DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, MARCH 13, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 2:35 p.m., in room SD-124, Dirksen Senate Office Building, Hon. Ben Nighthorse Campbell, presiding.
Present: Senators Gorton, Domenici, Campbell, Byrd, and Dorgan.

DEPARTMENT OF ENERGY

OFFICE OF THE SECRETARY

STATEMENT OF FEDERICO F. PEÑA, SECRETARY OF ENERGY

ACCOMPANIED BY:

ROBERT S. KRIPOWICZ, PRINCIPAL DEPUTY ASSISTANT SECRETARY, OFFICE OF FOSSIL ENERGY

JOSEPH J. ROMM, PRINCIPAL DEPUTY ASSISTANT SECRETARY, OFFICE OF ENERGY EFFICIENCY AND RENEWABLE ENERGY

ELIZABETH E. SMEDLEY, ACTING CHIEF FINANCIAL OFFICER

OPENING STATEMENT OF SENATOR CAMPBELL

Senator CAMPBELL. The Appropriations Subcommittee on the Interior will be in order. Senator Gorton is detained on the floor for a little while longer, so I will go ahead and start the proceedings, and I certainly want to welcome my friend and colleague for so many years and the new Secretary to our hearing today. I personally am very pleased at that opportunity. Federico and I go way back. I know his leadership is invaluable in a time when we have so many important issues to deal with at the Department of Energy.

Certainly this administration has sent him to the committee to justify the request of budget authority of \$19 billion. That is an increase of almost \$3 billion over fiscal year 1997. The budget says that a significant portion of that comes from, we are told, a change in the financing of construction projects. I am a little bit skeptical. Although this change seems sound from an accounting perspective, I do worry that it will also be used to mask some of the questionable spending changes as well.

Although it is not the subject of your testimony today, Mr. Secretary, I want to point out that Rocky Flats, that you know very

well and I do, too, is an example of items that really do concern me and all of us in Colorado because you are familiar with that.

The administration proposes funding for well under what most people, both sides of the aisle, think is necessary to contain and manage the plutonium and restore the site in a meaningful time-frame, and if you care to venture into that in your testimony, I would also appreciate that.

But before we start, I would like to defer to my colleague and a man that has been my mentor in many respects, Senator Byrd.

Senator BYRD. Thank you, Senator. I have a good many questions, and if you have to leave soon, perhaps you better go ahead with your questions.

Senator CAMPBELL. I can wait a while. Would you just rather go to the Secretary's testimony before you ask questions?

Senator BYRD. Yes; let us let him speak first. Thank you.

Senator CAMPBELL. Mr. Secretary, please proceed.

SUMMARY STATEMENT OF HON. FEDERICO PEÑA

Secretary PEÑA. Thank you very much, Mr. Chairman, Senator Byrd and members of the subcommittee. Let me thank you for giving me the opportunity to testify on behalf of the Department of Energy's fiscal year 1998 budget. Having just been confirmed I think less than 24 hours ago, I am especially pleased to be here.

Let me introduce the two gentlemen who are with me today. I think they are well known to you already. To my left or to your right is Robert Kripowicz, who is the Principal Deputy Assistant Secretary for Fossil Energy. In the event that there are some highly technical questions, Mr. Kripowicz will be able to assist me in that.

To my right or to your left is Dr. Joseph Romm who is the Principal Deputy Assistant Secretary for Energy Efficiency. I want to thank them very much for their hard work in preparing me in a relatively short period of time to be here this afternoon.

Mr. Chairman, it is appropriate that my first hearing be before this subcommittee, which has been such a crucial partner in the delivery of the Department's energy mission. Although the subcommittee is directly concerned with a portion of the Department's missions, this subcommittee is a key partner in the objective that we list at the very top, and that is the enhancement of our national energy security and the development and deployment of clean energy.

Each day Americans depend on the benefits of energy, usually without considering the role that it plays in our quality of life, but as this subcommittee well knows, when energy supplies are disrupted, every American feels it. There have been three major oil disruptions in the past 23 years, each causing substantial domestic and international turmoil.

In the next 15 years the United States net oil imports will grow to 60 percent of domestic consumption. Persian Gulf oil-producing nations will increase their oil exports to surpass their peak of 67 percent of global oil exports in the embargo year of 1974, and this is, frankly, unacceptable.

The budget that we present to you advances national energy objectives in two broad ways. First, it emphasizes energy supply solu-

tions through increased domestic energy production, expanded use of natural gas, diversification of oil supply options, development of alternative transportation fuels, and maintenance of the strategic petroleum reserve to ensure economic stability in the event oil supply disruption should occur in the future.

Second, it emphasizes energy use solutions promoting the increased efficiency of energy used in all sectors of the economy and enhanced competitiveness of the electric utility industry and other sectors of the energy industry.

For energy efficiency programs we are requesting \$707 million, a \$137.9 million increase or 24 percent above the fiscal year 1997 comparable appropriations.

Why should we request such a large increase? We believe it is a smart investment. Improved efficiency is not only achievable, it is essential if we are to avoid serious risk in the future. Moreover, it is a proven way to reduce the demand for energy while enhancing our standard of living and our environmental quality.

For example, EIA's 1997 annual energy outlook forecasts that in 2015 the average home will be 4 percent larger and will rely more on electricity-based technologies. Annual per capita personal highway and air travel, something that I'm familiar with from my former position, are expected to be 12 and 59 percent higher, respectively.

Despite this growth, the forecast report indicates that energy intensity per capita will remain essentially static. The reason—EIA forecasts that improvements in energy efficiency will provide higher levels of service without significant increases in energy use per capita. So energy efficiency products and improvements are built into these forecasts to at least keep per capita energy use stable for the next 10 or 15 years.

So our budget request is part of this energy efficiency strategy to deliver and design cars of the future, improve efficiency in energy-intensive industries, develop energy efficient buildings in communities for the 21st century and increase the use of proven efficiency measures by consumers in Federal, State, and local governments as well as low-income households.

This request also recognizes that nearly 85 percent of the Nation's energy is supplied by fossil fuels and that this percentage is expected to increase to 88 percent by the year 2015.

This budget includes \$346 million for fossil energy research and development. This is a 5-percent reduction from the fiscal year 1997 level because many supported gas and coal fuel power system projects are entering their final phase of development. At this level, the Department will continue its support for technologies that develop the clean, highly efficient powerplant for the 21st century, boost the Nation's production of natural gas and oil, and provide a new option to supplement our country's liquid fuels.

The Department does not propose to sell any oil from the strategic petroleum reserve to finance operations for this fiscal year. The Department proposes to return approximately \$153 million of Clean Coal Technology Program funds to the Treasury in fiscal year 1998 and defer \$133 million that will not be required until fiscal year 1999.

The proposed rescission does not impact, and I want to emphasize that, does not impact ongoing projects and returns to the Treasury, only funding that becomes available from canceled or restructured projects. We believe that this proposal honors our commitment to fiscal discipline without jeopardizing the already significant accomplishments of this program.

Mr. Chairman and members, the Clean Coal Technology Program began because of the foresight of this subcommittee. It is an excellent example of what is possible with Federal research and development assistance. The General Accounting Office, for example, cites this program as a model of public-private partnership.

One excellent success story concerns the development of low NO_x burners. This technology now provides utility powerplants with a way to reduce nitrogen oxide emissions, which contributed smog and ozone buildup to a level that is 10 times lower than would have been available without the Federal investment.

Today almost 25 percent of coal-fired capacity is now using these cleaner burners. Sales have exceeded \$750 million and will approach about \$4 billion by the year 2000.

Again, in part due to this subcommittee's foresight, the program includes a recoupment provision that requires that the Government be paid back for its investment, and that the technologies are a commercial success, and we're beginning to see some of that repayment now in the early years. This provision is now beginning to see those repayments, approximately \$400,000, to the Government.

Mr. Chairman and members, let me conclude my remarks with those very brief statements. Mr. Chairman, you asked me to make some comments about Rocky Flats, and there were some concerns about the proposed increase in the overall budget which addresses a new approach that we're using to try to facilitate the upfront funding of major programs for the Department in a way which I think will save us money in the long term.

PREPARED STATEMENT

I would be very pleased to respond to both those issues in my question-and-answer period, and of course respond to other questions that you and other members may have. Thank you very much for your courtesies.

[The statement follows:]

PREPARED STATEMENT OF HON. FEDERICO PEÑA

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you today to discuss the fiscal year 1998 budget request for the Department of Energy.

The President, in his State of the Union message to the Congress, spoke about our nation's responsibility to keep its commitments and to provide for the future. An important commitment he spoke about was fiscal discipline, the duty we have to future generations to balance the budget. He also spoke of our duty to future generations to maintain and refresh our nation's capacity for scientific and technological innovation and thereby shape the future.

These themes, keeping commitments and providing for the future, are at the heart of the Department's missions. Our sense of obligation to continue investments that ensure the nation's security, competitiveness, and improved environmental quality for generations to come drives our program objectives. Science, technology, research, and development are the common threads running throughout the Department's varied missions, providing the tools with which to shape our energy future.

PRIORITIES FOR THE FUTURE

The Department of Energy has four key priorities:

- (1) Enhancing our energy security by improving the energy efficiency of our economy and by developing and deploying clean and affordable energy supplies;
- (2) Ensuring a safe and reliable nuclear weapons stockpile and reducing the global nuclear danger;
- (3) Cleaning up former nuclear weapons sites and finding a more effective and timely path forward for disposing of nuclear waste; and
- (4) Leveraging science and technology to advance fundamental knowledge and our country's economic competitiveness with a stronger partnership with the private sector.

All of these needs present unparalleled opportunities and daunting challenges that will greatly affect the future of our nation and indeed the world. However, first among them is energy.

Each day, Americans depend on the benefits of energy, usually without considering the role it plays in our quality of life. But there have been three major oil disruptions in the past 23 years, each causing substantial domestic and international turmoil. In the next 15 years, U.S. net oil imports will grow to 60 percent of domestic consumption, and Persian Gulf oil producing nations will increase their oil exports to surpass their peak of 67 percent of global oil exports in the embargo year of 1974. The potential of this situation poses serious risks for America's future.

A STRONG ENERGY STRATEGY

We must have a credible energy strategy that provides for our energy security and meets our commitment to be responsible stewards of the environment. Our energy strategy must, at a minimum:

- Increase domestic energy production through smarter regulation and technological advances to improve production economics and reduce environmental impacts of both oil and natural gas development;
- Expand the use of natural gas;
- Diversify our oil supply options in areas such as the Western Hemisphere, Central Asia and the Caspian Sea;
- Reduce U.S. dependence on insecure sources of foreign oil by making us more efficient in our use of all energy;
- Develop clean, renewable energy supplies, alternative transportation fuels, and clean coal technology;
- Maintain our strategic petroleum reserve at levels which meet our international responsibilities and ensure stability in the event of supply disruptions;
- Maintain the safety of nuclear power reactors;
- Address the challenge of global climate change; and
- Enhance the competitiveness of the electric utility industry and other sectors of the energy industry.

The President's energy policies set out to accomplish these objectives in partnership with industry. These innovative partnerships feature: collaboration with industry to identify priorities; cost-sharing of projects; and federal support used as a catalyst to develop innovative research and development (R&D). These partnerships provide the edge that will help achieve our national energy goals.

PARTNERING WITH INDUSTRY TO ACHIEVE ENERGY OBJECTIVES

Recently, government investment in research and development and the appropriate federal role have been the subject of much debate. This budget request supports a strong portfolio of energy research and development which builds on prior year commitments to cutting-edge technologies. Fiscal year 1998 is a key year in which to steady our research and development investments because, after ten years of public-private collaboration, dividends are coming to the American people. For example, it is estimated that within two to three years, we will have successfully developed a "next generation" gas turbine that will surpass any competing turbine offered outside the U.S. Advanced gas turbines will provide the capability of generating electric power at efficiencies of over 60 percent, and with NO_x emissions so low as to allow them to be sited in environmentally restricted areas such as California.

We also will have developed an advanced fuel cell that will significantly boost the efficiency and environmental performance of twenty-first century natural gas and coal-fired power plants. When commercially available, these technologies will bring lower electricity costs, more U.S. jobs in the energy industry, and a cleaner environment with lower emissions for all Americans. In the case of both of these technologies, it is federal research and development support which provides the dif-

ference needed to develop the “state of the art” in terms of efficiency and environmental quality.

Similarly, the Clean Coal Technology program was begun in 1985 in recognition of the national interest in technologies which promote the environmentally sensitive use of the nation’s vast, and relatively inexpensive, coal reserves. Out of 40 projects, the Clean Coal Technology Program has successfully completed its involvement in 20 projects, and the remainder are in operation, construction or design phases. The General Accounting Office now points to the Clean Coal Technology program as a model of public-private partnership. The program has resulted in commercial development of 14 technologies, and the non-federal cost share now averages 66 percent per project. Nevertheless, because there are balances available from previously canceled or restructured projects, the Department proposes to rescind \$153 million in fiscal year 1998, and to defer an additional \$133 million in balances that will not be required until fiscal year 1999.

In fiscal year 1998 the Clean Coal Technology program will produce the following important results:

- Operation of the nation’s first three commercial scale coal gasification combined cycle power plants—at Tampa, FL; Terre Haute, IN; and Reno, NV—each facility achieving 95 percent or greater sulfur removal, and 90 percent nitrogen oxide reductions;
- Startup of a commercial-scale advanced combustor power plant at Healy, AK, which will reduce sulfur dioxide by 90 percent or more, and nitrogen oxides by 70 percent;
- Completion of tests at an advanced coal processing facility in Colstrip, MT, producing clean fuel with sulfur content as low as 0.3 percent and heating value up to 12,000 Btus/lb.

Research and development is critical if the U.S. is to maintain its technological edge. The question is: how should our national research and development investment be shared between the public and private sectors? U.S. private sector spending for energy research and development is down more than 30 percent since the early 1980s. One reason is that recent changes in domestic energy markets, particularly deregulation of the natural gas industry and the move toward greater competition in the electric power industry, have encouraged general corporate cost-cutting but discouraged research and development, especially if the payoff is beyond one to three years. At the same time, the makeup of the U.S. oil industry is shifting from large, multi-national producers to smaller companies (who drill 85 percent of all new wells) with limited research and development capability and access to advanced technologies. In addition, expectations of continued low oil prices may be discouraging private research and development that could lower the cost of new sources of fuels.

When the result will clearly benefit the public at large—for example through cleaner air, more affordable energy, or greater energy security—government involvement is justified and can make the significant difference. This is especially true when the research and development is beyond the private sector’s economic capability, or interest. Some research and development has no current “market driver.” Some research and development may be vital in the 21st century, but holds no economic incentive today for the private sector. For example, few companies can today justify an aggressive research program aimed at preventing the generation of the greenhouse gas carbon dioxide, much less investing in a means of capturing and disposing of it. There is no immediate “bottom line” payoff. If the public benefits are important—but research is too fundamental to offer commercial potential, or the advanced technologies pose too great a technical risk or are outside the time frame that would justify industry’s investment on its own—then federal support is justified, and sometimes critical to secure public goals and benefits.

The federal government has unique expertise. Our national laboratories have capabilities developed for defense purposes that can be adapted through research and development to improve domestic energy production. No private sector firm possesses these capabilities. With global markets for new energy technologies offering lucrative opportunities, other countries such as Japan and Germany are using government-industry research and development partnerships to develop innovations that will compete with U.S. technologies.

As Americans we have a duty to discipline government spending and eliminate the deficit in consideration of future generations. However, reducing federal support of energy research and development would place an even higher burden on future generations. Failing to sufficiently invest in energy technology development today sends a signal that we are not willing to work for the future. Affordable heating, cooling, transportation and cleaner supplies of energy will depend on continued in-

novation that keeps pace with future energy challenges. Industry is a critical partner in this effort.

THE FISCAL YEAR 1998 BUDGET—ENSURING SECURE SUPPLIES OF CLEAN, AFFORDABLE ENERGY

The Department's fiscal year 1998 budget request ties program funding requirements to specific outcomes. This budget was formulated to accomplish strategic objectives which support our national energy goals.

ENERGY EFFICIENCY

According to the 1997 Annual Energy Outlook from the Energy Information Administration (EIA), the average home in 2015 is expected to be 4 percent larger and to rely more heavily on electricity-based technologies. Annual highway travel and air travel per capita in 2015 are expected to be 12 and 76 percent higher, respectively, than their current levels. Despite this expected growth in demand, the EIA report expects that "primary energy intensity on a per capita basis will remain essentially static through 2015." The Outlook attributes this to anticipated improvements in energy efficiency which will "make it possible to provide higher levels of service without significant increases in energy use per capita".

These projections show the importance of energy efficiency technologies. However, these projected gains in efficiency will not be enough. The same forecast projected increased foreign oil reliance which could pose a severe risk to our energy and economic security in the coming years. In consideration of our future, we cannot afford to back away from the investment in energy efficiency technologies.

Reflecting the Administration's commitment to energy efficiency technologies as a key element of the national energy strategy, the Department's total fiscal year 1998 request for Energy Efficiency programs is \$707.7 million, a \$137.9 million increase or 24 percent above the fiscal year 1997 comparable appropriation. We recognize, of course, that this is a bold initiative that may be difficult to achieve in these constrained fiscal times. But we believe the program is well conceived and essential in order to provide for a more secure and environmentally responsible energy future.

The Office of Energy Efficiency and Renewable Energy programs is organized to address the challenges facing the major energy use sectors of the national economy—industry, buildings, transportation, and utilities. The request for Industry sector efficiency programs is \$139.6 million, Buildings \$302.4 million, and Transportation \$203.2 million. In addition, to directly address the energy efficiency of one of the largest consumers of energy, the federal government, \$31.1 million is requested for the Federal Energy Management Program.

The Department's fiscal year 1998 request continues key initiatives, started at the beginning of the Clinton Administration, designed to accelerate deployment of existing technologies and emphasize research and development technologies for the future. The Department has charted a course to provide energy solutions into the next century. We have outlined major goals and developed this budget request with the aim of achieving the following key objectives.

Designing and delivering cars of the future.—The Department of Energy leads the design team of the government-wide Partnership for a New Generation of Vehicles (PNGV), a multi-agency/industry collaborative initiative led by the Department of Commerce. The goal of PNGV is to develop an 80 mile-per-gallon family car and demonstrate a prototype car for the future by 2004. In fiscal year 1998 the Department proposes an increase of \$22.1 million for PNGV programs, for a total fiscal year 1998 request of \$128.3 million for PNGV related research and development in the Energy Efficiency program.

The total fiscal year 1998 request for Transportation programs, including PNGV related activities, is \$203.2 million. An increase of \$6.2 million is proposed for Technology Deployment activities which promote the use of alternative fuels through the voluntary Clean Cities programs and other activities. The \$2 million increase in Heavy Vehicle Systems research and development will support increased efficiencies in advanced diesel engines and activities to deploy existing technologies directed at heavy vehicles such as buses, and trucks. Decreases of \$2.9 million are proposed in Automotive Materials and \$3.5 million for Heavy Vehicle Alternative Fuels research and development.

Improving efficiency in energy intensive industries.—The Department is working closely with the most energy-intensive industries to focus cooperative research and improve U.S. competitiveness. Working together with industry to encourage the development and application of energy efficiency and pollution prevention technologies, our goal is to help achieve over \$10 billion of industry energy cost savings by the year 2010. The Department's fiscal year 1998 request emphasizes the Indus-

tries of the Future public-private partnership program and proposes a \$9.4 million increase for a fiscal year 1998 program total of \$55.7 million.

In addition, the Department is requesting increases to support other cost-effective industry pollution prevention partnership programs in fiscal year 1998: for Motor Challenge, \$2.1 million, to continue collaboration with the private sector to improve the efficiency of industrial motors; for Climate Wise, \$2.8 million, to continue efforts to voluntarily reduce global warming emissions from industrial energy users; for NICE3 partnerships, \$6.2 million, to continue the highly leveraged deployment of innovative energy efficiency and pollution prevention technologies in partnership with State, local and other federal agency partners; and Industrial Assessment Centers, \$1.1 million, to enhance technical support available to industries seeking to audit the efficiency of their facilities. Proposed for continuation at the fiscal year 1997 comparable level are: Advanced Turbine Systems, to continue development of highly energy efficient turbine engines for future use in industrial settings, and Advanced Materials R&D, to develop highly efficient industrial materials, such as ceramics, which are able to withstand greater heat and stress demands, thereby, operating more efficiently with lower energy requirements.

Developing buildings and communities for the 21st century.—By working with the building industry, community leaders and customers, the program's goal is to develop and implement a plan for buildings and communities of the future. The typical American family of four spends \$2,200 each year on energy. The Energy Efficiency program is targeting residential energy consumption with the objectives of cutting builder costs by 10 percent, consumer costs by 20 percent, and pollution by 30 percent, saving 3 quads of energy and reducing environmental emissions by 60 Million Metric Tons Carbon Equivalent by the year 2010.

Public-private deployment partnerships for the buildings sector which are designed to increase energy efficiency are proposed to increase by \$10 million in fiscal year 1998. One recent example of the benefits of this partnership approach is the Rebuild America program where \$500,000 in Federal funds was used to attract nearly \$33 million in State, local and private funds to implement energy efficiency technologies in commercial and government buildings at the State and local levels. The \$10 million increase in building sector programs will support: Rebuild America, as well as promote efficient and affordable residential and industrialized housing; Energy Star Appliances, a voluntary incentive program that promotes market demand for energy efficient appliances; and enhanced Building Codes and Standards activities with the States. Also supported is research and development funding for advanced building equipment and materials, including windows and lighting.

Transferring proven energy efficiency measures to consumers.—By applying energy efficiency measures to existing buildings and operations, our goal is to increase efficiency and reduce government energy consumption 30 percent by 2005 from a 1985 baseline. Through aggressive deployment of technologies available today, we propose to reduce annual energy consumption by one quad of energy by the turn of the century. To move toward these targets we propose the following program levels in fiscal year 1998:

For the Federal Energy Management Program \$31.1 million is requested. This is an \$11.3 million increase to let the program bring a series of new energy technology options to federal facilities managers and support the growth of alternate, non-Federal financing options to implement energy cost savings such as up-front capital financing from energy utilities which is to be repaid from the agencies' monthly energy consumption savings.

A \$41.3 million increase is proposed for grants. Federal support through these grants is cost-effective as the money often leverages investments by State, local and private sources to deploy energy related technologies. State Grants which support innovative energy efficiency programs of the State Energy Offices and help to generate \$19 million in non-Federal investments for every appropriated dollar, are proposed to increase \$8 million to a total of \$37 million in fiscal year 1998. Also proposed is a \$33.3 million increase for the Weatherization Assistance Program for a fiscal year 1998 total of \$154.1 million, to deploy existing energy efficiency technologies in households that cannot afford the investment without the program. This level of funding will weatherize close to 78,000 households in fiscal year 1998. Level funding between fiscal year 1997 and fiscal year 1998 of \$1.6 million is requested for the Municipal Energy Management Program which works with urban communities, and leverages four non-Federal dollars to every federal dollar.

FOSSIL ENERGY RESEARCH AND DEVELOPMENT

The budget request for the Fossil Energy program recognizes that nearly 85 percent of the nation's energy is currently supplied by coal, oil and natural gas. With

the use of these fuels projected by the Energy Information Administration to increase to more than 88 percent by 2015, the Department's fossil energy program focuses its funding primarily on ways to enhance our domestic energy security and ensure continued environmental protection.

The Fossil Energy fiscal year 1998 budget addresses these energy concerns. As a near-term response to a potential oil supply disruption, the fiscal year 1998 budget maintains the strategic petroleum reserve at 563 million barrels, respecting our international responsibilities and providing a powerful tool to blunt oil shortages and price fluctuations. For the longer-term, the budget continues research and development into new oil exploration, production and processing technologies that can lower costs and boost domestic oil supplies, particularly from properties owned by smaller independent producers. The budget also maintains research into alternatives to conventional petroleum, including technologies to produce high-quality liquid fuels from natural gas and coal.

The Fossil Energy Research and Development program is committed to new natural gas-and coal-fired electric power technologies that can produce significantly less carbon dioxide and acid rain emissions than current technology, while keeping electricity costs affordable.

The fiscal year 1998 budget moves into the final phases of development for several advanced electric power technologies, including low emission boilers, advanced generation fuel cells and ultra-high efficiency gas turbines, culminating a decade or more and several hundred million dollars of prior public and private sector investment. DOE's support for these 21st century technologies is becoming increasingly important as the U.S. industry, confronted by the uncertainties of restructuring, continues to cut back financing of longer-range, higher-risk R&D, while at the same time demand for new and cleaner sources of electricity rapidly increases throughout much of the world.

The fiscal year 1998 budget request also recognizes that U.S. demand for clean-burning natural gas could increase significantly in the next decade, particularly in the electric power generation market. The proposed budget would maintain a major effort to ensure that adequate and affordable gas supplies can continue to be produced to meet this rising demand. New exploration and production technologies, such as innovative imaging and improved fracturing techniques, will help the U.S. expand its natural gas production by several trillion cubic feet over the next 5-10 years, particularly from difficult, low-permeability formations that are currently beyond the capabilities of today's technology.

The fiscal year 1998 request for Fossil Energy Research and Development is \$346.4 million, which is a five percent reduction from the fiscal year 1997 level. This is because many of the Department's supported gas and coal-fueled power systems are entering their final phase of development this fiscal year and will be available to meet market demand close to the turn of the century. We plan to redirect our program to focus on advanced, high payoff research and development. The proposed budget retains a commitment to technology advancement and, in most cases, is highly leveraged by joint partnerships with the private sector. This budget was developed to address the following strategic objectives:

Develop the Clean, High Efficiency Power Plant for the 21st Century.—The goal is to provide the nation's electric power industry, between 2000 and 2010, with a new generation of natural gas and coal power technologies that progressively lower CO₂ emissions 30 to 50 percent, reduce SO₂ and NO_x emissions to as little as 1/10th the levels mandated by current federal standards, and produce electricity at costs 10 to 20 percent below today's conventional plants.

This request includes \$66.3 million for Advanced Clean/Efficient Power Systems under the Coal program. This funding will focus on developing progressively higher efficiency systems that emit significantly less CO₂ than current systems, and exceed environmental compliance requirements through processes that prevent, rather than control, pollutant emissions. In fiscal year 1998, \$5.5 million is proposed for the Advanced Pulverized Coal-Fired Power Plant program, which will stretch out the Department's schedule, and require the down selection of contractors to a lead developer.

Also included is \$31.4 million for continuation of the Advanced Turbine Systems Program which also will stretch out the Department's schedule and require selection of a lead developer.

Boost the Nation's Production of Natural Gas and Oil.—Through the development and application of advanced energy technologies, the Department's goal is to improve the capability of the nation's petroleum industry to produce additional supplies of secure, clean domestic natural gas and oil, helping to increase U.S. oil production by an average of 0.5 million barrels per day and gas production by 3.7 trillion cubic feet per year by 2010.

The budget includes \$25.3 million for the supply portion of the gas budget to continue to focus on advanced drilling; completion, stimulation, and reservoir characterization technology and resource assessment methodology; storage technologies and engineering techniques; upgrading of low-BTU gas; conversion of natural gas to clean liquid transportation fuels and feedstocks; and environmental research and analysis.

The request for petroleum activities is \$52.2 million, a 14 percent increase from the fiscal year 1997 level of \$45.9 million. This increase will support Exploration and Production Supporting and Environmental Research to achieve improvements in locating, processing and delivery of oil and gas resources in a more environmentally sensitive manner. The Supporting Research program includes the development of advanced technologies for exploration, drilling, reservoir characterization, and extraction.

Provide a New Option to Supplement the Nation's Liquid Fuels.—The goal is to provide the nation, by 2005, with an alternative source of liquid fuels, costing \$25 per barrel or less, that can be produced from coal and solid wastes.

This request includes \$15.8 million for the Advanced Clean Fuels program which demonstrates advanced concepts for the clean production of coal-based transportation fuels, chemicals and other high value products that can compete with petroleum products.

STRATEGIC PETROLEUM RESERVE

Maintenance of the Strategic Petroleum Reserve is a key component of our national energy security policy. No sale of oil is proposed for this fiscal year. At the proposed level of \$209 million, the program will maintain operational readiness and facilities maintenance, continue the Drawdown Readiness Program, conduct annual exercises, and continue the environment, safety and health program. The Department will continue its plan to degasify hot and gassy oil in the Strategic Petroleum Reserve. As is, this oil is currently unusable and presents potential safety concerns. In fiscal year 1998, the program will degasify 39 million barrels of gassy oil at Big Hill, Texas, thereby restoring capacity to the ready reserves. In addition, efforts to stabilize Weeks Island will continue as will the Life Extension Program, which will be completed in fiscal year 2000.

CLEAN COAL TECHNOLOGY

In fiscal year 1998, the Department continues current policy and does not propose to start any new domestic Clean Coal Technology projects. Funds available from canceled and restructured projects enable the Department to propose a rescission of \$153 million in fiscal year 1998. In addition, the Department proposes to defer the use of \$133 million which otherwise would have been available until fiscal year 1999. The Department has signed cost-sharing commitments for all projects in the program, and balances available from previous restructuring and cancellation enable a portion of the previously appropriated funds to be returned to the Treasury without endangering the success of this program.

NAVAL PETROLEUM RESERVES AND OIL SHALE RESERVES

The fiscal year 1998 budget request for the Naval Petroleum and Oil Shale Reserves of \$117 million provides for continued operation of the reserves until their sale and asset transfer is completed. The National Defense Authorization Act of fiscal year 1996, Public Law 104-106, requires the sale of Elk Hills, Reserve No. 1, located in Bakersfield, California no later than February 10, 1998. Based on this schedule, the budget request provides funding for seven and one-half months of operations for NPR-1, including a transition period and full year funding for NPR-3 and the Naval Oil Shale Reserves. Available current and prior year funds will be invested in the current year to conduct sale activities.

The Department is on track for completion of the Elk Hills sale as set forth by statute. Sufficient safeguards have been put into place to ensure that Elk Hills will not be sold unless the Government receives maximum value for the field. The statute requires the Department to hire five experts in the valuation of oil and gas fields to assess the value of Elk Hills under continued Government ownership. The Department may not sell Elk Hills for an amount less than the higher of the average of the five assessments, or the average of the middle three assessments (excluding the high and low assessments).

ENERGY INFORMATION ADMINISTRATION

The fiscal year 1998 request for the EIA totals \$67.8 million, comprised of \$62.8 million in direct appropriations and \$5 million in activities coordinated through the Office of Energy Efficiency and Renewable Energy. This level of funding will continue to support the data and analysis requirements of EIA's wide variety of customers with a streamlined portfolio of products in comparison to prior years.

In fiscal year 1998, EIA estimates that it will produce approximately 240 reports and analyses covering a wide variety of energy issues. The office anticipates the need to address approximately 300,000 inquiries and requests for energy information in fiscal year 1998 alone. The most significant change to EIA's core activities in the fiscal year 1998 request is the proposed addition of analysis and data collection in response to electric industry restructuring. Several changes are also proposed which will significantly alter the depth and scope of EIA's traditional programs by fiscal year 1998. These include: elimination or scale back of several publications; elimination or reduced frequency of data collections; elimination of the in-house mainframe computer; and release of the Residential Energy Consumption Survey on a quadrennial, rather than triennial basis. The funding proposed as an appropriation from the Office of Energy Efficiency and Renewable Energy will support the core EIA data and modeling activities needed to support energy efficiency program needs and measure program results.

OFFICE OF HEARINGS AND APPEALS

The Department requests level funding of \$2.7 million to continue to process and resolve applications for refund requests and other petroleum overcharge activities required under the Emergency Petroleum Allocation Act of 1973. The request will support personnel compensation and benefits, travel expenses, and support services within the Department's Working Capital Fund for rent, supplies, printing, and information technology.

A BALANCED PORTFOLIO

The Department's fiscal year 1998 budget request represents a balanced portfolio of investments in energy technologies required for the nation's advancement into the 21st century. This budget request stays on course to ensure that America's future includes sufficient supplies of energy needed to fuel a growing economy without sacrificing environmental quality. Now is the time to maintain the government's investment in energy technologies and finally deliver the benefits of these long-term efforts to the American people. These investments are critical, now more than ever.

BIOGRAPHICAL SKETCH OF HON. FEDERICO F. PEÑA

Federico F. Peña, the 12th U.S. Secretary of Transportation, compiled an outstanding record of increasing the global competitiveness of the transportation industry, improving the safety of travel, and streamlining the Department of Transportation, while investing more in America's infrastructure than any Secretary in history.

In the area of global competitiveness, the transportation sector is the healthiest it has been in decades; 500,000 of the 10 million jobs created since President Clinton took office are in transportation services.

Secretary Peña helped revitalize the U.S. airline industry and signed aviation agreements with 40 nations opening lucrative markets for American airlines and cargo carriers and promoted easier travel for Americans and tourists to the U.S. At the President's request, he conducted commercial diplomacy efforts around the world, and he was credited with helping American businesses sell billions of dollars in exports to Asia and the Middle East. He also orchestrated for President Clinton the revitalization of shipbuilding, leading to the sale of the first American-made large vessels to foreign countries in 38 years.

He was responsible for bringing airline consumers the same level of safety for all flights—from jumbo jets to a 10-seater, and he spurred the truck, bus, and rail industries to promote safety.

As for streamlining the Department of Transportation, Secretary Peña downsized the work force by 11,000 positions, while upsizing investments in America's infrastructure by 10 percent. He rewrote the rule book on financing highway projects, which encouraged private financing and sped up construction of more than 75 projects by 2 or 3 years at no cost to the Federal taxpayer.

He also led the way for cities to use new technologies to manage traffic congestion and set a national goal to cut American's commute time by 15 percent in a decade; and he emphasized consumer protection, by improving an auto safety hotline and ensuring proper airline ticketing and advertising practices.

As the Service Secretary for the U.S. Coast Guard, he provided leadership for the nation's fifth armed service to save lives and protect our environment. On his watch, the Coast Guard rescued 56,000 Haitian and Cuban boat people, and fought devastating floods and hurricanes.

From 1983-91, he was Mayor of Denver leading an urban and economic renaissance, reversing Denver's mid-1980's decline through a series of bold initiatives. Most notably, he won approval for the construction of one of the largest and most technologically advanced airports in the world, Denver International, which, as Secretary of Transportation, he dedicated in February 1995.

Peña also has served as a Colorado legislator and a civil rights lawyer.

He has received many honors. In 1995, he was named Father of the Year by the National Father's Day Committee. In 1994, the American Subcontractors Association of Colorado named him Man of the Year, and he received the Señor Internacional Award from LULAC Council 12, the American Heritage Award from the Mountain State Anti-Defamation League, the National Leadership and Service Award from the Travelers Aid Society of Washington, and the Person of the Year Award from the American Association of Port Authorities.

Secretary Peña did his undergraduate work at the University of Texas, where he also received his law degree. Florida International University awarded him an Honorary Doctor of Public Service degree in 1995.

Born in Laredo, Texas, in 1947, Secretary Peña is the third of six children of a cotton broker. He and his wife, world-class marathon runner and attorney Ellen Hart Peña, live with their two children in Alexandria, VA.

BIOGRAPHICAL SKETCH OF ROBERT S. KRIPOWICZ

Robert S. Kripowicz was appointed U.S. DOE Principal Deputy Assistant Secretary for Fossil Energy on March 4, 1996. As Principal Deputy Assistant Secretary he is assisting the Assistant Secretary for Fossil Energy with the internal development of a working budget and the external negotiations with appropriators in Congress. Mr. Kripowicz will also help the Assistant Secretary with strategic planning. One of his main duties will be to build a unified focus for the Fossil Energy coal, oil and natural gas programs for the long term.

Mr. Kripowicz previously was appointed Acting Deputy Assistant Secretary for House Liaison in April 1995. As House Liaison he was responsible for coordinating all interactions with members and staff of the House of Representatives on departmental programs. He was also responsible for establishing legislative and budget strategies and for coordination of hearings, floor, and conference action on all legislation in the House affecting the Department.

Previously, he was appointed Deputy Assistant Secretary for Building Technologies in January 1995. The Office of Building Technologies, within the Office of Energy Efficiency and Renewable Energy, is responsible for Department of Energy's (DOE) programs to increase the energy efficiency of the nation's residential and commercial heating and cooling systems; solar systems; high efficiency lighting, windows, and equipment; and advanced building materials.

Prior to joining DOE, Mr. Kripowicz was on the staff of the House Interior and Related Agencies Subcommittee of the Committee on Appropriations. He was responsible for appropriations for DOE programs in energy efficiency, fossil energy, clean coal technology, and Strategic and Naval Petroleum Reserve activities, as well as Interior Department energy, scientific, and land management programs. He also served as Staff Director of the House Energy Subcommittee of the Committee on Science and Technology, responsible for energy efficiency, renewables, fossil energy, high energy and nuclear physics, and basic science programs at DOE.

Mr. Kripowicz began his government career in the early 1970's in program analysis and budgeting activities at the Atomic Energy and Nuclear Energy Commissions and the Energy Research and Development Administration.

In the private sector, Mr. Kripowicz managed research and development programs at Mechanical Technology Inc.; construction contracts for Consolidated Edison of New York; and financial planning and budgeting at NUMEC, a nuclear subsidiary of ARCO, and was a chemist for Dupont. He also served as an officer in the United States Army. Mr. Kripowicz received his B.S. in chemistry (cum laude) from Lafayette College in 1963, and his M.B.A. from the University of Pittsburgh in 1970. A

native of Butler, Pennsylvania, Mr. Kripowicz currently resides in Silver Spring, Maryland.

BIOGRAPHICAL SKETCH OF JOSEPH ROMM

Dr. Joseph Romm was named Acting Principal Deputy Assistant Secretary for Energy Efficiency and Renewable Energy in August 1995. In this capacity, Romm helps the Assistant Secretary, Christine Ervin, manage the \$800 million portfolio of research, development, and deployment of clean industrial, transportation, building, and utility technologies. He is co-author, with Deputy Secretary Charles Curtis, of the April 1996 Atlantic Monthly cover story, "Mideast Oil Forever."

From July 1993 to July 1995, Romm was special assistant for policy and planning to the Deputy Secretary of the U.S. Department of Energy, where he advised the Deputy on energy efficiency, renewable energy, pollution prevention, and industrial competitiveness. He served as the Executive Director of the Department's Pollution Prevention and Waste Minimization Executive Board, which works to minimize the Department's own waste stream and to coordinate its pollution prevention R&D.

Romm is author of the recent book *Lean and Clean Management: How to Increase Profits and Productivity by Reducing Pollution* (Kodansha, 1994), a "how to" book for companies that want to improve their energy and environmental performance. The book documents two dozen case studies of companies that have increased productivity through energy-efficient building and office design, industrial energy efficiency, of pollution prevention.

From mid-1991 to mid-1993, Romm worked with Amory Lovins at Rocky Mountain Institute. Romm holds a Ph.D., in physics from M.I.T., and has written about pollution prevention and manufacturing for *Forbes*, *Technology Review*, *Foreign Affairs*, *Industrial*, the *New York Times*, and *USA Today*.

BIOGRAPHICAL SKETCH OF ELIZABETH E. SMEDLEY

Elizabeth E. Smedley was appointed Controller for the U.S. Department of Energy (DOE) on September 6, 1985 and named Acting Chief Financial Officer (CFO) when the Department established a CFO organization in August 1991. She served in that capacity until DOE's first Presidentially appointed, Senate confirmed CFO, Joseph F. Vivona, was sworn in on July 25, 1994. She was again named Acting CFO on January 17, 1997. As Acting CFO she manages the Department's budget and accounting operations which total over \$20 billion in resources annually, as well as in the development of financial policy and for conducting a compliance review program which ensures that proper financial procedures are followed by Headquarters and field offices.

Mrs. Smedley has been with DOE since December 30, 1979, serving first as the Director of the Office of Financial Policy, and then as Deputy Director, Office of Budget. She served as the Agency Budget Officer from June 1981 until June 1983, and most recently, as Assistant Controller for Budget, Policy and Compliance.

Prior to her assignment to DOE, Mrs. Smedley spent four and one-half years as Head of the Operating Forces Branch within the Office of the Comptroller of the Navy. In this position, she was responsible for formulation, defense and execution of the portion of the Navy Budget which provided operating funds for the Atlantic and Pacific fleets. From 1964 to 1975, she served in positions of increasing responsibility with the Public Health Service, Department of the Army, Defense Communications Agency, and Department of Navy.

In recognition of her work at DOE, Mrs. Smedley received the rank of Distinguished Executive in the Senior Executive Service in 1982; the DOE Meritorious Service Award in 1984 and 1990; the rank of Meritorious Executive in the Senior Executive Service in 1988; the Secretary's Award in January 1989; the Donald L. Scantlebury Memorial Award in 1989; and the Superior Performance Award in 1989, 1990, 1991 and 1992.

Mrs. Smedley received a Bachelor of Arts degree in International Relations from Goucher College in 1964 and did graduate work in Business and Public Administration at George Washington University. She has been active in community affairs, and from 1969 to 1973, served in a part-time elected capacity as Councilwoman for the city of Bowie, Maryland.

Born in Baltimore, Maryland on November 9, 1943, Mrs. Smedley currently resides in Boonsboro, Maryland. She is married to Jerry Morgan Smedley of Mishawaka, Indiana. They have four children: John, Jeremy, James, and Jennifer.

ROCKY FLATS

Senator CAMPBELL. Thank you. Let me come back to Rocky Flats for a minute, but based on your testimony, I think as you mentioned, the dependency we are now facing in getting up to 60 percent I believe is the figure you mentioned, it really is unacceptable to me, too.

You focused on production of natural gas, alternative fuels, efficiency, and so on. I commend you for that. I think that's all great.

NAVAL PETROLEUM AND OIL SHALE RESERVES

One thing I did want to deal with a little bit is the study that was due from the Department of Energy. I know you did not have anything to do with it, you were not there, but we did request a study sometime ago, and it was supposed to be delivered to us last summer on the Naval petroleum and oil shale reserves.

We have yet to get it, and yet we have seen some press releases and copies of memorandums that were released to the press that said that that had been done sometime ago. I was wondering if you know why we had not got it yet.

Secretary PEÑA. Mr. Chairman, I am aware generally of the problem. It is not completed, and I understand that staff has had conversations with others about the delay, and it is my understanding that the report will be finished in a very timely fashion, I hope in the next few months.

Mr. KRIPOWICZ. Actually by the end of March.

Secretary PEÑA. The end of this month hopefully.

Senator CAMPBELL. The end of March? OK. I would appreciate if you would focus on that and make sure we get one.

Secretary PEÑA. We will. We think it's very important and we want to comply with the requirements.

Senator CAMPBELL. It is also my understanding that the Department plans on introducing some legislation disposing of the oil shale reserves. I would draw your attention to a bill that I introduced that I will probably be reintroducing that would transfer the authority from Department of Energy to the Department of Interior to lease the natural gas that may measure in the trillions of cubic feet under the oil reserves.

We did not really get anywhere in the 104th with that bill, but we are going to try to move that this time with your input.

My question really is, first of all, is the administration going to introduce some legislation to sell the oil shale reserves or part of it?

Secretary PEÑA. Mr. Chairman, I do not believe we are yet at the stage of proposing legislation for the specific purpose of leasing or selling the oil shale reserves. However, we are very aware of the issues you have raised in this regard.

The Department has had preliminary conversations with the Department of Interior pursuant to the suggestion you raised, I believe, last year about how one might go about looking at either, if not sell, a lease of the minerals in that part of the reserve. We're going to continue those conversations.

I believe that by bringing in some independent experts we can get better judgment about that. In the context of an overall report

that the Department will be providing to the Congress I think in September of this year dealing with the whole naval petroleum reserve and other reserves, I think we'll be able to comment much more specifically about the direction we're going to head in, but I would be pleased to work with you on that. I know it's a high interest of yours to determine how we can best approach that particular problem.

Senator CAMPBELL. I know we are catching you a little bit flat-footed, but I was wondering if there had been any dialog with the environmental community. I was worried about wildlife, the ranchers that have grazing permits in that area and a number of other things, but I assume you will be taking all those into consideration and visiting with them at least before we—

Secretary PEÑA. That is correct, Mr. Chairman, and there are some concerns that have been raised, particularly about subsurface treatment. Of course, we do have some issues we are raising with the Department of Interior. Again, we hope to resolve those. Now that I'm official I can have those conversations with my good friend Bruce Babbitt to see how we can address this issue.

NATIONAL RENEWABLE ENERGY LAB

Senator CAMPBELL. Thank you. In addition, you know that the National Renewable Energy Lab is very important in our State, in fact very important to the Nation. They have done just some marvelous research there. I visited two or three times and was really impressed with some of the new technology that they are developing. Could you perhaps explain a little more in detail about the funding for the National Energy Resource Lab or perhaps your colleagues can.

Secretary PEÑA. Let me start, Mr. Chairman. I guess fortunately I'm also familiar with that very important lab since it's in Colorado, and I remember the very fine work it has done over the years, as you have, and I look forward to perhaps taking some time to visit again with you when you have some time and we can both be there together. That's a very high priority lab for us. We want to continue to be supportive in terms of funding. As far as I know our funding is in good shape. Let me ask Mr. Romm if he wants to add to that.

Senator CAMPBELL. Would you identify yourself for the record.

Mr. ROMM. Sure. Dr. Joseph Romm, the principal Deputy Assistant Secretary for Energy Efficiency and Renewable Energy at the Department.

Yes; we have requested in the energy and water account, roughly a \$70 to \$80 million increase in renewable energy technologies over fiscal year 1997. Much of this is either done at the National Renewable Energy Lab or passes through, and they help manage that, so a pretty significant increase in renewable energy funding.

Senator CAMPBELL. Thank you. Senator Byrd, do you have some comments or questions, please?

FOSSIL ENERGY

Senator BYRD. Thank you, Mr. Chairman. Mr. Secretary, I join with others in congratulating you on your new assignment and wishing you well.

The use of energy in so many facets of the daily routines of the American public has a huge impact on the U.S. economy. The Energy Information Administration estimates that end users of energy spend \$560 billion per year in the United States. Thus our energy security has a direct bearing on our economic and national security. These factors, when coupled with the environmental concerns associated with energy use, are at the root of the programs that are supported by the DOE budget.

Is it accurate that fossil fuels are the dominant source of energy in the United States and are projected to remain so in the foreseeable future?

Secretary PEÑA. That is correct, Senator Byrd.

Senator BYRD. Would you agree that based on the Department's own projections there remains a very important role for fossil fuels and particularly for coal in meeting our energy requirements for the future?

Secretary PEÑA. We agree with that statement. I personally agree with that statement, Senator, and that's why we're very supportive of the Clean Coal Program in particular.

Senator BYRD. How will the program investments in the fossil energy budget help us to continue to meet the demand for energy in this country?

Secretary PEÑA. Senator, in a number of ways. First of all, as I stated in my testimony, we will continue to be supportive of the Clean Coal Technology Program, which is a demonstrated success. We believe the efficiencies we have already demonstrated in that program where we have 40 individual projects, 20 of which have been completed, 20 which are now either in construction design or in operation are all, we think, going to have the potential for increasing the viability of the use of clean coal in the future. It is a very important part of that strategy.

The remainder of the investment we are making in other clean energy programs will do the same in other technologies. We believe that given what we are observing in the private sector, which is a decrease in the amount of investment for research and development, that as a matter of national policy, we as a government, as an American people need to make a decision about how much more we want to ensure that research and development, particularly in the long term, in this very important area, continues to be a high priority, so that we are not left behind, particularly compared to our competitors in Germany and Japan, which are making, at least compared to GDP, higher if not comparable investments in this kind of research and development.

It is my judgment that we need to continue to make this research and development investment. It is good for the country. It sustains a very important public policy, and given the conversations we had this morning about the need to establish an energy independent strategy for our country, this is a very important part of that strategy.

Senator BYRD. I am glad to hear you say that, Mr. Secretary. I am concerned about the impact that the proposed fiscal year 1998 funding levels for fossil energy will have on our ability to complete development of some of the major technologies in a timely manner.

What makes this a particular concern is that increased funding is proposed in other areas of the Department of Energy budget.

One of the largest programmatic increases requested for fiscal year 1998 is for the energy efficiency programs within the Interior bill which are proposed to grow by nearly 25 percent above the fiscal year 1997 level.

RENEWABLE ENERGY—USE AND FUTURE PROJECTIONS

How much of our current energy use is from renewable sources and what are the future projections?

Secretary PEÑA. Senator, I would be happy to get you the specific estimates of what our current renewable energy use is and what our projections are. Let me generally state and agree that they are not at the levels that we would like them to be.

[The information follows:]

RENEWABLE ENERGY—USE AND FUTURE PROJECTIONS

Current U.S. renewable energy capability is over 93 gigawatts. Nearly 85 percent of that is conventional hydropower. Future use of renewables is dependent on economic growth, rate of technology introduction, the price of oil and other factors affecting market penetration of nonhydro renewables. Minimally we expect the 15 gigawatts of nonhydro renewable capacity to at least double by 2015. In the Office of Energy Efficiency and Renewable Energy's aggressive technology and market penetration approach we expect installed capacity of more than 30 gigawatts and as high as 40 gigawatts 5 years sooner, by 2010. In most every scenario, nonhydro renewables are expected to comprise virtually all the domestic growth in the utility sector's use of renewables. As a point of reference, Royal Dutch Shell Oil Co.'s strategic planning group's growth scenario expects the world's renewable use to increase on the order of fivefold by 2015.

DECREASE IN DOMESTIC PRODUCTION OF OIL

Secretary PEÑA. However, we fundamentally have two problems we must face. One is the fact that we are seeing a decrease in domestic production of oil in particular, and that slope continues to go down, and second, we continue to see a very significant increase in consumption of energy.

If we do nothing and allow those two trends to continue over the next 10 or 15 years, we are going to be even more energy insecure. So our approach in the budget we have submitted is to deal with both, the production side and the consumption side.

We address the consumption side by our increased investment in energy efficiency. We can detail that with more specificity, and by continuing to work on the production side.

I stated several weeks ago in one of my confirmation hearings that one of my priorities will be to establish a credible and specific strategy on the production side to find a way, if at all possible, however difficult it might be, to get us to a position of becoming more energy independent, and that includes having timetables and targets and measurements and evaluation of our progress over a period of years. It will be a combination of both consumption and production strategies which I think we as a nation need now rather than waiting for the next century when we have a real crisis.

ENERGY EFFICIENCY AND RENEWABLE ENERGY

Senator BYRD. What funding is proposed in the fiscal year 1998 budget in total for efficiency and renewable energy research and development?

Secretary PEÑA. In the area of energy efficiency, approximately \$517 million for research and development. I'm sorry, Senator, the first part of your question was?

Senator BYRD. What funding is proposed in total for efficiency and renewable energy research and development?

Secretary PEÑA. The total amount, Senator Byrd, is a little over \$1 billion, \$1.017.4 billion in total.

Senator BYRD. For energy efficiency and renewable energy programs. So the budget proposes to spend about \$1 billion on programs that account for about 8 percent of our energy use. We are talking here about the nonnuclear, nonfossil sources; \$1 billion on programs that account for about 8 percent of our energy use and about \$350 million for programs that account for 85 percent of our energy consumption, we're talking there about fossil fuel. Now, to me that seems out of balance. What is your perspective?

Secretary PEÑA. Senator, I think we may have a misunderstanding of how you have reached your particular calculation, and we would be happy to sit down with you to have a better understanding of what we are trying to compare. Mr. Romm is indicating to me that there may be a different way in which we're characterizing that, and if I may ask him to at least share with you the way we're looking at that particular question, let's try to answer it for you.

Mr. ROMM. Senator Byrd, the efficiency and renewables budget does not all go toward renewable energy, which constitutes, as you know, just a few percent of the Nation's energy supply. Most of the \$1 billion goes toward the efficient use of energy, most of which is fossil fuels, if you see what I'm saying.

We work on automobiles that run on gasoline more efficiently, we work on gas turbines that industry might use, and we support technologies that would use electricity more efficiently. I would say the bulk of the technologies in the efficiency side which the Interior Committee supports are, in fact, for the efficient use of fossil energy, and, therefore, I don't think it's correct to characterize our \$1 billion as going toward supporting technologies that just constitute a few percent of the Nation's energy supply.

Senator BYRD. What type of reductions in our use of fossil fuels does the Department anticipate as a result of the energy efficiency improvements? What do you think will result from the energy efficiency improvements with respect to the kinds of reductions in the use of fossil fuels that will come about?

Secretary PEÑA. Senator, let me, if I might, come back and answer that question more specifically, and let me give you a general answer now. One of the questions that I have been asking as the new Secretary of Energy is this: As we make multimillion dollar investments in these strategies, I believe it is incumbent upon us to give you and the American people a much more specific answer on what we are producing, what is the product of these investments.

The question you're asking is one that I have been asking, too, and so let me at least today ask that I come back to you with a

much more specific answer to that question. It is a very important question, one that I need to refine with my colleagues at the Department of Energy.

FEDERAL ENERGY TECHNOLOGY CENTER CONSOLIDATION

Senator BYRD. Very well. In response to—let us talk just briefly about Morgantown, the Federal Energy Technology Center. In response to declining budgets and pressures for changes in the way that the DOE does business, last year Congress and the administration reached an agreement regarding changes in the Fossil Energy Program. As a result of this the Morgantown and the Pittsburgh Energy Technology Centers are being consolidated as one administrative organization with two sites, two locations.

This new entity is being called FETC, F-E-T-C, the Federal Energy Technology Center [FETC]. Could you state for the record, now, what is the status of the consolidation, what major hurdles have been cleared, and what are the next big issues to be addressed?

Secretary PEÑA. Senator, generally speaking, the consolidation is moving on a timely path and is meeting its objectives. We believe that with the consolidation we'll be able to reduce both our administrative overhead and some of the cost of duplicative contracting services at both facilities.

We have some money in the budget for 1998 to make sure we have a smooth transition so that we will avoid any major disruptions, as we have discussed before. We know that there may be some concerns that in the event we don't meet our milestones, there may be some problems.

We will watch that very carefully and obviously work with you because of your great concern there and make sure that we meet those milestones. As of today I've been informed that we are on target, the program and the consolidation are moving smoothly, and we expect to meet the milestones that we set out in the consolidation to begin with.

Senator BYRD. Would you agree that we need to remain flexible in terms of providing FETC the resources necessary to chart its new course in a manner that is as minimally disruptive as possible to the two sites?

Secretary PEÑA. Yes; I would, Senator. Again, we think that the money we have in the budget for this year to reach our goal of the consolidation is the appropriate amount. However, as we go through this process, if we determine that for some reason we're not meeting our goals and there needs to be an adjustment, we will obviously take appropriate action and work with you on that matter.

FEDERAL ENERGY TECHNOLOGY PROGRAM DIRECTION

Senator BYRD. I appreciate that very much, Mr. Secretary. The budget proposes a reduction of \$6.2 million in fiscal year 1998 for the FETC program direction budget, and I hope you will keep me fully apprised as to whether the remaining funding will be sufficient to allow the consolidation to proceed in an orderly way. You have indicated already that that is what you expect to do, but we will talk about it and work together on it.

Secretary PEÑA. We will do that, Senator.

Senator BYRD. I would like to touch on one other program area that is important to the Federal Energy Technology Center. How much time do I have left?

Senator CAMPBELL. We haven't been timing it, Senator, but we might—I don't know how long Senator Domenici can stay, but we might go to him and come back to you depending on how long you will be.

Senator DOMENICI. That is all right, Senator. Thank you.

Senator CAMPBELL. All right.

ENVIRONMENTAL MANAGEMENT PROGRAM AT MORGANTOWN

Senator BYRD. I would like to touch on one other program. That is with respect to environmental management and the technology development program. While funding comes from the Energy and Water appropriations bill, which is chaired by the distinguished Senator from New Mexico, Mr. Domenici, the environmental management program plays a strong role in helping FETC to have a diverse portfolio that works for many different clients within the Department of Energy.

Morgantown currently manages some \$85 million annually in environmental management programs to develop new technologies for use in the cleanup of environmental contamination resulting from nuclear weapons production. FETC brings some unique capabilities to this program—vast experience in implementing projects with industry and other governmental organizations that involve creative and complicated contractual arrangements, broad technical and engineering expertise, and an ability to be an objective partner in the decisionmaking process.

So, given the strengths that FETC can bring to the Environmental Management Program, is this a partnership that the Department will continue to support?

Secretary PEÑA. Senator, generally speaking, the answer is “yes.” We think there is an important role in the environmental management area and whatever contributions FETC can make, we believe we can continue to work with the organization.

Senator BYRD. Very well. One of the successes in FETC's participation in the Environmental Management Program has been its use of the capabilities of the International Union of Operating Engineers Hazardous Materials Center in Beckley, WV. How has this partnership benefited the environmental management program?

Secretary PEÑA. Senator, I'm going to have to turn to my associates here. I'm not familiar with that particular relationship. Let me ask Mr. Kripowicz to talk about that.

Mr. KRIPOWICZ. Bob Kripowicz. The particular contract looks at human factors, engineering, and hazardous waste operations, and we find that to be very valuable to the cleanup of our nuclear sites that have contamination problems, and that has been a very successful operation with the operating engineers.

Senator BYRD. It is because of the people's concerns about the safety issues that are associated with handling contaminated materials. I am glad to hear that you feel that the center has been helpful in addressing the end user issues associated with the Environmental Management Program.

Well, I close, Mr. Secretary, by thanking you for your testimony, and I look forward to working with you in support of programs that will contribute to the continued use of coal through more efficient power generation systems and improved environmental performance.

The Federal Energy Technology Center plays a key role in fostering these technologies. The facility in Morgantown employs some 550 persons, so I will stand ever vigilant to protect its role in promoting advanced fossil energy technologies. While the fossil energy budget is a relatively small part of the overall DOE budget, I encourage you to take an active role within the administration in defending this program against budget reductions and policy decisions that will jeopardize our ability to prepare for the energy challenges of the next century.

I am somewhat troubled by indications that the administration is not fully involving the Department of Energy and its vast expertise when policies and regulations are considered that will have a considerable impact on the energy producing and consuming aspects of our economy.

With respect to the budget, I will be working with Chairman Gorton to ensure that the subcommittee takes an approach to our energy research and development programs that is consistent with where our energy comes from and how we use our energy.

While dollars are constrained, I do not believe that this is the time for us to abandon our support of the technology development efforts already underway. We need to complete these programs so that the technologies will be commercially available in a timely manner to help us meet multiple goals.

Now, I have additional questions that with your permission, Mr. Chairman, the permission of the subcommittee, I would like to have answered for the record.

Senator CAMPBELL. Without objection.

Senator BYRD. Thank you again, Mr. Secretary. I thank your associates, and I thank Senator Domenici for his characteristic courtesy in allowing me to proceed and thank you, Mr. Chairman.

Senator CAMPBELL. We will now turn to the Senator who has corrected many of our colleagues on the pronunciation of your name.

Senator Domenici.

OPENING REMARKS OF SENATOR DOMENICI

Senator DOMENICI. We did have a good time, Mr. Secretary, the other day in full session, a lot of people there. Did you hear about that morning we had in the Energy Committee?

Senator CAMPBELL. He was not there that morning.

Senator DOMENICI. I know, but have you heard about it?

Secretary PEÑA. Generally I have.

Senator DOMENICI. Well, there was a huge crowd, you know, and I thought they were all there just because we were going to approve your nomination. They were there for an electric generating reform seminar, so we had lobbyists from all over and all these great Senators called you by your wrong name. So I told them how to say it. I said it's very simple, like pen, a fountain pen, with a y-a, Peña. I think we're getting it.

Secretary PEÑA. Thank you very much, Senator.

Senator DOMENICI. Mr. Secretary, first, I am glad you are here. I am hopeful that the long wait, with all its pressures have not been too difficult on you and your family, especially with your wife being pregnant. I hope she is feeling well and that everything is going fine.

Secretary PEÑA. She is, Senator. Thank you for your thoughts.

Senator DOMENICI. Please tell her that for me, will you?

Secretary PEÑA. I will.

Senator DOMENICI. I am glad Senator Byrd is still here, and I want to give you, my good friend, an observation about what is probably not going to happen with the President announcing what he has about the Consumer Price Index. I believe any chance of getting a negotiated budget agreement between the Republicans and the President are finished. I believe—

Senator BYRD. Why are you telling me this?

Senator DOMENICI. Well, because I want to tell you what is probably going to happen. It does not sound too good.

Senator BYRD. Why are you singling me out to be the victim?

INCREASES IN FISCAL YEAR 1998 PRESIDENT'S BUDGET

Senator DOMENICI. I think that perhaps you might be able to carry a message. I note here, Mr. Secretary, the President's request in energy conservation, represents a 24-percent increase.

Senator BYRD. I am not a homing pigeon.

Senator DOMENICI. The President's request for energy conservation research and development—

Senator BYRD. They carry messages.

Senator DOMENICI [continuing]. Represents a 24-percent increase; the transportation sector, a 16-percent increase; industrial sector, a 19-percent increase. Oh, here is a good one. Federal energy management, it is not a big account, but it has a 57-percent increase. Policy management, a 20-percent increase. Well, I have a whole list, but that is just a smattering.

Let me say to the subcommittee, and I am preaching to the choir in terms of my good friend the chairman because he understands as a member of the Budget Committee, that it seems to me we are left with no alternative other than to freeze discretionary appropriations for 5 years, and that probably means that all of these things we talked about here are gone. Forget about 24 percent increases and 19 and 16, and so on.

A freeze means a freeze. It means no more to spend 1 year than the next, and spend no more this year than last. It means, Mr. Chairman, that you have got competing interests, so some have to go up because they must, which means some have got to go down even below a freeze.

Now anybody that knows me understands that this is not my desire, but I am going to tell you right now, and I am telling the public from this day forward, this President's budget puts Republicans in a position where they have no alternative.

The President will not cut entitlement programs. If we touch them, it will be the end of the world. He has cut Medicare \$82 billion and claims it is \$100 billion, and one-half of that is phony. We have to produce a balanced budget. He is \$160 billion off the mark

on economics in the same period of time, and we are supposed to produce a budget.

Well, we will do one. Just be patient. We will do one, and I am guaranteeing you when we are finished, it is not going to be a pleasant life for the President and all these programs he wants. We will not be dumb because we will not cut the programs that he wants to resonate out there with the public. We will increase them. Let us see where the rest of it goes. Let us see where the Department of Commerce goes. I just came from one of the subcommittee meetings there. It might mean a nice 20 percent cut after you pay the personnel.

Senator BYRD. I have a suggestion.

Senator DOMENICI. Well, I am finished and I hope you do. I only have two little questions.

Senator BYRD. My suggestion would be that the President and the Republicans back off from their proposals to cut taxes at this time.

Senator DOMENICI. My distinguished friend, let me suggest that while I am not prepared to tell you that you are right, what I have just described is the case even if we do not cut taxes because of the lack of entitlement savings and the desire to get the budget balanced in 5 years. What I have just given you assumes no tax increase.

Senator GORTON [presiding]. No tax cuts.

Senator DOMENICI. Excuse me, no tax cuts. Now, having said that—and thank you for the thought.

Senator BYRD. Thank you.

SALE OF ELK HILLS

Senator DOMENICI. Now let me ask you about the Elk Hills Naval Petroleum Reserve. Are you familiar with it?

Secretary PEÑA. Yes; I am, Senator.

Senator DOMENICI. For many years we have been trying to do something about this. It is never the right time, but I guess we finally authorized the sale last year as part of the defense authorization bill. Could you tell the committee where are we in this sale? Is it going to be completed? I think we mandated it in February 1998.

Secretary PEÑA. That's correct.

Senator DOMENICI. Could you tell us about that, please.

Secretary PEÑA. I can, Senator. I've been briefed about this. Generally speaking, the work we have to do in complying with the congressional requirements for having the sale is moving along. In particular, we have already hired an outside financial advisor as required by the statutory guidance. We have hired five independent experts and will be doing the five independent analyses. These independent analyses will be used to formulate the minimum price, which cannot be lower than the higher of the average of the five or the middle three evaluations.

We are having discussions, as you know, with our partner we have in this, which is one particular oil company, but we are moving along with this, and at this point our target is still to comply with the February target.

STRATEGIC PETROLEUM RESERVE

Senator DOMENICI. One last question. The President's budget proposes to sell \$1.145 billion of oil from the strategic petroleum reserve. Are you aware of that or—

Secretary PEÑA. Yes; I am, Senator, I think that's in 2002?

Senator DOMENICI. Right. Now, the way it is structured, that is a mandatory spending proposal. Are you all familiar with mandatory versus discretionary?

Secretary PEÑA. I am, Senator. I think we are.

Senator DOMENICI. Now it is going to be difficult—the chairman can speak for himself and look at it perhaps even much more in depth—but it's going to be difficult to meet the subcommittee's 602(b) allocation and continue to fund the DOE programs at the 1997 level which included a \$220 million offset from these oil sales.

In your opinion, which would be preferable, selling the \$220 million of the strategic petroleum reserve to fund its appropriation or reducing DOE's other programs by \$220 million?

Secretary PEÑA. Senator, neither. Let me try to answer your question more specifically.

Senator DOMENICI. I gathered that.

Secretary PEÑA. No. 1, it is at least my view, and I believe the administration's general view, that we not make additional sales from the strategic petroleum reserve. Later on this year, I believe in October, we will present a report for the Congress on the overall administration's position on the reserve. I believe the reserve is very important. We have only 67 of 90 days of net import equivalent in the reserve today. There have been sales in the reserve. Some proposed by the administration, some by the Congress.

Senator DOMENICI. Yes.

Secretary PEÑA. But I think now that the dust has settled from those sales, and as we all begin to focus on the need to develop an energy independence strategy, the need for the reserve looms even greater. So let me respectfully suggest, Senator Domenici, that while there is the mark in 2002 for the sale of over \$1.1 billion in the reserve, that that is a mark, and it will be my view, at least, that we have some discussions within the administration about how we can look to other options other than that mark.

It is a ways out. There is time to make adjustments, and as you know in this multiyear budget sometimes some of these place markers are there for a reason, but I think that—I believe we ought to at least look for other ways of dealing with that kind of a cut.

Senator DOMENICI. Mr. Chairman, I guess you know I would agree with that last statement. I do not know how you feel, but, you know, I think we are perpetrating somewhat of a fraud on the American people.

We spend all their money telling them we need this big oil reserve and we go through all these expenditures and every time we run into a budget crunch we sell some oil. The world did not change any. The world is the same old world, oil dependence is growing.

But that is \$1.145 billion more that the President's budget is off in the year 2002. It is already off \$70 billion, so now we throw this

one away, that is \$71 billion. I mean, everywhere we turn it is one of these kind of things we find in this budget.

INCREASES IN PRESIDENT'S BUDGET

Since I talked about it, I think I should be fair and say to my good friend Senator Byrd that it is most interesting, the President's budget has the deficit going up \$25 billion under a steady-as-you-go, growing economy next year over this year, \$25 billion. I do not understand how that is deficit reduction.

In fact, deficits do not significantly start down until the fourth year. So obviously these budgets are full of these increases—16 percent, 20 percent, 12 percent, and so on.

I just came from Commerce. The whole Commerce Department is up 12.4 percent in the budget. Did you know that, Slade? It is just a big fat budget. Now we are going to have to change it, and the President is going to say, I could pay for all that stuff. You are all bad guys up there.

If I sound a little bit upset with the situation, I am. I am going to do my share to do what is right. I do not want to cut discretionary spending, but I do not know how else we can do it. Thanks for the time.

Senator BYRD. Well, we have already cut it to the bone. We have been cutting it to the bone for years, and I do not know how we can cut it much more. But I think it is absolutely folly to suggest that we ought to cut taxes, and I fault both parties for that, the administration as well as the Republican Party. It is no time to cut taxes. If we mean business about reducing the deficits, we ought to put that money on the deficit.

Senator GORTON. Well, Senator Byrd, as Senator Domenici said, given the situation we are in today, I think you are going to get your way, but I do not think that is going to solve the problem that we are going to face in this subcommittee.

First, Secretary Peña and Senator Byrd, I want to apologize for being late to my own wedding here, as it were, my own committee meeting. Only the importance I ascribe to the debate on the floor to emasculate the first amendment could have kept me away. Senator Domenici was there and knows the reason that I was there.

But I do want to welcome you to this job publicly, as I have privately, and express my delight that you are finally in office. This I guess is your first public appearance, is it not, since you have been sworn in?

Secretary PEÑA. That's correct, Mr. Chairman.

Senator GORTON. Well, I find that to be delightful, and an honor to this subcommittee. As I also told you in our private conversation yesterday, this subcommittee has been a matter of real gratification to me as chairman, in large part because of the wonderful education and support that I have gotten from Senator Byrd, who is the repository of so much that is great about the history of our entire Senate and the way in which we operate here. I hope that this year we're going to continue to work together, even under very, very difficult circumstances.

I'm not sure whether the materials that we gave you have in it this colored chart. Well, if it doesn't, we'll give it to you. When I took—

Secretary PEÑA. Mr. Chairman, I was not provided any materials.

ALLOCATION TO SUBCOMMITTEE

Senator GORTON. OK. Well, when I took over this subcommittee, because I didn't understand an awful lot of it and because I thought pictures were so significant, I started putting together colored charts like this that show the overall appropriation allocation to this committee and where it goes, just so that we can understand it conceptually.

Here you are, way down here in the orange for energy programs. Obviously the largest single use for our money is the various land management agencies—the Park Service, the Forest Service, and the Bureau of Land Management and the like—the heritage of the American people, and a field in which there is huge public interest, most particularly in the National Park Service.

The second area is the unique responsibility that Congress and every administration has for Indian programs. And then we get to science programs, your own, finally even smaller than yours, cultural programs, which I know my two colleagues here agree with me create much more in the way of correspondence and calls from our constituents than is warranted by the absolute size of each of those appropriations. But because they have so much to do with the culture and the heritage of this country, they are very, very important, and that puts you in a tough situation.

Your programs probably have smaller constituencies from the point of view of the general public than any of the other major or significant programs subject to the jurisdiction of this subcommittee.

That's not for 1 minute to say that they're less important. I am convinced that a large number of them are of vital importance to the future of the country, but it does impose on you a set of challenges in dealing with Members of Congress in both Houses that's perhaps greater than the other Secretaries or administrators of these other programs.

Second, I must, with great regret, join my colleague, Senator Domenici, in saying that I think the failure of the abortive but very sincere negotiations over an overall budget that result in an administration that does not want to make any significant changes in entitlement programs is likely, ultimately, to brutalize the discretionary appropriations process in general terms and very specifically in terms of this subcommittee.

I want to say across party lines that I agree totally with Senator Byrd on the proposition that budget cuts over the course of the last several years have been very disproportionately imposed on discretionary spending, spending that goes to the education of our young people, to our own direct responsibilities as landowners, to the advancement of knowledge, to the building of our infrastructure.

In extensive conversations over the last year with Senator Domenici, we had agreed that we just had to seek a budget this year that allowed discretionary spending once again to be able to rise at least to a modest extent, rather than consistently to be cut.

But it is not realistic to expect a closely divided partisan Congress to take on entitlement programs that the President won't

take on or to go through the exercise it went through 2 years ago, and I deeply fear that that means that the allocation that Senator Byrd and I will eventually get for this subcommittee will not be at the level that the President recommended. I would like very much for it to be so. I might have some different priorities within it, but I would like very much for it to be so.

And again, as I told you privately and can now say publicly, I'm not today going to ask you to set priorities or state what you would cut first. That would be an unwarranted imposition on you.

You're a member of the Cabinet, you're going to support the President's budget, but as we work forward, assuming that we are going to have to make significant reductions, I want to make them in the least harmful way that I can. I hope that we will be able to have your constructive suggestions as we go forward and that in your own mind, at least, you're going to set a number of priorities that will help us with this very difficult set of questions.

Secretary PEÑA. Mr. Chairman, if I could just briefly respond. Absolutely I will work in a very constructive way with you and members of the subcommittee to prioritize what we need to get done in the Department.

Having gone through, I think, four of these already in the last several years, I'm accustomed to the give-and-take of the budget process, but I've always tried to have a very constructive relationship with the important committees that must make these very difficult decisions.

So you have my commitment, Mr. Chairman, that we'll do that in a very honest and constructive way and tell you what our bottom line is and what our priorities are, and we understand that in any budget discussion there are going to be adjustments, and we're happy to work with you on that.

ELECTRICITY DEREGULATION

Senator GORTON. Another of my responsibilities, and now that Senator Dorgan is here, his as well, in the energy authorizing committee is the debate over competition and the form of deregulation in the electric power industry. That isn't our responsibility, of course, but in your research and development budget there are a number of programs that relate to power.

Have you had an opportunity yet or does your budget in any way reflect any dramatic changes in the way in which electric power is both produced and distributed in the United States? And if not, will that be a priority of yours?

Should we follow the same sorts of programs and priorities that we followed in the last several years if, in fact, we're going to see a rather dramatic change in the structure of the industry?

Secretary PEÑA. Mr. Chairman, if I understand your question, it is this: We are already observing significant reductions in our private sector partners' budgets in research and development generally. We have seen that in the overall deregulation of key industries in our country, and we are very troubled by that.

With respect to electric restructuring or deregulation, we would anticipate the same. That is to say, that if we move toward a deregulated environment, the kind of pressure that will be put on these now very fierce competitors who will be competing in a way

that they have not been competing before will mean that they will make significant efforts to reduce their costs, to be more competitive, and the programs that are likely to go first are their research and development budgets.

Having said that and recognizing the kinds of challenges we talked about earlier about trying to develop an energy independent strategy for our country, recognizing we've got to deal both with the consumption and the production side, it is my view that we are going to have to make sure that from the Federal side we have the kinds of investments in research and development to ensure that as a nation and as a matter of public policy we continue to make these kinds of investments despite the reduction from the private sector side that we'll see with competition, to make sure that we're continuing to think about the future and to develop those kinds of technologies that are critical to our ability to reduce consumption and to find more production.

So it's a concern of ours. We're aware of it. We haven't yet quantified it because we're not in that deregulated environment, but as we move through this year and all the bills that will be introduced to look toward deregulation, obviously that will be one aspect or by-product of deregulation that we'll follow very carefully.

FOSSIL ENERGY RESEARCH AND DEVELOPMENT ACCOMPLISHMENTS

Senator GORTON. Can you tell us what we've gotten from our investment in, say, fossil energy research and development over the last 4 or 5 years; what tangible results this society has obtained?

Secretary PEÑA. Mr. Chairman, I can. In fact, I have asked my associates at DOE to compile a list, and we would be happy to get that to you to give you a comprehensive view, but let me just give you a couple of examples, and I asked my associates to give me things that we could relate to.

[The information follows:]

EXAMPLES OF DOE/OFFICE OF FOSSIL ENERGY ACCOMPLISHMENTS FOR PROGRAMS FUNDED UNDER INTERIOR APPROPRIATIONS ACCOUNT

Built Strategic Petroleum Reserve, world's largest emergency petroleum storage reserve, designed to drawdown inventory of 563 million barrels of crude oil at sustainable rate of 3.9 million barrels per day within 15 days of direction from President. Ongoing accomplishments will extend SPR facility and systems capability to 2025 with highest level of reliability and operating cost efficiency.

Operated, maintained, and produced Naval Petroleum and Oil Shale Reserves (NPOSR) to achieve greatest value and benefit to United States. Since Reserve opened to full development in 1976, program through fiscal year 1996 has generated \$16.5 billion in revenues against cost of \$3.4 billion.

Supported Development and testing of powerplant technologies that have already had major economic and environmental impacts, and will form the foundation for future benefits. Technologies include:

- Low-polluting atmospheric fluidized bed coal combustor, the most significant advance in coal-fired boiler technology in more than half a century. Federal investment has contributed to more than \$6 billion in domestic sales, \$2 billion in foreign sales, and more than 250,000 jobs.
- Low nitrogen oxide (No_x) burners, which significantly lower costs of reducing No_x compared to other options. Domestic sales to date total more than \$250 million, supporting 1800 U.S. jobs.
- Integrated gasification combined cycle technology, and advanced coal-fired power generation system that will be one of the most important powerplant options of the 21st century. The potential global market (undiscounted) for this technology is estimated at more than \$400 billion in capital investment by 2030, and about \$150 billion in domestic market.

Supported development and testing of technologies and use of other approaches, resulting in increased domestic production of natural gas and oil through major improvement in recovery costs. Examples of technologies and approaches include:

- Mudpulse telemetry, which is one of the most important innovations used today and allows measurement while drilling. Savings are estimated at \$5 billion.
- Insulating doughnut for steam flood in deeper oil wells, which reduces heat loss in the wellbore and will save industry hundreds of millions of dollars over the next decade.
- Hot oiling paraffin treatment that reduces paraffin buildup in wellbores which cause lifting equipment failures, reducing industry operating costs by more than \$150 million per year.
- Assistance to states in implementing risk-based management approaches in effectively regulating oil and gas injection wells. Streamlining savings to domestic gas and oil exploration and production industry are estimated at \$1 billion through 2020.

