR NORTH AMERICAN STUDIES

This two-state funding initiative, which has received continual support from Congress since fiscal year 1994, would continue and expand the programs of the Center for North American Studies headquartered in The Texas A&M University System. The Center provides leadership for the promotion of stronger agricultural relationships among Canada, Mexico and the United States through cooperative study, research, policy analysis and training. We are requesting funding for this project at \$925,000 for fiscal year 2002.

SHRIMP AQUACULTURE RESEARCH

Federal support is needed to maintain continued funding for ongoing efforts and to expand programs of the U.S. Marine Shrimp Farming Program (USMSFP). This program, currently funded by the USDA/Cooperative State Research, Extension and Education Service (CSREES) through the Oceanic Institute in Hawaii and the Gulf Coast Research Laboratory Consortium as based in the Texas Agricultural Experiment Station and The Texas A&M University System Agriculture Program. We are requesting funding for this project at \$5,000,000 for fiscal year 2002.

INTERNATIONAL GOAT RESEARCH AT PRAIRIE VIEW A&M UNIVERSITY

Congressional funds are sought to continue the effort supporting dairy and meat goat research at the International Goat Research Center at Prairie View A&M University, a member of The Texas A&M University System. We are requesting funding for this project at \$750,000 for fiscal year 2002.

NEW PRODUCTS FROM RANGELANDS AT TEXAS A&M UNIVERSITY-KINGSVILLE

Congressional funds are sought to continue research efforts to support the commercialization of new industrial and food crops from native plants—such as cacti and mesquite—from arid lands, greatly benefitting Americans who live in the southwestern United States. We are requesting funding for this project at \$120,000 for fiscal year 2002.

SOUTHERN PLAINS COTTON RESEARCH AND EDUCATION CONSORTIUM

The cotton industry in the Southern Plains is under unprecedented stress from declining prices due to strong global competition, improved boll weevil management, and increased cotton acreage in the southeastern U. S. An agricultural research and education consortium composed of Texas Tech University, the Texas Agricultural Experiment Station, the Texas Agricultural Extension Service, and USDA Agricultural Research Service has been formed to address these challenges in the Southern Plains. The consortium proposes to initiate a five-year, \$27.5 million program to increase profits of Southern Plains cotton farmers and processors. The effort will accomplish its goal by developing and disseminating improved cotton germplasm, crop management practices, pest control programs, textile processing technologies, and marketing programs. We are requesting funding for this project at \$5,500,000 for fiscal year 2002.

AGRICULTURE AND THE ENVIRONMENT—LANDSCAPE ISSUES

The focus of the Texas Institute for Applied Environmental Research is on agriculture and the environment. Funding for this initiative will be used to continue development of (1) conceptual approaches that can be used to resolve environmental problems in agriculture while maintaining the competitiveness of the industry, (2) modeling tools that analyze policy alternatives to determine their effectiveness in achieving environmental objectives and their economic impacts on the targeted industry, and (3) implications of smart growth initiatives on production agriculture. We are requesting funding for this project from USDA at \$1,500,000 for fiscal year 2002.

PREPARED STATEMENT OF THE U.S. APPLE ASSOCIATION

The U.S. Apple Association (USApple) appreciates the opportunity to provide this testimony on behalf of our nation's apple industry.

Our testimony will focus on the following three areas: the Market Access Program (MAP); Food Quality Protection Act (FQPA) implementation; and Agricultural Research Service (ARS) funding.

USApple is the national trade association representing all segments of the apple industry. Members include 40 state and regional apple associations representing the 9,000 apple growers throughout the country as well as more than 500 individual firms involved in the apple business. Our mission is to provide the means for all segments of the U.S. apple industry to join in appropriate collective efforts to profitably produce and market apples and apple products.

Assistance for Apple Growers.—USApple urges Congress to provide apple growers with fair and equitable inclusion in any farm relief program that may help apple growers survive the current devastating economic crisis.

Apple growers lost an estimated \$760 million between 1995 and 1998 due to unfairly priced imports of apple juice concentrate, adverse weather conditions, continuing retail consolidation and rising regulatory costs among other factors beyond their control. Current apple prices, which are as much as 40 percent below grower production costs, are pushing apple growers deeper into financial crisis.

Congress provided \$100 million in market loss assistance and \$38 million in crop loss assistance for apple growers as part of the fiscal 2001 Agricultural Appropriations act (Public Law 106-387). It provides Commodity Credit Corporation funds to compensate apple growers for recent devastating market and crop losses. However, this assistance is not adequate to sustain America's apple growers through the current economic crisis.

Market Access Program (MAP).—USApple strongly supports increasing the annual appropriation for MAP from \$90 million to \$200 million.

All segments of the U.S. apple industry benefit directly from the use of export promotion funds, which increase export demand. In fiscal year 2001, the apple industry received approximately \$3 million in MAP export-development funds. These funds are matched by grower funds, and are used to promote apples in more than 20 countries throughout the world. Since 1987, when the apple industry first utilized MAP funds, apple exports have increased by 49 percent.

The U.S. apple industry faces keen competition around the globe from competitors who receive significant government funds for generic promotions. The governments of our foreign competitors spend approximately \$500 million on export promotion and market development. It has become increasingly difficult for U.S. exporters to compete with European and Chinese producers who receive massive government assistance. Increased funding for this critical program will assist U.S. apple producers to better compete and revive export demand in countries recently hit by adverse economic conditions.

Food Quality Protection Act (FQPA) Implementation.—USApple strongly supports full funding for the following programs intended to facilitate fair FQPA implementation and to offset its anticipated negative impact on apple growers.

Specifically, USApple supports the U.S. Department of Agriculture's following budget requests.

- \$20 million for the Pesticide Data Program, administered by the Agricultural Marketing Service (AMS);
- \$7.3 million for the National Agricultural Statistics Service (NASS) pesticide-usage surveys;
- \$2.6 million for the Office of Pest Management Policy administered by the Agricultural Research Service (ARS);
- \$4.1 million for minor-use registration of crop protection tools (IR-4) administered by ARS;
- \$16 million for area-wide Integrated Pest Management research administered by ARS;
- \$20 million for the Integrated Pest Management Research Grant Program administered by the Cooperative State Research, Extension and Education Service (CSREES);
- \$12 million for minor-use registration of crop protection tools (IR-4) administered by CSREES; and
- \$14.3 million for the Pesticide Impact Assessment Program, Regional Crop Pest Management Information Centers, Crops at Risk, and Risk Avoidance and Mitigation Program all administered by CSREES.

Temperate Fruit Fly Research Position—Yakima, Wash.—USApple requests continued funding of \$300,000 to conduct critical research at the USDA-ARS laboratory in Yakima, Wash. on temperate fruit flies, a major pest of apples.

FQPA implementation is expected to significantly reduce the number of pesticides currently available to growers for the control of pests such as cherry fruit fly and apple maggot. Left unchecked, these temperate fruit flies can be devastating. Research is critically needed to develop alternative pest controls should growers lose access to presently available crop protection tools as a result of FQPA implementation.

Congress appropriated \$300,000 last fiscal year for this critical position. We request that the committee appropriate \$300,000 for this position in fiscal year 2002.

Post Harvest Quality Research Position—East Lansing, Mich.—USApple requests that the committee provide continued funding of \$309,600 for postharvest-quality research at the ARS laboratory in East Lansing, Michigan.

This facility is conducting research that is critical to the future economic recovery of the apple industry. Using a series of new sensing technologies, researchers at the East Lansing facility are developing techniques that would allow apple packers to measure the sugar content and firmness of each apple before it is shipped to consumers. Research has shown that consumers will increase purchases of high quality products that consistently meet their expectations. We believe consumers will eat more apples if this technology is fully developed and employed, by our industry.

Congress appropriated \$309,600 last fiscal year for this critical position. We request that the committee continue to provide funding for this critical research in fiscal year 2002.

Fireblight Research—Kearneysville, W.Va.—USApple requests that the committee provide increased funding of \$220,000 for fireblight tissue culture research at the ARS Appalachian Fruit Research Station in Kearneysville, W.Va.

Fireblight is a devastating disease that threatens apple growers in all apple growing regions. This disease has become more prevalent and even more difficult to con-

trol as growers have shifted production to several popular new apple varieties on rootstocks that are especially susceptible to fireblight.

Fireblight is a bacterial disease typically controlled with timely applications of antibiotics. However, various Federal agencies are reevaluating agricultural uses of antibiotics due to concerns that these uses may contribute to human resistance to antibiotics. Meanwhile, fireblight strains are becoming resistant to the apple industry's only antibiotic tool to control fireblight. This new funding is needed to find new alternative controls to antibiotics using tissue culture research and genetic engineering.

We request that the committee provide an increase of \$220,000 for this important research in fiscal year 2002.

The U.S. Apple Association thanks the committee for this opportunity to present testimony in support of the U.S. apple industry's Federal agricultural funding requests.

PREPARED STATEMENT OF ASSOCIATION COORDINATION COUNCIL (ACC), THE NATIONAL LABOR COORDINATION COUNCIL (NLCC), AND THE UNION COORDINATION COUNCIL (UCC)

Chairman Cochran, Ranking Member Kohl, and members of the Subcommittee, I am Michelle Corridon, Communications Chairperson for the ACC, NLCC, and UCC. I thank you for this opportunity to offer comments on the proposed Department of Agriculture of Budget for fiscal year 2002.

INTRODUCTION

For the past three years, the Association Coordination Council (ACC), the National Labor Coordination Council (NLCC), and the Union Coordination Council (UCC) have been working together on issues of substance, which will maximize customer service and provide employees with a positive working environment. Our councils represent a coalition of employees who are located in both the USDA Field Service Centers and headquarters locations who work for the Farm Service Agency (FSA), Rural Development (RD) and the National Resources and Conservation Services (NRCS). We are the employees who deliver USDA programs on a daily basis and have first hand knowledge of what can be successful regarding our USDA Service Centers and the customers that we serve.

Since 1998, the Office of the Chief Information Officer (OCIO) and the Service Center Agencies have been working together to modernize the USDA Service Center Information Technology architecture. The employee coalitions have directly been involved and have supported those efforts and worked with the OCIO to secure funding for these improvements. We have taken our case to the Office of Management and Budget (OMB) and to the Congress. We are also working closely with our Service Center partners, which includes the local Soil and Water Conservation Districts. Most Service Center employees will agree that the new computers, printers, software, and telecommunications upgrades are bringing our business into the 21st century. However, the USDA modernization is only 70 percent complete and some of the additional components including GIS, will provide dramatic improvements in how we can serve our customers.

E-COMMERCE IS THE DIRECTION OF THE FUTURE

With the passage of H.R. 852, "The Freedom to E-File Act", USDA employees face the challenge that our customers will have service expectations that are greater than the level of service provided today. USDA employees are concerned that they will be on the "badside" of the digital divide. Our customers often have better equipment than the average USDA employee does and we are concerned that we will not be able to process electronic service requests as intended in the Act, the technology modernization, including the upgrading of our Service Center telecommunications system.

Our customers expect other e-commerce activities such as the sale of government owned real estate, electronic data interchange (EDI), and loan processing. Our Rural Development Guaranteed Rural Housing program lenders expect electronic processing of loan applications and loan underwriting. Lenders face the same problems as USDA employees, a lot of work with fewer employees. Web-based loan processing allows the lender to spend more time on more complicated applications while still maintaining volume. Without a web-based solution to process and underwrite loans, Rural Development and the Farm Service Agency will fall further behind in market

share. That will mean we are not serving Rural America in the manner in which we are charged.

As important as e-commerce is to our future, we all know that USDA will continue to have a large part of its customer base that is either not “e-savvy” or simply wishes to do business with us in other ways. We also have a large segment of Rural America that has traditionally not used our services such as Native American tribal organizations. Maximizing delivery of e-services and providing “mobile” technology tools will free up staff time to better address those needs.

HUMAN CAPITAL CRISIS

It is anticipated that within the next 5 years, approximately 50 percent of the USDA employee population can and will retire. We can all agree that the possibility of replacing those employees is not good. Additionally, USDA has lost about 22 percent of its employee population within the past 5 years with a corresponding increase in program level activity of approximately 78 percent. Also within that same time frame, employees have only been able to complete work that is absolutely necessary and have been unable to donate adequate time to important issues such as outreach to under served communities. For example in FSA, credit employees are mandated to provide supervised credit to borrowers. Employees have been unable to do so because of the demands of greeting borrowers, providing reports to upper management, and closing loans. USDA needs to stabilize employee numbers while updating outdated technology.

The GIS tools will save a lot of time for NRCS, FSA, and RD employees. The Old methods of designing practices such as buffer strips used to take days; with GIS now being deployed, an employee can generate options for the customer in about 15 minutes. FSA employees are using GIS maps and GPS units to measure complex CRP signup fields in hours instead of days. Many offices map oriented processes are seeing 80 to 90 percent efficiency improvements. The customer spends less time in the office, giving them more time to spend on farm management. The employee is able to assist more customers.