OFFICE OF ENERGY EFFICIENCY AND RENEWABLE ENERGY—RECENT ACCOMPLISHMENTS

The Clinton Administration has launched a series of initiatives in energy efficiency and renewable energy research, development and deployment that are moving our nation toward a future with improved environmental quality, greater energy security and increased global competitiveness. By the year 2000, these Clinton initiatives are estimated to save consumers and businesses over \$10 billion in annual energy savings and cut annual carbon emissions by 25 million metric tons of carbon equivalent. By 2010, these savings are projected to rise to \$50 billion per year, 500 million barrels of oil per year, and 80 metric tons of carbon equivalent. Specific recent accomplishments include:

- Implementing the Climate Change Action Plan which, by the year 2,000, will reduce carbon emissions by 15 metric tons of carbon equivalent.
- Initiated 16 Climate Change programs that have attracted over 2,000 voluntary business, industry and government partners.
- Signed more than 100 climate challenge agreements for emissions reductions with more than 600 utilities.
- Established 52 new state and local building retrofit programs, leveraging more than \$200 million of private sector investment.
- Established eighteen Motor Challenge showcase agreements to optimize electric system efficiencies resulting in more than 1,000 partners and an investment of \$15 million, exceeding goals by 700 partners and \$5 million.
- Leading the industry and government design and research for an 80 mile per gallon car for the future. Technologies already in the fleet are saving nearly 1 billion gallons of gasoline a year. Signed contracts for developing hybrid vehicles with the three major car companies and their suppliers. In fiscal year 1997 we will demonstrate a “no-compromise” 50 mpg proof-of-concept family sedan, maintaining or improving vehicle cost, safety, comfort, and performance factors.
- Displacing nearly 10 million gallons of gasoline annually through the more than 30,000 alternative fuel vehicles introduced to Federal and local fleets in 55 Clean Cities.
- Transferring proven energy efficiency and renewable measures such as technologies used in “Greening of the White House” to all Federal buildings to support reduction of federal energy consumption by 30 percent by 2005 compared to the 1985 baseline.
- Initiated Federal Greening Models such as the White House, the Pentagon, the Presidio in San Francisco, and the DOE Forrestal Building.
- Developed 6 major private sector/government energy service contracts, attracting millions in private sector investments to Federal energy projects, building a new business sector and saving federal dollars.
- Weatherized over 300,000 low-income homes (employing 8–10,000 people) and upgraded more than 1,000 schools and hospitals annually.
- Developing partnerships with energy-intensive industries such as refining, pulp and paper and metals, to develop research programs, strategies and technologies that will lead to dramatically improved energy and resource efficiency and competitiveness by the year 2000, and energy cost savings of \$10 billion by 2010. Signed Visions agreements with five of the seven industries and expect to complete Chemical and Refinery Visions before the year is out. Eleven related technology and research roadmaps are underway.
- Developed an Industry Vision and Technology Roadmap for the future in partnership with the Pulp and Paper industry that they estimate will save them \$8 billion in environmental control costs.

ELECTRONIC BALLAST

Secretary PEÑA. One was work that we did in the electronic ballast, which is the ballast that goes into the fluorescent lighting. That one technology success has produced \$3.7 billion in energy savings. The work that was done on refrigerator compressors has produced \$6 billion in savings.

Senator GORTON. In each of those cases, what was the public-private split on the cost of the research?

Secretary PEÑA. I would have to get that information for you, Mr. Chairman. We can break that down. Some of these have different variations. But I've got five before me here—advanced windows, flame retention heat oil burner, building design software. If you add all those up we estimate we saved consumer energy costs about \$28 billion, and that's just a flavor.

[The information follows:]

ENERGY CONSERVATION ACCOMPLISHMENTS

The Department's investment in buildings efficiency R&D over nearly two decades has yielded a number of highly successful energy conservation technologies. Five technologies in particular are estimated to have saved consumers over \$28 billion—savings that continue to accrue at a rate of more than \$5 billion each year. These five technologies are: building design software; efficient refrigerator compressors; electronic fluorescent ballasts; flame retention heat oil burner; and advanced (Low-E) windows. The total public investment in these five technologies was \$45 million and the total direct private cost share amounted to over \$27 million. The cost share for building software design was 19 percent; for efficient refrigerator compressors 12 percent; for electronic fluorescent ballasts 50 percent; and for advanced (Low-E) windows 68 percent. There was no private sector funding for the development of the flame retention head oil burner, which has saved consumers an estimated \$5 billion.

NEW FUEL CELL TECHNOLOGY

Secretary PEÑA. I haven't even talked about the much more aggressive things we're doing in the Partnership for a New Generation Vehicle Program, where already just a few months ago, even though that work is far from complete, we saw Chrysler announce a new fuel cell technology which is cutting edge, that no one thought would be able to be announced so early in this 10-year research program.

So we believe that there are demonstrable savings that we have been able to demonstrate with the technology investments we have made in the past, and what I want to do, as I said earlier, is develop a much more strategic direction on this question of how we can become energy independent by looking at both the consumption side and the production side and asking the question of all these dollars we're investing in technology what is the product, what are the gains we'll see, what are the reductions in energy use we can measure, what are the savings to consumers that will result from these kinds of investments.

And I'll be working very hard to develop that much more strategic focus because I share what I believe to be your concern, and that is we've got to show product. We have to show progress. We have to demonstrate that there is some significant improvement in the result of these very significant investments which I think are worthwhile, and I will work very hard on that issue.

REPAYMENT PROVISIONS

Senator GORTON. The first cousin to that question is, some of your programs have a recapture or repayment provision that when research and development is commercialized you get some of the money back. How have they worked? Should they be broader? Have they worked? Have we actually recaptured any money through them?

Secretary PEÑA. Mr. Chairman, we have. In the Clean Coal Technology Program, for example, which GAO has cited as a model public-private partnership venture, there were provisions in the early days in the investments we were making there for recapture, and we have received, I think, \$400,000 or so thus far, and that's only in the early stages.

So we think that by being very strategic in where we will require these kinds of recapture provisions, we can begin to get a repayment.

Now, we have to be very thoughtful about it and not impose such stringent requirements that our private sector partners will back off. But I think there will be occasion, and clean coal is one where it's working, where I think that will make a lot of sense.

CODES AND STANDARDS

Senator GORTON. One more set, then I am going to defer. One of the really controversial areas that we had to deal with in my first 2 years as chairman had to deal with codes and standards; 2 years ago we actually were frustrated in letting the Department go ahead with them. Last year I think we did.

Where are you on lighting and appliance standards? Is the cooperation in the private sector sufficient now so that they're no longer going to resist? Where are we there? I find this to be an extremely important area. I would like to continue it, but, again, are we making some real progress and is it a cooperative progress?

Secretary PEÑA. Mr. Chairman, I've been advised that 1 year or so ago the Department made extraordinary efforts to develop a much more cooperative working relationship with, in particular, the large manufacturing companies that are the subject of these standards and that a new relationship has been established. I think that was tested a year or so ago on the new refrigerator standard, which is still in discussion at the moment.

I want to say that I have had some experience with this new approach in what we call the negotiated rulemaking process, and I would hope that we could establish a constructive relationship with the private sector to agree on a public policy objective, a public policy goal, and then find a way to get there if at all possible in a mutually reinforcing and positive manner. I think that is a far more constructive way of dealing with these issues.

The President has asked us to be more creative in doing these rulemakings contrasted to the old process of simply publishing a rulemaking, having comments come in, and then finally issuing a final rule which may or may not be the appropriate thing to do.

So we want to work on this, obviously keeping in mind the important public policy objectives, but I think there is room for a very

constructive relationship that we can establish with the private sector.

Senator GORTON. At this point, Senator Dorgan is a new member of the committee, of the subcommittee, and a welcome one. I have a bunch of questions, Senator Dorgan. I want to give you an opportunity either to make a statement or to ask your questions now, and then stay as long as you want. I think it was just before you came in that I passed out these charts that I hope will help you understand the relationship between or among all of the various programs. I know it has been very helpful to me.

REMARKS OF SENATOR DORGAN

Senator DORGAN. Mr. Chairman, I have a Commerce Committee hearing going on. That is why I was delayed, and I have to go back as well, but I appreciate being here. I am going to enjoy being a part of this subcommittee, and I appreciate having the opportunity to visit with the Secretary at this hearing.

You showed me this chart last year, and I found it enormously interesting and helpful. This is the only chart of its kind that I have seen that actually describes in bar graph form exactly what we are spending and how we are spending it. I think it is very useful.

I would just like to say that I'm a newcomer to this subcommittee and a newcomer to the issue of priorities in these areas, but I really think that the fossil fuels research area is one account that we would want to beef up, not reduce, given the challenges we face and given the circumstances that exist in our country.

We have in North Dakota an example of a wonderful facility, the Energy and Environmental Research Center at the University of North Dakota, which I think is almost the model in the country of the partnership in public sector-private sector research, and I'll be visiting with the subcommittee about that.

I hope as we work through this and establish our priorities here in Congress that we will find a way to enhance rather than retreat on the issue of fossil fuels research. I know that we're faced with enormous challenges in every part of the budget. There isn't any question about that. But this is an area that truly is a critically important investment, and so I would hope that it would be the priority.

Again, I missed the presentation by the Secretary. I wish the Secretary well in this new job and I look forward to working with him very much on a wide range of issues.

PREPARED STATEMENT

Mr. Chairman, thank you very much for this instructive chart as we move ahead.

Let me just ask unanimous consent to have my statement inserted into the record.

Senator GORTON. Without objection.

[The statement follows:]

PREPARED STATEMENT OF SENATOR DORGAN

Mr. Chairman, Senator Byrd and other members of the Subcommittee. Since this is my first hearing as a member of the Interior Appropriations Subcommittee, I

want all of you to know that I am very pleased with this assignment and I look forward to working with all of you in the days and months ahead.

As I familiarize myself with the many agencies and programs funded in the Interior appropriations bill, I have able mentors in the Chairman and ranking member. I would like to note that many of the funding decisions made by this subcommittee will have a direct impact on the health and economic welfare of the people of North Dakota, and I look forward to working with you on a host of crucial issues affecting my State as the appropriations process proceeds.

I would also like to welcome Secretary Peña to his first subcommittee hearing as Secretary of Energy and to congratulate him on his confirmation by a vote of 99-1 just yesterday. I look forward to working with you, Mr. Secretary, as you assume your new responsibilities as the head of the Department of Energy and I wish you well as you take over your new responsibilities.

I would like to take a minute to make a few general comments on the proposed fiscal year 1998 funding levels for the Department for Interior before I address the items to be covered in today's hearing. While I am pleased that the total budget request of \$7.5 billion for the Department of the Interior represents an increase of \$462 million over last year's enacted level, it is still less than the 1994 level. Like most agencies, the Department of the Interior has had to learn to live with downsizing. While we all support the concept of streamlining—of doing more with less—we must make certain that we are not sacrificing long term policy interests for short term budgetary goals.

There are many high priority programs funded by the Department of Interior ranging from our national parks to wildlife refuges to our cultural institutions, all of which, in my view, deserve continued government support. I know hard choices have to be made in this era of shrinking federal resources, but those decisions are particularly difficult in a bill which funds so many meritorious programs.

Before I leave the topic of the Interior budget in general, I want to advise the subcommittee of one area of real and deep personal concern to me, namely, a woefully underfunded budget for Native Americans. The ever shrinking resources allocated to Native Americans are, in my view, a national tragedy and a national disgrace, and I will address this matter in more detail at the April hearing.

Fossil energy research and development within the Department of Energy, which is funded in the Interior appropriations bill, is the topic of today's hearing. This is an extremely important issue for the people of North Dakota and the nation. Since 85 percent of our national energy fuel consumption currently comes from fossil fuels and will remain our primary energy source far into the future, it is in all our best interests to ensure that fossil fuels energy is both efficient and environmentally safe. It seems strange to me, therefore, that the Department of Energy's Fossil Energy Research and Development Program funded in the Interior Appropriations bill is slated for a significant reduction in fiscal year 1998, from \$365.8 million to \$346.4 million.

I realize that I am a newcomer to this subcommittee, but I would think that fossil fuels research is one account we would want to beef up, not reduce. I know Senator Byrd has a longstanding interest in this matter, but I want the subcommittee to know that North Dakota also produces a significant amount of coal so this program is of great interest to me as well.

On a happier note, I would like to take just a few minutes of the Committee's time to talk about the outstanding fossil fuel and energy research that is being conducted by the Energy and Environmental Research Center (EERC) at the University of North Dakota under DOE's Cooperative Research and Development program. We in North Dakota are extremely proud of the high-quality work being produced by the EERC, and I am pleased that the President has recognized the EERC's contribution to the research and development of clean and efficient energy technologies by requesting \$1.96 million for EERC under the Jointly Sponsored Research Program (JSRP). The JSRP combines DOE and private sector support for commercialization of advanced technologies. Commercialization of cutting edge technologies is the key to our energy security, improved efficiency and environmental health and safety, and this partnership between government and industry is crucial if we are to be successful.

This JSRP program is complemented by a basic research component devoted to research on innovative concepts which have commercial potential as well as scientific and engineering fundamentals targeted to overcoming commercialization barriers. Unfortunately, the Department's budget request did not include funding for this basic research component.

I am pleased, however, to see that the Department's request included \$1.86 million for cost-shared coal related research that is approved by DOE and is consistent with the Fossil Energy mission. I am somewhat concerned and puzzled as to why

this research program does not include oil and gas research, given both the EERC's programmatic expertise in these areas as well as the fact that Fossil Energy's mission includes oil, coal and gas.

The EERC is a leading U.S. Center for Excellence in coal, oil, and gas technologies, placing particular emphasis on low-rank coals found in the western United States, Alaska, Central Europe, Australia, Russia, China, and Indonesia. Low-rank coals represent approximately half of the coal reserves in the lower 48 States, with much larger potential reserves in Alaska. The EERC is uniquely designed to combine cutting-edge basic and applied research with market forces to advance the goal of supplying clean and secure energy to sustain a high standard of living in an unpolluted environment and in increasingly competitive marketplace.

The technologies that are being successfully developed by the EERC would simply not be possible without some government assistance. Government support plays a vital role in the initial stages of research and development by fostering basic research that is not immediately rewarded in the marketplace. But government must have partners if the basic research is going to move forward to development, demonstration and ultimately to commercialization. That is the beauty of the DOE Cooperative agreement. After the basic research identifies promising new technologies, DOE works with industry to resolve the intractable barriers to full commercialization of technologies that will lead to more efficient and environmentally safe fossil fuel energy. Government doesn't pick the winners, the marketplace does.

I am attaching to this statement some examples of projects developed by the EERC through both the basic and jointly sponsored research components of the DOE Cooperative Agreement which I hope the subcommittee will find of interest. I hope these examples will convince the subcommittee of the exceptional work being performed by the EERC and that the subcommittee will fully fund the Administration's fiscal year 1998 request for EERC of \$3.8 million.

I have a number of questions which I have not been able to ask today and I would request that they be submitted for the record.

Again, I want to thank the Chairman and Ranking Member for their patience.

EXAMPLES OF EERC PROJECTS FUNDED UNDER THE DOE COOPERATIVE AGREEMENT

BASIC RESEARCH

Combustion 2000: A high performance power system is being developed and demonstrated by the EERC in partnership with industry and the DOE which will provide a strong leap forward in the performance of coal-fired powerplants. The EERC has teamed up with United Technologies in developing technology for indirect firing of coal in a gas turbine combined-cycle system, with construction nearing completion on a pilot slagging combustor and high-temperature alloy heat exchanger at the EERC. This system will increase thermal efficiency from 33 percent to 47 percent while reducing emissions by 90 percent as well as reducing the costs of electricity. If this system were to replace existing systems, it would reduce by one-fourth the current carbon dioxide emissions from coal-fired utility boilers.

Trace Element Emissions: Trace elements plug hot-gas filters, poison fuel cells, and pollute the environment. This EERC project provides an understanding, for the first time, of the release, transformation, emission and capture of trace elements in advanced coal gasification systems. Results have been incorporated in a computer code that is being used by industry to understand and predict the fate of trace elements in gasification systems and to optimize operating conditions and the design of hot-gas filtering systems to minimize plugging, improve reliability and efficiency, and lower emissions.

JOINTLY SPONSORED RESEARCH

Advanced Gasification and Hot-Gas Cleanup: The EERC is currently playing a key role in demonstrating an advanced fossil fuel gasification and hot-gas cleanup technology based on the M.W. Kellogg transport reactor, a sophisticated high-velocity circulating gasifier. Once commercialized, this combined-cycle technology will substantially decrease the emission of sulfur, particulate, and nitrogen species and, by improving efficiency, reduce the release of carbon dioxide which contributes to global warming. This program involves a large number of domestic and foreign participants.

Coal Ash Behavior in Reducing Environments: Ash and slag have severe impacts on the performance and reliability of advanced coal gasifiers as well as environmental control systems. This two-phased program, also supported by a large number of foreign and domestic energy companies, is developing methods to improve gasifier

design and operating procedures and to minimize emissions. It has received significant international attention because of its contribution to improving advanced gasification systems that are being exported outside of the United States.

Freeze-Thaw/Evaporation Process to Treat Oil and Gas Produced Waters: Eighty percent of the waste resulting from the production of oil and gas in the United States is saline water. A demonstration project jointly conducted by the EERC and B.C. Technologies (BCT) has demonstrated the economic advantage of coupling a natural freeze crystallization process with evaporation to reduce dramatically the volume of saline wastewaters and produce water for beneficial use. This process has been successfully demonstrated by the EERC and BCT over the past 2 years with the Amoco Production Company and the Gas Research Institute at a commercial Amoco Production Company coalbed methane facility in New Mexico. This process has the potential to increase domestic oil and gas production by extending the economic life of marginal wells and opening new reserves in areas where high volumes of produced water have prevented economic production. It also has the potential to help meet a global need for the desalinization of water to meet the demands of an ever expanding population base.

The Alaska Initiative: This initiative, managed by the EERC for DOE's Federal Energy Technology Center (FETC), provides a working affiliation under which DOE and Alaskan partners are demonstrating new technologies to meet the current and future needs of Alaska in an environmentally acceptable way. This activity has two distinct focuses: (1) the relocation of an existing Clean Coal Technology demonstration project, and (2) demonstration of remote-site power technologies. A number of milestones have already been achieved.

Clean Coal Demonstration: This project has already been relocated from Easton, Maryland to Fairbanks, Alaska. The partnership is currently working to finalize the nonfederal funding that must be in place by July 1997. Successful completion of this demonstration activity will meet the University of Alaska (Fairbanks) need for additional energy using indigenous fuels, reduce dependence on diesel fuel, create a new research focus at the University, create export potential for Alaskan coal resources, and create a showcase project with international appeal. This coal-water fuel technology under demonstration was developed under Cooperative Agreement.

Remote-Site Power Generation: The use of indigenous resources in remote areas for power generation offers a worldwide opportunity. The feasibility of applying fluidized-bed combustion technology to meet the power needs of the village of McGrath, Alaska, using indigenous fuels will be determined by April 1997. The EERC is coordinating the assessment evaluating local fuel resources, including coal, municipal solid waste, and biomass (wood), as a replacement for the fuel oil currently used for electrical generation and heating in this village. This showcase project, if successful, will lead to commercializing this remote-site power generation technology worldwide.

An assessment is also underway to evaluate the feasibility of a demonstration project in interior Alaska to use coalbed methane in a fuel cell to provide electricity for remote villages. EERC's project currently underway in New Mexico is proving coalbed methane produced waters can be cleaned in a cost effective manner. Successful completion of this demonstration will result in superclean and efficient electricity production using local resources and creating local jobs.

CLEAN COAL TECHNOLOGY RESCISSION

Senator GORTON. Senator Byrd, since I wasn't here on time, did you ask about and get sufficient answers to questions on clean coal technology and rescissions?

Senator BYRD. Mr. Chairman, I asked some questions, but I indicated that I had a good many additional ones that I would just submit for the record, and so I do not propose to ask any more questions now. I just want to thank you for your being so courteous, as always.

Mr. Secretary, let me add before I leave, I was chairman of this subcommittee for several years, and Senator Gorton has mastered the details of it in 2 years. As a matter of fact, he mastered the details in the first year far more than I had ever been able to accomplish, and he's been a very energetic and I would say accomplished and competent chairman and as far as I have been able to

determine in my membership here, he is just what—you get just what you see. He is right upfront and frank, and I am glad to have him as my chairman of this subcommittee.

If we have to have a chairman of the other party, I will buy this one any day and anywhere. I close by saying I know you are going to have a good relationship with our chairman and our committee, and this bright new member over here, Senator Dorgan, he is one of the shining new stars in our Senate.

I am not just passing out compliments today, but I have long ago come to the conclusion if you have got some good things to say, do not hesitate to say them about people, and say them right upfront, and if you cannot say good things, why, do not say anything until you have to, and then say it loud and clear.

FEDERAL ENERGY MANAGEMENT PROGRAM

Senator GORTON. That is great advice. I thank you very kindly, Senator Byrd. I hope I can live up both to that reputation and to your advice about how to deal with other people.

Again, Mr. Secretary, a few more questions before we submit a significant number to you in writing. Cooperation and support that you are getting from other agencies on energy management, can you comment on that? Are there some that are doing well and some that are doing poorly and how do you set your priorities when you have to deal with your equals in other agencies and attempt to persuade them to help you with your mission?

Secretary PEÑA. Mr. Chairman, I believe that the other department heads know that this is an important matter, and the President has made it a priority. I look forward now that I have the primary responsibility among the other Cabinet members in encouraging them to also act and take more appropriate steps here to work with them to be much more aggressive and more thoughtful about how all of the departments can focus on energy efficiency, so that's something I think we can do. We've made some improvements already, but I think there's much more that can be done.

As I begin to elevate the discussion within the administration on this priority of developing an energy independent strategy, which I have talked to the President about, I believe that that particular issue you've raised will take on a bigger importance because, after all, the Federal Government is one of the biggest users of energy in our country, among the various players who use energy, and so we have a responsibility to lead if we're going to work with the private sector and others to encourage them to take some steps.

EPA STANDARD ON PARTICULATES

Senator GORTON. Another subject in which I am sure Senator Byrd will be interested in as well—the new proposed Environmental Protection Agency standards on particulate matter, coupled with what seems to be a less than robust support for research and development on some of the very technologies that may be essential if we are ever to impose such standards. Do you think that the two are realistically related to one another?

Do you have any degree of confidence that we are going to have advanced our technology sufficiently to meet these standards, if

they are actually imposed, without tremendous economic dislocations?

Secretary PEÑA. Mr. Chairman, I can't answer that question today. I can't answer it yet. Obviously, in the months to come all of the departments will be engaged in an administrationwide effort looking at these new proposals, and the question you have raised is obviously one that we're going to put on the front burner.

So hopefully in the next several months I'll be able to answer your question much more specifically. But obviously there are concerns about whether or not we're going to have enough investment in those technologies that will help us meet those goals, and that is something that, since I am new to the Department, I will need to focus on very, very quickly.

Senator GORTON. That is going to be really important. We have how long, do you remember, Senator Byrd, to determine whether or not we would approve or disapprove of those regulations? Aren't they due out in June?

Senator BYRD. I do not recall.

Senator GORTON. When is that?

Secretary PEÑA. I believe you're correct, Mr. Chairman. I think the final rules would come out some time in June, at least under the current schedule.

Senator GORTON. Well, any help you can give us in your predictions as to whether or not the society is realistically going to be able to meet them, and what contribution our research and development will make to being able to meet them, I think is going to be very important because I strongly suspect we are going to be debating that issue here in Congress, don't you?

Senator BYRD. Yes; I bet we will.

ARTHUR D. LITTLE STUDY

Senator GORTON. Some time ago Arthur D. Little performed an analysis of the Department's quality metrics. It seemed to show an overestimation of some of the programs that were funded in this bill. Do you have a response to that study and, if so, is that response in any way reflected in this budget request?

Secretary PEÑA. Mr. Chairman, I have not had a chance to review that Arthur D. Little study, but Dr. Romm would like to make a comment on that, with your permission.

Senator GORTON. Fine. Yes.

Mr. ROMM. Yes; there's been some confusion in the press. That study was actually commissioned by the Department of Energy, it was commissioned by my program, in particular, as a peer review for our estimates of what the benefits of our programs would be so that we could present the most accurate estimates to Congress as possible.

The fiscal 1998 budget request that you have in front of you reflects all of those peer reviewed analyses, and Arthur D. Little wrote a letter, in particular, praising the Department for pursuing an independent peer review of its benefit claims, and at every point in time we have attempted to present as accurate information as possible about the energy and environmental benefits of our programs.

PARTNERSHIP FOR A NEW GENERATION OF VEHICLES

Senator GORTON. Another subject, and I am going to ask this in general terms, as Bruce Evans has written a number of specific questions which you can deal with in writing. I have become increasingly interested, and I think obviously the country is becoming increasingly interested in the research and development of alternative engines for automobiles—electricity—I cannot remember the proper name, but the flywheel technology and different forms of diesel and the like.

Could you give me an overview of that research and development and perhaps say where you think we might be fairly close to a breakthrough, and what the future in the next half dozen years looks like given the contribution of your funded research and development? Any of the technologies seem to you particularly significant?

Secretary PEÑA. Mr. Chairman, I would be happy to. Probably the area where we believe we will see the most significant advancement is in the Partnership for a New Generation Vehicle Program that we started a couple years ago.

While it had, I must say, a somewhat rocky start, I would say that today the program is working quite well. The Department of Commerce is the overall lead of that program, but the Department of Energy is the technical leader of that program. Our goal is to produce a new car that is three times more efficient than cars today, that perhaps can do 80 miles per gallon in terms of efficiency by about 2002.

Mr. ROMM. 2004.

Secretary PEÑA. 2004. Thus far what is very positive about this relationship.

Senator GORTON. 2002 just seems to be a magic year. It seems to just sort of drop off my lips every time whether it is relevant or not.

Secretary PEÑA. It's supposed to be, I think, a 10-year program, but we're already beginning to see some products. Chrysler very recently announced a new fuel cell that was a byproduct of the work we were doing jointly with the partnership. This is a fuel cell that will be able to take ethylene, ethanol, methanol, almost any fuel and have a fuel cell that operates in an effective fashion, and they rolled out that new technology.

So we believe there is great promise here. It is, I think, so likely that 2 years ago when I participated in the European ministers conference where I represented the Department of Transportation from the United States, our counterparts in Europe were so fascinated about the relationship we had established here that they are now doing the same thing, and establishing a partnership with their automakers to see if they can also produce a new car of the next century.

I think this is the area where we will see the greatest promise and thus far I think all the parties to this have worked very well. We're matching our investments one to one. We are basically on target. Mary Good, as you know, is the overall coordinator of this, but our Department is there working hard to make sure we're meeting our milestones.

So that is one example of where Government and the private sector can work together for a public good, for an enormously important objective given the tremendous use that transportation plays in terms of consumption of oil, about 70 percent from transportation.

So we know that on this issue of energy independence, unless we tackle and address the transportation part of this, it will be very difficult for us to make substantial gains in the next century. So I think that's one example of a program that's working well.

Senator GORTON. Is there any implication in your answer that we are spreading our efforts across too many alternative technologies and too thinly, and that we should concentrate on one? Or are we still at an early enough stage that we ought to be going down a number of alleys, hoping that at least one of them is not a dead end?

Secretary PEÑA. Mr. Chairman, at least on this program, and that is the development of a new car, a new engine, as you describe it, this is the focus, and we are all concentrating our resources and our time and our energy on it, and again, this is a very significant public-private relationship, one that is unique in the world.

I think that given the growing confidence that we have established among the parties, some of the early milestones and some of the byproducts that are developed already, that both industry and the Government are developing even a higher degree of confidence in the work that we're doing.

It's difficult. There's no question about that. But I think so long as we continue to be partners by bringing the Federal commitment to the table, the private sector will do the same, and I think we may surprise a lot of people when we can produce that new car in the next century.

HOME ENERGY RATING SYSTEM PILOT PROGRAM

Senator GORTON. You will certainly please a lot of people if you succeed in doing that.

One small request that you have in your budget here, the home energy rating system pilot program in seven States. How long have the pilots gone on? How long will the pilots continue to go on? Are we getting anything out of it?

Secretary PEÑA. If this is, Mr. Chairman, the program where we're going to rate homes, there are a number of States beyond the seven that already have State programs. I think it's 20 or so. So from our perspective, we are continuing to work on this program to determine if we should have a national effort here in rating the efficiency of homes, if that's the subject matter you're asking about. Let me have Dr. Romm amplify that.

Mr. ROMM. If you're speaking of the seven pilot States, the pilots are scheduled to go for about 2 years, and I think on average they have gone on about 1 year, so those pilots would be expected to continue for only about 1 more year.

Senator GORTON. Will there be more pilots after that?

Mr. ROMM. If funding permits, basically.

Senator GORTON. Just tell me in general terms what you think your most important functions are with respect to natural re-

sources, mining and the like, your natural gas programs, methane programs and coal mines, and the like.

Secretary PEÑA. Mr. Chairman, there are a number of priorities. For example, slant well drilling has already been successful and tested in a number of States where we have been able to generate very significant increases in output in wells that were essentially inefficient and almost ready to be abandoned.

Our 3-D seismic technology program has been extraordinarily successful and now there's a question whether we should move to a 4-D seismic technology program. There are a number of technologies like that which we think have already been quite helpful.

I think where we want to continue to place emphasis is in working very closely with the independent producers. These are essentially the small companies, the small operations that are only in the production phase. They're not in marketing. They are not in other aspects of that, and since they play such an important role in production, we think that by working more closely with them and sharing that technology, providing advice, we can make them even more efficient.

We are very concerned about the fact that we are losing about 16,000 to 17,000 marginal wells a year. That I think is not good news, and so that is a very high priority if we can find a way to help those small firms be more productive and stay in business and continue to produce. So in that area, I think that is a very high priority for the Department of Energy.

ARCTIC NATIONAL WILDLIFE REFUGE

Senator GORTON. The quest for energy independence has not caused you to begin to reconsider your position on ANWR, I take it?

Secretary PEÑA. Mr. Chairman, as you know, the President had established a position on ANWR sometime ago, and the administration position has not changed.

Senator GORTON. Let me just ask an open-ended question. We have a full series of questions on specific programs here that we will submit to you in writing, but what have I omitted? What area would you like me to focus on or know something about that has not been discussed here this afternoon? Do you have any last set of messages that you or any of your staff would like to leave with me?

Secretary PEÑA. In reviewing, Mr. Chairman, all the questions we covered today from fossil energy to energy efficiency, we didn't cover the Energy Information Administration but that work is superior. Let me turn to my colleagues here and ask, are there any other matters that they suggest we pursue?

I think we've covered the high points, Mr. Chairman, so we look forward to working with you and to answering the very specific questions that the subcommittee members would like to submit to us.

We're very much aware of the budgetary challenges that we all face, but let me say that this area of research and development, and even though it is a small portion of your portfolio here, is critical to our country, and while it may not receive the kind of constant support in terms of at least vocal expression as you see in

other areas, I will make a significant effort to elevate the importance of the work we do in this area to the country.

The American people need to understand that we are facing a very significant challenge, and this is the time to do something about it and not wait until the year 2004 or 2005 when it might be too late.

It seems to me that I have the responsibility, given the fact that I have the knowledge to help educate the American people to help educate other Members of Congress about the importance of these kinds of programs. Otherwise we are going to have a very significant problem, I believe, in the next century if we're not careful and prudent in how we conduct ourselves now.

Senator GORTON. Well, Mr. Secretary, you are a very quick study for the first day in office. You get an A for this performance.

Secretary PEÑA. You're very kind.

Senator GORTON. I hope we continue to work together constructively when the questions get tougher and more difficult, as I am afraid they will as this year goes on, but thank you very much for your coming and for your forthrightness.

Secretary PEÑA. Thank you, Mr. Chairman.

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. There will be some additional questions which will be submitted for your response in the record.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing.]

ADDITIONAL COMMITTEE QUESTIONS

ELECTRIC INDUSTRY RESTRUCTURING

Question. As a member of the Energy and Natural Resources Committee, I spent this morning in another of a series of workshops that the Committee is holding on electric industry restructuring. It is a highly complex issue about which the Committee, and the Senate as a whole, is trying to educate itself. Perhaps you can help us in this regard on one aspect of the issue.

In my tenure as chairman of this subcommittee, I have heard from both the Department and from industry that private sector funding for energy R&D is becoming more scarce as companies seek to reduce costs in order to survive in increasingly competitive and deregulated markets. Both the Department and industry have argued that this makes Federal R&D support more critical.

At the same time, uncertainty generated by market restructuring has made utilities wary of making major capital investments in new power generation, particularly if there are technological risks associated with the technology involved. As a result, it seems that several technologies developed with DOE support will be slow to be deployed in domestic markets.

I also understand that some states have recognized the relationship between deregulation and energy R&D, and have established R&D funds to assist in the development and commercialization of innovative, "clean" technologies.

How do you view the relationship between changes currently taking place in the electric industry and the R&D programs funded by this subcommittee?

Answer. The transition to competition in the industry will have near-term and long-term impacts on R&D programs. For the near term, utilities are already anticipating the transition to competition. Many companies are focusing intensively on reducing their costs, including research costs, and are making deep cuts, sometimes to survive and sometimes to gain market share. In either case, R&D is often seen as a non-vital expenditure, except for projects that promise immediate cost savings for the company. As a result, corporate commitments to internal R&D and to joint efforts with the Electric Power Research Institute (EPRI) are declining. Virtually all research sectors have been adversely affected, but some have been hit harder than

others. R&D pertaining to program areas that have historically led to higher utility costs, such as energy efficiency and renewable generation, has been cut severely, while R&D that could reduce costs in more mainstream areas of utility operations has probably been less affected.

For the long term, we expect that those utility companies that survive the transition to competition will eventually feel comfortable enough about their future to resume some of their R&D efforts. However, we also think that the nature of the R&D utilities support will change. Utilities will emphasize R&D on consumer products and marketing, and less on basic research and pre-commercial technologies. Today, electric utilities cooperate on R&D, but increasingly, companies will be reluctant to commit funds to R&D that could benefit a competitor just as much as themselves. The industry may rely more on generating technology R&D funded by equipment suppliers in the future. R&D related to "public goods," such as environmental protection and reliability, may be more difficult to support in a competitive industry.

Question. If Congress acts on deregulation legislation, how can it best ensure that U.S. leadership in energy R&D is maintained?

Answer. One potentially effective way to ensure that U.S. leadership is maintained is to include in the legislation a provision to establish a reliable and predictable mechanism for funding electricity-related R&D.

Question. Does the Administration intend to address this issue directly in the legislation it is developing? If so, how?

Answer. The Department believes that funding for research and development should be addressed in restructuring legislation. One option that might be considered would be to establish a federal/state system benefit fund that would fund state-level R&D programs, as well as other state-level public benefits programs such as universal service, conservation programs, and support for renewable technologies. The Federal part of the fund might be funded through a charge (capped at one mill/kilowatt-hour) on all generation sold into the bulk power system. States would be eligible to tap the fund to the extent that they raise matching funds.

R&D AND THE ECONOMY

Question. The Executive Summary in the Energy Efficiency portion of the budget justification (p. 254) states that "Since 1992, private industry R&D has stagnated. And today, less than one-third of private R&D is dedicated to research; the rest is being spent on product and process development." What is the cause of this "stagnation" in your view?

Answer. The stagnation in private industry R&D is caused by several factors, including increasing international competition, the structure of our financial markets, and, for energy R&D, pending utility sector restructuring.

The increasing globalization of international markets has led to increased competition among the many international players. For some companies to continue to be competitive in the short-term, they have focused on various areas to cut back on their investments, including personnel and long-term research and development. Many market structures place pressures on publicly traded companies in the U.S., including the need to show positive growth each fiscal quarter. Such a focus on short-term pay back has a negative effect on longer-term investment planning such as utility research and development. In the case of energy-related research and development, the uncertainty due to the pending industry restructuring and the forecast drop in electricity prices has many utilities and energy industry participants also searching for ways to restructure themselves to be poised for competition. This near term market response has for many companies resulted in cutting back on energy R&D. Such cuts recently drew the comments of Kurt Yeager, President and CEO of the Electric Power Research Institute, who warned "Do not let short term expenditures * * * sacrifice the engine of prosperity [R&D leading to innovation and productivity improvement] * * * entitlements cannot be paid if national productivity growth does not continue."

Question. Is it the Department's view that in the energy sector the Federal government must "make up the difference" in R&D?

Answer. Historically, research and development in energy-related R&D has worked through a partnership between the energy industry and the Department. Public investments helped underwrite the risks of long-term R&D, and funded activities that helped move technologies which had high social returns into the market. The net effect was to stimulate private investments that yielded social returns to society, including job creation, export growth potential, and cost-effective pollution prevention. However, the private investment in research, development and deployment has decreased by more than two thirds in the past 15 years. Restructuring

and the uncertainty it creates for the market has accelerated this decline. In addition, Federal energy R&D has been cut by 75 percent since the late 1970's.

Our fiscal year 1998 budget request would begin to put us on the path toward addressing this decrease on both sides of the public and private partnership in R&D by attempting to maintain at a minimum a level of Federal investment consistent with that of our international competitors, not increase it. The role of the Federal government and this investment is critical to ensure continued advances in energy efficiency and renewable energy technologies which would decrease our dependence on imported oil, increase our competitiveness, improve our balance of trade, and improve our national health and environmental quality.

Question. Since about 1992, the economy has been growing at a fairly steady rate and the stock market has skyrocketed. How do you explain this seeming contradiction between stagnating private sector R&D and continuing economic growth?

Answer. Economic growth occurs for many reasons, including national and international fiscal policies, domestic and international market condition and socio-political-economic change and disruption. Economic growth also tends to be cyclical in nature, with peaks and troughs. Much of the growth of today may be attributable to prior investment in our national economy, including private and public sector investments. In addition, some companies may be currently performing well in the market due to the cuts they have made in long-term investments, such as personnel and research and development. However, the effect of these short-term cuts may not be felt for several years out, even though investments made during economic upswings may very well carry the companies through economic downturns.

EXAMPLES

Question. In considering funding for programs that run to the hundreds of millions of dollars, I think it is often helpful to have some specific examples of how this money is being spent. Would you describe for Committee some specific examples of technological advances that have been made in the Fossil R&D or Energy Conservation program in the last fiscal year?

ENERGY CONSERVATION EXAMPLES

Answer. The Office of Energy Efficiency and Renewable Energy has been recognized globally as a leader in applied research and development. In this decade alone, the Office has garnered over 40 major awards for our research, development and deployment. Some examples of technological advances developed by our program activities with labs and partners that received recognition for this past year include:

The oxygen enriched air staging process which integrates two previously competing technologies, simultaneously reducing NO_x emissions and energy use in the glass making process improving process efficiency, energy efficiency and domestic industry competitiveness.

The Benchmarc Catalytic Converter using either electric preheating or chemical catalysis to significantly improve cold start combustion efficiency and significantly reducing emissions and energy waste during cold start in the transportation sector.

The thin film rechargeable Lithium batteries developed with our DOE basic research partner, the Office of Energy Research, in which ceramic deposition technology is used to create battery cell layers small enough to create batteries ten micrometers thick that are capable of nearly infinite recharging. The impact of this development, while important for existing battery applications, is that near nano size technologies that previously were only contemplated are now possible, affordable and reliable.

The UV Waterworks water purifier using the electricity of a lightbulb (40 watts) to kill waterborne pathogens responsible for diseases such as cholera, dysentery, and typhoid that kill millions every year.

FOSSIL ENERGY EXAMPLES

In the past fiscal year, examples of technological advances resulting from Fossil Energy's Coal and Power Systems R&D program include:

Successfully demonstrating two fuel cell power plants leading to ultra-clean, high efficiency distributed and on-site power applications; demonstrating an atmospheric fluidized bed combustor at a Veteran's Administration (VA) Medical Center for safely and cleanly disposing of hospital "red bag" waste and using the waste to generate clean and cost-effective electricity on site; and operating three utility-scale integrated gasification combined-cycle demonstration power plants.

Identifying promising, innovative technologies for cost-effective, ultra-clean emission controls, reflecting the culmination of over 20 years of research and development in concert with the Clean Coal Technology Demonstration program, to meet future, more stringent emissions standards at a fraction of today's cost.

Completing a product development unit test run on co-processing of waste (e.g., plastics, tires) with coal for a direct liquefaction process proving out favorable economics and environmental benefits; extending the commercialization of the Microcel technology, advanced microbubble fine coal cleaning technology developed over the last two decades, to use cleaned coal fines in power generation.

Examples of technology advances in Fossil Energy's oil and gas program in the last fiscal year include: Demonstrating and transferring to industry, using National Lab expertise, six new geophysical imaging technologies that will improve exploratory well success rates from a current average of 40 percent to 50 percent, Demonstrating five new data processing and simulation methods for applying advanced computing technology developed by national laboratories for other government programs to improve domestic prospects for producing natural gas and oil, and

Michigan Technological University, teaming with an operator in the Michigan Basin, targeted production from the Dundee Formation in the Crystal Field, one of 137 older fields that are nearing abandonment. The application of horizontal drilling strategies coupled with new computer modeling and analysis methods has resulted in a demonstration well producing at a rate of 100 barrels of oil per day, 20 times the best conventional well in the field. The successful results have caused 9 new horizontal wells to be permitted for drilling in the Crystal Field and 20-30 additional horizontal wells to be permitted in some of the other fields in the basin.

BENEFITS TO THE PUBLIC—ENERGY CONSERVATION

Question. Can you also describe for those examples the benefits to the public resulting from the technology, as well as the reasons why the particular advance would not have occurred without Federal financial support?

Answer. One example is the technology developed related to the glass industry. In addition to the direct and competitive benefits to the U.S. glass industry, this technology is one of the components of our Glass Vision of the Future (\$100 million in customer savings by 2000, one-half a million metric tons of carbon emissions displaced, and avoided consumption of more than 20 billion cubic feet of gas). Other work in our Industrial Technology Industries of the Future includes work on a Catalytic Converter. The cold start engine ignition is one of the least efficient combustion processes in the internal combustion engine, and on commuter trips it can be the equivalent of reducing vehicle fuel economy on the order of 1 mile per gallon. This new technology is one element of our advanced vehicle technologies program, the Partnership for a New Generation of Vehicles, which will develop a family sedan capable of 80 mpg without sacrifices in performance, safety or cost. These technologies will enable the U.S. to turn the corner on growing oil imports in the first decade of the 21st century and will result in annual consumer savings of \$10 billion and concomitant carbon reductions of 25 million metric tonnes by the year 2010.

An additional example is our work on advanced batteries. The potential commercial impact of this development is to leapfrog current battery technology, with cheaper, smaller, more efficiently made and yet to be determined how many times more rechargeable batteries. While important for existing battery applications, its larger potential payback is that near nano size technologies that a decade ago were only imagined in science fiction will soon be possible, affordable and reliable.

Our work on UV waterworks saves energy compared to conventional water treatment, where it exists. A more important contribution is that it makes water treatment easy and affordable and can readily be applied in parts of the world where it would not otherwise take place. Applications of the UV waterworks kill waterborne pathogens responsible for diseases such as cholera, dysentery, and typhoid that kill as many as four million children yearly.

Funding from our budget request provides at least three value added components to these and all of our programs. The budget provides resources and incentives for a public policy component to business growth while providing simultaneous productivity, economic, and environmental benefits at equal or lower cost and certainly lower current and future social cost. In cases where technology adoption is at least potentially possible and socially desirable, Energy Efficiency and Renewable Energy programs accelerate a possible future providing the energy, environment and economic benefits much sooner than would have been likely and extending the life of existing hydrocarbon stocks for their highest value added contribution. A third element of our involvement and support is to provide a diverse resource pool of technologies that collectively maintain pressure on price and stability on narrowly held

fuel supplies by continuously advancing energy science and technologies and providing a wide variety of options that are appropriate/competitive for many markets and could readily be accelerated and diffused widely if fuel prices or supply became unstable.

BENEFITS TO THE PUBLIC—FOSSIL ENERGY

The examples in the Coal and Power Systems program have resulted in the following benefits. First generation fuel cells are now commercialized with 120 units sold. Demonstration of the advanced generation technology is needed to expand the commercialization of fuel cells for clean, quiet, flexible and portable electricity for distributed and on-site power generation. They can be used in areas where local and regional emissions have difficulty complying with air standards, in remote locations, and in U.S. military installations and facilities around the country and around the world to enhance operational security of these military bases. The development of a domestic fuel cell industry will lead to the creation of thousands of high value, domestic jobs through the launching of a new domestic fuel cell manufacturing industry. The atmospheric fluidized bed (AFB) unit at the VA hospital demonstrates the benefits of AFB technology as a safe and clean way of disposing of "red bag" waste while utilizing that waste to produce clean on-site power. The Integrated Gasification Combined-Cycle (IGCC) advances will lead to world sales of advanced, clean, high efficiency coal based power systems that can use a wide variety of coals. Worldwide deployment of IGCC will allow coal to be used cleanly with reduced emissions, contribute to stabilizing greenhouse gas emissions, and create thousands of domestic jobs through international sales.

The latest concepts for environmental controls are the culmination of twenty years of R&D advances and the Clean Coal Technology Demonstration projects on environmental systems which have resulted in lower cost and more effective SO₂ scrubbers for coal-fired power plants. Currently one-quarter of all U.S. electric capacity (77 gigawatts) use these scrubbers which represent a reduction of \$40 billion in compliance cost according to a report done by Energetics, Inc. on the benefits/costs of the U.S. DOE Clean Coal RD&D program. While coal use for electric power generation more than doubled from 1970 to 1995, SO₂ and particulates came down by 27 percent and 90 percent respectively. In the same period, the average plant emission rate was lowered by 70 percent for SO₂ and 90 percent for particulate matter. In addition, a new generation of low NO_x burners and post-combustion devices have been developed in partnership with industry. Burner sales have exceeded \$750 million, and are projected to approach \$4 billion by year 2000. Previously available technology would have cost an order of magnitude more to achieve the same NO_x reduction. Sales of post-combustion technology (like Selective Catalytic Reduction) are projected at over \$2.5 billion by year 2000. Previously, this technology cost twice as much as today's version.

The advances in clean coal fuels technology have both environmental and long term energy security benefits. The tests on co-processing of waste with coal have confirmed the potential for favorable environmental and economic benefits for a direct liquefaction technology which can address the long standing environmental concerns with the large volume of waste plastics and mountains of used tires that continue to grow. Equally important, this technology offers an important option for addressing energy and oil security concern associated with our continued reliance on oil imports. The commercialization of the Microcel coal cleaning technology, being sold worldwide, is the culmination of research that started in 1980 and funded by the Federal Energy Technology Center. The benefits of this technology are that it provides a cost-effective means for emissions compliance prior to coal burning, it can use the over 2 billion tons of coal fines currently sitting in refuse ponds as fuel in clean power generation, and it is being used for various non-coal mineral processing applications around the world.

Prototype devices for five geophysical imaging technologies have been completed and are undergoing field trials, and one technology has been commercialized. The exploratory well success rate has improved to 48 percent for the first four months of 1996, and continued improvements are expected as new geophysical technologies, including those developed by DOE, are adopted by industry.

The five new data processing and simulation methods projects successfully completed interim products. These improvements are expected to increase U.S. oil and gas production by 1 million barrels of oil equivalent starting in 2001. Accomplishments to date include: computer code that provides a three-fold acceleration for parallel processing of subsalt seismic data; multiphase fluid simulator for underbalanced drilling; publications on prototype computer model to predict geopressured reservoirs; prototype data server available on the Internet; and synthetic seismic

data sets for a subsalt structure and an overthrust structure available for industry use in calibrating processing systems.

Additional development in the Crystal Field alone is expected to recover 2 million barrels of oil. The redevelopment of other fields is anticipated to produce between 80 to 100 million additional barrels with an anticipated tax revenue of about \$210 million.

PERFORMANCE MEASURES

Question. In reviewing the Energy R&D budget, it appears as if the Department has a program in virtually every area where there is a potential for energy savings (buildings, transportation, power systems). Is it possible that the Department is striving too hard to maintain a program in every energy “niche” without taking a hard look at the energy conservation benefits derived from these programs?

Answer. Energy conservation, fuel diversity, social and economic benefits to consumers and business, public needs, and the longer-term are all integral to our portfolio—we strive for an energy portfolio that is sustainable. While striving for sustainability and diversity in fuel and efficiency technology, the Department works with industry and the public to develop the critical few technologies that meet their expected needs, satisfy their market demands and are responsive to the charge of government to meet social needs not addressed by commerce and States. The process we use is to engage the business and consumer public in describing a likely and desired future and to work together to develop a sustainable future—government focusing on the social and high-risk components of that vision and industry, business and the non-federal government/public sector focussing on their direct constituency. Working together we prioritize and integrate the work and outcomes into a solution in which the parts work together better and the social and economic sum is greater than the sum of the parts would have been. Excellent examples of this strategy and the prioritization of our program focus are working in our Industry of the Future programs, Clean Cities, the Partnership for a New Generation of Vehicles, and our Federal Energy Management Program. A parallel process is underway in our buildings programs.

Early in technology development when the risk is high and the outcome/value uncertain, we solicit input from the energy community. As technologies mature, we add partners with social and potential business interests, increasing their involvement and commitments as we advance elements of a technology into tools that can be adopted by the public. This involvement improves products and provides researchers with near real-time feedback for improvements, next generation technologies, market signals of completion, and other needs to which program resources might more productively be spent.

Question. The budget justification lists performance measures such as “Quads of energy saved” for each of the major program areas. Do you intend to use these performance measures as a tool in formulating departmental budgets?

Answer. Energy saved, energy produced, energy cost savings, pollution prevented, results and performance and others are integral to the representation of our technologies and the public and internal dialogue used to determine allocation of resources and a balanced portfolio. However, portfolio balance is not limited to these performance measures. Portfolio balance includes considering work that will be performed by others, what will not be performed if we do not play a role, economic risk, technology risk, hedging, intergenerational equity, scale, need for catalysis, and many other factors. Some of these factors that go into considered judgment, business decisions and wisdom, are neither readily quantified nor even listable. Performance measures are integral to budget formulation but are more fundamentally important indicators to determine how we are doing our work, what is working, what needs mending, what can be emulated, what can be improved, setting goals, modifying plans, helping individuals measure the benefit of their effort and providing the public with some measure of what their investment has provided.

Question. Please provide for the record a table that shows a side-by-side comparison of budget levels for major areas (i.e., transportation, buildings) and the principal performance measures or “metrics” being used to measure program success.

Answer. The attached table details budget levels for our major programs and progress and outcome metrics:

[Dollars in millions]

Sector	Budget	1998 progress metric	Fiscal year 1998		Fiscal year 2010 outcomes
			MMTCE	Quads	
Industry	\$139	Three IOF visions; 2 signed and 1 developed	48	1.5	Seven visions and road maps implemented, saving industry \$10 billion.
Transportation	203	Demonstrate a 50 mpg family concept car	25	.6	An 80 mpg family sedan prototype in 2004, saving consumers \$10 billion.
Buildings, States, communities	302	Develop a strategic vision for buildings, weatherize 60,000 plus homes.	67	1.6	Implement the vision and road map with partners, adding +\$20 billion to consumer savings in 2010.
Federal energy management	31	Cut \$700 million from the Government's energy bill over a 1985 baseline.	1	.2	Cut government energy consumption by 30 percent by 2005 over a 1985 baseline.

STATE AND LOCAL PARTNERSHIP PROGRAMS

(PERFORMANCE MEASURES)

Question. The performance measures for Weatherization and the State Energy Conservation Program indicate that the Department expects the two programs in fiscal year 1998 to result in the conservation of .0014 and .007 quads of energy, respectively. The fiscal year 1998 request for Weatherization is \$154.1 million, the request for SECP is \$37 million. In light of the projected energy savings—which would seem to be the primary goal of the two programs—why is the Administration requesting the same increase for both programs on a percentage basis, and a vastly larger increase for Weatherization in absolute dollars?

Answer. Although both the Weatherization Assistance Program and State Energy Program (SEP) have the goal of creating energy savings, and, indeed, significant returns are realized through both programs, the Administration's budget request takes into account the two different program structures. With regard to the SEP appropriation request, the Department has addressed some of the needs for SEP activities by complementing them with DOE end use conservation program activities which also were targeted for implementation by States, consistent with states' Annual State Plans under SEP. These SEP Special Project activities funded from other DOE conservation programs are expected to continue in fiscal year 1998.

Under SEP, annual appropriations are allocated to States by formula and are used for program projects specified in each State's approved plan. SEP has consistently leveraged \$4 of Petroleum Violation Escrow (PVE), State, local and private funds for every \$1 of appropriated funds. The addition of SEP Special Projects has expanded the program, allowing States to implement State-oriented building, industrial, transportation and utility sector projects. Special Projects contributions from DOE end use programs of \$11.2 million in fiscal year 1996 and \$9.8 million in fiscal year 1997 represented an increase of 38 percent over the total of \$55 million appropriated for SEP in those two years. SEP enables States to address both local energy priorities and National energy initiatives. The Administration's budget projects an overall energy savings of .007 quads from all sources of funding.

In contrast, the Weatherization Program utilizes partnerships between State and local-level weatherization agencies. Specifically, DOE awards grants to States, which then award grants to the local agencies, usually community action agencies or other nonprofit or government organizations, to perform the actual services. Nearly 14 percent of currently eligible households have received weatherization services. Low-income households spend about 14 percent of their annual income on energy vs. 3.5 percent spent by other households. The program provides a benefit of \$2.40 for every dollar invested in Weatherization and leverages an additional \$3.39 from other Federal, State, local, and private sources. Additional benefits include: improvement of neighborhood housing conditions, reduction of power plant emissions, and providing education and practice with regard to newly developed conservation tools, materials, and techniques. The Administration's 1998 budget anticipates direct energy savings of .0014 quads from the DOE funding only. Thus, total savings from all funding sources are approximately three times greater.

Question. Are we getting the biggest "bang for the buck" with this allocation of Federal dollars?

Answer. Both the Weatherization Assistance Program and the State Energy Program (SEP) are cost-effective energy programs. The Department has recognized the impressive program impacts of SEP by utilizing it to implement State-oriented Special Projects in the buildings, industrial, transportation, and utility sectors. Special Projects contributions of \$11.2 million in fiscal year 1996 and \$9.8 million in fiscal year 1997 from DOE end use programs represent an increase in the dollars allocated to SEP by 38 percent over the appropriated total of \$55 million for fiscal year 1996 and fiscal year 1997. SEP Special Projects funding from DOE conservation programs is expected to continue in fiscal year 1998.

ENERGY CONSERVATION

ARTHUR D. LITTLE STUDY

Question. Some time ago, Arthur D. Little performed an analysis of the Department's "quality metrics." That study seemed to show that the Department has overestimated the benefits of many of the Energy Conservation programs funded in this bill. What is the Department's response to the Arthur D. Little study?

Answer. The Arthur D. Little (ADL) study was used by DOE in formulating the fiscal year 1998 request. DOE used the most conservative estimates at hand while formulating the budget, and these estimates were very close to the final numbers

arrived at by DOE with ADL review and assistance. While the final numbers in many cases were smaller than the preliminary energy savings, the benefits to the nation in energy productivity improvements, pollution prevention, and national security still demonstrate that energy efficiency and renewable energy technology programs are important to the nation. ADL stated "Overall * * * the selection of technologies in the DOE (Energy Efficiency) portfolio are very reasonable. They are in line with R&D programs of other industrialized countries and have gained a high level of industry support in the U.S. The portfolio mix in the post 2000 time frame will place the U.S. in a highly competitive position in the coming decades."

Question. Are the results of the study reflected in the fiscal year 1998 budget request? Have the budget requests for certain programs been increased or decreased in part because of this study?

Answer. The analysis of the expected energy savings in the future allowed DOE management to gain an understanding of how these programs related to DOE's strategic goals of maximizing energy productivity, preventing pollution, and enhancing our energy and national security. The analytical information from the study informed the decision making process in DOE as the fiscal year 1998 budget was developed, although other considerations also drive the Department's investment decisions, including priorities of the Administration, legislative requirements, stakeholder assessments of market opportunity, as well as the desire to capture benefits that are not easily monetized such as environmental or national security benefits. The use of portfolio selection criteria for our budget decision analysis is complex, and we are not able to ascribe specific increases and decreases in our request directly to a single set of criteria.

Question. Will the department continue to use such outside reviews to shape its programs and budget requests?

Answer. Yes, this year we are planning to expand our external review to a broader array of experts from business, industry, academia, and both government and non-government public sector.

Question. Will such reviews contribute to the Department's planing process pursuant to the Government Performance and Results Act?

Answer. The Office of Energy Efficiency and Renewable Energy has traditionally asked for stakeholder input for developing its strategic plans, portfolio planning, validation of metrics and performance. In response to the Government Performance and Results Act we have broadened our measures, exposition of measures and plans, and feedback from the entire spectrum of the public interested in EE's plans, performance and outcomes.

TRANSPORTATION

INFRASTRUCTURE, SYSTEMS AND SAFETY

Question. A significant increase is requested for Infrastructure, Systems and Safety. Is the entire increase attributable to commencement of Phase II of the corridor development program?

Answer. The fiscal year 1998 budget for Infrastructure, Systems, and Safety requests a \$3.1 million increase over fiscal year 1997. Of the increase, \$2.5 million is for Phase II of a nationwide infrastructure and corridor development program. The additional \$600,000 is requested to expand and refine systems and safety analysis of refueling, transport, and delivery infrastructure for alternative fuels.

Question. Exactly what does Phase II of the program entail?

Answer. Starting in 1995, the Department has worked with the Clean Cities and States to encourage private investment in refueling development in key regions and along key transportation corridors. We have supported State efforts to expand ethanol infrastructure in the Midwest, and liquefied natural gas corridor development in the West, among others. The Department's infrastructure and corridor development strategy encourages the use of Clean Cities as "anchors" in a strategic "backbone" that can dramatically increase the attractiveness of alternative fuels for fleets. In fiscal year 1997, we are launching Phase I of our nationwide program by building on the successes of these early pilot efforts. Phase I will involve sharing lessons learned; bringing local, State and regional organizations together to develop strategic plans for infrastructure and corridor development; increasing private participation; and providing grant funding to the States of about \$1 million to catalyze infrastructure and corridor efforts. In fiscal year 1998, Phase II will strengthen that effort, provide a second-round of funding to Phase I participants, and expand the program to additional regions.

Question. How many years will it take and what are the expected costs?

Answer. Analytical work by the Department has indicated that the success of alternative fuel vehicle programs will depend in large measure on the availability of sufficient refueling infrastructure. This finding has been confirmed by fleet operators and other stakeholders in Departmental hearings. The Department's financial investment is insignificant relative to the private investment that must be the driving force for any significant penetration of alternative fuel or electric infrastructure if these fuels are to be competitive. However, a small but significant investment by the Department of \$3-10 million per year for the next five years could be instrumental in catalyzing the growing alternative fuel market, supporting existing private investment, and attracting additional private investment.

Question. How will monies appropriated in fiscal year 1998 be used?

Answer. These funds will be used to catalyze Clean Cities and State cost-shared efforts that leverage significant private investment and increase the use of other Federal funding, such as Federal Highway funding. Infrastructure and corridor development projects typically include analytical work, planning, market development, public education, and acquisition and construction of refueling stations, of which the Department's funding plays a small but significant part.

Question. What would be the impact of level funding or a much smaller increase?

Answer. Level funding would not allow the Department to expand successful programs to other States and regions of the country, reducing the potential for a nationwide market for alternative fuels; and would not allow the Department to conduct the analyses needed to support an expanded market. A smaller increase than requested would restrict the number of regions.

VEHICLE FIELD TEST/EVALUATION

Question. A \$1.3 million increase is requested for Vehicle Field Test/Evaluation, some of which will be used to acquire and test new electric vehicles. For whose use are these vehicles being purchased?

Answer. The vehicles will be purchased for testing and evaluation by both public and private fleets. The two private organizations are Southern California Edison in conjunction with the California Air Resources Board and AAA of Southern California Systems; and Electric Transportation Applications in conjunction with Arizona Public Service, Salt River Project, Potomac Electric Power Company, and Underwriter's Laboratory. These two qualified vehicle test sites will purchase a limited number of electric vehicles for testing and evaluation on at least a 50 percent cost-share basis. Historically, additional utility expenditures increase the private cost-share percentage to well above 50 percent. Another portion of the funds will be made available to the Federal agencies to procure electric vehicles in accordance with Executive Order 13031 for testing and evaluation within the Federal fleet. Operational data will be provided by the agencies to the Department of Energy.

Question. Is this the first year in which funds in this activity will be used to actually purchase vehicles?

Answer. No, the program has provided funds on a cost-shared basis to purchase several thousand electric vehicles for testing, evaluation, and demonstration in both public and private fleets since its start in 1977. The program was known as the Site Operators Program until 1994.

Question. How many vehicles will be purchased?

Answer. The private organizations will purchase approximately 50 electric vehicles for testing and evaluation under this program. For Federal agencies, the expectation is to provide sufficient funding to test and evaluate up to 100 electric vehicles within the Federal fleet, bringing the total number of electric vehicles funded by fiscal year 1998 funds to about 150.

ADVANCED BATTERY DEVELOPMENT

Question. \$15.8 million is requested for Advanced Battery Development. Will the Department continue work on the mid-term nickel metal hydride battery in fiscal year 1998?

Answer. The Department anticipates that the United States Advanced Battery Consortium will complete all work on the mid-term nickel metal hydride battery in fiscal year 1998.

Question. Are fiscal year 1998 funds requested for this purpose?

Answer. About \$1.0 million is requested for fiscal year 1998.

Question. What is the status of this development effort?

Answer. Both development contractors are establishing the capability to manufacture this battery in response to market demand. The cost reduction programs begun in fiscal year 1996 are improving the ability of this technology to compete in the marketplace.

Question. How much is requested in fiscal year 1998 for work with the long-term lithium-based technology team?

Answer. The Department estimates that \$12 million will be used to support the long-term lithium-based technology team.

Question. If funded in fiscal year 1998 at the request level, how much does the Department anticipate will be required in fiscal year 1999 for this effort?

Answer. The Department estimates about \$4 million will be required in fiscal year 1999 to fund currently planned efforts. It is anticipated that the United States Advanced Battery Consortium may request additional funding in fiscal year 1999 for long-term advanced battery development.

HYBRID PROPULSION SYSTEMS

Question. \$45 million is requested for Hybrid Propulsion Systems, a \$6.15 million increase from fiscal year 1997. What would be the impact on program schedule if funding were held at the fiscal year 1997 level?

Answer. Reducing the budget to the fiscal year 1997 level will not only hurt the base program to develop a propulsion system capable of achieving 50 mpg in a mid-size automobile but will also have a significant negative impact on the development time for technologies that have the potential to be used in the Partnership for a New Generation of Vehicles (PNGV) program that are currently under development in the current contracts. Some technologies are strong candidates to move on to the next phase, Phase II, aimed at the 80 mpg target. If these candidate technologies are not funded in fiscal year 1998, the outcome will be to significantly increase the risk to achieve the 80 mpg fuel economy and stringent emission targets by the 2004 time frame because of the compressed development time. Level funding will also cause the current program to be extended by at least six months, moving the delivery of test bed vehicles into the mid-1999 time frame and increasing the overall cost of the program. This will delay obtaining important vehicle integration test data which will benefit solving integration issues in the Phase II program. The increased budget request is also directed at developing a broader supplier base of innovation and competition from which the automobile companies can draw to improve the chances for program success and reduce the risk of having a very limited number of suppliers on which to rely. Many smaller companies have unique and innovative technologies that have not been part of the current program. This budget request accounts for identifying these very promising companies whose ideas have not been evaluated and integrated into the existing partnership.

Question. What if funding were increased by only half the requested amount?

Answer. Reducing the budget to half the requested increase would impact the planned expansion of the supplier base and thus increase the risk for program success.

Question. Does the Department anticipate a further increase will be requested in fiscal year 1999?

Answer. Planned funding for fiscal year 1999 is expected to remain at the fiscal year 1998 requested level because the next phase of the hybrid program, Phase II, requires further efficiency improvements in the propulsion system and advances in vehicle systems, such as, lighter weight materials and reductions in accessory loads resulting from more efficient designs.

HIGH POWER ENERGY STORAGE

Question. The request for High Power Energy Storage nearly doubles to \$15 million. What would be the impact on program schedule if funding were held at the fiscal year 1997 level?

Answer. High power energy storage is one of the performance-limiting subsystems in hybrid vehicles for PNGV. High power batteries, ultracapacitors, and flywheels have been identified as potential energy storage candidates. If funding were held at fiscal year 1997 levels, the effort to scale up laboratory high power battery cells to 50-volt modules would be stretched out, and promising baseline battery technologies would be prematurely eliminated. This will triple the risk of failure; and the stretch-out would delay the fiscal year 1999 start of the development of the required 400-volt energy storage system for PNGV. Laboratory ultracapacitors will not be transitioned to industry for scale up. Flywheel efforts will be drastically reduced or eliminated. Seventy-five percent of the exploratory research aimed at improving power density, cycle life, and charge acceptance of the candidate high power technologies will be eliminated or deferred.

Question. What if funding were increased by only half the requested amount?

Answer. If only half of the increase is funded, the development effort to scale up one of the three laboratory high power battery technology options to 50-volt modules

would continue on schedule for fiscal year 1998. Risk of failure would be reduced to double; and the development of the required 400-volt energy storage system would not begin until mid-fiscal year 1999, about a year delay. Laboratory ultracapacitors will not be transitioned to industry for scale up. Flywheel efforts will be reduced—delaying the development of models and a safe containment system. This would move flywheels out of the PNGV time frame. Fifty percent of the exploratory research aimed at improving power density, cycle life, and charge acceptance of the candidate high power technologies will be eliminated or deferred.

Question. Does it make sense to consider the requested increases for this activity and for Hybrid Propulsion Systems in tandem, i.e., should any increases provided be proportional?

Answer. No, it does not make sense to consider the requested increases for this activity and for Hybrid Propulsion Systems in tandem. The development of the high power energy storage system is not paced by the development activity of the hybrid propulsion system, but rather by the considerable research and development effort that is required to mature the energy storage technology from potential laboratory-scale devices to full-size, 400-volt energy storage systems. Since this development effort is a long-lead, critical component R&D item for a viable hybrid propulsion system, the development effort needs to be accelerated with additional resources. Its funding should be considered as a separate activity that is required for the development of hybrid vehicles.

FUEL CELL R&D

Question. Within the request for Fuel Cell R&D, there is a significant shift away from Systems Development and towards Component, Reformer and Storage R&D. What is the reason for this shift?

Answer. The previously funded system efforts with General Motors, Ford, and Chrysler-Pentastar have been successful in identifying system level requirements and research challenges associated with the components which make up a fuel cell system for automotive applications. Therefore, the shift reflects the program's emphasis on working directly with fuel cell suppliers for the development of an on-board fuel-flexible fuel processor capable of operating on gasoline, methanol, ethanol, or natural gas. Previous research and development has identified key barriers to this technology which will be addressed, i.e., improved carbon monoxide clean-up devices; compact, efficient heat exchangers; and integrated fuel processor components (fuel purification system, heat exchangers, controls and sensors), into a vehicle-ready 50 kW system capable of rapid start-up and fast transient response. In addition, increased component R&D is necessary to reduce size, weight, and cost of the current fuel cell stack for automotive applications. R&D activities will focus on membrane-electrode assemblies using lower platinum loadings or non-platinum catalysts; low-cost, lightweight bipolar plates; high efficiency, compact compressors; and materials/processes amenable to low-cost, high-volume manufacturing. The system effort in the out years may increase to address R&D challenges associated with integration of the 50 kW fuel-flexible fuel cell system into a vehicle. Plans are that vehicle integration efforts would be done at 50-50 cost share.

Question. Does the Department anticipate requesting a further increase for Fuel Cell R&D in fiscal year 1999 if funded at the request level in fiscal year 1998?

Answer. The fiscal year 1999 request will depend on the current progress of the program. If fuel processor and fuel cell stack R&D activities are successful, additional funds will be needed for validation of these technologies in integrated fuel cell systems, and for testing these systems under normal drive cycles and required operating conditions (e.g., start up at 40° C) in a test bed vehicle. If key technical targets for fuel processor and fuel cell component technologies are not achieved, a sustained funding at the fiscal year 1998 level will be required to accomplish the R&D challenges associated with these major components.

Question. What does the Department make of recent demonstrations of fuel cell vehicles by foreign automobile manufacturers?

Answer. The recent demonstrations of fuel cell vehicles by Daimler-Benz and Toyota indicate to the Department that the potential benefits of fuel cell technology are clearly recognized worldwide. Furthermore, it also indicates that the promise of fuel cells is sufficiently bright that private industry, in partnership with government, is committed to sharing in the costs of future research needs. On the other hand, while these early demonstrations of research vehicles highlight the potential for fuel cell technology, there still is a great deal of enabling research and development work on components and systems that must yet be completed to meet automotive requirements in terms of performance and driving range.

Question. Where do United States manufacturers stand in comparison to Japanese and European manufacturers in fuel cell development?

Answer. For stationary power generation, U.S. fuel cell manufacturers are clearly the world leaders, a position resulting from the significant U.S. government investment in stationary fuel cell technologies. For transportation fuel cells, where U.S. government investment has been comparatively smaller to date, U.S. developers are facing fierce competition from abroad where public and private investment has increased dramatically recently. As a result, U.S. manufacturers are slightly behind, but narrowing the gap, in fuel cell stack technology. To their credit, U.S. developers are equal to or slightly ahead in fuel processing technology at this time.

Question. How dependent is the successful deployment of fuel cell technology on the development of advanced battery technology?

Answer. Development of advanced battery technology, like improved electric drive systems or lightweight materials, could certainly contribute to enhancing the successful deployment of fuel cell vehicles. Advanced batteries could ameliorate the requirements currently placed on fuel cells in terms of their power density and needed start-up time. However, fuel cell vehicle conceptual designs being pursued include either stand-alone fuel cells operating with on-board hydrogen storage which require no batteries, or alternatively, liquid fueled fuel cells which are battery augmented. Thus, depending upon the particular design approach and fuel used, fuel cell vehicles may or may not be dependent upon advanced battery technology.

Question. There recently were trade press reports describing the discovery of carbon materials that could potentially provide hydrogen storage sufficient to give a fuel cell vehicle a 5,000 mile range. Has the Department reviewed this information? Could this discovery have any impact on near or medium-term fuel cell development?

Answer. The Department is aware of the published results of the data generated by Northeastern University and has sent researchers to the university to observe the tests and talk to the Principal Investigators. The results reported by the university indicate a relatively large amount of hydrogen fuel could be stored and are significantly different from results reported by other laboratories for carbon-based storage systems. These results appear to warrant further validation.

This technology is relevant to hydrogen storage onboard a vehicle and is not directly related to fuel cell development. However, if this material could be incorporated into a storage system with a fuel cell, it would solve one of the many challenges facing the introduction of fuel cell vehicles.

ADVANCED AUTOMOTIVE TECHNOLOGIES

Question. The "metrics" for the Advanced Automotive Technologies program appear to be about 2-3 times higher than those for Advanced Heavy Vehicle Technologies, but the funding request is approximately 7 times higher. How does the Department account for this seeming imbalance?

Answer. Both of these programs have the potential to be cost-effective ways to reduce petroleum dependence in the transportation sector and deserve strong government support. Advanced Heavy Vehicle Technologies is a new program that has grown at only a modest rate because of the major financial commitments to the domestic auto companies.

The heavy vehicle program is modifying an existing diesel engine technology that has been in operation for many years to make it cleaner, more efficient, and useable in light trucks. While this is a formidable technical challenge, it is less challenging than designing technologies that will introduce electric drives, battery use and storage, alternative fuels, and fuel cells into automobiles.

Question. The budget request indicates that the Department is targeting development of highly clean and efficient diesel engines for heavy trucks, and hopes to develop this technology to increasingly popular light trucks/sport utility vehicles. Are the Department and its partners concerned that the popularity of light trucks might be on the wane by the time diesel technology is developed for use in light trucks?

Answer. Industry market studies indicate that light trucks/sport utility vehicles will continue to increase from 47 percent of light vehicle production in 1996 to somewhat over 50 percent by 2001, when it is expected to stabilize. These classes of vehicles have relatively poor fuel economy compared to automobiles, worsening the oil use situation in the U.S. This situation is substantially driven by the continuing availability of low-cost petroleum, which is expected to continue well beyond the date of introduction of the clean diesel engine to light trucks. Regardless of whether the popularity of these vehicles continues to increase or decline, there is still the imperative to increase their efficiency. Simple substitution of a low emission, high

efficiency diesel engine for the conventional gasoline engine will increase its miles per gallon by 50 percent.

Question. The budget request for Automotive Materials Technology/Propulsion Materials is reduced by \$2.25 million. What is the impact of the reduction in Propulsion Materials?

Answer. The major activity in the Partnership for a New Generation of Vehicles gas turbine effort in fiscal year 1998 is the development of ceramic manufacturing technology for critical gas turbine components, including a high speed rotor, combustor, and heat recovery system. The reduction in the Automotive Propulsion Materials budget will reduce the scope and stretch the schedule of the industry effort in ceramic manufacturing of these parts and the supporting technology programs at national laboratories and universities. The schedule for the go/no-go decision on the turbine option will be delayed until mid-2000 because of the funding reduction.

Question. If funded at the request level, will the Department have sufficient information on key components to make a go/no-go decision on the turbine option by mid-1999?

Answer. If funding were restored to the fiscal year 1997 level of \$6.5 million, it is expected that the ceramic manufacturing technology effort could be accelerated sufficiently to make a go/no-go decision by the end of 1999 to determine if the gas turbine remains a viable candidate for incorporation into the PNGV 2002 concept vehicle.

NORTHWEST ALLIANCE FOR TRANSPORTATION TECHNOLOGIES

Question. In the last year the Department has joined in supporting the formation of the Northwest Alliance for Transportation Technologies. What benefit does the Alliance add to the DOE Transportation program in terms of expertise, coordination and other factors?

Answer. The development of an ultra-high mileage and environmentally friendly vehicle of the future will require the introduction of lightweight materials into vehicle production while maintaining structural integrity, strength, and safety.

PNGV identifies aluminum, magnesium, titanium, and polymer composites as enabling lightweight materials. Before these materials find extensive use in automobiles, enabling manufacturing technologies that significantly reduce the cost of primary aluminum, magnesium, titanium, and polymer composites are required. Furthermore, the forming and joining of these materials for automotive applications will need to be addressed. The Northwest aerospace industry has been a world leader in the utilization, forming, and joining of lightweight materials. The infrastructure surrounding the Northwest aerospace industry includes primary aluminum, magnesium, titanium, and composite manufacturers (Tier I), as well as part forming and materials joining manufacturers (Tier II).

The Northwest Alliance for Transportation Technologies (NATT) will significantly benefit the DOE Transportation Technologies program by accessing and utilizing the established aluminum, magnesium, titanium, and composite manufacturing expertise built around the Pacific Northwest aerospace industry to address the critical lightweight materials objectives of PNGV. Also, NATT will provide an avenue for Tier I and II materials suppliers to play an active role in the DOE Transportation Technologies program. Tier I and II suppliers will ultimately be responsible for both reducing the cost of critical lightweight automotive materials and producing automotive production quantities.

The NATT will coordinate collaborative projects with industry, national laboratories, and universities to develop enabling manufacturing technologies that will lead to an increased use of lightweight materials in automobiles. One objective of these collaborative projects is to team with primary suppliers of aluminum, magnesium, titanium, and composites, such that technical advances can rapidly move manufacturing volumes required for the transportation industry. NATT will also coordinate projects to develop advanced forming and joining technologies that more effectively utilizes lightweight materials.

Question. Does the Department anticipate a continued productive working relationship with the Alliance?

Answer. Yes, the Department anticipates a very productive relationship with the Alliance, continuing to build on the partnerships established in fiscal year 1997. The introduction of lightweight materials into the transportation sector is critical for all future vehicle concepts. NATT not only allows the lightweight materials expertise developed in the aerospace industry to be accessed and utilized but it also incorporates the critical Tier I and II aluminum, magnesium, titanium, and composite materials manufacturers need to reduce primary and secondary material costs. NATT comprises an integral part of existing DOE transportation programs.

Question. What are some examples of work to be performed by the Alliance in fiscal year 1998?

Answer. fiscal year 1998 projects will focus on developing enabling technologies that lead to both the near term and longer term introduction of aluminum, magnesium, titanium, and polymer composites into automotive vehicles. Projects will address specific PNGV needs not currently funded by the DOE Transportation Technologies program. Project areas will include development of manufacturing processes that reduce the cost of primary magnesium, development of manufacturing processes that reduce the cost of primary titanium, development of aluminum forming processes that increase the utilization of aluminum in automobiles, and innovative development of fiber reinforced composites for automotive applications.

PROGRAM DIRECTION

Question. The justification indicates that the Program Direction activity for fiscal year 1997 is being evaluated to address a projected end-of-year shortfall of \$650,000. How does the Department plan to address this shortfall?

Answer. The Department is addressing this shortfall by implementing several actions. To date, the Office of Energy Efficiency and Renewable Energy has requested and received approval from the Office of the Chief Financial Officer to recover prior year deobligations (PYD), which had resulted from the close-out of expired contracts, to offset the projected shortfall. These prior year deobligations from various Sectors plus carryover balances from the Industry Sector were internally reprogrammed to the Transportation Sector's Program Direction area, in accordance with Congressional guidelines and thresholds.

Question. Why has a "contingency" of \$300,000 been requested for fiscal year 1998?

Answer. The contingency of approximately 4.7 percent is requested to accommodate variables such as payment for overtime and compensatory time, promotions and within grade salary step increases, benefits for former personnel, and other similar types of payroll activities to help preclude the need for a reprogramming action.

Question. The \$210,000 requested for employee incentive awards appears to mean an average of more than \$3,500 per person. Assuming not all employees will earn incentive awards, is the amount requested appropriate?

Answer. Although it is not envisioned that all employees will earn an incentive award we believe the \$210,000 is the appropriate amount for special act and service awards, employee incentive awards, and group awards.

BUILDINGS SECTOR

Building America

Question. The request for Building America indicates that industry teams will transfer system innovations to 15,000 homes over the next four years. Why is it necessary to demonstrate innovative systems in 15,000 homes before such systems are adopted as regular industry practice?

Answer. It is projected by the year 2000, the Building America DOE/Industry cost-shared partnership will have developed 2,000 highly energy efficient, environmentally friendly, and cost-effective houses in a number of communities. The technical dissemination, not demonstration, spinoff to regular industry practice is anticipated to be 15,000 houses constructed by other builders and developers applying the Building America system integration methods currently under development.

Question. How many states currently have Building America programs?

Answer. At present, the four Building America teams have projects under construction or to be initiated during fiscal year 1997 in 11 states: Arizona, California, Florida, Idaho, Illinois, Massachusetts, Nevada, New York, North Carolina, Pennsylvania, and Texas. The four Building America teams are composed of a total of more than 70 industries in 27 states: Arizona, California, Connecticut, Colorado, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Michigan, Minnesota, Nevada, Pennsylvania, New Hampshire, New Jersey, North Carolina, Ohio, Rhode Island, Virginia, Tennessee, Texas, Washington, and Wisconsin.

HOME ENERGY RATING SYSTEM PILOTS

Question. \$1.5 million is requested to continue Home Energy Rating System pilots in seven states. What progress have the pilot states made in implementing HERS?

Answer. The objective of the pilot states effort has been to overcome the barriers to the use of home energy rating systems and energy efficiency financing. Progress

in meeting these objectives has been constant in the seven HERS pilot states. Over \$150 million in energy efficiency mortgages were issued in these states through the spring of 1996 and a substantial amount of additional energy measures were installed based on ratings. Tens of thousands of ratings have been conducted and thousands of lenders, realtors, builders and appraisers have been trained.

Question. When does the Department propose to cease requesting funding for the existing pilots?

Answer. Funds for the pilot states will be reduced under the fiscal year 1998 budget proposal and not requested for fiscal year 1999.

Question. When the pilots are complete, will the Department propose to divert funds from existing pilots into new states, or does the Department feel HERS will be sufficiently demonstrated in the existing pilot states to allow states to establish their own programs independently?

Answer. There is not a need to replicate the large scale multi-year pilots. Technical assistance to other states however, will be necessary to achieve national acceptance of HERS and increased access to energy efficiency financing.

BEST PRACTICES

Question. In the justification for the Best Practices activity, a number of software development programs are described as having generated large energy savings for users. What unique advantage or expertise does the Department have in developing this software that could not be provided by a private software development firm?

Answer. The Department's role in software development stems from its need for energy-focused whole buildings software to carry out its research and development activities, and requests from industry to partner with it to develop software responsive to the defined needs of industry in the predesign, design or redesign in the case of renovation, commissioning and operation of buildings. The software developed for, and stemming from, research and development forms the basis for that developed with industry partners.

The process of ongoing consultation and interaction with industry so that software is responsive to its needs is time-consuming and costly. No single, private software developer has exhibited the ability to invest the time required for validated, energy-focused software tailored to the specific steps of the predesign, design and redesign, commissioning and operation of buildings. The software needs for specific types and sizes of buildings vary, further reducing the private developer's ability to absorb the financial risks. In addition, as new technologies and design know-how emerge as a result of research and development, the software must be updated, adding even more financial commitment and risk.

The objectivity, comprehensiveness and credibility associated with the Department/industry-developed software are crucial. These qualities tend to be perceived as, and oftentimes are lacking in the limited, narrowly-focused commercially available energy software that does exist, thereby discouraging energy-conscious building design.

Question. Does the Department anticipate continuing to develop this type of software into the foreseeable future?

Answer. To fulfill its research and development responsibilities, the Department must continue to improve software. As long as the financial risk is high and industry asks to work with the Department on software improvements capable of meeting its needs, it is essential that the Department continue its partnerships. Valid building energy simulation software is essential if industry is to have the tools it requires to properly integrate efficiency and renewable energy design know-how and technologies into buildings and have confidence that the buildings will perform as anticipated.

Moreover, because it is the Department's mission to encourage adoption of new know-how and technologies, there must be a process in place to assure that the tools needed to facilitate adoption are available. And, the Department must assure that procedures needed to verify the reliability of software continue to be improved. Adding capabilities as new knowledge and technologies emerge tends, however, to be a less intensive process than the original development of the software. Thus, it is expected that once the software industry wants and needs are met, a less intense effort will be required.

HI-COOL HEAT PUMP

Question. \$2,150,000 is requested for development of a Hi-cool Heat Pump, which the justification indicates will be ready for market introduction in 2005. What is the funding profile for this program?

Answer. This program began in fiscal year 1993 at \$450K and progressed as follows. fiscal year 1995 \$1.0 million, fiscal year 1996 \$600K, fiscal year 1997 \$900K, fiscal year 1998 \$2.1 million. Funding to date has produced two candidate advanced cycle absorption heat pumps concepts that will be further developed into prototype heat pumps with a cooling performance of 30 percent better than other cooling devices. When fully developed these technologies can penetrate the southern tier markets where cooling is the dominant mode of energy use for space conditioning.

Question. Does the optimal funding “curve” have a large peak in some future fiscal year?

Answer. As development of “Hi-cool” systems progresses, each successive phase requires increased funding. Hardware development of components (initiated in 1997) requires a higher level of funding than concept evaluation which is mainly an analytical effort. The laboratory development and testing of complete heat pump systems requires more funding than development of individual components. In the later stages of the project, these increases will be somewhat offset by increased cost sharing by industry. Industry will fund 50 percent of the field testing phase.

Question. If so, when and how much will be required?

Answer. The required Departmental funding needed to carry this program through all phases is indicated in the table below:

Phase	Activity	Fiscal year	Phase funding
I	Concept evaluation	1994–1997	\$3,800,000
II	Component development	1997–2002	7,000,000
III	System development	2001–2004	6,000,000
IV	Field testing	2004–2005	1,000,000

Question. Are the alternative Hi-cool heat pump cycles being evaluated as an alternative to the design being developed for market in 2005, or as a follow-on technology?

Answer. In fiscal year 1997, the “Hi-cool” program is developing critical components at small business R&D firms for two of the concepts evaluated in Phase I. The one or two alternative Hi-Cool cycles being further evaluated in 1998 are additional highly-ranked Phase I concepts which are possible alternatives to the two now undergoing hardware development. Modest parallel development of these concepts with additional small business contractors lowers the overall risk in the project by maintaining a range of technical options during the critical component development phase. All concepts are being evaluated for potential market introduction in the year 2005.

LARGE COMMERCIAL CHILLER PROGRAM

Question. The justification indicates that the Large Commercial Chiller program with York International will be completed. To what degree will DOE participate in getting this technology “ready for commercialization * * *”?

Answer. Testing of a prototype 40 refrigeration ton DCC chiller at York International will begin in mid 1997 and continue into early fiscal year 1998. Using laboratory test results and a newly designed advanced direct fired burner, a pre-production 400 ton DCC chiller will be fabricated and readied for field testing in late fiscal year 1998. The estimated completion date for field testing of the 400 ton production ready chiller will be early fiscal year 1999. The cost share from York International for field testing will be 50 percent.

Question. Is 35 percent the total cost share for the entire program, or just for the current stage of the program?

Answer. The current program is cost shared by York International at 35 percent however, this will increase to 50 percent for the field test.

ADVANCED DESICCANT TECHNOLOGIES

Question. The budget request includes \$2 million for advanced desiccant technologies. What is the funding profile for the remainder of this program?

Answer. The current research plans for both solid and liquid desiccants which extend through the year 2000 would require level funding.

Question. If funded at the request level in fiscal year 1998, does the Department anticipate requesting funding for this program in fiscal year 1999?

Answer. Yes. Current projects are focused on solid desiccants technology application in large commercial buildings because solid desiccants are further along in their

development and are available for test and evaluation. Research and development of enabling technologies for Indoor Air Quality (IAQ), and the development of sensors and specialized control will take full advantage of the energy saving and air quality improvement potential of solid desiccant-based air conditioning equipment. A need exists to establish desiccant based systems as mainstream HVAC equipment for indoor air quality and comfort control. HVAC and comfort control systems based on liquid desiccants is planned as part the longer term program.

Question. What level of cost-sharing has been achieved in this program?

Answer. There are two contracts in place for developing desiccant systems, one with SEMCO/Trane which has 37 percent cost-sharing and one with ICC/Englehard which has 63 percent cost-sharing. In addition, manufacturers of desiccant wheels being tested at NREL have donated their wheels and will continue to cost share as advanced wheel development is achieved. Gas industry cost share is in the form of site selection for test and evaluation of desiccant systems and a willingness to cost share in the testing and data collection.

FUEL CELL BUILDING MICRO-COGENERATION

Question. \$1.7 million is requested for Fuel Cell Building Micro-Cogeneration. When does the Department hope to achieve development of a commercially viable PEM fuel Cell?

Answer. The goal of the industry cost shared Fuel Cell Buildings Micro-cogeneration programs is to have the necessary critical technologies (i.e., fuel processor, bipolar plates, catalysts, membranes), developed and ready to be tested in a prototype 50kw Proton Exchange Membrane fuel cell in a light commercial building with conversion efficiencies of 36–40 percent, in the year 2002. Projected cost of the fuel cell is \$2000/kw or less. To accomplish this goal will require adequate funding for research and development focused on fuel processing of Natural Gas (NG) to develop the reforming techniques for extraction of Hydrogen (H) for use in the fuel cell. Catalyst development is necessary to make the fuel cell more tolerant of Carbon Monoxide (CO) gas, which is poison to the system and which will significantly reduce the power density of the fuel cell. Components such as membranes, catalysts and bi-polar plates in the cell stack are high cost items and will require substantial research and development to improve cell stack operation and to lower cost of construction.

Coordination with the automotive program will be maintained at a high level because of the synergistic nature of the two programs and the technologies developed can be incorporated into both programs. The Fuel Cell Buildings Micro-cogeneration program will provide an accelerated early market entry into the commercial building sector for the PEM fuel cell leading to the larger residential market, and assist the automotive market strategy. This schedule will lead to introduction of a prototype "First Generation" PEMFC operating in a commercial building by the 2004 with a cost target of \$1500/kw.

Question. Will further increases in the program be required to achieve this goal?

Answer. Further funding will be required in this program to achieve the "First Generation" PEM fuel cell operating in a light commercial building by the year 2002, and commercial introduction by the year 2004. An expected industry cost share for this program is 35 percent to 50 percent.

LIGHTING APPLIANCE R&D

Question. A number of technologies are being pursued in the Lighting Appliance R&D program. When does the Department hope to complete development of the low power sulfur lamp?

Answer. The Department is planning to complete research and development on the low power sulfur lamp in fiscal year 1999. By that time a 100 lumens per watt prototype, operating at less than 100 watts will have been successfully tested and will be ready for commercialization by the private sector.

Question. To what extent do near-term lighting technologies (such as compact fluorescents) stand to be overtaken and replaced by longer-term technologies (sulfur lamps, etc.)?

Answer. Over time, there has always been a mix of lighting technologies. New lighting technology has a relatively slow rate of penetration—a good estimate is that a superior new technology will replace about 50 percent of the older technology in ten years. Hence, compact fluorescents are not necessarily restricted by newer sulfur technology.

Question. Are the economics of compact fluorescents dependent on long-term use that would be obviated by development of more advanced technologies, or are there market niches available to justify a range of technologies?

Answer. Because there are so many different applications or needs in lighting, and so many technologies to draw upon, there are always large niches available for each technology for a considerable time, measured in decades.

ENERGY STAR PROGRAM

Question. Does the Department expect the Energy Star Program to become self-sustaining at a lower funding level at any time, or will a level of support comparable to the fiscal year 1998 budget request always be required?

Answer. The Department does expect the program to become increasingly self-sustaining and to require less funding in the future than requested in fiscal year 1998. We plan to demonstrate the value of a labeling and promotion campaign for high efficiency products through retail sales. Our experience so far has shown that retailers and utilities are willing to commit significant resources to offset program costs.

When the initiative has reached a critical mass of participants, federal involvement and funding requirements will decline as the partners pick up the cost of advertising, sales training, point of purchase displays, etc. Some federal activity will continue to be needed, however, to preserve the integrity and credibility of the Energy Star symbol, including collecting and compiling appliance efficiency data and designating qualifying models.

Question. The Department's response to questions submitted last year indicate that lighting manufacturers currently make dedicated fixtures on specifications of large commercial accounts (hotels, etc.). Given that manufacturers are already engaged in production of efficient technologies for large commercial accounts, why does the Department continue to invest in the volume purchase program for lighting?

Answer. There's no question that economical high-efficiency lighting is available to large commercial accounts. While we are pursuing further efficiency improvements for commercial lighting, the volume purchases are intended to bring the efficiency of residential lighting up to the standard of best practice in the commercial sector. One way to do this is by overcoming the perceived shortcomings of compact fluorescents as replacements for incandescent lamps, in partnership with industries which buy large numbers of lamps and fixtures of the varieties that individual consumers buy for their homes.

Volume purchases that lead to increased sales of dedicated compact fluorescent light (CFL) fixtures in hotels, multi-family residential dwellings and commercial buildings will have a positive impact on price, i.e., as more and more fixtures are manufactured, manufacturing costs and retail prices decrease. In addition, a residential home-owner might be educated about the benefits of CFLs by first having used them in a hotel room or office suite.

STATUS OF HOME ENERGY RATING SYSTEM COUNCIL

Question. The Committee has previously expressed concern that the Home Energy Rating System being developed by the Department and the HERS Council might skew consumers' perception of the actual total energy usage of a particular home. What is the status of the HERS Council?

Answer. The HERS Council issued their own set of guidelines in 1995. They continue to support their guidelines and energy efficiency financing without any Department funds.

Question. How does the Department plan to proceed on this issue in fiscal year 1998?

Answer. The Department continues to analyze options on how to best proceed to ensure accurate, clear and concise information gets to customers and the financial community.

Question. Does the Department feel it is possible to develop a rating system that will be generally agreeable to the stakeholder community?

Answer. The stakeholders remain deeply divided over the voluntary guidelines. The Department continues to consider options that will result in meaningful information to consumers and the financial community, and also meet stakeholders' concerns. We are working to develop a resolution of these issues.

LIGHTING AND APPLIANCE STANDARDS

Question. A \$3.6 million increase is requested for Lighting and Appliance Standards. As you may know, the development of these standards has been a controversial issue for the Department and for this subcommittee. How far along is the Department in implementing the process improvements that were developed last year?

Answer. One of the key features of the process improvement was the establishment of the Advisory Committee on Appliance Energy Efficiency Standards. This

Committee was established to provide the Department with regular guidance on the implementation of the Process Rule as well as on other critical issues that cut across a variety of products. The first meeting was held on January 8, 1997, and a number of subcommittees were created to deal with some of the following specific issues: analytical methods for the determination of energy saving forecasting, future electric prices, life-cycle cost, etc.; screening and engineering analysis, consumer and utility impact issues; and non regulatory approaches. These subcommittees will be making recommendations to the Advisory Committees. The Department also convened a workshop on manufacturing impacts on March 11–12, 1997. At this Workshop, the Department presented a proposed approach and methodologies for analyzing the impacts on manufacturers. One of the conclusions from the workshop is that each rule-making will tailor the manufacturing impact analysis to the specific product and the plan for conducting the analysis will be discussed with stakeholders. In addition to the manufacturing impact analysis workshop, the Department has held four workshops (clothes washer and ballasts standards, and electric motors and water heater test procedures) since the publication of the process rule.

Question. Does the Department feel it has regained the confidence of the industries whose products are being subjected to codes and standards?

Answer. The Advisory Committee meeting and the five workshops held since the publication of the process rule were generally well attended and well received and the Department is committed to continue the implementation of the new procedures, including the commitment to frequent and early stakeholder consultation.

Question. What will the increase in Lighting and Appliance Standards enable the Department to do that it would not be able to do if held to the fiscal year 1997 level?

Answer. The increase allows for continuation of the new standards development process as planned and on schedule: issuance of notice of proposed rulemaking (NOPR) for conservation standards for clothes washers and water heaters (responsible for 14 percent of residential energy use), and final rules to incorporate legislated standards and test procedures for plumbing equipment and large electric motors. This increase will also provide for the final rule to amend test procedures for residential central air conditioners/heat pumps and initiate rulemaking for energy conservation standards for these products. Without the increase, delays will occur and DOE would lose credibility with the stakeholders that have invested in, and contributed to the revised rulemaking process.

BUILDING STANDARDS AND GUIDELINES

Question. A \$4.9 million increase is requested for Building Standards and Guidelines, 3.5 million of which is for Updating State Codes and \$1.4 million of which is for Voluntary and Federal Energy Codes. How many state codes could be updated if funding for this activity were held at the fiscal year 1997 level?

Answer. A total of ten state codes could be updated if funding for this activity were held at the fiscal year 1997 level. Additional funding will support cost shared incentive grants and will enable the Department to develop and implement programs, tailored to specific states and user groups, especially those not directly supported during fiscal year 1997, to provide a range of materials, including information to state officials about code options, promotion of energy efficiency benefits to new home buyers and builders, compliance and educational materials, advocacy assistance, model legislation or regulations, and testimony on technical and administrative matters at legislative and administrative hearings.

Question. In how many additional states will DOE be active if the requested increase is granted?

Answer. The increase in funding will enable the Department to assist an additional 15 states in updating and implementing their building energy efficiency codes. Representatives from states participating in a multi-state working group have all decided that there are important benefits to them in adopting upgraded portions of the emerging commercial building energy consensus code without waiting to the year 2000. These early adopters will not only benefit their regions of the country but can also facilitate adoption of the updated code by other states in the year 2000 and beyond, through their early adoption experience.

Question. At some point will all state codes be updated, or will the Department continue to revisit and help modify the codes ad infinitum?

Answer. The Department is assisting states to strengthen their energy code infrastructure, improve their professional and trade energy expertise and strengthen their partnerships with producers so that states will increasingly be able to routinely update their energy codes without Federal assistance.

At the same time, the Department is working with the building industry consensus code organizations to make the model codes easier to implement and use, to im-

prove their technical basis, and to incorporate new energy efficiency and renewable energy measures that are technologically feasible and cost effective. The Council of American Building Officials has published an upgraded edition of its Model Energy Code twice since 1992 and will do so again in 1998. The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) and the Illuminating Engineering Society of North America (IESNA) are currently in the process of upgrading their building industry consensus code, Energy Code for Buildings Except Low-Rise Residential Buildings, ASHRAE/IESNA 90.1-1989R. When implemented, it is expected to reduce energy use in buildings by 25 percent. It is expected to be published in 2001.

VOLUNTARY AND FEDERAL ENERGY CODES

Question. What will the increase requested in Voluntary and Federal Energy Codes enable the Department to do in fiscal year 1998 that wasn't done in fiscal year 1997?

Answer. In fiscal year 1997, the Department proposed energy standards for Federal buildings. In fiscal year 1998, the Department will prepare and publish final standards. The increase will permit the Department to prepare and distribute materials and information that will assist Federal agencies to train their people to implement and enforce these improved energy standards. In fiscal year 1998, the Department will complete modifications to its Federal residential energy standards that address renewable energy benefits and propose them for public comment. The increase will permit the development of support materials to implement the proposed revisions.

In fiscal year 1997, the Department has been working with the building industry consensus standards organizations to technically improve the model codes and to make them easier to implement. In fiscal year 1998, that work will continue and the residential improvements of the previous three years will be published in the 1998 edition of the Model Energy Code. The increased funding will enable the Department to make the legislatively required determination as to whether the revisions would improve energy efficiency in residential buildings, and to make that analysis available to states that wish to consider updating their energy codes. Regarding commercial building energy codes, in fiscal year 1998, the Department will continue to provide analysis supporting resolution of comments received on the second public review draft of ASHRAE/IESNA 90.1-1989R. The additional funding will support analysis of whether ASHRAE/IESNA 90.1-1989R will save energy in commercial buildings, as legislatively required. This analysis will be used to support early adopter states.

FEDERAL ENERGY MANAGEMENT PROGRAM

Question. The text accompanying the justification for FEMP indicates that total energy cost savings from capital improvements in place through fiscal year 1996 will be \$7.8 billion by 2002 and \$15 billion by 2015. Are these net figures that reflect the cost of the capital investments?

Answer. Yes. However it should be noted that the cumulative \$7.8 billion energy cost savings in fiscal year 2002 represents the savings attributable to investments put in place from 1985 through 1995, plus cost savings from anticipated new investments from 1996 forward, based on full funding of the FEMP budget request. The \$15 billion net energy cost savings by 2015 reflects both the capital cost of projects and estimated cost of private sector funding accessed through energy savings performance contracts and utility-based financing, which should dominate the investment stream over the fiscal year 1995 to fiscal year 2005 period. No investments beyond fiscal year 2005 were assumed. These cost savings do not include savings attributable to energy efficient product procurement practices, energy cost savings achieved through improved energy and building systems operations and maintenance, or to the improved efficiency of new buildings entering the Federal building stock.

Question. The justification also describes FEMP's increasing emphasis on "Energy Saver" performance contracts in which other agencies order energy savings projects through FEMP personnel, then reimburse FEMP once energy savings are realized. Has this system of reimbursement been established and demonstrated?

Answer. Several methods of performing work on a reimbursable or revenue-generating basis have been identified by FEMP. Several promising methods will require changes in policy and, in some cases, require legislation. These include the development of a revolving fund for energy-efficiency work and the ability of FEMP to be reimbursed for work on a shared-savings basis or reimbursed in years following the delivery of services. FEMP has been and will continue to pursue these methods as

they have significant potential to improve FEMP's ability to perform work for other agencies.

Question. Is the Department confident it has the authority to retain and use reimbursements for its own personnel?

Answer. Although this approach is consistent with the use of reimbursable revenue in other agencies, this is one of the issues that still needs to be confirmed and resolved before a pilot project can be established.

Question. The Committee is aware that budgeting for energy management in other agencies has been erratic, due to both Congressionally imposed cuts and Administration budget requests that have given such programs a low priority. How does the Department view the level of cooperation and financial support it is receiving from other agencies?

Answer. There is both interest and cooperation from Federal agencies and they continue to look to FEMP for leadership. Even though agency budgets are decreasing, FEMP, as part of its mission will continue to help agencies identify alternate financing arrangements. To help streamline the contracting process, DOE issued a solicitation for a FEMP Energy Saver Performance Contract (Super ESPC) in May 1996. The Super ESPC process allows Federal agencies to issue orders off of each contract awarded and begin to realize energy cost savings more quickly. Each agency will pay the contractor from the savings in the agencies' energy expenses. The first Super ESPC for energy efficiency should be awarded in the next 60 days and will cover 8 western states and the pacific territories and has a contract value of \$750 million, and delivery orders will be placed up to that amount. Demands on agency resources to develop contracts should be reduced by this process, allowing agencies to use their valuable and scarce resources on other priorities. As a result, other agencies are cooperating in the establishment of this contracting mechanism and are anxious to see it in place across the country. Individual delivery orders will be subject to Congressional notification requirements, and agencies placing those orders will be responsible for said notifications.

Question. Does the Department feel other agencies are responding to the letter and spirit of EPACT and Executive Order 12902?

Answer. Yes. Ten agencies, the Department of Agriculture, Defense, Energy, the Interior, Justice, Transportation, Veterans Affairs, the Federal Emergency Management Agency, General Services Administration, and the National Aeronautics and Space Administration have already achieved the Energy Policy Act goal of a 10 percent reduction in buildings energy use from 1985. In addition, three agencies, the Departments of Energy and Justice, and Federal Emergency Management Agency have already achieved a 20 percent reduction in buildings energy use from 1985. The remaining agencies continue their efforts to reach the goals set under EPACT and Executive Order 12902. And, while their progress has been slower, they have indicated their willingness to strive to reach their goals without taking away from their mission requirements and remain within resource constraints.

Question. Has the Department considered prioritizing allocation of FEMP resources to give preference to those agencies that are the most willing to devote their own resources to energy savings projects?

Answer. The Interagency Energy Policy Committee, Interagency Energy Management Task Force and FEMP believe that activities leading to the broadening and deepening of participation in Federal energy management efforts is an essential FEMP role, and is foundational to the long term goal of institutionalizing sound energy management practices in the Federal government. While FEMP makes all policies, tools, and information available without regard for agency cost sharing, it does seek to apply its training, SAVEnergy audits, design assistance, and partnership facilitation services where agencies are committed to implement projects with their own resources or through their own or FEMP's alternative financing mechanisms. In general, FEMP applies its resources where a particular activity will have the greatest energy and cost saving effects. FEMP is committed to and attempts to utilize its limited resources in ways that will leverage resources of agencies, utilities, manufacturers and energy service companies and result in replication of results beyond immediate projects.

Question. What agencies or Departments have been the most active in pursuing energy savings opportunities?

Answer. The agencies who are most active are the ten agencies who have achieved the Energy Policy Act goal of 10 percent reduction in buildings energy use from 1985 as well as the three agencies who have achieved a 20 percent reduction in buildings energy use from 1985. The ten agencies achieving the 10 percent goal are: Departments of Agriculture, Defense, Energy, the Interior, Justice, Transportation, Veterans Affairs, the Federal Emergency Management Agency, General Services Administration, and the National Aeronautics and Space Administration. The three

agencies attaining the 20 percent goal are: Departments of Energy and Justice and the Federal Emergency Management Agency. However, recent budget reductions and the elimination of some budgets may change these statistics over time.

Question. Are there certain agencies or departments in which notably large opportunities for savings exist, but which have not pursued those opportunities for one reason or another?

Answer. For the most part, agency energy managers recognize and actively strive to implement programs and projects which can achieve energy savings in their facilities. However, limited resources and internal procurement and legal opinions are the major barriers facing those agencies which are having difficulty implementing energy efficiency measures. FEMP and the Interagency Energy Management Task Force continues to work towards overcoming these barriers within those agencies and across the Federal Government. The large agencies clearly have the most opportunities for savings, and those agencies have been aggressively pursuing opportunities, except where funding limitations exist. Within agencies there are unique opportunities such as the effort now being investigated by the Department of Energy's own programs where surplus facilities are reviewed for energy cost reduction projects.

Question. Aside from providing funding for the FEMP program, is there anything this Committee can do that would prompt Federal agencies to aggressively seek out and implement energy saving projects that would produce concrete budgetary savings?

Answer. As stated earlier, the Department is exploring several methods of performing work on a reimbursable or revenue-generating basis. Some of these methods will require legislative and policy changes. The Department encourages the Committee to work with the Department on any required legislation as recommended or proposed by the DOE. Planned proposed policy and legislative changes will allow the Secretary of Energy to accept funds from agencies assisted by the Department in completing privately financed energy savings projects. Funds received would only be used for supporting the ongoing burden of contract management and for developing additional privately financed energy efficiency projects from energy savings performance contracts and utility financed projects.

Question. In response to a question posed by the Committee last year, the Department indicated that "FEMP has considered charging agencies for both technical assistance and the development of energy savings performance contracts * * * and [is] continuing to examine what authorities and mechanisms could be used." Has the program pursued this option any further? If no, why not?

Answer. Yes. The Department has already been charging agencies for training under the reimbursable work for others program. All training reimbursement funds go to the laboratories where the training programs are run and are reinvested in improved training quality. However, current training charges do not nearly cover the cost of the courses.

FEMP also continues to assist agencies under the reimbursable Work for Others process and has expanded our efforts in this area. Examples of reimbursable work for others at national laboratories include:

- Cost sharing from GSA on improved computer modeling for helping plan lower energy use in new buildings;
- Reimbursement from several agencies (CIA, NASA, EPA) for help in assessing renewable opportunities nationwide to comply with Executive Order 12902, and selected related feasibility studies; and
- Reimbursement from the Army and Navy for integrated energy systems analysis at various bases.

Question. The Committee will likely be unable to fund the entire increase requested for FEMP as a whole. Should a smaller increase be spread across the various program elements within FEMP on a pro rata basis? Or, for instance, should all of a \$5 million increase for FEMP be devoted to Project Financing?

Answer. The FEMP budget request reflects an integrated program. Reduced funding would impact all program elements since they are complimentary. Each \$1 million cut in program funding is likely to result in lost savings on the order of \$40 million, over the life of an average project of fifteen years.

The most important of these is the financing program. This program is projected to put in place several streamlined energy savings performance contracts which will give agencies the ability to quickly use non-Federal funds to save energy and operations expenses. These contracts are also the foundation for FEMP to work to establish a significant reimbursable revenue stream to enhance the program from savings delivered to the agencies in future years. Reductions in funding will delay the start of the agency savings from the contracts and delay the start of FEMP's additional revenue source to expand the program and capture more savings for the agencies.

Continued funding at the \$19.8 million level would only allow a few or these contracts to be signed by the end of fiscal year 1998. FEMP would concentrate efforts on only establishing those contracts which could provide some coverage for energy efficiency for all areas of the country. Any of the technology specific contracts which help to install renewable or advanced technologies would be delayed until fiscal year 1999 or later. In addition, FEMP would only provide the most minimal support to train and assist the agencies on how they would use the contracts, concentrating instead on getting the remaining contracts signed. This would further delay the savings that the agencies would see.

Should the Committee not fund the full FEMP budget request, FEMP asks that it be allowed flexibility in applying its appropriation, within the bounds of its program, so as to maximize potential savings based on the opportunities present during fiscal year 1998.

IN-HOUSE ENERGY MANAGEMENT STAFF

Question. The justification indicates that staff from the terminated In-House Energy Management program have been transferred to FEMP. How many FTE's are attributed to former IHEM staff?

Answer. There are five FTEs who have been integrated into the FEMP programs of Project Financing; Technical Guidance and Assistance; and Planning, Reporting and Evaluation from the IHEM program that was eliminated by Congress.

Question. Are personnel costs associated with IHEM staff reflected in the Personnel Compensation line in the Program Direction activity?

Answer. All Federal Energy Management Program staff are included in the Personnel Compensation line in the Program Direction activity which includes IHEM.

Question. If so, why does the request for Personnel Compensation go down in fiscal year 1998?

Answer. The request for Personnel Compensation is reduced in the fiscal year 1998 budget because we are estimating a need for only 20 FTEs, a reduction of two from fiscal year 1997. When considering the costs of Personnel Compensation, it is important to also consider the impact of the costs of Civilian Personnel Benefits since Benefits must be paid for activities such as Federal Employee Retirement, participation in some types of Thrift Savings, and health insurance coverage. The savings from the two FTEs is partially offset by a 4.5 percent increase to cover a projected cost-of-living increase and for other personnel actions such as promotions and expected grade increases.

INDUSTRY SECTOR

Industries of the future

Question. A portion of the technologies and projects being supported in the Industries of the Future (specific program) are geared to waste reduction and environmental improvements. While these are laudable goals, should such projects continue to be a priority in a program whose primary purpose is energy efficiency? Is energy efficiency the primary goals of the program? Is it the Department's view that these projects all contribute to energy savings via waste reduction, etc.?

Answer. Waste reduction is inescapably linked to energy reduction, which explains why most of the projects you see are focused on reducing environmental and other wastes. In fact, resource efficiency is a highly intertwined subject, where wastes and energy are synonymous in their growth, or reduction.

For example, if wastes are reduced in an industrial plant, there is less raw material used, less energy used to convert the raw material to a finished product, less handling costs to move the waste material within the plant, less shipping costs (and energy) to haul the wastes away, less costs and energy to dispose of the waste (whether it be burial, incineration, or other means of disposal). By having less waste as a part of its production, the plant uses and requires less raw material, which means that there is less mining (if that is where the raw material is derived) and less transportation from the mine to the plant. These, too, have energy costs which are thereby reduced.

The "life cycle" costs of all wastes, when summed, are very high in terms of total energy potential. This is particularly true in "process" industries represented in the Industries of the Future, which typically operate around the clock, year-round. Even a one percent reduction in wastes can have a large impact on total resource efficiency. We believe, therefore, that projects which reduce wastes have a very large impact on energy efficiency in the industrial sector of the United States—from production of raw materials to creation of final products.

To ensure that the Department is funding research which contributes to the maximum resource/energy efficiency, each project submission is rigorously reviewed by experts at the proposal stage, and again at various milestones during the research phase. We have a comprehensive system to estimate the true savings in energy and waste reduction of every project, with review by the Arthur D. Little accounting firm. All of the projects have strong energy efficiency gains.

The Industries of the Future research projects are solid investments to increase energy efficiency, improve competitiveness, and maintain U.S. leadership in environmental stewardship through efficient use of nature's finite resources.

Question. Funding requested for the different industry groups varies by a considerable degree. Are these differences a function of how far the individual industries have come in developing technology road maps? Are they a function of potential energy savings in each of the industries?

Answer. Yes, the differences in requested funding reflects a delicate balance of the potential energy savings and size of each industry, historical funding levels for these industries, and the industry's commitment to the process of creating their Vision and Technology Roadmaps.

ADVANCED TURBINE SYSTEMS

Question. The funding request for the Industries of the Future (crosscutting) is essentially flat. How much lower is the request for industrial Advanced Turbine Systems than the original program plan? What will be the impact of funding the ATS program at the request level? How much will be required to maintain the program on its current schedule?

Answer. In the Report to Congress Comprehensive Program Plan for the Advanced Turbine Systems, the fiscal year 1998 budget was \$31.0 million. The request is \$6.35 million below the program plan. For the total program:

[Dollars in millions]

	Funding level—		Year of completion
	Plan to date	Plan to completion	
Plan estimate	\$93.3	\$75.8	2000
Actual	75.7	105.0	2002

The program will be extended to 2002 and the near-term opportunity for reduced emissions and commercialization in the distributed generation and deregulation market will not be realized until after 2002. Market share would be lost by the industrial manufacturers and potentially result in a loss of jobs.

[In millions of dollars]

DOE fiscal year 1998 funding	\$43.0
Contractor cost-share (60 percent)	63.7
DOE fiscal year 1999 funding	37.0
Contractor cost-share (69 percent)	93.0
DOE fiscal year 2000 funding	28.5
Contractor cost-share (86 percent)	181.5

Question. Is it the Department's view that the stretching out of the program is justified by a delay in the development of market opportunities for this technology?

Answer. A delay in the program will result in missed market opportunities and U.S. market share. Each year, an estimated 2 gigawatts of new and replacement power production will be required as a result of the deregulation of the utilities in the form of distributed generation. With deregulation, opportunities for the industrial advanced gas turbine exist in the near term (1999/2000) and utilities are accelerating their interest in distributed generation or on-site generation with industrial scale gas turbines. Approximately 20 states are currently addressing deregulation and California made the first move proposing all out state-wide retail wheeling beginning with the largest industrial electric consumers in 1996 and ending with residential customers in 2002. Electric service utilities are under increasing pressures to reduce the cost of service and face limitations on the existing transmission and distribution system. ATS is recognized as an important option for adding supplemental generation capacity on-site while alleviating the existing transmission and distribution limitations.

Question. Does the Department feel the market for the utility scale turbine will develop prior to the market for the industrial scale turbine, or the reverse?

Answer. The Department feels that both markets are significant. In the industrial program, the advent of utility deregulation is doubling the projected sales of these turbines over the non-deregulated case by 2005. These industrial turbines will be cost competitive to central generation. The timing for the market for the industrial scale turbine will be in demand for distributed generation (local small scale generation) and cogeneration applications since this will be the best product on the market. Under the current funding profile, the ATS program will have products ready by 2002 and will be poised to impact this market. Twelve other states have legislation pending. Essentially, the markets for utility and industrial gas turbines are following a close timeline. In the Report to Congress Comprehensive Program Plan for the Advanced Turbine Systems, the engine manufacturers (both utility and industrial) outline the best time frame for introduction of both an utility and industrial gas turbine. Under the original funding profile, these industrial products would be ready in 2000.

INDUSTRIAL ASSESSMENT CENTERS

Question. The justification indicates that the Department is supporting Industrial Assessment Centers. What sort of follow-up is performed by these centers to determine how many audits lead to installation of energy saving technologies?

Answer. All centers are required to contact a client firm 6 to 9 months following their assessment to confirm those recommendations that will be implemented. Implementation action during the 2 year period following the industrial assessment may be counted, recognizing that some recommendations may require capital budget planning.

NICE³ GRANTS

Question. Are NICE³ grants frequently used to demonstrate technologies developed in the Industries of the Future program?

Answer. The NICE³ grants are frequently used to demonstrate technologies that are directly related to the Industries of the Future (IOF.) Since the Industries of the Future focus on pre-competitive research, it is not always possible to directly link IOF funded research to NICE³ grants. However, it is possible to link the research areas of the IOF's to the NICE³ grants. While the NICE³ proposals are not limited to the Industries of the Future, the vast majority of the projects are directly related to the Industries of the Future research areas. Using only grants to the State of California by way of example, six of the seven demonstration projects are related to previous research areas funded by the Office of Industrial Technologies.

Question. Is any follow-up of NICE³ grants performed to determine how many demonstrations lead to large-scale implementation of particular energy savings technologies?

Answer. Yes, follow-up is performed on all NICE³ grants to determine how many demonstrations lead to implementation of particular energy savings technologies. When sales have occurred, methodologies to measure energy savings are jointly developed by the grantee and NICE³ and energy savings are calculated for all installations.

Question. Please provide for the record an example of a NICE³ grant made during fiscal year 1997.

Answer. The grants for fiscal year 1997 have not yet been made. Awards will be announced in April 1997. An example of a NICE³ grant made during fiscal year 1996, the most recent year at the present time for grant awards, is the Oxy-Fuel Burners for Steel Reheating project. The awardees in this example are the Indiana Department of Commerce, Energy Division, and Bethlehem Steel Corporation. The goal of the project is to successfully demonstrate the use of oxy-fuel burners in a slab reheat furnace, to reduce energy consumption by 45 percent and NO_x emissions by 90 percent for the converted furnace zones.

Question. What are the differences between the NICE³ and Climate Wise programs?

Answer. The NICE³ and Climate Wise programs are complementary in that they both deal with industries which are either developing or trying to locate innovative technologies to solve industrial energy efficiency, environmental and cost problems. NICE³ emphasizes demonstrations of specific innovative technologies while Climate Wise establishes partnerships with industry to plan and carry out comprehensive

energy efficiency and environmental technology solutions which emphasize the adoption of technologies to minimize CO₂ emissions. The plans developed with Climate Wise partners often involve the implementation of NICE³ technologies.

POLICY AND MANAGEMENT

Question. At headquarters, Golden and the regional offices, there is a continuing decrease in funds for Salaries and Related Expenses and an increase in funds for Contractual Services. What is the reason for this shift?

Answer. The increase of \$1,570,000 in contractual services at headquarters is primarily the result of a realignment of the Working Capital Fund (WCF). In fiscal year 1997, the first year of the WCF, the amount for the Office of Energy Efficiency and Renewable Energy was distributed on a 50-50 ratio for Interior and Related Agencies (Interior) and Energy and Water Development programs. In fiscal year 1998, the split for the WCF reflects a more equitable distribution of the funding request since the costs for the WCF are primarily driven by the number of staff supported and approximately 77 percent of EE's FTE's are in Interior. A total of \$1,019,000 of the \$1,570,000 increase is attributed to this more equitable distribution of the WCF.

The balance of the increase at headquarters is \$551,000 to help support cross-cutting activities such as the continued development of quality metrics and performance measurement activities.

The \$102,000 increase in contractual services for the Regional Support Offices (from \$3,928,000 in fiscal year 1997 to \$4,030,000 in fiscal year 1998) is less than 3 percent and is the result of projected inflationary increases for rental costs, communications, and utilities.

The \$1,090,000 increase in contractual services for the Golden Field Office reflects two principal activities. The first is support service landlord activities such as the costs for several contract employees to assist with procurement and personnel functions. Additionally, the increase supports project monitoring and technical and administrative support of program specific functions such as National Industrial Competitiveness through Energy, Environment, and Economics (NICE³).

FOSSIL ENERGY RESEARCH AND DEVELOPMENT

General

Your testimony (page 8) states that the 5 percent decrease in the request for Fossil Energy Research and Development is justified because many of the gas and coal-fueled power systems supported by the Department are entering their final phase of development.

Question. Isn't the final stage of development generally the most expensive part of the R&D "pipeline" that the Department often describes?

Answer. Yes, the final stage of development is generally more costly as a technology scales up for eventual market readiness. However, it is also true that as development of the technology matures, an increasing percentage of the cost participation is sought from industry. In addition, generally there are either fewer participants selected to enter the final stage, or as, in some cases, a program schedule stretch out can be accommodated by a widening of the time window of opportunity for market entry due to changes in market conditions.

Question. In light of the funding situation in programs such as LEBS, the Advanced Turbine System, molten carbonate fuel cells, and solid oxide fuel cells, does the Department still feel that the statement in its testimony is accurate?

Answer. The Department believes that statement in the testimony as reflected in the budget request is reasonable considering several factors such as the current budget constraints, the need to balance our energy portfolio, and the planned structure of these programs.

Question. Will the Department request decreases or termination of these programs in fiscal year 1999 as they get further into the final stages of development?

Answer. The Department at present does not anticipate requesting termination of these programs as long as they continue to show good progress, as they have thus far, in achieving their objectives.

Question. The Environmental Protection Agency has provoked considerable controversy with the release of its draft rules on particulate matter. It seems to me that many of the technologies being supported by the Fossil R&D budget will be essential if this country is ever to achieve the considerable reductions in particulate matter contemplated by the proposed rules. In light of the fact that the fiscal year 1998 budget request reduces and stretches out a number of key Fossil R&D pro-

grams, do you feel the Administration is taking a balanced approach to improving air quality?

Answer. The levels of funding proposed for fiscal year 1998 reflect a balancing of the funding of R&D and the need to reduce Federal expenditures. Even at the reduced funding level, the program will produce important results. The funding levels proposed are deemed to achieve an appropriate balance.

Question. Will reductions in the Fossil R&D budget make it less likely that cleaner generation technologies will be available to achieve the proposed regulatory targets?

Answer. The need to achieve reductions in Federal expenditures and the large number of competing R&D needs require difficult decisions. However, even at the reduced levels of funding proposed, the remaining program can make technologies available in a timely manner.

Question. Is it the Administration's policy to achieve air quality goals by reducing support for R&D and emphasizing the use of regulatory techniques?

Answer. No. The proposed reductions in R&D reflect a balancing of priorities among many competing R&D needs, while still achieving necessary reductions in the levels of Federal spending.

ADVANCED CLEAN FUELS

Question. Funds are requested to continue advanced liquefaction both in-house and with various contractors such as CAER. What progress is being made in this area?

Answer. Baseline economic studies conducted in the early 1990's estimated that liquefaction technologies were competitive with crude at about \$34 per barrel in greenfield plants. Continued advanced clear fuels research and development, such as that to develop improved slurry catalysts, and improvements in solvents have the potential to reduce cost to the mid-twenties per barrel or less for greenfield plants. In addition, coprocessing of coal, resid and wastes to produce a low sulfur distillate syncrude for refinery upgrading in facilities adjacent or integrated with existing refineries offers the potential to reduce these costs to less than \$20 per barrel and even lower if combined with technology improvements currently under development.

Question. Are significant further advancements in liquefaction technology likely to be achieved without construction of demonstration units?

Answer. Yes, continued progress is being made in advanced liquefaction technologies. Continued laboratory and bench scale research and development, such as that to develop improved slurry catalysts, and improvements in solvents have the potential to reduce cost to the mid-twenties per barrel or less for greenfield plants. In addition, coprocessing of coal, resid and wastes to produce a low sulfur distillate syncrude for refinery upgrading in facilities adjacent or integrated with existing refineries offers the potential for earlier introduction by reducing the cost of syncrude distillate to less than \$20 per barrel or lower when combined with technology improvements under development. While demonstration of these technologies will be required prior to commercial deployment, additional laboratory and bench scale progress will further reduce cost, increase efficiency, and improve environmental performance, shortening the time to deployment.

Question. Has the Department considered "shelving" further advanced liquefaction research until oil prices rise to a level likely to resurrect interest in the technology?

Answer. No. The Energy Information Administration in its Annual Energy Outlook projects that crude oil could be \$21 per barrel in their reference case or as high as \$28 per barrel in 2015 in 1995 constant dollars. The EIA points out that U.S. will be importing over 60 percent of its oil supply in 2015. Continued laboratory and bench scale research and development have the potential to reduce cost to the mid-twenties per barrel or less for greenfield plants. In addition, coprocessing of coal, resid and wastes to produce a low sulfur distillate syncrude for refinery upgrading in facilities adjacent or integrated with existing refineries offers the potential for earlier introduction by reducing the cost of syncrude distillate to less than \$20 per barrel or lower when combined with technology improvements under development. With continued development these technologies would be available for use in this timeframe. If the activity were to be "shelved", it could take ten years or longer to rebuild the technical infrastructure and knowledge base after the need was identified.

Question. Is significant further cost reduction through bench scale research likely?

Answer. Yes, continued bench scale development may reduce cost to the mid-twenties per barrel or less for greenfield plants. In addition, coprocessing of coal, resid and wastes to produce a low sulfur distillate syncrude for refinery upgrading in facilities adjacent or integrated with existing refineries offers the potential for

earlier introduction by reducing the cost of syncrude distillate to less than \$20 per barrel or lower when combined with technology improvements under bench scale development.

Question. \$100,000 is being requested in both Direct and Indirect Liquefaction to initiate a pioneer plant feasibility study. When will this study be completed?

Answer. It is envisioned that this study would take about 18 months to define the conceptual project, site issues and potential database needs.

Question. Is the study necessary for the Department to evaluate whether to proceed with development of a pioneer plant?

Answer. The primary purpose of this study is to provide a body of process information and engineering data which will be used by a strong industrial team preferably including end users (refiners, electric utilities), technology developers, A&E's, coal companies and interested stakeholders as well as DOE to establish the advisability and context for entering into a partnership to design, construct and operate several pioneer plants which will produce liquid fuels and chemicals.

Question. Given current budget constraints, is it likely that the Department would budget for development of a pilot plant in the foreseeable future?

Answer. It is unlikely that the Federal government would cost-share this type of first-of-kind "pioneer plant" demonstration under current budget constraints. The Office of Fossil Energy is studying innovative revenue neutral or revenue positive funding options which would spur the possibility of implementing pioneer plant demonstration in the next decade. A feasibility study would be performed to provide a body of information to the Department and interested potential industrial and stakeholders, so that informed decisions could be made on the advisability for proceeding with pioneer plant activity.

Question. In looking at the funds provided in fiscal year 1997 for activities in Advanced Research and Environmental Technology (p. 44), it appears that all funds for STTR and SBIR were derived from the money earmarked for the Consortium for Fossil Fuel Liquefaction Science. Why were all SBIR and STTR funds derived from this one activity, as opposed to being pro rated across all activities within AR&ET?

Answer. SBIR and STTR funds are assessed against extramural activities (contacts outside of in-house work). The consortium for fossil fuel liquefaction is the only activity that is not an in-house activity and is therefore subject to the assessment. Also, it is the activity with the largest amount of funding, and the funds assessed for SBIR and STTR would have the smallest impact.

ADVANCE CLEAN/EFFICIENT POWER SYSTEMS

Question. The "Mission Supporting Goals and Objectives" in the justification describe the target efficiencies and emissions levels for the four major technologies being developed with DOE support. Target levels for IGCC seem comparable to those given for the HIPPS and High Efficiency PFB programs. Why does the Department continue to fund all three technologies, particularly when the more near term LEBS program is entering a critical phase with insufficient resources to proceed?

Answer. LEBS is nearer term, but it does not have the performance potential to reach our ultimate program goal of 60 percent generation efficiency by 2010. The latter efficiency goal coupled with the simultaneous achievement of our environmental and economic goals is extremely difficult to attain. Today, IGCC coupled with advanced turbines and fuel cells is the front runner, but technology development has not progressed to the point where we can judge, with any accuracy, what the final winning system will be. A LEBS system could also serve as the bottoming cycle for one of these advanced systems, but it is too early to judge.

All of the advanced power technologies are targeted towards achieving the highest efficiency and least emissions at the lowest possible cost. As such, the performance goals for these technologies are very similar. The Department believes that the IGCC, HIPPS, LEBS, and PFB technologies show much promise and based on the progress to date, merit continued funding. Therefore, the best approach is to continue to develop these most promising technologies to afford them the opportunity to achieve their full potential for commercialization. Additionally, each of these technologies has a different level of developmental maturity, technical risk, and time frame for market readiness. Their market applications also vary somewhat. IGCC systems, for example, are ideally suited for the coproduction of electricity and petrochemicals from coal (i.e., a coal refinery application).

The Department believes that it is in the best interest of the nation, utility industry, and customers to have an array of technologies from which the power genera-

tors may choose in order to meet their specific needs. Therefore, the continuation of all these technologies is in keeping with our balanced energy portfolio strategy.

Question. Since several IGCC plants are already operating under the auspices of the Clean Coal program, and since the Department's request for the China Clean Coal program indicates that IGCC technology is being well received in potential markets, does it make sense to continue to support development of the other technologies?

Answer. Yes, continuing support is critical to meeting established program goals. The Clean Coal Technology Demonstration Program (CCT) is demonstrating the first generation versions of IGCC systems with efficiencies in the 42–45 percent range and is establishing an industrial base upon which further R&D advances can be achieved. The IGCC R&D effort under way is critical to extending the performance of these systems into the 60 percent range while reducing emissions to less than 1/10 NSPS and simultaneously reducing the cost of electricity by at least 10 percent, which would clearly establish our global leadership in this area and would provide the technological capability to meet a key public need—a clean environment.

In addition, IGCC technology is being demonstrated within the Clean Coal Technology program at or near commercial scale, various technical and economic issues must be resolved before commercial acceptance is achieved. For example, the technical and economic issues associated with hot gas cleanup for particulates and sulfur capture must be resolved if the higher efficiencies are to be achieved through the integration with the advanced turbines. Effective, reliable and long life particulate control devices must be attained as well as effective, low cost, and regenerable sorbents for sulfur control. IGCC costs must continue to be reduced through design optimization and reduced construction costs in order to be competitive in a deregulated utility market with low natural gas prices.

IGCC technology has captured much domestic and international attention. However, commercial acceptance of IGCC on coal for utility application still depends on acceptable cost and performance targets being achieved.

Question. What advantages does HIPPS technology have over IGCC technology?

Answer. IGCC technology is gasification based. PFB technology is fluidized bed combustion based. HIPPS represents a major extension of more conventional combustion technology employing ceramic heat exchangers and/or advanced furnace designs. It represents an alternative design approach for generating power cleanly and at high efficiency.

Question. Would it appeal to a different sector of the market?

Answer. Both IGCC and HIPPS technologies are aimed primarily at utility scale power applications. However, IGCC has the ability to utilize a broad range of coals and fuels and the capability to operate in a co-processing configuration to produce coal-based liquid fuels and other chemical feedstocks and products in addition to generating power. It appears that IGCC technology may be commercially available much earlier than HIPPS.

Question. The Department has argued that stretching out certain advanced power generation programs (such as turbines) is acceptable because market uncertainty resulting from utility deregulation has pushed back the “market window”. Could this mean that the need for medium-term technologies being developed with DOE support could be lessened, and that emphasis should instead be placed on longer term, higher-performance technologies?

Answer. The coal and gas power systems technology being developed today is driven by the long term goals of 60 percent efficiency with coal (70 percent with gas) and with emissions more than 90 percent below today's modern regulated plant, while reducing the cost of electricity. This technology achievement would also cut CO₂ emissions from coal power plants by almost half at no cost to the ratepayer. The achievement of this long term goal requires the development of technology for turbines, fuel cells, IGCC, and other program elements from where it is today to its mid-term goal state and eventually to its long term goal—i.e., the mid-term goal is really an intermediate milestone on the path to meeting our long term objectives.

Question. Have recent changes in the anticipated development of power generation markets changed DOE's funding priorities in the Advanced Clean/Efficient Power Systems program?

Answer. While U.S. power generators are cutting costs and delaying power generation capacity additions, EIA is forecasting 39GW of coal based capacity additions/replacements (that is about a \$39 billion investment or 390 100-MW plants) and over 100 GW (that is about 1,000 100-MW plants) of gas based additions by 2015. This is still a substantial market which will grow even more after 2015. The global market remains huge. As a result, we have made some changes in the program (such as increased emphasis on initial capital cost reduction through technology advances), but our major program goals remain as before. The Fossil Energy RD&D

program maintains a balanced support for a number of technologies in its portfolio. This balanced approach reduces the overall risk in achieving the Fossil Energy mission. The mix of technologies, their respective development schedules, their respective performance potentials and other factors are considered in the formulation of our budget request profile.

LOW EMISSION BOILER SYSTEMS

Question. Information supplied by the Department indicates that the funding request for LEBS for fiscal year 1998 would only be sufficient to fund one of the three competing technologies. How does the Department propose to make a rational, competitive selection of the best LEBS proposal in the face of these funding constraints?

Answer. The process for selecting a developer to continue Phase IV of the LEBS program will be to form a Federal team of experts who will review and evaluate the Phase II and Phase III results as submitted by each of the three contractors. Selection will be based on an evaluation of the submissions and arrived at by a ranking grounded on a set of technical and other criteria.

Question. Has the Department attempted to restructure Phase IV of the program in a way that might allow performance, as opposed to available funding, be the determining factor in the downselection?

Answer. While we have considered some alternatives, the down-selection to a single contractor for Phase IV is in keeping with the original program concept. Fossil Energy intends to evaluate the three submissions for Phase IV based on a comprehensive set of criteria as stated above.

PARTICULATE CONTROL/AIR TOXICS

Question. In Advanced Research and Environmental Technology, an increase is requested for Fine Particulate Control/Air Toxics while a decrease is requested for Super Clean Systems. Will the Department terminate support for the B&W Air Toxics Facility in fiscal year 1997 as indicated in the budget justification?

Answer. Funding support of the B&W Air Toxics Facility as originally planned was completed in fiscal year 1996. Funding support for this facility was not included in the fiscal year 1997 Appropriation, and no funds are being requested for fiscal year 1998.

Question. Will the increase in Particulate Control/Air Toxics simply allow for more contracts to be pursued from the fiscal year 1995 Mega PRDA, or will it accommodate more costly work being done on the same contracts?

Answer. In fiscal year 1998 the MEGA PRDA contracts reach the end of phase 1 at which time the plans are to select a reduced number of projects to enter phase 2. Since the phase 2 research will be at a somewhat larger scale, the amounts required for each project selected will be greater than it was in phase 1.

Therefore, the requested funding will support a reduced number of projects in phase 2, but those supported will likely be funded at higher levels than they were in phase 1.

Question. What would be the impact of maintaining Particulate Control/Air Toxics at the fiscal year 1997 level?

Answer. Funding below the requested level would require reductions in technology base research on new methods of measuring and characterizing mercury emissions, thereby increasing the risk that current inaccurate approaches would be employed by the EPA in setting standards. That could lead to significant over-control with very high cost implications, since current methods are believed to overestimate the emissions which could be subject to control.

There would also be a reduction in the number of MEGA PRDA projects that could be funded, and possibly would require stretchout or reduced funding of those that were funded. This would increase the risk that no cost-effective technology for reduction of mercury emissions would be forthcoming. As of now, there is no cost-effective technology for achieving control of mercury.

Question. How does work being done in both Particulate Control/Air Toxics and Super Clean Systems relate to the EPA's proposed rule on particulates and ozone?

Answer. All of this work addresses improving the cost-effectiveness of control technologies for all the above emissions. In Super Clean Systems, advanced technologies are being developed to further reduce SO₂ and NO_x emissions, which are precursors to ambient fine particulate levels. Reduced NO_x emissions will be required to meet proposed ozone regulations. Hence, all of this work is applicable to addressing the need for improved approaches to meeting potential future regulatory requirements for reductions of those precursor species.

Question. Why is funding for contracts under Super Clean Systems being decreased while those under Air Toxics are being increased?

Answer. Given the need for reduced levels of Federal expenditures and the many competing R&D needs, not all of the activities can be fully funded.

Since there are no acceptable methods for measuring, characterizing, or controlling mercury emissions, which are a primary focus of attention under the air toxics provisions of the Clean Air Act, that activity was assigned a higher level of funding.

ADVANCED RESEARCH AND TECHNOLOGY DEVELOPMENT

Coal technology export

Question. \$1,047,000 is requested for Coal Technology Export. Exactly how will these funds be used?

Answer. A goal of the Department of Energy's Strategic Plan is to enhance energy productivity to strengthen the United States economy and improve living standards by promoting programs that will establish the United States as a world leader in developing and deploying energy technologies and services throughout the world. Fossil Energy will achieve this goal by funding coal technology export programs that will:

- Protect and expand international demand for U.S. coal and U.S. coal technology;
- Provide technical assistance to foreign governments;
- Level the playing field for U.S. industry by helping to eliminate economic/political/social barriers to international trade; and
- Facilitate trade promotion and trade finance.

Question. Travel costs for DOE personnel on trade missions?

Answer. Travel costs are usually covered within Fossil Energy's Program Direction line item. No Fossil Energy Coal Technology Export funds are planned to be used to pay for any travel costs.

Question. Technical support?

Answer. Fossil Energy does have a series of Memoranda of Understanding and other international agreements where technical information is shared between countries. However, none of Fossil Energy's international programs provide for "direct technical support" to a foreign government or industry.

Question. How do funds expended in this activity relate to functions performed and services provided by the Department of Commerce, the State Department and other agencies?

Answer. Fossil Energy's efforts are complementary to and are not duplicative of efforts done by other agencies. The work of Fossil Energy is focused upon expanding the use of Clean Coal and Advanced Power Technologies into world-wide markets. Fossil Energy is a member of a number of inter-agency committees (e.g., Trade Promotion Coordination Committee—Dept. of Commerce) to ensure that Federal agencies are not duplicating efforts and that the most effective use of the Federal dollar is realized.

BIOPROCESSING OF COAL

Question. Funds are requested in fiscal year 1998 to continue work on the bioprocessing of coal. Does work in this area have any significant relationship to gasoline and diesel desulfurization work being performed with support from the Office of Industrial Technologies' Petroleum program?

Answer. At this time, there is no significant relationship between work being done on the bioprocessing of coal and research on gasoline and diesel desulfurization work supported by the Office of Industrial Technologies Petroleum (OITP) program. OITP issued a solicitation in January 1997 seeking proposals for the biodesulfurization of gasoline (total funding is \$800,000). However, there is an ongoing coordination effort between FE and OITP regarding the development of coal derived diesel fuels employing FE liquefaction processes for OITP diesel engine applications.

The Office of Fossil Energy's bioprocessing program is focused on producing inexpensive liquid fuels from coal that can be used in power systems, and ethanol that can be used as an additive to gasoline for motor vehicles.

UNIVERSITY COAL RESEARCH

Question. An increase of approximately \$1 million is requested for University Coal Research, with a smaller increase requested for HBCUs. Will this entire increase be used to fund the Innovative Concepts program described in the budget request?

Answer. No. Only about \$500,000—\$750,000 will be directed to seeking innovative concepts having the potential of making revolutionary advances in coal utilization technologies. The rest will be used to address key focus areas of high priority in the Fossil Energy program, such as NO_x control, mercury abatement, and CO₂.

Question. Could the program be initiated with a lesser amount of funding and grants?

Answer. The effectiveness of the program would be severely reduced with further budget reductions. The program had been supported at about \$5 million through fiscal year 1995. It was reduced to about \$4 million in fiscal year 1996, and further reduced by Congress to about \$3 million in fiscal year 1997. So the fiscal year 1998 request is merely a partial restoration of the funding needed to adequately address the broad spectrum of research and the novel and innovative concepts that may spawn this nation's next generation of advanced, cleaner and more efficient coal conversion and utilization technologies.

Question. Can the Department provide some examples of research that has been funded in this activity during the last few years that has contributed directly to the development of coal power system technologies being developed with DOE support?

Answer. Since the inception of the University Coal Research (UCR) Program in 1979, research grants awarded to U.S. Colleges and Universities have contributed directly to the development of more efficient and environmentally acceptable coal power system technologies. Many of these researchers have received patents and various citations. The following are just a few examples:

Researchers at the Virginia Polytechnic Institute developed a coal cleaning process that produces a "super-clean" coal using microbubble flotation. It provided a way to significantly reduce the ash and pyritic sulfur in U.S. coals thereby enabling the use of coals that were previously discarded as waste because they could not be cleaned with conventional technology. Initial development of the process, which is now known as the Microcel Process, was supported by the UCR program over a period of four years. It is now in commercial use throughout the world.

University of Pittsburgh researchers received a patent for their work originating from a UCR Grant in coal liquefaction catalysis. Through their research efforts, a method for synthesizing methanol at temperatures far below those used in commercial synthesis was developed.

Dr. Sarofim, the recipient of several UCR awards, has contributed significantly to the understanding of the mechanism of coal combustion, leading to research in reducing the environmental impacts of coal. He was recognized for his work in combustion engineering and nitrogen oxide chemistry by receiving the 1995 Homer H. Lowry award from the Secretary of Energy. This is the highest such award in the area of fossil energy by DOE.

Dr. Donald P. Olah, University of Southern California, won a University Coal Research grant to study superacid catalysts for coal conversion. He subsequently received the Nobel Prize for his work in the creation of these superacids. Dr. Olah's work significantly contributed to technologies for producing lead free gasoline and numerous industrial processes.

INTERNSHIP PROGRAM

Question. Why is the Department requesting new funds for an internship program that will focus on undergraduates at colleges without graduate programs in science and engineering?

Answer. The Internship subprogram element, which is part of the UCR program, provides opportunities for undergraduate science and engineering students nationwide to experience a graduate level research environment. Students who apply to and are accepted in the program are placed at host laboratories across the country for 10-week summer internships. Hosts for the students are grant recipients under the UCR program. The host provides a research project, space, and materials for the intern and the intern's costs (room, board, stipend, and travel) are covered by the Internship Program. This provides an opportunity for promising undergraduate students to make decisions about entering into graduate programs that deal with energy-related research, and ultimately work in energy-related fields that promote technology development.

Question. How does this help meet the goals of the Fossil Energy Research and Development program?

Answer. The internship program provides opportunities for undergraduates to be exposed to high levels of scientific research which may influence their pursuit of graduate education in their areas of interest, as applied to Fossil Energy. This program promotes the development of U.S. based technical expertise in fossil energy and energy-related technologies. The Administration's technology plan of February 23, 1993, recognizes this by setting a key goal for the Nation, to be a world leader in science, mathematics, and engineering. Furthermore, the Performance Agreement between the President of the United States and the Secretary of Energy supports

the Administration's Goals 2000 objective of recapturing U.S. preeminence in science and math education.

Question. Is \$5,000 per internship a reasonable price for this activity?

Answer. The intern's costs for room, board, travel, and stipend for 10 weeks are marginally covered by the \$5,000 per student. If these funds are not provided, many of our potential hosts will not be able to accept interns based upon local costs of living and travel costs. Targeted students will not be able to make up the difference in most cases.

MINORITY INSTITUTIONS ELIGIBLE FOR FUNDS

Question. What are the "other minority institutions" eligible for funds appropriated for the HBCU activity?

Answer. Beginning in fiscal year 1997 the Office of the Assistant Secretary for Fossil Energy expanded the program to include Other Minority Institutions. This was requested by Congress in order to be in compliance with the Department of Energy Hispanic Outreach Initiative Strategic Plan. Eligible OMI organizations must be on the official Department of Education—Office of Civil Rights—listing of Minority Institutions. There are certain ethnic population requirements of school enrollment to be classified as a Minority Institution. Institutions that have more than 25 percent Hispanic, Asian, or Native American are eligible.

Question. When did such institutions become eligible for these funds?

Answer. They became eligible in fiscal year 1996, but because of confusion over the official definition of what constitutes a minority institution, a decision was reached by Fossil Energy management to postpone OMI inclusion until fiscal year 1997.

Question. How many such institutions are there?

Answer. According to our information there are 360 "other" minority institutions that fit the definition of minority institutions as described in 10 U.S.C. 2323(a)(1)(c) and 20 U.S.C. 1135-d-5(3). This definition is used by the Department of Education from which we derived our list.

Question. Given the expansion in eligibility for these funds, is there an appreciable difference in the way in which HBCU and University Coal Research funds are utilized?

Answer. Yes, there are several differences in the way the funds are utilized which overshadow the similarities of the UCR and HBCU/OMI Programs. Those differences include:

- 1. The HBCU/OMI Program includes oil and natural gas, while the UCR program does not.
- 2. The HBCU program covers a broad spectrum of energy-related areas, while the UCR program addresses "key research focus areas" that deal with specific coal technology needs, and an "innovative concepts" area that takes advantage of research outside of the traditional fossil energy area.
- 3. The UCR Program is open to all Universities/Colleges, while the HBCU/OMI Program is restricted to just those that are actual HBCU or minority institutions.
- 4. A research and technology transfer symposium is held annually in the HBCU/OMI Program that includes more than just technical papers. It is a forum for various DOE sites and offices (national labs, EE, ER, etc.) to showcase opportunities for the HBCU/OMI. It also focuses on the students of the institutions and includes oral presentations and poster presentations by the students.

NATURAL GAS

Question. The Department is again requesting funds to initiate development of a "revolutionary/smart drilling system." Has the Program Research and Development Announcement been issued for this program?

Answer. A solicitation for cooperative agreement proposals for "Advanced Drilling Systems" was issued on December 2, 1996. Proposals were received on February 3, 1997.

Question. If so, what was the response and how many contracts have been entered into?

Answer. The proposals are under technical and cost evaluation at this time. Information relative to the number of proposals can't be released at this time due to procurement regulations. The solicitation provided for multiple awards, however the actual number of awards can't be identified at this time due to procurement regulations.

Question. Does the Department anticipate the same funding profile described to the Committee pursuant to last year's hearing?

Answer. The revised funding profile anticipated for the project is as follows: fiscal year 1996—\$200,000, fiscal year 1997—\$781,000, fiscal year 1998—\$750,000, and \$1,769,000 of outyear funding.

COAL MINE METHANE PROGRAM

Question. The Department has again request funds for a coal mine methane program. How would these funds be administered?

Answer. These funds would be administered through the Federal Energy Technology Center (FETC), which has responsibility for implementation of the coal mine methane program. The funds would be awarded to five contractors selected for Phase II engineering design preparation.

Question. As competitive grants?

Answer. Ten Phase I awards were made in fiscal year 1995 for feasibility studies in response to a competitive solicitation that sought proposals for cost-shared demonstrations of alternative ways by which recoverable methane released in the course of underground coal mining could be economically utilized. Based on FETC assessment of these studies, five of the proposers were selected for Phase II engineering design preparation.

Question. How many demonstrations would the requested amount likely fund?

Answer. The requested amount would fund the Phase II Engineering Design for the five contractors selected.

Question. Would the demonstrations be multi-year?

Answer. The demonstrations would be multi-year. Subject to the Phase II results, three demonstrations might possibly be sufficient to define the most cost-effective and greatest benefit options for commercialization.

Question. How much time and Federal investment would likely be necessary to demonstrate methane recovery to the point where mining operations would regularly employ such technology?

Answer. The time and investment for the methane recovery and utilization technologies selected for mine demonstration will likely vary for each of the alternatives selected. For any given technology to be regularly used in mining operations, we would expect a period of about 5 years to be required. Individual mine demonstrations should be completed in three years. Adopting successful technology for use in a significant share of mining operations would require another 2 years. Total additional funds required, including the fiscal year 1998 request of \$963,000, are estimated to be \$4 million. For any given mine demonstration project, the industry cost-sharing contribution will be greater than the Federal funds required.

ADVANCED TURBINES PROGRAM

Question. The Department is requesting \$31.4 million for the advanced turbines program. If funded at the request level, how long would completion of the turbines program be delayed?

Answer. A delay of up to 2 years would result.

Question. When would Phase III be completed and a downselection be made for Phase IV?

Answer. The Department anticipates that it will complete Phase III in early fiscal year 1998, assuming no unforeseen technical issues or other program uncertainties arising that might impact cost and schedule.

Question. What is the estimated Federal cost of Phase IV?

Answer. Based on the current schedule, the estimated federal cost of Phase IV of the program is approximately \$155 million.

Question. How would the stretch-out associated with the budget request impact market entry of advanced turbine technologies?

Answer. The primary impact of the stretch out on market entry would be a 2-year delay, possible cost increases due to the increased development costs. It is reported that the turbine manufacturers believe that it is in the best interest of program cost and U.S. competitiveness to maintain the currently planned levels of funding given in the Report to Congress, inclusive of additions to the Administration's fiscal year 1998 budget request that have been identified in recent public testimony. They believe this will achieve the lowest total program cost and provide a commercially available, U.S. manufactured system to the marketplace earliest, allowing U.S. companies to challenge other international competitors for major orders which will produce U.S. jobs.

Question. Is it the Department's view that the "market window" for this technology has been pushed back, enabling the development program to be stretched out?

Answer. The demand for new generation and uncertainties in the market due to the electricity industry restructuring have had some effects that could likely widen the domestic “market window” for some of the technologies planned for market entry during the post-2000 timeframe. In addition, the advanced turbine development program stretch out, as is the case for most of the program in our power systems technology portfolio, is necessitated in order to meet budget constraints and to maintain a balanced funding for all these promising technologies.

Question. Is the Department considering modifications to the program that would prolong Phase III and increase contractor participation/risk in Phase IV?

Answer. The baseline program as reflected in the fiscal year 1998 budget request assumes a down selection to one developer for Phase IV. The Department is also evaluating the feasibility of modifications to the program that would continue government participation with both contractors. This could allow the DOE to invest government funds in only critical areas to reduce industrial risks and achieve the goals of the program. Under this scenario, the Phase IV long-term demonstration would be completed by the contractors without government participation.

Question. How would this impact costs in fiscal year 1998?

Answer. The cost impact in fiscal year 1998 would remain unchanged.

Question. How much funding would be required in fiscal year 1998 to keep the program on schedule?

Answer. As indicated in our 1994 Report to Congress, \$58.6 million would be required in fiscal year 1998 to keep the program on schedule.

Question. Is market entry for utility-scale advanced turbines likely to occur at the same time as the industrial-scale turbines being developed with Energy Conservation support?

Answer. Yes; market entry for both utility scale and industrial-scale advanced turbines is anticipated to occur within the same timeframe.

Question. Can one program accommodate stretch-out better than the other?

Answer. Both programs are of high priority to the Department and target different markets. The fiscal year 1998 budget takes into account our balance of these programs, along with others in our energy portfolio, given the current budget constraints.

GAS UTILIZATION

Question. In Gas Utilization, the Department is investigating technologies that would allow economic delivery of Alaska North Slope gas via the Trans-Alaska Pipeline. What is the estimated window of opportunity for development and implementation of this technology?

Answer. A recently completed, detailed study for the Department (Economics of North Slope Gas Options, August 1996), placed the period of 2009–2016 as the time within which production from existing ANS reservoirs would dwindle to the point that continued operating viability of the Trans-Alaska Pipeline (TAP) would be jeopardized because of low oil throughput. This would mean that supplemental GTL liquids, miscible with the crude still being transported, would be desirable by 2009. Allowance for a minimum of 2 years of construction time and 2 years for permitting, design and early component ordering would mean that economical, commercially ready (demonstrated), advanced GTL technology should be ready by 2005 or so, to be prudently ready for early onset of low flow TAP problems. Thus, advanced GTL process development and pre-commercial testing should be done by 2005 so that initial commercial implementation on the North Slope could be attainable by 2009 to insure that TAP operation is not halted because of insufficient liquid throughput.

A number of factors influence when the critical flow point is reached: production from new ANS reservoirs, gains in crude prices, improved oil recovery and others factors could act to extend the TAP “jeopardy” time horizon. However, lower than expected reservoir recoveries or crude prices, or other events could trigger an earlier date than 2009 for pipeline jeopardy.

Question. How much interest and financial commitment is there from companies doing business on the North Slope?

Answer. Since becoming aware of the North Slope gas option analysis undertaken in 1995 and 1996 for the Department by its Idaho National Engineering (and Environment) Laboratory (INEL), Arco and BP (the principal North Slope oil operators) appear to have increasing interest in GTL as a possible option for utilization of North Slope gas now seen as essentially unmarketable. This is particularly the case for the 21 trillion cubic feet (TCF) of recoverable gas at the giant Prudhoe Bay reservoir. Produced with the oil, this gas is currently being reinjected into the reservoir to maintain reservoir pressure for optimum oil recovery. However, with the projected conclusion of Prudhoe’s oil producing life in 10 or so years, this gas will be

ready for sale around 2005. The operators were helpful to INEL in reviewing an early study draft for factual accuracy, and they also have recently agreed to add GTL to their joint study efforts directed to reducing investment costs of North Slope gas marketing options.

Question. Is gas-to-liquids technology likely to be equally applicable on the North Slope as in the Gulf of Mexico?

Answer. It is too early to comfortably suggest gas-to-liquids (GTL) technology has equal potential in the Gulf as on the North Slope. Much will depend upon how a number of factors will stack up for respective companies in specific situations. The highest potential situations would be those where gas is totally without a nearby market (North Slope) and thus very low value gas. Pipeline access will also be an important factor. If such access is not readily available through gathering line extension, and if the lack of gas transport means that production of the potential flow of associated crude oil is not permitted, the producer might well be interested in relatively costly GTL simply to obtain the profit from the otherwise locked in oil. Other situations will also bear examination, including those that might fit market niches, where gas could be converted into 'liquefied natural gas' (LNG) at a remote Gulf site and barged to shore for use in peak gas storage activity. This is why the GTL research program seeks to encourage development of a variety of GTL process options, geared to both large and modest-scale operations, and development of technologies that can be adapted to these specific situations.

Question. Is it likely to become economical in one location before the other?

Answer. At the current constrained pace of GTL development, and for reasons cited earlier, a definitive answer is extremely difficult. Given the economics of scale of current GTL technology, despite the capital and operating penalties of working in the climatic conditions of the North Slope, a best guess at this point in time is that advanced GTL technology would show better economics for the North Slope than for operations in the Gulf using higher priced gas.

STATUS OF CERAMIC MEMBRANE PROJECT

Question. What is the status of the ceramic membrane project initiated with AMOCO?

Answer. After several months of negotiations between Amoco and Air Products, the firm that allied with Amoco in submitting an unsolicited proposal to develop and demonstrate the ceramic membrane technology for gas-to-liquids (GTL) application and which was accepted by the Department, it became apparent to Department procurement officials that the two firms could not consummate a formal agreement to collaborate in this work. After due notice by the Department, the proposal acceptance was canceled in September 1996. Because the work was deemed important and appropriate for the GTL research program, however, a competitive solicitation for comparable work was prepared and announced in December 1996, with a closing date of February 28, 1997. Proposals are currently being evaluated with selection tentatively scheduled for Spring 1997.

ENVIRONMENTAL TECHNOLOGY DEVELOPMENT

Question. A significant increase is requested in Environmental Research/Regulatory Impact Analysis for Technology Development. Are there specific regulatory requirements that precipitated the requested increase?

Answer. The request for increased funding in Environmental Technology Development was not prompted by specific regulations, but by the identification of this area as a high priority for the industry and the nation. The Department not only has expertise and technology to offer to the industry through the national labs and other facilities, but the process of developing and applying lower cost environmental compliance technologies can lead to a better understanding of environmental risks that contributes to better regulatory decisionmaking.

However, in turning to industry to ascertain their technology development priorities, the program has found that those priorities are driven by regulatory requirements. For example, industry advisors recommended that the fiscal year 1997 request for proposals from national laboratories-industry collaborations focus on two areas: produced water minimization and treatment, and stationary source air emissions control, both the subject of recent EPA rulemakings. Additional recommended priorities for fiscal year 1998 include risk assessment for decision making, treatment and disposal of naturally occurring radioactive materials (NORM), and soil remediation, all areas that are the subject of ongoing regulatory discussions at the state and federal levels.

FUEL CELLS

Question. \$32.7 million is requested for the Molten Carbonate program. How does the amount requested compare to the amount called for in the original molten carbonate cooperative agreements?

Answer. Original funding estimates in the two molten carbonate cooperative agreements show somewhat larger DOE amounts for fiscal year 1998 than the request for that year (a total for the two agreements is \$35 million in fiscal year 1998, but the total for fiscal year 1997 in the agreements was \$55 million, indicating a prior significant shortfall). The impact is a slippage in the original schedule by about two years.

Question. How much would be required in fiscal year 1998 to complete the program according to the original schedule?

Answer. The original schedule had a completion date of 2000. The amount estimated to be required in fiscal year 1998 toward completing the program according to the original schedule is \$50 million.

Question. How much would be required to prevent further slippage?

Answer. The amount estimated to be required in fiscal year 1998 to prevent further slippage beyond 2002 is \$32.7 million.

Question. Is it the Department's position that a delay in the molten carbonate program will have minimal impact on the success of the two contractors due to changing market windows?

Answer. A delay in the molten carbonate program will have an impact of a 2-year delay on the ability of the two contractors to enter the market on original planned schedule of 2000. However, the time window of market opportunity has widened given the changes in the domestic power generation market due to the restructuring of the electricity generation industry.