FARM BILL ISSUES

The crisis in the farming community will mean a hard look at the current farm bill. Most farmers and FSA employees will agree that “Freedom to Farm” is not working. Due to the economic crisis across the U.S. and the world, the open market concept has not brought economic success to our American Farmers. FSA employees are under mandate from Congress to provide assistance checks to farmers because of low prices. These employees are stretched to the limit and need modern automation tools.

WHAT IS NEEDED FOR FISCAL YEAR 2002

In order for USDA to meet its obligations to Rural America, both in the short run and for the future, we ask that you provide fiscal year 2002 funding sufficient to:

- Maintain current staffing levels to allow us to provide current services while at the same time devoting resources to modernize our program delivery.

- Complete the Common Computing Environment (CCE), as originally planned by the end of fiscal year 2002.

In terms of the CCE, we believe that it is important to continue to provide these funds continually under the OCIO so that the new equipment is not “owned and controlled” by any one of the Service Center agencies but is available to all. We also know that from the USDA Service Center Modernization Technology Blueprint published in December 2000 and through our work with the OCIO technology team, that \$100 million will be required in fiscal year 2002 to complete the CCE as scheduled. This will provide the critically needed telecommunications upgrade (\$15 million), the needed GIS/application hardware, software and enterprise license (\$44 million), the necessary labor saving tools such as digital cameras, GPS units, scanners etc. (\$32 million) and support training, architecture, and security at the levels needed to successful (\$9 million). Not funding the completion of the CCE in fiscal year 2002 will delay the benefits and stretch out the technology modernization to five years when some of the initial components begin reaching the point of needing replacement. The completion of the CCE in fiscal year 2002 and the establishment of a “refresher fund” in fiscal year 2003 will ensure that we will have a viable common technology infrastructure to provide customer service on into the future.

CONCLUSION

USDA employees are committed to serving Rural America in the finest possible manner. However, it is difficult to do this without the proper tools. Your committee has been very supportive of our modernization efforts in the past and provided some special funding for this in fiscal year 2000 and 2001. We ask that you ratchet up this support to the point that we can finish this job this year and begin providing the kind of services that our customers deserve and a work environment that makes full utilization of the skill and knowledge that our employees have to offer. Mr. Chairman, on behalf of the many employees at the Service Center agencies, I want to thank you for this opportunity to present testimony and I offer the assistance of the employee councils at any time.

PREPARED STATEMENT OF THE UNITED STATES TELECOM ASSOCIATION

SUMMARY OF REQUEST

Project Involved.—Telecommunications Loan Programs Administered by the Rural Utilities Service of the U.S. Department of Agriculture.

Actions Proposed.—Supporting RUS loan levels and the associated funding subsidy for the hardship, cost of money, Rural Telephone Bank and loan guarantee programs in fiscal year 2002 in the same amount as loan levels specified in the fiscal year 2001 Agriculture Appropriations Act, and opposing the Administration's proposal which was contained in "A Blueprint for New Beginnings" to not fund Rural Telephone Bank loans. Also supporting an extension of the language removing the 7 percent interest rate cap on cost of money loans. Also supporting continuation of the restriction on the retirement of class A Rural Telephone Bank stock in fiscal year 2002 at the level contained in the fiscal year 2001 Agriculture Appropriations Act and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund. Supporting funding in the amount of \$27 million in loan and grant authority designated for distance learning and telemedicine purposes, including allocation of \$2 million of that funding to extend the pilot program begun last year of direct loans and grants to finance broadband transmission and local dial-up Internet service in rural areas.

The United States Telecom Association (USTA) represents over 1000 local telecommunications companies that provide over 95 percent of the access lines in the United States. USTA members range from large public-held corporations to small family-owned companies as well as cooperatives owned by their customers. I am Gary Lytle, Interim President and CEO of USTA. I submit this testimony in the interests of the members of USTA and their subscribers.

USTA members firmly believe that the targeted assistance offered by a strong RUS telecommunications loan program remains essential in order to maintain a healthy and growing rural telecommunications industry that contributes to the provision of universal telephone service. We appreciate the strong support this committee has provided for the telecommunications program since its inception in 1949 and look forward to a vigorous program for the future.

This testimony is based upon the Administration's budget proposal for fiscal year 2002 entitled "A Blueprint for New Beginnings". As of the filing of this testimony, that document is the only information available concerning the President's plans for RUS for the fiscal year beginning October 1, 2001. This testimony is necessarily based upon the assumption that there are no changes from the fiscal year 2001 Agriculture Appropriations Act other than those specified in the budget blueprint. USTA respectfully requests that the Subcommittee not close the hearing record until we have had an opportunity to supplement our testimony if the full Administration budget proposal differs from the budget blueprint with respect to appropriations for the RUS Telecommunications program.

A CHANGING INDUSTRY

As Congress recognized through passage of the Telecommunications Act of 1996, telecommunications in the United States is in the midst of the most significant changes any industry has ever undergone. Both the technological underpinnings and the regulatory atmosphere are dramatically different and changing at an extraordinarily rapid pace. Without system upgrades, rural customers will be left out of the emerging information revolution.

The need for modernization of rural telecommunications technology employed by RUS borrower rural telecommunications companies has never been greater. In addition to upgrading switching capability to allow new services to be extended to rural

subscribers, it is crucially important that rural areas be included in the nationwide drive for greater bandwidth capacity. In order to provide higher speed data services, such as Digital Subscriber Line (DSL) connections to the Internet, outside plant must be modernized in addition to new electronics being placed in switching offices. With current technology, DSL services cannot be provided to customers located on lines more than three miles from the switching office. Rural areas have a significant percentage of relatively long loops and are therefore particularly difficult to serve with these higher speed connections. Rural telecommunications companies are doing their best to restructure their networks to shorten loops so that DSL may be provided, but this is not an inexpensive proposition and may not be totally justified by market conditions. However, these services are important for rural economic development, distance learning and telemedicine. RUS-provided financial incentives for additional investment encourage rural telecommunications companies to build facilities which allow advanced services to be provided. The economic externalities measured in terms of economic development and human development more than justify this investment in the future by the Federal government.

Greater bandwidth and switching capabilities are crucial infrastructure elements which will allow rural businesses, schools and health care facilities to take advantage of the other programs available to them as end users. The money spent on having the most modern and sophisticated equipment available at the premises of the business, school or clinic is wasted if the local telecommunications company cannot afford to build facilities that quickly transport and switch the large amounts of data that these entities generate. RUS funding enhances the synergies among the FCC and RUS programs targeted at improving rural education and health care through telecommunications.

The RUS program provides needed incentives to help offset regulatory uncertainties related to universal service support, interstate access revenues and interconnection rules with a reliable source of fairly priced, fixed-rate long term capital. After all, RUS is a voluntary program designed to provide incentives for local telecommunications companies to build the facilities essential to economic growth.

RUS endures because it is a brilliantly conceived public-private partnership in which the borrowers are the conduits for benefits from the Federal government which flow to rural telephone customers, the true beneficiaries of the RUS program. The government's contribution is leveraged by the equity, technical expertise and dedication of local telecommunications companies. The small amount of government capital involved is more than paid back through a historically perfect repayment record by telecommunications borrowers as well as the additional tax revenues generated by the jobs and economic development resulting from the provision and upgrading of telecommunications infrastructure. RUS is the ideal government program—it generates more revenues than it costs, it provides incentives where the market does not for private companies to invest in infrastructure promoting needed rural economic development, it allows citizens to have access to services which can mean the difference between life and death and it has never lost a nickel of taxpayer money. Furthermore, if the Administration's projected lower interest rates materialize, the already very small subsidy required to maintain this program will be even further reduced.

IMPACT OF CREDIT REFORM ON THE RURAL TELEPHONE BANK

Contrary to the intent of Congress, the interpretation of credit reform by the Office of Management and Budget (OMB) has significantly affected the operation of the Rural Telephone Bank (RTB). One of the most damaging impacts of OMB's interpretation of the credit reform law is to essentially cleave the RTB into two banks—a liquidating account bank which is responsible for pre-credit reform loans, and a financing account bank which is responsible for post credit reform loans. USTA has protested this arrangement since it began, since it prevents the relending of borrower repayments to fund new loans in direct contravention of Sec. 409 of the Bank's enabling act. This, in turn, forces the RTB to borrow unnecessarily from the Treasury to fund new loans. It also permits funds to build up in the liquidating account that were generated by GAO-documented interest rate overcharges, instead of those funds being returned through relending to the same universe of borrowers that initially generated them. OMB should adhere to Sec. 409 of the Rural Electrification Act and allow those repayments to be used to fund new RTB loans.

RECOMMENDATIONS

Continuation in fiscal year 2002 of the loan levels and necessary associated subsidy amounts for the RUS telephone loan programs that were recommended by this committee and signed into law for fiscal year 2001 would maintain our members'

ability to serve the nation's telecommunications needs, maintain universal service and bring advanced telecommunications services to rural America.

USTA strenuously objects to the proposal in the budget outline to not fund Rural Telephone Bank loans in fiscal year 2002. The proposal is fundamentally flawed. The RTB's mission is far from complete. Loans made today are to provide state of the art telecommunications technology in rural areas. Furthermore, the budget savings are miniscule. If no RTB loans were made in fiscal year 2002, at the current loan level of \$175 million, the outlay savings next year would amount to less than \$26,000, not the \$3 million quoted in the budget outline, because RTB loans are funded over a multi-year period. Moreover if administration interest rate predictions are accurate, RTB loans could potentially generate a profit for the government because there is a minimum statutory interest rate of five percent!

Not funding RTB loans will not "generate increased member and borrower support for statutorily authorized privatization". This ignores the fact that privatization of the RTB began in 1995 under the current law and is proceeding annually. Over \$115 million, or almost 20 percent, of the government's equity investment in the bank has already been retired. As a matter of fact, not funding new loans in fiscal year 2002 could actually impede privatization since the law requires that the Bank annually retire government stock at the rate of at least five percent of the amount of new loans. With no new loans, there is no minimum requirement for retirement of government stock.

For a number of years, through the appropriations process, Congress has eliminated the seven percent "cap" placed on the insured cost-of-money loan program. The elimination of the cap should continue. If long term Treasury interest rates exceeded the 7 percent ceiling contained in the authorizing act, adequate subsidy would not be available to support the program at the authorized level. This would be extremely disruptive and hinder the program from accomplishing its statutory goals. Accordingly, USTA supports continuation of the elimination of the seven percent cap on cost-of-money insured loans in fiscal year 2002.

The restriction on the retirement of the amount of class A stock by the Rural Telephone Bank, adopted in fiscal 1997, should be continued. The Bank is currently retiring Class A stock in an orderly, measured manner as current law requires. This should continue. The Committee should also continue to protect the legitimate ownership interests of the Class B and C stockholders in the Bank's assets by continuing to prohibit a "sweep" of those funds into the general fund.

Recommended Loan Levels

USTA recommends telephone loan program loan levels for fiscal year 2002 as follows:

| | |
|--|--------------------------|
| | [In millions of dollars] |
| RUS Insured Hardship Loans (5 percent) | 75 |
| RUS Insured Cost-of-Money Loans | 300 |
| Rural Telephone Bank (RTB) Loans | 175 |
| Loan Guarantees | 120 |
| Broadband Pilot Program | 100 |
| | <hr/> |
| Total | 770 |

Distance Learning and Telemedicine

USTA strongly supports the loan and grant proposal and recommends its funding for fiscal year 2002 at the levels adopted in last year's Agriculture Appropriations Act, that is, \$27 million for loans and grants. This program is a perfect complement to the traditional RUS telecommunications loan programs. For distance learning and telemedicine to become a reality, schools and hospitals need training and equipment. Similarly, local telecommunications companies need modern infrastructure to connect these facilities to the telecommunications network.

USTA also supports continued allocation of \$2 million of this appropriation for the pilot program of loans and grants to finance broadband transmission and local dial up access to the Internet in rural areas. In its initial year, \$100 million of loans for these important purposes were made. RUS was founded on the notion that rural Americans should have no lesser service, facilities and prices for telephone service as those living in more densely populated, lower cost areas. As we move into the Information Age, in which increases in productivity, economic development, education and medicine can greatly benefit from the tremendous potential of the Internet, it is a continuation of the historic mission of RUS to support the extension of vital new services to rural America.

CONCLUSION

Our members take pleasure and pride in reminding the Subcommittee that the RUS telecommunications program continues its perfect record of no defaults in over a half century of existence. RUS telecommunications borrowers take deadly seriously their obligations to their government, their nation and their subscribers. They will continue to invest in our rural communities, use government loan funds carefully and judiciously and do their best to assure the continued affordability of telecommunications services in rural America. Our members have confidence that the Subcommittee will continue to recognize the importance of assuring a strong and effective RUS Telecommunications Program through authorization of adequate loan levels.