Question. In response to questions posed by this Committee last year, the Department stated that it would be prepared to evaluate the results of the three major fuel cell contracts at the end of fiscal year 1997, and that it was likely that only two contractors would continue full system development in fiscal year 1998. Is this still the Department's view?

Answer. The Department intends to support all three fuel cell developers on a stretched out basis. Each of the three fuel cell developers is aiming for different power generation applications with different technologies. One molten carbonate developer is targeting the onsite cogeneration application, the other is focusing on distributed generation. The solid oxide fuel cell developer's thrust is a combined cycle system with gas turbines for the central station power application. All three contractors are making good progress in their respective technologies. It is in the best interests of this nation to allow all three to build a strong domestic fuel cell industry to compete in the international fuel cell market and produce very clean, highly efficient energy, to create numerous domestic high value jobs, and other economic benefits that fuel cell power systems promise for the U.S.

Question. How much would be required to fully fund one molten carbonate contract while continuing to fund only component and stack development for the other?

Answer. Funding required to fully fund one molten carbonate contract to develop a commercially ready power system in the year 2002 would require about \$20 million per year. Although the capital cost of a fuel cell stack is expected to be about 30 percent to 40 percent of the total powerplant cost, this ratio does not apply relative to amounts for development funding. The bulk of technology development for a fuel cell power system must be focused on the more challenging cell and stack issues. Thus, continuing to fund only component and stack development for the other contractor is estimated to be about \$15 million per year.

Question. Does the Department view the technological problems experienced at the Santa Clara demonstration plant as significant, or as routine and surmountable?

Answer. The general assessment by all the participants in the Santa Clara field test is that the plant operation was successful in spite of problems encountered that are unrelated to the fuel cell technology itself. All systems operated such that full rated power was produced resulting in the largest operating fuel cell power system in the U.S. The fundamental problem is easily surmountable and is not an issue in the redesign configuration for the next prototype system.

Question. The Department is requesting \$12.8 million for the solid oxide fuel cell development program. What would be the impact of this funding level on the estimated completion date of the program?

Answer. The requested funding of \$12.4 million for the solid oxide fuel cell development is expected to stretch out the development schedules for two years and reach a commercially ready power system in about 2002.

Question. What would be required to keep the program on its original schedule?

Answer. Funding level required to keep the program on its original schedule is estimated at \$20 million.

Question. The Department of Defense has been involved in the commercialization of phosphoric acid fuel cells. Is any money requested in DOD's fiscal year 1998 budget for fuel cells?

Answer. There is no known funding requested in the DOD fiscal year 1998 budget for a Climate Change rebate program for fuel cell systems.

Question. If so, is the program limited to phosphoric acid technology? Why?

Answer. It is our understanding that the Climate Change rebate program for fuel cells is intended for fuel cell systems that are available commercially and is not focused on any specific fuel cell technology. Phosphoric Acid Fuel Cell systems happen to be the only fuel cell technology being offered commercially at this time, but we know of no funding requested in the DOD fiscal year 1998 budget for the Climate Change rebate program.

Question. Would either of the molten carbonate contractors be prepared to prepared to participate in this type of buy-down program?

Answer. Either of the molten carbonate fuel cell contractors might be prepared to participate in this type of buy-down program at a later time when they are ready to make such commercial offerings.

RESERVOIR CLASS PROGRAM

Question. Much of the research being performed in the Oil Technology program is designed to increase the economic life of domestic wells. What progress has been made in this regard?

Answer. The expected benefits from the Reservoir Class Program are proving to be greater than originally projected although the program is only 4 years into its 10 year duration. The economic life of wells in Utah, Texas, Michigan, Colorado, and Oklahoma have been increased through several early successes. Industry participants estimate, based on documented production and reservoir modeling, that transfer of the technologies demonstrated in 32 projects will provide an additional 500 million barrels of domestic production. Thus far, over 43 million barrels in increased reserves have been achieved through initial technology transfer.

Question. Have we slowed the rate at which wells are being shut-in?

Answer. We have slowed the abandonment rate in the basins where these early successes were achieved. It is difficult to assess the overall impact we have had on the national abandonment rate because this data usually lags production data by 2 years and our program is less than half completed.

Question. \$2.1 million is requested to revisit Classes I, II and III of the Reservoir Class Program. What have been the benefits of the Class program thus far in terms of enhanced domestic oil recovery?

Answer. Industry participants estimate, based on documented production and reservoir modeling, that transfer of the technologies demonstrated in 32 projects will provide an additional 500 million barrels of domestic production. Thus far, over 43 million barrels in increased reserves have been achieved through initial technology transfer.

Examples of some early successes include:

- Lomax/Inland Resources' waterflood in the Uinta Basin of Utah, going against conventional wisdom in the region, established viability of waterflooding in the area. During the 44 months of the project, 1.13 million barrels of incremental oil has been produced with tax revenues and royalties totaling \$5.9 million. Thirteen new waterflood projects have been initiated by other companies in the region as a direct result of the DOE project, with an anticipated minimum of 31 million barrels of additional oil recoverable, worth \$160 million in tax and royalty revenue.
- Michigan Technological University, teaming with an operator in the Michigan Basin, targeted production from the Dundee Formation in the Crystal Field, one of 137 older fields that are nearing abandonment. The application of horizontal drilling strategies coupled with new computer modeling and analysis methods has resulted in a demonstration well producing at a rate of 100 barrels of oil per day (BOPD), 20 times the best conventional well in the field. The successful results have caused 9 new horizontal wells to be permitted for drilling in the Crystal Field and 20–30 additional horizontal wells to be permitted in some of the other fields in the basin. Additional development in the Crystal Field alone is expected to recover 2 million barrels of oil. The redevelopment of other fields is anticipated to produce between 80 to 100 million additional barrels with an anticipated tax revenue of about \$210 million. This technology has also been

transferred through the Kansas region office of the Petroleum Technology Transfer Council, and operators are in the process of drilling a Kansas horizontal well.

—Offshore, in the Gulf of Mexico's Outer Continental Shelf, the Lamont-Doherty Earth Observatory of Columbia University evaluated the hypothesis that some Gulf Coast reservoirs are "recharged" periodically along faults. 4-D seismic technology was used to model subsurface fluid flow and to locate growth faults that may be pathways for oil flowing up from deeper formations. The first well drilled as a result of the 4-D seismic technology initially produced 1,500 BOPD. Federal revenues from this well alone will equal the amount of funding provided by DOE within five years. Also as a result of this project, \$400 million in contracts have been signed between Western Geophysical and producers to track reservoir recharge using 4-D seismic.

Question. What is the estimated increase in production on Federal lands attributable to technologies developed in the Class program?

Answer. The technologies demonstrated in the Class program were actually developed by the oil and gas industry. The purpose of the Class program is to promote the technology. In an effort to estimate the relative "improvement" of Federal lands due to the DOE Reservoir Class Program, the "Change Resource Implementation Probability" software was run on the eight Reservoir Class projects found on Federal Lands (of the total 29 Reservoir Class projects). The estimated increase in production on Federal lands attributable to technologies demonstrated in the Class program is almost 300 million barrels of domestic production.

Question. What is the estimated increase in royalties and taxes accruing to the Federal government as a result of the increased production on Federal lands?

Answer. The estimated increase in royalties and taxes accruing to the Federal government as a result of the increased production on Federal lands is 1.3 billion dollars.

Question. In the Department's view, would this increased production have occurred, been delayed, or not occurred in the absence of DOE support?

Answer. The Department believes that these increases in production would not have occurred in the absence of DOE support due to the risk involved and the availability of financing. An offset operator to Lomax/Inland Resources noted that, "My management would not have attempted their waterfloods without seeing the results of the Monument Butte flood."

NATIONAL LABORATORY/INDUSTRY PARTNERSHIP PROGRAM

Question. A \$2 million increase is requested for the National Laboratory/Industry Partnership program. Can the Department provide some examples of technology gains that have been achieved in this program in the last year?

Answer. Prototype devices for five geophysical imaging technologies have been completed and are undergoing field trials, and one technology has been commercialized. The exploratory well success rate has improved to 48 percent for the first 4 months of 1996, and continued improvements are expected as new geophysical technologies, including those developed by DOE, are adopted by industry.

The five new data processing and simulation methods projects successfully completed interim products. These improvements are expected to increase U.S. oil and gas production by 1 million barrels of oil equivalent starting in 2001. Accomplishments to date include: computer code that provides a three-fold acceleration for parallel processing of subsalt seismic data; multiphase fluid simulator for underbalanced drilling; publications on prototype computer model to predict geopressured reservoirs; prototype data server available on the Internet; and synthetic seismic data sets for a subsalt structure and an overthrust structure available for industry use in calibrating processing systems.

Question. How many additional projects would be funded by this increase?

Answer. The Industry Review Panels will review ongoing projects to determine their progress against stated goals. Early in fiscal year 1998, a call for new proposals would be issued as older projects are completed. With the \$2 million increase an additional 5 or 6 new or continued projects could be funded.

UPGRADING RESEARCH

Question. \$900,000 is requested for Upgrading Research, with a focus on using biotechnology to remove sulfur and heavy metals from crude oil. Is this program coordinated with the biocatalytic desulfurization research being performed under the auspices of the Office of Industrial Technologies' Petroleum program? If not, why not?

Answer. Yes. This program is coordinated with the biocatalytic desulfurization research being performed under the auspices of the OIT Petroleum program. The Fossil Energy program is sponsoring biochemical research to prevent the formation of pollution by removing sulfur, nitrogen, and heavy metals from heavy crude oil before it is refined. The proposed OIT research program will be directed at upgrading gasoline by biocatalytically removing sulfur, thereby, satisfying the need for cleaner fuels. The OIT program issued a Request For Proposal (RFP) which closes the end of March 1997. As evidence to the cooperation between the two offices, Fossil Energy scientists have been asked to help review the anticipated proposals received in response to the RFP and OIT representatives will be attending Fossil Energy's 1997 Oil Processing program review. The programs are supportive of each other and cover the broad spectrum of interest to the industry, i.e., economically upgrading heavy crude and producing an ultra low sulfur gasoline.

PROGRAM DIRECTION

CONSOLIDATION OF PITTSBURGH AND MORGANTOWN ENERGY TECHNOLOGY CENTERS

Question. The fiscal year 1997 Interior and Related Agencies Appropriations Act approved the consolidation of the Pittsburgh and Morgantown Energy Technology Centers into a single management structure. What is the status of the consolidation?

Answer. While there are a multitude of administrative details (e.g., new position descriptions, performance elements and standards) to be completed, the consolidation is essentially complete. The final organization structure was defined December 2, 1996. The employee crosswalk was completed on January 13, 1997, with employees beginning to work in the proposed new organizations on February 10, 1997. The Organization Change Proposal was approved February 26, 1997, to be effective March 2, 1997. All employees have been realigned into the new Federal Energy Technology Center organizations; office moves consolidating staff are well under way; reviews, revisions, and creation of administrative procedures are in process; and senior staff has begun development of a FETC strategic plan.

Question. What plans does the Department have to consolidate support services and contracts at the two sites? What savings might be realized from such consolidation in fiscal year 1998? Do these savings justify the entire reduction in Contract Services, or will there be a general reduction in services beyond the reductions attributable to the consolidation?

Answer. The primary site support contractor for the Morgantown office is EG&G WASC, Inc. The primary site support contractor for the Pittsburgh office is a team comprised of Burns and Roe Services Corp., Parsons Power, and SAIC. These organizations submitted, during February, an approach to jointly provide support services to the FETC. In response, a request to the contractors for a detailed technical and cost proposal is being made. The target is to have a joint venture or cross-teaming arrangement in place and fully operational for fiscal year 1998 operations.

In addition, other support contract activities presently conducted at each site are being studied for combined operations and consolidation efficiencies.

The budget proposed a reduction in contract services and contracts of \$5.4 million based on preliminary estimates of consolidation savings by the field. The current field estimate is that approximately \$3 million in total savings from the consolidation of contract activities during fiscal year 1998 can be expected. Once the consolidation process is underway additional savings may be identified. Otherwise, reduction would be necessary in the types and nature of current services to meet the budget target. An analysis of such potential savings has not yet been done.

Question. As part of the fiscal year 1997 appropriations Act, the Department was directed to study the integration of the Federal Energy Technology Center into the field management reporting structure. What is the status of this study? If complete, what did the study conclude? How does the Department propose to implement the recommendations of this study?

Answer. A large working group of Departmental field and headquarters staff was assembled to initiate the process to conduct this study. The decision was made to approach the Appropriations Committees about postponing the performing of the required analysis. Office of Fossil Energy senior staff consulted with the Committees about postponement until the Secretary of Energy assesses overall Departmental organizational requirements.

PRIVATIZATION OF NATIONAL INSTITUTE OF PETROLEUM RESEARCH

Question. Last year the Committee also approved the privatization of the National Institute of Petroleum Research (NIPER). What is the status of the privatization?

Answer. Privatization of NIPER is on schedule. The M&O contract was amended in August 1996 to facilitate privatization. The research activities of the M&O contract have been relocated off-site. DOE personnel and the programmatic support activities of the M&O contract are scheduled to move off-site May 1997. The remaining activity for full privatization is the environmental remediation necessary for GSA to market the facility. This activity is on schedule to be complete by November 1998 at the completion of the M&O contract.

Question. What is the status of DOE personnel at the Bartlesville Project Office?

Answer. The DOE personnel at the Bartlesville Project Office will continue to implement the Oil and Related Environmental Research Programs. The Program office is co-locating with the Southwest Power Administration in Tulsa, Oklahoma on May 5, 1997. Some personnel will relocate to Tulsa and others will commute.

Question. Is it anticipated that staffing at BPO or its successor will remain steady or decline?

Answer. It is anticipated that staffing at the new office, the National Petroleum Technology Office, will remain steady for the near future. National Oil Program management activities assigned to the M&O contractor will revert to the federal staff in November 1998. This will create a need to reevaluate staffing levels.

Question. How is transition funding for NIPER addressed in the budget request?

Answer. NIPER transition funding is being supported in the research and program direction accounts with no specific request being made for transition.

COOPERATIVE RESEARCH AND DEVELOPMENT

Question. The Department has requested \$1,966,000 each for WRI and UNDEERC, plus an additional \$1,864,000 for coal research at UNDEERC only. Is there any technological reason why the Department has requested additional funds specifically for UNDEERC?

Answer. UNDEERC has excellent R&D capabilities in areas particularly important to the Coal Program and the additional funds were requested for the Center to carry out Department directed projects.

Question. Given that the Department proposed to terminate the Cooperative R&D program two years ago on the basis that funds should not be appropriated to specific facilities, how does the Department justify the earmark for UNDEERC?

Answer. Since the Congress has provided funding each year for WRI and UNDEERC, it was felt that it would be best to try and direct funding for these two centers to the areas of R&D that would be most beneficial to DOE. Thus, the language directing the additional funds for UNDEERC to be targeted toward projects in the Coal Program selected by the Department.

Question. Does the Department feel that politicizing the Cooperative R&D program will increase the quality of the research performed in the program?

Answer. No. Our request was not intended to politicize the Cooperative R&D program.

Question. Is the Department trying to provoke Congress into terminating the Cooperative R&D program?

Answer. The Department does not intend to provoke the Congress into terminating the Cooperative R&D program.

ENVIRONMENTAL RESTORATION

Question. \$2.5 million is requested for restoration actions associated with the closing of NIPER. What is the total cost remaining for such activities?

Answer. The total remaining cost for restoration actions at NIPER is \$2.5 million. This amount will allow all restoration requirements to be completed that are necessary for the site to be placed with GSA for disposal. These activities must, by State and Federal law, be completed before DOE is free of responsibility for the site.

Question. Is it imperative to the privatization of NIPER that the funds requested be appropriated?

Answer. Yes; the funds are essential to bring the site to the point where GSA can accept it for disposal.

Question. What would be the impact of a lower funding level?

Answer. A major goal of the privatization effort is to realize the cost savings of not owning and operating the NIPER site. The facility must be environmentally clear before GSA will take it for disposal. The requested funds are essential to bring the facility to that point. If funds are reduced, the schedule for turning the facility over to GSA will slip beyond the November 1998 date schedule for closeout of the M&O contract. This will require the M&O to be extended and the overhead cost of owning the facility to continue until the requested funds are obtained and the necessary work completed.

MINING RESEARCH AND DEVELOPMENT

Question. The budget justification indicates that the Albany research center will begin crosscut research to complement Fossil Energy R&D objectives. What types of complementary research will be performed?

Answer. The Albany Research Center is developing a program which complements the Office of Fossil Energy while retaining current customers and identifying potential future customers having needs which can be met by the capabilities resident at the Center. The Materials Program at Albany will contribute to FE objectives by formulating partnerships to determine or develop materials for use in current and future power systems. Efforts will focus on research which provides data on the performance characteristics of materials being specified, on developing cost-effective materials for construction of new and enhanced power systems, and for solving potential environmental emission problems of such energy producing systems. An emphasis is also being placed in Albany's Research Program on resolving near-term materials problems associated with the retrofitting of existing coal-burning powerplants.

A CRADA was signed with the Wyman-Gordon Company to produce specific alloys using the reactive foil bonding fabrication technique developed at ALRC. Phase I of the proposed and planned work has been completed and discussions have begun with manufacturing personnel from Wyman-Gordon to apply this technology to specific high-wear components of fossil energy/power generation systems.

Question. Is work being performed at Albany coordinated with activities funded by the Department of Energy's Office of Industrial Technologies?

Answer. The Office of Industrial Technologies in EE offers a variety of opportunities for materials-related research. The Albany Center is a member of the OIT Laboratory Coordinating Council and actively participates in the Industries of the Future Program. The research cupola melting studies conducted at Albany are currently part of the OIT Metal casting program. Other opportunities for cooperation are being actively pursued.

Question. If not, might there be opportunities for coordination, particularly in the area of metal casting?

Answer. ALRC's research capabilities are aiding other activities in DOE. Currently, discussions with the Office of Transportation Technologies' (OTT) program manager on advanced automotive materials indicates the potential for utilizing light metal (Ti and Al) expertise/capabilities at ALRC. The Center is planning to partner with OTT through the Northwest Alliance for Transportation Technologies, NATT, by leveraging the low-cost Ti program.

The Center is a cooperator in an EM test program which includes Clemson University, Clemson, SC, and AJT Enterprises, of Charleston, SC. Albany has conducted a series of melting tests on contaminated soils from the Charleston (South Carolina) Naval Shipyard in preparation for the subsequent vitrification of these residues in the larger pilot-scale vitrification furnace at the Center. The Center also provides support to DOE in evaluations of the treat ability of contaminated soils at specific, identified sites in the Formerly Utilized Sites Remedial Action Program (FUSRAP). Research includes mineralogical characterization of soil matrices to determine the nature of contamination; conceptual design of potentially effective volume-reduction strategies with accompanying cost analysis; and technical review for DOE of studies of contaminated sites by other contractors.

Question. How much reimbursable work is currently being performed at Albany? In cooperation with what agencies?

Answer. Albany is currently performing reimbursable work in cooperation with the following agencies:

- 1. U.S. Environmental Protection Agency (EPA), Metal Contaminant Speciation for Superfund Site Cleaning Research, \$180,000
- 2. U.S. Environmental Protection Agency (EPA), Environmental Technology Initiative (ETI), \$774,000
- 3. U.S. Agency for International Development (USAID) Asia Sustainable Energy Initiative, \$366,000
- 4. Department of Defense (DOD), U.S. Army and Army Corps. of Engineers, \$76,000
- 5. Department of the Interior (DOI), National Park Service, \$2,500

These activities are in various stages of completion. All funding amounts, therefore, represent total project funding since inception of the agreement.

CLEAN COAL TECHNOLOGY

Repayments

Question. The tables included in the budget justification indicate that significant repayments are being realized from Clean Coal Technology projects that are currently in operation. What is the total of repayments received through the end of fiscal year 1996?

Answer. The tables in the budget justification on the Clean Coal Technology Program indicate that 15 projects are "in commercial use" as noted by the asterisk. "In commercial use" means that the technology has been retained for commercial operations after completion of the Cooperation Agreement or the technology has sold commercially or the technology is being used commercially during the operational phase of the demonstration to produce revenues. The term "in commercial use" is not the same as repayment. Qualification for repayment from those projects which are in "commercial use" must follow the terms and conditions of the Cooperative Agreements.

Currently, \$385,953 has been repaid to the government from the Clean Coal Technology Program. Repayments from most projects will be derived from future commercial sales of the technology after completion of the demonstration project. The larger and more expensive power projects, which are currently in design, construction and operation, aren't expected to achieve commercial sales until after 2000.

Question. What are your estimates of repayments through the end of fiscal year 1997 and fiscal year 1998?

Answer. Significant sales from CCT projects are not anticipated until after fiscal year 1998. Estimates for repayment through fiscal year 1997 and fiscal year 1998 are expected to be minimal and will probably remain at approximately \$400,000. Several environment retrofit technologies may achieve commercial sales after fiscal year 1998 for Clean Air Act compliance. Sales of the large power project technologies are not expected until after 2000.

Question. Milestone decisions on the YORK and PENELEC projects are due to be made at the end of May. These decisions have an impact on the funding requirements for the Clean Coal Program. Is the Department confident that it will be able to meet these target decision dates?

Answer. Yes; the Department continues to be hopeful that decisions on restructuring these projects will be made by the end of May 1997. However, any changes among the proposed team members or the proposed project sites could cause some delay beyond May.

Question. Press accounts indicate that the NOXSO project is undergoing some difficulty. Given that no decision milestones remain on the project, what are the Department's options if the project is terminated?

Answer. If the current difficulties being encountered by the NOXSO project cause the industrial participant to withdraw from the project, the Department will proceed in the same manner that it has in the case of other projects that have encountered similar difficulties. The cooperative agreement will be closed out and the funds remaining will be returned to the Clean Coal Technology Program for use in accomplishing the program's objectives.

Question. What costs would the Department be able to recover for use elsewhere in the program?

Answer. At the time the industrial participant withdraws from the project and steps are taken to close out the cooperative agreement, the Department's funds that have not been committed or needed in the close out activities will be returned to the Clean Coal Technology Program. Additional funds may be recovered during the close out negotiations. The amount will be dependent upon the agreements reached in coming to some settlement about facilities constructed or commitments made.

PROGRAM DIRECTION FOR CLEAN COAL TECHNOLOGY

Question. The budget justification indicates that \$15,866,000 will be required for Clean Coal Technology Program Direction. What have been the costs of Program Direction in each of the last 5 fiscal years?

Answer. The following costs have been incurred for Program Direction over the past 5 fiscal years for the Clean Coal Program:

Incurred costs for program direction

Fiscal year:		
1997 (estimate)		\$16,000,000
1996		14,768,416
1995		17,914,680

Incurred costs for program direction—Continued

1994	17,445,440
1993	19,017,348

Question. What are the projected requirements for Program Direction in the next several fiscal years?

Answer. The following are the estimated requirements for Clean Coal Technology Program Direction for the next several fiscal years:

Fiscal year:	
1998	\$15,850,000
1999	14,833,000
2000	13,112,000

Question. Is the Department confident that the resources devoted to Program Direction are appropriate and comparable to other Fossil programs?

Answer. We believe the estimated Program Direction costs are appropriate to support the Clean Coal Technology (CCT) program activities which include 40 projects in various stages. The Program Direction in budget for CCT is expected to decline in the out years as more projects are completed. We will continue to review these requirements and update the budget estimates to reflect changing program requirements. In comparison to other Fossil programs the CCT program direction costs as compared to total program obligations represent about four percent in fiscal year 1997 and were among the lowest of Fossil Energy programs.

INTEGRATED GASIFICATION COMBINED CYCLE PROJECT IN CHINA

Question. The budget includes a \$50 million request for a technology introduction program in the People's Republic of China. For what specific purpose will these funds be used?

Answer. The funds will be used to reduce the cost differential between a U.S. IGCC plant and a less clean, less efficient conventional plant. The funds will be used either as a direct buy down of costs or to leverage more favorable financing, to compete with foreign technology and financing terms.

Question. Will all funds be used simply to buy down the cost of Integrated Gasification Combined Cycle (IGCC) projects to be located in China?

Answer. Yes, funds will be used to offset the increased costs of doing the first project for IGCC in China.

Question. How many individual projects does the Department anticipate the \$50 million would support?

Answer. It would support less than 50 percent of the differential cost of one project.

Question. Over what period of time?

Answer. The funds would be expended over 3 years (1999–2002).

Question. Will any of the funds be used for research and development?

Answer. A small portion of the fund will be used for coal testing and adapting U.S. IGCC technology for the China market.

Question. While the Committee recognizes that China is a huge potential market, why is the proposed program being limited to China?

Answer. It is being limited to China to best leverage success. The requested funding is sufficient to buy down the cost differential for only one project. China represents the single largest global market for power generation equipment, reportedly planning to add 10–20 GW of capacity annually. The U.S. leads the world in coal based IGCC technology. Success in penetrating the Chinese market should assure continuing sales of U.S. IGCC systems or components.

Question. Does it not make sense to make some of the funds available for use in India or in other key markets so that U.S. technologies are more widely distributed?

Answer. It may, but it would require additional funds. The present request is sufficient to buy down the cost differential for only one project.

Question. Why is the China program focused only on Integrated Gasification Combined Cycle (IGCC) technology?

Answer. This technology has been identified by China as a priority for demonstration. Another technology of importance is a large fluid bed combustor of 300 MW, but this would require additional funds. In the long term, the technology with the largest projected market share is IGCC.

Question. Why shouldn't the program be open to other advanced power generation technologies that might be of interest to China?

Answer. It could be, but this was judged to offer the greatest probability of success.

Question. With at least three CCT-supported IGCC projects slated to be operational in fiscal year 1998 and other IGCC plants coming on-line in other countries, why is additional \$50 million required to make such plants palatable to China?

Answer. There are two reasons: (1) to offset the cost of doing the first IGCC in China (estimated difference, based on U.S. experience, between first and next plants is \$200/kW) and, (2) to allow U.S. technology financing package to be competitive with foreign technology.

Question. At the conclusion of the China program does the Department anticipate that the costs of IGCC technology will be reduced to the point where the technology will be competitive in developing countries such as China?

Answer. The projections of U.S. industry are that the technology would be very competitive at \$700/kW and 45 percent efficiency. This project would be a major stepping stone in achieving that goal.

Question. The focus on IGCC in the China program suggests that IGCC technology is becoming a "favorite" among the advanced power generation technologies that are being developed with DOE support. Does the China market have specific characteristics that make IGCC the obvious technology choice?

Answer. Yes. China is a coal based economy and the efficiency of IGCC is extremely important to resources used and rail transport. Also, China needs the products of a multi-generation facility that results from IGCC-power, steam, fuel gas, town gas, synthesis gas, hydrogen, and ammonia.

Question. What does the focus on IGCC technology mean for other technologies (LEBS, etc.) that might be available in the same market window?

Answer. The introduction of IGCC technology into the Chinese marketplace could give it a significant advantage, but it may also help in the acceptance of all advanced, clean and efficient technologies (such as LEBS and others).

Question. Should the Department be concentrating more of its resources on the IGCC program and less on the other advanced power generation programs?

Answer. The DOE should always maintain a balanced source of technology options. There is no universal technology option for all situations. Therefore, a suite of technology options should be developed.

CLEAN COAL TECHNOLOGY RESCISSION

Question. The budget proposes a rescission of \$153 million and a deferral of an additional \$133 million in the Clean Coal program. I also understand that the emergency supplemental funding request will include an additional \$10 million rescission from Clean Coal. However, information supplied by the Department indicates that completion of projects currently underway would leave the program with a \$23.8 million deficit if the proposed rescission were enacted. What additional steps does the Department propose to take to ensure that ongoing projects can be completed within the budget proposal?

Answer. The projected \$23.8 million deficit assumed that all projects would proceed to completion and require all funds as committed under the current Cooperative Agreements. At the time of the proposed rescission, PENELEC has proposed to the Department to restructure and downsize the Warren Station External Fired Combined Cycle (EFCC) Project. This would result in a reduction of the Federal commitment for that project of nearly \$40 million. The proposed rescission amount took these savings into account, leaving the Department with the ability to complete all remaining projects, barring any major contingencies. The Department is working closely with the industrial participants to reduce the probability of future cost growths.

Question. Is the \$10 million rescission reportedly included in the supplemental request based upon new information that was not available during formulation of the fiscal year 1998 budget request?

Answer. The proposed supplemental \$10 million rescission was based on a re-evaluation of Program needs after consideration of the restructuring of the Warren Station Project and the resulting small amount of uncommitted funds made available. The supplemental rescission limits the ability of the Department to fund future cost overruns, however, the Department is working closely with the industrial participants to reduce the probability of future cost overruns.

Question. The fiscal year 1997 budget requested a rescission of \$325 million from the Clean Coal program, but Congress approved a more conservative rescission of only \$123 million. The sum of the rescission approved in fiscal year 1997 and the rescission proposed in the fiscal year 1998 budget request is only \$276 million—substantially less than the \$325 million proposed in the fiscal year 1997 budget. What

has changed in the last year that caused the Administration to lower its estimate of the total that can safely be rescinded from the program while allowing for the completion of ongoing projects?

Answer. Since the beginning of fiscal year 1997, the Department has made one project award and approved the restructuring of several other projects that were already under Cooperative Agreements. These actions have committed significant funds that otherwise would have been available for rescission.

Question. In light of the \$50 million increase in estimated funding requirements since last year's request, why should the Committee have confidence in the fiscal year 1998 estimate?

Answer. The proposed rescission in the fiscal year 1998 budget request represents surplus funds that actually became available in fiscal year 1996 and early fiscal year 1997 from approved project restructuring and projects that officially ended prior to completion. These funds are in surplus of the requirements needed to fully fund (excluding large cost increases) the active Cooperative Agreements currently in the Clean Coal Technology inventory. The fiscal year 1997 request was based only on the "probability" that projects would be restructured or evaluated prior to completion. The proposed deferral of funds in the fiscal year 1998 budget request reflects known and acknowledged schedule delays in several projects.

STRATEGIC PETROLEUM RESERVE

Question. The Administration has submitted a proposal to rescind \$11 million from the Strategic Petroleum Reserve account. How has the Administration determined that a rescission of this magnitude is justified? Is there new information that was not available during the fiscal year 1997 appropriations process that might justify the rescission?

Answer. The Strategic Petroleum Reserve is in a transition due to two factors. First it is well into its Life Extension Program, which is designed to standardize, streamline and simplify the surface facilities of the Reserve in addition to extending the useful life expectancy to the year 2025. As that program proceeds, it is resulting in cost reductions that could only be estimated until the work was actually complete, but which we are starting to realize now.

Second, the Department signed its first agreements to commercialize certain facilities that are critical to drawing down the Reserve but which otherwise sit idle. One of these facilities, the St. James terminal, part of the Capline complex on the Mississippi River, was leased to Shell Oil and custody actually transferred. While the signing of this contract was foreseen during fiscal year 1997, the timing of the actual transfer was highly problematic and the Department planned to occupy the facility and perform maintenance and provide security for the whole fiscal year. The cost of those functions now transfers to Shell under the terms of the lease, and accounts for the bulk of the \$11 rescission.

These savings had been anticipated for the whole of fiscal year 1998, but were not originally projected to reduce the budget for fiscal year 1997, and absent the rescission, the funds would not be spent in fiscal year 1997.

Question. What impact would this rescission have on Reserve operations, drawdown readiness, Weeks Island decommissioning, life-extension, etc.?

Answer. The rescission will have no programmatic impact, the funds are available because of savings from activities already completed. All of the program areas are progressing at the fastest responsible rate. If the money were not rescinded it would not be obligated by the Department during fiscal year 1997.

Question. Does the proposed rescission include the \$1.36 million remaining from the reserve expansion study, or have these funds already been reallocated?

Answer. The rescission does not include the \$1.36 million remaining of the appropriation for a Strategic Petroleum Reserve Plan Amendment, nor have the funds been reallocated, which would require legislation. The Administration has proposed amendments to the Energy Policy and Conservation Act, but the Congress has not acted to amend the Section 159(j) of the Act which requires the Secretary to amend the Strategic Petroleum Reserve Plan to prescribe plans for completion of storage of one billion barrels of petroleum products in the Reserve. The Department plans to request the transfer of the remaining funds appropriated for the purpose of preparing the Plan Amendment after the Congress acts to remove the legislated requirement for an immediate plan amendment.

DECOMMISSIONING OF WEEKS ISLAND SITE

Question. Decommissioning of the Weeks Island site will be largely completed during fiscal year 1998. Does the Department have a high degree of confidence that the

decommissioning will be completed within current cost estimates? Is there any significant chance that DOE will carry substantial liabilities beyond fiscal year 1998?

Answer. We are very confident that the Weeks Island site can be emptied, refilled with brine, and decommissioned without any extraordinary unplanned cleanup costs, all within the cost estimate. However, liability is a legal concept, and the Department cannot guarantee that it will not have to defend against claims for actions taken in the past or during the decommissioning. The Department shares ownership of the salt dome with Morton Salt, and Morton has at times asserted that the Government's actions have had negative impacts on Morton's interests.

Question. There are currently 117 million barrels of unused capacity in the Reserve. Does the Department have a cohesive policy as to the use of this excess capacity? Is it the Department's position that the entire excess capacity should be leased to foreign governments? If such lease agreements are not forthcoming, does the Department plan to simply maintain the capacity in anticipation of future acquisitions, or is there a long-term policy for reducing the total size of the Reserve?

Answer. The Department has proposed to lease excess capacity in the Strategic Petroleum Reserve to other foreign governments. While the Department would like to lease as much of this excess capacity as possible, the precise amount of capacity leased will depend on the number and nature of the contracts negotiated. The level of capacity will also vary depending on specific terms negotiated, such as whether commingled or segregated storage is desired.

If such lease agreements are not forthcoming, the Department plans to maintain the capacity in anticipation of future acquisitions. The existence of the extra storage capacity will allow the United States to quickly start acquiring oil if circumstances dictate that the inventory of the Reserve should be increased. If we sell or decommission any of the existing sites, creating a new site would be prohibitively expensive and would take many years.

Question. Information supplied to me by the Department indicates that by 2010, the number of days for which the SPR inventory could displace imports will decline to 44 days in absence of any further oil sales. I also understand that current international commitments obligate the U.S. to maintain a 90 day reserve capacity, including both public and private reserves. Given that U.S. private reserves seem to be declining, is there any point in the foreseeable future in which the U.S. will not be able to meet the 90 day reserve requirement?

Answer. If imports continue to expand and private inventories continue to decline by a half percent per year, protection will decline to 90 days of import protection by the year 2010. A host of events, including low oil prices that encourage consumption and discourage domestic production, could cause the 90 day threshold to be reached before that time. We must also consider that Reserve might be drawn down in an emergency, further reducing the inventory and the days of protection.

As a matter of foreign policy we would like to continue to lead the International Energy Agency and encourage all member countries and applicants to increase their petroleum stocks.

Question. Does the Department anticipate generating any revenues from similar activities in fiscal year 1998?

Answer. The Department will continue to generate revenues for the Federal Government during fiscal year 1998 from the facilities leased during 1996 and 1997. Estimated annual lease revenues from the St. James Terminal and Bayou Choctaw pipeline will be \$1 million based on a percentage of the gross revenues generated from its commercial operations. In addition, the Department expects lease revenues of approximately \$500,000 to be received from its lease of the Big Hill pipeline.

NAVAL PETROLEUM AND OIL SHALE RESERVES

Naval petroleum reserves-1

Question. I am aware that the Chevron Corporation has filed a lawsuit regarding the equity determination for a portion of NPR-1. How might this lawsuit affect the schedule for the sale of NPR-1?

Answer. On March 17, 1997, the U.S. District Court for the Eastern District of California entered an order which denied Chevron's motions and granted the United States' motion for summary judgment. Accordingly, the suit is now dismissed and will not affect the sale schedule.

Question. In the last calendar year, the Appropriations Committees have approved two reprogrammings making available over \$23 million for sale-related activities. This amount far exceeds original estimates of sale costs. Is the Department confident that it will be able to execute the sale within the amounts already made available for this purpose?

Answer. The Department has just completed hiring the last set of contractors as required by section 3412(d)(1) of the National Defense Authorization Act for Fiscal Year 1996. These contractors are five independent experts in the valuation of oil and gas fields who will conduct separate assessments of the value of the interest of the United States in NPR-1. Based on the preliminary cost estimates for these contractors, the Department believes that the present level of funding authorized to execute the sale should be adequate.

Question. If the requirements of the Defense Authorization Act are not met, or if the sale does not proceed for some other reason, the Department will have to operate the field for all of fiscal year 1998. Would the Department be able to operate the field for the entire year within the amount requested in the President's budget?

Answer. The amount contained in the President's budget provides for operation of NPR-1 for seven and one-half months of the fiscal year, through mid-May 1998, and for operation of NPR-3 and the NOSRs for the entire fiscal year.

Question. If not, what is the minimum additional amount necessary to operate the field for the remainder of the fiscal year, assuming no significant development activities were initiated?

Answer. The minimum additional amount necessary to operate NPR-1 through the remainder of fiscal year 1998 is estimated at \$34 million. This does not include any significant development activities.

Question. Should the sale not occur, how would Federal revenues be affected if no additional funds were made available for the operation of NPR-1 for the remainder of fiscal year 1998?

Answer. If NPR-1 received no additional funds for the remainder of fiscal year 1998, it is estimated that operations would close down in mid-May of fiscal year 1998. Production and sale of petroleum and related products would cease at this time, resulting in a short-term revenue loss to the Federal Government estimated at \$35 million per month for the remainder of the fiscal year. Further, cessation of operations at NPR-1 would probably result in reservoir damage, and additional production and revenue losses in the future.

Question. Many different estimates have been made regarding the sale value of NPR-1 and the value of the revenue stream from NPR-1 should the Federal government retain ownership. Many of these estimates factor in scoring rules, scoring windows and other budget-related arcana. Setting these factors aside, are there any market or programmatic reasons why the sale price of NPR-1 would be significantly lower than the net present value of the projected revenue stream, provided that the sale attracts a number of competitive bids?

Answer. In compliance with the National Defense Authorization Act for Fiscal Year 1996, five independent experts in the valuation of oil and gas fields will conduct separate and independent assessments of the value of the interest of the United States in Elk Hills. In preparing their assessments, these independent experts will consider the net present value of the anticipated revenue stream that the Treasury would receive if the reserve were not sold, adjusted for any anticipated increases in tax revenues that would result if Elk Hills were sold. This net present value calculation will be prepared by the Department in conjunction with the Office of Management and Budget. The minimum acceptable sale price may be set no lower than the average of the five independent assessments or the average of three of these assessments after excluding the high and low assessments, whichever is higher. This process effectively ensures that, in setting the minimum acceptable sale price for Elk Hills, the Department will be able to consider six separate assessments, including the government's net present value calculation, of the future revenues that would have accrued to the government from continued operations.

Question. The budget justification indicates that only development activities with a short pay-back time will be undertaken in fiscal year 1998. If funded at a level higher than the request, are there activities that could be performed at NPR-1 prior to the sale date that would result in a net "profit" to the U.S. Treasury?

Answer. There are no additional activities (such as drilling or facilities work) that could be started, completed and provide a net "profit" to the U.S. Treasury by the February 1998 sale date.

Question. If so, what are those activities, how much would they cost, and how much revenue would they likely produce?

Answer. The only activity that provides a net "profit" in such a short time is remedial well work, which is already funded in the fiscal year 1998 budget.

MANAGEMENT AND ADMINISTRATION OF NAVAL PETROLEUM RESERVES 1 AND 2

Question. \$20 million is requested for Management and Administration at NPR-1 and NPR-2, only \$500,000 less than the amount appropriated for fiscal year 1997.

The request also indicates that \$2.2 million in prior year funds will be available for this activity in fiscal year 1998, an increase from fiscal year 1997. Why is the request for this activity not reduced to reflect the sale of NPR-1?

Answer. The request for this activity was reduced to reflect the sale and estimated operating time for fiscal year 1998. However, these reductions were offset by one-time cost increases for M&O contractor severance and contract close-out activity.

Question. How much does the Department expect to pay for severance and other such costs?

Answer. The fiscal year 1998 budget requests \$15.8 million for contractor severance costs. Of this amount, \$4.6 million is budgeted in the Management and Administration activity. The remainder is budgeted in Production Operations and Technical Services. Contract close-out costs for fiscal year 1998 are budgeted at \$4.5 million in the Management and Administration activity.

DEVELOPMENT DRILLING

Question. \$26 million and \$17 million were appropriated for Development Drilling in fiscal year 1996 and fiscal year 1997, respectively. Have these drilling activities been "profitable" for the Treasury, as expected?

Answer. The development drilling programs for fiscal year 1996 and fiscal year 1997 have been extremely profitable. In fiscal year 1996, 23 wells were drilled and placed on production. The response of those wells has been an increase in production of 5,000 barrels of oil per day (BOPD) and 25 million cubic feet of gas per day. On an oil equivalency basis, this represents 9,166 barrels of oil equivalent per day (BOEPD). Without assigning a value to the gas produced that is not sold (most of the gas is used on site for maintaining the pressure in the reservoirs), the payout for these 28 wells is 11 months—a very successful program.

For fiscal year 1997, five wells of the 17 planned have been drilled and completed as of March 21, 1997, and placed on production. Although production testing is currently in progress on these wells, the current oil production rate is about 970 BOPD (an average production rate of 193 BOPD/well). The wells are expected to payout within seven months and will be very profitable. The remaining wells in fiscal year 1997 development drilling program are also expected to payout within a comparable period. The total response of the 17 wells planned for fiscal year 1997 is expected to be over 5,000 BOPD and add over 11 million barrels of proved reserves. There have been no indications that this development drilling program will be anything but very profitable for the Treasury.

DEVELOPMENT FACILITIES

Question. \$15.6 million is requested for Development Facilities, a large portion of which will be used for the Rule 4701 NO_x reduction project. Are these funds sufficient to complete the Rule 4701 project?

Answer. It is not likely that the \$11.4 million budgeted in fiscal year 1998 will be needed by NPRC for compliance with Rule 4701.

In fiscal year 1995, the local air district commenced a formal rule making for proposed Rule 4701 to reduce emission levels for NO_x and CO and to establish a limit for volatile organic compounds (VOC). Early versions of the Rule required that all internal combustion engines in operation at NPR-1 greater than 50 horsepower meet very stringent NO_x/CO/VOC emission limits by May 1999. Based on preliminary engineering analyses it was determined that given the current configuration of the engines (numerous very large engines driving "one of a kind" compressor units) significant and very expensive modifications would be required to meet the proposed emission limits. The fiscal year 1998 portion of the work was estimated to be \$11.4 million, and this figure was included in the NPRC fiscal year 1998 Facility Development budget.

Concurrent with engineering analysis, NPRC continued to participate actively in the rule making process with the intent of reducing the requirements that ultimately would be included in the final Rule. The rule making process continued over an approximate 2-year period before the Rule was finalized and formally put in place in December 1996. Not knowing what the final outcome of the rulemaking would be, NPRC continued to budget \$11.4 million in fiscal year 1998 throughout the rule making process to cover what was believed to be the most likely rule making outcome: i.e., that NPRC's efforts to reduce requirements significantly were not likely to be successful. Upon release of the final Rule in December 1996, however, and based on Rule clarifications received from the air district on March 17, 1997, Rule requirements have been reduced significantly, and the compliance date for NPRC deferred until May 2001. On the basis of these recent developments, and re-

duced requirements, NPRC is now of the opinion that the \$11.4 million budgeted for fiscal year 1998 will most likely not be required to comply with Rule 4701. It must be understood, however, that the full impact of the Rule is still being analyzed. The next step in the compliance process is for NPRC to collaborate with the air district and develop a compliance plan that is to be submitted to the district for review by December 1997. The district then has 6 months until July 1998 to approve or disapprove NPRC's plan. It is anticipated, based on experience, that during the process of compliance plan development, NPRC will be introduced to at least some requirements that to this point have not been obvious which would require funding. It is considered, however, that any such requirements can be funded with funds budgeted for Rule 4701 in the fiscal year 1997 budget.

Question. Is it necessary to complete this project at NPR-1 prior to sale?

Answer. No. As stated above, the project does not need to be completed until May 2001. Assuming the sale is completed in February 1998, the work on 4701 that NPRC needs to accomplish between now and sale completion is to collaborate with the air district and develop a compliance plan that reflects a thorough understanding of regulatory and engineering requirements. Understanding regulatory requirements will require intensive collaboration with the air district. Understanding engineering requirements will require data analysis, field/pilot tests, engineering studies and evaluations, cost analyses, and conception engineering designs. The goal is to have a cost effective compliance plan in place for the new owners. The actual funding of the implementation plan will fall to the new owners. The new owners should have no problem completing the compliance project if the sale is completed by or near February 1998, as scheduled.

Question. What would happen if the project was deferred?

Answer. With the change in compliance date from May 1999 to May 2001, together with the reduction in requirements, in effect the project has already been deferred. It does not appear that deferring of the project will have an adverse effect on NPRC.

Question. What sanctions would be incurred if the project is not completed by the deadline?

Answer. If an operator willfully does not meet the May 2001 compliance date, they could be fined up to \$25,000 per day per violation and jailed for up to one year by the State of California. Similar sanctions are in place at the Federal level. Additionally, the district could revoke all equipment operating permits, and for each piece of equipment (approximately 500 in number) the facility could incur similar penalties.

In addition to the final compliance date of May 2001, there also are intermediate milestone date requirements (such as the requirement to complete a compliance plan by December 1997), and the same sanctions that apply to the final date also apply to intermediate dates.

Question. Will the requirements of Rule 4701 apply to the purchaser of NPR-1 as they apply to DOE?

Answer. Yes, the requirements of Rule 4701 will apply to the purchaser of NPR-1.

INCREASE FOR TECHNICAL SERVICES AT NAVAL PETROLEUM RESERVES-3

Question. A \$2 million increase is requested for Technical Services at NPR-3. Is the entire increase attributable to activities at the Rocky Mountain Oilfield Testing Center?

Answer. Yes, the entire increase is attributable to the Rocky Mountain Oilfield Testing Center, and is based on increased industry interest in the test center and a large increase in proposed projects.

Question. Would a lesser increase simply result in fewer tests or cooperative agreements at the facility?

Answer. If funding for this activity were reduced, it would result in the completion of fewer projects.

Question. If provided, would the budget increase leverage an increase in non-Federal cost-sharing at the facility?

Answer. Yes, since all projects performed at the test center are cost shared, the increase requested will increase private industry cost-sharing.

Question. It appears that savings achieved at NPR-3 through operational and management efficiencies are being funneled into the Rocky Mountain Oilfield Testing Center, resulting in a flat appropriation request for NPR-3. Are there Development Facilities or Development Drilling activities that could be performed with these funds that would generate a net return to the Treasury over a relatively short time period?

Answer. Analyses of proposed facility and drilling projects indicate that none of the projects would generate a net positive return to the Treasury in a relatively short time period.

Question. If so, why were funds not requested for such activities?

Answer. Funds were not requested for these activities because technical analyses have not identified any projects that would provide a reasonable degree of profitability.

Question. Why is RMOTC a higher priority?

Answer. RMOTC appears to be a higher priority only because of the lack of opportunities for investments in NPR-3 drilling and facilities projects. In addition, RMOTC is generating increasing industry interest and support, and provides positive benefits through cost-shared projects.

PROGRAM DIRECTION FOR NAVAL PETROLEUM RESERVES-1

Question. Within the amount requested for Program Direction, the justification indicates that funds will be used for severance and employee transition. Does the Department anticipate that funds will be needed in fiscal year 1999 for residual severance costs or similar requirements related to NPR-1 personnel?

Answer. The Department plans to complete all NPR-1 severance and employee transition actions in fiscal year 1998, and no funds are anticipated to be required for these activities in fiscal year 1999. It is expected that funds will be required in fiscal year 1999 to support 10 NPR-1 employees to work on close-out of the M&O contract and the Unit Plan Contract.

Question. If so, how much will be required and in what account will such funds be requested?

Answer. Funding for NPR-1 employees in fiscal year 1999 will be requested in the Program Direction account for NPR-1, however estimates of the amount required have not yet been developed.

UNOBLIGATED BALANCES

Question. The Budget Appendix indicates that a high level of unobligated balances will exist in the NPOSR account at the end of fiscal year 1998, despite the sale of NPR-1. Is the table in the Budget Appendix correct?

Answer. The table in the Budget Appendix reflects the correct number for fiscal year 1996 of \$437 million, but is not correct for fiscal year 1997 and fiscal year 1998. The correct numbers for fiscal year 1997 and fiscal year 1998 are \$425 million for each year.

Question. What is the reason for the large unobligated balance that carries forward each year?

Answer. The large unobligated balance carried forward each year reflects program revenues deposited in the NPOSR appropriation account as a result of the appropriation law for fiscal year 1992 and fiscal year 1993. This law was subsequently changed with passage of the fiscal year 1994 appropriation, and all revenues since fiscal year 1994 have been deposited in the Miscellaneous Receipts account at the U.S. Treasury. The revenues contained in the balances brought forward total \$424.5 million and are not available to the program for use. It would be appropriate for these revenues to be returned to the U.S. Treasury.

Question. Does the Department anticipate that at the end of fiscal year 1998 there will be any prior year balances available to the NPOSR program for use in fiscal year 1999?

Answer. The Department does not expect there will be any prior year balances available to the NPOSR program for use in fiscal year 1999.

QUESTIONS SUBMITTED BY SENATOR BYRD

ENERGY SUPPLY AND THE ROLE OF FOSSIL ENERGY

Question. What percentage of the United States energy supply is fossil-based?

Answer. Fossil-based energy comprised 85 percent of total U.S. energy supply in 1995.

Question. Is the picture much different when the global energy supply is considered?

Answer. Fossil-based energy comprised 86 percent of world energy supply in 1995.

Question. Based on the Energy Information Administration's projections, is the energy supply mix expected to change?

Answer. U.S. fossil-based energy is projected to increase from 85 percent in 1995, to 88 percent of total supply by 2015. World fossil-based energy consumption is projected to increase 86 percent to 87 percent between 1993 and 2015.

Question. When we look specifically at the electricity aspect of the energy picture, how much of electricity is derived from fossil fuels?

Answer. Fossil-based electricity generation comprised 68 percent of U.S. electricity generation in 1995. Fossil-fuel use accounted for 63 percent of the world's electricity generation in 1995.

Question. How much of this is coal?

Answer. Coal-fired electricity generation comprised 51 percent of U.S. generation and 36 percent of global generation in 1995.

Question. Is the outlook for sources of electricity anticipated to change?

Answer. Total fossil-based electricity is projected to increase to 80 percent of U.S. generation by 2015. Share of U.S. coal-based generation is projected to remain basically flat contributing 50 percent (including cogenerators) to electricity generation in 2015. Globally, the share of fossil use for electricity generation is projected to increase slightly to 66 percent in 2015.

Question. Does any other source of fuel come close to coal in meeting our electricity demands?

Answer. No. The next highest energy source for U.S. electricity generation is nuclear which is projected to decline from 20 percent in 1995 to 10 percent in 2015. Globally, the next highest share is for use of renewable energy (including hydroelectric) rising slightly from 22 percent in 1995 to 23 percent in 2015.

Question. In light of these types of projections, why is the fossil budget proposed to decrease \$18.3 million, or 5 percent, in the fiscal year 1998 budget?

Answer. Fossil energy R&D remains a high priority at the Department of Energy and an integral part of a portfolio of energy R&D programs to ensure a secure energy future under current fiscal constraints. The budget, along with available Clean Coal Technology funds, allows pursuit of a full range of fossil energy options for the future.

Question. What impact will the proposed fiscal year 1998 funding level for the fossil energy program have on the timely development of technologies that will allow for the continued use of fossil fuels in a more effective and environmentally-sensitive manner?

Answer. The Fossil Energy Program continues to be a high priority in our overall energy R&D portfolio. We believe that the proposed fiscal year 1998 funding is a reasonable level given the current fiscal constraints and the need to structure a balanced energy R&D portfolio to meet the future energy and environmental challenges. Given the current uncertainties resulting from electricity generation industry restructuring, it appears that the time window of opportunity is widened, thus allowing us to develop these technologies within a time frame that can ensure the continued use of fossil fuels more effectively and in a more environmentally-sensitive manner.

Question. If Congress were to fund the energy efficiency budget fully, what effect would that have on reducing our use of energy?

Answer. Estimated primary energy displaced due to DOE energy efficiency programs at the requested funding level is projected to be 0.5 to 0.8 quads in the year 2000 and 4 to 7 quads in 2010. This translates into consumer and business energy cost savings of \$3.5 to \$4.3 billion per year in 2000 and \$25 to \$44 billion per year in 2010.

Question. Mr. Secretary, there are a number of promising technologies under development in the fossil energy program that appear to be under funded in fiscal year 1998. The budget seems to walk away from commitments and schedules developed for cooperative programs in the area of advanced power systems, such as turbines, fuel cells, and low emission boiler systems. Yet these technologies, if proven and cost-competitive, can contribute to more efficient use of energy in a more environmentally sound manner. What effect will the proposed fiscal year 1998 budget have on our ability to complete these programs in the 2000 timeframe?

Answer. The proposed fiscal year 1998 budget may cause some slippages in the original 2000 time frame completion schedule for turbines and fuel cells by 2 years and possibly the same for the low emission boiler systems. However, we believe that the budget, as submitted, represents a reasonable balance among the various technologies in our energy portfolio given the current budget constraints.

Question. What are the current forecasts with respect to energy demand—is it expected to remain relatively constant, or is it expected to grow?

Answer. Between 1995 and 2015, U.S. energy demand is expected to grow one percent per year.

Question. What are the Department's projections about how we will meet the challenge of addressing increased demands for energy?

Answer. Increasing demand for electricity generation is projected to be satisfied primarily through increasing use of natural gas followed by increased use of coal and a modest increase in renewable energy through 2015. Nuclear electricity generation is projected to decline.

Question. What consequence would program "stretch-outs" have on our ability to have economically viable alternative power generation systems available to respond to projected growths in energy demand?

Answer. The uncertainty, due to the prospects for deregulation of the electricity market, has delayed the incentive for the market to deploy new technologies in its generation mix. Therefore, limited "stretch-outs" of deployment of alternative power generation are not expected to severely affect the market's ability to respond to projected growth in energy demand.

Question. How realistic is it to assume dramatic shifts in the foreseeable future when it comes to our energy picture—both in terms of where our energy comes from and how we use it?

Answer. Current projections of the energy picture does not anticipate any dramatic shifts in the mix of energy supply of energy use.

GLOBAL CLIMATE CHANGE

Question. To what extent do you believe improved technologies being pursued as part of the fossil energy program will contribute to the more efficient production of energy and improved environmental performance in a way that will help our global environment?

Answer. We believe that the improved technologies being pursued as part of the Fossil Energy Program will have a major global contribution to more efficient energy production and improved environmental performance. The goals of the advanced technologies are to almost double the efficiency of current powerplants and to reduce the carbon dioxide emission by over 40 percent. The environmental systems technologies being pursued are aimed at reducing pollutant emissions by up to 90 percent, at a fraction of today's cost. This attractive combination can encourage the deployment of these advanced technologies in the use of fossil fuels around the world to create a cleaner global environment, especially in developing and transitional countries which rely heavily on fossil fuels.

Question. Given that the pressure is to address the global environmental debate sooner rather than later, doesn't that argue for staying on track in the development of some of these new fossil energy technologies so that they can contribute to our having available as broad an array of economically viable options to meet our energy needs as possible?

Answer. Given current budgetary constraints, there is a need to balance our overall energy portfolio by considering many viable options, including fossil energy technologies, to address the global climate issue.

Question. If so, then why should the Committee concur in the proposed reductions to the fossil energy budget?

Answer. We believe that given the current budget constraints, the Fossil Energy Program budget submitted to the Committee represents a reasonable balance of the overall energy portfolio options.

Question. Will spending less somehow make these technologies available any sooner?

Answer. No, spending less will not make these technologies available any sooner.

Question. Isn't it true that some of the programs DOE is working on in advanced coal fired power generation systems can reduce emissions of carbon dioxide by more than 30 percent compared to current baseline systems?

Answer. Yes. Current conventional coal powerplants range in efficiencies from less than 30 percent for older plants to 36 percent for newer plants. Our portfolio of coal-fired powerplant technologies are aiming at efficiencies in excess of 60 percent, thus having the potential for reducing carbon dioxide emissions by close to half.

Question. And in terms of cleaner fuel sources, such as natural gas, don't some of the technologies under development—such as advanced turbines and fuel cells—have the potential to reduce emissions 30–50 percent compared to current systems?

Answer. Yes. Our Advanced Gas Turbine Program and our Fuel Cells Program are aimed at developing powerplants with efficiencies in excess of 60 percent and when coupled with coal, can have the potential for reducing carbon dioxide emissions within that range compared to current systems.

Question. Wouldn't the successful deployment of these technologies help further progress towards reducing emissions?

Answer. Yes, they would in comparison with currently available technologies.

Question. And if so, doesn't it make more sense to address the technological issues before considering binding targets?

Answer. It would be desirable to address the technological issues early. However, given the long-range, high risk nature of the technology being developed, the 60-percent efficiency goal for coal power systems will not be attained any earlier than 2010.

Question. To what extent are global environmental concerns driven not just by the U.S. but also by pollution and emissions elsewhere?

Answer. Managing emissions outside the United States is critical to solving the problem of greenhouse gas emission increases. For example, although North America CO₂ emissions (in tons of carbon) are projected to increase from 1.56 billion tons per year (TPY) in 1990 to 2.084 billion TPY in 2015, global totals increase from 6.07 billion TPY to 9.35 billion TPY over the same period.

Question. Is it not possible that the successful development of alternative technologies, which could then be exported, could contribute to the global solution as well as provide job opportunities in the U.S.?

Answer. Yes, it is possible to realize the potential for these advanced technologies, if successfully developed and exported, to contribute to the global solution, as well as provide opportunities in the United States. In fact, these are among the program drivers in the development of these technologies.

CLEAN COAL TECHNOLOGY

Question. The fiscal year 1998 budget proposes some restructuring of the funding profile for the Clean Coal Technology program. While I am pleased that the Administration has not proposed the huge raids on the clean coal program that have been rejected in the past, I still have some concerns about the proposal. Is it accurate that the DOE budget proposal for fiscal year 1998 assumes a "savings" in current year budget authority of \$286 million from the clean coal technology program?

Answer. The Clean Coal Technology budget proposal for fiscal year 1998 includes a rescission of \$153 million and a deferral of \$133 million until fiscal year 1999. The proposed \$153 million rescission represents savings made available from approved project restructuring and projects that ended prior to completion. The proposed deferral of \$133 million would not decrease the total value of the Clean Coal Technology Program. The combined rescission and deferral represents a proposed decrease in budget authority of \$286 million for the Clean Coal Technology Program in fiscal year 1998 and an increase of \$133 million in budget authority in fiscal year 1999.

Question. Isn't this somewhat disingenuous in that the Administration recognizes that some of these are not true savings from clean coal, because the deferral amount will become available right away next year?

Answer. No. The proposed decrease in budget authority for fiscal year 1998 represents an earnest effort to be fiscally responsible in meeting budget constraints in fiscal year 1998, as well as reducing overall Clean Coal Program costs wherever possible. The combined rescission and deferral represents a proposed decrease in budget authority of \$286 million for the Clean Coal Technology Program in fiscal year 1998 and an increase of \$133 million in budget authority in fiscal year 1999. The proposed rescission amount of \$153 million represents savings made available from approved project restructuring and projects that ended which results in a net decrease in overall program budget authority and would decrease the total cost of the Clean Coal Technology Program. The proposed deferral of \$133 million would not decrease the total cost of the Clean Coal Technology Program. The proposed deferral reflects known and acknowledged schedule delays in several projects and does not represent "true savings" from the Clean Coal Technology Program.

Question. Is it mere coincidence that the estimated savings from the clean coal deferral total nearly the same amount of the proposed fiscal year 1998 increase for the energy efficiency program?

Answer. In the Department's annual budget process, all programs are independently reviewed in regard to their resource requirements. As a result of the schedule delays in several major Clean Coal projects, a deferral of budget authority from fiscal year 1998 to fiscal year 1999 was proposed. The overall DOE budget for fiscal year 1998 reflects many decreases and increases due to various factors including resource requirements, schedule and priorities. The overall budget constraints require decisions that trade-off savings found in some programs against increased requirements in others in order to fund a balanced energy portfolio.

Question. If we were to defer clean coal funding, wouldn't it make more sense to not spend any of the artificial savings in fiscal year 1998 given that the dollars will be required in fiscal year 1999?

Answer. The overall annual budget constraints for the Department require re-allocation of resources between programs each year to conduct programs in the most efficient manner.

Question. In addition to the proposed deferral, the budget also includes a recommended rescission of \$153 million. To date, Congress has already rescinded \$323 million from the original clean coal program appropriation of \$2.7 billion. Has DOE been able to identify \$323 million in savings yet? In other words, is there enough funding in the clean coal program under current law to complete projects still in the pipeline?

Answer. Under current law, there is a surplus of funds after fulfilling all commitments for the remaining projects in the Clean Coal Technology Program. Even after the proposed \$153 million rescission for fiscal year 1998, adequate funds would exist to fully fund all projects in the pipeline assuming no major contingencies.

Question. It is my understanding that a restructuring of the PENELEC clean coal project in Pennsylvania must occur if the clean coal program is to avoid a deficit under the proposed rescission scenario. What is the status of this project and has the necessary restructuring (and resulting savings) occurred?

Answer. Negotiations are continuing with PENELEC to restructure and downsize the Warren Station External Fired Combined Cycle (EFCC) Project. Additionally, negotiations are continuing with PENELEC to restructure and relocate the York Atmospheric Fluidized Bed Combustion (AFBC) Project. The projected savings of \$40 million are associated with the downsized Warren Station EFCC Project and not the York AFBC Project. The resulting savings are expected to occur when the Cooperative Agreement is officially modified. Even after the proposed \$153 million rescission for fiscal year 1998, adequate funds would exist to fully fund all projects in the pipeline assuming no major contingencies.

Question. When do you expect to know for sure whether the estimated savings from PENELEC will accrue?

Answer. The estimated savings which are based on the Warren Station EFCC Project will officially occur when the Department makes a decision on the restructured project and officially modifies the Cooperative Agreement. The Department expects to make a decision on both of these projects and modify the Cooperative Agreements accordingly by early summer 1997.

Question. What is DOE's current level of confidence on the cost estimates associated with the clean coal projects currently in the pipeline?

Answer. The Department's confidence level in the remaining Clean Coal projects is the same as it has been for all the other projects. The cost estimates on all these projects are normally accurate to within plus or minus 20 percent in the early design stages, and the accuracy increases as the projects progress toward completion. We are likely to incur cost increases with the remaining projects, as they are large repowering and greenfield projects, which are in the design stage. However, as most of the Clean Coal Technology projects are either in operation or have ended, the need isn't as great to maintain as large a management reserve for cost increases. Please note that each Cooperative Agreement states that the government will consider cost sharing cost increases subject to available appropriations, but the government is under no obligation to fund them.

Question. Under the proposed rescission, is there any allowance being provided for the possibility of cost growth?

Answer. Yes. The Department has taken into account the anticipated savings from restructured projects, the risk of projects not continuing to completion, and probable cost increases on other projects in arriving at the proposed rescission. The Department believes that sufficient funds remain even with the proposed rescission in fiscal year 1998 to complete the existing Clean Coal projects.

Question. Is cost growth something that is common with new technologies?

Answer. Cost growth is common for new technology demonstrations. Cost growth was anticipated from the beginning of the program, with the Department provided the authority to share in cost growth of up to 25 percent of the originally awarded federal commitment to a project.

Question. Has cost growth been experienced on the earlier clean coal projects?

Answer. Of the twenty projects that have concluded operations under the Clean Coal Program, only three projects had no cost growth from the original Cooperative Agreement amount. Two additional projects had minimal cost growth to perform emissions characterization testing that was not part of the originally budgeted project. Of the 40 projects currently in the Clean Coal inventory, 26 have had some amount of federal sharing in cost growth. As of December 31, 1996, the Department

has approved a total of nearly \$120 million in federal funds for cost growth in the Clean Coal Program.

Question. On another clean coal matter, the Administration is proposing an advance appropriation of \$50 million, to become available in fiscal year 1999, to initiate an international clean coal program with China. Does the Administration envision that this will be a one-time requirement, or will there be additional international clean coal projects in the future?

Answer. This will be a one-time requirement.

Question. What is different about the technology proposed for this international initiative from the technologies currently being worked on as part of the domestic clean coal initiative?

Answer. The IGCC technology that would be utilized for this initiative must be adapted for the Chinese environment. Adaptations would be made to achieve lower capital costs, performance with Chinese coals, and lower operating costs. Modifications would also be made to the technology to allow for less stringent performance standards than those imposed for the U.S. market.

ADVANCED CLEAN FUELS RESEARCH

Coal preparation

Question. The fiscal year 1998 budget proposes to increase funding for air toxics by \$812,000 in order to finance a down selection from three contractors to one in the area of advanced coal cleaning. Why is increased funding necessary for a downselection?

Answer. Increased funding is necessary for a downselection because of the larger scale research and development effort now necessary to fully investigate the potential of advanced coal cleaning to reduce the trace elements that are precursors to potential hazardous air pollutants that could be emitted during coal combustion. Research work on air toxics (Phase I) has already demonstrated some good results that are worthy enough to proceed with obtaining economic, as well as technical, information on the technology.

Question. Does going to one contractor correlate with proceeding to a next phase of the air toxics program?

Answer. Yes, going to one contractor correlates with proceeding to Phase II of the air toxics program.

Question. If so, what will be the next major objective to be accomplished by the remaining contractor?

Answer. The next major objective to be accomplished by the remaining contractor is a proof-of-concept demonstration of a coal cleaning technology for control of hazardous air pollutant precursors.

Question. The budget proposes an increase of \$140,000 for advanced dewatering research to enable the commercial deployment of advanced coal cleaning systems already developed. How will the increased funding proposed expedite the resolution of problems in this area which have impeded commercial development?

Answer. The budget proposes an increase of \$420,000 for advanced dewatering research to facilitate greater commercialization of advanced dewatering and fine coal cleaning technologies. This increased funding will expedite the resolution of problems in this area by supporting the formation of a coal preparation or solid fuels consortium that will interface with industry and conduct appropriate research related to solid fuels processing. The consortium will include academic, industry, and government involvement.

Question. If the technology involved is otherwise commercially viable, why is this not an investment that the owner of the technology should make?

Answer. The owner of the technology does not have sufficient resources to make the initial investment necessary to fully commercialize the technology.

Question. An increase of \$266,000 is proposed to fund new ideas for lab scale research. The budget indicates these funds will be used for research on solid fuels for advanced combustion systems. What benefit would come from this higher funding level?

Answer. This \$266,000 increase is due to increased funding for a greater level of effort in advanced dewatering research as discussed in previous answers.

Question. Why is it important to spend money on solid fuels for advanced combustion systems?

Answer. The benefit that will come from the higher funding will be greater commercialization of fine coal cleaning technologies. It is important to spend money on solid fuels for advanced combustion systems because these technologies have the potential to effect significant improvements in coal-based power systems, including improved efficiency, economics, and environmental performance. Other benefits include

the potential to develop coal-based fuels of consistent quality for new boiler applications, the ability to reduce emissions of acid rain and hazardous air pollutant precursors from coal-fired power systems, and a reduced dependence on imported oil.

DIRECT LIQUEFACTION

In-house research and advanced liquefaction

Question. A reduction of \$279,000 is proposed for in-house research on advanced liquefaction. This will affect activities at the Pittsburgh site. What impact will this funding reduction have?

Answer. The reduction of \$279,000 is proposed in the key activity for laboratory and bench scale innovative research which includes FETC in-house research. Therefore this reduction will come out of in-house innovative research activities which support coprocessing of coal and waste and direct liquefaction. This reduction is consistent with the redirection of priorities leading to a change in emphasis of activities at FETC. The development of liquefaction technologies will proceed on a longer schedule while efforts on other activities will be accelerated.

Question. What activities will be eliminated at the lower funding level?

Answer. \$200,000 of this reduction will come out of in-house innovative research activities which supports coprocessing of coal and waste and direct liquefaction. Therefore, these activities will be stretched-out. It is not anticipated that any projects will have to be eliminated.

COPROCESSING OF COAL AND WASTE

Question. An increase of \$595,000 is proposed for coprocessing of coal and waste. What is the objective of conducting bench-scale studies in this area?

Answer. Coprocessing of waste products from coal is the most promising approach very recently found for greatly reducing the cost of liquid fuels from coal (while also eliminating waste products). Development of a continuous bench scale database for coprocessing of wastes (such as plastics, tires refinery wastes, and mixed solid wastes) with coal and petroleum resid technology offers the potential for producing a supplementary source of low sulfur liquid distillate for refinery upgrading. The distillate crude could compete with petroleum crude at \$20 per barrel or lower. An important additional benefit will be the reduction of landfill required for waste disposal.

Question. What additional benefits are expected if the funding is increased from the current level of \$300,000?

Answer. The bench scale database for the concept would be expanded to include municipal solid waste which is primarily paper materials and refinery waste materials. This would significantly increase the availability of waste materials for production of distillate liquids and would also provide additional significant environmental benefits by reducing landfill space and providing environmental waste clean-up. This database would be available for use in feasibility studies and economic evaluation of this coprocessing concept.

Question. How will this research area contribute to achieving the goal of developing economically competitive and environmentally acceptable technology for the manufacture of liquid fuels from coal?

Answer. The development and demonstration of coprocessing of coal with resid and waste materials (plastics, tires, refinery wastes, municipal solid wastes) technology offers the potential for producing low sulfur, premium distillate crude which could compete with petroleum crude at \$20 per barrel or less. The distillate would be utilized in existing refinery facilities. The liquefaction facilities would be state-of-art complying with all environmental siting requirements. The development and potential demonstration activities which will be partnered with industry would be directed to mitigate technical, economic and environmental concerns, so that commercialization of these technologies could be accomplished by the private sector without further government involvement.

Question. What is different between this research initiative and the activities being pursued by the Consortium for Fossil Fuels Liquefaction?

Answer. This research is focused on continuous bench scale development to achieve a database which can be utilized in further development of the technology leading to engineering scaleup and feasibility studies. The Consortium for Fossil Fuels Liquefaction is comprised of five universities (University of Kentucky, University of Pittsburgh, Auburn University, West Virginia University, University of Utah) and is chartered to conduct innovative studies to improve our understanding and providing novel approaches to direct liquefaction of coal. For the last several years the consortium has been conducting innovative laboratory research in the coprocess-

ing of coal and waste materials, expanding the database by looking at additional sources of waste to be processed. This information is utilized as the basis for defining the continuous bench scale tests. The Consortium work and the continuous benchscale research is complementary.

PIONEER PLANT FEASIBILITY STUDY

Question. The fiscal year 1998 budget proposes \$100,000 for a "pioneer plant feasibility study". What is the proposed plant, and how is it different from liquefaction technologies that have, as of yet, not been cost-competitive?

Answer. The purpose of the feasibility study is to further define the concept, feed materials including coal to be used, database requirements and siting issues related to the design of a "pioneer plant" by an industrial team. The direct liquefaction pioneer plant is envisioned to be a small commercial plant to demonstrate technology for coprocessing of coal with resid and wastes. It would be built adjacent to an existing refinery which would provide the resid for coprocessing, the low sulfur distillate crude would be returned to the refinery for upgrading to produce refined products, the waste gases produced in the liquefaction facility would be processed in the refinery and petcoke produced in the refinery could be used to produce hydrogen for the liquefaction process. The combining of these activities would substantially lower the capital cost of the liquefaction facility.

The purpose of the first-of-kind "pioneer plant" demonstration, which would be partnered with an industrial group, would be to answer technical, economic and environmental issues so that private sector could finance and economically operate these facilities without any government involvement.

The economic analysis based on bench scale data suggests that the syncrude distillate from a commercial coprocessing liquefaction plant could compete with crude at \$20 per barrel or less.

Question. Who are the partners on this feasibility study?

Answer. The Federal Energy Technology Center earlier this year distributed a Sources Sought Announcement which asked for parties who would be interested in participating in feasibility studies to submit responses of interest. These responses from interested parties are currently being reviewed. The Office of Fossil Energy envisions significant participation from the private sector and interested stakeholders, such as state and local governments.

Question. What is the cost-sharing that will be associated with this effort?

Answer. There are no specific project discussions at this juncture. The Office of Fossil Energy is interested in substantial cost-share to be provided by the industrial and stakeholder partners for this activity.

Question. What is the estimated cost to construct the plant?

Answer. The specific costs of the pioneer plant will not be known until a feasibility study is completed which will define site specific aspects and produce the required engineering database. Preliminary estimates based on the existing bench scale database suggest that a plant to produce 12,000 barrels per day of distillate crude could cost in the \$350 to \$400 million range.

Question. What would be the Federal share?

Answer. The funding of the first-of-kind "pioneer coprocessing plant" would have to be negotiated between the industrial and stakeholder partners and the government. The staff of the Office of Fossil Energy, is studying innovative approaches to identify possible options that may be ways to pay the up-front costs for this "first-of-kind" pioneer plant demonstration. The proposed effort is to conduct a cost-shared feasibility study to better define engineering aspects and development concepts that could result in a successful project.

INDIRECT LIQUEFACTION

Air separation membrane development

Question. In fiscal year 1998, the Department proposes to spend \$191,000 to initiate development of an "air separation membrane". Why is development of this product necessary?

Answer. In indirect coal liquefaction, oxygen or enriched air from the air separation plant is used to combust the coal in the gasifier to produce synthesis gas which is the precursor for liquid fuels and chemicals. Current air separation plants use cryogenic technology which is both capital and energy intensive and accounts for a significant portion of the product costs for indirect liquefaction. Recent advances in membrane R&D have shown its use in air separation offers great promise as a cheaper alternative to the conventional cryogenic technology. Any liquefaction tech-

nological developments that can significantly lower the cost of oxygen will result in U.S. technologies being more competitive in the global market.

Question. How is it anticipated to contribute to lowering costs?

Answer. In the conversion of coal, petroleum coke, biomass, waste plastics, and any other carbonaceous material to electricity, fuels, and chemicals via gasification, the production of oxygen via conventional cryogenic air separation technologies can account for up to 25 percent of the total capital cost of the facility. Preliminary indications are that the use of ceramic membranes for producing oxygen has potential for reducing the cost of oxygen by 35 percent. In a current CRADA, the economic impact of this novel technology on the cost of fuels and power from IGCC, Indirect Liquefaction, IGCC/indirect liquefaction coproduction, and advanced combustion technologies are being assessed. If such economic improvements are confirmed, it is envisioned that a joint project between the Indirect Liquefaction, IGCC, and Advanced Power Systems programs would be initiated to speed the development and commercialization of this technology. If successful, improvements in efficiency will result in their being competitive in the market in the next decade.

Question. What previous investments in indirect liquefaction are failing to realize their potential because of this problem?

Answer. None. The major thrust of the indirect liquefaction program has been to develop a novel liquid phase reactor to convert synthesis gas from advanced coal gasifiers to premium fuels and chemicals. The accomplishments from this program include the successful proof-of-concept (POC) scale development of liquid phase methanol technology which is now under commercial demonstration at the Eastman Chemicals plant in Kingsport, Tennessee with the support from the DOE Clean Coal Technology program. The current effort is to extend the know-how in this technology to the liquid phase Fischer-Tropsch (F-T) technology which is to convert synthesis gas to premium hydrocarbon fuels and chemicals. The proposed work on air separation membrane represents a new initiative which is to further reduce the costs of indirect liquids through a system integration approach.

Question. What is the estimated total cost to resolve the air separation membrane issue?

Answer. The proposed program would be structured in two phases: Phase 1 is laboratory research to validate technical feasibility. The federal cost of the phase 1 program is estimated to be \$12 million over three years, assuming at least 50 percent industrial cost share. In addition, due to the applicability of air separation technology to both fuel and power systems it is anticipated that federal costs would be shared through a joint program in this area. If the proposed effort were started in fiscal year 1999, phase I activity would be completed around 2002.

CONSORTIUM FOR FOSSIL FUEL LIQUEFACTION SCIENCES

Question. A group of six universities, including West Virginia University, has been conducting research and investing promising technologies for ways of converting waste materials into oil using coal liquefaction technology. If a cost-effective means can be determined, this may be a way to achieve the environmental benefit of helping dispose of urban waste by co-processing it with coal to develop a new domestic oil source. What results have been achieved to date as a result of Federal support provided for this consortium?

Answer. The Consortium for Fossil Fuel Liquefaction Sciences has conducted considerable laboratory experimentation of coal with waste material such as tires, plastics, paper and other waste materials to provide the fundamentals which are now being exploited at the continuous bench scale level. The consortium is also performing a study to determine the optimum feeds and conditions for a conceptual waste/coal liquefaction facility. This approach has the potential of reducing the cost of coal derived liquid fuels to below \$20 a barrel.

Question. Are there important "next steps" that need to be taken?

Answer. The next steps would include development of a continuous bench scale database for coprocessing of coal/petroleum resid/waste materials. The continuous database is being developed by Hydrocarbon Technologies, Inc. (HTI). Emphasis is being placed on establishing process conditions and expanding the waste materials that can be effectively handled. This database will be utilized for future feasibility studies for a coprocessing "pioneer plant" facility.

Question. In fiscal year 1997, the consortium is funded at a level of \$1 million. The group has requested \$1.7 million for fiscal year 1998, but no funding is proposed in the DOE budget. What could be accomplished if the Consortium's requested funding level (\$1.7 million) is provided?