PREPARED STATEMENT OF THE UNIVERSITY OF SOUTHERN MISSISSIPPI POLYMER
INSTITUTE

Mr. Chairman, distinguished Members of the Subcommittee, I would like to thank you for this opportunity to provide testimony describing ongoing research and commercializing efforts of The University of Southern Mississippi (USM) and the Mississippi Polymer Institute. I am very grateful to the Subcommittee for its leadership and the continued support of the Institute and its work. This testimony will include an update on the progress of the Institute since my testimony of approximately one year ago. During the past year, our efforts have focused principally on two commercialization thrusts. One effort involves our novel, agricultural-based inventions in emulsion polymerizations, and the other is to produce a commercial, formaldehyde-free, soybean derived adhesive for a variety of composite board materials, i.e., particleboard or oriented strand board (OSB). During the past year, we have continued to refine the adhesive and have made much progress. We are optimistic that these materials will be of commercial quality. I will discuss the progress made with the two inventions separately in order to offer more clarity.

In the case of castor and soy oil, we have designed and synthesized several more novel monomers or polymer building blocks that offer state-of-the-art technology. For instance, the attributes of the technology includes the ability to produce odor free, solvent free, non-polluting latex coatings. This represents best-available-technology for the production of solvent free latex coatings. The success of the technology depends on the use of agricultural materials as a building block of emulsion derived polymers offering a new opportunity for ag derived materials as a raw material in the polymer industry. By contrast, contemporary latex coatings contain 250 grams/liter or more of air pollutants or volatile organic content (VOC) per gallon. Moreover, this novel technology, if practiced, would allow governmental regulatory agencies to tighten the restrictions on volatile organic content (VOC) emissions of applied coatings without harm to the coatings industry. The fundamental scientific principles regarding its mode of action have been confirmed, yet additional data must be collected as even more novel monomers, or polymer building blocks are designed and synthesized. We have identified emulsion polymerization as a synthetic technique particularly suited for use of these materials. We have also found that it holds much promise in ultraviolet cured polymers in that hard, scratch resistant coatings are produced in seconds from this novel technology. We have utilized this technology in the design and fabrication of industrial coatings that offer high performance, flexible, and non-blocking products. We have secured a pilot scale manufacturing facility for this material and as a result can produce 20 gallons of product per run. Financial assistance was obtained via the USDA SBIR division via competitive grant applications. We have met our SBIR objectives for Phase I and have thus submitted a Phase II award grant application. As a result of this work, we are now able to provide sufficient quantities of product to prospective users of this technology. We have sampled many interested parties and are in continuing negotiations with several firms regarding commercialization.

Over the past year, several new patents have been obtained from the U.S. Patent office protecting this technology. Foreign patent filings have also been affected. Two new patent applications are anticipated for submission to the U.S. Patent office within the next few weeks. Negotiations are also underway with Pentagon officials to obtain "Green Seal" certification for paints formulated from this technology. Paints have been formulated and submitted which, in our hands, meet the Green Seal requirements. However, the formulated coating is, at this writing, being evaluated by outside testing laboratories. Should the formulated paint meet the Green Seal requirements, and we have no reason to believe that it will not, we expect an order(s) from the Pentagon for coatings to be used in the Pentagon.

In summary, commercialization efforts have continued over the past year. New patents have been approved, new patent applications have been submitted, a pilot scale manufacturing process has been implemented, a USDA SBIR grant has been obtained to assist in the development of this technology, new industrial coatings have been designed, manufactured, formulated, and tested and formulation efforts have been directed toward the generation of finished goods, i.e., high performance, low odor, and low VOC coatings. We are optimistic that sales of these ag derived products will commence during 2001!

In yet another of our novel ag based technologies, we have developed formaldehyde-free adhesives for use in the composites industry, specifically for particleboard and oriented strand board. The new adhesives are composed of more than 98 percent agricultural products and are comparable in properties with traditional formaldehyde adhesives. Formaldehyde emissions are regulated as formaldehyde is considered a potential cancer producing agent. Consequently, there is a move afoot to remove formaldehyde from articles of commerce. This work continues to be refined. More specifically, water absorption values have been too high and efforts have been underway during 2000 to reduce water absorption values. This goal has been met but at a slight cost; i.e., a slight reduction in internal bond strength. Thus, continual modification or property adjustments are necessary and will be the focus of work during the 2001 year. If successful, this work would provide an additional and substantial outlet for America's soy bean farmers.

In 1983, the Mississippi Legislature authorized the Polymer Institute at USM to work closely with emerging industries and other existing polymer-related industries to assist with research, problem-solving, and commercializing efforts. During the past year, seventeen new polymer-related industries have located in Mississippi. In particular, during the past four years Sunbeam-Oster, Dickten and Masch, Wellman, and Kohler have constructed facilities approaching a cost of 1.4 billion dollars and each has commented on polymer science and engineering as a significant factor in their decision to locate near to The University of Southern Mississippi and the Mississippi Polymer Institute.

The Institute provides industry and government with applied or focused research, development support, and other commercializing assistance. This effort complements existing strong ties with industry and government involving exchange of information and improved employment opportunities for USM graduates. Most importantly, through basic and applied research coupled with developmental and commercializing efforts of the Institute, the Department of Polymer Science continues to address national needs of high priority.

The focus of my work is commercialization of alternative agricultural crops in the polymer industry. This approach offers an array of opportunities for agriculture as the polymer industry is the largest segment of the chemical products industry in the world, and heretofore has been highly dependent upon petroleum utilization. However, my efforts are directed to the development of agricultural derived materials that will improve our nation's environment and reduce our dependence on imported petroleum. As farm products meet the industrial needs of the American society, rural America is the benefactor. Heretofore, this movement to utilize alternative agricultural products as industrial raw materials has received some attention but much less than opportunities warrant. Your decisions are crucial to the accomplishment of these goals as funding from this Subcommittee has enabled us to implement and maintain an active group of university-based polymer scientists whose energies are devoted to commercializing alternative crops. We are most grateful to you for this support and ask for your continued commitment.

The faculty, the University, and the State of Mississippi are strongly supportive of the Mississippi Polymer Institute and its close ties with industry. Most faculty maintain at least one industrial contract as an important part of extramural research efforts.

Polymers, which include fibers, plastics, composites, coatings, adhesives, inks, and elastomers, play a key role in the materials industry. They are used in a wide range of industries including textiles, aerospace, automotive, packaging, construction, medical prosthesis, and health care. In the aerospace and automotive applications, reduced weight and high strength make them increasingly important as fuel savers. Their non-metallic character and design potentials support their use for many national defense purposes. Moreover, select polymers are possible substitutes for so-called strategic materials, some of which come from potentially unreliable sources.

As a polymer scientist, I am intrigued by the vast opportunities offered by American agriculture. As a professor, however, I continue to be disappointed that few of our science and business students receive training in the polymer-agricultural discipline as it offers enormous potential. The University of Southern Mississippi and the Mississippi Polymer Institute are attempting to make a difference by showing

others what can be accomplished if appropriate time, energy, and resources are devoted to the understanding of ag based products.

I became involved in the polymer field 37 years ago and since that time, have watched its evolution where almost each new product utilization offered the opportunity for many more. Although polymer science as a discipline has experienced expansion and a degree of public acceptance, alternative agricultural materials are an under-utilized national treasure for the polymer industry. Moreover, there is less acceptance of petroleum derived materials today than ever before and consequently the timing is ideal for agricultural materials to make significant inroads as environmentally friendly, biodegradable, and renewable raw materials. These agricultural materials have always been available for our use, yet society for many reasons, has not recognized their potential. The following examples are included and represent opportunities other than those already described which supports this tenet:

—A waterborne, waterproofer has been designed and formulated with the help of several natural products. The material functions as a waterproofer yet is carried in water. However, after application to the intended substrate, typically wood or cementous products, the material becomes hydrophobic and highly water resistant. We have collected two and one-half years of exposure data on this product with excellent success. We have made additional contacts with industrial firms during the year in hopes for commercialization but industry is complacent and no driving force for change exists. For instance, unless VOC emission laws are tightened, little movement will be toward new, environmentally friendly, products. However, we will continue our efforts to promote the use of ag based products offering improved environmental attributes, i.e., high performance accompanied by low odor and low VOCs.

—We have exploited the potential of lesquerella, a crop that produces a triglyceride similar to castor oil. Several high performance products have been prepared and include polyesters, stains, foams, pressure sensitive adhesives, and 100 percent solid ultraviolet (UV) coatings. This technology was highlighted at the AARC/NASDA meeting in Washington, DC. We have developed a cooperative relationship with Alcorn State University, Lorman, MS to grow and thus evaluate the agronomics of lesquerella as a new crop for Southeastern U.S. region. Consequently, we have fabricated ag based foams for use as weed retardant mulches. The new foams are under test as this report is being written.

U.S. agriculture has made the transition from the farm fields to the kitchen tables, but America's industrial community continues to be frightfully slow in adopting ag based industrial materials. The prior sentence was included in my last testimony and rings true one year later as I write this report. However, we must continue to aggressively pursue this opportunity and in doing so:

—Intensify U.S. efforts to commercialize alternative crops and dramatically reduce atmospheric volatile organic content emissions. The result will be much cleaner air for all Americans.

—Reduce U.S. reliance on imported petroleum.

—Maintain a healthy and prosperous farm economy.

—Foster new cooperative opportunities between American farmers and American industry.

Mr. Chairman, your leadership and support are deeply appreciated by the entire University of Southern Mississippi community. While I can greatly appreciate the financial restraints facing your Subcommittee, I feel confident that further support of the Mississippi Polymer Institute will continue dividends of increasing commercialization opportunities of agricultural materials in American industry. Advances in polymer research are crucial to food, transportation, housing, and defense industries. Our work has clearly established the value of ag products as industrial raw materials and we must move it from the laboratories to the industrial manufacturing sector. Only then can the U.S. enjoy a cleaner and safer environment which these technologies offer, as well as new jobs, and expanded opportunities for the U.S. farmer. We are most grateful for the support you have provided in the past. The funding you have provided has allowed the laboratory work to be conducted, yet we are at the crossroads of commercialization and additional funds are needed to take this technology from the laboratory to manufacturing and to the market place. Moreover, past funding has been essentially level with some slight increases.

Since our testimony last year we have reached new levels of commercializing efforts. The technology has matured and marketing and sales must move parallel with continued commercial development of new products. Thus, we are in need of additional resources to take these technologies to the market place and to continue our developments of other exciting technologies. We therefore respectfully request \$1.5 million in Federal funding to more fully exploit the potentials of commercializing the technologies described herein. When we are successful, our efforts will be recognized

as instrumental in developing a “process” for commercialization of new ag based products. That is, we will have taken a technology from the “idea” stage to commercialization. The development of this process, and to show it successful, is extremely important to all entrepreneurs who believe in ag based products. Thank you Mr. Chairman and Members of the Subcommittee for your support and consideration.

PREPARED STATEMENT OF THE UPPER MISSISSIPPI RIVER BASIN ASSOCIATION

The Upper Mississippi River Basin Association (UMRBA) is the organization created 20 years ago by the Governors of Illinois, Iowa, Minnesota, Missouri, and Wisconsin to serve as a forum for coordinating the five states’ river-related programs and policies and for collaborating with Federal agencies on regional water resource issues. As such, the UMRBA has an interest in the budget for the U.S. Department of Agriculture’s conservation programs and technical assistance.

Funding for conservation programs on private lands—the working lands—has eroded over time and is now less in constant dollars than during the depths of the Great Depression. The USDA’s conservation programs and technical assistance are the only viable alternatives to a totally regulatory approach to improving water quality. These important programs are inadequately funded. The UMRBA supports continuation and expansion of funding for these programs.

Of particular importance to the UMRBA is funding for the Conservation Reserve Program (CRP), Wetlands Reserve Program (WRP), and Environmental Quality Incentives Program (EQIP). Taken together, these three Commodity Credit Corporation-funded programs provide an invaluable means for the USDA to work with landowners, local conservation districts, and the states to ensure that agricultural productivity is maintained while protecting the nation’s soil and water resources. Moreover, they do this in a voluntary, non-regulatory fashion. As stewards of some of the nation’s most productive agricultural lands and important water resources, the five states of the Upper Mississippi River Basin believe these programs are vital. Strong farmer interest and state support demonstrate the region’s commitment to the objectives of these programs. In 1998, state, local, and private entities matched every dollar of NRCS investment in the five states with an additional \$0.80.

Unfortunately, the President’s fiscal year 2002 budget request does not place sufficient priority on these three key programs. Funding for the CRP would be increased modestly to \$1.788 billion. While this funding increase is certainly welcome, the UMRBA is increasingly concerned that the CRP’s 36.4 million acre enrollment cap threatens its continued success. Since its inception, enhancements to the CRP have increased its effectiveness in improving water quality, soil conservation, and habitat. These same enhancements, which include noncompetitive enrollment for filter strips, riparian buffers, and similar measures as well as establishment of the Conservation Reserve Enhancement Program, have made the program more flexible and thus more attractive to farmers. But, while demand for the program is up, the CRP is unable to capitalize fully on its increased attractiveness and effectiveness because of its acreage cap, which USDA projects will be reached by December 31, 2002. Thus, the states urge Congress not only to provide sufficient funding but also to increase the enrollment cap, thereby ensuring that the CRP will continue its vital role in helping states, local communities, and landowners meet their water quality and conservation goals.

Even more pressing is the need to fund and expand the enrollment cap for the WRP, which will reach its 1.075 million acre cap before the end of 2001. Citing the cap, President Bush has not requested any fiscal year 2002 funding for the WRP. Since the WRP’s establishment in 1996, its easements have proven to be important tools for restoring and protecting wetlands in agricultural areas. This is clearly evident from the overwhelming landowner response and the resulting improvements to water quality and habitat. In the fiscal year 2001 agriculture appropriations bill, Congress addressed the WRP acreage cap problem on an interim basis, increasing it by 100,000 acres. However, as noted above, this increase will be fully subscribed this year. Clearly the time is right for Congress to secure the WRP’s future in a longer term way this year by significantly expanding the acreage cap and providing continued funding for this valuable program.

The CRP and WRP have been extremely effective in helping Midwest farmers to protect land and water resources by curtailing production on some of their most sensitive land. And there are certainly many more opportunities to make good use of the CRP and WRP in the region. However, it is also essential to support sound conservation practices on the far greater amount of land that remains in production. EQIP is the USDA’s largest and most effective means of assisting farmers and ranchers to implement conservation practices on land currently in production. EQIP

assistance can, for example, help operators balance the new dynamics of livestock production with the need to protect soil and water resources. The President has requested level funding of \$174 million for EQIP in fiscal year 2002. While the states are gratified that the new Administration supports EQIP, the UMRBA encourages Congress to increase fiscal year 2002 funding to the authorized level of \$200 million and to expand the EQIP authorization as part of the upcoming Farm Bill.

The UMRBA remains concerned with the adequacy of funding and staffing levels in the NRCS' conservation operations account. The technical assistance funded through conservation operations provides the foundation for the USDA's voluntary conservation planning. The Administration has proposed an increase of \$59 million in conservation technical assistance funding for fiscal year 2002. However, up to \$44 million of this increase would be for CRP technical assistance costs that were previously reimbursed from the CCC. As a result, NRCS field staff will likely continue to have difficulty providing the timely, comprehensive technical assistance that farmers need if they are to participate effectively in the USDA's conservation programs. A 2001 National Workload Analysis indicates that the NRCS needs approximately 1,900 employees at the field level in Illinois, Iowa, Minnesota, Missouri, and Wisconsin. Actual field staff in the five states numbers about 1,250, or one-third below the estimated needs. The UMRBA urges Congress to ensure that the NRCS has both the staff and funding necessary to deliver its conservation programs effectively.

The Midwest and indeed much of the nation faces significant challenges in the future as dams built under the Public Law 534 and Public Law 566 programs age. More than 600 flood control structures in Illinois, Iowa, Minnesota, Missouri, and Wisconsin need rehabilitation if they are to continue to function safely and effectively. This represents approximately one-third of the structures built in the five states under the USDA's dam-building programs. Rehabilitation costs in the five UMRBA states alone are estimated at \$53.9 million. Last year's enactment of the Small Watershed Rehabilitation Amendments authorized NRCS to assist in rehabilitating these structures. The UMRBA now asks Congress to provide NRCS with the funding it needs to serve as an effective Federal partner in addressing these needs.

The five states of the UMRBA acknowledge that our region faces enormous soil and water conservation needs and limited public and private resources to address those needs. In this context, it is imperative that NRCS work with the states, conservation districts, and farmers to identify and target the most pressing problems. Coordination and communication with the states is particularly critical to success in addressing the interstate resource challenges faced on the Upper Mississippi River. Success in addressing such complex, large-scale issues will not come quickly. It will require long-range thinking and commitment over time from all levels of government and from farmers. The states look to both Congress and the Administration to join them in providing such leadership.

PREPARED STATEMENT OF THE USA RICE FEDERATION

USA Rice is a federation of U.S. rice producers, millers and allied businesses working together to address common challenges, advocate collective interests, and create opportunities to strengthen the long-term economic viability of the U.S. rice industry. USA Rice members are active in all major rice-producing states: Arkansas, California, Florida, Louisiana, Mississippi, Missouri, and Texas. The U.S. Rice Producers' Group, USA Rice Council and the Rice Millers' Association are charter members of the USA Rice Federation.

SUMMARY

USA Rice supports agriculture appropriations falling into three major categories: international trade promotion, food aid and domestic programs. A total of \$96 million is needed for international trade promotion, \$1.507 billion for food aid and \$3.825 billion for domestic programs. In addition, the Foreign Agricultural Service should be funded to the fullest degree possible to ensure adequate support for trade policy initiatives and oversight of export programs like the Foreign Market Development program and the Market Access Program. All of these programs are critical for the economic health of the U.S. rice industry.

INTERNATIONAL TRADE PROMOTION

Exports are critical to the U.S. rice industry. Historically, 40–60 percent of annual U.S. rice production has been shipped overseas. U.S. rice that is not shipped over-

seas stays in the domestic marketplace, driving down already low prices for rice even further. Thus, building healthy export demand for U.S. rice should be a high priority.

In addition, exports mean U.S. jobs. According to USDA data, in fiscal year 1999, U.S. rice exports of \$1 billion supported an estimated 15,200 direct jobs. Indirect jobs are estimated at more than 45,000 (unofficial USDA estimates).

Foreign Market Development

The Foreign Market Development program allows USA Rice to focus on importer, food service, and other non-retail promotion and other activities around the world. For fiscal year 2002, FMD should be fully funded at \$33.5 million. As the president's budget only calls for the Office of Management and Budget to apportion \$27.5 million from Commodity Credit Corporation resources for this program for fiscal year 2002, an additional \$6 million (USDA, Foreign Agricultural Service) needs to be appropriated to reach the full funding level. If only the expected \$27.5 million apportionment is realized, this will result in a 20 percent cut in the program from recent levels. The Foreign Market Development program allows USA Rice to focus on trade servicing activities around the world. Without a fully funded FMD program, USA Rice will have to drastically reduce and/or cancel several of its worldwide activities targeted at markets that represent major growth opportunities for future U.S. rice exports. For example, USA Rice will forgo activities in Syria and Jordan where opportunities are expected for U.S. rice as state trading continues to give way to private sector rice trading, in Eastern Europe where increasing personal disposable income should lead to increased ability to purchase U.S. rice, and in Taiwan where opportunities are expected for U.S. rice once Taiwan joins the World Trade Organization.

Market Access Program

The Market Access Program allows USA Rice to focus on consumer promotion and other activities around the world. For example, USA Rice's MAP-funded efforts to increase U.S. milled rice sales to Japan have led to a tripling (from 500 to 1,800 metric tons from fiscal year 1998 to fiscal year 1999) of U.S. milled rice being sold in identified, unblended form to the Japanese consumer. Another example is that as a result of USA Rice's MAP-funded in-store promotions in Guatemala this year, not only did sales of U.S. rice jump 25 percent during the promotion, but also a Guatemalan company is now importing U.S. rough rice, processing it, and labeling as "U.S. rice" on its consumer retail packaging. For fiscal year 2002, MAP should be fully funded at \$90 million (USDA, Foreign Agricultural Service), the level currently authorized. Ideally, the program should be funded at \$200 million as called for in legislation such as H.R. 98 and S.366.

USDA/FAS

Equally important to these programs is an adequately staffed and funded Foreign Agricultural Service in Washington, D.C. and in our embassies overseas. USA Rice and other agricultural groups rely on the significant expertise these agricultural experts bring to the table, and we rely upon them to help us gain, grow, and maintain market access worldwide. FAS should be funded to the fullest degree possible to ensure adequate support for trade policy initiatives and oversight of export programs like the Foreign Market Development program and the Market Access Program.

FOOD AID

Food aid continues to be vital to the health of the rice industry and local economies as an instrument to remove excess rice stocks from the U.S. market, generate business, stabilize prices, and create market development by allowing entry into foreign markets not otherwise accessible to the United States. Nearly half of all U.S. grown rice is exported. Over twenty percent of this amount is reliant on food aid programming. In fiscal 2000, this accounted for nearly 9 million hundredweight (400,000 metric tons) of rice that otherwise would have remained on the U.S. market, severely impacting the welfare of farmers, millers, and allied industries by driving down prices, eliminating jobs, and undermining the infrastructure of the industry and local economies.

Rice farmers as well as millers are dependent on food aid in order to remain financially solvent. Without adequate food aid funding levels, milling capacity is underutilized. Delays in the release of food aid funding in fiscal 2001 by OMB have meant fewer tenders, forcing some millers in the South to temporarily shut down operations, creating economic hardship for these businesses and for local workers. Such continued hardship would force these operations to close permanently. Rice farmers are equally dependent upon the stabilizing effect of food aid movements as

a price support mechanism. With production costs nearing the \$12.00 per cwt. mark, where they are approximately double the current market price, the reduction of ending stocks from the U.S. market is crucial to help increase prices, and avoid further emergency assistance.

Last year the movement of rice food aid accounted for 1,200 jobs, and created an influx of millions of dollars to local economies in terms of labor hours, utilization of equipment and services, and investment in the rice industry infrastructure. This level of economic activity was dependent the use of value-added rice in food aid programs. For every 1 million hundredweight of U.S. food aid sent as rough rice rather than value-added, the total effect on the U.S. rice industry would be a loss of \$23 million and nearly 136 jobs in the six rice-producing states. The rice producer as well as the rice miller directly benefits from value-added product. In years of larger supply, the margin of premium gained by the producer from value-added rice increases dramatically. For instance, in the 1999 crop year, one grower cooperative returned an average of 60 cents per bushel on milled rice over rough rice returns. Farmer-owned cooperatives account for about 40 percent of the rice milled in the United States.

Last year, 9 million hundredweight of rice was exported as food aid. The economic gain generated by further processing was retained within the United States. Furthermore, taxpayer dollars, including those of U.S. rice producers and millers, fund food aid programs. The U.S. government should maximize the use of taxpayer dollars by exporting the highest value product possible, not use U.S. taxpayer dollars to subsidize the development of foreign processing facilities. For these reasons, the appropriations bill language should indicate that for rice, only value-added products are to be used in food aid.

Food aid programs are critical for the United States in maintaining its competitive position in the global marketplace. Overall, exports of U.S. agricultural commodities, including rice, are decreasing. The United States must look to new markets and gain access to developing markets in order to rebuild its comparative export advantage. Food aid is the only tool that allows for entry into an underdeveloped country's market when it cannot afford to pay a premium for high quality U.S. product, further aggravated by currency devaluations. Food aid allows a preference for U.S. rice to develop among foreign consumers and trade, setting the stage for future commercial sales when foreign economies improve. Food aid continues to be fundamental to humanitarian assistance efforts.

Public Law 480 Title I

Maintain \$180 million in funding (USDA, Foreign Agricultural Service), with retention of at least \$160 million dedicated to commodity loans, and any additional funding being allocated to freight and financing expense. Congress has recently criticized high funding carry-over levels in this program; funding carry-over has been diminished due to use in funding Title I Food for Progress sales to Russia in fiscal 2000. Therefore, retention of base level funding is necessary. Through work with FAS and foreign governments, USA Rice helps maintain a high percentage rate of successful agreement fulfillments, avoiding carry-over of unused funds. Public Law 480 sales into developing countries such as the Philippines have provided a critical link to local trade. Under Title I, 104,000 metric tons of U.S. rice reached the trade and consumers in the Philippines last year that otherwise would not have been competitive with Asian suppliers. Just as importantly, the movement of this rice enabled the U.S. rice industry to access local trade that is now allowed to transact limited private imports as the Philippines slowly transitions from monopoly control of sales under a state trading entity to a more liberalized market. By cultivating relationships with local trade through the Public Law 480 Title I program, a private commercial sale of thousands of metric tons of premium quality U.S. rice was made to the Philippines this year. This is a critical step in developing long-term prospects for a high quality niche market for U.S. rice in the Philippines.

Public Law 480 Title II

Maintain \$837 million funding level (USDA, Foreign Agricultural Service). As Public Law 480 title I funding levels have declined by \$580 million since 1990, other food aid programs are now crucial to maintain movement of rice stocks. Title II projects involving private voluntary organizations (PVO's) that monetize rice to fund other development projects are the most far-reaching vehicle to introduce U.S. rice into markets where the United States has limited or no commercial access. For instance, in Ghana, since the 1980's, as a result of Public Law 480 program penetration, U.S. rice has become the benchmark of quality in rice for Ghanaian consumers and remains the product against which all other imported rice is gauged. U.S. rice sales have grown steadily over the last five years, and in 1999 sales of almost

77,000 metric tons represent an 18 percent increase over 1997, and account for about 33 percent of the total market.

Food for Progress

Maintain \$94 million funding level (USDA, Foreign Agricultural Service). The Food for Progress program is particularly effective for market development because rice moves into the foreign market at local market prices. USA Rice works closely with PVO's in this program to develop trade connections. Increased movement of rice through this program is needed to most effectively target new markets, and to enable the United States to maintain market share when U.S. rice would otherwise be unable to compete commercially. This was the case in Cote D'Ivoire in the late 1990's, when the effects of currency devaluations in both Cote D'Ivoire and Thailand, a leading rice competitor of the United States, led to a period where U.S. rice could not compete commercially. Some market share was maintained through Food for Progress programs, which enabled quick recovery when conditions improved. This enabled retention of a market that had originally grown from a niche market to a large importer due to Public Law 480 sales. Imports of U.S. rice, including both commercial and government assistance programs, rebounded from around 1,000 metric tons in 1998 to over 25,000 metric tons in 1999 and 2000.