Answer. If the requested funding of \$1.7 million for fiscal year 1998 is provided, the Consortium could continue investigating additional methods for pre-treatment

and exploring additional coprocessing feed mixtures utilizing coal with municipal solid waste, plastics, used tires, and other hydrogen-rich waste. The program would be able to explore additional commercial opportunities to utilize the cleaned product stream and convert it into high value products such as commercial chemicals for transportation fuel production. Efforts would also increase to improve the environmental performance of direct liquefaction concepts leading to potential reduction in carbon dioxide production.

Question. What would be achieved if the prior year funding level (\$1 million) is maintained?

Answer. With the restoration of the prior year (fiscal year 1997) funding level of \$1.0 million, the Consortium could continue to maintain the present level of effort in conducting bench-scale research to improve the data base of knowledge for coal/waste coprocessing.

ADVANCED CLEAN/EFFICIENT POWER SYSTEMS

Advanced pulverized coal-fired powerplant

Question. A major objective of this program is to redesign the currently widely-used pulverized coal combustion system to gain major performance improvements. In the end, it is hoped that the result will be a powerplant design with very low emissions (<1/6 New Source Performance Standards) and significantly higher efficiency (> 42 percent) than conventional plants. If this can be achieved, export opportunities for these technologies could be pursued.

Low Emission Boiler System (LEBS).—This program was conceived as a four phase technology development effort to test at a scale sufficient to provide performance guarantees for a commercial system when the test is completed. Three contractors completed phase II (engineering development) in fiscal year 1996; during fiscal year 1997, three contractors will complete Phase III (engineering design of proof-of-concept test facility); for fiscal year 1998—budget proposes downselect to one contractor to continue Phase IV (proof-of-concept facility construction and operation). Based on the results to date in the LEBS program, are there particular strengths of the various technologies being developed by the three contractors that would lead DOE to support continuing more than one contractor to Phase IV?

Answer. The program objectives, plant efficiency, emissions levels, and cost are the same for each contractor. Although each contractor uses different technologies, based on the results, to date, it appears each will meet the requirements for Phase II and Phase III. Currently, it is premature to judge the specific strengths and weaknesses of the technologies under development. However, it can be observed that two distinct development approaches are being pursued. One, the Kalina cycle, represents a high risk, revolutionary approach to bring a totally new power technology into the marketplace. The other represents a low risk approach to greatly extend the performance of pulverized coal plants in a less revolutionary manner. The process for selecting a developer to continue in Phase IV of the LEBS program will be to form a Federal team of experts who will review and evaluate the Phase II and Phase III results as submitted by each of the three contractors. Selection will be based on an evaluation of the submissions and arrived at by a ranking grounded on a set of technical and other criteria.

Question. Are the economics of some of the technologies under consideration more attractive than others?

Answer. Until the submission of the results for Phase II and Phase III, there is no basis to conclude that one technology is more economically attractive than another technology.

Question. How so?

Answer. A thorough and critical evaluation of the results for Phases II and III is required before a conclusion regarding the economics of each technology can be made.

Question. What is the schedule for making a down-selection prior to the start of Phase IV?

Answer. Results for Phase II and Phase III are due at the end of July 1997. A 2-month evaluation period is planned. Phase IV is scheduled to begin in early fiscal year 1998.

Question. Might the selection of one contractor's proposed technology as compared to another's affect the funding requirements for fiscal year 1998?

Answer. Yes, but we expect to negotiate a cost, a cost-sharing level, and a schedule for the project acceptable to both DOE and the contractor.

Question. To what extent is the overall DOE funding required over the life of Phase IV a factor in the down selection decision-making process?

Answer. We expect to select the best proposal based on a thorough evaluation of the results from Phases II and III as ranked against a set of criteria. For the anticipated funding, we expect to negotiate a cost, a cost-sharing level, and a schedule for the project acceptable to both DOE and the contractor.

Question. What funding is necessary in fiscal year 1998 to begin Phase IV?

Answer. We believe the request for \$5,462,000 allows us to begin Phase IV in fiscal year 1998.

Question. What was the original program plan for the duration of Phase IV?

Answer. The duration of Phase IV was always anticipated to be approximately 3 years.

Question. Is it possible to stick to this schedule at the funding level proposed for fiscal year 1998?

Answer. Until a developer is selected and negotiations begin, it is premature to know, with any certainty, the actual duration of Phase IV. For the larger proposals, the schedule could be extended beyond three years if funding levels could be increased sufficiently in future years.

INDIRECT FIRED CYCLE

Question. The High Performance Power Systems (HIPPS) program incorporates a new high temperature advanced furnace that integrates the combustion, heat transfer, and emission control processes. As with LEBS, HIPPS is geared at increased efficiencies (>45 percent) and reduced emissions (<one-tenth New Source Performance Standards). These system efficiencies will also contribute to reduced carbon dioxide emissions levels. The fiscal year 1998 budget proposes continuation of Phase II (engineering development and testing) for the HIPPS program. There are presently two contractors participating in this program. An increase of \$1.5 million is proposed to put the program on a schedule to complete Phase II by the year 2000. What is the estimated cost to complete Phase II?

Answer. In order to complete Phase II at the end of fiscal year 2000, a total of \$44 million is required for fiscal years 1998 to 2000.

Question. What level of cost-sharing are the partners contributing to this program?

Answer. The cost sharing required in Phase II of the HIPPS project is 25 percent.

Question. Given the significant additional costs and time required to complete Phase II, should this program be continued?

Answer. We recommend that HIPPS be continued. The Fossil Energy RD&D Program has a number of technologies in its portfolio, HIPPS being one of them. This balanced approach reduces the overall risk in achieving the Fossil Energy mission. To not continue HIPPS, increases this risk.

Question. What consequences will accrue if the increased funding for HIPPS is not provided for fiscal year 1998?

Answer. The schedule will be stretched. However, the current re-structuring occurring in the electrical power industry has widened the window of opportunity for advanced pulverized coal technologies. At this time, a delay of several years does not appear to have a major impact on the potential success of HIPPS technology.

Question. Will the schedule be stretched to the point that it no longer makes sense to continue HIPPS?

Answer. It depends on how it is stretched. A schedule based on historical funding does not appear to place the success of HIPPS technology in jeopardy since it is a longer-term technology.

Question. Which is more important based on technological promise—continuing more contractors to Phase IV in LEBS or continuing the HIPPS program?

Answer. While LEBS currently is of higher priority, both LEBS and HIPPS are promising technologies—LEBS for the near-term and HIPPS for the mid-term. Both should remain in the Fossil Energy portfolio of technologies. The approach of including several technologies that would enter the market at different time periods reduces the overall risk of Fossil Energy achieving its mission.

INTEGRATED GASIFICATION COMBINED CYCLE

Question. This technology can convert coal into a clean gas used to fuel gas turbines and provide steam for a steam turbine cycle. Increased efficiencies (>52 percent) and reduced emissions (<one-tenth NSPS) are the goal. To date, costs have not been reduced sufficiently to make this a widely used technology. DOE's program is focused on hot gas sulfur and particulate removal and control of air toxics and pollutants. To assist in these efforts, a desulfurizer process development unit (PDU) is being constructed at Morgantown. What is the status of construction of this unit?

Answer. As of February 1997, PDU construction is 78 percent complete and scheduled for start of shakedown operation in fall 1997. Integrated operation will begin in June 1998.

Question. Are additional funds necessary in fiscal year 1998 to complete construction?

Answer. No funds in addition to the fiscal year 1998 Budget Request are needed to complete construction. Within the funding for IGCC, \$2.4M will be required to complete construction activities and \$530,000 will be required to complete shakedown operation activities during fiscal year 1998 (total \$2.93M).

Question. Are these funds included in the budget request?

Answer. Yes, the required funds have been included in the fiscal year 1998 budget request.

Question. What is the significance of the desulfurizer PDU to making integrated gasification combined cycle technology more cost-competitive?

Answer. The Hot Gas Desulfurization (HGD) PDU is a flexible facility capable of operating either as a fluid-bed or transport-bed reactor. Reactant gas is provided by a synthesis gas generator that can simulate a broad range of coal gasification product compositions. The PDU will operate over a wide range of sulfur concentrations and process conditions to optimize performance and provide engineering data for a wide variety of IGCC applications. Compared to other HGD technologies, the transport and fluid-bed reactors provide for a stable operation, improved heat integration, improved sorbent performance and life, and lower capital cost. These features are expected to lead to a reduction in capital cost, as well as higher efficiencies for future IGCC applications. The engineering data and capital cost reduction to be provided by the PDU are expected to lead to a reduction in the cost of electricity.

Question. How will the PDU contribute to better efficiency and reduced emissions?

Answer. Development of the fluid-bed and transport reactor technology for hot gas desulfurization is expected to result in approximately a 2 percentage point improvement in overall plant thermal efficiency compared to conventional technologies. Such improvements in efficiency from hot gas desulfurization coupled with further developments in advanced power cycles, advancements in air separation technologies using ceramic membranes, and the coproduction of environmentally superior transportation fuels and/or high value chemicals, has potential for achieving very high thermal efficiencies, approaching 55–60 percent by 2010. At these efficiencies, IGCC technologies will be among the cleanest, environmentally friendliest technologies for the generation of electricity and other products.

Question. The budget also includes a proposed increase of \$1.251 million for enhanced testing of sorbents to address hot gas clean-up and sulfur controls. What portion of this funding will be used for testing of sorbents in the desulfurizer being constructed at Morgantown?

Answer. No portion of this funding increase will be used for testing of sorbents in the FETC Morgantown hot gas desulfurization PDU. The funding increase is for continued R&D and testing of novel and advanced sorbents to control sulfur and NO_x emissions, completing R&D on sulfur recovery concepts, and validating performance of promising hot gas cleanup materials, components, or subsystems in facilities through slipstream/coupon testing. Such work is to be conducted at General Electric, Research Triangle Institute, and industrial companies yet to be determined through competitive solicitations.

Question. Why is it important to conduct tests both at Morgantown and at the IGCC clean coal project at Tampa?

Answer. Two very different reactor concepts are being tested by Tampa Electric and FETC Morgantown. The Tampa project will demonstrate the General Electric moving-bed desulfurizer concept for hot gas cleanup. This concept has been developed by General Electric over the past 10 years through DOE sponsorship. It has been taken through the research scale-up process from bench-scale simulated gas testing to real coal gasifier-fired Process Development Unit testing. It is ready for demonstration in a commercial setting as planned for this year at Tampa Electric's Polk Power Station. The FETC desulfurizer is at the Process Development Unit testing scale. It employs two reactor concepts, the fluid-bed and transport-bed reactor for hot gas desulfurization. It is fired by a simulated coal gas, and initial R&D efforts will focus on transport-bed desulfurization.

All three concepts are being developed and proven out in order to establish the most efficient and effective desulfurizer system for hot gas cleanup. Hot gas cleanup is a critical subsystem to both IGCC and PFB technologies in order to achieve much higher efficiencies. The Department believes that it is necessary to develop more than one desulfurizer system to minimize the technical risk. Additionally, the two desulfurizers at FETC Morgantown will be used to test and develop various sulfur

sorbents. The Tampa CCT project is demonstrating the larger G.E. moving-bed desulfurizer as a critical subsystem versus conducting a sorbent R&D test program.

PRESSURIZED FLUIDIZED BED

Question. This technology involves high combustion and heat transfer efficiency; sulfur dioxide removal through the introduction of sorbents; and low NO_x emissions as a result of low combustion temperatures. In fiscal year 1998, an increase of \$796,000 is recommended for continued research at Morgantown on hot gas particulate cleanup and to improve understanding of combustion in the PFB technology. The objective is to reduce the risks associated with commercialization of PFB technology. To what extent is the funding necessary for the research at Morgantown linked to technical issues that have surfaced as a result of testing done at the Wilsonville facility?

Answer. Filter testing to date at Wilsonville is limited to shakedown mode of operation. There are insufficient hours of operation for technical issues to surface to date. The Wilsonville Advanced PFBC pilot scale process, which includes high-temperature filter systems, is scheduled to go into operation in first quarter 1998. The Morgantown Research Development Program is the primary center of effort which focuses on filter systems development in support of future testing at Wilsonville. For example, the filtration systems are being developed in partnership with scientists at the Oak Ridge National Laboratory and with cost-share industrial vendors such as Westinghouse Science & Technology Center (Pittsburgh, PA); Pall Corporation (Cortland, NY); Babcock & Wilcox (Lynchburg, VA); DuPont/Lanxide (Newark, DE); Techniweave (Rochester, NH); Combustion Power Company (San Mateo, CA); and Industrial Filter & Pump Mfg. Company (Cicero, IL). Other vendors providing systems and components include Coors Ceramics (Golden, CO); 3M (St. Paul, MN); Refractron Technologies Corp. (Newark, NY); and CeraMem (Waltham, MA). This research is necessary in support of the performance of advanced PFBC systems in order to meet current and future particulate emissions standards and stringent gas turbine inlet specifications. In addition to supporting the Wilsonville facility, the Morgantown research also supports the DOE Clean Coal Technology Program which currently has one advanced PFBC project that will utilize this technology.

Question. If the increased funding is not provided, what consequence will this have on making further progress towards proving the viability of the PFB technology?

Answer. If the increased funding is not provided, it would significantly delay resolution of key filter issues, e.g., long-term temperature degradation, overall system reliability, and would significantly increase the performance risks associated with the hot gas cleanup system operation at Wilsonville and the Lakeland Advanced PFBC CCT Demonstration project.

NATURAL GAS RESEARCH

Coal mine methane

Question. The fiscal year 1998 budget proposes \$963,000 for research into the issue of coalmine methane. Current mining practices often result in venting of methane gas to the atmosphere, which is a concern in terms of greenhouse gases. Is the release of methane gas into the atmosphere a problem for all mines, or is it particularly focused on smaller mines?

Answer. Methane emissions from coal mines are a significant source of greenhouse gas. EPA estimates that in 1988 about 9.0 to 12.6 million metric tons of carbon equivalent (MMTce) was released from the methane emission of 60 mines classified as large and gassy (greater than 0.5 million tons of coal per year and greater than 500 cubic feet of methane per ton of coal). EPA further estimates that 19.2 to 30.0 MMTce will be released from coal mines in 2000.

Question. Why is it more of a problem for smaller mines?

Answer. The goal of the program is to expand existing research efforts to broaden the range of cost-effective technologies/methods for recovering and utilizing methane associated with mining, especially in smaller mines where the economics of methane recovery is marginal.

Question. How would the proposed funds be used?

Answer. Ten Phase I awards were made in fiscal year 1995 for feasibility studies in response to a competitive solicitation that sought proposals for cost-shared demonstrations of alternative ways by which recoverable methane released in the course of underground coal mining could be economically utilized. Based on an assessment of these studies, five of the proposers were selected for Phase II engineering design

preparation. The requested amount would fund the Phase II Engineering Design for the five contractors selected.

ADVANCED TURBINES PROGRAM

Question. In fiscal year 1997, Congress funded the advanced turbines program at a level of \$46.6 million. In fiscal year 1998, the Administration proposes to reduce this program by \$15.2 million to a level of \$31.4 million. This reduction occurs despite indications that development of advanced turbines is a high priority because of the potential results—high efficiency (greater than 60 percent, as compared to current power generation systems in the 35 percent range). When the turbine program began, the Department laid out its plan for a comprehensive program and a series of timetables. Based on the funding provided to date for this program, what is the current schedule for completion of the turbines program?

Answer. Based on the funding to date, and assuming future funding is consistent with the ATS Turbine funding profile provided to Congress in fiscal year 1994, estimated completion is the end of 2000. However, with the fiscal year 1998 budget request of \$31.4 million, the estimated completion is the end of 2002.

Question. How does this compare to the initial proposal?

Answer. The funding provided thus far is consistent with the same completion date as the initial proposal. However, with the fiscal year 1998 budget request, the estimated completion is stretched out by two years.

Question. How does the funding level proposed for fiscal year 1998 affect the schedule?

Answer. The administrative budget for fiscal year 1998 of \$31.4 million would stretch out the program by 2 years.

Question. What are the advantages and disadvantages of stretching out the schedule?

Answer. An advantage to stretching out the schedule is that budget needs are spread out over a longer time period, thus enabling us to deal with budget constraints. The disadvantage to stretching out the schedule is the potential loss of market share to foreign competitors and increases in overall program cost due to slip in schedule.

Question. How does it affect the overall cost of the program?

Answer. The overall cost of the program would escalate due to general inflation caused by a stretch in the schedule. This is due to work that will have to be performed at a date later than currently planned with attendant higher labor and material costs.

Question. Does the fiscal year 1998 budget include adequate funding to complete all aspects of Phase III (full scale component and sub-system testing)?

Answer. The fiscal year 1998 budget of \$31.4 million is adequate to complete the originally planned baseline activities for fiscal year 1998 (including Phase III), but will stretch out the overall program schedule by up to 2 years.

Question. Are there promising technological advances thus far in the turbines program that merit further investigation as part of phase III?

Answer. With the funding levels of fiscal year 1997 (\$46.6 million) Phase III has remained on schedule and several promising technological advances have been made in the program. Both General Electric and Westinghouse have performed tests and collected data to verify that their advanced gas turbine designs can be successfully manufactured and operated. During the past year, both General Electric and Westinghouse have made significant progress in advanced turbine engine design and technology validation testing. GE successfully completed heat transfer testing on full-scale, first-stage nozzle cascades at their laboratory in Evendale, Ohio. Results of the test showed that steam cooling is as effective as predicted with pre-test calculations. Steam cooling is a revolutionary technique which has not yet been used to enable gas turbine operation at ultra-high efficiencies. The GE Advanced Technology Combined Cycle promises improved economics of electric power generation with outstanding environmental performance in natural gas and coal-fired applications. Under the first year of Phase III, Westinghouse has also been highly successful in technology development and testing. During this stage of the program, Westinghouse has successfully developed and tested the piloted-ring combustor for ultra-low NO_x emissions with excellent stability, advanced seals for increased turbine efficiency, new thermal barrier coatings (TBC), and a new inspection tool to spot TBC defects before they become a problem. These promising technologies developed during Phase III may merit further investigations beyond the originally planned baseline activities for Phase III.

Question. If so, what funding is necessary to conduct the investigations?

Answer. Funding required to conduct the investigations and to remain on the original schedule is estimated at \$58.6 million for fiscal year 1998 as given in the 1994 Advanced Turbine System Program Report to Congress.

Question. If the increased funding is not provided, how will DOE proceed?

Answer. A stretch out in the program will occur and certain activities planned to be initiated in fiscal year 1998 will not begin until fiscal year 1999.

Question. There are presently two major contractors participating in the utility-scale aspect of the turbines program. Is it DOE's estimation that a logical down-selection to one contractor should occur after completion of phase III and prior to initiation of phase IV?

Answer. The original baseline program is structured to include a down-select to one contractor to continue in Phase IV. Down-selection to one contractor for Phase IV continuation could occur prior to final completion of Phase III if sufficient information from Phase III exists upon which to base a selection. The Department is also evaluating options for a restructured program that could include the retention of both developers, while maintaining cost to the Government within the original program estimate.

Question. What funding is necessary to initiate phase IV and keep the program on-schedule?

Answer. Funding of \$58.6 million (as indicated in the 1994 Report to Congress) is necessary to initiate Phase IV and keep the program on-schedule.

Question. Is this amount included in the fiscal year 1998 budget request? If not, what funding level is necessary to stay on schedule?

Answer. No. The fiscal year 1998 budget request of \$31.4 would result in a shortfall of \$27.2 million needed to stay on the initial schedule. The funding level of \$58.6 million would be required to stay on that schedule.

Question. What is the estimated total cost of phase IV?

Answer. The anticipated Government cost for Phase IV of the program is approximately \$155 million.

Question. What level of cost-sharing is anticipated?

Answer. The anticipated range of industrial cost share for Phase IV is in the 60 percent range. It will vary depending on final selections and negotiations.

FUEL CELLS

Question. Fuel cells represent another technology supported in the fossil energy program because of their promising prospect as a highly efficient and environmentally "clean" power system. Technology development continues to address cost barriers that preclude widespread market introduction. These systems, which can be operated using natural gas, and gas and coal (liquefied into gas), offer reduced pollutants and lower emissions than conventional power systems. When combined with gas turbines, fuel cells have the potential to operate at higher efficiencies (70 percent) and low emissions. The fiscal year 1998 budget proposes \$46.3 million in total for the fuel cell program, a decrease of \$3.8 million from the fiscal year 1997 level. As with the turbines program, multiple contractors are involved in a multi-year program. What impact does the proposed fiscal year 1998 funding level have on the schedule for the molten-carbonate fuel cell program?

Answer. The requested funding level for molten carbonate fuel cells for fiscal year 1998 is \$32.7 million and is a result of having to balance the funding priorities given budget constraints. The impact is a 2-year slippage in the original schedule. It is now expected that developers would have a commercially ready molten carbonate fuel cell power system in 2002.

Question. What funding would be necessary to maintain the current schedule?

Answer. The estimated amount as reported by the contractors required in fiscal year 1998 to maintain the current schedule is a total of \$50 million.

Question. If the fiscal year 1997 funding level cannot be restored, would DOE consider downselecting to one contractor in the molten carbonate program?

Answer. Downselecting to one contractor in the molten carbonate program is not planned. The prospects of successful market entry and a sustained domestic fuel cells industry are enhanced by maintaining both developers although it may result in the schedule being slipped.

Question. What are the advantages and disadvantages of doing such a downselection at this time? (Appear to be in Phase III—product improvement and cost reduction—which is anticipated to last through fiscal year 1999).

Answer. The advantages of a downselection to one contractor at this time are the concentration of requested molten carbonate funding to the remaining contractor thus allowing acceleration of that contractor's schedule. Disadvantages of down selection of a developer at this time include the following: It could result in collapse

of the downselected developer or entry of foreign investors to fill the gap; since each developer is targeting a different power system application, it would leave that application unfilled; it would not protect the taxpayers' investment in this highly beneficial technology; the establishment of a strong, diverse, domestic fuel cell industry would not be realized; clean, highly efficient energy benefits, high value jobs and other economic benefits to the United States would be limited.

Question. A different type of fuel cell technology is the solid oxide fuel cell. This program is proposed for funding at a level of \$12.4 million in fiscal year 1998, roughly level with the fiscal year 1997 appropriation. It is my understanding that the industry partner in this program has identified a need of \$16 million for SOFC in fiscal year 1998. If this higher level is not provided, what do you anticipate will happen with the program?

Answer. The requested level for fiscal year 1998 for the solid oxide fuel cell is a result of having to balance fiscal constraints with program needs to generate an overall balanced portfolio of technologies. The effect is that the developer is expected to stretch out the development schedules for 2 years and reach a commercially ready power system in about 2002.

QUESTIONS SUBMITTED BY SENATOR COCHRAN

STATE AND LOCAL PARTNERSHIP PROGRAMS

Question. Mr. Secretary, I've heard some good things about DOE's State and Local Partnership Programs as they operate in Mississippi. These funds have been used by our State Energy Office to create partnerships with other levels of government, non-profit entities, and businesses to leverage substantial additional funding and resources. While the fiscal year 1998 Request would provide a modest increase over last year, it is still far below the level provided back in fiscal year 1995. Are you aware of the success that some of the States have achieved with these funds?

Answer. We are indeed aware of the success of these programs. As example we cite the following programs sponsored by the State of Mississippi:

Master Lease Program.—Utilizing services of legal and financial consultants funded under a DOE State Energy Program, the Mississippi Department of Economic and Community Development (MDECD)—Energy Division worked with state government leaders and secured legislative authority to establish a tax-exempt loan program through which a third-party financier would provide pre-arranged, tax-exempt financing for energy efficiency projects in public facilities. The Master Lease Program reduces high origination fees associated with individual project financing and streamlines an otherwise lengthy funding process. The Energy Division provides technical assistance to the public administrators in determining an energy management improvement plan and provides the financier with verification of project need. Currently, more than \$2.5 million in energy projects with an estimated \$400,000 annual energy dollar savings are underway in facilities operated by public school and local governing authorities.

Alternative Passenger Rail Program.—Funding provided by the MDECD-Energy Division along with other state, federal, local government units, and private entities has enabled four Mississippi coastal municipalities to renovate or construct manned or unmanned passenger facilities for both passenger and freight rail services. The renovations, such as parking lot improvements, upgrading handicapped facilities, and enhancing public waiting areas, enables the municipalities to promote energy efficiency by diverting traffic into intermodal activities such as park-and-ride and use of public transit for local travel along the Mississippi Gulf Coast.

Energy Efficient Building.—Through local, state and federal funding, an energy efficient, environmentally controlled Math/Science Complex building was constructed on the campus of Northeast Mississippi Community College, Booneville, Mississippi. The MDECD-Energy Division provided both technical assistance and funds to install the most energy efficiency technologies currently available. The building has served as a model for energy efficient management planning for public use facilities. It has also been featured on national and international radio and television stations and in national consumer and trade magazines.

Over the history of the State Energy Program and its predecessors, the State Energy Conservation Program and the Institutional Conservation Program, on a Nationwide basis over 8,000 State energy projects of many types have been funded, and over 69,000 schools and hospitals buildings have been made more energy efficient. Additional funding provided by DOE end-use sector offices since fiscal year 1996 has allowed States to implement additional State-oriented building, industrial, transportation and utility sector programs.

Question. Given these good results, why isn't the funding for the State Partnership Programs being increased even more to bring it back in line with the fiscal year 1995 level of \$53 million?

Answer. In addition to the increased funding the Administration has proposed for the State Energy Program, which includes the State partnership activities, the Department of Energy has provided funding from end-use sector offices for Special Projects under SEP. Those funds totaled \$11.2 million in fiscal year 1996 and \$9.8 million in fiscal year 1997. It is anticipated that Special Projects funding will continue in fiscal year 1998. Traditionally State Energy Offices have been able to leverage their Federal funds for this program at the rate of 4 non-Federal dollars for each Federal dollar received, and have leveraged as much as 13 to 14 non-Federal dollars for each Federal dollar for some activities.

CLEAN COAL TECHNOLOGY

Question. Mr. Secretary, there is a very large clean coal technology project currently underway in Mississippi. What are your thoughts on DOE's long-term commitment to the Clean Coal Technology Program?

Answer. The DOE is fully committed to the successful completion of the Clean Coal Technology Demonstration Program. Considerable effort is being dedicated to careful financial management and project stewardship of the program to successfully achieve a number of objectives. These objectives include completion of all projects in the program that continue to show success in achieving their technical milestones while at the same time providing the fiscal management that permits the Department to recommend the rescission of funds as they become excess to the needs of the program in accomplishing its objectives.

QUESTIONS SUBMITTED BY SENATOR LEAHY

ENERGY INFORMATION ADMINISTRATION

Question. Given this winter's unusually high prices for many fuel commodities across the country, especially home heating oil and propane, what actions is the Energy Information Agency planning to take to address the need for increased tracking and dissemination of information on trends in fuel prices?

Answer. The Energy Information Administration took a number of measures to make the public aware of price volatility in the market place during the 1996/1997 heating season. EIA increased the frequency of its State Heating Oil and Propane Program (SHOPP) survey from semimonthly to weekly, thereby providing residential heating oil and propane prices on a more timely basis. In addition, EIA prepared numerous briefings, presentations, and articles, keeping the public informed of current market conditions. In early November, EIA cosponsored the Winter Fuels Conference in Washington, D.C., to inform energy officials about heating fuel outlooks for the upcoming winter heating season.

Weekly price and supply information were disseminated through publications, market watch publications, phone (price hotline), fax-on-demand, and the Internet. Through its energy emergency communications protocol with State Energy and Emergency Management offices, EIA was able to exchange information with states regarding any concerns and problems associated with transportation logistics, motor driver waiver restrictions, refinery problems, and heating fuel shortages. EIA also participated in biweekly conference calls with state offices to keep them informed of energy markets, as well as the status of the Low Income Home Energy Assistance Program. Currently, EIA is conducting an analysis of the propane market to examine the supply and demand conditions of the past heating season. This report will be published in May 1997.

With respect to increasing the tracking and dissemination of fuel price information, EIA recognizes that there are several gaps in its coverage of sensitive winter fuels. These include timely data on retail natural gas prices year around and on other winter fuels during critical stock building periods in the late summer. There is little likelihood these gaps can be filled with existing resources. EIA will continue, however, to conduct the SHOPP survey for the upcoming heating season, publish monthly price and supply data, provide heating fuel assessments as needed, and coordinate energy information with State and Federal agencies.

Question. In particular, I am concerned about the effects of potential cuts in EIA's budget on the provision of state-based data. How will EIA insure that this information is produced?

Answer. EIA recognizes that state-level data is essential to many users and expects to continue its current coverage within the 1998 budget. This has been pos-

sible through smaller samples and more efficient editing, processing, and dissemination procedures, including electronic methods. Nevertheless, any erosion of EIA resources from proposed levels may jeopardize all programs, including state-level data.

Question. The Administration has stated that one of its primary goals for the coal program of the Fossil Energy and Research Development is to develop super-clean emission control systems for SO₂, NO_x, air toxics and particulate matter that can be applied to existing plants. Has the Department conducted studies or models on how these developments will assist industry in meeting the proposed EPA ozone and fine particulate standards and what cost-savings have been projected for industry in developing new systems?

Answer. We have not conducted any modeling studies of the proposed EPA ozone and particulates standards. However, the goals of our programs are to achieve greater than 95 percent reduction in SO₂, 70- to 90-percent reduction in NO_x at one-half the cost of currently available approaches, and to reduce particulate emissions to less than one-tenth New Source Performance Standards. Achievement of those goals could significantly reduce the cost of meeting potential new standards and the regulations implemented to achieve those standards.

ELECTRICITY DEREGULATION

Question. As states begin to develop and implement their utility restructuring plans, a number of questions arise about the future of existing energy generating facilities that face regulatory and other costs that may affect their competitiveness. Some may argue that the closure of these plants will have environmental benefits and the federal government should look at ways to assist these facilities to be converted to more cost-effective power generation or decommissioning. Has the Department considered the establishment of a "decommissioning fund" to assist facilities and their surrounding communities reduce the economic impact of the transition.

Answer. The overall impact of restructuring on plant retirement patterns is unclear, but we would not be surprised if it hastened the retirement of some existing fossil and nuclear generation units. We are aware of the potential economic hardships related to plant retirement, particularly in a small community that has relied on the plant as both a major source of employment and tax revenue. The Department has not, however, considered the idea of an economic decommissioning fund. The core of the problem appears to be the need for new economic development in communities affected by plant closures. We see this as an issue that states need to address as part of their overall plans for the transition to competition in retail electric markets.

QUESTIONS SUBMITTED BY SENATOR DORGAN

COOPERATIVE RESEARCH AND DEVELOPMENT

Question. The scientific community, as well as the Administration itself in its 1994 report: "Science in the National Interest", recognizes the significance of basic research as the foundation for emerging technologies. The basic research component of the Jointly Sponsored Research program under the DOE Cooperative Agreement ensures that development activities address the public interest and not the special interests of individual industry partners; it is the antithesis of "corporate welfare". Yet, each year the Department of Energy's budget request fails to include funding for basic research under this program. Congress has traditionally restored funding for the basic research component so this crucial function has, fortunately, been able to continue. Can you provide me with the Department of Energy's justification for not including basic research funds in the Cooperative Research and Development Account?

Answer. The Department is very satisfied with the cost sharing that both the Western Research Institute (WRI) and the University of North Dakota Energy and Environmental Research Center (UNDEERC) are receiving under the jointly sponsored research program. In order to get the greatest benefit from our limited budget resources, it was decided to support the cost shared aspects of this program instead of the base program, because it leverages the government funding to provide for significantly more research, and better assures its development in the marketplace.

Question. The Department has recognized the EERC's expertise by including \$1.864 million for cost-shared coal related research approved by the Department of Energy and which is consistent with the Fossil Energy mission. Did the DOE intend to limit this research initiative to coal to the exclusion of oil and gas, and if so, why?

Answer. The Department, in requesting funds for University of North Dakota Energy and Environmental Research Center (UNDEERC), has anticipated a need to

utilize the specific, recognized talents of the UNDEERC employees in the area of coal research. Currently, UNDEERC is providing support to Fossil Energy in the Advanced Clean/Efficient Power System area and it is possible that the Department would have a need for additional research in this area or in the Advanced Clean Fuels Research area.

ADVANCED FUEL CELLS

Question. During your testimony before the subcommittee last year, you mentioned that you would be testing in the commercial market “advanced fuel cells” that were developed under the Fossil Fuel R&D Program. Can you advise me of the results of these tests?

Answer. The Molten Carbonate Fuel Cell Program has two field test demonstrations of technology developed under the Fossil Energy R&D Program. The first is a megawatt-scale integrated unit in Santa Clara, CA, operated by the City of Santa Clara. Testing has just been completed. The general power plant operation was successful despite some technical problems encountered. The unit operated as designed and produced full rated electric power into the power grid resulting in the largest fuel cell power plant operated in the United States. The fundamental problems experienced were not caused by principal developmental equipment and are easily surmountable. Plant operating time was limited to about 4,000 hours primarily by private-sector funding. The second field test demonstration is a 250-kilowatt integrated unit near San Diego, CA, operated by the local utility. It contains the world’s largest molten carbonate fuel cell stack. Operation began in January and is currently successfully generating about 80 percent of full electric power and co-generated heat. Operating time of about 8,000 hours is scheduled. No significant technological problems have been encountered.

SUBCOMMITTEE RECESS

Senator GORTON. The subcommittee will stand in recess until 9 a.m., Thursday, April 10, when we will receive testimony from the Bureau of Indian Affairs and the National Indian Gaming Commission.

[Whereupon, at 4 p.m., Thursday, March 13, the subcommittee was recessed, to reconvene at 9 a.m., Thursday, April 10.]

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, APRIL 10, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Slade Gorton (chairman) presiding.
Present: Senators Gorton, Cochran, Domenici, and Bennett.

DEPARTMENT OF THE INTERIOR

BUREAU OF INDIAN AFFAIRS

STATEMENT OF HON. ADA E. DEER, ASSISTANT SECRETARY FOR INDIAN AFFAIRS

ACCOMPANIED BY:

HILDA A. MANUEL, DEPUTY COMMISSIONER OF INDIAN AFFAIRS
JOANN SEBASTIAN MORRIS, DIRECTOR, OFFICE OF INDIAN EDUCATION PROGRAMS
DEBORAH J. MADDOX, DIRECTOR, OFFICE OF TRIBAL SERVICES
TERRY VIRDEN, DIRECTOR, OFFICE OF TRUST RESPONSIBILITIES
JAMES H. McDIVITT, ACTING DIRECTOR, OFFICE OF MANAGEMENT AND ADMINISTRATION
LINDA RICHARDSON, DIRECTOR OF AUDIT AND EVALUATION
JERRY SCHWEIGERT, FACILITIES TRANSITION PROGRAM STAFF
ROSS MOONEY, DAM SAFETY OFFICER, BIA

BUDGET REQUEST

Senator GORTON. Good morning. The subcommittee meets today for the second of its hearings on 1998 budget requests for agencies funded by the Subcommittee on Interior and Related Agencies.

This morning we will hear testimony regarding the 1998 budget request for the Bureau of Indian Affairs and the National Indian Gaming Commission. Testimony on the Office of the Special Trustee for American Indians will be heard in conjunction with the Secretary of the Interior's hearing.

We will begin with the Bureau of Indian Affairs and then proceed to the National Indian Gaming Commission [NIGC]. Because members of the subcommittee may have questions on both programs, we ask that all of the witnesses remain at the table for the duration of the hearing.

Ada Deer, who has announced her departure from the BIA but who has not yet been replaced, will present testimony on the BIA

budget together with staff. Ada Deer will also testify on behalf of the NIGC as the Commission's Acting Chairman. I encourage both the Bureau and the Commission to complete their processes for finding a permanent Assistant Secretary and Chair.

Before you begin I would like to remind everyone here of the formidable task before the subcommittee. We are responsible for funding a number of diverse agencies. A large part of the bill is devoted to funding the four land management agencies: the Park Service, the Bureau of Land Management, the Fish and Wildlife Service, and the Forest Service. The cost of day to day management of our natural resources continues to increase in spite of a reduction in the rate of land acquisition, and inventories of infrastructure maintenance backlogs are increasingly unmet and growing into the billions of dollars.

The second significant group of agencies in our bill is more loosely defined and consists of scientific agencies, like the Geological Survey, the Minerals Management Service, and the Office of Surface Mining, each of which has important regulatory, land management, or study responsibilities.

The third major group of agencies in our bill are cultural: the Smithsonian, the National Gallery of Art, the Kennedy Center, and the National Endowments for the Arts and Humanities. While these agencies account for only a small portion of the total funds appropriated in the Interior bill, they are in many cases responsible for the protection of our Nation's heritage. As for the endowments, I imagine you are aware of the vocal support they receive from people all across the country, as well as from many Senators on both sides of the aisle.

The fourth grouping of funding is for a portion of the Department of Energy programs.

A final group consists of programs for the benefit of native Americans, including the BIA and the NIGC, but also including the Indian Health Service, for which the cost of simply maintaining existing levels of health services increases at an annual rate that exceeds inflation by a substantial amount.

The bill will be increasingly burdened also by the costs associated with reform of trust responsibility functions.

I have broken the bill out this way, Ms. Deer, so that you can see what your challenges are. The competition for funds will be even more fierce if the President and Congress are unable to enact a budget that includes measures that enable us to achieve balance without relying almost exclusively on reductions in discretionary spending. It is becoming ever more possible that such draconian measures are likely.

The President's budget this year is relatively generous with this subcommittee, but the President's budget is also, by any rational and conservative standard, dramatically out of balance, and we will simply not get the allocation in the President's budget unless there is an agreement on entitlement reform and a number of other issues that have caused dramatic differences between the Congress and the President in the past.

I hope we are going to be able to get that full allocation, but I am going to have to plan for a markup which has considerably less. As I told you each of the last 2 years, under those circumstances

we are going to need your aid and assistance in setting priorities for the programs that are under the jurisdiction of the Bureau.

With that, I will be delighted to hear your opening statement.

SUMMARY STATEMENT OF HON. ADA DEER

Ms. DEER. Thank you, Mr. Chairman, and the other distinguished members of the committee when they arrive.

Senator GORTON. We hope we will have some more of them here before you are finished.

Ms. DEER. I am delighted to be here today to present testimony on support of the President's request for the Indian affairs budget. Rather than read the prepared testimony which has already been submitted for the record, I will present a very short summary.

INTRODUCTION OF ASSOCIATES

Accompanying me we have: Hilda Manuel, Deputy Commissioner; Deborah Maddox, Director of Tribal Services; Terry Virden, Director of the Office of Trust Responsibilities; Joann Sebastian Morris, Director of Tribal Education; and Jim McDivitt, budget and administration. I am not sure I have your correct title, but those are your functions.

Mr. MCDIVITT. Close enough.

Ms. DEER. This budget is extremely lean. Yet it is responsive to the needs of the tribal communities. It provides funds for the basic operation of the Bureau and will permit us to alleviate some backlogs in trust programs. Great care has been taken in its preparation and we strongly urge this committee to appropriate funds at the President's requested level of \$1.73 billion.

The proposed budget contains a modest increase of \$126 million over the fiscal year 1997 appropriation. Nearly one-half of this increase will accrue to the tribal priority allocation to support vital tribal governmental services such as law enforcement, social services, child welfare programs, among others.

Since 1995 shortfalls in these programs have been particularly serious. The exceptionally harsh weather patterns of the past 2 years have damaged buildings, roads, bridges, and other physical infrastructure in many areas, increasing needs as well.

About one-third of the requested increase will benefit Indian schools. I have made a point of visiting as many tribal and BIA schools as possible. Recently I had the opportunity to visit the Chief Leschi High School in Washington State. While I was there I learned, Mr. Chairman, that you have been a strong advocate and supporter for the school, and I want you to know how much your efforts are appreciated.

It is a wonderful school, one of the finest, and any community would be proud to have a school like this. I wish that every school in our system was like the Chief Leschi High School. Unfortunately, this is not the case. Classrooms are overcrowded in virtually all of the schools and some are in a disgraceful state of dilapidation and disrepair. The bus fleet is aging, a process accelerated by the rough roads and harsh climates in much of Indian country.

Funding has not kept pace with the needs of our school system, which are growing. We anticipate an annual increase in enrollment

of approximately 3 percent. One-third of the BIA's requested construction budget will be used for education construction so that we can continue to replace some of the unsafe schools on the priority list.

The schools on that priority list are some of the oldest, most dilapidated schools in our system; \$8 million of the requested increase in the facilities improvement budget and repair will be used for school repairs.

At a minimum, we must provide children a safe learning environment in schools that meet accreditation standards and good teachers who are provided essential training and continuing education. The requested resources are vital to this result.

The remainder of the requested increase will be used to address high priority needs in a number of areas, particularly in relation to public health and safety. Some \$4 million of the increase will be used to repair structural deficiencies in high-hazard dams on Indian lands. This is particularly important given the severe flood conditions in many areas of the country this past year.

We have requested a \$12 million increase for public safety and justice construction, which will fund the construction and repair of detention centers and the establishment of fire protection safeguards and schools and other facilities.

Mr. Chairman, I know that you are interested in determining the level of tribal investment in various tribal governmental operations in comparison to the Federal contribution. I am pleased to be able to address this issue here today. While there are some differences between the accounting methodologies used by Federal and tribal governments respectively, we were able to produce a reasonably reliable snapshot based on information in the single audit reports filed by tribal governments.

We reviewed the expenditures documented by 192 tribes in these reports. The total came to 1.3 billion. You may be surprised to learn that 45 percent of the total, or \$593 million, came from the tribes' unrestricted general fund. Department of the Interior contributed slightly less than 25 percent or \$324 million. The remaining 30 percent, or \$399 million, came from other Federal and State sources.

Finally, Mr. Chairman, I know you have had serious concerns about the BIA's efficiency. I would like to take this opportunity to emphasize that we have been sensitive and responsive to fair criticism. I have long been a strong and outspoken advocate of measures to make the Bureau a more efficient, effective responsive, and responsible agency, and I have pushed hard to improve its management and operations.

We have also worked hard to carry out Congress' intent to shift greater authority and responsibility for program and service delivery to tribal governments. Accordingly, we have been able to reduce our FTE level by more than 2,000 positions since 1995, achieving our lowest staffing level in more than 15 years. This is due to large congressional budget reductions as well as increased tribal contracting.

In spite of diminished resources, we have achieved a 66-percent improvement in resolving material weaknesses in our management. We have satisfactorily resolved 11 material weaknesses, bringing

the number from 16 to 5 in the last 4 years. We have closed all of the 123 overdue external audits which existed when I was sworn in and none are overdue at this time.

We have dramatically improved the rate at which corrective actions are taken to problems identified in internal audits, 11 internal audits have been closed just since September.

While we have worked hard to improve our management and become more efficient, we have realized some negative impacts from downsizing. The backlogs in land titles and records have increased. Recently the inspector general identified problems in our computer operations attributable to lack of staff. There was a loan servicing failure in the Phoenix area because of insufficient staff.

The few modest increases requested in this budget will allow us to alleviate some of the most severe backlogs in our trust operations, including land titles and records and administrative records management, and to continue work toward replacement of the facilities management information system.

PREPARED STATEMENT

We have made a real difference in the way our Nation conducts its affairs with the first Americans. Today 90 cents of every dollar directly serves tribal communities and tribal members. Gone is the attitude that the Bureau knows what is best for Indian people. Today the Bureau works to empower tribal governments. It is a new era. Yet we must be cognizant of and act consistently with the solemn duties and obligations to which our Nation pledged itself some 200 years ago.

There are no frills in the budget that we have presented today. Hard choices were made and priorities were set. We urge favorably the consideration of the President's request.

Thank you and we are open for questions.

[The statement follows:]

PREPARED STATEMENT OF HON. ADA DEER

INTRODUCTION

Good morning, Mr. Chairman and Members of the Committee.

The Bureau of Indian Affairs (BIA) is the principal bureau within the Federal Government responsible for the administration of federal programs for federally recognized Indian tribes, and for promoting Indian self-determination. In addition, the BIA like all Federal agencies has a trust responsibility emanating from treaties, statutes, judicial decisions and agreements with tribal governments. The mission of the BIA is to enhance the quality of life, to promote economic opportunity, and to carry out the responsibility to protect and properly manage the trust assets of Indian tribes and Alaska Natives. The BIA provides resources and delivers the kinds of services to support tribal government operations similar to those provided by State, city, and municipal governments. These services include, but are not limited to: law enforcement, social services, education, housing improvements, loan opportunities for Indian businesses, and leasing of land.

The BIA currently provides Federal services to approximately 1.2 million American Indians and Alaska Natives who are members of more than 550 federally recognized Indian tribes in the 48 contiguous States and in Alaska. The BIA administers more than 43 million acres of tribally-owned land, more than 10 million acres of individually-owned land, and over 400,000 acres of federally owned land which is held in trust status.

The Bureau is headed by the Assistant Secretary—Indian Affairs, who is responsible for BIA policy. Reporting to the Assistant Secretary are the Deputy Assistant Secretary for Indian Affairs, the Deputy Commissioner of Indian Affairs, the Director, Office of Indian Education Programs and the Directors of the Offices of Amer-

ican Indian Trust, Self Governance and Audit and Evaluation. Day-to-day operations of the BIA are directed by a Deputy Commissioner of Indian Affairs, who has authority over 12 Area Offices, 83 Agency Offices, three subagencies, six field stations, and two irrigation project offices. The Director of the Office of Indian Education Programs has direct authority over 26 education line officers. At the end of fiscal year 1996, the BIA's total employment was 10,672 full-time equivalents.

STREAMLINING

While increased tribal contracting of programs and the transfer of schools to tribal operation has resulted in a consistent decline in BIA staff over the last decade, the most significant change in Bureau staffing levels occurred in fiscal year 1996 as a result of Congressional budget reductions. The number of BIA staff is at its lowest level in over 15 years; FTE levels have been reduced by more than 2,000 since 1995.

The BIA Central Office has been trimmed to a "residual" level where only trust and inherently federal functions remain. Management and administrative positions have been reduced bureau wide to levels at or below the ratios and proportions recommended by the National Performance Review. Budget specialists, acquisition specialists, accountant positions, and personnel specialists have all been reduced by significant numbers.

At the field level, many FTE reductions are taking place as a result of increased tribal contracting and self-governance compacting. One recent example is the Red Lake Agency in Minnesota, where the Red Lake Band of Chippewas is now contracting for all BIA funded programs resulting in the displacement of more than 70 Bureau employees. Another example is the Mississippi Band of Choctaws who are taking over all of the BIA facilities operations at the Choctaw Agency displacing 12 to 15 BIA employees. Many tribes which have not previously contracted with the BIA are issuing notices of intent to contract an entire agency, such as in the Albuquerque Area, or law enforcement programs, as has occurred at several agencies.

FISCAL YEAR 1998 BUDGET OVERVIEW

The fiscal year 1998 budget request for the BIA is \$1.73 billion in current appropriations, an increase of about \$126 million above the 1997 enacted level. The budget emphasizes the resources tribes need to provide basic reservation programs, develop strong and stable governments, ensure accreditation of Bureau schools, address critical infrastructure needs, and meet the Secretary's trust responsibilities. The BIA continues to keep administrative costs low; more than nine of every ten dollars appropriated to the BIA is provided directly to reservation programs.

While the BIA's role has changed significantly in the last two decades with an increasingly greater emphasis on Indian self-determination, Indian tribes still look to the Bureau to provide a broad spectrum of critical and complex services administered either by the tribes or the BIA: from an education system for an estimated 52,400 elementary and secondary students; to 24 tribally controlled community colleges; to law enforcement and detention services on more than 200 reservations; to social services programs for children, families, the elderly, and the disabled; to management of the forest, mineral, fishery and farmland resources on trust land; to the maintenance of more than 25 thousand miles of roads and bridges on rural and isolated reservations; to economic development programs in some of the more depressed areas in the U.S.; to the negotiation and implementation of legislated land and water claim settlements; to the replacement and repair of schools and detention centers; and to the repair of structural deficiencies on high hazard dams.

OPERATION OF INDIAN PROGRAMS

In fiscal year 1998, the total request for Operation of Indian Programs (OIP) is \$1.54 billion, an increase of \$105 million over the fiscal year 1997 enacted level.

Within OIP, the single largest budget activity is tribal priority allocations (TPA) on which tribes depend for basic necessities and services such as law enforcement, child welfare, scholarships, natural resource management, and other programs critical to improving the quality of life and the economic potential of the reservations. Congress has given the tribes the flexibility to prioritize funds among TPA programs according to their unique needs and circumstances. TPA supports the goals of Indian self-determination by providing tribes with a choice of programs, as well as the means of delivery, either by the tribe or the BIA.

In fiscal year 1998, TPA will comprise nearly half of the BIA operating budget. The TPA activity is funded at \$757 million, an increase of \$76.5 million over the fiscal year 1997 enacted level, to help tribes address the unmet needs in basic pro-

grams. Shortfalls in these programs have become particularly serious with the reductions in this activity since 1995.

In fiscal year 1998, the BIA will continue to operate as a highly streamlined and decentralized agency, with maximum resources going to tribal programs. The BIA has identified \$3.4 million that will be transferred to TPA programs in fiscal year 1998. The BIA anticipates that about half of the fiscal year 1998 operating budget will be spent directly by tribes which elect to operate various Bureau programs under self-determination contracts, grants, or self-governance compacts. Self-governance compacts, which give tribes greater flexibility to administer BIA programs, now number 60 and are expected to rise to more than 70 in 1998.

Congress continues to fund specific Indian Education programs in response to treaty requirements and federal statutes. Current Indian Education programs are governed by a number of laws, including the Snyder Act, the Johnson O'Malley Act, the Elementary and Secondary Education Act, the Tribally Controlled Community Colleges Assistance Act, the Tribally Controlled Schools Act; the Education Amendments of 1978; the Hawkins Stafford Act; and most recently, Goals 2000 and the Improving America's Schools Act. Collectively, these laws are aimed at ensuring quality education of Indian youth and improving the long-term employment and economic opportunities on reservations.

The fiscal year 1998 budget includes a significant investment in Indian education. The request for School Operations, which will fund schools and dormitories serving an estimated 52,400 elementary and secondary students in 23 States, is \$467 million, an increase of \$16.8 million over fiscal year 1997. The increase is needed to ensure that schools can deliver quality education, maintain accreditation, and provide safe and adequate transportation for an estimated 3 percent annual increase in enrollment. The BIA anticipates that between School Years 1996-97 and 1998-99, the student population will increase by more than 3,000.

The budget provides an additional \$3 million for operating grants to the 24 tribally controlled community colleges, which have been successful in providing college-age and adults with college degrees and eventual professional employment. It is also anticipated that this increase will support Tribal Community Colleges as they provide job training, continuing education and GED's to those seeking employment due to Public Law 104-193, the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (Welfare Reform).

The budget includes trust investments crucial to saving additional costs in the out years. The BIA environmental management program is increased by \$3 million to begin to address the backlog of environmental cleanup work, which is estimated at approximately \$200 million. An additional \$1.5 million is needed for water rights studies and negotiation, as successful negotiations are always less costly than litigated claims. An additional \$3.4 million is requested to address the backlogs in adjudication and certification of title and ownership to Indian lands. Until the backlog is eliminated, trust income cannot readily provide an accurate and timely reflection of account holders' land interests and related revenues.

CONSTRUCTION

The request for the BIA Construction appropriation is \$125.1 million, with over one-third for Education Construction. In the last 2 years, the BIA has made progress in eliminating the unobligated balance in Construction facilities projects, mainly due to an increasing emphasis on tribal contracting for projects. The unobligated balance at the end of 1996 was the lowest in 5 years.

The Replacement School Construction program funds the replacement of older, unsafe, and dilapidated schools on reservations according to a Congressionally approved priority list, which is currently limited to 16 schools. In fiscal year 1998, \$14 million is requested to construct the Many Farms High School in Arizona, the fourth school on the Priority List. The main facility was demolished due to structural building failure; therefore, the 400 children at Many Farms are attending school in portable trailers that are more than 17 years old and have now deteriorated to the point where children's safety could be at risk. The Education Facilities Improvement and Repair Program is funded at \$32 million and includes an increase of \$8 million to continue to address the \$682 million backlog of repair work in existing education facilities.

The budget also requests \$16.5 million, an increase of \$12 million above the fiscal year 1997 level, for Public Safety and Justice construction. This activity funds detention centers on reservations and fire protection safeguards in schools and other facilities. Tribes cite law enforcement as a top priority; without adequate reservation detention facilities, offenders are prematurely released into the community. An increase of \$2 million is requested for facility improvement and repair of existing de-

tention facilities. The budget also includes \$9.1 million for replacement of the Ute Mountain Ute Detention Facility in Colorado and \$1 million to complete the design of the facility to replace the Salt River Detention Center in Arizona. Inmates of the current Ute facility are housed in a building so overcrowded that the health and safety of the inmates are a serious concern. A recent consent decree requires the BIA to immediately address the overcrowded conditions at the Ute facility.

The budget includes \$22 million, an increase of \$4 million over fiscal year 1997, for the correction of structural deficiencies of high hazard dams on Indian lands. The backlog of repairs to hazardous dams currently exceeds \$400 million. In fiscal year 1998, the BIA will begin correction of high risk problems on dams in Wyoming, New Mexico, and Montana.

INDIAN LAND AND WATER CLAIM SETTLEMENTS AND MISCELLANEOUS PAYMENTS

The program provides payments to meet Federal requirements for legislated settlements. The fiscal year 1998 budget request includes \$59.4 million for payments for settlements resolving long standing tribal claims to water and lands. A large portion of the fiscal year 1998 request is dedicated to the Ute Indian Rights Settlement, in order to move closer to the funding schedule set forth in the settlement.

TRIBAL SHARES AND THE NATIONAL PERFORMANCE REVIEW

The centerpiece of the National Performance Review Reinventing Government Phase II in the BIA is the tribal shares process. Along with the negotiated rule-making process for self-governance compacts and self-determination contracts, the tribal shares process is the mechanism that the BIA is using to accelerate the transfer of program operations to tribes and, ultimately, to downsize and restructure the BIA. The tribal shares process builds on the Administration's commitment to the policy of self-determination and local decisionmaking.

The first attempt to implement tribal shares was completed by a BIA team in February 1996. However, the process was delayed because consultation meetings with tribes revealed that tribes wanted full tribal participation in reviewing and determining inherently federal functions and their costs. The tribes feared that additional dollars identified for tribal shares would again be taken by the Congress for budget reductions as had occurred in fiscal year 1996. Tribes were also disappointed by the relatively small amount of funding being made available for tribal shares which offered little financial incentive to choose to contract/compact BIA programs. Some small tribes were also concerned about the diminishing amount of resources available to provide for tribes which did not contract services from the BIA.

Since September 1996 the Deputy Commissioner authorized and directed the election of 24 tribal representatives, two from each of the 12 areas, to serve as members of a tribal workgroup to establish a mutually agreeable tribal shares determination process in partnership with the Bureau. The joint federal/tribal workgroup recently met and achieved consensus on their plan to publish a list of inherently federal functions in the Federal Register by May 1, 1997. During the 90-day comment period, May 1–August 1, 1997, three regional tribal consultation meetings will be scheduled to obtain feedback and explain the list of functions. A revised list of inherently federal functions will be published as final in September 1997. The next phase of the tribal shares process is the identification of the costs associated with performance of the inherently federal functions, as well as the costs associated with functions available for contracting. The projected completion date is May 1998.

GOVERNMENT PERFORMANCE AND RESULTS ACT

As required by the Government Performance and Results Act (GPRA) of 1993 (Public Law 103–62), the BIA intends to submit a final strategic plan to the Congress by the end of fiscal year 1997. Based on a multitude of statutes, court rulings and treaty obligations, the plan will define the Bureau's long-term mission, broad goals and objectives. The program goals and objectives reflected within the budget justifications support these broad goals. In fiscal year 1998, the BIA will complete the fiscal year 1999 annual performance plan which will expand upon these programs goals by adding performance measures. These performance measures will help indicate the BIA's progress in meeting its mission as set forth in the strategic plan.

The BIA has made progress in implementing a GPRA pilot project for forestry and ecosystem restoration in the Pacific Northwest. The project's strategy included tribal participation in prioritizing projects which has resulted in a noticeable improvement in the tribe's satisfaction with funding distribution. The BIA is continuing to refine its methodology of collecting accurate data to measure overall project performance.

CONCLUSION

The funds requested in the President's fiscal year 1998 budget are critical to the health and well-being of tribal communities, tribal governments, and the tribal resource base. This funding will allow the Government as trustee to fulfill trust obligations and reduce the liability for failure to meet legally defined trust obligations.

This concludes my opening comments. My staff and I would be happy to respond to your questions.

SOURCES OF MONEY FOR TRIBAL GOVERNMENT

Senator GORTON. Thank you, and let me say before I begin my questions that, at least for myself, I am quite favorably impressed with the changes that you have made, not only in your administration, but with respect to tribal shares, over the period of your time here. You have a right to be proud of a great deal of what you have done, because much of it is not just purely administrative, but based on a set of theories.

I would like you to go over once again those sets of figures of the sources of money for tribal governments and exactly what services it is that they cover. Would you read that for me?

Ms. DEER. Level of tribal investment in various tribal government operations?

Senator GORTON. Yes, yes.

Ms. DEER. In comparison to the Federal contribution?

Senator GORTON. Yes; that is what I am after.

Ms. DEER [reading]:

While there are some differences between the accounting methodologies used by Federal and tribal governments respectively, we were able to produce a reasonably reliable snapshot based on information in the single audit reports filed by the tribal governments. We reviewed the expenditures documented by 192 tribes in these reports. The total came to \$1.3 billion.

You may be surprised to learn that 45 percent of the total, or \$593 million, came from the tribes' unrestricted general fund. The Department of the Interior contributed slightly less than 25 percent, or \$324 million. The remaining 30 percent, or \$399 million, came from other Federal and State sources.

Senator GORTON. OK, that is what I would like to pursue. Those figures relate to the moneys expended by tribal governments on their governmental activities, am I correct in that understanding?

Mr. MCDIVITT. Yes; that is correct.

Senator GORTON. That does not include their expenditures on other activities, even though some of them may have been funded by the BIA? Or does that include all the distributions of moneys from the BIA to the tribes?

Ms. RICHARDSON. Mr. Chairman, it includes all expenditures from the BIA and Federal agencies to the tribes, the general fund expenditures of tribes' unrestricted funds. Then tribes have a special revenue fund and in the special revenue fund all of the Federal funds are accounted for, and State funds as well.

Senator GORTON. Now, how, Ms. Deer—or any of your staff can answer this question if they wish—how do you determine at this point how much each tribe receives out of that fund?

Ms. MANUEL. Out of the special revenue fund or the general fund?

Senator GORTON. The general fund.

Ms. MANUEL. We do not have any control over the general fund. These are typically funds that are generated from tribal enterprises.

TRIBAL FUND DISTRIBUTION

Senator GORTON. No; I do not mean what the tribes are spending. I mean how do you determine—I have got the wrong question. How do you determine, of the money that we appropriate to BIA and that you distribute to the tribes, how do you determine how much each tribe gets?

Ms. MANUEL. Historically, the funding that has been allocated to tribes has been based on an old system that the Department and the Bureau had in place for several years called the Indian priority system, where the tribes in each location and each area establish what they felt was their need for funding on the basis of population, land base, forestry dollars. They looked at the number of forestry acres.

There was a process that actually was followed which to this day when we look at funding for new tribes we take the same factors into consideration.

So the funding was established years ago and it has been pretty constant. Tribes pretty much know what their base funding has been for the past several years.

Senator GORTON. And is it affected at all by your individual agreements with individual tribes on tribal shares? Do those agreements guarantee a certain share?

Ms. MANUEL. They should not, but we are finding in some locations where, especially where you have multitribe agency situations where the tribes all share an agency and one of the tribes or two of the tribes may want their shares, there is a process that the superintendent and the area director have to undertake to ensure that, if they provide a share to the requesting tribe and it is a share of a program or an activity that is funded to benefit all the tribes in that agency, if they take their share there has to be a determination that the reduction in funding and resources will not impact or harm the remaining tribes who do not take their shares.

Senator GORTON. Now, in making these determinations do you take into consideration the relative prosperity or poverty of the individual tribes, the income that the tribes are receiving from other sources?

Ms. MANUEL. No.

Senator GORTON. You do not?

Ms. MANUEL. Not in determination of tribal shares. It is based strictly on what has traditionally been available to that tribe through the budget formulation process.

Senator GORTON. Well, that leads me to a policy question for Ms. Deer. Through my State news clippings the other day I learned of a story about the Colville Tribe in north-central Washington. The thrust of the story is that the members of the tribes were going to meet on the following Saturday to determine how to distribute \$10 million in gambling profits.

They had four proposals that were going to be before them, I think all of which included distributions—or most of which included per capita distributions to the members.

Is it appropriate, Ms. Deer, for us to consider the profits that tribes are making from gambling over and above the salaries they pay, in determining how much money the taxpayers of the United

States should distribute to those tribes for their annual governmental activities? Should the tribes be required to put some of those profits into activities that demonstrate a degree of self-sufficiency in the case of those tribes that have gambling enterprises that make profits?

Ms. DEER. As you know, Senator, the tribes must spend money, according to the Indian Gaming Regulatory Act, for tribal economic development, for improving the tribal welfare, for improving the quality of life on their reservations. They make contributions also to other governmental, and charitable purposes.

I have not seen that particular article you are referring to, but the tribe must submit and receive permission to dispense these per capita payments.

Senator GORTON. I am sorry? Must receive permission to do what from whom?

Ms. DEER. There has to be a request made by the tribe. They must receive permission from the Secretary.

Senator GORTON. In other words, from you.

Ms. DEER. Well, it is just not me, but it is the whole process, yes, in order for the per capita payments to be distributed.

I would point out that the States also have lotteries and that there is no, at this point as far as I know, no tie-in for dispersal of Federal funds in relation to the State lotteries. The tribes are opposed to that type of testing. The Bureau does administer some eligibility criteria in some of their programs, such as housing improvement and higher educational services and general assistance.

So I think from your point of view it is a question that has arisen and would require some additional study and discussion in my opinion.

Senator GORTON. Well, I have here the statute and one of the purposes for the use of those revenues, to quote from the statute, is to "fund tribal government operations and programs."

Ms. DEER. That is true.

Senator GORTON. Now, my question is whether or not your formula for distribution for government operations programs should not reflect those profits, so that more of your distributions would go to tribes that are isolated and do not have this form of income and less should go to those tribes that do have that, the ability to fund at least some of their governmental operations through gambling revenues.

The answer was that you have got a formula that is an ancient formula, that has hardly ever changed. Should it not change in the light of these, these relatively new sources of income?

Ms. MANUEL. I think the IGRA does provide that opportunity, because if you look at the statute it does require that the Secretary be satisfied that the tribe—before we approve a revenuesharing per capita plan, we have to make a determination that in fact the tribe is spending—and we have established that to be at least one-half or 50 percent of whatever the gaming revenue is, for the purposes that are authorized in the statute, before they can distribute it as per capita.

And I would certainly encourage my area directors to look at situations where, if there is a shortfall in tribal government funding and clearly the tribe has revenue from gaming that could offset

that and they are not looking at spending it for offsetting their shortfall, we would have to take a real hard look at their per capita plan before it is approved.

Senator GORTON. So that the last alternative I see here in this clipping, which says \$8 million for per capital distribution and \$2 million for government activities, would be unlikely to be approved?

Ms. MANUEL. That is right, that is right.

Senator GORTON. We now have Senator Domenici here. Since I have a whole long lists of questions and I know that Senator Domenici is responsible for the whole budget, I am going to defer to him for any statement he has and any questions that he has.

Senator DOMENICI. Sir, I would prefer that you go on maybe 15 minutes.

Senator GORTON. All right. Well, you tell me whenever it is that you would like to ask questions.

Senator DOMENICI. May I just comment, however, on the one issue you have raised with reference to Indian profits from gaming. The one thing that is of concern to me in any effort to do a new formula is that we clearly should understand the great disparity, even among casinos and gambling profits.

My State has been in a state of turmoil, as you know, as to whether or not our Indian casinos are legal or illegal. It has nothing to do with us. It has to do with State law. After many months of wrangling, they are going to make them legal.

We have some that make very little money, some that make a lot of money, and I think it is all going to change.

Senator GORTON. And some that are so isolated that they cannot do it at all.

Senator DOMENICI. What bothers me is, if you get into a formula where you then have all those who do not have casino profits that are getting a certain amount, and then all of a sudden the gaming falls off and then you have got to change the amount they are getting. I think before we do anything like that we ought to be very careful to understand it.

I also truly believe that, from the standpoint of Indian economic development, unless there is some big social damage occurring, gaming is a source of funding. People take one side or the other of that with reference to gambling all the time. It does seem to me, however, that Indian people have hit upon something that does give them an opportunity to raise their standards of living and to do some very exciting things for their people.

Whatever one reads about the very, very wealthy, those who are making millions and millions of dollars, it is a lot different than my State. A lot of my casinos in New Mexico—casinos in New Mexico; I should not say mine. I do not have anything to do with it. [Laughter.]

Sometimes I refer to New Mexico that way, but I should stop that.

In any event, a lot of gaming revenue is going for improvements. It is rather interesting. A couple of Pueblos have built some very exciting facilities for their people. They are very positive projects. I have not visited every one, but I have visited enough to say that there are some very responsible, in anybody's sense, uses of these funds for the Indian people.

I think we need a little time to see how that works in States like mine, as compared with perhaps a few that have the biggest casinos in the world. I guess there is one up there on the east coast. So they are very different. I think the question is a legitimate one, but clearly I still believe it is a little premature to decide how to change gaming. I guess I would resist your efforts if you move that way this year.

TRIBAL SHARES

Senator GORTON. Ms. Deer, on this subject of tribal shares agreements and decentralization and greater authority on the part of the individual tribes, how far have you proceeded? How many tribes now have such agreements?

Ms. DEER. Are you talking about tribal shares?

Senator GORTON. Yes.

Ms. DEER. That whole process has not been completed yet. Ms. Manuel, can you explain a little more about that? There have been many, many meetings on this.

Ms. MANUEL. We do not have any tribes that are taking their shares under the authority of title I of Public Law 93-638, which is the contracting self-determination part. We do have, as you know, about I believe 60 tribes that take their shares under self-governance. In other words, they have negotiated self-governance compacts and are now in the self-governance program.

As I reported, I believe a year ago, we were looking at having completed the tribal shares process, where we have clearly identified inherently governmental functions or inherently Federal functions, identified the contractable, compactable activities and functions in a very detailed manner. That process has been further delayed by actually the tribes themselves.

I established a work group in July of last year to ask them to provide us assistance and to work with us in developing this final process to enable the tribes that had indicated at that time their desires to take their shares under the 638 title I section. They have spent—the tribal work group, which consists of two representatives from each of our 12 areas, tribal leaders, who sit on this work group, in turn established a smaller work group to work with Bureau staff in trying to come to some final closure on the tribal shares process.

Last month in Albuquerque, the complete work group met, heard from the subwork group, and determined that they were still at least 2 years away from completing and coming to some final tribal shares process.

What we are going to do, and in fact, I believe in May, we are taking to the Federal Register a notice to the public of a preliminary list of inherently Federal functions, what we, working through the tribal work group, have identified as inherently Federal or inherently governmental functions, that will be published for public comment.

Senator GORTON. So you do not need any further authority, then? Only 60 tribes take their shares, and you have got a process that is going to take another couple of years. I think in each of the last 2 years we have expanded the number of tribes.

Ms. MANUEL. I do not believe we have.

Senator GORTON. You do not need any additional authority in that connection?

Ms. MANUEL. No; I think the authority we have now under title IV is sufficient. We expect that we will probably have at least 10 more tribes. The 60 compacts do represent 200-plus tribes.

Senator GORTON. That is right, OK. But you have enough authority?

Ms. MANUEL. Yes; that is right.

Senator GORTON. You are not going to need any more from us this year?

Ms. MANUEL. That is right, no.

Senator GORTON. Now, you have already anticipated my next question, something that Ms. Deer referred to. What is an inherently Federal function? Is it a short enough list so you can tell me right here what you are going to publish among those functions that you think are essentially Federal?

Ms. MANUEL. No; it is not short enough. That is why we want to publish the list, because I am sure there are probably functions or activities that we did not think of and the public will have the opportunity to come and let us know. And even the definition has created some great debate and discussion within the tribal work group, within the Federal work group, and I believe even the solicitor's opinion has not been that specific or clear, and in fact has referred us to a number of governmental publications out of OMB that define how you look at and determine what is inherently Federal.

But simply, the easiest response is it is those functions which by statute or even judicial opinion can be performed only by a Federal official and cannot be delegated to anyone other than a Federal official.

Senator GORTON. So you do see a permanent and significant Bureau of Indian Affairs?

Ms. MANUEL. Yes.

Senator GORTON. You do not see the end of this process being one in which there is a set of formulas or block grants pursuant to which aid goes directly from the Congress to each individual tribe and each individual tribe makes all of its own decisions? That is not the end process?

Ms. MANUEL. No; in fact, as you know, Indian tribes and Indian affairs is the most regulated business in the Federal Government. There are just hundreds and hundreds of statutes that impose some statutory requirement on the Secretary.

Senator GORTON. Sure, but those statutes could be repealed.

Ms. MANUEL. Most are based either in treaty or have some historical foundation that is based in the political relationship between tribes and the United States.

Senator GORTON. So you do not see any time in the future in which either the bill that Senator McCain had last year from the Indian Affairs Committee or a simple block grant proposal that we had briefly in this bill last year would be appropriate? The administration is not going to recommend any fundamental statutory changes in the relationships between the Federal Government and the tribes?

Ms. MANUEL. I think there will be fundamental changes in how the Bureau conducts business as tribes become more sophisticated and progressive and take on the noninherently Federal activities and functions. You are going to see, I think, a much more streamlined organization that I think will be comprised of purely professional technical skills and abilities that are going to be there to provide technical assistance to tribes.

You are not going to see the Bureau of Indian Affairs of 10 years ago, where you had 15, 16,000 employees and the Bureau did pretty much everything for tribes. They ran the courts, they ran the police, they ran the social services program. I think you are not going to see that kind of an organization.

Senator GORTON. I have just been informed that Senator McCain is reintroducing his bill today. Assuming that it is the same bill as it was 2 years ago, will the attitude of the Secretary and the Bureau be identical to what it was a year ago?

Ms. MANUEL. From the Bureau's perspective, the concept of developing a Bureau with the active participation of the tribes is something that we believe in and we are doing for the tribal shares process. The only aspect of the bill that concerned me was the many layering of consultations and compacts that were required, and if the bill is identical I would have great problems supporting it.

Ms. DEER. Mr. Chair.

Senator GORTON. Yes?

Ms. DEER. I would like to mention that at the meeting of the tribes, the President and the Cabinet on April 29, 1994, the President did reaffirm the government-to-government relationship between the Federal Government and the tribes. So I think that that outlines the basic thrust of the administration toward the tribes to reaffirm the government-to-government relationship.

Senator GORTON. But you are not going to propose a statutory change like Senator McCain's? We are going to get nothing from you with respect to fundamental statutory change?

Ms. DEER. I doubt it.

Senator GORTON. OK.

Senator Domenici.

Senator DOMENICI. Yes.

Senator GORTON. I have finished my questions on this subject matter area, so if you have some.

Senator DOMENICI. I thank you. Thank you very much, Mr. Chairman.

EDUCATION FACILITIES

I want to talk just for 1 minute and also share with you a concern. You know, in America we all say the gateway to the future is in education, and that opportunity is closely linked. Frankly, one of the biggest shortcomings that we are foisting on young Indian people is the inferiority of the Bureau of Indian Affairs school system that they run for the young Indian people. Not all of them, I understand.

First I have four or five questions, just to make my case, of individual schools run by the BIA where I have had to intervene, or a school is left half built, or dormitories that are patently necessary

way out in Navajo country are not built, so the school does not work.

Now, it seems to me that there is an awful lot of money being spent sort of running in place and making legal decisions and determining the nuances of relationships, while in Indian country among the Indian people the education plant is falling apart. Now, is anybody here capable of telling us the current evaluation of what is needed to bring just physical plants—do not worry about whether we get enough teachers—just to bring them up to standards that others are living under in the United States? How much is that?

Is my recollection of \$700 million for dilapidated buildings and inferior, second-rate schools and dormitories, correct? Is that a fair number?

What is your name, sir?

Mr. SCHWEIGERT. Jerry Schweigert. I am the Director, Acting Director, of the old Office of Construction Management. Now we are the facilities transition program staff.

Yes, we did, for the 1998 budget, we ran a new inventory or updated our inventory, and we found that to bring all of our facilities up the standards, codes and standards, it would cost approximately \$890 million.

Senator DOMENICI. So close to \$1 billion?

Mr. SCHWEIGERT. That is correct, sir.

Senator DOMENICI. I have heard a couple of Senators who had a chance to go out and visit Indian schools on their reservations. Maybe you have, too, Mr. Chairman. I am talking about the dilapidated condition of a school and just its total inferiority. I heard one Dakota Senator speak about that. I was wondering whether anybody could get educated in that kind of facility.

This issue causes me a great deal of concern. I will say, I am not terribly impressed with the President's budget, asking for \$5 billion for here and there new construction of schools around the country, when the one school system that, for better or for worse, that we are responsible for does not even have adequate buildings to educate young Indian people. I do not think you have got a budget to take care of anything like that.

We are not even making any headway on the priority list on education. It is longer rather than shorter each year that you fulfill the top five or six requests. Is that a fair assessment?

Mr. SCHWEIGERT. Well, as the buildings age, currently we have 63 percent of our buildings that are over 30 years of age and 26 percent that are over 50 years of age. Normally we design the life of a building around 30 years. So our buildings are basically aging and 80 percent of them are education related. So as our buildings age, they escalate in deterioration. So the older they get, the faster they deteriorate.

Senator GORTON. Excuse me. Can I interrupt?

Senator DOMENICI. Of course.

Senator GORTON. Does that 30 year rule and 30 year and 50 year percentages represent a different set of standards from public schools in most of the 50 States? Aren't a majority of all of our schools over 30 years old?

Mr. SCHWEIGERT. Normally our facilities are designed and built along the same codes and standards as public schools are.

Senator DOMENICI. That was not his question.

Senator GORTON. That really was not my question. Are not most public schools more than 30 years old?

Mr. SCHWEIGERT. I have no idea, sir, on that.

Senator DOMENICI. I think for a number of reasons that is a relevant question. You might want to plug that in and see if somebody in the Department of Education knows. I will bet they do. I think that does give us another set of facts that we would want to explore.

Nonetheless, the kids, they are the ones at the bottom of this that have to get helped. They are not getting the right education. So we have got to work on that issue.

I have two or three education issues that I want to raise, as I indicated. I do not like to do this and I wish the system was running so we would not be up here doing this, so I would not be in a subcommittee saying fund this particular school even though it is not on the priority list because we ought not be running a school system as broad as that in my opinion. I think you agree with that, Mr. Chairman.

Senator GORTON. I certainly do.

Senator DOMENICI. I am going to just tick them off for you, and I would appreciate an answer for the record from whomever is qualified. Santa Clara Day School, this remains two-thirds completed. Last month I raised the issue with you, Madam Secretary, and I pointed out that the school was a monument to the incompetence—and I say this very, very forthrightly—to the incompetence of the Bureau of Indian Affairs and its monumental bureaucracy.

Somehow or another, somebody has been able to identify \$300,000. Apparently it needs \$900,000 to get finished, and I would ask you to explain for the record what the situation is.

[The information follows:]

SANTA CLARA DAY SCHOOL

A Public Law 93-638 contract was awarded to the Pueblo of Santa Clara on December 19, 1991, in the amount of \$1,312,041. The funds were authorized for the renovation and expansion of the existing day school serving grades Kindergarten through 6th grade.

Additional funds for phase 2 were requested by the Bureau and were received in the fiscal year 1995 appropriations to complete the project. Subsequent contract modifications including phase 2 funding resulted in a revised contract award amount of \$3,416,123. The phase 2 funding was requested from Congress based on the Tribe's Architect's estimate of what it would cost to complete all work on the project. However, when the Tribe awarded the construction subcontract in November 1995, the total combined appropriation was insufficient to complete all of the work in the project. The Tribe awarded the subcontract at an amount which exceeded the Architect's estimate by \$643,064 or 23 percent. The Tribe has been pursuing additional funds estimated at \$1.2 million to complete the renovation project.

The fiscal year 1997 Senate Report contained the following direction: "The Committee urges the BIA to continue its efforts to settle the dispute over funding for the facilities improvement and repair at the Santa Clara Day School."

Working with the Tribe's planning administrator, FMCC provided an additional \$315,000 on March 4, 1997, based on items of work that were felt to be absolutely necessary and were related to safety and health conditions. In addition, in a letter dated March 3, 1997, from the Director, FMCC 997 letter to the Tribe, the Tribe was requested to provide additional information so that a final decision on additional funding could be made by FMCC. The information requested has not been received as of May 19, 1997. The tribe has requested additional items of work that were outside Congressional authorization and are not safety and health related.