Global Food for Education Initiative

The Global Food for Education Initiative should be funded (USDA, Foreign Agricultural Service) for fiscal year 2002 at \$300 million for preschool and school feeding programs and \$50 million for maternal and infant health and feeding programs, per draft legislation of "George McGovern-Robert Dole Global Food for Education and Infant Feeding Act of 2001." This program is designed to most efficiently deliver food to its targeted group. It will provide much need alternative access for distribution of rice to offset losses in other programs.

DOMESTIC PROGRAMS

Rice Research

The Dale Bumpers National Rice Research Center should be funded for fiscal year 2002 at a minimum of \$3.675 million, the same level as fiscal year 2001 (USDA, Agricultural Research Service).

The mission of the Dale Bumpers National Rice Research Center is to conduct research to help keep the U.S. rice industry competitive in the global market place, by assuring high yields, superior grain quality, pest resistance, and stress tolerance.

The DB NRRC is an \$11.2 million, state-of-the-art laboratory. The 46,000 square foot DB NRRC contains offices, research laboratories, seed storage, and greenhouse space. The DB NRRC has USDA-ARS scientists in eight research categories: genetics, germplasm evaluation and enhancement, biology and control of weeds, cereal chemistry, molecular genetics, cytogenetics, molecular plant pathology and molecular biology. Shared laboratory space also is provided for the University of Arkansas rice research groups, as well as visiting scientists.

Blackbird Control

The Louisiana blackbird control project should be funded for fiscal year 2002 at \$120,000 and the blackbird control research at \$30,000. This is the same level of funding as fiscal year 2001 (USDA, Animal Plant Health Inspection Service). This program has been critical in reducing the damage this pest does to rice fields. If not controlled, blackbirds can significantly reduce rice yields, resulting in substantial loss of income to the producer.

PREPARED STATEMENT OF THE UNITED STATES BEET SUGAR INDUSTRY

INTRODUCTION

The United States Beet Sugar Industry continues a long and productive working relationship with the Agricultural Research Service of the United States Department of Agriculture. Since before 1938, USDA-ARS research on sugarbeet has provided essential germplasm and knowledge to the U.S. sugarbeet industry. USDA-ARS research continues to enhance the productivity and profitability of growers across the United States. Over 50 years ago, the Beet Sugar Development Foundation signed a Memorandum of Understanding with the USDA-ARS, providing for close cooperation in defining, funding, and meeting challenges to the sugarbeet industry through research. No other public program in the United States, other than ARS, is involved in breeding disease resistance for sugarbeet. And no other program in the United States is involved with the fundamental biology of sugarbeet.

Sugarbeets are produced on over 10,000 farms in 15 states (including seed production), often in northern tier states where crop choices are limited, population densities are low, and rural economies are heavily reliant on sugarbeet production. Market forces are reshaping sugar processing economics, with the increasing result that most growers own and operate their factories as cooperatives. Few, if any, of these cooperatives are able to provide the needed basic research that will keep the U.S. sugar beet industry viable.

Over the years, the industry has noted a decline in the number of USDA-ARS scientists involved in sugarbeet research. As it has been in the past, the products of this research are vital for the future of our domestic industry. Currently, there are five USDA-ARS stations serving the national research needs of the U.S. sugarbeet industry. A brief summary of the activities and accomplishments at each sugarbeet research location as well as the status of personnel and funds at each location is provided below. Also included is an industry perspective on the resources required at these locations to maintain and enhance our current efforts. For budgeting, we have used the USDA-ARS baseline figure of \$300,000 per SY (scientist year).

KIMBERLY, ID

There is one very large void in the USDA-ARS sugarbeet research program. We grow 230,000 acres of sugarbeets in Idaho and eastern Oregon. Although all of the USDA/ARS stations work together on common problems in the industry nationwide, there is a great need for USDA/ARS sugarbeet research for this growing area with its unique challenges. The USDA/ARS has an existing research station in Kimberly ID, in the heart of the beet growing area. The addition of a sugarbeet unit to this existing station would be an excellent fit. We know that a USDA/ARS sugarbeet research program at this location would strengthen national sugarbeet research in three significant ways. We propose a new unit that would include a Physiologist, an Irrigation Specialist and an Agronomist/Crop Fertility Specialist.

The Station at Kimberly has particular strength in Irrigation/Water Use research. The Irrigation Specialist would fit well with that group. It has been many years since irrigation work was done on sugarbeets, and this is especially needed with the increase in overhead irrigation. In growing areas where we are required to irrigate, the cost of water, along with the energy costs of pumping and distributing the water are major factors in the cost of production. With the current energy situation and outlook, an irrigation specialist for sugarbeet and other row crops is desperately needed.

Although there has been considerable work done on sugarbeet fertility, basic work has been lacking recently on the interactions between fertility, genotype, irrigation, and crop quality. The research an Agronomist/Crop Fertility Specialist would do in this area is very much needed. This is an area that is also tied to the energy situation, since the majority of our fertilizers are produced from petroleum products. The costs of these inputs are steadily increasing. Also, a major problem in sugarbeet processing in the presence of impurities in the beet. This can be caused by over or improper fertilization. Of course, fertility is not isolated to one years' crop, but must be studied as an ongoing evolution, taking into consideration the other crops in the rotation.

Finally, a Physiologist to work with crop biochemistry and post harvest storage is needed, not only for the Idaho area, but also for all growing areas. The area of crop biochemistry is directly related to the Irrigation Specialist and the Fertility Specialist. The basic knowledge to understand the best and most efficient usage of water and fertilizer, will require the input of physiological factors in sugarbeet development. Sugarbeet storage has been mentioned at three locations in this write-up. This is not by accident, and certainly not a duplication of efforts. Decreasing losses in the storage pile is a major component to profitability of the beet sugar industry. Each of the areas, where storage work in either going on or proposed to go on, are unique. Therefore they need to be investigated independently, however, these three stations working in unison would definitely be able to interact, and we are sure, speed up the delivery of useful results. Information obtained from all of these research areas is a national priority. We feel we would need \$1,250,000 to start this program with three SY's and capital investments in research equipment.

FT. COLLINS, CO

This station currently has three SY's working on CRIS projects involving sugarbeets. There is one Research Geneticist/Plant Breeder, one Plant Physiologist/Biochemist and one Plant Pathologist. The Fort Collins Unit is funded at a level of \$750,413.00. A Molecular Geneticist is needed to complement the skills of the cur-

rent geneticist and plant breeder, who is also Research Leader. An increase of \$500,000 is needed in this program.

This station is the primary source of germplasm with resistance to *Rhizoctonia* root rot worldwide. It also is the primary ARS station involved in breeding for resistance to *Cercospora* leaf spot and has a very active program breeding for resistance to the curly top virus.

One of the major pests lowering sugarbeet production in the US is the sugarbeet cyst nematode. Basic biochemical research on the mechanism of action of mustard and radish crops that can be used to decrease the soil concentration of this nematode has been undertaken in Fort Collins. Use of these "trap crops" can contribute to gains in productivity without the use of fumigants.

Biological control research is ongoing at Fort Collins using *Trichoderma* strains. In other crops, a single seed treatment with similar strains has been demonstrated to reduce severity of several diseases, which cause seedling death. The use of one treatment to control multiple diseases would reduce cost of fungicides for disease control.

Critical to solving many disease problems is the ability to complement traditional breeding, biochemistry, and plant pathology approaches with a molecular genetics approach. Researchers at Fort Collins have begun investigations to provide molecular markers and to identify resistance genes for sugarbeet diseases to increase efficiency in the plant breeding process.

In addition to improved germplasm, new plant breeding techniques, and better disease management techniques, the Fort Collins scientists emphasize research addressing sugarbeet's biochemical quality, especially as it affects the amount of sugar that can be recovered through current processing technology. Scientists have worked with processing companies to assess and improve sucrose and chemical quality analysis procedures, which has reduced processing costs. Research to assess the effects of various diseases on the quality of beets held in storage before processing is being planned. Disease can have a tremendous impact on the potential amount of sucrose that can be extracted from such stored beets, and increase the cost of processing.

EAST LANSING, MI

This Station currently has three SY's working on two CRIS projects involving sugarbeets. They include one Molecular Geneticist, one Geneticist and one Pathologist. The Genetics CRIS has two scientists, and a total of \$389,000, short \$211,000 from the ARS target. The Pathology CRIS has one scientist projected to retire in the near future and a total of \$169,500, or \$130,500 short. Each of these positions is needed for future viability of the industry. In addition, a Physiologist/Biochemist position is needed to characterize processes of sucrose accumulation and focus on modifying those processes for alternative uses for sucrose. Expanding the uses of sucrose is the key to expanding profitability in sugarbeet production. This position would require \$300,000. Therefore, a total request for East Lansing of \$641,500.

The sugarbeet Genetics program at East Lansing has three primary responsibilities: (1) to continue and strengthen sugar beet germplasm enhancement for the Eastern U.S. growing areas ongoing for 70 years, (2) to develop and apply molecular methodologies for dissection of genetic traits, and (3) to elucidate mechanisms and engineer solutions to persistent seedling emergence and stand establishment problems.

Field emergence and stand establishment is perennially among the concerns for sugar beet growers. Recent results implicate a single gene that describes the difference between good emerging varieties and poor emerging varieties. This conclusion could only be drawn by the judicious application of the modern, and expensive, technologies that can now be applied to solve pernicious problems in sugarbeet growth.

In very few instances is it known what genes influence agronomic traits in sugarbeet. With increasing requirements for multiple disease resistant sugarbeets in all areas of the U.S., it is imperative to be able to tailor gene combinations efficiently to meet changing environmental challenges imposed by these new disease pressures. The East Lansing location is developing the requisite materials to discover and deploy these genes.

The Pathology/Physiology position at East Lansing conducts disease nurseries and examines pathogen populations throughout the growing regions, examining the structure of pathogen populations for type and fungicide resistance, and examining mechanisms of disease resistance that may be exploited for germplasm enhancement. This position interacts closely with growers and agronomists, and provides management options and recommendations when disease problems occur. The pathogens that affect the Eastern growing region occur elsewhere, but are particu-

larly severe and occur regularly in Michigan. One reason costs of production are lower in Michigan than elsewhere in the U.S., aside from the lack of irrigation costs, is the wide use of disease resistant varieties. Resistance appears to carry a yield penalty, and one important future goal is to create high yielding, highly resistant sugarbeet germplasm that can be deployed through breeding.

One of the keys for any commodity to develop new uses to identify alternative market. Sucrose is the most abundant, chemically pure, renewable resource on the planet, and would be ideal as a chemical feedstock for industrial and other chemicals. The only limitation for using sucrose industrially is its over-functionality. That is, chemical reactions are difficult to control because of the large number of potentially reactive sites on the sucrose molecular. The goal of the Physiologist /Biochemist CRIS is to develop strategies that would block most of the reactive groups, and allow for controlled chemical reactions.

FARGO, ND

The Fargo ARS Station currently has three SY's working on CRIS projects involving sugarbeets. Unit scientists include one Pathologist, one Geneticist and one Physiologist. The CRIS funding for this location is \$974,084.00. The sugarbeet industry is plagued by several major production problems in this area. Pre-harvest losses include crop damage incurred by the sugarbeet root maggot and by fungal diseases, such as root rot caused by *Aphanomyces* and leaf spot. Unit research activities include two major thrusts addressing these issues. Research focusing on both disease resistance and crop protection, as well as pathogen virulence is being actively pursued and is making excellent progress. A major portion of the unit's Genetics and breeding efforts is directed at identifying and introducing plant resistance to the sugarbeet root maggot. Research on sugarbeet physiology is directed toward identifying the internal processes that affect sucrose accumulation and retention in sugarbeets.

Decreased pesticide use would greatly reduce producer's input costs. To this end, an entomologist conducting research on root maggot biology or on other insect-related problems of national importance (e.g. sugarbeet root aphid, beet army worm, nematodes) could be added. This research would compliment current unit efforts in breeding natural resistance to sugarbeet root maggot as well as investigating field application of a biological insecticide for root maggot control.

Improvements in the management of postharvest beet storage would also result in increased profitability. Postharvest deterioration of piled beets due to storage pathogens, harvest injury, and temperature extremes and other physiological processes occurs frequently and results in the loss of a large portion of the harvested sucrose. Fundamental research into maintenance of sugarbeet quality during storage would therefore be appropriate for this location. These studies would complement current physiological studies on sucrose metabolism in sugarbeets. We feel an increase of \$300,000.00 would be needed to fill either an Entomology or Storage (Physiology) SY position at this location.