The construction appropriation does not have funds to cover these costs in today's environment of constrained budgets. The major item in the Tribe's request is a new gymnasium. The Tribe has a community center, with gym, across the street from the school which the school has been using for physical education. Although unobligated balances exist in the Facilities Improvement and Repair Program, funds are already committed to specific projects which were justified in prior budget requests.

In addition to the \$315,000 indicated above, FMCC will make available to the Tribe, at no cost, new surplus equipment and furnishings from completed school construction projects. We have made the offer to the Tribe and the Tribe is working with FMCC staff to determine if what we have available will meet the needs of the school.

Conclusion

FMCC could potentially provide an additional amount up to \$185,000 without seeking reprogramming authority from Congress and without impacting other funded projects, but does not have the remaining \$700,000 for non-health and safety requirements.

MESCALERO APACHE PROPOSAL

Senator DOMENICI. I have another. Again, I do not know why I should have to do these, but one of the tribes in New Mexico that ranks high in good management is the Mescalero Apaches, Wendell Chino's tribe. I think when they have a good idea you ought to give it serious thought. They want to put a manager in to manage all the programs of the Bureau that apply to them. They have had great success whenever they have had management in their various industries and businesses. I urge you to consider that request, and I am submitting for the record for you to review a letter with attached documents from Wendell Chino indicating why they think this is a good idea. Would you take a look at that, please?

[The information follows:]

MESCALERO APACHE PROPOSAL

The Tribe proposes to contract for the Superintendent's position without assuming responsibility for all agency positions and responsibilities. This would create a situation where federal employees were being supervised by a person other than a federal employee and would violate federal personnel laws.

The Superintendent provides direct service to the Tribe and, in addition, supervises federal employees, has other federal responsibilities and reports to the Albuquerque Area Director. Consequently, if contracting were to occur based on the Tribe's current proposal, in order to comply with federal law, it would be necessary for the Bureau to retain federal supervision over federal employees by withholding the supervisory portion of the Superintendent's responsibilities from the contract, and placing that function with another federal employee.

LETTER FROM WENDELL CHINO

MESCALERO APACHE TRIBE,
Mescalero, NM, April 9, 1997.

Hon. PETE V. DOMENICI,
U.S. Senate,
Washington, DC.

DEAR SENATOR DOMENICI: Mescalero Apache Tribe is in the process of attempting to contract the Superintendent's position at Mescalero Indian Agency. In place of the superintendent we want to hire a manager so we can breathe new life and innovation into the agency with a manager.

For years as you know, we have utilized several managerial positions with our Tribal enterprises and they have proven highly successful. We believe it is time we applied the same concept and principle with just one position under contract at Mescalero. All of the trust obligations and responsibilities remain with the Bureau of Indian Affairs through the remaining positions and branches at the Mescalero Indian Agency.

Enclosed is a position paper we developed regarding the proposed agency manager. We are enclosing a copy of the pertinent code of Federal Regulations which allows for a contract of all or part of the Bureau Programs in Mescalero.

We trust that you will support our efforts to contract the position. In addition we hope you will convey to the Secretary of Interior about our new concept that can make the Bureau of Indian Affairs highly successful on an Indian reservation.

Very truly yours,

WENDELL CHINO, *President.*

AGENCY MANAGER

SCOPE OF WORK

The scope of this contract will establish a managerial position between the Mescalero Apache Tribe and the Bureau of Indian Affairs. This position will manage the work force of the Mescalero Apache Agency and will be responsible for its day to day operation.

The Agency Manager will coordinate all activities which contribute to the accomplishment of the Bureau of Indian Affairs mission statement. Much of this will be accomplished by the management of the Agency Branch chiefs as they carry out the trust responsibility of the Federal Government.

THE AGENCY MANAGER WILL

Maintain an Official relationship between the Federal government and the Tribe, providing programs and services in this capacity develops and fosters a positive relationship between the Tribe and the Bureau which supports a co-equal partnership arrangement in carrying out all governmental Trust and program responsibilities of the Bureau to the Tribe and its people.

Responsible to the Tribe for the Trust and program work of the agency branch chief and the federal employees they supervise. The Agency Manager administers these programs and services in accordance with Federal Laws, regulations, policies, procedures, and guidelines and has the authority to use discretion concerning the uses of all government resources (dollars, manpower, facilities, supplies and materials); establishes internal policies, and controls all program and activities in a manner which will best benefit the Tribe and its people.

Reviews the planning, organizing, coordinating, operating, evaluating, and controlling actions taken and recommendations submitted by immediate subordinates to assure compliance with technical, managerial and administrative requirements. Reviews justifications for resources such as personnel, funds, equipment or facilities; compares them with other requirements; and endorses, modifies, or rejects them as considered appropriate. Also, reviews a variety of progress reports, status records, comments of tribal and bureau and management officials and similar data to ensure that assigned functional objectives are being achieved.

The Agency Manager is to justify, defend, negotiate or settle matters involving significant or controversial issues. This usually involves active participation in conferences, meetings, hearings, or presentations involving problems or issues of considerable consequences or importance. The manager's contacts usually have diverse viewpoints or objectives requiring the manager to achieve a common understanding of the problems and a satisfactory solution by convincing them, arriving at a compromise, or developing suitable alternatives.

Based on knowledge and understanding of tribal goals, priorities, and needs determines the kinds and scope of programs and services to be provided by the Agency. Determines results to be achieved. Develops policies, rules, and procedures to carry out operations, organizes work into manageable units and allocated resources to each. Discusses proposed final plans with the Tribal President and make modifications as necessary.

The Agency Manager is the official responsible for settling disputes, negotiating joint ventures and finding solutions to complex problems between the Tribe, Federal Agencies, State Government and private enterprises.

The Agency Manager will direct the planning, organization staffing, and budgeting of the total Federal Government operation which provides a variety of programs and services; identify its goals, priorities, policy, guidelines and procedures; and determines, identifies, and procures the support necessary for implementation.

The Agency Manager will be supervised by the Tribal President and receive advice, counsel, and analysis from the Area Director or his staff.

The Agency Manager will have signature authority for all personnel actions, payroll, and leave.

The Agency Manager will be responsible for the faithful and efficient discharge of the Federal Government's responsibilities to the Mescalero Apache People in accordance with established laws and approved policies, objectives, and standards, and for the protection and sound management for the extensive resources and funds held in trust by the United States Government for the Tribe as well as individual tribal members.

The Agency Manager will supervise with the idea, of managing all functions through subordinate staff and allow the subordinate staff to have the latitude to manage their respective programs. This latitude will provide greater stability, span of control and confidence to supervisors giving them the ability to be more effective.

Subpart B—Application Process

§ 271.11 Eligible applicants.

Any tribal organization is eligible to apply for a contract or contracts with the Bureau to plan, conduct, and administer all or parts of Bureau programs under section 102 of the Act. However, before the Bureau can enter into a contract with a tribal organization. It must be requested to do so by the Indian tribe or tribes to be served by the contract in accordance with § 271.18.

§ 271.12 Contractable Bureau programs.

(a) Tribal organizations are entitled to contract with the Bureau to plan, conduct, and administer all or parts of any program which the Bureau is authorized to administer for the benefit of Indians. All or parts of any program include:

(1) Any part of a Bureau program which is divisible from the remainder of the program so long as the contract does not significantly reduce benefits to Indians served by the noncontracted part(s) of the program. However, to the extent that it is within the Bureau's existing authority and the program or part thereof involves only one tribe and one Bureau Agency or Area Office, the benefits provided to Indians by the non-contracted part(s) of the program may be reduced at the request of the tribe. When the program or part thereof serves more than one tribe, the benefits provided by the non-contracted part(s) of the program may be reduced when all of the tribes served consent to a reduction.

(2) A single employee position only when the functions to be performed provide a direct service to Indians and meets the criteria in paragraph (a) of this section.

(3) Programs or parts of programs or services that are authorized but not currently operated or provided by the Bureau.

(4) Operation of, or services provided by, previously private schools.

(5) Alterations and repairs in direct support of a contracted program. Individual construction projects are not contracted under title I of the act, but can be contracted under other authorities.

(6) Architect and engineer services.

(b) Paragraph (a) of this section also applies to trust resources programs or portions thereof. Additional criteria for contractable trust resources programs, or portions thereof are given in § 271.32.

[40 FR 51286, Nov. 4, 1975, as amended at 43 FR 37440, Aug. 23, 1978.]

EDUCATION

Senator DOMENICI. I was in error. On the school that is two-thirds completed, you found \$300,000 but the total needed is \$1.2 million. So they are still \$900,000 short.

There is a very serious dormitory problem on the Navajo Nation. They have made a request with an inventory. I am very hopeful that you will take a look at that and give us your recommendations.

I want to share another thought with the chairman. I do not know what to do about it, but we are in the process of taking an inventory of the Indian colleges and community colleges and post-high school institutions that we are in some way obligated to pay for, and it is absolutely amazing. On the one hand, we have some that we fund on par with what it costs to run a reasonably good,

comparable non-Indian college. But we have these college institutions going up and some of the funding is, on just a rough analysis, \$5,400 per student count is about average elsewhere, and we are funding them at \$2,900.

I do not know how anybody would expect to run a first class institution, unless the \$5,400 is outrageous, and I do not imagine it is 100 percent outrageous. Maybe 30 or 20 percent, but not 100 percent. So I just share that here is another area where here we are encouraging our young Indian people to go to those schools, and they have got to be inferior by definition.

LAGUNA INDUSTRIES

I have one last issue, since you have invited me to take my turn and use your valuable time. I want to talk about the Laguna Industries in New Mexico. Are any of you aware of that? Do you know something about it?

Ms. MANUEL. Yes.

Senator DOMENICI. Laguna Industries is one of the best success stories of an Indian group setting up a business, employing their own people, and doing some big time contracting with the U.S. Department of Defense. They are in the process of refinancing, and I would urge that you take a look at what is being recommended with reference to the refinancing package and seriously consider what might happen to that industry if the current financing is not continued in some way as you put a final package together.

They have a huge backlog of jobs. Their management is back in shape. They employ over 500 Indian people in good jobs. I would very much like you to take a look at that situation. They have \$40 million in backlog of contracts. I do not want to see somebody trying to make a point up here in the bureaucracy that they are smarter than the banks and that they know what is best when there is a market out there. I would hope you will take a look at this issue.

Ms. MANUEL. We have been working very closely with Laguna Industries and the bank. There is now a new bank involved. There were a lot of problems that we have worked through with the tribe and the management at Laguna Industries, and I think as of last week my understanding is that everyone was on board and we were going to be able to do what the tribe wanted.

Senator DOMENICI. Well, I would hope then that you would take another look, will you, because I think it is not done. There is a proposal.

Ms. MANUEL. OK.

EDUCATION

Senator DOMENICI. Mr. Chairman, I hate to bother you with these kind of questions when you have the whole budget of this committee to put together, but this is a big piece of it. I thank you for the time.

Senator GORTON. Well, Senator Domenici, even on my own list of questions here, the next ones were all on education. If you want to stay around for that, I can follow up and supplement yours. And if the education gentleman wants to take a seat up here again, that would be appropriate.

First let me just ask you a factual question. Of all of the Indians of school age who live on reservations, what share, what percentage, what number, attend Indian schools and what number attend the regular public schools of the States in which those reservations are located?

Ms. MORRIS. I do not have the figures for the 23 States where schools are located. Nationally, Indian students comprise 85 percent of the public schools, 10 percent of BIA schools, and about 5 percent are in church or Catholic, various denominational schools.

Senator GORTON. Roughly, when we are speaking about this budget and this money we are speaking about schools for about 10 percent of the Indians?

Ms. MORRIS. Ten percent.

Senator GORTON. Are those schools usually in relatively isolated places?

Ms. MORRIS. Yes; consistently.

Senator GORTON. I am curious. I had a very parochial question before you came, Mr. Chairman. Ms. Deer was talking about the magnificent Leschi High School in the State of Washington, which has recently been completed and which I visited and which is a wonderful facility. It certainly is not isolated. It is about 1 mile from the city limits of the city of Tacoma.

How do you set your priorities with respect to construction funds in Indian schools? Have we done that for you? Have we just told you which ones you are going to do, as against letting BIA make that determination itself?

Ms. MORRIS. Mr. Schweigert handles the construction money.

Mr. SCHWEIGERT. We do set the priorities, Senator. Those schools were prioritized in fiscal year 1992-93, and then in 1993 Congress basically froze the 16 that were on the Federal Register. The prioritization goes back to about 1979, when the Bureau worked out the process with Congress which basically determined that the highest ranking factor would be unhoused students. Those students at Chief Leschi were basically unhoused when their school was condemned.

Senator GORTON. The previous school.

Mr. SCHWEIGERT. So they competed, and in 1993 when we went through the process and only five schools were eventually put on the Federal Register, 66 schools actually applied and would have been eligible, but the criteria has weighting factors that were determinative.

Senator GORTON. How many of those five schools or the earlier 16 are still on a priority list? Are some of them under construction? Would the others still be priorities?

Mr. SCHWEIGERT. Well, we basically froze the 1992-93 list, and so far we have built seven schools, and Chief Leschi was the last. We have nine more schools to go and that includes Many Farms, which was in the 1997, is now in the 1998 list as well.

Senator GORTON. Does this budget have enough money in it for the completion of that school?

Mr. SCHWEIGERT. Many Farms, yes. We put \$14 million in the 1998 budget, yes.

Senator GORTON. Senator Domenici, you came up with that figure of \$890 million on the backlog of school facilities. My notes say

that there is another \$400 million backlogged on dam repairs and \$2 billion for irrigation projects. And the whole budget request for facilities construction is less than \$74 million out of that \$2 billion, which certainly supports the point you made earlier.

In addition, assuming you get that \$74 million, how much of the funds that have already been appropriated are still unobligated, for all kinds of construction projects?

Mr. SCHWEIGERT. Well, for education we have a little over \$100 million currently unobligated. Those are all earmarked for specific projects.

Senator GORTON. All on that list of 16?

Mr. SCHWEIGERT. No; Many Farms is the only one.

Senator GORTON. The rest is for rehabilitation?

Mr. SCHWEIGERT. FI&R, facilities improvement and repair projects that go back several years. And with 638 and self-determination regulations, we deal with the tribes and a great many of those projects are joint efforts between the tribes and the government, and it takes a while to get them designed and constructed.

Senator GORTON. So would it be fair to say that with respect to the moneys that you have and are seeking now, the higher priority is for repair and rehabilitation than for new construction?

Mr. SCHWEIGERT. Well, in the current budget, we have a much higher figure, \$30 million-plus for facilities improvement and repair, versus \$14 million for new construction, yes.

Senator GORTON. And can I infer from your previous answer that, in addition to the money that we appropriate, that various tribes make contributions of their own to both construction and repair and rehabilitation projects?

Mr. SCHWEIGERT. We have had several schools in Wisconsin that have built their own schools, but normally that is not the case.

Senator GORTON. Either on construction or on improvement and repair?

Mr. SCHWEIGERT. We supply the money for the schools, basically.

Senator GORTON. How do you balance priorities? You have the frozen priority list for construction. How do you set up your priorities for repair and rehabilitation?

Mr. SCHWEIGERT. We have an automated system. First of all, we have a backlog and our backlog is an amalgam of items that are comprised of codes and standards, national codes and standards such as the National Fire Code and so forth, and those are determined and put in a backlog by building. So we develop a program of requirements, the areas and agencies develop.

On an annual basis they put their program of requirements in, and we have an automated system. We have an automated computer system that ranks all of these program of requirements that ultimately become projects, and it is a weighted average based on such things as the age of the students, the condition of the building, whether it is a fire code versus a structural, and things such as that.

Senator GORTON. How much money have you actually spent on the repair and rehabilitation of Indian schools in the last year?

Mr. SCHWEIGERT. Last year I think we spent \$56 million.

Senator GORTON. That's not much of a dent on the deferred maintenance, is it, or on the necessary repair and rehabilitation?

Mr. SCHWEIGERT. Not if you consider that we have \$890 million, no.

Senator GORTON. No.

Ms. Deer, perhaps this is an inappropriate question for you, but do you have the slightest idea when the President is going to appoint a successor to you?

Ms. DEER. Various names are in contention and so far no one has been officially announced.

Senator GORTON. And have you agreed to stay on until your successor is nominated and confirmed?

Ms. DEER. Confirmed, yes.

Senator GORTON. So there will not be a vacancy.

Ms. DEER. So we will have continuity, yes.

Senator GORTON. My other subcommittee, Transportation, has the budget for Federal Aviation Administration and it is not as fortunate as the BIA. We have been waiting a long time for a successor to the leadership position.

LAW ENFORCEMENT FACILITIES

Briefly, would you answer some of the same kinds of questions that you have answered now with respect to schools in connection with justice facilities: what your backlog is, what you are doing about the backlog, how you set priorities?

Mr. SCHWEIGERT. Yes, I can, Senator. We have 34 justice facilities that we have responsibility for. We have approximately \$112 million, \$112 million it would take to do the repair or replacement of those facilities. Currently in our latest inventory we say that 13 of those facilities should be replaced.

I do not have the exact figures in my head, but I think it was around \$27 million. It was around \$27 million to replace those facilities.

Senator GORTON. My notes say that the budget has just over \$2.5 million for existing public safety and justice facilities, so that would be about 10 percent of your backlog?

Mr. SCHWEIGERT. Well, what we have is the 34 facilities, and we have 13 that we indicate—\$34 million, my correction, \$34.2 million that we should have replaced. The renovation of the 21 remaining facilities would be \$22.7 million, and it would cost us approximately \$5.7 million for planning and design.

However, if we were to take those facilities and actually build them to the size that they should be, it would cost us approximately \$112.7 million. So what I am using as the figures for replacement of the 13 is basically the same size as we currently have there that exist, not taking into consideration that they should be larger.

So we do have a major—we did a major inventory of the law and order facilities here in the last 3 years.

SAFETY OF DAMS

Senator GORTON. Let me go on. I guess I am with you for the next several sets of questions. Dam safety. Let us move the microphone down there and talk to me about dam safety.

My notes tell me here that your classification of dams with respect to safety has less to do with the risk that one of them is going

to fail as it does with the consequences of a failure if it took place. How do you determine and how do you set priorities for the repair of dams in looking at the actual risk of a failure?

Mr. VIRDEN. We participate with the Department of the Interior in a technical rating of all dams. The Bureau of Indian Affairs has approximately 100 dams out of the 400 the Department of the Interior has. And you are correct, the technical priority rating is based on consequences of failure.

Senator GORTON. Is there a separate determination of the actual risk of a failure? You know, the consequences can be overwhelming and the chances of failure 1 in 10,000, and consequences in another case, I suppose, considerably smaller, but the dam may be in imminent danger of collapse. Is there a separate rating system for the chances of a failure as against what the potential consequences might be?

Mr. VIRDEN. I have a staff person here I can check with, but I believe that the technical rating priority system does include that, the structural soundness.

Senator GORTON. How do you set your priorities for this? You have got 104 dams. How many of them are actually at serious risk of failure right now?

Mr. VIRDEN. Ross Mooney is our dam safety person.

Senator GORTON. OK.

Mr. MOONEY. Good afternoon. My name is Ross Mooney.

Senator GORTON. It is still morning. It just seems long.

Mr. MOONEY. It seems like we have been here for a while. [Laughter.]

I am the dam safety officer for the Bureau of Indian Affairs. As Terry said, we have about 100 dams in the Bureau of Indian Affairs that are rated as a high or significant hazard. The criteria by which we evaluate dams is set up by the Federal guideline, which all Federal agencies must use throughout the country.

There are two different things you look at. First is, as you said, the impact of the dam regardless of what its condition is. If it did fail, what is its impact on life and property? There are three classifications—high, significant, and low. Low hazard means nobody will get killed and minimal or no property damage will occur.

To be on the departmental technical priority ranking list, a dam must be a high or a significant hazard. These two ratings mean that life is in danger and significant property damage could occur. You can have a perfectly safe dam, but it will be a high or significant hazard dam because if it failed, what we call a sunny day failure, it could take life or damage property.

Over on the other side, you have technical factors, about eight of them, that you go in and look at various criteria of the dam—the seepage, the structural integrity—various factors that are then evaluated, assigned a point value. The Department under Secretarial Order 3078 has assigned the Bureau of Reclamation with departmental oversight. As part of their oversight responsibilities they are the keepers of the TPR, the technical priority ranking list.

This list is comprised, I think, of about 420 dams now. As Terry said, we have 100. Actually we are up to about 110. Since the Indian Dam Safety Act was passed in 1994, it refers to I believe 54 dams. We have doubled that since then. It is not that we have built

any dams. it is just that we have gone out and reevaluated the dams that we do know about. And some of them, because we found people living downstream, we have had to reclassify to high or significant hazard.

We do have an agreement with the Bureau of Reclamation, by the way, to have them go out and do some of the technical work for us, the evaluations, since they are the experts in this area for the Department of Interior, and that is why they have departmental oversight.

Is that the information you needed?

Senator GORTON. Well, what are you going to get done if you get your \$22 million this year? What dams are you going to work on and how have you determined which ones are going to get that relatively modest amount of money?

Mr. MOONEY. Well, the Bureau of Indian Affairs uses the TPR's for setting its priorities, the list. I neglected to say, when you assign all these points to each of the dams and add them up and you rank them, the dam with the highest number of points is at the top and it goes down. The Bureau of Indian Affairs uses this list for funding purposes, and we fund the dam with the highest likelihood of failure.

Senator GORTON. If we get the \$22 million, will we get 1 dam completely repaired or 10?

Mr. MOONEY. Historically, we got \$18 million in the past. You want to know what we would do for the \$4 million?

Senator GORTON. Whether it is \$18 or \$22 million. You have got all of these dams on the list. How many dams will that actually repair?

Mr. MOONEY. We will be working on 12 dams. There will be three dams for which the final construction will be funded.

In the safety of dams program it is a six-step process from the evaluation of the dam as a high or significant hazard dam, then you go in and look at the physical site of the dam, and then you do the conceptual designs, final designs, and then finally construction. So it is a six-step process which takes a couple years to get through.

Senator GORTON. So when you say—I am sorry; was it 12?

Mr. MOONEY. Yes; 12 dams we will be working on.

Senator GORTON. Yes; but that includes the very first of those six elements?

Mr. MOONEY. Right.

Senator GORTON. You will actually finish three?

Mr. MOONEY. We will actually fund the final construction for three. The rest will be funding the other portions of steps in other dams.

Senator GORTON. All right. Thank you. You have certainly answered my questions.

Good morning. One more set of questions.

Senator DOMENICI. I am just here to listen.

Senator GORTON. OK. Ms. Deer, as you of course well remember, last month the Indian Affairs Committee and the Banking Committee had a fairly well publicized hearing on Indian housing programs. We both learned, without regard to any misuse, that Indian housing costs are higher on average than other low income housing

projects, partly, I suppose, because they are often in isolated areas, partly because of Native hiring preferences, and partly because of the Davis-Bacon Act.

The misuses of the money in the Indian housing programs were nationwide and were significant. Fortunately, you did not have any responsibility for that. But I would like to ask the general question connected with all of these construction projects we are talking about, whether it is work on dams or on schools or on justice facilities: Are all of the same factors of additional costs applicable to other Indian construction projects as they are to schools?

Second, do you run the risk of the same kind of misuse of money for which HUD was at least partly responsible?

Ms. DEER. Well, let me say that nobody is perfect and that, yes, there have been problems. But we are consistently working to prevent problems, and in my earlier statement I talked about the resolution of these audits and better management. So everyone knows that we have to adhere to the highest standards and that when there are problems there is a lot of publicity on them.

I would have to refer to our construction person in terms of your question about the general problems.

CONSTRUCTION ON INDIAN RESERVATIONS

Senator GORTON. Well, I would like an answer to that question. Does construction of all these other facilities cost considerably more on Indian reservations than it does for local governments or in the private sector?

Mr. SCHWEIGERT. In facilities, which I can speak for, Senator, our costs are relatively the same. Because of the fact that in most cases our facilities are in rural or out of the way places, they do cost more money generally, because you have to haul material and people in as opposed to cities and so forth, metropolitan areas.

But we feel that our projects are well designed. We have architects and engineers that are registered normally in the States in which we design and build those facilities, and our cost estimates are based on national costs. So we feel that our costs are——

Senator GORTON. Does either Indian preference or the Davis-Bacon Act add significantly to the cost of these projects?

Mr. SCHWEIGERT. It would depend on whether the tribes handled the project through a 638 contract. If they handle it through a 638 contract or a 297 grant, it could be higher because of their associated costs of managing the project.

Senator GORTON. Thank you.

Mr. SCHWEIGERT. But that would vary from tribe to tribe. There is quite a variance between tribes.

Senator GORTON. Thank you.

EDUCATION PROGRAM PERFORMANCE

I would now like to ask a few more questions on education, but in this case not education construction but education performance. Since we have a significant number of Indian students in Indian schools, but a far greater number in public schools, how do you evaluate the quality of education that is being provided by the Indian schools? Is there a significant difference in student perform-

ance in the Indian schools and among Indians in the regular public schools?

Do we know that we are getting a decent quality of education for the money that we are investing?

Ms. MORRIS. The difficulty surfaces because you do not have identical assessment measurements in public schools as in our school system or to compare also with, say, the church schools on the reservations. In the past there have been reports, none very recently, that gave indications that Indian students attending public schools fared much better than they did in Bureau schools. We have not seen a report in recent years that is documenting that.

Within our schools, since about 1987–88 we have been working very strongly with the schools on improving. The focus has been on improving them academically. And there is an effective schools movement that began in about 1988, and that has continued now that there is legislation for Goals 2000 and the Improving America's Schools Act.

All of our schools are in the school reform movement. They are looking at how they test the children, how they assess them with multiple measures, rather than simply standardized tests. There is one school that is in the process of getting reaccredited. Otherwise, 99 percent of the schools are all accredited now, whether regionally, and/or by the State.

Senator GORTON. Are Indian schools required to meet the State education requirements of the State educational authorities in the States in which they are located?

Ms. MORRIS. They are not required to. Many of them choose to. If they choose to be accredited by the State, then they follow those mandates.

Senator GORTON. Did you say 99 percent were accredited?

Ms. MORRIS. Either by a regional accreditation agency and/or by the States. Some are dual accredited by a State and regional.

Senator GORTON. How many of the Indian schools are actually accredited by the States in which they are located?

Ms. MORRIS. Is it about 67? Yes.

Senator GORTON. Can you make comparisons on ultimate performance by SAT scores? Are SAT scores in Indian schools comparable to those in public schools or comparable to the Indians in public schools who take SAT's?

Ms. MORRIS. Again, we are not talking about standardized achievement tests, but SAT's, those that are preparing people for college—

Senator GORTON. Right.

Ms. MORRIS [continuing]. That is very much a voluntary test that young people can take, like the ACT's. And the States maintain that data, we do not, because the States administer the tests, those tests. So we could gather that data for you if you wanted it for the 23 States where we are, where we have schools. But we do not maintain that.

Senator GORTON. Do you not think that that would be of considerable value to you?

Ms. MORRIS. It would give us additional indicators. But again, it does not impact all of the young people.

Senator GORTON. No; of course not.

Ms. MORRIS. Because it is a voluntary test.

Senator GORTON. It would seem to me that a comparison of how your young people who voluntarily take that test in Indian schools do as against the general population or against the Indian population in public schools would be of great value to you in determining and setting priorities.

Almost 10 years ago, Congress requested that the Office of Indian Education Programs complete a comprehensive education plan on the requirements of Bureau schools and how best to address them. We, at least, have never received such a plan. At last year's hearings you told us that a single comprehensive plan was found to be inappropriate for all of the various schools, and I am told that your office has been developing a strategic plan to comply with the requirements of the Government Performance and Results Act of 1993.

When are we going to see that, and how does it differ from what was requested in 1988?

Ms. MORRIS. I was not here 10 years ago and I understand that there was quite a bit of turmoil that was generated as a result of that request. I do not know the facts behind that.

Our intention in this last year since I have come in as the Director has been to set a plan for the next 5 years that any organization, any entity, has to have. You have to have a plan to know where you are going and to measure yourself to see what progress you are making. So we have been meeting with staff in the field, with tribal reps as well, to develop a strategic plan.

A draft was prepared last December. We started consultation with tribes in February on that. We are in our official consultation mode right now. The first regional hearing, regional consultation in fact, started today for the east coast. The draft plan has been distributed across the country. The strategic plan is a part of our consultation package. There are eight major items that we are consulting on, and it is included in the yellow consultation booklet that has been distributed for review prior to the consultations.

If we did not get a copy to you and your staff, we can do that so you would have a copy of that. But it has been available since December.

Senator GORTON. OK. We would like that.

[CLERK'S NOTE.—Due to its volume, the above mentioned document has been retained in subcommittee files.]

REMARKS OF SENATOR BENNETT

Senator GORTON. Senator Bennett, at this point I am at the end of one set of questions and ready to move to another. We are delighted to have you here, and if you have any comments or any questions I will defer to you at this point.

Senator BENNETT. Thank you, Mr. Chairman. I am going to have to leave very shortly because, in the genius of the Senate, we have two subcommittees of the Appropriations Committee meeting simultaneously and I am a member of both of them. So I am going to have to run off.

Senator GORTON. You are going to have to ask my transportation questions for me.

Senator BENNETT. Yes; I will do my best to do that.

I have a personal observation. We had an Indian foster daughter who lived with us for 4 years coming off the reservation. We put her in the schools where we lived then in the Los Angeles area and found a very significant difference between her Indian experience and the experience she had in public schools in the Las Virgines School District in the Los Angeles basin.

When she returned to the reservation, which was an appropriate thing for her to do given her past experiences and her long-term life goals, her educational opportunities dropped off very dramatically from those that she had had in our neighborhood, and we were sorry to see that happen.

We stayed in touch with her, consider her still a foster daughter, and her child our foster grandchild. We are personally very distressed at what we see as a rather bleak future for this grandchild compared to what would be available if she could somehow get into a school that we would consider more traditional in the American educational system.

LONG-TERM GOAL FOR BUREAU OF INDIAN AFFAIRS

It is a universe of one and it is never fair to make generalizations from it, but I could not resist, given the line of questioning you are having. And that brings me to the general question that I guess, Ms. Deer, is your responsibility, of what is the long-term goal of the Bureau of Indian Affairs?

We are giving you roughly \$2 billion every year to spend on, if I understand your testimony correctly, about 1.2 million Indians. Where do we want this segment of our population to be 10 years, 20 years from now? What are we hoping to build with this \$2 billion that can say to my foster granddaughter, things are going to be better for you and your children as a result of the money the Federal Government is spending than they were for your mother? We are building a ramp toward what? Fill in the blank for me.

Ms. DEER. The Bureau of Indian Affairs is the main mechanism by which the U.S. Government carries out its responsibilities to the tribes as outlined in the treaties and court decisions and attorney general's opinions and other types of acts. I would envision the Indian tribes having the basic standard of living comparable to the rest of the U.S. population.

At this point, by every single census American Indians and Alaska Natives are at the bottom of the socioeconomic ladder. I feel that there is the power here, especially in the Appropriations Committee, to meet many of these needs. It is not rocket science. We need to invest more in education, more in health services, so that the tribes will be able to march into the 21st century with hope.

So I would emphasize that you have the power in your capacity as U.S. Senators, as members of this Appropriations Committee, to allocate sufficient resources so that we can repair the dams, so we can build the schools, so we can make it possible for the tribes to have a very realistic standard of living.

Senator BENNETT. So the long-term goal is to raise the standard of living, without making any attempt to bring the Indian population into any kind of integration with the rest of the population of the country?

Ms. DEER. Many thousands of Indian people live in urban areas, and it is an individual's choice whether they want to live on the reservation or whether they want to live off the reservation. You ask a very interesting question which has been the subject of many articles and many discussions, integration versus assimilation. I would point out in the fifties relocation was one of the policies, where they attempted to have many Indian people leave the reservations and move into the cities. It was also the termination era, et cetera.

I would like to point out that it would be important for individuals to have the choice and for the tribes to exercise their choices in all these matters. And at this point, again, if there could be a long-term commitment on a bipartisan basis to fund these programs, we could resolve many of these problems.

We, the United States, rebuilt Europe after World War II, and this is a much smaller population. It is within our interior boundaries. So I would ask you to consider this as you make your deliberations.

Senator BENNETT. Well, this is an appropriations hearing, so probably not the proper venue for this, but, yes, we put money into the Marshall plan and rebuilt Europe, and then we disappeared economically. We stayed there militarily for a variety of reasons, but at the invitation of the Europeans. We put them on their feet and then they took over.

Is there an anticipation that at any point this will cease, in the European pattern?

Ms. DEER. That is Europe and this is this country, and we are talking about the native peoples here. Efforts such as the self-governance, self-determination, have been aimed at helping tribes assume more responsibility and to make a change from the previous policies of paternalism that the Bureau and the Government followed to one of self-governance and self-determination.

So I think it is too far in the future to anticipate that, but I always anticipate that there will be American Indians and Alaska Natives living in this country, that we will have a government-to-government relationship with. This is a large country. We have millions of people here, and I think that the fact that we have approximately 2 million Indians now is a great tribute to the courage and the leadership of the individual Indian people as well as the tribes, in view of the harsh policies and many of the problems that the tribes have encountered over the years.

Senator BENNETT. Well, as I said, this is probably not the appropriate venue to have this discussion, but we appropriate money year after year—and if I am not mistaken, Mr. Chairman, is this not the largest single portion of this subcommittee's budget?

PROGRAMS SUBCOMMITTEE IS RESPONSIBLE FOR

Senator GORTON. Well, Senator Bennett, you bring up something that I want all the audience to be able to come up and see when they wish. This chart shows the relative amounts of money spent for the various purposes within this subcommittee's jurisdiction. The blue are Indian programs. That is not as tall as all of the land management programs together, but it is taller than any one of them.

Senator BENNETT. Yes.

Senator GORTON. Land management agency budgets are large. Energy and research and cultural activities are all much smaller. So yes, funding in our bill for native programs is a considerable amount of money. It is larger than any single other purpose, but it is not as large as all of our land management combined.

Senator BENNETT. Yes; I see. Well, coming from where I come from, in the business world, I always like to think in terms of a strategic plan and a goal, and where this is going to take us 5 years, 10 years from now. Or are we in a circumstance where 5 years, 10 years, 20 years from now, we are going to be appropriating money on a maintenance basis and nothing is going to change, other than we want to raise the standard of living within the present context?

If that is the policy decision made someplace else, I should understand that that is what our appropriations' function is. But I would like at some venue to open that question, and this is clearly not the venue, and I have exhausted my time.

Senator GORTON. No; it is appropriate—no, on the contrary, Senator Bennett, it is an appropriate venue for that. I asked that question of Ms. Deer last year and got the answer that you fear, that it is essentially a maintenance program.

I guess my followup question to yours to Ms. Deer would relate to the fact that, while the goal is that the standard of living of Indians in Indian country be roughly the equivalent of that of all Americans, in fact, it is the lowest socioeconomic identifiable ethnic group in America, which would seem to me at least to indicate that 150 years of this kind of policy have been an overwhelming failure.

I guess my philosophical question to Ms. Deer would be, is that simply because we have not appropriated enough money and that it should be double or more of this, more or less in perpetuity? Is it because of the total ineffectiveness of the Department of the Interior and the Bureau of Indian Affairs for 100 years or more? Or is it because there is a conceptual flaw in attempting to keep people separate and say that there are obligations toward them other than their own obligations to work for themselves?

Ms. DEER. You have asked a mouthful of questions.

Senator GORTON. I sure have. I think that is what Senator Bennett was looking at, too.

Ms. DEER. Indian people want to be Indians. They want to live in the reservation areas. They would like to maintain the culture, the kinships. Not everyone wants to melt into the mainstream. When the relocation came, some Indians did stay in the cities, but there was a lot of travel back and forth.

One of my own tribal people camped out in Chicago—this is my term—camped out in Chicago for 30 years. When retirement came, she now lives 10 miles from the reservation. So Indians moved into the cities, but established Indian centers and maintained their cultural and ethnic identity.

Again, these are questions that I think would be very appropriate for the tribal people to answer. But I want to say that Indian people want to be Indians, wherever it is, and each person can decide for themselves what this means. But we do envision the Federal Government carrying out its responsibilities as specified in

the treaties and the court decisions and the Attorney General's opinions and some of the other actions.

I think that, to answer your question about the cost, the wealth of this country is built from the wealth of the tribes. This all at one time was Indian country and, as you know, over a long period of time the reservations were established, and the tribes have been deprived of meaningful economic opportunity for many years. In my opinion, if there could be this long-term commitment to resolve some of these very serious problems that we talked about here with the schools, with the dams and roads and so on, and help the tribes with their economic development projects, the tribes could in all probability really function well.

There are tribes that are doing this now, and I would point out that the Mississippi Band of Choctaw Indians has done a remarkable job in a 30-year period, going from the bottom of the socio-economic ladder in Mississippi to now being the major force in that area. This has occurred through the hard work and determination and leadership of the chief and the tribal leaders there, taking advantage of the opportunities that were made available by this Government. They are doing well and I do not envision that they would want to make backward changes.

So some of the problems of the tribes are very hard to solve. For example, out in the plains we have significant numbers of people and there are not enough resources at this point to adequately meet the health and education and economic development needs of the tribes out there.

So again, it is hard to answer in a global way speaking for all the tribes, because there are small tribes, there are medium tribes, there are large tribes. I really do appreciate the many-faceted questions that are being asked here and I would encourage all of us to carry on some additional discourse when it is appropriate.

Senator BENNETT. I suppose we have probably exhausted that subject, but I am sure we are going to come back to it again and again, because you have given me an example of a tribe that demonstrated—I know nothing about it. I am just taking what you told me at face value. I would guess, from what you have said, this is a tribe which members have shown some fairly significant entrepreneurial spirit, created their own economic activity, and, therefore, got themselves into a circumstance where the long-term vision can be that they would ultimately be off any Federal kind of subsidy, just the way, back to your earlier analogy, the Europeans have gotten off the American subsidy at the end of the Second World War.

If indeed that is a correct analysis of what you said, it would seem to me the clear message on the part of all of society, as manifested through its elected representatives here, would be to try to engender that entrepreneurial spirit on the part of every tribe, because the Mississippi Choctaw Indians apparently solved their problems. Their standard of living is not at the bottom. They have, in your phrase, become one of the leaders in that area.

That is what I would like to see eventually happen, so that we could look at this money and say ultimately this was seed money put up by the Federal Government, on the basis of which the Indian tribes in America, wisely using this seed money, became eco-

nomically self-sufficient and weaned themselves to the point where they would not require it any more.

But if that is a philosophical no-no and you are saying, no, under the treaties these people must never be weaned from some kind of a Federal subsidy, then I want to know if that is the basic policy.

Ms. DEER. The tribes wish to have economic self-sufficiency and, as I mentioned earlier, good education, good health. We have tribes that have achieved some of these and I mentioned one, the Mississippi Choctaws. Others are striving toward this.

But again, the reason I mentioned the Marshall plan was to remind all of us how we helped rebuild the European countries, and we have not been able yet to do that, to help the tribes rebuild so that they can be economically self-sufficient.

Senator BENNETT. I think we have exhausted this.

POLITICAL CONTRIBUTION

Senator GORTON. I would like to go on to another question. Recently the Washington Post reported that the Cheyenne Arapaho Indians had given \$107,000 to the Democratic National Committee during the course of last fall out of a welfare fund for tribal members who need help with hospital bills, heating bills, and the like, from a tribe with what the newspaper described as 80 percent unemployment.

Was that an appropriate use of tribal money?

Ms. DEER. Well, let me say that tribes, like all other groups of citizens, do have the right to make political contributions. I am not sure that that is where the money came from, but it is their basic right. And I think that your question is appropriate.

Senator GORTON. Well, do you know the source of that \$107,000 contribution?

Ms. DEER. No.

Senator GORTON. You say you do not know whether it was from the tribal welfare fund?

Ms. DEER. No; I do not have that information.

Senator GORTON. Do you know whether Federal appropriated funds were involved, went into that fund out of which the contribution was made?

Ms. DEER. No; I am sorry, I do not know that.

Senator GORTON. Does BIA have the right to ask?

Ms. MANUEL. We are fairly certain that the funds did not come from Federal sources. However, you may be aware that the inspector general has sent a letter to Mr. Regula and Mr. Livingston dated April 8 that indicates that there will be an audit by the inspector general on the Federal funds, as requested.

Senator GORTON. I am sorry. The inspector general of the Department of the Interior?

Ms. MANUEL. Yes; of the Department of the Interior.

We have been working with the Bureau of Indian Affairs and the Cheyenne Arapaho Tribe over the last couple of years over some audit issues, so that we are fairly certain that these funds did not come from Federal dollars. Upon the conclusion of the inspector general's review and our own conclusion of the outstanding audit issues that we are working with the tribe on, I think we can give you a more definite answer.

Senator GORTON. But the Cheyenne Arapaho Tribe does get a distribution for tribal government and for other purposes from the BIA?

Ms. MANUEL. Yes.

Senator GORTON. And some of that money certainly does go into the tribe's welfare fund, does it not?

Ms. MANUEL. They operate a social services program, yes.

Senator GORTON. With money appropriated to the BIA and distributed by the BIA?

Ms. MANUEL. The social services program is actually run out of the area, so the tribe does not run—my understanding is that the tribal welfare fund that was referred to in the press releases was actually a tribal fund that was established by the tribe, and we had no control over it and none of the Federal dollars go into that fund.

Senator GORTON. Federal dollars do go into it?

Ms. MANUEL. Do not, do not.

Senator GORTON. Do not go into it? Well then, what funds do go into it?

Ms. MANUEL. Apparently funds that the tribe generates from sale of cigarettes, bingo revenues, funds that they generate from tribal enterprises.

Senator GORTON. All right. So this fund to the best of your knowledge did not have any Federal money in it?

Ms. MANUEL. That is right, that is right.

Senator GORTON. And that is what the inspector general is attempting to determine?

Ms. MANUEL. Yes.

Senator GORTON. And I assume that you would take the position that it would be inappropriate for a tribe to make a political contribution out of Federal money?

Ms. MANUEL. Yes.

INDIAN COUNTRY IN ALASKA

Senator GORTON. I had hoped that Senator Stevens would be here. I know he has a large number of questions about the recent decision with respect to Indian country in Alaska. I guess I would just like to ask you, Ms. Deer, perhaps one general question on that subject.

I understand that the BIA has said that that decision, assuming that it is finally upheld, will not have any significant impact on BIA funding. Am I correct in that assumption?

Ms. DEER. That is correct.

Senator GORTON. And why would it not?

Ms. DEER. At this point, according to the information I have, it will not have any significant impact. The tribes do have self-governance compacts and they make decisions under the self-governance compacts as to how the moneys are spent.

Senator GORTON. So in your view, while the tribes might have more authority or more responsibility, the relationship between the tribes and the distributions to the tribes from the BIA would not be affected?

Ms. DEER. Basically, yes.

Senator GORTON. Well, as I say, Senators—there are a number of very detailed questions on that subject from Senator Stevens,

and we will submit those to you in writing and hope that you can answer them.

Ms. DEER. We will be very happy to provide the information.

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. I also have some questions from Senator Cochran, and there could be those from others, and there will be some followup questions under my name on the subjects that we have already discussed. As Senator Domenici is, I am particularly interested in education programs and you will get some more questions on those.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing.]

ADDITIONAL COMMITTEE QUESTIONS

WA HE LUT SCHOOL

Question. Last year Congress appropriated \$2.5 million to begin rebuilding of the Wa He Lut Indian School in Washington State. \$2 million was sent to the school as a construction grant last November. Based on the Bureau's own program of requirements calling for a 17,500 square foot facility, the total project cost will be \$4 million. Is the Bureau supportive of an additional \$2 million for this project?

Answer. The Bureau provided a \$2 million construction grant to the school board from the fiscal year 1996 emergency supplemental appropriations. The other \$500,000 was provided for emergency evacuation of the school children during the flood. Based on an estimate prepared by the school board's architect dated April 11, 1997 for a 18,151 square foot replacement school, the estimated total construction cost is \$4,182,000, or an additional \$2,182,000 above the appropriated amount.

Question. The Wa He Lut School rebuilding was chosen as one of five pilot projects to make BIA school construction "more entrepreneurial and customer-focused," in Vice President Gore's words. Given the fact that the Office of Indian Education Programs originally requested \$5 million for this effort, can you advise this Committee of any compelling reason why we should not provide the additional funding to complete this task?

Answer. The request from the BIA, the Department and the Administration for the Wa He Lut School emergency response and repair needs from the 1996 floods was \$2.5 million. The request was based on the report on the school's needs at the time as well as the comparative need of the other reservation emergency project needs. This amount was funded in the fiscal year 1996 emergency supplemental appropriations.

The Wa He Lut School Board was working with the Federal Emergency Management Administration (FEMA) to try to secure additional funds for the school replacement since the old school was destroyed by the 1996 floods. The Bureau understands that there is potentially up to \$402,000 which will be made available to FEMA and eventually to the School Board. If this occurs, the balance needed for reconstruction is \$1,780,000, based on the school board's estimate for replacement.

The Bureau recognizes that Wah He Lut School cannot be completely replaced by the \$2 million grant to the school board from the emergency supplemental appropriations. However, the Bureau's existing schools have an immense backlog of over \$680 million in code and standard deficiencies, many of which related to health and safety. In order to fairly distribute the limited funds available under constrained budgets, it has been necessary to establish a national prioritization process. Through this competitive process, a national list of annual repair projects are determined based on need. For School replacement projects must be funded in the order of the Congressionally approved priority process projects in order of need. Unfortunately, Wa He Lut School replacement is not currently high enough on the repair priority projects list; is not on the replacement school priority list frozen by Congress, and of which only seven of the 16 schools on the list have been completed. The school will need to compete in the future for any additional funds necessary for replacement if funds are not forthcoming from other sources.

TRIBAL BASE FUND DISTRIBUTION

Question. Will you please provide this Committee with information on how Tribal base is determined? When was this formula last revised? Does the BIA take into consideration Tribes' current and changing population, their socioeconomic status—their need? Why isn't the base reevaluated periodically to reflect changes? Shouldn't it be, given that federal funding is declining? Would legislation be necessary to effect this?

Answer. Historically, the funding allocated to Tribes has been based on the Indian Priority System, an old system that the Department and Bureau had in place for several years. In that distribution system the Tribes in each location and each area established what they felt was their need for funding on the basis of population, land base, forestry dollars, number of forestry acres. While a new system, the Tribal Priority Allocations System (TPAS) is now in place, the historic method of distribution is still in place.

Tribal base fund distribution has not, to date, taken into consideration changing population or socioeconomic status, but included, historically, Tribes' determination of their need as described above. As programs such as Indian Child Welfare Assistance have been transferred to TPA, the distribution has been based on population, number of children at risk, etc. In the fiscal year 1998 budget, however, an increase of \$7.3 million is requested largely due to the increase in reservation population. Similarly, an increase of \$10 million is requested for contract support based on the proposed TPA general increase and the fact that about 65 percent of the TPA funding is contracted by Tribes.

Several programs recently transferred to TPA are not included in the Tribal base: contract support, welfare assistance, road maintenance and the housing improvement program. Funds appropriated for these programs are distributed by a variety of formulas. Need is still a key factor for welfare assistance and housing improvement. Need is based on an individual eligibility basis. Contract support is distributed, for the most part, based on rates negotiated with the Inspector General. Road maintenance is distributed on the following factors: the actual need requests for emergency, administration, bridges, airstrips and snow/ice removal; and the miles in the BIA Roads system. The BIA Roads system miles are weighted to reflect the road surface-type priorities.

An additional factor that has come into play in Tribal base fund distribution is the focus and needs of Small and Needy Tribes and the need to provide funding to Tribes that are newly recognized. The method of distribution is currently the same for both programs: provide a minimum of \$160,000 for Tribes in the continental United States and \$200,000 for Tribes/Native entities in Alaska. The Joint Tribal/DOI/BIA Reorganization Task Force (Task Force) prepared a report on the Small and Needy Tribes and the fact that base funding for many Tribes, particularly in Alaska and California, are far less than the defined minimum levels above, and not enough to even begin to provide a viable Tribal government operation. The Task Force preliminary assessment of the total needed to bring small and needy Tribes to the minimum level was \$23 million. To date, \$6 million has been appropriated and \$8 million is requested for fiscal year 1998.

Over many years, several studies have been undertaken to explore and define an "equitable fund distribution methodology". The most recent, done in 1989, used population, Tribally owned acres of land, individually owned acres of land as criteria and created agency management pools. Using the formula created in the study and comparing to current funding levels at the time, Tribes in five areas would have received increased funding, the Navajo Nation funding would have remained basically level, and the Tribes in seven areas would have received less funding. The report found that the data available was lacking and not always comparable from area to area. The report recommended that if a formula is instituted at all, that it be instituted over a number of years (five to ten) to minimize short term large dislocations.

This study, similar to those undertaken earlier, basically resulted in the same results. There is not a formula for "equitable funding" that would produce a consensus from Tribes, much less a majority.

The Task Force recommendations also included creating a "standard assessment methodology" tool for each individual program in the Bureau's annual appropriations. Considerable time over a two year period was spent in developing a model for one program, to be followed and used for the rest of the programs. A Work Group to develop this model was comprised of both Tribal and Bureau staff. There were exhaustive hours of discussion on the subject and again, it was discovered that it is virtually impossible to achieve "equitable fund distribution" that will achieve a consensus among Tribes and if that were possible, it would only be so with signifi-

cantly increased appropriations in TPA. Finally, the Bureau does not believe legislation would be required to change the fund distribution methodology.

EDUCATION FACILITIES

Question. The Bureau has raised the fact that many of its education facilities are very old. Will the Bureau provide this Committee with specific information as well as comparative information on the average age of public schools in the United States?

Answer. The table below shows the number of school facilities in age increments of nine years.

SCHOOL FACILITIES BUILDING AGE

	School facilities building age in years										Total
	0-9	10-19	20-29	30-39	40-49	50-59	60-69	70-79	80-89	90-99	
School facilities	21	26	23	49	20	9	26	7	2	2	185
Percentage of total	11	14	12	26	11	5	14	4	1	1	100

Bureau staff have attempted to obtain a report providing the national average age of public schools but have found no information from either GAO or the Department of Education. It is important to point out, however, that public schools have a tax base and other resources upon which to draw. The Bureau does not.

The Administration has requested \$5 billion to address facility repair needs for public schools across America with a two percent set-aside for the Department of Interior. This resource combined with the Bureau's education construction budget request will help eliminate the ever-growing backlog of repairs in these schools.

EDUCATION PERFORMANCE

Question. Does the Bureau review the relative performance of Indian students in public schools versus BIA schools? Shouldn't it, if it does not already? How does the Bureau determine whether BIA schools are doing a good job of teaching? What is the average SAT or ACT score (or other standardized test of aptitude and achievement) in public schools? What is the average for students taught in BIA schools?

Answer. No, the Bureau does not compare the performance of Indian students in BIA funded schools with Indian students in public schools. It is difficult to make comparisons between BIA schools and public schools. The Bureau does not collect SAT or ACT scores on its Indian students. Any testing for career planning or academic student assessment for BIA schools is designed at the local level with school board and parental input. BIA schools offer programs which are accredited by states or regional associations and require all teachers to meet state certification requirements. Almost all schools are participating in the school reform movement as defined in Goals 2000: Educate America Act and Improving America's Schools Act of 1994.

Within the Bureau's overall strategic plan to be submitted to the Congress in September 1997, the Office of Indian Education Programs' (OIEP) performance goals for fiscal year 1999 will address student dropout rates, student attendance, student academic performance, Native languages and school accreditation rates. Under the requirements of GPRA, the student performance indicators selected for measurement will reflect the effectiveness of the Bureau's school system.

QUESTIONS SUBMITTED BY SENATOR STEVENS

INDIAN COUNTRY IN ALASKA

In December, the Ninth Circuit Court of Appeals issued its opinion in *Alaska v. Venetie Tribal Government* that the Alaska Native Claims Settlement Act did not extinguish Indian Country in Alaska and that the land Venetie occupies is Indian Country. The State of Alaska opposes this decision and has submitted a petition for writ of certioraris to the Supreme Court. The Court will decide later this summer whether or not to hear the case. It is unclear what the Supreme Court will decide; and this decision opens the door for the remaining 225 Native villages in Alaska to explore the possibility that they have Indian country.

I would like to know more about BIA funding of Alaska Native programs and the potential consequences on the Federal programs in the Interior bill if the Ninth Circuit's holding stands. Assume for the sake of argument that all 226 tribes in Alaska are successful in proving they have some Indian country.

Question. Solicitor Sansonetti issued an extensive 180-page opinion in 1993 that there is no Indian Country in Alaska. Is that still the Department of the Interior's position?

Answer. The Office of the Solicitor's position is that the portion of the 133-page Opinion of former Solicitor Sansonetti, that "notwithstanding the potential that Indian country still exists in Alaska in certain limited cases, Congress has left little or no room for Tribes in Alaska to exercise governmental authority over land or nonmembers," M-36-975, at 108 together with the January 19 Supplemental I (58 Federal Register 54364(1993)), is subject to review, but has not been withdrawn or modified. However, unless it is overturned, the Ninth Circuit's decision in Venetie remains the law in Alaska.

In his Opinion, Solicitor Sansonetti did not conclude unequivocally that there is no Indian country¹ in Alaska but found that Indian country might exist in certain circumstances, although he believed that Native villages do not have governmental jurisdiction over lands and nonmembers on ANCSA Native corporation lands and village owned fee lands.

Question. My staff tell me that the Solicitor's Office is preparing a report on the potential impact of Indian Country in Alaska. Is that report completed? When do you expect to complete it? Please provide a copy of it to the Appropriations Committee before it is publicly released.

Answer. The Department's Office of the Solicitor and the Bureau of Indian Affairs have prepared an analysis of the implications of the existence of Indian country in Alaska. The paper was sent to the Appropriations Committees on March 11, 1997. A copy is attached.

ANALYSIS OF THE IMPACT OF INDIAN COUNTRY IN ALASKA

The following provides an analysis of the implications of the existence of Indian country in Alaska, prepared in response to a request from the Senate Interior Appropriations Subcommittee. The paper is written in general terms, as it is difficult to say with any degree of certainty exactly what these implications are, since as of this date the Venetie matter remains in litigation and is on petition for certiorari to the Supreme Court. However, this paper explains the Venetie decision and discusses whether the decision would have an impact on BIA funding. While the scope of the Venetie decision currently remains unresolved, for the purposes of the discussion below, the paper assumes that the Venetie decision would apply to all Alaska tribes.

Background. The total BIA funding allocated in fiscal year 1996 for Alaska programs was \$80.2 million. The estimated total funding level for BIA Alaska programs in fiscal year 1997 is \$91.7 million and the fiscal year 1998 budget request is \$97.4 million. The greatest share of funding for BIA Alaska Programs (over 90 percent) goes to the Tribal Priority Allocations (TPA) activity for programs such as tribal government operations; social services programs; law enforcement and tribal courts; scholarships; and natural resource management. Tribes may prioritize and reallocate TPA funds among programs in accordance with their unique needs and circumstances. In addition, almost 60 percent of the Alaska TPA funds are provided to Tribes through Self Governance grants whereby Tribes are allowed greater flexibility in program management. Additional information on BIA funding to Alaska is provided in the Attachment.

The Department believes there are no immediate budget impacts anticipated beyond the current levels of funding even if Indian country is assumed to apply to all Alaska Native communities.

¹ In 1948, Congress defined "Indian country" as follows:

Except as otherwise provided in sections 1154 and 1156 of this title, the term "Indian country", as used in this chapter, means (a) all land within the limits of any Indian reservation under the jurisdiction of the United States Government, notwithstanding the issuance of any patent, and, including rights-of-way running through the reservation, (b) all dependent Indian communities within the borders of the United States whether within the original or subsequently acquired territory thereof, and whether within or without the limits of a state, and (c) all Indian allotments, the Indian titles to which have not been extinguished, including rights-of-way running through the same. 18 U.S.C. § 1151.

INDIAN COUNTRY

By way of background, the phrase “Indian country” is a term of art in Indian law. Its meaning evolved over time, and Congress in 1948 statutorily defined it for application in the criminal context. 18 U.S.C. § 1151. This definition is also used for civil jurisdiction. *DeCoteau v. District Court*, 420 U.S. 425, 427 n.2 (1975).

[T]he term “Indian country”, as used in this chapter, means (a) all land within the limits of any Indian reservation under the jurisdiction of the United States government, notwithstanding the issuance of any patent, and, including rights-of-way running through the reservation, (b) all dependent Indian communities within the borders of the United States whether within the original or subsequently acquired territory thereof, and whether within or without the limits of a state, and (c) all Indian allotments, the Indian titles to which have not been extinguished, including rights-of-way running through the same.²

Subsequent case law in the contiguous forty-eight states has continued to refine this definition in a variety of applications, but the general absence of reservations in Alaska led many to believe that Indian country in Alaska did not exist beyond the Annette Island Reservation. In its decision in *Alaska v. Native Village of Venetie Tribal Government*, 101 F.3d 1286 (9th Cir. 1996) (*Venetie*), the Ninth Circuit held that this belief was not correct.

THE VENETIE DECISION

The issue presented to the Ninth Circuit in *Venetie* was whether the Village of Venetie’s Tribal Government had the authority to collect a Tribal “business gross receipts” tax from an out-of-town building contractor who came to the village to construct a school under a contract paid for by the State of Alaska. The resolution of this issue turned on whether the village was a “dependent Indian community” within the definition of Indian country set out in 18 U.S.C. § 1151. The district court ruled that the village could not impose the tax because it did not satisfy the district court’s reformulation of the Ninth Circuit’s six criteria for finding a dependent Indian community.³

Although on appeal the Ninth Circuit agreed with the district court that federal set aside for Indians and federal superintendence were two prerequisites for a finding of Indian country, it stated that these requirements should be construed broadly as it had previously ordered in its 1988 decision in the same case. *Alaska v. Native Village of Venetie*, 856 F.2d 1384 (9th Cir. 1988). Reversing the district court, the Ninth Circuit ruled that the Alaska Native Claims Settlement Act (ANCSA) did not extinguish Indian country in Alaska. “In sum, we hold that ANCSA neither eliminated a federal set aside for Alaska Natives, as such, nor terminated federal superintendence over Alaska Natives. As a result, Indian country may still exist in Alaska.” *Venetie* at 1299–1300.

Applying its six factor test to the specific factual situation presented, the Ninth Circuit held that the land in question was federally set aside for Indians as such, and that the Native Village of Venetie remained under federal superintendence even if not under its dominance. *Venetie* at 1300–02. Based on these findings, the Ninth Circuit concluded that Venetie is a dependent Indian community, that the land in question is Indian country, and that the Tribe therefore has the power to impose its tax within such territory. The Ninth Circuit remanded the case to the district court “to determine whether Venetie has the power to impose a tax upon a private party where the State of Alaska will ultimately pay the obligation.” *Venetie* at 1302–03.

²Under 18 U.S.C. § 1151, Native allotments are Indian country, and some might be considered to lie within the boundaries of a dependent Indian community. However, the extent of tribal governmental jurisdiction over them arguably could be analyzed under the terms of the allotment statute, regulations, and 18 U.S.C. § 1151© case law.

³The *Venetie* case had been remanded previously to the district court by the Ninth Circuit for consideration in light of Court of Appeals’ opinion in *Alaska v. Native Village of Venetie*, 856 F.2d 1384 (9th Cir. 1988), which set out the Circuit’s six-factor test for determining a dependent Indian community. The six factors articulated by the Ninth Circuit in its first *Venetie* decision include:

- (1) the nature of the area;
- (2) the relationship of the area’s inhabitants to Indian tribes and the federal government;
- (3) the established practice of government agencies toward the area;
- (4) the degree of federal ownership of and control over the area;
- (5) the degree of cohesiveness of the area’s inhabitants; and
- (6) the extent to which the area was set aside for the use, occupancy, and protection of dependent Indian peoples. *Venetie*, id., 856 F.2d at 1391.

After the Ninth Circuit's decision was announced, the appellee State of Alaska petitioned the Ninth Circuit for rehearing, with a suggestion for rehearing en banc. The Ninth Circuit rejected that petition on January 6, 1996. The state has since announced its intention to submit a petition for writ of certiorari to the United States Supreme Court and calculates that its petition is due on April 7, 1997, under the Supreme Court's rules. Venetie's opposition will be due 30 days later. On January 23, 1997, the Ninth Circuit granted the Alaska's motion to stay issuance of the mandate in the Venetie case pending the Supreme Court's final disposition of the case. The United States is not a party to this litigation, and the Supreme Court may or may not request our views on it. Thus, the scope of the Venetie decision remains unresolved but applies, at a minimum, to the circumstances of the Native Villages of Venetie and Arctic Village: a Tribal government which has obtained title to its former reserve through a voluntary transfer of the land from both Native village corporations.

IMPACT OF THE VENETIE DECISION

Although the Venetie decision can be strictly applied only to the facts of the case, in accordance with the request of the Subcommittee, the following analysis assumes, for purposes of discussion, a broad interpretation of Indian country in Alaska, i.e., it assumes all 226 Alaska native groups.

GENERAL INDIAN PROGRAMS IN ALASKA

The existence of Indian country in Alaska would not affect the provision of social services programs in Alaska.

Historically, services provided to Alaska Natives have been authorized by the Snyder Act of 1921 which has an extremely broad authorization of appropriations "for the benefit, care and assistance of Indians throughout the United States." Although the BIA has attempted to restrict its "benefits, care and assistance" in the lower 48 only to Indians living on or near a reservation, the realities in Alaska have required the BIA to extend the scope of its activities to include all of Alaska, treating the entire state as a "reservation" for provision of services. This scope includes the total Native population identified within the state which was served by the BIA prior to statehood and which continues today.

The programs having a service area defined as on or near a reservation include Grant Assistance, Housing Improvement Program, and Indian Child Welfare grants. The BIA currently funds these types of Social Services programs in Alaska through the TPA activity.

EDUCATION PROGRAMS IN ALASKA

The existence of Indian country in Alaska would not affect the current prohibition on BIA-funded schools in Alaska.

The BIA currently provides, either through direct program delivery or through contract or grants, the following education programs in Alaska: Johnson O'Malley education assistance program for eligible Indian students attending public schools; Post-secondary Scholarships; Adult Education; Higher Education Scholarships.

While at one time BIA operated an extensive elementary and secondary school system in Alaska, responsibility for educating Alaska Natives was transferred to the state over the course of twenty years (1966-1985) as a result of an agreement reached with the state in 1964. In fiscal year 1982 and 1983, the Congress appropriated over \$40 million to the State of Alaska for costs of upgrading facilities to complete the transition from Bureau operated to state operated schools. (These funds were provided in addition to routine school operations and facility repair funds for the remaining BIA operated schools in Alaska.) The transfer of BIA-funded schools to the state culminated in Public Law 98-63, the 1985 Appropriations Act, after extensive consultation among the state, the BIA, and the Alaska Native community. Public Law 98-63 included a permanent legislative provision that prohibits the BIA from funding BIA schools in the State of Alaska.

After enactment of Public Law 98-63, the Tribally Controlled Schools Act of 1988 (Public Law 100-297), authorized a new program of Tribal grant schools and included Alaska Native villages within the definition of "Tribe" for purposes of the program. On May 21, 1993, the Department of the Interior Solicitors made a determination that Public Law 100-297 requires funding of grant schools for Alaska Native villages meeting the eligibility requirements of the statute. Since fiscal year 1994, Congress has enacted annual appropriations language prohibiting funding for BIA grant schools in Alaska.

TRIBAL COURTS AND LAW ENFORCEMENT IN ALASKA

The existence of Indian country in Alaska might motivate Tribes to exercise governmental authority, but the Tribes would have to reallocate current funds in order to exercise this authority.

Alaska is a Public Law 83-280 state which means that the state has general criminal and civil jurisdiction for police and courts over Indian country. Tribes retain jurisdiction under the 1968 Indian Civil Rights Act over misdemeanors, but only those which involve Indians, a limitation imposed by the Supreme Court. Under Public Law 83-280, states can retrocede their jurisdiction back to Indian Tribes. However, for this to happen, the Secretary must consult with the Attorney General and agree to accept the retrocession. In recent years, the Secretary has declined to accept retrocession due to the lack of federal funding.

As a matter of policy, the Bureau of Indian Affairs (BIA) does not provide funding in Public Law 83-280 states specifically for Tribal courts or law enforcement. However, some Alaska Tribes have prioritized their TPA funds for tribal courts and law enforcement programs.

At the present time, the State of Alaska is responsible for providing law enforcement and detention services on Alaska Native lands. The Alaska State Police have developed the Village Public Safety Officers (VPSO) program in which local village members are provided minimal public safety training and can act as first responders to calls for service.

ALASKA NATIVE TRUST LANDS

The presence of Indian country in Alaska would not affect the Secretary's trust responsibility since the land is not currently in trust, and current regulations prohibit the Secretary from taking land into trust for Alaska tribes or individuals.⁴

The land acquisition regulations (25 C.F.R. § 151.1) prohibit the acquisition of land in trust status in Alaska for Alaska Natives and tribes (except for the Metlakatla Indian Community of the Annette Island Reservation). Since 1978, the Department has declined all requests to take land in trust for Alaska Natives or Tribes.

In 1994, several Alaska Villages (Chilkoot Indian Association, Native Village of Larsen Bay, Kenaitze Indian Tribe) represented by the Native American Rights Fund (NARF) submitted a petition requesting that the Department undertake a rulemaking to change the existing regulation to allow the Secretary to exercise his discretion to acquire land in trust for Alaska Natives.

The Department subsequently published a Notice in the Federal Register that it had received the petition and requested comments on it by March 6, 1995. Only two comments were submitted, and the Department has not undertaken any additional actions concerning the petition.

BIA SCHOOLS IN ALASKA

There are 557 federally recognized Tribes in the United States. Alaska has 226 of the 557 Federally recognized Tribes—almost half of the Nation's Tribes.

Question. How many of the Tribes outside of Alaska have been held to possess "Indian Country"?

Answer. We are not aware of any federally-recognized Indian Tribe in the contiguous 48 states that does not possess some Indian country, by virtue of having a reservation, having members with trust or restricted allotments, or being a dependent Indian community.

Question. Today, BIA is financially responsible for 185 elementary, secondary and boarding schools on 63 reservations in 23 States. Do each of those reservations have "Indian country"?

Answer. As noted above, all land within existing Indian reservations is Indian country by definition.

Question. What would be the impact on the BIA budget if the Congress did not continue the annual prohibition on BIA funding of grant schools in Alaska?

Answer. Discontinuation of the annual prohibition on BIA funding of grant schools in Alaska would not affect the BIA budget because there is an annual prohibition on allowing new, previously public schools into the BIA school system in all regions of the country as well as an annual prohibition on allowing schools to expand their grade structures. These prohibitions have been necessary, in the recent

⁴Although trust status per se does not require a finding of Indian country, courts may find it easier to determine that trust land is a dependent Indian community and thus Indian country under 18 U.S.C. § 1151.

climate of severe fiscal constraint, in order to avoid diminished funding for the schools currently in the system.

Question. If the 226 Alaska Native communities seek recognition of their core township land as Indian country, could Alaska Natives seek to have their children educated in BIA schools?

Answer. The current prohibition on BIA funded schools in Alaska is not related to the issue of Indian country. While at one time BIA operated an extensive elementary and secondary school system in Alaska, responsibility for educating Alaska Natives was transferred to the state over the course of twenty years (1966–1985) as a result of an agreement reached with the state in 1964. In fiscal year 1982 and 1983, the Congress appropriated over \$40 million to the State of Alaska for costs of upgrading facilities to complete the transition from Bureau operated to state operated schools. (These funds were provided in addition to routine school operations and facility repair funds for the remaining BIA operated schools in Alaska.) The transfer of BIA-funded schools to the state culminated in Public Law 98–63, the 1985 Appropriations Act, after extensive consultation among the state, the BIA, and the Alaska Native community. Public Law 98–63 included a permanent legislative provision that prohibits the BIA from funding BIA schools in the State of Alaska.

After enactment of Public Law 98–63, the Tribally Controlled Schools Act of 1988 (Public Law 100–297), authorized a new program of Tribal grant schools and included Alaska Native villages within the definition of “Tribe” for purposes of the program. On May 21, 1993, the Solicitor made a determination that Public Law 100–297 requires funding of grant schools for those Alaska Native villages that would be able to meet the eligibility requirements of the statute. Since fiscal year 1994, Congress has enacted annual appropriations language prohibiting funding for BIA grant schools in Alaska.

Furthermore, the moratorium on allowing new, previously public schools into the BIA school system in all regions of the country would prohibit BIA schools in Alaska, regardless of any determination about the existence of Indian country. All Tribes are prohibited from bringing new schools into the BIA school system.

Question. What is the estimated cost to restore BIA schools for these 226 communities?

Answer. As noted above, Public Law 98–63 prohibits the BIA from funding BIA schools in Alaska. In 1994, Senator Stevens requested a GAO report on the estimated costs of BIA schools in Alaska. The GAO’s estimate at that time was that there were 200 schools in Alaska with 70 percent or more Alaska native students. Should BIA assume responsibility for these schools, GAO estimated that annual School Operations costs would range from \$150 to \$190 million annually. However, there is a prohibition on allowing any new schools, regardless of the states where they are located, into the BIA system.

Question. The fiscal year 1998 budget request for operation of 185 BIA schools is \$450 million. That works out to about \$2.4 million per school annually. Alaska costs are much higher than average costs in the “South 48.” Have you taken that into account in answering the previous question?

Answer. The 1994 GAO estimate of cost ranged from \$150 to \$190 million to support School Operations in Alaska included a 25 percent adjustment.

Question. How much does BIA spend per student under the Indian School Equalization Program (ISEP)—which is formula-based funding for the 185 Bureau operated, grant, contract, elementary and secondary schools?

Answer. The fiscal year 1996 funding level provided about \$5,300 per student for the ISEP program in School Year 1996–97.

Question. Has the Administration or the Department of the Interior or BIA made any statement relative to resuming responsibility for BIA schools in Alaska? If so, please provide a copy of any such statement(s) to the Committee.

Answer. During Conference action on the fiscal year 1995 Interior Appropriations bill, the Department supported the Senate proposal to limit the number of BIA funded schools in order to secure stabilized funding for the school system in existence at the time. The Conference managers adopted the Senate bill language into law. Tribes residing in all states are prohibited from bringing new schools into the BIA school system. A copy of the fiscal year 1995 effect statement, which presents the Department’s position, is attached. The Bureau has supported the proposal since that time.

ATTACHMENT 1

EFFECT OF HOUSE AND SENATE ACTION

Activity/Subactivity: Other Recurring Programs/Education.

Bill language which limits the number of Bureau-funded schools to 187.

House action: The House did not address this item.

Senate bill Language: "Provided further, That funds made available, in this Act and hereafter, for schools funded by the Bureau of Indian Affairs shall only be available to the 187 schools which will be in the Bureau of Indian Affairs school system as of September 1, 1995." (p. 33, lines 9-13)

Senate report statement: "Bill language has been included which limits the number of schools to be funded to 186 [sic] schools for fiscal year 1995 and future years. With the limited resources available to the Committee in fiscal year 1995 and for the foreseeable future, the Committee does not support adding additional schools which will result in diminished funding for schools currently in the system. Given the tremendous backlog for facilities maintenance and improvement projects and new school construction, the Committee cannot support the increased demand for these already insufficient resources, which would result by adding more schools to the system. This limitation of funding to schools included in the fiscal year 1995 budget expands the current exclusion which applies only to new schools from Alaska to include all regions of the country." (p. 58)

Effect of senate action: The Senate action will help to secure stabilized funding for the 187 existing Bureau-funded schools.

Preferred action: The Department strongly recommends that the Conference managers adopt the Senate bill and report language.

TRIBAL COURTS AND LAW ENFORCEMENT IN ALASKA

Alaska is a Public Law 83-280 state, under which the state has concurrent jurisdiction with the Federal government over general criminal and civil matters, even in Indian country.

Question. Does the position of BIA on Indian country in Alaska permit the 226 Native entities to request funds to establish tribal court systems?

Answer.

Note: The jurisdictional statement presented above requires clarification. The State of Alaska exercises jurisdiction that is concurrent to the Tribes in Alaska. Public Law 83-280 did not divest the tribes of civil or criminal jurisdiction that they otherwise possess.

The Sansonetti opinion specifically recognized the right of Alaska Tribes to regulate internal Tribal relations and to exercise authorities granted by Congress, including authorities under the Indian Child Welfare Act.

The 1993 opinion of then-Solicitor Sansonetti concluded that Alaska Natives possess the same powers and attributes as other Indian Tribes, except to the extent limited or preempted by Congress, Solicitor's Opinion M-36975. Like Tribes in the contiguous 48 states, Tribes in Alaska perform those functions and services that have not been limited or preempted by Congress. The Bureau of Indian Affairs' policy within Tribal Priority Allocations (TPA) is that federal funds awarded to the Tribes may be used for Tribal judicial systems. Alaska Tribes have and continue to prioritize funds from their TPA base for Tribal judicial systems.

Question. The State of Alaska is responsible for law enforcement and detention centers on Alaska Native lands at the present time. Please inform this Committee on the procedure in states where there is a Tribal court system. Do such states continue to provide state services, or are Tribal systems deemed solely the responsibility of Tribes?

Answer. Until such time as the Tribes reassume jurisdiction, the states remain responsible for law enforcement and detention and Tribes retain jurisdiction which is concurrent to that of the state.

Due to limited funding, Tribes that exercise exclusive criminal jurisdiction may elect to contract with states or other Tribes for detention services. In non-Public Law 83-280 states, many Tribes contract with other Tribes and county or municipal governments to provide detention services. Historically limited funds were prioritized for those Tribes exercising exclusive jurisdiction. As a result, Tribes situated in Public Law 83-280 states receive a lower allocation of funds for courts and law enforcement.

A significant increase in funding for Tribal Priority allocations would provide Public Law 83-280 and non-Public Law 83-280 Tribes with the resources to develop judicial and law enforcement programs. Many Tribes in the contiguous 48 states use

Tribal development dollars (i.e., gaming, natural resource, development) to underwrite a panoply of governmental services including judiciaries and law enforcement.

Question. My staff tell me that Alaska's Tribes have already been using some BIA funding—from the Tribal Priority Allocations—to fund Tribal justice and law enforcement. Will you please detail how much money has been provided and to which Tribal entities?

Answer. The fiscal year 1998 President's Budget Request includes \$31,137 prioritized by 29 Alaska Tribes and one agency to the Tribal Courts program. The Fairbanks agency and the following Tribes chose to place funds in their Tribal Courts program: Andreafsky, Atmautluak, Chefornek, Marshall, Kuigpagmuit, Nightmute, Platinum, Pitka's Point, Kwinhagak, Toksook Bay, Tuluksak, Russian Mission, Lower Kalskag, Upper Kalskag, Aniak, Chuathbaluk, Lime Village, Kwethluk IRA, Orutsaramuit, Mekoryuk, Kipnuk, Akiak, Akiachak, Kasigluk, Kwigillinguk, Newtok, Chistochina, Chitina, Mentasta. No Tribes chose to prioritize funding to the Law Enforcement program. In addition, Self Governance Tribes negotiated \$82,200 for Tribal judiciaries.

Question. If Tribes in Alaska take over various functions—juvenile prosecutions, misdemeanors, alcohol control, child custody proceeding, fish and game management, environmental enforcement—what funds are available for training and support to ensure that these functions are adequately carried out?

Answer. Because Alaska is a Public Law 83-280, the state has general criminal and civil jurisdiction for police and courts over Indian country. Tribes retain jurisdiction under the 1968 Indian Civil Rights Act over misdemeanors, but only those that involve Indians, a limitation imposed by the Supreme Court. Under Public Law 83-280, states can retrocede their jurisdiction back to Indian Tribes. However, for this to happen, the Secretary must consult with the Attorney General and agree to accept the retrocession. In recent years, the Secretary has declined to accept retrocessions due to the lack of federal funding.

In 1988, the Bureau attempted to deny funding for law enforcement services in Public Law 83-280 states, but the Congress disagreed, directing that the Bureau continue to provide such funding in House Report 100-498, 100th Congress, First Session, at 891 (1987).

At this time the only BIA funds currently available for Tribal court and law enforcement programs are the funds which Tribes prioritize within their Tribal Priority Allocations base budgets. This is true for both Alaska Tribes and Tribes in the contiguous 48 states. In order to provide more funds for judicial and law enforcement programs, Tribes would have to reprioritize resources from other programs. Although this is not a viable option, it is the only option available at this time.

Currently the State of Alaska is responsible for providing law enforcement and detention services on Alaska Native lands. The Alaska State Police have developed the Village Public Safety Officers (VPSO) program in which local village members are provided minimal public safety training and can act as first responders to calls for service but they are not certified law enforcement officers.

Question. Alaska Tribes believe Indian country will enable Alaska Natives to assume jurisdiction to control the sale of alcohol and prosecute those who violate Tribal law. Does the BIA have any agreement with the Justice Department regarding providing prosecution to back up the Tribes' efforts to do their own alcohol control programs?

Answer. Three villages have liquor control ordinances that have been approved and published in the Federal Register as required by 18 U.S.C. § 1154. See Chalkyitski, 48 Federal Register 21373 (May 12, 1983); Northway, 48 Federal Register 30195 (June 30, 1983); and Minto, 51 Federal Register 28779 (August 11, 1986). Many villages wish to affirm that the possession, sale and consumption of liquor is illegal. Like many Public Law 83-280 Tribes in the contiguous 48 states, villages may wish to impose civil, rather than criminal, penalties including impoundment, fines and exclusion.