SALINAS, CA

This station currently has four SY's working on CRIS projects involving sugarbeets. They include two Virologists and two Geneticists. The Virology CRIS is funded at \$647,027.00. This virology program has been very productive in the past and continues to produce information which is used not only in California, but across the entire sugarbeet production area. This team continues the excellent virology work at this station. At this time, this CRIS, we feel has adequate funding. The Genetics CRIS is funded at \$571,620.00. According to USDA/ARS baseline, the Genetics CRIS is currently under funded, we agree. Salinas unquestionably has the world's foremost sugarbeet breeding program. Germplasm created from this program has been used worldwide. The incorporation of genes for Rhizomania resistance, not only saved the industry in California, but is now used throughout the country and throughout the world. They are also concentrating their breeding efforts on sugarbeet cyst and rootknot nematode. These are a major pest in many growing areas, and ones that have very limited chemical control means. The chemical control means available are very expensive. It is imperative that this program continue. We are requesting and increase of \$100,000.00 annually to fund this CRIS at a level where quality research can be conducted.

BELTSVILLE, MD

This Station currently has two SY's working on CRIS projects involving sugarbeets. They include one Microbiologist and one Pathologist. This station is ade-

quately funded at a level of \$650,000.00 and doing a good job. No additional funding is requested for Beltsville.

SUMMARY OF NEEDED FUNDING

| | |
|------------------------|----------------|
| Kimberly, ID | \$1,250,000.00 |
| Ft. Collins, CO | 500,000.00 |
| East Lansing, MI | 641,500.00 |
| Fargo, ND | 300,000.00 |
| Salinas, CA | 100,000.00 |
| Beltsville, MD | 0 |

PREPARED STATEMENT OF THE U.S. MARINE SHRIMP FARMING CONSORTIUM

Mr. Chairman, we greatly appreciate the opportunity to provide testimony to you and the Subcommittee, to thank you for your past support and to discuss the achievements and opportunities of the U.S. Marine Shrimp Farming Program.

We would like to bring to your attention the success of the U.S. Marine Shrimp Farming Consortium and its value to the nation. The Consortium consists of institutions from six states: The University of Southern Mississippi/Gulf Coast Research Laboratory, Mississippi; The Oceanic Institute, Hawaii; Tufts University, Massachusetts; Texas A & M University, Texas; The Waddell Mariculture Center, South Carolina; and the University of Arizona, Arizona. These institutions have made major advances in technology to support the U.S. shrimp farming industry, and the program's excellent performance through multi-state collaboration has been recognized by the USDA in its recent program reviews. The Consortium is at a point of opportunity to make significant contributions to building the U.S. industry, reducing the trade deficit, and satisfying increasing consumer demand for shrimp. Seafood imports constitute the second largest trade deficit item for the U.S. at \$7.1 billion and shrimp represents approximately half of this deficit.

ACCOMPLISHMENTS

The Consortium, in cooperation with private industry, industry associations, and government agencies has generated new technologies for producing premium quality marine shrimp at competitive prices. To date the program has: (1) established the world's first and currently most advanced breeding and genetic selection program for marine shrimp; (2) completed pioneering research and development of advanced diagnostic tools for disease screening and control; (3) described the etiology of shrimp diseases associated with viral pathogens; (4) fostered shrimp production at near-shore, inland/rural farm and even desert sites; (5) served a lead role in the Joint Sub-committee on Aquaculture's efforts to assess the threat of globally transported shrimp pathogens; (6) supplied the U.S. industry with selectively bred and disease resistant shrimp stocks; (7) developed advanced technology biosecure shrimp production systems to protect both cultured and native wild stocks from disease; and (8) developed new feed formulations to minimize waste generation. These accomplishments are encouraging. The advances in these fundamental areas have provided the foundation for achieving our overall goal.

INDUSTRY VULNERABILITY

While exceptional progress has been made, this emerging and important industry is continually confronted with new challenges. It depends on the U.S. Marine Shrimp Farming Program for high-health and improved stocks, disease diagnosis and production technologies. As a result of the consortium's support, the U.S. industry has maintained relative stability while other countries have had major losses in their production due to diseases and environmental problems. Disease losses due to exotic viruses in Asia and Latin America during the last year approached \$1 Billion and \$250 million U.S., respectively. We are happy to report that U.S. farmers experienced no disease outbreaks during the same period while at the same time producing record harvests. In addition to supporting today's industry, our advanced biosecure shrimp production systems will allow the expansion of shrimp farming into near-shore, inland/rural, and desert sites away from the environmentally sensitive coastal zone.

INDUSTRY INDEPENDENCE

As a result of the work of the Consortium, investor confidence is increasing. Notably, within the last three years, new shrimp farm startups have begun in Mis-

issippi, Hawaii, Texas, Arizona, South Carolina and Florida and are being considered in other states. Importantly, these new production technologies produce the highest quality shrimp at world competitive prices, consume U.S. grains as feed, and do not pose any threat to the environment. Shrimp farming is the newest agricultural industry for the U.S., and CSREES has suggested that our program represents a model program for resolving important problems and capturing opportunities in both agriculture and aquaculture.

To begin completion of our remaining tasks, an increase in the current funding level from \$4.177 million to \$5 million is being requested. Allocation of \$5 million per year for the next few years to work in cooperation with the private sector, to support existing efforts, and to build this new industry with its associated jobs and economic benefits is in the best interests of the nation.

Mr. Chairman, the U.S. shrimp farming industry and our Consortium deeply appreciate the support of the Committee and respectfully ask for a favorable consideration of this request.

PREPARED STATEMENT OF THE WILDLIFE MANAGEMENT INSTITUTE

Dear Mr. Chairman: I am Ronald R. Helinski, Conservation Policy Specialist for the Wildlife Management Institute. Established in 1911, the Institute is staffed by professional wildlife scientist and managers. It's purpose is to promote the restoration and improvement of wildlife in North America. I am submitting testimony for the Senate Subcommittee on Agriculture, Rural Development and Related Agencies concerning appropriations for:

NATURAL RESOURCES CONSERVATION SERVICE

With such a short timetable I will hit the highlights of each line item/program and offer observations on impacts of this proposed fiscal year 2002 budget on conservation, particularly this nation's fish and wildlife resources.

Conservation Technical Assistance—The proposed increase of \$59 million dollars is woefully inadequate to meet the needs of farmers, ranchers and private landowners who have or plan to participate in the current Farm Bill programs. Technical assistance is an expected service. It is provided by natural resource professionals to assist farmers, ranchers and private landowners in the planning, implementation and evaluation of said programs. It has often been argued that private landowner participation hinges on what kind of support the constituent obtains from those professionals. Given a 5:1 demand for EQIP, 5:1 for WRP, and 3:1 demand for WHIP, landowners EXPECT those services and guidance.

Admittedly, there is a need for more personnel in NRCS to provide this on-the-ground service. Consideration to alternative providers is one way to help address this endemic problem. WMI suggests that through the leveraging of NRCS monies, state fish and wildlife agencies and conservation NGO's are in a position to help fill this void. Currently, this type of infrastructure is in place in many states including Missouri, Kentucky, Georgia, Texas and Arkansas. Reimbursement from NRCS to state agency personnel would go a long way to help resolve this problem. The state fish and wildlife agencies bring professional expertise to the table and are experienced in developing conservation plans to assist with the current overwhelming demand of Farm Bill applications.

Specific Farm Bill Programs.—WHIP and WRP programs without a doubt are two of the most successful programs to ever come down the road for private landowners. As mentioned above, the current demand for the programs speak volumes to there popularity. This popularity equals additional monetary assistance to landowners in this time of economic decline. The conservation bonus has helped resolve many natural resource problems while acting as a long term investment for providing quality of life improvements for this nations citizens.

WRP.—Increase the cap on WRP to 3.5 million acres or the annual enrollment cap to 250,000 acres. With a 3:1 ratio of applications to approved projects, the demand exists. Projects should be designed more carefully to help achieve wildlife restoration goals. Currently there is no additional acres for enrollment in 2002, this needs to be corrected.

WHIP.—Provide \$100 million annually. WHIP projects have reached non-traditional farm bill constituents where they have been able to address many endangered species scenarios while keeping regulations to a minimum. This program was embraced by landowners and formed many partnerships between USDA (NRCS) and non-Federal organizations, resulting in tremendous leveraging of non-Federal dollars.

Section 211 (b) of the Agricultural Risk Protection Act provided an additional \$40 million for soil and water conservation assistance. The 2001 Consolidated Appropriations Act gave the Secretary the authority to reallocate these funds to WHIP and FPP, \$8 million in additional funds was provided for FPP and \$12 million was allocated to WHIP. The original allocation was \$20 million allocated to WHIP. It goes without saying that the recognition of the utility and need for this program comes up year after year. It's time to allocate the necessary monies to make this a true national program. The allocations to the Northeast and far Western states are inadequate to meet these regional needs. In fact, WHIP is of the same stature as CRP to these regions.

Forestry Incentive Program.—WMI recommends creating one non-industrial private landowner cost-share assistance program by combining the existing Forestry Incentives Program (FTP with the Stewardship Incentives Program (SIP) and fund it at \$100 dollars. A financial incentives program is needed to encourage private land owners to adopt management practices that respond to national needs for healthy sustainable forests.

Farmland Protection Program.—Provide \$200 million for the Farmland Protection Program. Require conservation easements under the program to consider wildlife habitat, in addition to soil, and water conservation.

Forest Legacy Program.—Increase to 5200 million annually. The Forest Legacy Program has a proven track record of protecting productive forestlands from development and fragmentation. Weather through conservation easements or fee purchase, Legacy focuses on state assessments of need to set program priorities. Public benefits amass from both environmental and economic values.

Forest Stewardship.—Provide \$50 million per year to increase planning assistance to private forest landowners. Non-industrial private forestland owners provide great benefits to wildlife through their forest management. Forest Stewardship plans ensure that non-commodity forest resources such as soil, water and fish and wildlife recreation and aesthetics are considered and balanced with commodity outputs.

FARM SERVICE AGENCY

With an environment that includes low commodity prices and shrinking overseas markets, producing more commodities will not solve the problem. Given that there is no foreseeable change in this equation, giving private landowners options for other monetary sources would be a good thing. As I review the submitted budget for fiscal year 2002 I see a number of popular Farm Bill programs being zeroed out. CRP has been a mainstay on this country's landscape. CRP has enabled private landowners to retire land to assist this country with soil, water and wildlife habitat enhancement. Alternative opportunities are presented for farmers and ranchers to secure additional monies for helping to improve the quality of life for all our citizens. Why stop now when the job is far from being completed.

CRP.—On page 102 of the Budget for fiscal year 2002 it shows a zero allocation for obligations and technical assistance (CCC funds). What a mistake this would be. CRP is USDA's largest conservation/environmental program. It also includes the Buffer Initiative and Conservation Reserve Enhancement Program (CREP) programs. WMI recommends raising the cap on CRP to 63.9 million acres (with a minimum of 45 million acres). A sensible approach to reduce excess production capacity through long-term idling of surplus cropland exists in this very popular program. The demand by landowners is tremendous. The program has enhanced more wildlife populations than any action ever taken in this nation. CRP has helped raise commodity prices, too. The value of the CRP's improvements to wildlife viewing and to pheasant hunting has been estimated at \$704 million/year (Claassen et al., 2001). Specific improvements to CRP include state flexibility in addressing rental rates and seed mixtures, along with natural regeneration on riparian buffers and marginal pastures.

Technical Assistance.—In fiscal year 2001, \$26 million was obligated for technical assistance services (see page 108 The Budget for fiscal year 2002). It is zeroed out for fiscal year 2002. If we minimally increase the cap to 45 million acres we will need an increase in technical assistance between percent 60 to 80 million dollars. If you refer to the section above entitled "technical assistance" under the MRCN section you will find that there is an alternative to this request.

PREPARED STATEMENT OF THE STATE OF WYOMING

This statement is sent in support of fiscal year 2002 funding in the amount of \$12,000,000 for the Department of Agriculture's Colorado River Salinity Control (CRSC) Program, which, pursuant to Public Law 104-127, is a component program

within the Environmental Quality Incentives Program (EQIP). The U.S.D.A.'s Natural Resources Conservation Service designated the Colorado River Salinity Control Program as a national conservation priority area in fiscal year 2000. I request inclusion of this statement into the formal hearing record concerning fiscal year 2002 appropriations.

Wyoming views the inclusion of the CRSC Program in EQIP as a direct recognition on the part of Congress of the Federal commitment to maintenance of the water quality standards for salinity in the Colorado River—and that the Secretary of Agriculture has a vital role in meeting that commitment.

The State of Wyoming is a member state of the seven-state Colorado River Basin Salinity Control Forum, established in 1973 to coordinate with the Federal government on the maintenance of the basin-wide Water Quality Standards for Salinity in the Colorado River System. The Forum is composed of gubernatorial representatives and serves as a liaison between the seven states and the Secretaries of the Interior and Agriculture and the Administrator of the Environmental Protection Agency (EPA). The Forum advises the Federal agencies on the progress of efforts to control the salinity of the Colorado River and annually makes funding recommendations, including the amount believed necessary to be expended by the USDA for its on-farm CRSC Program. Overall, the combined efforts of the Basin states, the Bureau of Reclamation and the Department of Agriculture have resulted in one of the nation's most successful non-point source control programs.