The Bureau does not have an agreement with the Department of Justice to enforce village liquor control ordinances. However, the villages may wish to enter into agreements with the Assistant United States Attorneys to enforce 18 U.S.C. § 1154 which prohibits the sale, possession and consumption of alcohol within Indian country.

Question. Last Congress during passage of welfare reform legislation, I offered an amendment, which was accepted, limiting Native administration of welfare programs in Alaska to the 12 regional non profit corporations and Metlakatla. I took this step to make sure that the maximum amount of limited federal dollars for needy families would go to provision of services, and to avoid unnecessarily high administrative costs in a block grant environment. At the time I proposed my amendment, I consulted with Native groups in Alaska and gained their agreement. Since

passage of the welfare reform legislation, Native regional non profit corporations have been working with the State of Alaska to coordinate development of their programs.

Now I understand the BIA has successfully urged the Justice Department to request that my amendment be deleted as part of the Administration's comments to the House Ways and Means Committee on its technical corrections bill. None of the Alaska Congressional delegation have been contacted on this matter by either Justice or BIA. I also understand that the Department of Health and Human Services, which administers welfare, does not have problems with my amendment.

Please explain (1) the rationale for BIA's objections; and (2) why the Alaska Congressional delegation was neither notified nor consulted.

Answer. The Bureau is one of several federal agencies that offered recommendations to the Department of Health and Human Services (DHHS), the lead agency for welfare reform. The Secretary of Health and Human Services and the Commissioner of the Social Security Administration proposed technical and conforming amendments to the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA) in a letter to the Chairman of the Committee on Finance dated December 16, 1996. Among the proposals was a request to amend Section 419A of the Social Security Act (as added by section 103(a) of PRWORA).

The Bureau recommended that the Section 419A of the Social Security Act definition of Indian, Indian Tribe and Tribal organization have the meaning given such terms by section 4 of the Indian Self Determination and Education Assistance Act (25 U.S.C. 450b). The DHHS Child Care Bureau expressed concern that the portion of Child Care Development Block Grants (CCDBG) funding transferred from the TANF program under section 418 would make impossible, in the case of Alaska Natives, operation of a single unified child care program.

The Bureau's concern, and that of DHHS, was the government's liability. This concern was expressed to the Alaska delegation on several occasions. For example, in a meeting on February 5, 1997, with Liz Connell of the Committee staff and Martha Stewart of the Governor's staff, we discussed the constitutionality of special statutes for Indian Tribes and the risk of litigation for the DHHS when entities that are not on the list of federally recognized Indian Tribes are included by definition while federally recognized Tribes are excluded. It was recommended to Ms. Connell that limitations in eligible beneficiaries be accompanied by sufficient legislative history to support the exclusion of beneficiaries that are otherwise recognized by special statutes.

Question. Under 25 U.S.C. § 450b, in the Indian Self Determination Act, Indian Tribe in Alaska is described as "any Alaska Native village or regional or village corporation as defined in or established pursuant to the Alaska Native Claims Settlement Act [43 U.S.C.A. § 1601 et. seq.] * * *." Nothing in that law ranks one type of organization over another. Yet, I continue to hear that BIA creates obstacles for regional corporations or their designees and continues to give preference to "Alaska Tribes" in 638 contracts and compacts. What is the legal justification for BIA's apparent policy and what is its history?

Answer. Inclusion on the Indian entities list demonstrates that the Secretary unequivocally recognizes the Tribal status of the listed villages and regional Tribes that are acknowledged to have "the immunities and privileges available to other federally acknowledged Indian Tribes by virtue of their government-to-government relationship with the United States as well as the responsibilities, powers, limitations and obligations of such Tribes" (25 C.F.R. § 83.2). Inclusion on the list does not resolve the scope of powers of any particular Tribe over land or non-members. It only establishes that the listed Tribes have the same privileges, immunities, responsibilities and obligations as other Indian Tribes under the same or similar circumstances including the right, subject to general principles of Federal Indian law, to exercise the same inherent and delegated authorities available to other Tribes. This position was confirmed by Congress when it enacted the "Federally Recognized Indian Tribe List Act of 1994".

Although regional, village, and urban corporations organized under state law in accordance with the Alaska Native Claims Settlement Act (ANCSA) (43 U.S.C. § 1601 et seq.) may be designated as "Tribes" for the purposes of some federal laws, primarily the Indian Self Determination and Education Assistance Act (ISDA), 25 U.S.C. 450(b), they are not included on the Departmental list of villages and regional Tribes which the Department believes to have functioned as political entities, exercising governmental authority. The membership of the corporations is defined by a property interest. However, village members are in a political relationship which is the constitutional foundation for the federal programs available to Indians. *Morton v. Mancari*, 417 U.S. 535 (1974). The Bureau's policy was recently upheld

in *Cook Inlet Treaty Tribes v Shalala*, No. A94-0589-CV (HRH) (D. Alaska January 6, 1997).

Question. I have been made aware that the Central Office of the BIA has recently requested a position paper from the Juneau Area Office explaining why tribal organizations in urban areas of Alaska are entitled to contract/compact under Public Law 93-638. We have a long standing history in Alaska of contracting in these communities.

Who is seeking this position paper? For what purpose? With what intentions? Is the Bureau attempting to reverse more than 20 years of precedent in Alaska?

Answer. The Bureau's Office of Tribal Services inquired of the Juneau Area the history of how the service area in Alaska has been determined. The inquiry was for information purposes only.

QUESTION SUBMITTED BY SENATOR COCHRAN

The Mississippi Band of Choctaw Indians has two 1930's era schools which are overcrowded and unsafe and are in danger of losing accreditation because of the deficient and failing facilities. The BIA priority list for new school construction has been frozen for several years; schools on the list are still waiting for progress in planning, design or construction; schools not on the list, but in need, have no realistic chance of action in the foreseeable future. Since the new school construction program is proceeding so slowly, the Tribe has proposed a fifty percent cost sharing arrangement with the BIA for the replacement of the schools. This request was turned down by the BIA.

Question. What can be done to allow a Tribe such as the Mississippi Band of Choctaw Indians to pursue a method of matching federal funds with tribal funds for school construction?

Answer. The legislative report accompanying the fiscal year 1994 Interior Appropriations Act requested that the Department conduct a study of alternative funding. A Report was submitted to the Committee in July 1994. Although the study group explored over 20 conceivable options, unfortunately, no acceptable method was found at that time mainly because lease options, loans and bonding require repayment which is subject to appropriation. In the fiscal year 1996 budget the Bureau requested appropriations for a pilot project for alternative funding. The Omnibus Appropriations Act for fiscal year 1996 did not include funding for this project.

The BIA continues to explore a number of alternatives that may in the future provide viable means to facilitate more construction and repair of high priority BIA ranked projects, as described below.

(1) Cost sharing of construction expenses by the tribes/schools and BIA for repair or replacement of existing facilities.

(2) Bonding legislation that would be available to the Tribes and acceptable to OMB, DOI, and BIA.

(3) Support of the Administration school reconstruction initiative, which proposes \$5 billion dollars over four years for nationwide school construction and renovation, with a set-aside provided for Indian schools.

(4) Expanded use of the existing portable classroom program to address problem areas such as increased enrollment, programmatic space, and unsafe and unhealthy classrooms.

(5) A Lease-purchase program has been considered in the past, however, due to the scoring requirements by OMB it was determined infeasible. Legislation and/or policy changes could enhance prospects for this alternative in the future.

The above are some of the alternatives that, if they were appropriately structured and become available, would stretch the BIA construction dollars to cover more projects. At the present rate of deterioration and with a constrained budget that has not kept up with aging buildings, more emphasis will continue to be placed on addressing the most critical deficiencies that exist in a particular building/facility.

In addition, the Bureau's Office of Indian Education Programs and Facilities Management and Construction Center have discussed alternative funding and intend to consult on the matter in the summer consultation meetings with Tribes.

The Administration has requested \$5 billion to address facility repair needs for public schools across America with a two percent set-aside for the Department of Interior. This resource combined with the Bureau's education construction budget request will help eliminate the ever-growing backlog of repairs in these schools.

Unfortunately, both the Bureau's and the Department's efforts to explore alternative financing options have resulted in the finding that there are not many opportunities, mainly because lease arrangements, loans, and revenue bonds require re-

payment which is subject to appropriation. The chief way to ensure that education construction needs are met is through increased appropriations.

QUESTIONS SUBMITTED BY SENATOR DORGAN

CHILD PROTECTION AND FAMILY VIOLENCE PREVENTION

Question. I am extremely concerned that the Bureau's fiscal year 1998 budget request includes no funding for Child Protection and Family Violence Prevention under the Tribal Priority Allocations account. Can you explain how this decision was arrived at and what steps the BIA is taking to ensure that the prevention of child abuse and neglect is a top priority?

Answer. In the Bureau's fiscal year 1998 budget, a separate line item is requested for Child Protection and Family Violence Prevention under the Tribal Priority Allocation (TPA) budget activity. This decision was made to give Tribes the ability to make prevention a high priority within TPA and redistribute funds from other TPA programs or from overall or general increases included in appropriations enacted for TPA into this new line item. The Bureau is required by the Indian Self Determination Act, as amended, to conduct national budget hearings with Tribal representatives from the Bureau's twelve Area Offices. National Tribal funding priorities are communicated to the Bureau at these Hearings. Over the past few years, the Tribes have listed TPA programs as their highest priority. These national Tribal funding priorities become the Bureau's priorities in the submission of the initial annual budget request to the Department of the Interior. General increases in TPA have been requested so that Tribes can prioritize resources to meet their needs at the local level. The Bureau has held six annual National Budget Hearings, beginning in 1992. The Bureau will continue to support this process. Individual Tribes establish individual priorities.

The Bureau's fiscal year 1998 budget includes a proposed general increase of \$46.7 million for TPA. If the increase is appropriated, Tribes can fund a variety of programs including child protection.

SCHOOL CONSTRUCTION

Question. The Ojibwa Indian School, located on the Turtle Mountain Reservation, is in desperate need of a new permanent facility. There are severe safety deficiencies, asbestos, and structural problems in the School's three buildings. In fact, the BIA decided in 1994 that these buildings, housing 150 students, had to be evacuated and the students had to be relocated to temporary portable classroom units. However, the School currently is not on the BIA's Education Construction priority list. Even if it were, though, it would be many years before a new school could be built and students could have the opportunity to learn in a safe environment. What actions will the Bureau take to ensure that the severe education construction needs on Indian reservations will be met in a more timely fashion, either through creative financing mechanisms which would use existing construction and repair funding or other proposals?

Answer. The Bureau is very concerned about the safety deficiencies in the Ojibwa and many other Bureau school facilities. Of the total backlog of Bureau facility repairs (\$890 million), \$682 million is needed for education facilities; \$62 million is needed for education quarters; \$121 million is needed for non-education facilities; and \$25 million is needed for non-education quarters. The new school priority list of 16 schools, approved by Congress in fiscal year 1993, remains frozen until all schools are funded. The Bureau has completed construction of seven new schools. Funding for the construction of the Many Farms High School, requested annually since fiscal year 1996, has yet to be funded by the Congress.

The BIA continues to explore a number of alternatives that may in the future provide viable means to facilitate more construction and repair of high priority BIA ranked projects, as described below.

(1) Cost sharing of construction expenses by the Tribes/schools and BIA for repair or replacement of existing facilities.

(2) Bonding legislation that would be available to the Tribes and acceptable to OMB, DOI and BIA.

(3) Support of the Administration school reconstruction initiative, which proposes \$5 billion dollars over four years for nationwide school construction and renovation, with a set-aside provided for Indian schools.

(4) Expanded use of the existing portable classroom program to address problem areas such as increased enrollment, programmatic space, and unsafe and unhealthy classrooms.

(5) A lease-purchase program has been considered in the past, however, due to the scoring requirements by OMB it was determined infeasible. Legislation and/or policy changes could enhance prospects for this alternative in the future.

The above are some of the alternatives that, if they were appropriately structured and become available, would stretch the BIA construction dollars to cover more projects. Unfortunately, both the Bureau's and the Department's efforts to explore alternative financing options have resulted in the finding that there are not many opportunities, mainly because lease arrangements, loans, and revenue bonds require repayment which is subject to appropriation.

In addition, the Bureau's Office of Indian Education Programs and Facilities Management and Construction Center have discussed alternative funding and intend to consult on the matter in the summer consultation meetings with Tribes.

The Administration has requested \$5 billion to address facility repair needs for public schools across America with a two percent set-aside for the Department of Interior. This resource combined with the Bureau's education construction budget request will help eliminate the ever-growing backlog of repairs in these schools.

At the present rate of deterioration and with a constrained budget that has not kept up with aging buildings, emphasis will continue to be placed on addressing the most critical deficiencies that exist in a particular building/facility. The liability risks to the federal government are serious and potentially very costly. At the current time, however, the chief way to ensure that there are sufficient and adequate educational facilities in Indian Country is through increased appropriations.

LAW ENFORCEMENT FACILITY CONSTRUCTION

Question. The need for correctional facilities in Indian Country far exceeds existing resources. For example, on the Fort Berthold Reservation, there are 3,000 arrests annually, but the jail facility that the BIA leases only houses 8 inmates. Due to this situation, there essentially is no deterrence to crime on the reservation. I am disappointed that, despite the substantial backlog in construction projects, the fiscal year 1998 budget request contains only \$9.1 million to construct a jail in Colorado for a Tribe that has been court-ordered to immediately address serious facility problems. Can you explain what steps the BIA will immediately take to ensure that there are sufficient and adequate correctional facilities in Indian Country?

Answer. The Bureau strongly agrees that the need for correctional facilities far exceeds existing resources and that current facilities are inadequate, overcrowded and outdated. The Bureau has sought a coordinated effort by Tribal leadership and federal agencies to convince Congress to provide funding necessary to build many more adult and juvenile detention facilities. Despite this effort, Congress eliminated funding for jail construction for fiscal years 1995 through 1997.

The Bureau is aware of and very concerned about the jail facility for the Three Affiliated Tribes, as well as the facilities for other Tribes on the Detention Center Priority List (list). As the Senator points out, the Ute Mountain facility is currently under federal court order to address serious health and safety related facility repairs. The fiscal year 1998 budget is the third year the Bureau has sought funding to construct the Ute Mountain Ute facility, number 5 on the list. The Three Affiliated Tribes jail facility is number 17 on the list. There are facilities ahead of the Three Affiliated Tribes awaiting design completion and construction funding. No funds have been appropriated for law enforcement facility construction since fiscal year 1995. The Bureau can only ensure that there are sufficient and adequate correctional facilities in Indian country if additional appropriations are provided.

CIRCLE OF NATIONS SCHOOL

Question. In December, the ND Congressional delegation wrote to Secretary Babbitt and OMB Director Raines to urge the Administration to secure additional resources for the therapeutic model program at the Circle of Nations School in Wahpeton, North Dakota. The fiscal year 1998 budget request contains no additional dollars. What steps will the BIA take to allocate existing or new resources to ensure that the special educational, health and psychological needs of the students at the Circle of Nations School are met and to ensure the creation of a viable model for other Indian educational institutions?

Answer. The Bureau is aware of the school's effort to implement a therapeutic model program. In 1993, 1994, and 1995 the Bureau has provided additional funds to the school for purposes of implementing the model. The additional funds provided were above what the ISEP formula generated for the school. Due to current fiscal constraints, the Bureau can no longer provide additional support to the school without negatively affecting other Bureau schools. In an effort to help the school, the Bureau staff will be working with the school to explore several other options such as third

party payments for some of the children they accept, outside funding from local, State, Federal and Tribal organizations whose children attend the school and new funding from private foundations. The BIA will do all it can to promote the efforts of the school, including collaboration with Indian Health Service officials, in implementation of the model.

IMPACT OF FUNDING REDUCTIONS

Question. Chairman Russell Mason of the Three Affiliated Tribes in North Dakota has contacted me about the negative impact that the fiscal year 1997 funding reductions in Tribal Priority Allocations has had on social services, tribal court, and higher education scholarship programs. What is the actual amount allocated to Area Office administration of each of the functions and activities related to the programs listed above? What is the Area Office reduction compared to agency and tribal level reductions in each of these programs?

Answer. There are no funds allocated to Area Office administration for each of the functions and activities related to the social services, tribal courts, and higher education scholarship programs. These programs are operated by the Tribe through Public Law 93-638 contacts funded within the Tribal Priority Allocations (TPA) budget activity. The following table illustrates the funds allotted to the programs based on the Tribe's priorities.

FUNDS ALLOCATED TO PROGRAMS OF TRIBE'S PRIORITIES

	Fiscal year—				
	1995 appropriation	1996 request	1996 appropriation	1997 request	1997 appropriation
Social services	\$349,700	\$358,600	\$345,100	\$500,300	\$350,300
Scholarships	489,300	512,600	452,800	600,900	494,800
Tribal courts	303,200	311,900	254,300	368,000	275,800
Total	1,142,200	1,183,100	1,052,200	1,469,200	1,120,900

The modest increase provided in 1997 following the 1996 Conference mark did not bring the overall TPA funding back to the 1995 level, which has exacerbated the Tribe's shortfall in delivery of these program services.

Each program under Area Office Operations received an equitable reduction of approximately 29 percent in fiscal year 1996. For fiscal year 1997 there was a reduction of approximately 1.7 percent. The following is a comparison of the Aberdeen and Bureau wide Area Office Operations recent funding:

FUNDING FOR ABERDEEN AND BUREAUWIDE AREA OFFICE OPERATIONS

	Fiscal year—				
	1995 appropriation	1996 request	1996 appropriation	1997 request	1997 appropriation
Aberdeen	\$5,883,000	\$4,434,000	\$4,586,000	\$3,485,000	\$4,279,000
Bureauwide	54,617,000	54,994,000	36,714,000	36,562,000	38,861,000

NATIONAL INDIAN GAMING COMMISSION

STATEMENT OF ADA E. DEER, ACTING CHAIR

ACCOMPANIED BY:

JOSEPH DUTZ, CHIEF FINANCIAL OFFICER
ALAN FEDMAN, DIRECTOR OF ENFORCEMENT

BUDGET REQUEST

Senator GORTON. Now, I understand that, because we do not have the Director, you are going to wear the Indian Gaming Commission hat today for our hearing, too?

Ms. DEER. That is right. I am the interim Chair of the Gaming Commission.

Senator GORTON. Do you have any statement that you would like to make as we move into that area?

Ms. DEER. Yes; I do.

Senator GORTON. OK, please proceed.

SUMMARY STATEMENT OF HON. ADA E. DEER

Ms. DEER. Mr. Chairman, members of the committee: Thank you for the opportunity—

Senator GORTON. You are back to one again. [Laughter.]

Ms. DEER. Thank you for the opportunity to appear before you to testify on the fiscal year 1998 budget request of the National Indian Gaming Commission. My name is Ada Deer. I am the Acting Chair of the Indian Gaming Commission, and with me today are members of the NIGC staff: Mr. Joe Dutz, who is the Chief Financial Officer, and Mr. Alan Fedman, who is the Director of Enforcement. I also wanted to recognize the two Associate Commissioners who are here, Mr. Tom Foley from Minnesota and Mr. Phil Hogen from South Dakota. Pursuant to 25 U.S.C. 2706[a][1], the budget for fiscal year 1998 was unanimously approved by the Commission.

With your permission, Mr. Chair, I would like to make brief opening remarks and submit my written statement for the record.

Senator GORTON. Certainly.

Ms. DEER. Gaming activity has been conducted on Indian lands for close to 20 years. Briefly, it has been almost 10 years since Congress passed the Indian Gaming Regulatory Act that created the NIGC, and there has been an immense change in the industry during that time period. In just the past 5 years, Indian gaming activity and revenues have more than doubled.

If you would look at the first chart, you will see that Indian gaming revenue has grown from just over \$2 million in 1993 to over \$5 billion in 1995. During that same time period, the funding and the staff of the NIGC have remained relatively constant.

<i>Indian gaming operations revenues</i>		
<i>Fiscal year</i>		<i>Billions</i>
1993		\$2.2
1994		3.2
1995		5.3

NIGC MISSION

The mission of the NIGC, in keeping with the declaration of policy of the Indian Gaming Regulatory Act, is to ensure that Indian gaming is regulated, to shield it from organized crime and other corrupting influences, to ensure that the Indian tribe is the primary beneficiary of the gaming operation, and to assure that gaming is conducted fairly and honestly by both the operator and the player.

Currently the 33-person NIGC staff is responsible for monitoring and regulating gaming in 273 tribal gaming establishments operated by 183 tribes in 28 States. Tribal governments share in the

responsibility for the day to day regulation of class II gaming, while many aspects of the regulation of class III gaming are controlled by tribal-State compacts.

The NIGC undertakes this regulatory responsibility with an operating budget of \$4.4 million. In fiscal year 1997 the NIGC is undertaking this regulatory responsibility with an operating budget of \$4.4 million, comprised of a \$1 million direct appropriation, \$1.5 million in fees assessed on class II tribal gaming revenue, investigative fees, and unobligated funds from prior years.

It is expected that these prior year funds will be nearly depleted at the conclusion of fiscal year 1997, leaving the NIGC with anticipated revenue of between \$2.5 million and \$3 million in fiscal year 1998. To adequately meet its responsibilities under IGRA, NIGC needs additional funds that should be obtained through additional user fees, rather than through additional appropriations.

For the last 2 years, NIGC has assessed fees on class II tribal gaming at a rate of 0.5 percent of gross revenue. IGRA permits assessments under a two-tier scheme, with rates ranging from zero to 5 percent. However, there is a \$1.5 million statutory limitation on the amount of fees that NIGC can assess annually on tribal gaming gross revenue. Raising or eliminating the statutory cap would permit NIGC to assess fees at a rate in keeping with IGRA that would generate additional operating funds.

Assessing fees on class III gaming is another potential source of funds for NIGC. Currently NIGC is permitted to assess fees only on class II gaming revenue, even though many of our enforcement actions involve class III facilities.

As the next three charts indicate, the majority of our activities involve class III gaming ordinances, management contracts, and especially enforcement contracts during the past year and a half. Being permitted to assess fees on class III gaming revenue would help defray the expense of enforcing and litigating class III aspects of IGRA.

<i>Chart 1.—Approved ordinances—by type of gaming</i>	
Class II and III, and III only (percent)	84.47
Class II only (percent)	15.53
Total, percent	<u>100.00</u>
Class II and III, and III only	185

STATUS OF ACTIVITIES

NIGC is working with the administration on legislation to submit to Congress that incorporates both these concepts. Given the scope of the responsibilities of NIGC, as well as the growth of the Indian gaming industry, now is the time to ensure that NIGC has sufficient funds to fulfil its statutory responsibilities.

In the conference report accompanying the 1996 appropriations, NIGC was instructed to submit a report to the Secretary of the Interior detailing tribal compliance with IGRA. The first report documenting compliance as of September 30, 1996, was sent to the Secretary in November 1996. Few tribes were in compliance with all of the items covered in the report. However, the report showed that each of the eight categories had a compliance rate of at least 50 percent.

NIGC is committed to 100 percent compliance with IGRA. I believe that the tribes also are committed to this goal. That commitment is apparent in the preliminary results of the March 31, 1997, report. As the next two charts show, the next report should indicate that there is over 60 percent compliance in each category and almost 40 percent of gaming operations are in compliance with IGRA. As soon as the report is finalized and printed, we will be sending it to you.

ENFORCEMENT ACTIVITIES

From 1991 to 1996, NIGC issued eight formal enforcement documents. Since the beginning of 1996 when NIGC underwent a reorganization, the NIGC has opened 30 new enforcement cases and issued eight notices of violation.

In addition to these formal enforcement actions, NIGC also worked with tribes to resolve a number of disputes that threatened the financial integrity of the gaming operations. These included disputes between the tribe and its management contractor, as well as disputes between rival factions within a tribe.

NIGC expects a further acceleration of its enforcement program during the next 6 months. The NIGC will continue to give enforcement priority to cases involving individuals and companies managing tribal gaming operations without an approved management contract and will continue to investigate and take action against gaming operations offering class III gaming without approved tribal-State compacts.

During the last year, NIGC has undergone a number of changes. The staff has been reorganized, budget and management review processes have been undertaken, and personnel, internal management, and travel procedures in keeping with applicable Federal law and regulations have been implemented.

With each of these actions, it has become increasingly apparent that the NIGC needs additional funds to fulfill its mandate to enforce IGRA. It is my hope that you will support our fiscal year 1998 budget request of \$1 million and our legislative efforts to lift or eliminate the statutory cap on fees and to include class III gaming revenue in the fee assessment structure.

PREPARED STATEMENT

I believe that, with the increased funds our legislative initiative will raise, the next chair of the NIGC will be able to expand the enforcement of the Indian Gaming Regulatory Act to better accomplish the agency's regulatory mission.

Thank you and we welcome your questions.

[The statement follows:]

PREPARED STATEMENT OF HON. ADA E. DEER

Mr. Chairman, Members of the Committee, thank you for the opportunity to appear before you today to testify on the fiscal year 1998 Budget Request of the National Indian Gaming Commission. My name is Ada E. Deer, and I am the Acting Chair of the National Indian Gaming Commission (NIGC). The budget submitted to

you for Fiscal 1998, pursuant to 25 U.S.C. § 2706(a)(1), was unanimously approved by the Commission.

Gaming activity has been conducted on Indian lands for close to twenty years. Briefly, it has been almost ten years since Congress passed the Indian Gaming Regulatory Act (IGRA) that created the NIGC and there has been an immense change in the industry during that time period. In just the past five years Indian gaming activity and revenues have more than doubled. During that same time period the funding and the staff of the NIGC have remained relatively constant.

The mission of the NIGC, in keeping with the declaration of policy of the IGRA, is to ensure that Indian gaming is regulated, "to shield it from organized crime and other corrupting influences, to ensure that the Indian tribe is the primary beneficiary of the gaming operation and to assure that gaming is conducted fairly and honestly by both the operator and the player."

Currently, the NIGC is responsible for monitoring and regulating gaming in 273 tribal gaming establishments operated by 183 tribes in 28 states. Tribal governments share in the responsibility for the day-to-day regulation of class II gaming, while many aspects of the regulation of class III gaming are controlled by tribal/state compacts.

The 33 person staff of the NIGC is responsible for: (1) monitoring gaming operations on a continuing basis; (2) approving all contracts for the management of gaming operations by non-tribal parties; (3) conducting background investigations on individuals and entities with a financial interest in, or management responsibility for, a class II or a combined class II/III gaming management contract; (4) approving all gaming related tribal ordinances; (5) reviewing background investigations of key gaming employees conducted by the tribes; (6) reviewing and conducting audits of the books and records of the gaming operations; and (7) initiating enforcement actions to help ensure the integrity of Indian gaming operations.

In fiscal year 1997, the NIGC is undertaking this regulatory responsibility with an operating budget of \$4.4 million comprised of a \$1,000,000 direct appropriation, \$1,500,000 in fees assessed on class II tribal gaming revenue, investigative fees and unobligated funds from prior years. It is expected that these prior year funds will be nearly depleted at the conclusion of fiscal year 1997, leaving the NIGC with anticipated revenue of between \$2.5 and \$3 million in fiscal year 1998.

To adequately meet its responsibilities under the IGRA, the NIGC needs additional funds that should be obtained through additional user fees rather than through additional appropriations. For the last two years, the NIGC has assessed class II tribal gaming at a rate of 0.5 percent of gross revenue. The IGRA permits assessments under a two-tier scheme with rates ranging from zero to 5 percent. However, there is a \$1,500,000 statutory limitation on the amount of fees the NIGC can assess annually on tribal gaming gross revenue. Raising or eliminating the statutory cap would permit the NIGC to assess fees at a rate, in keeping with the IGRA, that would generate additional agency operating funds.

Assessing fees on class III gaming is another potential source of funds for the NIGC. Currently, the NIGC is permitted to assess fees only on class II gaming revenue even though many of our enforcement actions involve class III facilities. Being permitted to assess fees on class III gaming revenue would help defray the expense of enforcing and litigating class III aspects of the IGRA.

The NIGC is working with the Administration on legislation to submit to Congress that incorporates both of these concepts. Given the scope of the responsibilities of the NIGC, as well as the growth of the Indian gaming industry, now is the time to ensure that the NIGC has sufficient funds to fulfill its statutory responsibilities.

COMPLIANCE WITH IGRA

In the Conference Report to H.R. 3019, the Appropriations for fiscal year 1996, the NIGC was instructed to submit a report to the Secretary of the Interior: "detailing those Indian tribes or tribal organizations with gaming operations that are in full compliance, partial compliance, or non compliance with the provisions of the Indian Gaming Regulatory Act (25 U.S.C. 2701 et seq.)."

The first report, documenting compliance as of September 30, 1996, was sent to the Secretary in November 1996. It covered the major compliance obligations for gaming tribes, including: (1) obtaining a tribal-state compact approved by the Secretary of the Interior (DOI) prior to conducting class III gaming; (2) submitting investigative reports and suitability determinations on each key employee and primary management official summarizing the results of the tribal background investigation; (3) submitting finger print cards to the NIGC for processing; (4) submitting gaming employee applications to the NIGC at the commencement of employment; (5) adopting a gaming ordinance that has been approved by the NIGC; (6) paying

a fee assessment to the NIGC based on class II revenues; (7) issuing a separate license for each facility where gaming is conducted; and (8) submitting an annual independent audit of the gaming operation to the NIGC. Few tribes were in compliance with all of the items covered in the report; however, the report showed that each of the eight categories had a compliance rate of at least 50 percent.

The NIGC is committed to 100 percent compliance with the IGRA. Due to limited resources, voluntary compliance with the IGRA has been emphasized by the NIGC. This emphasis and agency outreach efforts were increased after the first report. Those efforts utilized the majority of NIGC enforcement resources and included letters and telephone calls to each tribe as well as on site visits where possible. In addition, the NIGC held a compliance workshop in January to outline compliance procedures. More than three hundred representatives of seventy tribes were in attendance. At that workshop, it was announced that any tribe not in compliance as of March 31, 1997, would be subject to enforcement action unless they had executed a memorandum of understanding (MOU) with the NIGC to come into compliance by an agreed upon date. Depending on the severity of the violation, NIGC enforcement action for non compliance could be the issuance of a closure order or a civil fine of up to \$25,000 a day for each violation by a tribe.

In late March, the NIGC released the results of the report for the period ending December 31, 1996. Although there was substantial improvement in certain categories, especially those involving background investigations, the level of total compliance was still low. It is our hope that the next report, which will be as of March 31, 1997, will show that more than 50 percent of operations are in total compliance with the IGRA.

ENFORCEMENT

From 1991 to 1996, the NIGC issued eight formal enforcement documents. Since the beginning of 1996, when the NIGC underwent a reorganization, the NIGC has opened 30 new enforcement cases and issued eight Notices of Violation. These cases address a wide range of violations including: tribes that have failed to perform background investigations on key employees, tribes that are operating without an approved ordinance, operations engaged in illegal pull tab sales, operations which are not licensed by the tribe, tribes conducting class III gaming without a compact with the state, operations being managed by contractors whose agreements have not been approved, and operations maintained in a manner that could threaten the health and safety of the public.

In addition to these formal enforcement actions, the NIGC also worked with tribes to resolve a number of disputes that threatened the financial integrity of the gaming operations. These included disputes between the tribe and its management contractor as well as disputes between rival factions within a tribe.

To date, the NIGC has imposed \$2,950,000 in civil fines and assessments. These fines are deposited in the general fund of the U.S. Treasury, or in special circumstances, are payments from management contractors to the tribes.

The NIGC expects a further acceleration of its enforcement program during the next six months. The NIGC will continue to give enforcement priority to cases involving individuals and companies managing tribal gaming operations without an approved management contract and will continue to investigate and take action against gaming operations offering class III gaming without approved tribal-state compacts.

REORGANIZATION AND MANAGEMENT CONTROLS

During the last year the NIGC has undergone a number of changes. In 1996, the staff structure was reorganized to better address enforcement actions. Early in fiscal year 1997, a budget and management review process was implemented that resulted in changes to internal processes and procedures, and the Office of General Counsel also streamlined legal review processes. As a result of these actions, the NIGC reduced the time required to complete background investigations to less than six months, reduced the time for the final legal review of contracts to less than a month, reduced the backlog of contracts under review, and increased the number of finger print cards processed to sixteen hundred a month.

Within the last few months, the NIGC has implemented personnel, internal management and travel procedures in keeping with applicable federal law and regulations. A complete analysis of the fee assessment program has begun in order to develop a plan of action regarding the overpayment of class II fees. The NIGC has worked with the Office of Fiscal Services at DOI to ensure the proper accounting of assets and liabilities and to develop a procedure to begin billing for background investigations. In addition, the amount of deposit required for management back-

ground investigations has been analyzed, an analysis of the billing rate for finger print cards has begun, and a more substantive review of the audits submitted by the tribes has been implemented.

With each of these actions, it has become increasingly apparent that the NIGC needs additional funds to fulfill its mandate to enforce the IGRA. It is my hope that you will support our fiscal year 1998 budget request of \$1,000,000 and our legislative efforts to lift or eliminate the statutory cap on fees and to include class III gaming revenue in the fee assessment structure. I believe that, with the increased funds our legislative initiatives will raise, the next Chair of the NIGC will be able to expand the enforcement of the Indian Gaming Regulatory Act to better accomplish the Agency's regulatory mission.

Thank you for the opportunity to testify on behalf of the NIGC.

BIOGRAPHICAL SKETCH OF HON. ADA E. DEER

Ada E. Deer is a member of the Menominee Indian Tribe of Wisconsin. Ms. Deer was nominated by President Clinton on May 11, 1993, to be Assistant Secretary of Indian Affairs and confirmed by the United States Senate on July 16, 1993. On January 31, 1997, she was selected by President Clinton to be the Acting Chair of the National Indian Gaming Commission.

She is the first woman to hold the position of Chair of the National Indian Gaming Commission. Her appointment, which was done under the Vacancy Act, will be for 120 days from the date of the appointment. Ms. Deer has indicated she does not wish to be nominee for the position of Chair of the NIGC.

FUNDING PROPOSAL

Senator GORTON. Has the administration submitted a bill to accomplish those goals that you so eloquently outlined?

Ms. DEER. Yes; there is a legislative initiative.

Senator GORTON. Really?

Ms. DEER. That is part of the budget discussions.

Senator GORTON. I am not aware of a bill in the Indian Affairs Committee on the subject. But in any event, we are going to have something? You are getting an answer from one of your staff.

Ms. DEER. I guess there has been discussion, but it has not been formally submitted.

Senator GORTON. Well, I would urge you to submit it formally and promptly, because I think you are probably going to get a favorable response to it, either through the regular authorization process, or it is even possible that it might happen in the appropriation process.

Ms. DEER. Yes.

Senator GORTON. Let me ask you this. If the cap were lifted and we permitted collections from class III gaming, would that, for 1998, obviate the necessity for any general fund appropriation at all?

Ms. DEER. I think we would have to study this. But it would certainly be a wonderful change.

Senator GORTON. Well, it would certainly help if we were able to use that million dollars for some other purpose by letting the Commission be essentially self-supporting, whether subject to appropriation or not. Presumably these fees could bring in a sufficient amount of money adequately to fund the Commission, could they not?

Ms. DEER. Yes; that is true.

Senator GORTON. Well, in any event, we would like to see a precise proposal as soon as you possibly can come up with it. I understand that the total amount of money that this Commission spends

is considerably less than that of many individual State gambling regulatory commissions. Is that not the case?

Ms. DEER. Yes; our current budget is about \$4.4 million. I know that one State spends approximately \$50 million—that is New Jersey—to regulate.

Senator GORTON. I understand Nevada is about \$21 million. My own State, which does not have open gambling, is \$10 million. So certainly the Commission is relatively modest in its size as against the responsibilities it has.

What percentage of all the gambling in the United States, legal gambling in the United States, is conducted by Indians?

Ms. DEER. I think it is approximately 10 percent.

COMPLIANCE WITH REGULATIONS

Senator GORTON. You have indicated optimism with respect to compliance, but it does seem to me rather shocking that we are only roughly at the 60-percent level of Interior-approved State-tribal gambling compacts. Does that not indicate that there is a great deal of gambling activity being conducted by Indians that is not approved, not subject to compacts or not otherwise approved?

Mr. FEDMAN. There certainly are a large number of gaming operations doing class III gaming activities without compacts. But it is a very complex situation that varies from State to State and it turns on questions of State law. Most of the numbers, the large numbers, are in States where there is reason to have optimism that compacts will be concluded in the very near future, and there are some encouraging developments in California, which has the largest number of gaming operations without compacts. New Mexico has come very close to resolving the compact issue.

So, the percentage of class III gaming activities operating without a compact should be reduced significantly in the course of the next year if things continue as they are now.

GAMING IN CALIFORNIA

Senator GORTON. Well, let me ask you. Why do you not give me some details about California? It obviously is very important. What is the present status in California? Does the Commission support the Department of Justice action to require State compacts by the first of next month or to shut down much of what is going on now?

Mr. FEDMAN. The situation in California is so fluid, it depends on who you talk to from day to day as to what has happened. But from what I am hearing, there are encouraging developments about the compact negotiations. The States and the tribes appear to have resolved every issue except the precise gaming technology that would be authorized to be played, which I know is the key question.

But I also hear that there is some encouragement there, that they are coming closer together. Nobody is getting exactly what they want, but there appears to be a good chance of reaching an agreement on the scope of gaming issue. So, if that issue can be resolved, they will enter into a model compact with the Pala Tribe and that compact will then presumably be adopted by the other tribes in California.

There is some division, I understand, developing within those tribes. Not everyone is crazy about what looks like it is going to be in the Pala compact.

Senator GORTON. What is the reason that, after all this time, you are so optimistic? Does it relate to the change in relative bargaining ability between States and tribes out of last year's *Seminole Tribe of Florida v. Florida* decision or the recent decision, I think it is a ninth circuit decision in Oregon?

Mr. FEDMAN. Well, it does—what happened does involve legal decisions, but it was not either one of the two that you mentioned. In my opinion, the problem in California has always been confusion about what the State law permitted in terms of the gaming. And there was a State supreme court case, which is commonly referred to as the *Western Telecom* case, which for the first time set down parameters that both the tribes and the State could agree defined the permissible scope of gambling in California.

The decision was so significant that when it came out our Commission adopted a policy that it no longer believed that the state of the law in California was unclarified. Therefore, any gaming operation opened after the *Western Telecom* decision had been issued that did not approximate the standard of gaming defined in that case would be targeted for enforcement.

Once this *Western Telecom* decision came out, there appeared for the first time a meeting of the minds as to what was legal in California, and that really triggered the compact negotiations.

Senator GORTON. So you are optimistic about settling this long-standing dispute in California in the relatively near future?

Mr. FEDMAN. I would be the first to say that what I hear is that the talks go up and down, but they look very promising right now.

SEMINOLE DECISION

Senator GORTON. Well, let me go back to the *Seminole* decision. Now that we have had it for more than 1 year, what have its impacts been? Is it affecting the number of compacts or the terms of compacts? Certainly it gave States more authority. Does that mean that the States by and large have been more restrictive, saying "no" more frequently?

Mr. FEDMAN. I think that is fair to say, that the effect of the *Seminole* decision has been that States that do not want to negotiate have simply said "no." We are hearing a lot of complaints and concerns from tribes that say that this is just simply not fair. After the *Seminole* decision, if a State wants to call off the talks, they are in a position to do that.

So far, that has not resulted in any new unauthorized gaming. I think the frustration level is high, and there is a great hope on the part of the tribes that the Interior Department will develop its own procedures.

Senator GORTON. Well, that was my next question. The Department did make such a proposal last year. It caused a great deal of furor and opposition, and it certainly has delayed implementation. What is the current status? Is the Department seriously considering regulations that would try to avoid the impact of the *Seminole* case?

Mr. FEDMAN. I am really not in a position to answer that, Senator. That is completely within Interior and we are not really part of that.

Senator GORTON. We have to ask the Secretary that question, that is what you are telling me?

Mr. FEDMAN. I think so. I would rather you ask him than me.

Senator GORTON. OK. Can you answer the question or can Ms. Deer answer the question of whether there are any efforts being undertaken by the administration to negotiate amendments to the basic statute itself that are acceptable to the Governors of the States? I can remember years of hearings on the subject in the Indian Affairs Committee, but no action. Obviously, the *Seminole* decision has caused proposed changes within the Department of the Interior itself. But has it caused any negotiations to take place between the administration and the Governors as far as any of you know?

Ms. DEER. Not as far as I know. The Department is still receiving or analyzing the comments that have been requested.

Senator GORTON. But that is for new regulations, not for negotiations with the States.

Ms. DEER. That is right.

GAMING IN WASHINGTON

Senator GORTON. Well, as is usually the case, for each of you I have a parochial question. Obviously, I learn more about what is going on in Washington than I do in most of the States, and you have created quite a furor on and off the Colville Reservation in north central Washington with an attempt to close down taverns that I believe are located within the city of Omak, on fee land, but inside the exterior borders of the reservation, that are operating totally and completely in compliance with State law, as they have for many years. At the same time the Commission has ignored the obviously illegal slot machines that are being managed by the Colville Tribe without any compact or shred of legal authority whatsoever.

I would sure like your comments on that. That seems to be a rather perverse set of priorities.

Mr. FEDMAN. We were taken aback somewhat by the furor that arose when we issued those letters, because this is certainly not the first time or the first State in which we have taken action. From our perspective, what we saw on the Colville Reservation were five establishments that were doing class III gaming without a license from the tribe or a tribal-State compact.

Senator GORTON. It is not class III.

Mr. FEDMAN. If you sell pull tabs, you have to, at the same location, you also play bingo. The sale of pull tabs without the play of bingo is a class III activity. It is a rather technical definition but it is, under our regulations, a class III activity.

I can understand the confusion, but nevertheless that is how we have treated it all over the country. We saw unauthorized gaming without a license from the tribe and without a tribal-State compact. Wherever we have seen these situations, all over the country, we have done these kinds of actions—in Oklahoma, New York, and California. We have treated them all the same way. We simply advise the parties that if it is on Indian lands then you are required

to have a license from the tribe and in most cases a tribal-State compact.

There is quite a bit of legal authority that supports our position. The U.S. attorney in Montana several years ago took a very similar action on the Flathead Reservation. There were video machines being operated by the State of Montana on that reservation, and in that case the State agreed with the U.S. attorney's analysis, as did the supreme court in Montana, and they simply ceased the licensing of those machines.

In Idaho three tribes sued the State over the same issue, and there a Federal district court ruled that if it was on Indian lands it was required to have a license from the tribe, and a compact. This case involved primarily fee lands, which is the same situation as in Washington. The Idaho case was confirmed by the ninth circuit and that remains the state of the law in the ninth circuit today.

So, we felt we were on fairly solid legal grounds in taking the action on the Colville Reservation. Nevertheless, as soon as we issued the letters we were called by the Washington State Gambling Commission. Frank Miller called me. I have the highest regard for the Washington State Gambling Commission. I think they are one of the best State regulatory agencies in the country. And I have a personal regard for Frank Miller.

He said: You have made a terrible mistake, you do not understand the law in Washington; we are protesting the action; we would like you to stop.

What we have done, based on the State's objection, is to defer any further enforcement on the Colville Reservation until such time as the attorney general of the State of Washington can file a brief with the Commission pointing out their legal arguments. And if we, after looking at what they file, conclude that we have made a mistake, then we will certainly not go forward.

That is where the action stands today. We have notified all five establishments that the action has been deferred, that they can continue to sell pull tabs until we resolve this issue. We think that that is a reasonable way to go forward. Maybe we have missed something and maybe something applies in Washington that we have not seen in another part of the country.

To answer the second part of your question, about why the class III gaming goes on at the Colville Reservation, it is also a rather complex legal situation. I will try to give you the short version rather than the long version. Essentially what happened there is that after the Colville and the State's lawsuit, in which the Federal district judge ruled that the compacting provisions of IGRA were unconstitutional, neither side appealed.

It created a great deal of uncertainty as to the applicability of IGRA in that part of the State of Washington. The Colville Tribe did not put in class III machines, but the Spokane Tribe did. The U.S. attorney went after those machines, and he got a preliminary injunction in the district court. The Spokane Tribe appealed to the ninth circuit, and the ninth circuit issued a stay of the preliminary injunction. Thus, the issues about the applicability of IGRA, the illegality of the gaming, the scope of Federal authority, is now on appeal to the ninth circuit.

Any action against the Colville Tribe would in all likelihood be stayed in the same manner as the issues that were stayed in the *Spokane* case, because essentially the same issues would be involved.

We confer with the U.S. attorney all the time about this issue because it is a very frustrating situation. I talked to him yesterday, the assistant handling the case, and in his mind and in mine it would be a waste of resources to go after Colville.

Senator GORTON. What is the status in the ninth circuit?

Mr. FEDMAN. Well, the strangest thing happened. For 2 years it was put on the settlement track and it stayed there. Nothing happened. It has recently been taken off that track and is now being actively reviewed by the court. The briefing schedule is moving forward. The U.S. attorney is filing their brief next week.

So the end is in sight, and when that matter is resolved then I think you will find that both the U.S. attorney and our Commission will be very active in that part of the State.

Senator GORTON. Well, let me just say, even as a lawyer and a former attorney general, that it would be hard to present to an ordinary citizen a more bizarre or a more unjust set of circumstances than, for whatever reason, a Federal agency ignoring open casino class III gambling on a reservation being conducted without a compact and at the same time trying to close down pull tabs operated in a non-Indian business on the land that they own and inside a city, while inside the exterior borders of a reservation.

If you try to sell that as an appropriate regulatory activity, you are going to have a very difficult time, because fundamentally, whatever the law is, it is not appropriate. So I will appreciate, I would greatly appreciate it, if you will keep us apprised of all of the progress on both sides, on both sides of that equation.

Mr. FEDMAN. We certainly will.

FUNDING POSSIBILITIES

Senator GORTON. I am encouraged, Ms. Deer, about your report on progress in the administration to give us really the ability to allow the Commission to operate more effectively, without asking for more appropriated money out of the general fund, and I think you are going to find us most cooperative when you come up with precise recommendations to carry out that set of ideas.

Ms. DEER. Well, we certainly appreciate your receptivity.

Let me say, it has been unusual for you, conducting this with a couple of people, Senators, coming in. It has been unusual for me to have two hats, too.

Senator GORTON. Well, you have two hats, both temporary.

Ms. DEER. That is right.

Senator GORTON. I admire you for being able to carry on under such an ambiguous and indefinite status.

Ms. DEER. Well, thank you.

Senator GORTON. Starting a couple of years ago, I began to prepare visuals like this of our appropriations bills and others. We will leave this up here for you or any of the audience. This illustrates in the best way that I possibly can, for my own purposes and the purposes of my subcommittee, the kind of relative costs of our programs and the value judgments that we have to make when we get

into a zero sum game, because once we have got our allocation it is a zero sum game, and more money for one of these important purposes can only come out of the pockets of others.

It is an interesting chart and you are all welcome to come up here and look at it. We have a few notebook-sized copies of it that we will be happy to distribute.

Ms. DEER. Thank you very much.

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. I think that about exhausts me. We do have a few other questions, but I think it is appropriate to submit them to you in writing.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing.]

QUESTIONS SUBMITTED BY SENATOR CAMPBELL

Question. In your March compliance report to the Secretary of the Interior you indicate that the FBI has informed the Commission that there is a backlog of over two million fingerprint cards to process and that as a result, these criminal checks are taking an average two to four months to process.

Is this process a result of a lack of capacity from the FBI or a lack of capacity from the Indian Gaming Commission?

Answer. Based on discussions with representatives from the Liaison Unit of the Federal Bureau of Investigation (FBI), the fingerprint card backlog is now approaching nearly three million. This number includes criminal and civil fingerprint cards. The backlog is largely attributed to the relocation of fingerprint processing from Washington, DC. to their new facility in Clarksburg, West Virginia. The average turnaround time to receive the completed FBI checks is two to four months.

Processing fingerprint cards to and from the FBI is one of the NIGC's top priorities. It is NIGC policy to process fingerprint submissions from tribal governments within two weeks of receipt, barring any unforeseen circumstances. Likewise, the NIGC processes FBI record check results on a weekly basis so that the results are returned to tribal governments as quickly as possible. With an increase in resources and personnel, the NIGC could improve its internal fingerprint processing time.

FBI representatives have advised the NIGC that they are implementing a 24 hours a day, seven days a week work schedule in an effort to reduce the backlog. As a result, the NIGC has seen some improvement in the response time. A recent check of NIGC records indicates that current turnaround time for fingerprint processing averages six to eight weeks.

Question. Do you suggest any alternative way that would enable this process to be expedited?

Answer. The analysis of fingerprint records and the completion of background investigations are key components in the safeguarding of Indian gaming. Careful scrutiny of these documents is essential and time consuming. Although the FBI is experimenting with the electronic submission of fingerprint cards, it is our understanding that the electronic submission for non-criminal justice purposes is at least several years away.

Question. I noticed in your compliance report that several tribes were currently not in compliance with regard to "Class II Fees paid to the Gaming Commission.

Understanding, of course, that the compliance report reflects only a snapshot in time, I am interested to know what are some of the factors that result in tribes not coming into compliance with Fee payment.

Answer. The major factor is timeliness of the payments. NIGC regulations state, "The quarterly statements shall be transmitted to the NIGC to arrive no later than the due date" (25 C.F.R. § 514.1(c)(4)) and "Each Class II gaming operation shall determine the amount of fees to be paid and remit them with the statement" (25 C.F.R. § 514.1(c)(5)). Quarterly statements and payments are due March 31, June 30, September 30 and December 31. If the NIGC is not in receipt of the quarterly statement and the payment by the due date, the tribe is shown as being in non-compliance in the fee payment's category. Historically many fee payments do not reach the NIGC by the due date.

In addition, tribes often fail to submit quarterly statements of assessable gross revenues along with the fee payments. Total compliance requires the timely submission of both quarterly statements and quarterly payments. Tribes are required to submit quarterly statements even if no fee payment is due. For example, the fee assessment is based on the previous calendar year's assessable gross revenue figures. When a tribe first begins a gaming operation, they should be submitting to the NIGC on a quarterly basis a statement that shows zero assessable gross revenues for the previous calendar year.

Last, a few tribes submit nothing. These include tribes who have failed to pay fees from the beginning, and tribes who were paying fees and then stopped for various reasons.

Question. You indicated in your testimony that during the last two years, the Commission assessed class II tribal gaming at a rate of one-half on one percent of gross revenue when statutorily the Commission could assess rates up to 5 percent.

Is the existing cap of \$1.5 million the primary reason for setting assessment rates at their current level?

Answer. Yes. Even at the current 0.5 percent fee rate, the NIGC still collects amounts in excess of the \$1.5 million cap included in the IGRA.

Question. Has the Commission projected what revenue would be generated at higher rates up to the statutory maximum of 5 percent?

Answer. Yes, the NIGC has calculated the amount of fees that could be generated at fee rates up to the statutory maximum of 5 percent on class II gaming revenues. These fees would be based, in keeping with NIGC regulations, on a percentage of assessable gross revenues from tribal gaming operations.

The class II fee base for the 1997 calendar year, based on quarterly statements of assessable gross revenues provided by the tribal gaming operations to the NIGC through March 31, 1997, is \$595,829,291.77. The NIGC is aware that this figure includes revenues from non class II gaming that is not subject to fee assessment. Thus, it is inappropriate to utilize this figure as the base number for final NIGC revenue projections. The final base number could be as low as \$300,000,000 or slightly higher than the amount reported through March 31, 1997.

Given these two extremes, an average of \$450,000,000 could be a reasonable figure for calculating an NIGC revenue projection. Using this average as the base figure would yield potential revenue from a low of \$2.25 million at .5 percent to a high of \$22.5 million at 5 percent. This is in comparison to the \$20.7 million fiscal year 1997 Budget of the Nevada Gaming Control Board and the \$52 million appropriated by the State of New Jersey to fund its regulation of gaming.

Question. You indicated in your testimony that you currently have a staff of 33 people. How many of these individuals are operating in the field?

Answer. To cover the 28 states with Indian gaming, the NIGC currently has seven staff members operating in the field. Each works out of an office maintained in their home.

Question. How many are located here in your Washington Office?

Answer. Excluding the Acting Chair (part-time) and the two Associate Commissioners, there are 25 people located in the Washington office.

Question. How many individuals do you have on your staff that are devoted primarily to enforcement efforts and following through with collections of fines and assessments?

Answer. Of the entire NIGC staff, twelve employees are in the Enforcement Division. Of this total, seven are devoted directly to field investigation and enforcement efforts. The estimated fiscal year 1997 expenditure for this section of the Enforcement Division is slightly less than \$1 million. Issues concerning fee assessments are dealt with by two Washington staff members in the Administrative Division.

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Question. The Mississippi Band of Choctaw Indians operates a class III gaming operation and has, in addition to its arrangement with the State, its own Indian Gaming Commission. In each NIGC report, the Choctaws have been found to be in complete compliance with the Indian Gaming Regulatory Act.

Has the Commission found a correlation between those tribes that have set up their own regulatory agencies and effectiveness in compliance?

Answer. The NIGC believes that there is a definite link between the existence of tribal gaming commissions and the quality of the regulation within an Indian gaming operation. Those tribes which have strong, well funded gaming commissions are much more likely to have established a strong compliance record.

Question. What are the budgets of the successful tribal gaming commissions?

Answer. The budgets of tribal gaming commissions vary dramatically depending on the size of the gaming operation. Information received from some tribal gaming commissions indicates that funding levels can range from \$20,000 to hundreds of thousands of dollars. While the level of funding is a significant issue, other factors such as the regulatory experience of the commission members and the independence of their authority, appear to be more important predictors of a successful gaming commission.

Question. What actions has the Commission taken to support tribal regulatory agencies in meeting the requirement of their compacts?

Answer. The NIGC has taken a number of actions supporting tribal gaming commissions including publishing of a bulletin advising tribes how to establish and operate such a commission, holding workshops and conferences on the subject of tribal gaming commissions, and speaking at conferences of organizations consisting of tribal gaming regulators. The NIGC does not have the authority to enforce the requirements of tribal/state compacts.

Question. How many Class III tribal gaming operations are in compliance today?

Answer. According to preliminary figures for the quarter ending March 31, 1997, there are 99 operations in compliance with each of the items on the compliance report. This is a more than 30 percent increase in the total compliance rate as of December 31, 1996.

SUBCOMMITTEE RECESS

Senator GORTON. With that, the hearing is recessed.

Thank you all very much. The subcommittee will stand in recess until 9 a.m., Thursday, April 17, when we will receive testimony from the Forest Service.

[Whereupon, at 11:20 a.m., Thursday, April 10, the subcommittee was recessed, to reconvene at 9 a.m., Thursday, April 17.]

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, APRIL 17, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9 a.m., in room SD-192, Dirksen Senate Office Building, Hon. Slade Gorton (chairman) presiding.

Present: Senators Gorton, Stevens, Cochran, Domenici, Burns, Leahy, Bumpers, Reid, and Dorgan.

Also present: Senator Craig.

DEPARTMENT OF AGRICULTURE

FOREST SERVICE

STATEMENT OF HON. JIM LYONS, UNDER SECRETARY, NATURAL RESOURCE AND ENVIRONMENT

ACCOMPANIED BY:

MIKE DOMBECK, CHIEF, FOREST SERVICE

DAVID G. UNGER, ASSOCIATE CHIEF, FOREST SERVICE

JANICE McDOUGLE, ACTING, DEPUTY CHIEF, NATIONAL FOREST SYSTEM

BARBARA WEBER, ACTING DEPUTY CHIEF, RESEARCH

JOAN COMANOR, DEPUTY CHIEF, STATE AND PRIVATE FORESTRY

CLYDE THOMPSON, ACTING DEPUTY CHIEF, ADMINISTRATION

RON STEWART, ACTING DEPUTY CHIEF, PROGRAMS AND LEGISLATION

STEVEN SATTERFIELD, DIRECTOR, PROGRAM DEVELOPMENT AND BUDGET STAFF

BUDGET REQUEST

Senator GORTON. The subcommittee will come to order.

We are meeting today to hear from the Forest Service, obviously one of the vitally important agencies funded by the Subcommittee on Interior and Related Agencies.

We are pleased to have Jim Lyons, Under Secretary, and Mike Dombeck, Chief of the Forest Service.

You are both welcome, as are those who accompany you.

As my colleagues are aware, this subcommittee is responsible for funding a diverse array of agencies. A large portion of our bill is comprised of the four land management agencies: The Park Service, the Bureau of Land Management, Fish and Wildlife Service, all

of which are in the Department of the Interior, together with the Forest Service from the Department of Agriculture.

I want to highlight that fact of being in the Department of Agriculture, because I am going to get back to it in a moment.

It is important to note that the Forest Service represents the largest single agency funded by this bill, a full 19 percent of the money we appropriated for the current fiscal year, and, along with the other three land management agencies, a full 44½ percent of the entire bill.

While these four agencies are significant in the subcommittee's funding efforts, there are obviously other demands. I have for you, as I have had for the others agencies at past hearings, this large chart of the current fiscal year and the relative size of the appropriations for each of those agencies.

That indicates, among other things, that once we receive our 206B allocation, everything is a zero sum game. Any extra money for one agency can only come out of some of the others.

In any event, Mr. Lyons, you are over there at the base of the green line, the large, green bottom portion of it. And that is a very significant part of what we do.

[The information follows:]

Interior programs fiscal year 1997 enacted

Land management programs:	
Forest Service	\$2,361,000,000
National Park Service	1,414,000,000
Bureau of Land Management	1,090,000,000
Fish and Wildlife Service	653,000,000
Total	<u>5,517,000,000</u>
Indian programs:	
Indian Health Service	2,054,000,000
Bureau of Indian Affairs	1,606,000,000
Navajo-Hopi/IAIA/special trustee/Indian gaming/Indian education	119,000,000
Total	<u>3,779,000,000</u>
Science and minerals management programs:	
Geological Survey	739,000,000
Office of Surface Mining [OSM]	272,000,000
Minerals Management Service [MMS]	163,000,000
Total	<u>1,174,000,000</u>
Energy programs:	
Energy conservation R&D	570,000,000
Fossil energy R&D	365,000,000
Naval petroleum NPR/reserves	144,000,000
Energy information administration/economic regulation	69,000,000
Alternative fuels production	-4,000,000
Clean coal technology	-123,000,000
Total	<u>1,020,000,000</u>
Cultural programs:	
Smithsonian Institution	370,000,000
National Endowment for the Humanities	110,000,000
National Endowment for the Arts	99,000,000
National Gallery of Art	60,000,000
Holocaust Memorial	31,000,000

Interior programs fiscal year 1997 enacted—Continued

Institute of Museum Services	22,000,000
Memorials	41,000,000
Total	<u>733,000,000</u>
Interior departmental offices:	
Interior affairs	88,000,000
Departmental management	58,000,000
Solicitor	35,000,000
Inspector general	25,000,000
Total	<u>207,000,000</u>
Total bill	12,430,000,000

NATIVE AMERICANS

Senator GORTON. Another large part of the bill is comprised of programs for the benefit of Native Americans, primarily the Bureau of Indian Affairs and the Indian Health Service.

The Indian Health Service is an especially demanding responsibility for this subcommittee, as the cost simply of maintaining existing levels of medical services increases at an annual rate that exceeds inflation and has certainly exceeded any additional appropriations that we have received.

The third major group of agencies in our bill is that including the cultural agencies, the Smithsonian, the National Gallery of Art, the Kennedy Center, and the National Endowments for the Arts and Humanities.

While these agencies account for a smaller portion of the total funds appropriated in the Interior bill, they are in many cases the agencies responsible for the care and protection of our Nation's heritage. These programs receive vocal support from all across the country and from many Senators on both sides of the aisle.

The fourth group of agencies in our bill include the Science and Mineral Management Programs, and a fifth major grouping consists of programs within the Department of Energy.

I have broken the bill out this way and provided this chart, Mr. Lyons and Mr. Dombeck, so you can see the nature of the problems that we have and, therefore, the nature of the problems that you have. It is tough competition.

That competition will become even more fierce if the President and Congress are unable to enact a budget that includes meaningful entitlement reforms or other measures that enable us to achieve balance without relying almost exclusively on reductions in discretionary spending.

If no such agreement is reached between the President and Congress, I fear that this subcommittee will be forced to cut sharply, many programs and terminate others.

With regard to the immediate issue of fiscal year 1998, I note that the President's request for programs under the jurisdiction of this committee is a good \$700 million above the 1997 level.

Given that a freeze or reduction in total discretionary spending is a real possibility, it is clear that some reductions from the request level will almost certainly have to be made.

I really look to the two of you and to your assistants for help in prioritizing programs when it comes time to make tough choices.

Having said all that, I do want to note that the Forest Service fiscal year 1998 increase of 0.3 percent over the 1997 enacted amount is the smallest requested increase in the four land management agencies.

Enjoy that positive comment about the Forest Service budget request, because you may not hear many more such positive statements this morning.

I say that because I am truly concerned about the Forest Service. I told you I would get back to the issue of the Forest Service being in the Department of Agriculture. I think it is fair to say that the Forest Service is undergoing a significant transition.

Last year my colleague, Senator Stevens, questioned why we have a Forest Service. Many people scoffed at the thought. This year the same issue has been brought up again.

Over in the House just last month one of the Congressmen likened the current Forest Service situation to the Civil War and President Lincoln saying to the military, "If you aren't going to use the army, I might like to borrow it."

It is clear that many people are asking what the Forest Service is doing with itself. The agency was placed in the Department of Agriculture under the guidance of its founding father, Gifford Pinchot.

Make no mistake about it, Mr. Pinchot's perspective was wise use of the resources for the good of the population of the United States over the long term.

Many people now, both in the country and in the Congress, feel that the administration has abandoned this concept of wise use. There appears to be a new perspective strongly in favor of preservation programs over everything else.

I must say to both of you that many actions on the part of this administration seem to support that premise. It clearly seems to be a time to examine the mission of the Forest Service as represented and reflected in its budget proposal, and that is what we would like to do here today.

As I told you last night, Mr. Lyons, long after we scheduled this meeting the majority leader asked me to be in his office at 9:30 a.m. Senator Burns has kindly agreed to preside over the committee hearing for a half an hour or so. We hope that we can continue through with all of the really important questions that we have.

In the absence at this point of Senator Byrd for an opening statement, I will ask whether or not my colleague from Montana would like to say anything.

OPENING REMARKS OF SENATOR BURNS

Senator BURNS. Well, thank you, Mr. Chairman. I will just put my statement in the record.

I think I have the same concerns that you do and especially in—nobody has to know that you own a big chunk of my State.

And we are getting to the point where the same concerns that there is a louder, small voice here that happens to set policy on lands than the people who actually are near those lands, whose economic survival depends on those lands, and also, that our ability

to take care of them is hampered by people of little bitty minds just about the size of the eraser on this pencil.

So I can—it amazes me. It just absolutely amazes me about this 13 square miles of logic-free environment on where we come up with some of these crazy, damn things that we have to—we hear coming down the chute.

So I will put my statement in the record, a strong letter to follow, and get a shot at the questions.

Thank you very much, Mr. Chairman.

SUMMARY STATEMENT OF HON. JIM LYONS

Senator GORTON. With that, Mr. Lyons, we will be happy to hear from you and Mr. Dombeck.

Mr. LYONS. Well, thank you very much, Mr. Chairman. I appreciate this opportunity to appear before you, Senator Burns, and the subcommittee today.

In light of your tight schedule, I will limit my comments and ask that Chief Dombeck have a little more of my time to offer his perspectives in his new role as the head of the Forest Service.

We are very pleased to have Mike join the Forest Service. After his brief tenure over in Interior he has come back home. I think he is going to provide outstanding leadership and will help us tremendously in addressing the many challenges we face, both resource management challenges and organizational management challenges in the Forest Service.

I also want to acknowledge the presence of Dave Unger, Mike's associate chief. Dave recently received the Presidential Rank Award, the highest award that can be provided a civil servant, for his many years of dedicated service to the Forest Service, as well as the Soil Conservation Service, now the National Resources Conservation Service.

Dave recently announced, at the height of his career, that he is going to retire, which shows his continual wisdom, going out when he is at the best of his game.

I just want to say for the record how much I have appreciated Dave's long service and commitment and dedication and want to acknowledge the role he has played in providing for the Nation's legacy of natural resources.

I will let Mike introduce the other members of the Forest Service who are here with us today.

Mr. Chairman, I would like to make three points that I think help set the stage for the situation and the challenge we face, the committee, the administration and the Forest Service, in dealing with the difficulties we have in coming up with a budget to support the Forest Service activities.

The first point is that, we have a very, very broad mission in the Forest Service. We have the world's largest natural resource research organization. We play an extensive role through our State and private forestry programs and working with private landowners in protecting the Nation's forests and lands, not just the National Forest System lands, from insects and disease.

We do extensive work in urban and suburban areas, helping the 80 percent of all Americans who reside in those areas understand

their relationship to the out of doors and hopefully improving their environment.

One of our primary focuses is the work we do on the National Forest System, 191 million acres of the best landscape in America and a very important part of the landscape in Montana and Washington and other parts of the United States.

Our challenges are growing, and our work is changing over time. I find myself in a position these past 4 years and in this term trying to deal with an agency that is going through tremendous change, as the Nation's economy has gone through tremendous change. I think we are caught up in a change as well.

The second point I want to make is that this change in mission and change in direction is not something that is being driven by administrative fiat or differences in philosophy between ourselves and all of you but simply reflects, I think, changing values in how the American public wants to use its landscape.

I would offer as an example a significant increase in recreation demand across the United States, a significant increase in recreation and tourism as an important part of the economic engine of States like Washington and Idaho and Montana and other places, also a growing challenge in dealing with threatened and endangered species.

We face a listing decision here with regard to coastal coho, which could affect Washington, Oregon, and northern California, as well as bulltrout, which could affect Montana in the inland West.

Increasing challenges in providing for and supporting the economies of rural communities that are going through transitions from economies that were based almost solely on extractive industries and on timber and mining to economies that are now much more broadly based. They may have as their anchor timber and mining, but now have to consider things such as recreation and tourism in other parts of their economy. We play a critical role.

We also remain an important source of high quality outdoor recreation opportunities and a primary source of high quality water for most of the communities in the Western United States.

So we have a very diverse role, and public values certainly are affecting how our role changes over time. Jack Thomas, Mike's predecessor, instituted a philosophy in the organization called adapted management, management based on change, recognizing that our circumstances and our resource demands change.

I would suggest as an organization we are going through adaptive management in trying to change our organization, as other businesses are doing, to respond to changing times.

Finally, I want to address the question that you raised and that Chairman Stevens has raised before and that is: Why do we have a Forest Service?

I would suggest that now more than ever we need a Forest Service because of the changing circumstances that we see and because we are uniquely positioned, the professional expertise we have with the scientific understanding we have of good resource stewardship to ensure a continuous supply of the goods and services that the public demands from its national forests, that the public requires of private forest lands, and that we will need to provide in terms

of the research and understanding that is going to help guide these resources on into the future.

As I said, the national forests are increasingly required to provide a great deal more than just timber and minerals and opportunities for grazing and the like. The demands continue to grow.

And in many respects, the Forest Service's mission is spinning around to the mission that was originally established for the National Forest System when it was first established, which, as Senator Stevens reminds me often, was a continuous supply of timber, but also continuous water flows.

In fact, many of the national forests in the West were first established to protect water supplies for cities like Los Angeles, San Francisco, Portland, and Seattle.

We recognize this changing mission and changing direction by trying to respond as much as we possibly can. Our overall mission as an organization is caring for the land and serving people. And I think that mission is sound.

But what is different is what people are demanding from their national forests and their expectations of the kinds of service and support we are going to be providing.

In fact, in many respects, Mr. Chairman, I think the organization is going through a transition from producing things to providing services as we enter the service economy as well. That does not mean that we will not continue to provide timber as an important product of national forest management.

But more and more we are using the timber sale program to achieve other goals and objectives, such as improving forest health, improving wildlife habitat, and protecting other natural resources.

We are more and more investing in other kinds of resource management to try and respond to increasing demand for recreation and tourism, to respond to community needs to diversify the products, goods, and services that we provide.

We are doing our best to respond to these changes with declining budgets and also a declining work force. It creates a tremendous challenge.

We are committed to working with you to try and deal with challenges, to provide guidance, and set priorities. We are trying to be creative and use the tools that you have provided us to be more responsive.

Those tools run the gamut from recreation fee demo project, which may afford us a way to provide more support for the recreation program, to innovative uses for land management, such as the Forest Legacy Program, one of the projects which of course you and I will go visit here in 2 weeks, where we purchase long-term easements instead of fee simple purchases, so we can spread our dollars further.

It is a tough challenge these days, Mr. Chairman, but I think as an organization the Forest Service, better than any other land management agency, is well positioned to deal with those challenges and prepare itself for the resource management challenges that we are going to face in the 21st century.

PREPARED STATEMENT

I am proud of the organization. We have gone through some difficult times. I think the real question is not why do we have a Forest Service, but what is it that we need to manage for, and how can we best position ourselves and obtain the resources we need to ensure that we can meet the public's demand for the goods and services that come from the Nation's natural resources in perpetuity?

Thank you.

[The statement follows:]

PREPARED STATEMENT OF HON. JAMES R. LYONS

Mr. Chairman, Senator Byrd, and Members of the Committee: Thank you for inviting me and the new Chief of the Forest Service, Mike Dombeck, to appear before you and discuss the fiscal year 1998 budget for the USDA Forest Service. We are joined by several other Forest Service professionals who have worked long hours and weekends to assemble the budget for the President.

As you and your staffs review the specifics in our budget proposals for 1998, I hope you can keep in mind three key themes and principles which provide the foundation for all the goals, objectives and programs in this budget. (1) The broad scope and mandate of the Forest System Mission; (2) The imperative of restoring and protecting healthy ecosystems; and (3) Our efforts to help spread conservation and forest stewardship beyond the National Forest System borders.

THE FOREST SERVICE MISSION

The Forest Service mission is "caring for the land and serving people." I want to focus first on "caring for the land." Many people cannot comprehend exactly how much land we care for. The National Forest System's nearly 192 million acres is the equivalent land area of Michigan, Ohio, Kentucky, West Virginia, Virginia and the whole northeast—a total of 16 states plus the District of Columbia. We manage 156 forests with the average size of the State of Delaware.

Consider this: each Forest Supervisor wakes up each morning to manage an area the size of a small state. Their jobs are not easy.

In caring for the land, we need to address all of our assets—clean streams, abundant fisheries, birdlife, game, endangered species, trees, clean air, windblown mountain tops, lakes, grasslands, arid canyons, the temperate rainforests, open meadows, woodland swamps. The list goes on. We have enormous responsibilities to make sure this land is healthy. Most of our proposed budget will be spent on trying to protect this national treasure chest of natural resources coast-to-coast.

The second part of our mission is "serving people." Again, it may sometimes be difficult to comprehend exactly how many people depend on the forests for services.

Tens of thousands of the private landowners—who own and manage the rest of the 600 million acres of private forest land—look to our State and Private Forestry Programs for technical advice and financial incentives.

National forests provide the more outdoor recreation opportunities than any other federal land agency. Millions of Americans visit the National Forest System to hunt, camp, hike, fish, sight-see, climb, ski, canoe, birdwatch and other activities. The Forest Service goal is to provide high quality outdoor recreation opportunities to meet users' demands while still being good stewards of the land.

Since 1973, more than one million Americans have spent a day, a week or even more working with Forest Service employees as campground hosts, trail builders, researchers and dozens of other activities.

In addition, many other Americans go to work on National Forest Lands to operate timber sales, grazing permits, mining claims, guiding companies and carry-out other commercial uses.

When you consider all of these customers coupled with the people who depend on Forest Service research, international expertise, urban and community forestry and the rest of our activities, you begin to realize the scope and breadth of "caring for the land and serving people." This is the philosophy behind the \$3 billion dollar budget.

RESTORING AND PROTECTING ECOSYSTEMS

The best and most credible science today demonstrates that Aldo Leopold was right decades ago—everything is connected to everything else. We are applying his sage advice to “not throw away the parts” when we tinker with our natural ecological systems. I am proud to say that the USDA Forest Service has demonstrated to the world the cutting edge in ecosystem management. In the Pacific Northwest, we have standards and guidelines in place which are not directed at one outcome, one product or one use. We have a system in place that, according to the best available science, ensures that we are on track to manage those ecosystems for perpetual sustainability. We will continue to learn more, but today that region is on track and the services we provide and the health of the land will be dependable.

In the Pacific Northwest we are working to restore aquatic ecosystems. Degraded anadromous fish habitat and their watersheds will be restored and enhanced by reducing sedimentation and streambank erosion, introducing structures to create pools that provide hiding cover or accumulate spawning gravel, and remove or modify man-made barriers to improve adult and juvenile migration conditions.

In Oregon, the Forest Service and the Governor are committed to working together to achieve restoration of eastern Oregon forests. Efforts to accelerate and emphasize restoration will be a partnership, with community-based support, and will be done within the framework and guidelines of the Eastside Environmental Impact Statement and other direction, such as PACFISH.

In the Sierra Nevada range we are in the process of applying the best science available in a similar effort. I believe we basically have all of the information we need to make wise resource choices, and in the next few months, a team of scientists familiar with the issues, region and National Forest System process will help us confirm a direction that ensures long-term dependability for goods and services and ecological integrity.

In the next few months we will take significant steps forward in the Columbia River Basin. Again, we have the best minds working to provide a unified consensus approach to sustaining this ecosystem for the people who live in the area and depend on the resources for their quality of life, as well as for the area’s wildlife.

We have completed a scientific assessment for the Southern Appalachian region and are working to improve our understanding of the Great Lakes region. Our budget provides the tools and funding necessary that continues to propel the Forest Service to the forefront of forest management. Throughout our ecosystem efforts you will probably begin to see the evidence of Chief Dombeck’s “collaborative stewardship” concept, and I will leave this point for his remarks. For now, I can say I am very optimistic about the potential.

FORESTRY BEYOND THE NATIONAL FOREST SYSTEM

USDA is the premier forest landowner assistance organization in the world. The Department conducts extensive scientific research, has a workforce with technical expertise in counties across the country, and provides financial incentives to help landowners increase the conservation contributions that private land makes to our nation’s fish, wildlife and clean water resources. Our 1998 budget includes funding to support this well-established, broadly supported leadership role in the Department of Agriculture.

We have included in the 1998 budget a strong continuation of our stewardship assistance program that includes a 5.7 million dollar increase for Stewardship Incentives. I want to emphasize that the increases in certain state and private forestry programs are not offset by national forest system cuts; the state and private budget is essentially flat. However, we strongly believe that willing landowners deserve the technical and financial support of the Forest Service if they want to go the extra mile to deliver food and fiber to the marketplace while practicing good stewardship on their lands.

In addition to \$16 million within the National Forest System for “Jobs In the Woods”, \$17 million is included in the budget to provide critical assistance to rural communities in the Pacific Northwest. The other programs in the State and Private Forestry—including Urban and Community Forestry, Forest Legacy and Cooperative Fire Management—are all critical to our efforts to enhance non-federal forest resource and protect productive timber land from fire and conversion to non-forest uses.

We also intend to step up our nationwide monitoring capacities so that we can be better tuned to the forest trends across the landscape. The program will cover 60 percent of the forest land in the lower 48 states, compared with 53 percent in 1997 and 40 percent in 1996. Coupled with our level budget in research, we will have the basis to make good decisions.

The Forest Legacy program is designed to conserve the resource values of forest land, emphasizing lands of regional and national significance that are threatened with conversion to non-forest uses. Conservation easements, or fee simple purchase are methods used by the Forest Service and our partners in working with willing landowners. An example of a successful partnership is the Mountains to Sound Greenway for the protection and preservation of a "green corridor" along I-90 from Seattle through the Cascade Mountains. About 950 acres have been added to this long-term effort through acquisitions and partnerships. The largest conservation easement east of the Mississippi resulted from Forest Service negotiations and a state grant option allowing Vermont to step in and complete this acquisition. This easement covers 31,450 acres in the "Northeast Kingdom" of Vermont, protecting a large contiguous block of forest land from development. This joint approach also fits in with our objectives of coordinating state and federal efforts to achieve mutual objectives.

The Urban Resources Partnership program was initiated on Earth Day in 1994. Eight cities, including Los Angeles, Seattle, Denver, Chicago, New York, Philadelphia, Atlanta, and East St. Louis, currently participate in the Program. This program is providing urban residents the opportunity to address local environmental issues and improve the quality of urban life. Additional events are planned for Earth Day celebrations this month. This is a continuing program throughout the year that has achieved successes that include conducting environmental education, habitat restoration to revitalize wetlands in the Los Angeles Basin, established community gardens for food and educational purposes, supported Arbor Day activities, and is helping build community capacity. Partners in Los Angeles include the USDA Natural Resource Conservation Service, National Park Service, Housing and Urban Development, Environmental Protection Agency, California Department of Forestry, the City of Los Angeles and over 50 non-profit organizations in the Los Angeles Basin.

The Forest Service is a science-based organization and our research products are used around the globe. Each day, field foresters, land managers, farmers, ranchers, mill operators, urban foresters, public interest groups and many others apply the knowledge developed by Forest Service scientists and cooperators in academia and industry. The Forest and Rangeland Research Budget is to be funded at \$179.8 million, the same funding level as fiscal year 1997. However, the programs are continually being adjusted to meet changing and emerging national and regional issues and maintain a broad-based scientific capability.