Farmers and agricultural producers in the five project areas of Colorado, Utah, and Wyoming, where the Program's salinity control efforts are underway, have been willing participants in the salinity reduction effort. The salinity control effort has cost-sharing partners ready to participate, and through use of the Upper and Lower Colorado Basin Development Funds, additional funding above and beyond appropriations to the USDA can be expended to further increase the maximization of environmental benefits per appropriated dollar expended.

One of the five CRSC Program units presently being implemented is located in southwestern Wyoming. The Big Sandy River Unit is located within the boundaries of the Eden Valley Irrigation and Drainage District. About 15,800 acres are irrigated on the District's lands each year, and it is projected that about 85 percent of the District's lands will have salinity reduction practices in place at full implementation of this CRSC Program unit. With that level of participation, the Natural Resources Conservation Service (NRCS) has projected that 53,000 tons of salt will annually be prevented from entering the Colorado River system. The majority of the producers have opted to install center pivot sprinkler systems as the means to greatly increase their irrigation application efficiency.

For the past 17 years, the seven-state Colorado River Basin Salinity Control Forum has actively assisted the U.S. Department of Agriculture in implementing this unique, collaborative, and important program. At its recent October 2000 meeting, the Forum recommended that the U.S. Department of Agriculture Colorado River Basin salinity control program, a component part of the EQIP, should expend \$12,000,000 in fiscal year 2002. This funding level is appropriate to reduce a growing "backlog" in meeting the pace of necessary salt loading reductions. Failure to maintain the standards' numeric criteria could result in the imposition of state-line water quality standards and impair the Colorado River Basin states' ability to develop their Compact-apportioned water supplies. "Catch-up" funding in the future will require expending greater sums of money, increasing the likelihood that the numeric salinity criteria are exceeded, and create undue burdens and difficulties for one of the most successful Federal/State cooperative non-point source pollution control programs in the United States.

The State of Wyoming greatly appreciates the Subcommittee's support of the Colorado River Salinity Control Program in past years. We continue to believe this important basin-wide water quality improvement program merits funding and support by your Subcommittee.

RELATED AGENCY

COMMODITY FUTURES TRADING COMMISSION

PREPARED STATEMENT OF JAMES E. NEWSOME, ACTING CHAIRMAN

Thank you, Chairman Kohl and members of the Subcommittee. I am pleased to submit this testimony on behalf of the Commodity Futures Trading Commission.

First, I would like to discuss the mission and responsibilities of the agency and provide you with a detailed description of the manner in which we have used previous budget allocations. Then, I would like to describe how the profound changes in the regulatory landscape that have resulted from the passage of the Commodity Futures Modernization Act of 2000 will impact our budget plans for fiscal year 2002.

MISSION OF THE AGENCY

Since creating the Commission in 1974, Congress has tasked the CFTC both with protecting participants in the commodity futures and options markets against manipulation, abusive trade practices, and fraud and with enabling the markets to serve better their critically important economic role of providing a mechanism for price discovery and a means of managing risk. Most of the participants in the futures and option markets are commercial or institutional users of the commodities they trade and those commodities wind up ultimately in countless food and consumer products or are consumed in the provision of many important services.

The mission of the Commodity Futures Trading Commission as an oversight regulator is two-fold: (1) to foster open, competitive, and financially safe and sound futures and options markets in the United States, and (2) to protect the public from fraud, manipulation, and abusive practices in these markets. To achieve these goals, the Commission employs a well-trained, dedicated, and responsive staff, consisting of lawyers, economists, accountants, auditors, futures trading specialists, computer specialists, and support and administrative staff. The staff is primarily comprised of three main operating divisions (Economic Analysis, Trading & Markets, and Enforcement), and two offices (Office of International Affairs and Office of the General Counsel). The Commission is headquartered in Washington, D.C. and maintains regional offices in Chicago, New York, Kansas City, Los Angeles and Minneapolis. Commission staff oversee the activities of futures exchanges and registrants—futures commission merchants, salespeople, floor brokers, floor traders, commodity pool operators, commodity trading advisors, and introducing brokers—in addition to working with the exchanges as self-regulatory organizations (SROs) and the National Futures Association (NFA), a statutorily recognized SRO overseen by the Commission, to maintain safe and secure markets.

RESPONSIBILITIES OF THE AGENCY

The oversight functions of the Commission encompass many diverse areas. The Division of Economic Analysis (EA) has a critical responsibility to ensure that futures and option markets operate competitively, free of manipulation and congestion, and serve the risk-shifting and price discovery needs of the United States and world economies. EA staff conduct daily market surveillance to ensure that the markets are functioning in an orderly manner and can, in an emergency, order an exchange to take specific action to restore an orderly market. EA staff also analyze reports of large trader positions in order to identify and address potentially problematic concentrations in the marketplace. The Commission is briefed weekly regarding any surveillance issues or concerns, and additional briefings are scheduled as necessary in response to specific market events. EA staff maintain ongoing liaison with other Federal regulators—for example, the United States Department of Agriculture and the Federal Energy Regulatory Commission—to discuss issues of common interest and to share information regarding market conditions.

The Division of Trading and Markets (T&M) develops, implements, and interprets regulations that protect customers, prevent trading and sales practice abuses, and assure the financial integrity of the futures markets and firms holding customer

funds. T&M staff oversee the compliance activities of the futures industry self-regulatory organizations, including the futures and options exchanges, their clearinghouses, and the NFA. Regarding solicitation of customers, T&M staff monitor issues relating to the requirements that registrants disclose market risks and past performance information to prospective investors. T&M staff also review registrant compliance with the requirements that customer funds be kept in accounts separate from those maintained by the firm for its own use. In addition, staff ensure that customer accounts are adjusted to reflect the current market value at the close of each trading day. T&M staff oversee NFA's activities relating to registration of individuals and companies that handle customer funds or give trading advice, and make appropriate referrals to enforcement staff as necessary. Moreover, T&M staff monitor registrants' supervision systems, internal controls and sales practice compliance, and ethics programs. T&M and EA staffs perform trade practice surveillance and work closely with exchanges in their self-regulatory capacity to ensure that their rules and regulations comport with Federal regulation in various areas, including clearance of trades, trade orders and records, position limits, price limits, disciplinary actions, and floor trading practices. The staffs conduct comprehensive semiannual reviews of all domestic futures and options exchanges to ensure that they remain in compliance with the Commodity Exchange Act and its regulations.

The Division of Enforcement (DOE) investigates and prosecutes alleged violations of the Commodity Exchange Act and Commission regulations. DOE takes actions against individuals and firms registered with the Commission, those who are engaged in commodity futures and options trading on designated domestic exchanges, and those who improperly market futures and options contracts.

DOE staff base investigations on information they develop independently, as well as information referred by other Commission divisions; industry self-regulatory organizations; State, Federal, and international authorities; and members of the public. At the conclusion of an investigation, DOE staff may recommend that the Commission initiate administrative proceedings or seek injunctive and ancillary relief on behalf of the Commission in Federal court. Administrative sanctions may include orders suspending, denying, revoking, or restricting registration and exchange trading privileges and imposing civil monetary penalties, cease and desist orders, and orders of restitution. The Commission also may obtain temporary restraining orders and preliminary and permanent injunctions in Federal court to halt ongoing violations, as well as civil monetary penalties. Other relief may include appointment of a receiver, the freezing of assets, restitution, and disgorgement of unlawfully acquired benefits. The CEA also provides that the Commission may obtain certain temporary relief on an ex parte basis, including restraining orders preserving books and records, freezing assets, and appointing a receiver. When those enjoined violate court orders, DOE staff may seek to have the offenders held in contempt.

The Division of Enforcement works with the Department of Justice in the prosecution of criminal activity involving commodity-related issues. In addition, DOE staff provide expert help and technical assistance to U.S. Attorneys' Offices, other Federal and State law enforcement agencies, and international authorities. The Commission and individual States may join as co-plaintiffs in civil injunctive actions brought to enforce the Commodity Exchange Act.

The Office of International Affairs (OIA) assists the Commission in responding to global market and regulatory changes by coordinating the Commission's international activities. OIA provides information and technical support to the Commission and to its other offices and divisions on international matters; assists the Commission in developing rulemakings having foreign implications; analyzes foreign regulatory developments; develops regulatory information-sharing arrangements; shares regulatory and fitness information with foreign authorities; and coordinates technical assistance to foreign jurisdictions. OIA represents the Commission in international organizations, organizes international conferences on behalf of the Commission, and provides technical comments to other U.S. financial regulators with respect to relevant international activities.

The Office of the General Counsel (OGC) is the Commission's legal advisor. OGC represents the Commission in appellate litigation and in certain trial-level cases, including bankruptcy proceedings that involve futures industry professionals. Through its opinions program, OGC assists the Commission in performing its adjudicatory functions. As legal advisor, OGC reviews all substantive regulatory, legislative, and administrative matters presented to the Commission. OGC also advises the Commission on the application and interpretation of the Commodity Exchange Act and other administrative statutes.

HIGHLIGHTS OF FISCAL YEAR 2000

The Commission's fiscal year 2000 appropriation was \$62.8 million. This was \$1.6 million or a 2.6 percent increase over our fiscal year 1999 level. Actual staffing levels for fiscal year 2000 were down to 556 full-time equivalent employees (FTEs) in fiscal year 2000 from 567 FTEs in fiscal year 1999.

Approximately three-fourths of the CFTC's appropriation is to cover the salary and benefits of the Commission staff. Recruiting and retaining a professional staff, consisting primarily of attorneys and economists, continues to be one of the Commission's largest management challenges. Beginning in fiscal year 2000 and continuing in this fiscal year, the Commission has moved aggressively to recruit, and more importantly retain, its highly specialized professional staff by using, when fiscally feasible, all of the flexibilities available to it within Title V.

The remaining quarter of the Commission's budget covers all other operating expenses. The two largest operating expenses are the lease of office space and the cost of maintaining an information technology infrastructure that enables the Commission to maintain an effective enforcement and market surveillance presence.

Keeping pace with the rapid information technology developments in the futures industry is perhaps the Commission's second largest management challenge. For the first six months of the year 2000, the Commission undertook an independent assessment of its information technology program. The report included a number of specific recommendations including:

- Reorganizing the Office of Information Resources Management;
- Reestablishing an information technology strategic planning body with enhanced senior management involvement;
- Increasing staff, over a two-year period, from 38 FTEs to 58 FTEs, to bring the Commission to acceptable industry standards;
- Implementing skill requirements for staff based upon the Chief Information Officer's Council Core Competencies framework;
- Changing the information technology infrastructure, including an enhanced security program; and
- Reengineering the change management process.

The Commission initiated a number of these changes with fiscal year 2000 and fiscal year 2001 resources. For example, the Commission has already reallocated an additional six FTEs for information technology positions.

In addition to the significant resources devoted to the substantial revisions to the Commodity Exchange Act, the following are some highlights from the ongoing work of the Commission's programs:

Enforcement

In the program areas, the CFTC has used its appropriations to maintain an effective enforcement and market surveillance presence in the growing futures and option markets. The largest share of our resources goes to support the Commission's enforcement program. The primary goal of the enforcement program is to police futures markets for conduct that violates the Commodity Exchange Act or Commission regulations. The Enforcement program continuously looks for new ways to enhance the Commission's ability to detect and deter wrongdoing. In fiscal year 2000, for example, the Enforcement staff took action in a variety of areas including:

Fraudulent Internet Solicitations.—Internet fraud poses a grave new threat because technology now enables malefactors to solicit business fraudulently from millions of people quickly and cheaply. To combat this threat, the Commission's enforcement program:

- Published a new Consumer Advisory; participated in Internet surveillance "surf days" in cooperation with the Securities and Exchange Commission and the Federal Trade Commission; and trained international enforcement agencies in the investigation and litigation of Internet-related fraud actions.

On May 1, 2000, the Commission announced the initial results of a coordinated enforcement initiative with the Securities and Exchange Commission and the Federal Trade Commission aimed at cleaning up Internet Web sites. As part of the initiative, the Commission filed and simultaneously settled 10 administrative enforcement actions.

Fraudulent Illegal Commodity Contracts.—Illegal futures or option contracts continue to pose a financial threat to the public. The Enforcement program actively seeks to protect the public from wrongdoers who fraudulently solicit customers for what are purported to be financed speculative purchases of precious metals and other commodities but which are in fact illegal futures or option contracts. In fiscal year 2000, the Commission brought several civil actions charging defendants with this type of misconduct. The Commission has also issued a Consumer Advisory to

address these issues. In the Consumer Advisory, the Commission warned that companies making such pitches often overstate profit potential while minimizing the risk involved, falsely claiming that they are purchasing and storing metal, and charging phony “storage” and “interest” fees.

Other enforcement initiatives focused on fraudulent trade allocations—targeting, for example, wrongdoers who purposefully failed to provide account numbers for trades—until after they knew the prices at which the trades had been confirmed—in order to favor some customers over others in the allocation of profits and losses.

Market Surveillance, Analysis, and Research.—As noted above, one of the Commission’s principal responsibilities is to assure that futures markets operate competitively, free of manipulation and congestion, and serve the price discovery and risk management needs of the U.S. and world economies. The Market Surveillance, Analysis, and Research programs in the Division of Economic Analysis focus on these objectives, periodically examine the effectiveness of their programs, and seek to institute revisions that reduce the costs of compliance. The following are examples of fiscal year 2000 initiatives in these programs:

Adoption of New Procedures for New Contract Listing and Rule Reviews.—The Commission proposed a far-reaching and fundamental change to its procedures for listing new contracts offered by U.S. exchanges. The change responds to U.S. futures exchanges’ concerns that their ability to list new contracts without delay is important to their continued competitiveness, particularly with foreign exchanges. Specifically, the Commission adopted procedures allowing an exchange to list new contracts one day after the exchange files a notice with a certification that the contract meets the Commission’s requirements. The certification, in conjunction with fast-track procedures for approval of new contracts previously adopted by the Commission, ensures that the benefits of a new contract can be brought to the marketplace as soon as possible. Since then, the Commission further streamlined the exchange rules approval process to permit single, weekly summary filings rather than individual submissions.

Listing of a Variety of New Products. The Commission approved 29 new futures and option contracts, two of which were approved under 10-day fast track procedures, and 13 of which were approved under 45-day fast track provisions. In addition, exchanges filed 23 new contracts for listing under the Commission’s certification procedures, which permit exchanges to certify their own contracts and list them prior to receiving Commission approval. Examples of new contracts include:

- U.S. Agency Notes based on Freddie Mac and Fannie Mae instruments;
- Illinois Waterway Barge Freight and St. Louis Harbor Barge Freight futures;
- Cottonseed Oil futures and futures option contracts;
- U.S. equity index contracts, including the Dow Jones Utilities Average and the Dow Jones Transportation Average, as well as the Dow Jones Composite Average;
- Dairy and Livestock products, such as the cash-settled live cattle futures and option contracts based on the value of cattle at slaughter weight;
- Regional Electricity contracts such as the MidColumbia electricity futures contract, which provides electricity market participants with risk management tools to respond to the evolving electricity cash market in the Pacific Northwest region of the U.S.

Trading and Markets.—As noted above, T&M staff develop, implement, and interpret regulations that protect customers, prevent trading and sales practice abuses, and assure the financial integrity of the futures markets and firms holding customer funds. During fiscal year 2000, the Commission published the following final rules, proposed rules, orders, and advisories as part of the Commission’s effort to reduce regulatory burdens:

Block Trading Proposals.—The Commission approved a proposal by the Cantor Financial Futures Exchange, Inc. (Cantor) to establish block-trading procedures at Cantor. The block-trading program at Cantor allows qualified market participants to negotiate and arrange futures transactions of a minimum size bilaterally, away from the centralized, competitive market. Once the specific terms of the block transaction are agreed to, the counterparties report the relevant details of the transaction to the exchange for clearing and settlement. The Commission also approved a later submission from the Chicago Mercantile Exchange to establish block trading.

Electronic Signatures.—The Commission adopted new rules permitting futures commission merchants or FCMs, introducing brokers or IBs, commodity trading advisors and commodity pool operators to accept from their customers, clients or pool participants electronic signatures in those instances where Commission rules require registrants to obtain a signature on a document—such as an acknowledgement of receipt of required disclosure. The new rules include a definition of “electronic sig-

nature” patterned on the definition in the Uniform Electronic Transaction Act and a requirement to employ reasonable safeguards in accepting electronic signatures.

Average Price Calculations.—The Commission issued an advisory permitting FCMs to calculate average prices for their customers, when permitted to do so by exchange rules, if multiple prices are received on an order or series of orders. Previously, the Commission had authorized only U.S. trading clearinghouses to perform the calculations. FCMs now have greater flexibility and increased efficiency in providing average pricing.

Foreign Futures and Options.—The Commission adopted a rule permitting foreign firms acting in the capacity of FCMs and IBs to accept and execute foreign futures and option orders received directly from certain sophisticated U.S. customers without the firms being required to register with the Commission.

COMMODITY FUTURES MODERNIZATION ACT OF 2000

The Commodity Futures Modernization Act (CFMA) was signed into law on December 21, 2000, and with its enactment, the Commission was given the task of overhauling virtually the entire regulatory structure of the commodity futures and options industry. While this will bring tremendous pressures to bear on its staff and resources, the Commission is extremely pleased to have the opportunity to carry out the mandates of this flexible new oversight structure, and the agency is firmly committed to doing so in accordance with the timetables that are given within the statute.

The CFMA provides legal certainty for over-the-counter markets, lightens regulatory burdens on domestic exchanges, and lifts the ban on single-stock futures. The new Act requires action by the Commission, including 15 rulemakings and three studies. In some cases, the Commission is required to coordinate its efforts with those of other Federal regulators. The CFMA also clarified the Commission’s authority with regard to prosecuting foreign exchange bucket shops and provided a new framework for the oversight of designated clearing organizations.

Additionally, the CFMA moved the Commission from a role as a front-line regulator to a more flexible oversight role. It might appear that, in this new capacity, the Commission would need fewer resources than in the past. However, just the opposite is likely to be true. Implementation of the CFMA promises to liberate market participants from prescriptive, often out-dated, regulations so that innovation in new products and new trading platforms may flourish. Market participants have already begun to respond enthusiastically to this opportunity. However, this very innovation, and the increasing diversity in products and platforms that it generates, can present the Commission with significant oversight challenges.

For example, rapid developments in technology, particularly in telecommunications and the Internet especially, have sparked great interest in electronic exchanges and trading platforms. In just the last year or so, the Commission has approved three new exchanges and granted no-action relief to two electronic trading platforms for energy products. By comparison, for more than a decade prior to that, only two new exchanges were designated and neither became an economically viable trading platform.

And it is very likely that those three new exchanges represent only the tip of the iceberg. Commission staff are currently reviewing the applications of, or have received serious inquiries from, another half dozen proposed electronic exchanges and we anticipate that some of the electronic cash markets may also give rise to additional electronic futures exchanges.

This exciting growth and innovation in the marketplace has begun, and will continue, to provide real benefits to market participants, customers, and the economy as a whole. However, because the Commission’s primary responsibilities have not changed, growth and innovation will also place increasingly greater demands on our resources. Several areas in particular require significant attention and effort:

- New exchanges and alternate trading platforms, for which tailored oversight must be fashioned to fit each market along a spectrum of regulatory classifications from full oversight to basic fraud and manipulation protections;
- A new product area (single-stock futures) which potentially will lead to new contracts;
- Advancements in the practices of clearinghouses to respond properly to these new products and new trading platforms; and
- Clarification of our enforcement mission to now include prosecutions in the increasingly problematic area of foreign-exchange bucket shops.

To effectively fulfill its responsibilities in these areas, the Commission and its staff must rely heavily upon information management and telecommunications resources that are capable, efficient, and up-to-date in order to allow flexible, fast, and

appropriate responses to market conditions and events. It should be emphasized that, as a financial regulator, and particularly a regulator that is witnessing phenomenal growth in electronically based market activity, the Commission depends heavily upon its information management and telecommunications resources. Without adequate resources in this area, the Commission cannot effectively monitor markets to detect potential problems on a timely basis. Nor can the Commission reconstruct market events when disputes arise or when violations are alleged. These monitoring and investigative responsibilities require the processing of vast quantities of information and the Commission's Office of Information Resources Management represents not a support function but rather a mission-critical core competency of the Commission.

But our human resources, the dedicated people that interpret and act upon the information provided by our computer resources, are even more critically important to the performance of our mission, the protection of market participants, and the markets themselves. This mission requires staff members with the proper training and solid experience in the specifics of the markets we oversee.

BUDGET REQUEST FOR FISCAL YEAR 2002

The President's fiscal year 2002 budget request for the Commission is \$70.4 million. That sum represents an increase of \$2.6 million (or 3.7 percent) over fiscal year 2001 appropriations. To maintain its current level of services and operations, the Commission would require for fiscal year 2002 approximately \$76.2 million. Therefore, this budget will finance an estimated 57 fewer FTEs (in staff-years) for fiscal year 2002 than is provided for in fiscal year 2001.

OVERVIEW OF FUNDING LEVELS AND OPERATIONAL EFFECTS

The proposed funding level for fiscal year 2002 will require the Commission to make some hard choices as it prepares to transform itself from a front line regulator to an oversight agency. The Commission's top priorities will continue, to every extent possible, to dedicate resources to the Enforcement and Surveillance programs and to permit ongoing critical investments in technology to increase the Commission's ability to make the most of the limited resources.

The Commission will strive to ensure that the staff reductions will not seriously impair the Commission's ability to keep pace with the rapid growth in volume and the profound changes resulting from novel transactions, new trading systems, new market practices, technological advances, market globalization, and efforts to carry out the long awaited regulatory reform efforts culminating in the passage of the Commodity Futures Modernization Act of 2000 or CFMA.

Specifically, the fiscal year 2002 President's Budget will result in a reduction of twelve staff-years in the Enforcement program—a decrease that is approximately the size of an entire investigation/litigation team. While the FTEs eliminated will be distributed through the Enforcement program in an attempt to minimize the impact, this decrease will most likely have a measurable impact on the program. For example, more and more Americans have money at risk in the futures markets either directly or indirectly through pension funds or ownership of shares in publicly held companies that participate in the markets. The growing size and sophistication of these markets present new challenges to the Enforcement program and place new demands on its resources. The Enforcement program is important both as a deterrent to wrongdoers and as a signal of integrity to inspire confidence on the part of market participants. This reduction in staff means the Enforcement program will be less well equipped to respond to these challenges in the future.

In fiscal year 2002, the Market Surveillance, Analysis, and Research program will lose nine positions. This loss means the level of surveillance, exchange oversight, contract design review, and market and product study may not be commensurate with the growth in new types of exchanges and the initiation of new products, such as single stock futures. If growth in the industry outpaces the resources available to oversee the industry, several risks are introduced, including the increased possibility of undetected price manipulations and abusive trading practices. A key goal of the Commission is to ensure that its regulatory policies reflect of industry developments so as not to impede market innovation. But because these markets and the products traded on them are increasingly complex, it will be difficult to meet this goal with fewer staff resources.

The Division of Trading and Markets will lose approximately 17 positions in fiscal year 2002. Trading and Markets plays an important leading role in developing many of the regulatory reform initiatives undertaken by the Commission and is key to the implementation of the CFMA and the many studies that it requires. In fiscal year 2002, in addition to providing guidance to the public and industry professionals con-

cerning compliance with the CEA, the program will review Commission rules to determine if they should be streamlined further in light of technological and market developments, provide guidance to foster innovative transactions and electronic trading systems, and monitor the risks to regulated industry participants by unregulated derivatives activities as well as the risks posed to registrants by their unregistered affiliates. In addition, Trading and Markets will strive to maintain U.S. leadership in setting internationally acceptable standards for the regulation of markets and trading. However, with the decreased level of resources the program will not be equipped to respond as quickly as desired to these critical challenges and their associated interested parties.

Other program areas at the Commission affected by this decrease include the Office of the General Counsel and the Office of Proceedings. In the Office of the General Counsel, a reduction of four FTEs means there may be delays in reviewing contract market designation applications, rule changes, and proposed enforcement actions; in analyzing legislation and proposed legislation affecting the Commission; in defending the Commission in appellate and other litigation; and in assisting the Commission in the performance of its adjudicatory functions. Likewise, the Office of Proceedings, which will lose five staff members, is expected to experience delays in the performance of its responsibility, which is providing an inexpensive, impartial, and expeditious forum for handling customer complaints against persons or firms registered under the CEA.

The one function that will receive a net increase in staff is information technology. The Commission recognizes that the effective use of information technology is critical to the Commission's ability to carry out its mandate. The fast growing information-intensive and increasingly complex futures industry continues to expand into new markets and embrace electronic trading, creating a virtual global market. The Commission's investment in staff and budgetary resources in information technology is a recognition that the Commission must maintain technology capabilities that enable it to provide effective oversight of an industry with platforms and products that are constantly evolving based on technological innovations. It is critical that the Commission's information technology capacity stay on par with the industry in order to provide the right information at the right time and in the right format to our investigators, analysts, and attorneys. The increase of four positions for information technology will be more than offset by a reduction of seven positions in finance, human resources, and administrative services. The loss of seven positions among these administrative support functions means less responsive support to our program areas in critical areas such as recruiting and retaining employees and planning for the financial resources necessary to carry-out our mission.

Thank you for the opportunity to present our mission, responsibilities, and resource needs as we take on the challenge of rethinking our former methods of regulating the safest, soundest futures and options markets in the world. The Commission looks forward to working with Congress and other Federal financial regulators to ensure that we foster innovation and competition in the marketplace to enable the markets to grow and maintain their global leadership role. I would be happy to provide answers to any questions you may have.