CONCLUSION

Let me close by saying that the challenges and activities I have highlighted represent shifts in business as usual as well as our goals for the future management of the national forest system. Within the framework of a balanced budget by the year 2002, this budget meets the highest priorities of a very expansive mission and ever increasing public demands.

I am confident that the budget before you meets our central challenge: Caring for the Land and Serving People. The job is large, the demands are great and the stakes for the future are high.

That concludes my testimony, Mr. Chairman. I would be happy to answer any questions at the conclusion of Chief Dombeck's statement.

SUMMARY STATEMENT OF MIKE DOMBECK

Mr. DOMBECK. Good morning, Mr. Chairman, Senator Burns.

I am pleased to appear before you for the first time in this job as Chief of the Forest Service. I have been just a little over 3 months in the job, and of course as I think both of you know, I am no stranger to the agency.

I grew up in a national forest in Wisconsin's beautiful lake country in the Chequamegon National Forest. So I come with that perspective as well.

I have to say, as you implied in your remarks, that we are faced with competing demands, tough challenges, new pressures, and a greater diversity of people living on the land today than every before. I would hope that we in this room can help move the ball forward.

I believe that if we work together, we can usher in a spirit of trust, a spirit of moving forward, and a deep commitment to the healthy forest, healthy lands, and the service to the people.

I come here with a willingness to hear all sides of the debate, a commitment to remain open and responsive to new ideas, new values, new information, and a commitment to leave our national forests healthier than when I first came into this job.

I want to say that I am proud to be back in the Forest Service. I continue to remind myself it is an agency with some of the best resource professionals in the world, the best wild land firefighters, the best recreation planners, some of the best silviculturists, the best biologists, and an administrative support staff. We have a work force that in essence is second to none in capability.

I want to also add that I am not so naive to think that people will not sometimes disagree. I think our task as public servants, as resource professionals, is to focus on areas of agreement and move forward where we can.

My commitment, what I call collaborative stewardship, is listening to people and having our people, the resource managers, work hand in hand with local communities, with the constituencies, both local and national, to move forward.

I will also keep my remarks short, because I know you have to leave soon. I want to call your attention to the many successes that I have included in my testimony. I think it is important that we continually remind ourselves that in spite of so many challenges that we have, there are also many, many successes.

In every State there are places where things are working very well, and we need to take a look at those as models of how we can improve relationships in other places.

I do want to mention accountability. Our first priority is to the land and people, but our responsibility in this agency is to deliver goods and services and values for which public lands are cherished, to deliver healthy lands and waters, to deliver a sustainable supply of timber and forests, to deliver environmentally benign energy and minerals development, to deliver better hunting, better fishing, high quality recreation experiences and the many other things that this agency needs to be held accountable for.

And I will again for the sake of brevity, stop here. But I do want to introduce the leadership of the Forest Service that is here to help me. Given the fact that I am just a little over 3 months in the job, there are a lot of things that I have not yet learned.

INTRODUCTION OF ASSOCIATES

Of course, Dave Unger, Associate Chief, and I would like to second Mr. Lyons's comments about Dave and thank him for agreeing to stay with me through this transition and help me get going.

Janice McDougale is Acting Deputy Chief for National Forest Systems. Barbara Weber behind me here is Acting Deputy Chief for Research. Joan Comanor, Deputy Chief for State and Private Forestry, Clyde Thompson, Acting Deputy Chief for Administration, Ron Stewart, Acting Deputy Chief for Programs and Legislation.

And the guy that really knows what is going on, that has all the numbers, is Steve Satterfield. And I know all of you know Steve well.

PREPARED STATEMENT

I would like to ask that my statement be entered into the record. Senator GORTON. It is and so will Mr. Lyons's be.
[The statement follows:]

PREPARED STATEMENT OF MIKE DOMBECK

Mr. Chairman, Senator Byrd and Members of the Committee: I am pleased to appear before this committee for the first time as Chief of the Forest Service. As some of you may know, I am no stranger to the Forest Service, having grown up 25 miles from a town of 1,500 people in northern Wisconsin's beautiful lake country, in the Chequamegon National Forest.

Today, faced with more competing demands, new pressures on the land and greater challenges than ever before, resource management has become contentious. We in this room can help to change that. I believe that if we work together, we can usher in a new era of resource stewardship and a deeper commitment to conservation. A commitment marked by a willingness to hear all sides of the debate. A commitment to remain open and responsive to new ideas, new values, and new information. A commitment to leave our lands healthier and our waters cleaner.

I am not so naive to think that people will not sometimes disagree. Our task as public servants and resource professionals is to focus on, and build from, the many more areas of agreement. To regain the trust of the American people. To demonstrate to the rest of the world that yes, people of good will can come together and find a way to live sustainably on the land.

I call this commitment to working with people to maintain and restore the health of the land, collaborative stewardship. Collaborative stewardship rests on one very basic premise: we simply cannot meet the needs of people, if we do not first secure the health of the land.

To get a better sense for how people feel the Forest Service should pursue collaborative partnerships, I have recently talked with many in the Administration, members of Congress and their staff, former Forest Service Chiefs, employees, retirees, and conservation and industry leaders. In all of my conversations, three themes are repeated: people, knowledge and land. It strikes me that that's what the Forest Service is all about—using knowledge to conserve and restore the health of the land for the benefit of the nation's people.

I'd like to share with you some examples of how the Forest Service is meeting the needs of people through better land management decisions and more effective use of knowledge. For instance:

- In Washington, the Pacific Northwest Region of the Forest Service is aggressively pursuing the reduction of fuels from the national forests. Not only does this improve resource protection against catastrophic wildfires, but it improves ecosystem health as well. In addition, implementing the Northwest Economic Adjustment Initiative through close cooperation with state and local governments is helping many of this region's timber-dependent communities move towards more diverse and sustainable economies.
- In partnership with the Alaska Department of Community and Regional Affairs, rural development grants of \$319,000 to 21 communities were awarded focusing on enhancing the overall quality of life in rural areas primarily through natural resource based solutions. In addition, economic recovery program funds targeted grants to nine communities dealing with the acute problems associated with federal or private sector land management decisions and policies to complete projects identified in their community action plans. In addition, Research has prioritized its efforts in the Northwest to address two major issues of concern in Alaska: (1) how to produce wood consistent with sustaining ecosystems and producing multiple values; and (2) how to address the spruce beetle infestation on over one million acres.
- The National Forests in Mississippi during 1995 experienced one the worst southern pine beetle outbreaks on record. A cooperative effort led to an incident command system to battle this outbreak as if they were fighting a major forest fire. This innovative approach worked well and helped minimize the impact of the beetle outbreak. It has been effectively used during the resulting salvage sales program in 1996.
- In New Mexico, the Cibola National Forest began charging parking fees along the Sandia Crest Scenic Byway as part of the recreation fee demonstration program authorized by Congress in August 1996. Monies collected are being used to provide safe and clean picnic grounds and trailheads along the Scenic Byway.

Since implementation, vandalism has dropped dramatically. Cooperators in this venture include the New Mexico State Highway Department, East Mountain Chamber of Commerce, the Turquoise Trail Association, and Tinkertown Museum. In addition, efforts on the Gila National Forest to develop improved relationships with Catron County have resulted in a Memorandum of Understanding to clarify roles and improve communications. The Lincoln National Forest and the Cloudcroft Municipal School Board, Otero County have worked out a land exchange using public lands to meet the growing needs for classroom and faculty expansion.

- In Montana, the development of the Lincoln County Log Yard with Forest Service Economic Action Program support to unload, sort, scale and forward short logs will expand the raw material supplies, enhance business opportunities for small business owners and create incentives for implementing forest health management practices.
- In Utah, the multiple uses of public lands can be clearly seen. Preparations continue for the 2002 Olympics. The Natural Resource Coordinating Committee will steer the State's government agencies in a coordinated support role for the Salt Lake Organizing Committee. This partnership will allow the world to see the value of public lands and environmental stewardship with nearly all the venues on National Forest System lands. Many partners, contributing nearly three times what the Forest Service is contributing are working to improve stream and wildlife habitat and do fish and wildlife population surveys. Coal production in the State is contributing nearly \$35 million in bonus bids and royalties to the federal government during a three-year period.
- In New Hampshire, the acquisition of Bretton Woods at the base of Mt. Washington on the White Mountains National Forest will secure this land for public use of its outstanding vistas, provide protection of 2 miles of Ammonoosuc River frontage, and provide access to Upper Falls.
- In Colorado, the Boulder Community Volunteers have won the Chief's National Volunteer's Award four times. These volunteers are a shining example of how local people can come together to join in with the Forest Service to achieve the goals of caring for the land and serving people. Elsewhere in Colorado, we are working with Dow Chemical and the counties to develop alternative methods of controlling noxious weeds.
- In West Virginia, the gypsy moth pest management efforts and watershed projects in Morgantown and the timber and watershed efforts in Parsons are successfully integrating research, with the cooperative programs in forest health, to the management of the national forests for use not only in West Virginia, but across much of the Appalachians.
- In Vermont, the acquisition of 2,800 acres of the Chittenden Reservoir property was completed. This tract of land will serve as a valuable addition to the public's lands and the National Forest System.
- In Arkansas, the epidemic of southern pine beetle infestation and storm damage on the Ouachita National Forest led to a successful timber salvage and fuel treatment program contributing to the goals of protecting ecosystems.
- In South Carolina, the Sewee Visitor and Environmental Education Center was opened in 1996. This project is a visitor and environmental education center for the interpretation of the Cape Romaine National Wildlife Refuge and the Francis Marion NF. This is a cooperative project between the U.S. Fish and Wildlife Service, Cape Romaine National Wildlife Refuge, and the U.S. Forest Service.
- Elsewhere in South Carolina, the Savannah River Forest Station sponsors two innovative and unique education programs serving under-represented, minorities through collaboration with local, state, and federal partners. The education programs focus on improving science, math and engineering education through hands-on activities for students in grades 3–12 and also serves science and engineering college undergraduates and faculty.
- In Nevada, partnerships are accomplishing improvements to fish and wildlife habitat and conducting population surveys and monitoring of plant and animal populations. At Walker Lake, partnerships are doing important research and monitoring, including inventories, and studies of riparian and range processes and functions.
- In North Dakota, an average of 6,800 acres each year are added to the non-industrial private forest land base which is managed under the guidance of professionally developed Forest Stewardship Management Plans. These plans are designed to accomplish the specific objectives of individual private landowners such as windbreak planting and renovation, forest products utilization, and wildlife habitat improvements.

—After wildfires in southern California were successfully suppressed, a Burned Area Emergency Rehabilitation team initiated watershed rehabilitation measures. These measures, involving many federal, state, and local agencies and the California Native Plant Society, were put in place prior to the first damaging storm of the season reducing the potential for additional loss and damages. Rehabilitation efforts included the protection of threatened and endangered species habitat, hydroelectric power, heritage resource sites, and flood control and water supplies. The rest of my testimony outlines the key funding priorities for fiscal year 1998 and re-emphasizes many of the points the Under Secretary has already made.

ACCOUNTABILITY

Our first priority is to the land and the people who use and care for it. Our responsibility is to deliver the goods, services, and values for which public lands are cherished. To deliver healthy lands and waters. To deliver a sustainable supply of timber and forage. To deliver environmentally benign energy and minerals development. To deliver better hunting and fishing. To deliver quality recreation experiences, and to do all of the above through an efficient, and accountable organization.

Every forest supervisor, on every forest, must be held accountable for conserving and restoring the health of the land. Clearly, we must deliver sustainable supplies of wood fiber for American homes; forage for livestock; and minerals and energy that help support healthy economies. But as I said earlier, the health of the land must be our first priority. Failing this nothing else we do really matters.

THE FISCAL YEAR 1998 PRESIDENT'S BUDGET

This year's budget proposal reflects the Forest Service's priorities and programs within the agency's mission "Caring for the land and serving people". It focuses on implementing the Forest Service's strategic long term goals:

- Restore and Protect Ecosystems.
- Provide Multiple Benefits within the capabilities of ecosystems.
- Ensure Organizational Effectiveness.

Within this framework, in fiscal year 1998 we will make a major effort to improve financial and ecological accountability. Three significant initiatives—the road building program, fire fighting funding and the salvage fund—illustrate this.

Many people question the logic in trading roads for National Forest trees, especially given the current expansive network of roads on the National Forest System and the cost of maintaining many of these roads once they are built. The time has come to address our transportation needs in a different way. Our Budget proposes to discontinue the use of Purchaser Credit which will make the road a direct cost of the timber sale. Bid prices for timber sales are expected to decline commensurably. Forest Service engineers will continue to work with private contractors to ensure Forest Service roads meet our standards.

Funding mechanisms for our fire programs need to change. Discretionary spending levels cannot accommodate the escalating costs of fire suppression, which have increasingly been met through emergency spending outside the budget caps. We have proposed two main changes: First, we want to ensure that funds to fight fire are available to our fire fighters when wildfires begin. The fiscal year 1998 President's Budget proposes a government-wide contingency fund to cover various disasters including emergency firefighting. Second, we want to better ensure that we capitalize on opportunities to use management techniques that reduce catastrophic wildfires. Under our proposal, between \$30 and \$50 million is recommended for hazardous fuels reduction—a 25- to 100-percent increase over 1997. The cost of reducing much of the fuels buildup before a wildfire occurs, pales when measured against the costs of putting out intense, fuel-driven wildfires. These are two significant improvements that address our financial and ecosystem needs, and I hope you will support us in this effort, as you have in the past.

We are proposing a change in the current salvage sale fund so that funding we receive more closely reflects the type of work that we are doing in the field. Active management is necessary to restore ecosystem health.

Our budget proposal retains the existing Salvage Sale fund account and its primary function—funding the removal of dead or dying timber on National Forest System lands. A separate, distinct account is proposed to fund ecosystem health and restoration projects. This fund would be called the "Forest Ecosystem Restoration and Maintenance" fund—or FERM. This is an important first step to provide funding for necessary watershed restoration work that is not directly tied to the timber receipts of each separate forest. I hope you can agree with our motivations and objectives. We must accelerate the restoration of our publicly owned lands and waters.

This new fund draws from several existing sources and would begin fiscal year 1998 with 121 million dollars for restoration efforts. We must use all of the tools we have available to accelerate the restoration of our nation's forests—thinning, increased use of prescribed burns, mechanical treatments, and so on. These restoration efforts are investments—investments that will, for example, diminish the risk of catastrophic fire along the urban wildland interface. The cost of not making these investments grows exponentially every year.

There are also two more emphasis items within the President's fiscal year 1998 Budget:

The President's Forest Plan for the Pacific Northwest:

Continuing to implement provisions of the President's Plan is a priority in fiscal year 1998. The budget includes \$107.4 million to carry out critical work for watershed protection, monitoring, timber harvest, adaptive management and development of rural communities' long-term economic strength.

HAZARDOUS WASTE

Funding for the fiscal year 1998 Forest Service hazardous waste work is provided within the USDA central fund for this purpose. For fiscal year 1998 \$14.25 million is identified for the Forest Service. Efforts will be targeted on cleaning up hazardous waste sites identified on national forest lands, especially identifying responsible parties under CERCLA so that they, not the taxpayers, pay the cost of cleanups.

ADDITIONAL APPROPRIATIONS HIGHLIGHTS

This year's budget reflects continuation of our research program at last year's level. Science is critical to our program as a nation. As I said before, we are about knowledge and our research program produces much of the knowledge necessary to address contemporary issues. We will continue to adjust our efforts to meet changing and emerging national and regional issues and maintain a broad based scientific capability.

Our overall State and Private Forestry program is also at last year's level. However we are proposing to place a greater emphasis on our Stewardship Incentive Program (+ \$5.7 million). In addition, State and Private Forestry, the National Forest System, and Forest and Rangeland Research would jointly expand the scope of forest health monitoring to cover 60 percent of the forest land in the lower 48 States. This program is built on a strong partnership among the Forest Service, the National Association of State Foresters, and the Bureau of Land Management. The program includes all forest ownerships; Federal, State, and private.

Under the National Forest System appropriation, we are requesting an increase of \$50 million. This increase is targeted for Recreation Use, Wildlife and Fish Management, Rangeland Management, Forestland Management and our Soil, Water and Air Program.

Our efforts in the Reconstruction and Construction area will be targeted at extensive reconstruction needs with emphasis on health and safety items such as contaminated water systems.

CONCLUSION

Finally, I believe the Forest Service mission—caring for the land and serving people—is more important than ever. Within the overall plan to balance the nation's budget by the year 2002, these proposals will help us to meet our highest priorities and ever increasing public demands.

That concludes my testimony, Mr. Chairman. I would be happy to answer any questions you or members of the Subcommittee may have.

ORGANIZATION CHANGES

Senator GORTON. I would like to begin by discussing the direction the Forest Service seems to be oriented toward in the near future.

It is apparent, Mr. Dombeck, based on recent changes at the top of your organization, that you have plans for new direction. While official documentation might reflect otherwise, it seems pretty clear that you have removed three of your principal deputy chiefs. You filled two of these positions.

Now that Mr. Unger is leaving, and in concert with another vacant deputy chief, you will still have three vacancies at the top of the organization to fill.

Many comments, including those of former Associate Chief George Leonard, point to the fact that you are purging the organization of resource professionals who have performed their jobs based on sound stewardship principles, but otherwise would not do the administration's bidding.

In addition, you brought with you into the chief's position several assistants with little if any Forest Service experience. Would you tell me why you let three deputy chiefs go?

Mr. DOMBECK. Well, first of all, let me say that they selected to do what they did, as it was their choice. I did not ask them to leave. I offered them options and did not suggest retirement.

Part of the function and intent of the Senior Executive Service is to provide flexibility in leadership jobs. I believe that as a new chief, I should have the option to select my team.

I want to assure you the people that have been selected, for example, the incoming Deputy Chief for Research, Robert Lewis, is a long-time employee of the Forest Service, a senior executive with impeccable credentials, highly regarded by, I believe, the people that have criticized me for the actions.

Likewise, Bob Joslin, who is coming in as Deputy Chief for National Forest System, is a long-time Forest Service employee, highly respected across the board by the timber industry, as well as the conservation community. I have received many, many compliments from both employees and retirees for those selections.

I want to assure you that other selections will be made in that vein of resource professionals. I hardly think that 3 changes out of 35,000 is a purge. From the standpoint of the employees that I brought with me, again, three people.

One is a secretary at a GS-11 level. Another one is a policy analyst at a GS-12 level. And another one is currently a special assistant, GS-15 level.

I would be happy to elaborate on any other questions that you have concerning all this.

ORGANIZATION CHANGES

Senator GORTON. I gather by implication from that answer that we can look for significant additional personnel changes.

Mr. DOMBECK. Obviously, as Dave Unger, who elected to retire effective July 3, the demographics of the agency are such that, like a lot of agencies, many, many of the senior executives are of retirement age and of course have the option to do as they wish.

And from the standpoint of my intent, I do not believe you will see massive changes as maybe some of the folks may have been concerned with.

Senator GORTON. You have spoken about the experience at least of some of your new people. Can you tell me whether or not these new people will be committed to the multiple use concepts that have been the historic basis of the Forest Service organization?

Mr. DOMBECK. Yes; very much so. In fact, I would like to—since I have discussed it with some of the staff—and the concern, as I understand it, may be with Francis Pandolfi.

Let me say that the role Francis will play has to do with the finance and the numbers business of the agency. He has an MBA from Harvard, is an executive that has run a couple of major corporations.

As you know, the area of finance is one of the areas where we have some challenges. This is the reason for bringing in this high level of expertise. He has not been brought to the agency to make natural resource policy decisions but to deal with the business side of the organization.

Senator GORTON. Thank you for those answers. And once again, I apologize for being requested elsewhere at 9:30. Senator Burns has agreed to take over in my absence. I am sure I will be back before we are finished. But thank you for this beginning.

And, Senator Burns, for the time being, it is all yours and Senator Stevens.

Senator BURNS [presiding]. Before I get into my questioning—and thank you, Mr. Chairman. And I look forward to seeing you in 30 minutes.

And I will—Senator Stevens has joined us this morning, and we look forward to his—if he has a statement that he would like put in the record, or would you like to start off with some questions? We will just start with you, because I know you are a busy man.

Senator STEVENS. No; I am going to stay until 10:30. You go ahead.

Senator BURNS. You are going to stay until 10:30? That is pretty dangerous right there. You guys are in big trouble. [Laughter.]

And he is in a good mood, so that sort of gets hard, too. [Laughter.]

RECREATION

Let us talk a little bit, Mike, about—I hear the statement of the Assistant Secretary, and we have changing times. You know, I will have to be right honest with you, I do not hear that.

Maybe you hear it here, but you get out on the ground, if you get outside and get on the ground and people who really count, I think we are still in the resource management business.

And recreation kind of comes second, because I do not see any increase in numbers of people crawling around in the forests out there.

No. 1, I see a lot of rich people buying accesses to forests, so they cannot get through one ranch to get to another backing up to those things. And I am concerned about that.

But let us put recreation as it should be with resource management. Tell me about the dollars that are derived from the resources that are found, the timber, mining, grazing, as compared to what your recreation dollars are.

Mr. DOMBECK. Let me—first of all, I think the statement I made that you may be referring to is that the way I intend to look at the National Forest System is that one resource is not dominant over another. As Jim mentioned, the importance of maintaining water flows, timber programs, mining, forage, grazing, recreation and those sort of things.

Some of the data associated with recreation use that I have here—and I can look at Montana, for example, where we had 8.8

million recreation visitor days in 1986, and in 1996 it was 13 million, 13.4 million.

So the increases in demand, in some States has doubled. Alaska, for example, it went from 3.5 million in 1986 to 6.9 million in 1996. We are not suggesting that the other resources are less important.

Many of the—if you look at, for example, the national forests of California and the tremendous, tremendous pressures people from the Los Angeles basin place on the Cleveland National Forest, and the San Bernardino National Forest.

The workloads there are just absolutely tremendous. The trash that we have to pick up, the inflow of immigrants coming through there, the hazard of fire and the tremendous workload associated with it.

It is important that we manage this recreation to prevent resource degradation, whether it is cultural resources, water, or streams, all those kinds of things. So those are some of the numbers associated with the increased demand.

From the standpoint of overall programs, the receipts from timber were about \$500 million, from recreation about \$48 million.

However, the contributions of recreation and tourism to local economies, of course, are significant. A lot of communities in Montana that I have been to, as well as the area where I grew up, have people wanting to spend time in open space. The number of people that move to areas because of the open spaces and the opportunities to hunt and fish and do all the things that people like to do in the country is very, very important.

We can provide you with any breakdown of numbers, and we will do that for the record that you wish.

From the standpoint of allocations to programs, what we are requesting for in the timber program in 1998 is about \$210 million.

And what is it for recreation?

That is receipts. Excuse me. Do you have the request?

FOREST MANAGEMENT

Mr. LYONS. If I could, Mr. Chairman, let me just make one point, because I want to make sure that my comments were not misunderstood. I do not mean to imply, and certainly I am not asserting, that we have to manage for one resource or one use over another. And as you know, using multiple use is a philosophy that underpins everything we do.

We can manage for recreation and produce timber. We can manage for water quality and continue to have high quality forest production and grazing. We have to manage for it all.

I think more and more what we see is that management is critical to ensuring we have good range lands, good water quality, and good wildlife habitat. As the forests, particularly in the intermountain west, are at risk of damage from insect and disease, forest health and ecosystem health need to be improved.

I do not want to imply that these things are mutually exclusive. In fact, I think more and more we demonstrate that we need to recognize these things in concert and manage them in totality, and not one resource against the other.

Mr. DOMBECK. The request for 1998 for recreation is \$216 million, and for timber it is \$269 million. And I have any other combinations of breakdowns that you would like.

FIRE AND FOREST HEALTH

Senator BURNS. Mr. Babbitt has suggested he wants to burn some forest land for forest health, around 3.5 million acres. How does that figure in with your plans over in the Forest Service?

Mr. DOMBECK. Well, in the National Forest System we have 39 million acres, we estimate, in high-risk or catastrophic stand.

I think what we are proposing is the flexibility to do between 800,000 and 1.3 million acres. We would like to be able to do about 3 million acres per year to sort of get ahead of—start catching up with this.

But I also want to point out that some of the reasons for the condition of the forests, in a sense part of it is that we have of course put out every fire for a lot of years.

Some of it is also the fact we have not practiced the silviculture we need to practice and that we know how to do. Part of the problem is the social environment is such that it makes it very, very difficult. The forest health issue is not necessarily a technical issue.

I was on the Deschutes National Forest about 1 month ago, and the Deschutes has received real high marks for its success in implementing timber programs and other things.

What the people of that part of the State are telling the forest employees there, as they tell it to me, is what they want is the forest to look like forests. You know, they do not want to see a mountainside of bug-killed trees.

They do not want to see a mountainside that is black from a catastrophic fire. And they do not want to see a mountainside that is clearcut.

We have not been doing large clearcuts for a long time. Within that window there are tremendous opportunities to deal with some of the problems. For example, I might show you some pictures of a situation that is very common throughout the West. This happens to be in northern California. I think you have these photos in your packet.

THINNING PROGRAM

This is—here is about 1,500 trees per acre. You can see the—the other thing I might point out is we have fir that has grown up in what were traditionally pine stands. And, of course, the economic value of the fir is much lower.

So what do we do in a situation like that to get in and fix it? Well, the first thing they did was a thinning. And in the thinning program, they removed approximately 2 million to 3 million board feet per acre, along with about 35 to 40 tons per acre of non-merchantable material, and left about 100 trees per acre in that stand.

Now 8 years later, that same stand would look like that. And now it is ready to do a prescribed fire, because the fuel ladders have been reduced enough. The fuel ladders that would carry the

fires all the way up to the tree tops and kill the entire trees are gone.

What I am advocating is that we have to use all the tools at our disposal and continue to look for more tools as we deal with this forest health challenge. Those tools include everything from timber sales, to perhaps grazing, to thinnings, to sometimes mowing, to whatever works.

The choice of tools is not for Washington to dictate. That is for our resource professionals in the field to determine, what are the best mechanisms to deal with this issue, because the issue of fire is going to keep on coming up.

One point I would like to make, I think is very important, is a lot of these areas do not have the timber values on the land to pay for the cost of the work that is needed. So what do we do?

In essence, just like a farmer might or a rancher, sometimes you have to make investments in land. And from the standpoint of the timber harvest rotation period, the harvest cycle may be 80 years, a generation or two ahead of us.

But it is important that we go ahead and do the thinnings, provide the appropriate recreation facilities, and use all the tools to get on top of this forest health issue, because it is a significant problem.

I know it is expensive, but it is interesting that we can come up with \$900 million a year to fight wild land fire, but—so how can we begin to shift some of that cost into preventive measures that, you know, provide local jobs and other things, rather than just simply responding year after year to this massive fire situation that is continually getting worse and worse?

Senator BURNS. Senator Stevens.

Senator STEVENS. I think Senator Cochran has to go before I do.

Senator COCHRAN. No; and I just got here.

Senator STEVENS. Are you all right?

Senator BURNS. Or I can go to Senator Reid.

Senator STEVENS. No; that is fine. I am happy. I just thought he had a committee meeting.

Senator COCHRAN. I do, but it has been moved to 10:30 a.m.

FOREST SERVICE ORGANIZATION

Senator STEVENS. Mr. Lyons, as you know, I have reached the conclusion that the Forest Service is no longer a Forest Service; it is a recreation and public service and should be combined with the Park Service and the Fish and Wildlife Service.

We should eliminate the redundant management of these three entities because of the administration's position that they are primarily recreation.

I state that coming out. As you know, that is my feeling, and I am going to pursue that. But beyond that, what did you think when Mr. Dombeck removed—by the way, Mr. Dombeck, it is not 3 out of 35,000; it is 3 out of 5, you removed 3 of 5 of the professional Deputy Chiefs.

Now was that done with your approval or at your direction at all, Mr. Lyons?

Mr. LYONS. No, sir; Mr. Stevens.

Senator STEVENS. Is there any memoranda between you and Mr. Dombeck over what his job would be when he took over the administration of the Forest Service? Did you give him a memo of directions?

Mr. LYONS. No, sir.

Senator STEVENS. Did you personally interview him and give him directions?

Mr. LYONS. No; I certainly talked to Mike before I introduced him to the secretary, but no, I do not—we did not discuss any agenda.

Senator STEVENS. I am just asking if, at the Assistant Secretary level or the Secretary level, Mr. Dombeck was directed to do what he did.

Mr. LYONS. No, sir.

Senator STEVENS. Mr. Dombeck, you said you offered options to the directors. I remember when the Kennedy administration came in and they offered the option to several people to be moved across the country in 30 days or quit. What were the options that you gave to these three?

Mr. DOMBECK. I elected to—we probably have about how many Senior Executive Service [SES] slots in the agency?

Senator STEVENS. That is not what I asked you. What were the options you gave these people?

Mr. DOMBECK. I offered them the choice of coming to me with where they—what they would like to do. For example, in the case of Mark Reimers, Mark thought about it and came back and is now working as a volunteer in the area of international forestry.

That is the area he was most interested in, and was his decision because he felt that with the many, many years that he had in, that there really—

Senator STEVENS. That is one. You had a State and private. Which one—you have State and private, research, National Forest System, administration and programs and legislation. What are the three you gave the options to?

Mr. DOMBECK. National Forest System, research, programs, and legislation.

Senator STEVENS. The three that are primarily involved with Forest Service practices, right? What was the option you gave the research? Who was it, by the way, that you asked to leave?

Mr. DOMBECK. Well, first of all, let me say no one was asked to leave.

Senator STEVENS. Well, you were going to remove them from their position, were you not?

You gave them the options to take other jobs, but you did not say, "You can keep your job, if you wish" did you?

Mr. DOMBECK. That is correct. Part of the—

Senator STEVENS. All right. So you asked them to leave their jobs, the jobs that they had when you came on board.

Mr. DOMBECK. Yes; that is right.

Senator STEVENS. Now, what was the job you offered the research director?

Mr. DOMBECK. The research director is currently working on—

Senator STEVENS. I did not ask you that, Mr. Dombeck. What did you offer him?

Mr. DOMBECK. I offered them the—I asked them to come back and tell me, what would work best for them. What they would be interested in doing, how they feel they could contribute the most and what would work with their personal situations.

And they—of course, they know the options of the agency as well or better than I did. In the case—

Senator STEVENS. Well, who appointed them? Who moved them in the Research—who moved the Research Deputy Chief into that position?

Mr. DOMBECK. I assume that it probably would have been Chief Robertson that was in that—

Senator STEVENS. And who was the National Forest System Deputy Chief?

Mr. DOMBECK. Gray Reynolds; that would have likely been Jack Ward Thomas.

Senator STEVENS. Where did—you say the people that came in were long-term forest employees. Any of them foresters?

Mr. DOMBECK. The Deputy Chief for National Forest Systems, Bob Joslin, is a—has broad experience across the agency. I believe his degree is in—he is classified as a forester. I believe his degree is in forestry. And as I—

Senator STEVENS. Where was he before you brought him into that position?

Mr. DOMBECK. He was a Regional Forester in Atlanta. Prior to that he was Assistant Director of—Deputy Regional Forester in the intermountain region. Was he not a Deputy Director of timber management?

He has very broad support across the board from both the timber industry, the employees, and the conservation community.

TONGASS TIMBER

Senator STEVENS. All right. Let me go to you, Mr. Lyons. As you know, my State used to have a very vibrant timber industry.

It had two pulp mills and I think at the time the administration came in eight timber mills. To my knowledge, none of them are running now.

We had a 1947 Tongass Timber Act, and then we had a Tongass Timber Reform Act of 1991. Under that Tongass Timber Reform Act we have made available, Congress made available—and I might add I do not think the administration requested the money—\$30 million to prepare a Tongass timber reform plan, or TLMP.

Where is that plan?

Mr. LYONS. Senator Stevens, as I believe you are aware from some meetings we have had with you and Chairman Murkowski—

Senator STEVENS. I am aware of it, but I want you to state it on the record.

Mr. LYONS. Yes; I just want to let you know that consistent with the conversation we have had previously that we are committed to completing this draft TLMP plan and getting it out by June 20.

Senator STEVENS. The administration came into office in 1993. TLMP was completed and ready for final approval. And the administration directed the then Regional Forester to disapprove it. And we can prove that.

You actually asked him to prepare two opinions and finally told him to sign one. And he resigned after he did what he was told, a Mr. Barton.

All right. Now, it was finished in 1993. This is 1997. When will it be finished now under this administration's plan?

Mr. LYONS. Well, we will issue the draft here early this summer. Then we will go through a comment period and hopefully wrap it up soon afterward.

Senator STEVENS. And what will be the timber supply under that plan?

Mr. LYONS. I do not know, sir.

Senator STEVENS. Is it not in final draft now?

Mr. LYONS. But I do not know what the actual numbers are. They are in the process of completing their analysis now, and that is a decision for Regional Forester Janik to ultimately make.

Let me correct my statement, Mr. Stevens. I want to be clear that—actually, this is the final rod. So when this goes out, we will have to deal with an appeal process, which I am sure we are going to hear a lot of in potential litigation. So I do not mean to imply this is another draft. This is the plan.

Senator STEVENS. How much have you spent on plans in other forests? Have you spent \$30 million on any other forest?

Mr. LYONS. I hope not. I do not know what our total expenditures have been for forest planning.

Senator STEVENS. Well, would you give me for the record a listing of the plans you have prepared and how much they have cost?

Mr. LYONS. Yes, sir; we can provide that.

[The information follows:]

LAND MANAGEMENT PLANS

The Records of Decision for the Land and Resource Management Plan (LRMP) revisions have been published for the following five National Forests:

—Black Hills (South Dakota, 3/97).

—Rio Grande (Colorado, 12/96).

—Targhee (Idaho, 4/97).

—Francis Marion (South Carolina, 3/96).

—National Forests in Texas (3/96)

The Record of Decision for the Tongass National Forest in Alaska is expected within the next month.

LRMP revisions are actively underway in more than a dozen other forests which have already published a related Notice of Intent in the Federal Register.

The costs of LRMP revisions is only now becoming possible to estimate based on these initial experiences. As you have indicated, the cost for the Tongass revision was very high and we consider this to be atypical. Based on figures provided by the Regional Planning Directors for those other five revisions noted above, we calculate that LRMP revisions will each take an average of \$500,000 per year for four years, or an average of \$2 million per plan.

TONGASS TIMBER

Senator STEVENS. The Tongass Timber Reform Act requires that the plan be prepared to provide timber to meet market demand. Do you know what the market demand is now?

Mr. LYONS. No, I do not know precisely what it is. It is certainly part of the analysis that is being done as part of this TLMP process.

Senator STEVENS. Well, since you have closed essentially all the facilities, where is the demand going to come from now?

Mr. LYONS. Well, I assume that the demand will come from remaining independent operators and the potential for mills to come back on line as there is a clear understanding of what the timber supply will be from the Tongass and surrounding areas.

Senator STEVENS. In the 6 years that we have been dealing with this plan—it is really 5, I guess, with your stewardship—the Forest Service has never met its own timber program target. Can you tell me why?

Mr. LYONS. I think one of the issues we have had to deal with in the Southeast, as you know, Senator, have been challenges to particular sales.

We had a challenge, in a particular large number of sales, the CPOW sales, which were originally offered to Ketchikan. And that certainly has caused significant delay.

One of the things we hope to accomplish by completing the land management plan is to provide a sound, scientific basis and legal framework for fending off challenges to future timber sales that are prepared under the plan.

Senator STEVENS. The Tongass is still divided into two separate forests for management, right?

Mr. LYONS. The Tongass actually has three areas that are administered. Is that right?

Senator STEVENS. That was back in the days when we were dealing with three separate portions of the industry that was purchasing timber. Why does it still have three separate managements when there is really no timber produced for sale now?

Mr. LYONS. I really cannot speak to the management structure up there, Senator, but I certainly could—if Mike wants to address that, perhaps he could, or we could ask Phil Janik to follow up.

Senator STEVENS. Well, I would like to have a statement for the record, what is your plans for consolidation of management in view of the fact that there are no timber operations going on any longer.

Mr. LYONS. I would be glad to address that.

[The information follows:]

CONSOLIDATION OF TONGASS NATIONAL FOREST MANAGEMENT

Timber operations, although at a reduced level due to recent mill closures, are occurring under the independent sale program and under the terms of the KPC settlement agreement. In addition, the program of work in the region in all resource areas is such that we need to continue the management structure currently in place (3 administrative units on the Tongass NF). The workload associated with the burgeoning tourism industry is proving to be large, for example.

PERFORMANCE AWARDS

Senator STEVENS. Now, in your report—by the way, you have just given out a series of performance awards in the Forest Service. How many of them actually were foresters? Would you put that in the record, please?

Mr. LYONS. Yes, sir; maybe we could just get some clarification on what those awards are. Chief Dombek just handed out the chiefs' awards last week. And then, of course, we hand out spot awards from time to time for outstanding performance.

So maybe we will just try and put it altogether for you and provide that information.

[The information follows:]

PERFORMANCE AWARDS

Foresters and forestry technicians received a slightly smaller percentage of performance awards in comparison with the entire Forest Service workforce. In fiscal year 1996, 66 percent of total FS permanent employees received a performance award, while in the same period, 61 percent of foresters and forester technicians received a performance award. This includes all types of awards, including spot, time off, extra effort, bonus, quality step increase, and gain share.

The following table shows the total number of awards and the number of awards to foresters/forestry technicians for fiscal year 1996:

NUMBER OF AWARDS TO FORESTERS/FORESTRY TECHNICIANS FOR FISCAL YEAR 1996

	Permanent employment	Number awards	Percent
Total permanent workforce	29,705	19,709	66
Forester/forestry technicians ¹	10,234	6,233	61

¹Includes all permanent employees in the GS-460 and GS-462 Office of Personnel Management occupational series. These are included in the total permanent employees.

Additionally, the Chief's Honor Awards presentation was held on April 10, 1997, to recognize team and individual accomplishments during fiscal year 1996 that were of national significance to the Forest Service. Awards were presented in the following categories:

- Stewardship Award: One group award.
- Technology Transfer: Two individual awards and one group award.
- Distinguished, Superior, and Early Career Scientists Awards: Four individual awards.
- Ecosystem Management: Two group awards.
- Multicultural Organization Awards: One group award and one individual award.
- International Forestry: One individual award.
- Labor-Management Partnership Award: One group award.
- Law Enforcement and Investigations: Two individual awards.
- Internal Communications: Nine group awards.
- Course to the Future: One individual award.

AWARDS

Senator STEVENS. I have had a complaint that since this administration has come into office that people involved in forestry do not get awards. But those who are involved in environmental, recreational, water service, and other things do.

If that is true, I think it just proves my point that you are no longer a forest service. You are managing the Federal lands under your control for other purposes, which if this administration is going to do that, we ought to recognize that. And we ought to adjust accordingly.

And I again say that we ought to have a recreation and public service entity managing the Park Service, Fish and Wildlife Service and the Forest Service, and save all this money that we are spending for people to cruise timber and do all the studies of timber and then not sell it. As a consequence, I think we are just spending a lot of money.

I want to go back to those pictures, Mr. Dombeck. I am going to get back to you in a minute here.

If any of you have timeframes, let me know because I have adjusted my timeframes. I do not have any timeframe that is going to interfere with this, this morning.

Senator COCHRAN. Well, can I interrupt and just ask a couple questions?

Senator STEVENS. Yes, sir.

Senator COCHRAN. You were very kind, Mr. Chairman, to offer to permit me to go ahead and ask a few questions awhile ago. I appreciate that very much.

Let me just for the record officially welcome Mike Dombeck and congratulate him on his selection as chief. This is the first hearing where I have had an opportunity to claim some credit for his education.

He served in my office as a legislative fellow back in the mid-eighties, and I came to respect him and appreciate his intelligence and hard work and good judgment. He has turned out to be, of course, the top career person in the Forest Service now and is so recognized by his selection as chief.

PURCHASER CREDITS

I wonder what your reaction is to the budget provision that has been brought to my attention with respect to the elimination of the purchaser credits. I am told that the budget submitted by the President proposes to eliminate these credits and its system for road construction on national forest lands.

I am told by those in my State who are familiar with the practical consequences of this that this will either eliminate the 25-percent funds to many county governments and school districts because those amounts are paid based on gross receipts from the sale of timber.

And if the purchasers are required to pay for the road construction and do the road construction out of their own pocket with no credits for the expense, that is going to eliminate some sales and drastically reduce sales in other forests.

Has there been any assessment made as to what the actual reduction in timber sales would be in States such as Mississippi as a result of this change?

Mr. LYONS. If I could, Senator Cochran, I think I will address that one.

Senator COCHRAN. Sure.

Mr. LYONS. The administration had proposed in the 1998 budget the elimination of purchaser credits, which are basically credits that timber operators get for road construction.

As an alternative, what we proposed was that timber purchasers build in to their bids for particular timber sales an estimate of the costs of road construction. And we assumed that would then, of course impact total bids, would reduce revenue to the treasury by some degree. It certainly does affect the 25-percent payments.

Senator COCHRAN. Do you intend to do this by administrative decision, or are you suggesting that legislation be passed to authorize this elimination of that credit? What does the budget actually suggest?

Mr. LYONS. I believe we have the authority to do so, although there is a proviso I would add, and that is to address the concern that you raised that some small operators, particularly small businesses, may find themselves in a position where they do not have the capital to invest in road construction up front.

We would look to change the authority we have under the purchaser credits to expand the purchaser elect program. That is

where a purchaser would come to the Forest Service and basically say: I cannot afford to build the road; you build the road for me. And then I would like to be able to purchase the timber.

That, we would require additional authority to address.

Senator COCHRAN. OK. Let me ask you this: Would you put in the record for us so we will know what we are talking about in terms of practical results of this change what the change will be, if any, in the amount of timber harvested and sold or the price impact that it will have on the cost of timber to ultimate consumers and users, like any additional housing costs and the like?

Could you do that analysis for us, or have you already done it? Maybe you have already done it.

Mr. LYONS. I do not know that there would be the latter impact that you are concerned about, Senator, but we will certainly prepare that analysis and provide you the information.

[The information follows:]

ANALYSIS OF EFFECTS OF ELIMINATION OF PURCHASER ROAD CREDITS

The fiscal year 1998 Budget proposes to discontinue timber purchaser credits as one means of providing for road reconstruction and construction required in support of planned timber sales. These are roads planned as part of the permanent transportation system.

Timber purchasers would be required to reconstruct and construct roads as a direct cost similar to other purchaser costs associated with the sale, such as felling, removing, and hauling the timber from the sale areas. Construction and subsequent obliteration of temporary roads are currently, and will continue to be, other direct sale costs to the purchaser.

The Road standards will not change from current requirements nor will the Forest Service engineering responsibilities to plan, locate, design, and supervise road construction or reconstruction change if purchaser credits are eliminated.

Elimination of purchaser credits may have some effect on the competition for timber sales, but will not affect the number of sales. Those prospective purchasers without the financial resources to carry the costs of road construction until they sell the timber may no longer be able to bid competitively for the timber offered.

Consideration is on-going to determine under what conditions purchasers may still use the current purchaser elect program to have the Forest Service reconstruct or construct roads required by the timber sale. This would mitigate the impact on purchasers of eliminating purchaser credits.

The elimination of purchaser credits would not affect the amount of timber offered, sold, or harvested.

Bid prices for timber would be expected to decline as they reflect both the loss of purchaser credits and the possible additional costs to the purchasers of the costs to borrow funds to complete required road construction and reconstruction. Lower bids should cover these additional purchaser costs without resulting in the need to raise the prices for lumber and other products for the consumer.

National forest timber receipts would be expected to decline commensurate with the costs of the road construction and reconstruction that must be completed by the timber purchasers without purchaser credits.

In addition, any reduction in timber receipts would also reduce these payments. Because states and counties receive 25 percent of purchaser road credits as a portion of total timber receipts, elimination of these credits would reduce payments to states and counties by a like amount.

The Administration is concerned about the impact on payments to counties and is considering language which would provide that the costs of permanent roads would be counted as money received for the purposes of calculating payments to States.

TIMBER SALES LEVEL

Senator COCHRAN. OK. One other question on that subject is that I understand that in the budget you also propose that the timber sale level for the southern region, region 8, be reduced from 835 to

675 million board feet in fiscal year 1998. Is that a direct consequence of the change in the purchaser credits, or what drives that decision?

Mr. LYONS. No, sir; I would suggest it is a function of a couple things, and maybe Mike wants to comment on this, although he was not in a position to have a real hand in those original allocations.

I think one is simply trying to make the most efficient use of the timber dollars we had incorporated in the 1998 proposal and make sure that we had adequate investments in other regions of the country.

I think the other is there has been some concern that there is the potential for over cutting the Southeast, which is our most productive region. And we are trying to beef up our inventory and monitoring so as to assess what represents a sustainable supply.

I would not suggest that we are exceeding sustainable harvests in the Southeast at all yet, but in the long term this is an issue that we are addressing.

BEAVER MANAGEMENT

Senator COCHRAN. We have a couple of parochial problems. I am going to just submit questions on them, but one has to do with research. And another has to do with control of the beaver population in the national forests.

I do not know whether you realize this or not, but this is a problem because beavers are building dams and they are not controlled in the national forests. And what happens is the waters are flooding adjacent private landowners. And this is causing a big problem.

The private landowners expect the Forest Service to try to do something about this. Of course, private landowners cannot legally go onto the public lands and tear down a beaver dam or blow up a beaver dam or anything to relieve the flooding on their crop land. But this is a serious problem. I hope you will be able to look into that and tell us what you are going to do about it.

[The information follows:]

BEAVER CONTROL

We assume you are addressing the difficult problems we have had on the Delta National Forest in Mississippi. With funding you helped secure in fiscal year 1997, we have aggressively worked with the Animal Plant Health Inspection Service, Animal Damage Control (APHIS, ADC) and with local landowners to identify problem areas and treat them. In the last 19 months we have removed over 1,562 problem beaver and over 500 beaver dams on the Delta National Forest and adjacent areas. In August 1994 we have had over 14,000 acres flooded during the summer months on National Forests and adjacent private lands.

Today we have about 2,000 acres wholly within the Forest that we manage as summer flooded land. Through an agreement with APHIS, local Forest Service officers administer a contract with private trappers to attack problem areas on both National Forest lands and adjacent private drainages with permission of the landowners. If local landowners report a problem, our field people can generally respond within a few days. Most of this work has been done with a \$74,000 appropriation this last year.

If funding had not been provided through APHIS, this work would not have been possible. The operation plan calls for 2 years of aggressive trapping and dam control, followed by 2 years of intermediate treatments, followed by annual low level maintenance. Funding for the second year is not included within the President's budget request for the Forest Service, and would logically be provided through APHIS as it was in fiscal year 1997.

Senator COCHRAN. Thank you very much.
Thank you, Mr. Chairman.

Senator BURNS. Senator Reid.

Senator REID. Chairman Stevens, you have awhile that you are going—I do not want to interfere with you.

Senator STEVENS. Senator, go ahead. I have just been told that I am going to have to leave at 10:30, but go ahead. I have time.

Senator REID. Well, I will just take 5 minutes.

Senator STEVENS. If it will relieve you, I will come back, Senator.
[Laughter.]

TAHOE BASIN/FOREST HEALTH

Senator REID. Mr. Chairman, I have just a few questions. One of the concerns we have in Nevada is, of course, with the Tahoe basin. The President has agreed to come there this summer to hold a summit, have California and Nevada represented there, and look at that very distressed resource that we have.

Talking about forests generally, though, is the Forest Service changing the way they do business to improve forest health? And I assume this picture is an example of that, is that true?

Mr. DOMBECK. Yes; and I discussed that early. But just let me elaborate on a few points again. No. 1 is that I have been to the Tahoe basin many times and am well aware of the forest health problems there.

We estimate that we have about 39 million acres of high-risk or catastrophic fire. And as a result of long-term fire suppression and various management strategies over the years, we have situations where we have a very high density of trees now as compared to what was the natural situation.

We might have had 100 stems per acre of ponderosa pine, for example, and depending upon rainfall and other things, today we might have 1,500, 2,000, 3,000 stems per acre as that first photograph on top indicates. We have not only a higher density, but trees competing for moisture, for the nutrients that are there.

Because of the crowding, they are less vigorous, they are more susceptible to bug kill, to disease problems.

What we need to do is we need to get in there and use whatever tool we can from the standpoint of management. The tools go all across the board from prescribed fire to logging, to thinnings, to perhaps grazing, to a wide variety of things.

Part of the challenge we have is the social environment, the fact that—and again, I mentioned this earlier, that what people are telling us—and I assume that this is really true in Tahoe—that they want the forests to look like forests.

They do not want to see a hill, a mountainside that is bug killed. They do not want to see a mountainside that is black from a catastrophic fire, nor do they want to see a mountainside that is clearcut.

And what we—and we have these—we know what the silvicultural practices are needed to get in there and work on some of that stuff.

What we need to do is build our local support base, so we have the level of trust, and we do not end up in court and in litigation and shutdowns as we have to do the things we need to do.

Senator REID. To do the things that you have indicated you need to do, do you have the resources to do it, thinning and all the things you have mentioned?

Mr. DOMBECK. No.

Senator REID. So what are we—

Mr. DOMBECK. We are projecting that in 1998 we will be able to do 800,000 to 1.3 million acres using a variety of tools. And what we would like to do is be able to do at least 3 million acres a year to sort of catch up on the backlog.

And let me just give you a contrast to the expense. For example, some of the practices we can do for \$10 to \$15 per acre to maybe \$100 per acre. When we deal with suppression in a catastrophic wildland fire, we can be talking anywhere from \$1,000 to \$4,000 an acre in cost of dealing with suppression.

So what I am—the point I want to get across is we need to get in there and manage this before the trees die. We need to have an environment where we are not dealing with these catastrophic fires, that we have the appropriate stand densities and make sure that we have a public awareness of the problems.

Senator REID. Do you see then, Dr. Dombeck, more fires coming with the management that obviously is not going to take place?

Mr. DOMBECK. Well, the trend of acres of severe fires has been increasing over the last couple of decades. In fact, I think fires of the 6 million-and-some acres that burned last season, most of that was on Bureau of Land Management lands just because we had high moisture levels in a lot of the forests.

And of course that—there was higher moisture levels in the forests, but also we had increased grass growth on some of the BLM lands.

Senator REID. So in answer to my question it is “yes,” there will be more fires unless you get more management tools in there.

Mr. DOMBECK. Yes.

WATER QUALITY

Senator REID. What about water quality? We of course are concerned about that also in the Forest Service.

Mr. DOMBECK. Well, I think water quality is part of the key original mission of this agency, of sustaining favorable water flows.

But a lot of the things that we need to do in investing in watersheds, in addition to the vegetation management practices, is bringing roads up to standards, roads that may have been built decades ago.

For example, I think the roads money requested is for about 2,300 miles of roads. But of that, only 300 miles are new roads. The remaining 2,000 are upgrading and—

Senator REID. With the floods we had around the first of the year in northern Nevada this year, we believe a lot of that was because of the watershed problems that we had in the forests. And this is happening in other places in the country, is that not true?

Mr. DOMBECK. I think—you know, one of the most important things that we can do is practice the silviculture and the land management practices that will keep the topsoils on the land, keep the sediments out of the streams. And we know how to do most of those things.

RECREATION DEMAND

Senator REID. My last question—I really appreciate my friend from Alaska allowing me to take my time out of sequence. Since I have been here this morning at least, there has been a lot of talk about the cutting of trees, which I know is important. But in the areas in Nevada we are more concerned with recreational use of forests.

Is there anything that the Forest Service can do to meet the public recreation demands in the national forests, which are becoming more intense each day that goes by in Nevada?

Mr. DOMBECK. Well, recreation, as again I mentioned earlier, is one of the growth areas, based on the demographics. We have some 80 percent of the people in the United States living in large urban areas.

With the growth they are experiencing in Las Vegas and so on, we have had a—I see the 10-year change in Nevada has been from 2.1 million recreation visitor days in 1986 to 3.8 million in 1996.

So there has been tremendous growth in this area. And we—

Senator REID. And frankly during that period of time, we have done very little to help the forests as far as improving the recreational areas or even putting toilet facilities in some of those that are badly needed because of the almost doubling of use in less than 10 years.

Mr. DOMBECK. That is right. As a matter of fact, we have a significant backlog in maintenance of campgrounds, trails, and various facilities.

Senator REID. Many of the facilities in the area right outside Las Vegas were built during the depression by the CCC workers and have not been upgraded basically since then. And that is a significant problem for us.

Thank you, Mr. Chairman.

Senator BURNS. Senator Stevens.

Senator STEVENS. Thank you.

Senator Reid, I am certain that Nevada could manage those forests a lot better than they are being managed now for recreation, if that is what you want to do with them. And I would be happy to talk to you about that sometime.

I think we ought to look at finding a way we can have this recreation managed without the tremendous cost of playing like we are going to manage the forests, the national forests, for forest production.

Mr. Lyons, the Sierra Club's announced position by vote nationally was that there be no harvest of timber, commercial harvest of timber, from the national forest lands. You are aware of that, are you?

Mr. LYONS. Yes, sir.

Senator STEVENS. Are you a member of the Sierra Club?

Mr. LYONS. No, sir.

Senator STEVENS. Are you, Mr. Dombeck?

Mr. DOMBECK. No, sir.

Senator STEVENS. Have you had correspondence with the Sierra Club concerning that matter, their position?

Mr. LYONS. Me personally? No, sir.

Senator STEVENS. The Department.

Mr. LYONS. I cannot speak to what——

Senator STEVENS. Well, I want to make a request that I be given a copy of the correspondence that you have received and the replies you have given the Sierra Club pertaining to their concept of national policy not to harvest timber from the public lands, particularly from the Forest Service.

Mr. LYONS. I would be glad to that, sir.

[The information follows:]

SIERRA CLUB CORRESPONDENCE

The Forest Service does not recall having received any specific correspondence from the Sierra Club regarding their relatively new policy against timber harvest on public lands. We have searched our databases covering our tens of thousands of documents without finding such correspondence. We will continue to keep this request in mind should any correspondence on this subject be received in the near future, and would be happy to provide copies of it at that time.

INSECT AND DISEASE

Senator STEVENS. All right. Let me shift over to the problem of the insect kill in my State. In your report, which is forest insect and disease conditions in 1995, published in December 1996, states that the number of trees that died in 1995 from infestation totaled 27 million trees in Alaska.

That represents a mortality of over 1.2 billion board feet of timber resource or approximately 4 years' worth of harvest volume from the Tongass National Forest.

To my knowledge, that has not been a beetle kill in the area that was left open to harvest. I could be corrected on that, but my memory is we have a 17 million acre forest; 1.7 million acres was left open to harvest originally under the 1991 act.

And the Department has now withdrawn for administrative purposes 600,000 of that. So we are down somewhere to around 1.1 million acres being available for timber harvest.

To your knowledge, is any of the beetle kill in the 1.1 million acres that is still open for harvest?

Mr. LYONS. I could not tell you that specifically, Mr. Chairman. I will have to get you that information.

[The information follows:]

HARVESTABLE TONGASS BEETLE KILLED TIMBER

In 1995, the spruce beetle infestation in Alaska totaled 893,000 acres. The infestation increased in size to 1.1 million acres in 1996. Of the 1.1 million acres, 1 percent or 12,730 acres were on the Tongass National Forest. These acreages are where the beetle is currently active and tree mortality is occurring.

The 27 million figure that you got from our report was misquoted in the testimony. The number represents trees reported as having died in 1995, not the number of acres.

None of the 12,730 acres of spruce beetle infestation reported in 1996 on the Tongass National Forest, is available for harvest. Beetle kill in the Taku River Drainage and on the Dall Island is in a land use designation of semiremote recreation. Beetle kill in the Stikine River delta area is in a land use designation of wilderness. These are the land use designations in Alternative 11 of the Tongass Land Management Plan revision (preferred alternative).

TAKOO RIVER

Senator STEVENS. I have searched this report, and I do not see it, although it does talk about the Takoo River infestation at 3,900 acres, Taquin River Delta at 2,040 acres.

I do not know of any, but my problem is this: In view of the fact that it is very costly to use this process—and, Mr. Dombeck, you might want to comment—it is my understanding that that timber was put up for harvesting in selected areas to stop the flow of this natural fire. It is worse than a fire.

The amount that was lost in the last year alone for insect kill in my State is worse than the largest fire in the history of Alaska, which was some 20 million acres.

Now these 27 million trees are gone. We still have less than 1.1 million acres available for timber harvest. Why has not some of this timber in these infested areas been opened to harvest and get some money out of it, so that you can finally achieve the objectives of trying to control this insect kill.

It is more than beetles, I understand. It is—I guess the worst part is the beetle kill, but there are lots of other worms up there, I understand, that are feeding on them, too.

But why has not some of that been put up for harvest?

Mr. DOMBECK. Well, I cannot speak to the specific areas. I do not know if anyone here has the detailed knowledge of the areas.

Senator STEVENS. The Forest Service just stood by and watched a natural, the equivalent of a fire, 27 million trees killed in a year. And it is a footnote in a report. And we are arguing over having access to 1.1 million acres, which was reserved for timber harvest and is now shut down.

In effect, you have done what the Sierra Club wanted. You have shut down the whole State of Alaska to timber harvest. I want to know, is this your goal?

Mr. LYONS. It is not the goal. Let me just respond, Mr. Chairman, that I do not know the details either of this specific case, but it certainly would be our general practice in the national forests that when we have a situation like that, it is appropriate to salvage as much of the timber as possible, sales will be put up and they will be salvaged.

Of course, the Tongass is operated in a somewhat different way than the other forests of the country because of the management plan. But we would have to get the details of that for you and see if we can explain that to you, sir.

[The information follows:]

TONGASS BEETLE INFESTED TIMBER

There is a large and serious spruce bark beetle infestation that has been occurring in Southcentral Alaska on the Kenai Peninsula. The Forest Service has been working with the State of Alaska, other federal agencies and the public to try to resolve this complex issue.

The primary insect infestation area is located approximately 500 miles from the Tongass NF. It is widely spread in the interior of Alaska and in Southcentral Alaska, and is typically much smaller and of shorter duration in Southeast Alaska. Approximately 2 percent of the beetle damage is located on National Forest System lands; 1 percent each on the Tongass and Chugach National Forests. Due to the nature of the forests in Southeast Alaska insects and diseases have had limited effects on overall timber availability. Also, timber harvest is not shut down on the Tongass NF but has been reduced because of recent mill closures.

The 1979 Tongass Land Management Plan was the first forest plan completed under the National Forest Management Act of 1976 and was updated in 1986 and 1991 through plan amendments. In recent years a great deal of effort and funding has gone into revising the forest plan (approximately \$13 million). The Record of Decision for the revision has been recently signed. The new forest plan will provide for sustainability in all the resource areas and consideration of the impact on people and communities. The new forest plan revision establishes an annual sale quantity (ASQ) of 267 mmbf.

INFESTED TIMBER

Senator STEVENS. Well, I have been around government a long time, you know. I was assistant to the Interior Department. Before that I was a U.S. attorney, and I have been around here now for 29 years. I have never seen Federal employees ignore the law to the extent that you all have.

You have spent now \$30 million studying 1.7 million acres to see how much timber should be harvested out of it over a period since 1993. In the same period of time, you are losing annually, losing, more timber from these beetle kills and these insect kills than we have ever lost to wildfire.

And yet you continue to spend the money studying that one area that is open to timber to prevent it from being timber harvested and just stand by and watch this other timber just go down. It is my understanding that it is spreading so badly now—and again, I am quoting from your own report.

There is increasing concern that the endemic and graver beetle populations in budworm impacted areas may take advantage of the stressed trees and explode to outbreak proportions.

Also of concern to biologists is the predicted crash in the red squirrel populations. Red squirrels are highly dependent upon spruce cones for winter food. Interior spruces have not had a cone crop for almost 5 years.

And to my knowledge, no one has ever come to my office and said: We would like to have your help trying to save some of these trees.

You are trying to save the trees from cutting in southeastern in 1.1 million acres, spent \$30 million to prevent cutting. And at the same time we are losing some 27 million trees a year to this invested area. Then you wonder why we are concerned about the management of the Forest Service under this administration.

That indictment is so bad in my opinion that you all ought to offer your resignations. You are not carrying out the law. And I just—I get so frustrated, I cannot even hardly think when I see what is happening to my State since you all have come into office.

It is probably the worst, worst situation I know of in the history of the U.S. Government from the point of view of management.

I will have some further questions later. I will submit them for the record.

Thank you, Mr. Chairman.

Senator BURNS. Senator Bumpers.

Senator BUMPERS. You have been there since January, and you have done an awful lot of damage, Mr. Dombeck, according to Senator Stevens.

Millions of acres of beetles have infested the forests, and you will not let him cut anything off of it. You have been there 4 months, and you have not stopped the beetles.

Now you say you are not a member of the Sierra Club, is that correct?

Mr. DOMBECK. That is correct.

Senator BUMPERS. And you, Mr. Lyons, you are not a member of the Sierra Club?

Mr. LYONS. No, sir.

Senator BUMPERS. You are not old enough to remember the old question, "Are you now or have you ever been a member of the Communist Party," are you?

Mr. LYONS. I have read about it.

Senator BUMPERS. I am not going to ask, do not misunderstand.

Mr. LYONS. Thank you, sir.

Senator BUMPERS. Mr. Dombeck, what authority—I was really interested to follow up on what Senator Stevens said.

What authority do you have under existing law to declare an area salvage because of beetles or natural disasters and put timber up for sale because of it?

Mr. DOMBECK. I would have to—

Senator BUMPERS. And let me pursue that one step further. Is the law different on the Tongass than it is on forests in the lower 48 in that regard?

Mr. DOMBECK. Staff tells me the law is not different.

Senator BUMPERS. The law is the same?

Mr. DOMBECK. Is not different. Is that correct?

Senator BUMPERS. Well, then the question is: What authority do you have to determine that an area should be declared salvage and harvested so that it will not be lost?

Mr. DOMBECK. Well, I—the authority, and I can cite several examples of where fairly rapid salvage has occurred, of course Hurricane Hugo, some of the storm damage that occurs from hurricanes, from tornadoes.

In fact, I think in your State, Senator Burns, in the far south, the northwestern corner of Montana and northern Idaho, I know it hit Idaho with a very severe ice storm that broke trees off this big around.

And our employees are continually doing surveys. What we need to do is get in here and manage the forests to prevent those kinds of problems over the long haul. Much of what we are talking about here is, in a sense, not a silvicultural problem. It is a social problem, the way that people feel about forests, that we are dealing with.

We have some of the best foresters, silviculturists in the world working for these agencies, and—let me maybe ask Dave or Janice if they would like to elaborate on the specifics of the authority.

Senator BURNS. Well, if I might, excuse me, if the Senator would yield, that is not answering his question.

Senator BUMPERS. That is what I was just getting ready to say. Go ahead.

Mr. UNGER. I was just going to amplify a little by saying that out of our 1998 planned timber program about one-third is ex-

pected to be composed of salvage sales based on insect or disease damage or other disasters.

Senator BUMPERS. Well, let me reiterate the question. Do you have legal authority, to declare that an area has been so invested with beetles or some other insect and will continue and that the forest will be lost for any productive reasons unless it is cut?

Do you have the generic authority and law to declare an area a salvage area because of insect infestation?

Mr. UNGER. My understanding is that we can conduct salvage sales for that purpose under our existing authority. There are some cases where we have to ask for special permission, if it is in a wilderness area, and, therefore, would require some treatment.

Senator BUMPERS. What is your special permission? Who do you get it from?

Mr. UNGER. I believe that we get it from the Secretary of Agriculture.

Senator BUMPERS. Are you familiar with the situation that Senator Stevens was alluding to, that has been so severely damaged by beetles that it should be declared salvage and harvested? Are you familiar with that area that he is talking about?

Mr. UNGER. I am not familiar with the situation—

Senator BUMPERS. Are any of you?

Mr. UNGER [continuing]. That the Senator brought up.

Mr. LYONS. No, sir.

Mr. DOMBECK. The briefing that I have on that topic—and we will verify this again for the record—is that about two-thirds of the infestation is on State and private lands. About 1.1 million acres of active and newly infested areas were detected in 1996, about half a million acres on the Kenai Peninsula and about 154,000 acres in the Copper River area.

Senator BUMPERS. Well, I may have misunderstood Senator Stevens. I thought he was alluding to 30 million acres.

Mr. DOMBECK. And we will double check that for the record.

Senator BUMPERS. Well, send me a copy of that, too. I am interested in that.

In all fairness, Senator Stevens and I often disagree on these issues. But I must say what he said this morning, if that were true, that would be very disturbing to me.

[The information follows:]

SPRUCE BEETLE KILLED TIMBER IN ALASKA

Of the 1.1 million acre infestation reported in 1996, 12,730 acres (1 percent) occurred on the Tongass National Forest. A total of 757,111 acres (67 percent) occur on State and private lands including Native Corporation lands.

ACRES OF SPRUCE BEETLE INFESTATION IN ALASKA BY OWNERSHIP REPORTED IN 1996

Ownership	Acres	Percent
State and private	418,357	37
National Forest:		
Tongass NF	12,730	1
Chugach NF	14,042	1
Other Federal	346,873	31
Native Corporation	338,754	30

ACRES OF SPRUCE BEETLE INFESTATION IN ALASKA BY OWNERSHIP REPORTED IN
1996—Continued

Ownership	Acres	Percent
Total	1,130,756	100

ROADS

Senator BUMPERS. Let me ask you, regarding timber, purchaser road credits do you have generic authority now in a timber sale to declare that you are not going to allow, I mean road building, to be a credit against the contract price? Do you have the authority to do that now?

Mr. LYONS. Yes, sir.

Senator BUMPERS. You do have?

Mr. LYONS. I believe so.

Senator BUMPERS. Congress gave it to you?

Mr. LYONS. Well, Congress gave us the authority to establish road credits. So that is kind of an additional authority we have. We do not have to offer credits on any particular sales.

Senator BUMPERS. So if you do not want a sale to include credits for building roads, you just do not include that in the request for bids.

Mr. LYONS. It would be part of the contract.

Senator BUMPERS. Pardon?

Mr. LYONS. It would be part of the contract, part of the proposal for that particular sale. Yes, sir; we would like not to do it.

Senator BUMPERS. You know, this is not all that big, but just as a lawyer, I want to get this straight. You say it would be part of the contract. If you ask somebody to bid on a tract of timber and then also, as a part of that proposal, tell what part of the cost will be road building, if you do not put the road building part in it, whose obligation is it to build a road?

Mr. LYONS. It would be the purchaser.

Senator BUMPERS. And he does that at his own expense?

Mr. LYONS. Yes; and that is why we would anticipate it would certainly affect the price he bid for the timber.

Senator BUMPERS. So what he would do, if he were going to bid \$100,000 for the timber, and in his own mind it was going to cost him \$30,000 to build the road, he would just bid \$70,000?

Mr. LYONS. Yes; he would be bidding less. That is correct.

Senator BUMPERS. But he would just personally take into consideration the cost of the road building.

Mr. LYONS. Yes, sir.

Senator BUMPERS. Without you mentioning it in your contract? Would your contract not provide that he was to build the road? Request for bids?

Mr. LYONS. Ordinarily, and it has been a long standing policy, that we would provide for a first-year credit for those roads. If we elected not to, then we would make that clear up front.

And then the purchaser would have to take that cost into consideration in making whatever bid he or she would make for the timber.

Senator BUMPERS. Does the Forest Service ever build roads to fulfill a contract?

Mr. LYONS. Yes, sir; in two ways. One is we do continue to build some roads. We are mainly focused on multipurpose roads now—that is, roads that provide recreation access, et cetera—that will allow entry into new units. And that is with appropriated dollars.

There is another mechanism, though, that is used somewhat. And that is where small businesses elect to have the Government build the roads for them, rather than accept credit. And we call that the purchaser elect option.

Senator BUMPERS. Well, I was just curious as to how the program worked.

In my State we were ravaged by tornadoes back in early March. And I flew from Little Rock down to Arkadelphia, and you could just see the swath of timber all the way from Little Rock to Arkadelphia, in places one-quarter mile wide and other places as much as one-half mile wide, where the timber was just leveled.

That is private timber, so you do not have to worry about salvage sales. The amount of timber destroyed on the forest, the Ouachitas, was fairly limited, I think.

But my question is this: We have about 13,500 acres valued at \$6 million in the area that was hit by the tornado, 13,500 acres. Now, this is privately owned timber, and they will salvage that timber and get what they can out of it, I suppose.

STEWARDSHIP

But the question is: Some of them are having a terrible time with debris clearing, site preparation and replanting. There is no money in SBA, and there is no money in FEMA to do that. Does the Forest Service have any fund that could possibly be tapped for that purpose?

Mr. LYONS. I believe we would, Senator. And I think we could probably fund that through the stewardship program under the State and private portion of our budget, particularly—

Senator BUMPERS. Say that again. I did not understand.

Mr. LYONS. Under the stewardship program, which is in the State and private segment of our budget, we have provisioned for site preparation and replanting, as well as other landowner assistance programs. So I would imagine that we could work with the State forester to develop a proposal and get that area cleaned up.

Senator BUMPERS. Well, I would like to nail that down.

Mr. LYONS. And we will second that. We would also like folks to know that the stewardship program is available because it is an extremely important tool for us to assist private landowners.

Mr. DOMBECK. And we will provide you the details of that in writing. Those funds are somewhat limited because of the size of our State and private program, but there are—we will get you that in writing.

[The information follows:]

STEWARDSHIP

The Forest Stewardship Program and the Stewardship Incentive Programs were established by Congress under the provisions of the Cooperative Forestry Assistance Act of 1978. Together, the purpose of the programs is to provide financial, technical,

educational, and related assistance to State Foresters in order to help non-industrial private landowners manage their forest lands.

The Programs emphasize managing and enhancing the productivity of timber, fish and wildlife habitat, water quality, wetlands, recreational resources, and the aesthetic value of forest lands. State Stewardship Committees in each State identify program priorities for their State, which could enable a focus on site preparation and replanting activities within available program resources.

Landowner requests for stewardship assistance through the programs exceed appropriated funds available. Even as appropriation levels have decreased, requests for stewardship assistance have increased. In some states, three times as many landowners request assistance as receive it.

In the past, funds for debris clearing and site restoration after natural disasters such as the recent tornadoes in Arkansas, have been provided by the Federal Emergency Management Agency (FEMA), or through supplemental funding provided by Congress.

FTE HITS

Senator BUMPERS. Just 1 second, Mr. Chairman.

Now, you are going to take a 14-percent FTE hit in 1998, is that correct?

Mr. LYONS. I believe so.

Senator BUMPERS. You are the biggest employer in the Department of Agriculture.

Mr. LYONS. That is correct.

Senator BUMPERS. And I assume, my staff tells me that the plan is to leave you with 36,000 FTE's. That 36,000, is that after the 14-percent cut in personnel?

Mr. LYONS. No; let me be clear. Right now we are at 37,184, actually 35,784. That is the adjusted total. And we would go down in 1998 under our proposal to 34,943. So that is not quite 14 percent, not at all. I will have to check the numbers.

Senator BUMPERS. Well, Mr. Chairman, I will not take any more time. We may submit a couple questions in writing, but I just want to make this comment. Everybody applauds reduction in force.

And the Vice President has been very actively involved in it, and the President has made a great deal of it. And that is fair. They have done a really great job of reducing the number of government employees in this country.

But I keep looking at this and monitoring this, and I wonder sometimes when that is going to become counterproductive, because it certainly will become counterproductive if we continue it at the current pace.

I do not know at what level that occurs, but we depend on people like you to come here and be honest, even if it means saying to the Vice President: You know, what you have done to us is going to substantially reduce our effectiveness in managing the forests and running this department.

Mr. UNGER. Senator Bumpers, I think the 14-percent figure you are referring to may refer to the loss in employees over the past several years.

Senator BUMPERS. Is it?

Mr. UNGER. Yes.

Senator BUMPERS. I would say that is an awful big hit for 1 year.

Mr. UNGER. Not for 1998, but for 3 or 4 years.

Senator BUMPERS. OK. Well, my statement still stands, Mr. Chairman. I thank you.

Senator BURNS. Senator Dorgan.

GRASSLANDS

Senator DORGAN. Mr. Chairman, thank you very much. I regret I was delayed because of other committee commitments.

Let me just ask one question of the Chief of the Forest Service. It is a question we discussed the other day. The Forest Service is engaged in creating a revised Forest Service plan, which includes the grasslands in North Dakota.

I had received assurances, and the folks who are involved in grazing associations had received assurances, from the Forest Service that ranchers and environmentalists and other interested parties would be consulted as the plan is developed.

And as I indicated to the Chief, those involved in grazing have told me recently that there has been no consultation. I hope that you perhaps have had an opportunity to look into that, or will at least, and tell me what kind of approach will be used to bring everyone into the consultation process in this development of a plan.

Mr. DOMBECK. Yes; I talked to the staff about that after our meeting, and perhaps I will have Janice respond.

Ms. McDOUGLE. The effort that is underway in the great plains is probably the most significant effort in terms of looking at the grasslands in a holistic way. The assessment covers national forests. And the plan is that at the time the assessment is completed, the forest plans will be revised to reflect those outcomes.

There have also been a number of other efforts. I led a national grasslands review 1 year ago. And since then we have formed the National Grasslands Council, who are dealing with some of the things that we heard from the over 300 people, permittees, ranchers, State and local officials, and just citizens within the national grasslands, to respond to their issues and concerns.

A number of other things are currently under way. So, I guess the answer to your question is yes, there will be opportunities for the local people to provide input into what ultimately are forest plan decisions.

Senator DORGAN. But that opportunity must be contemporaneous. And what I think grazers said to me is, they see something going on there behind closed doors, whatever it is. And they were assured that during this process there would be a consultative role, and they say that there has been no effort to consult with them.

Mr. DOMBECK. Well, just let me assure you that will be fixed.

Senator DORGAN. Please do.

Mr. DOMBECK. And we will get back to you with a response on what action was taken. One of the hallmarks that we need to do is the more we work together with people, that does not mean we always agree, and with local communities, the better understanding we have and I think the more buy-in and better results of the plans.

What is really important is what happens on the land. With the technical expertise that our people can provide, the better local relationships we can have. That is what I want to work for. And I think that is the way we get results on the ground.

So I will assure you that will happen.

[The information follows:]

NORTHERN GREAT PLAINS PLAN

The Plan revision process for the Northern Great Plains encompasses three national forests and multiple national grasslands within Wyoming, Nebraska, and both North and South Dakota. The stewardship goal of the effort involves extensive collaboration with people and communities across the four States. To date, the planning team has reported multiple involvements with grazing associations through presentations, visits, and other communications by District Rangers, Forest staff, and the planning team.

The engagement of people in this process is ongoing and open. As a special event, during the week of June 9–13, the North Dakota National Grasslands will be hosting a series of public open houses across the State. Grazing associations not involved to date may contact the Planning Team to discuss further opportunities for meaningful and productive participation.

GRAZERS

Senator DORGAN. Well, I appreciate that. Most of the folks—you know, we have a wide range of people who want to be involved in the multiple uses of this land. And among them, and important among them, are the grazers.

And these are ranch families who in North Dakota are generally small ranchers. We are not talking about large ranchers. They are good stewards of the land.

When a plan is being developed, they would very much like to be a part of the consultative process. And so I appreciate your commitment on that.

I have no further questions, Mr. Chairman.

Senator BURNS. Thank you, Senator Dorgan.

I have one question. I have to run real quick here, and I will turn it over to Senator Craig.

BISON CONTINGENCY PLAN

Tell me about contingency plans or what you are talking about with the Park Service with regard to Yellowstone Park and our little problem with bison.

Mr. DOMBECK. Well, as you know, Senator, the Forest Service is not in the driver's seat on that issue. What I have offered to Montana and the Park Service and those involved is that we can provide a relief valve on the Gallatin from the standpoint of winter range and those kinds of things. We are perfectly willing to play whatever role we can in helping solve that bison issue.

If it takes some land acquisition, if it takes some special practices, whatever we can do, the Forest Service is there to help be a relief valve until that issue is resolved.

Senator BURNS. Would it be any advantage to you if you might advise the Park Service on the care and capacity they have within the boundaries of that park?

Mr. DOMBECK. Well, I think our folks at the local level have been talking. Dave Garber, the forest supervisor, I am sure has close interaction with the Park Service and the various things that have occurred this winter.

My hope is that that problem would be solved out there.

BRUCELLOSIS

Senator BURNS. I think it is being solved, but we are taking the heat in the State of Montana for very, very bad management as far

as the Government is concerned. And I can understand the frustration here.

We only made one mistake a couple years ago. Mr. Lyons knows what that is. I capitulated on a situation I wish we had not capitulated on now.

But there are people in Montana that are concerned about the extension of the boundary of that park to accommodate animals and still no plan is in place to deal with the eradication of brucellosis. And that has us all concerned in the State of Montana. You might not think it is a big deal. By God, I think it is.

Mr. DOMBECK. Well, we do think it is a big deal.

Senator BURNS. Well, then I would—then I want to see more action especially with the higher ups here, because I think someplace somebody has to start the discussion around here that we have a problem out there, and it is not ours.

It was created by people who have eroded and they have equivocated on a court order that was handed down, worked out, agreed to by Forest Service, States, and Park Service.

And yet they have equivocated on that and eroded that plan to where there is no integrity to it at all now. And that is why we had the incident Sunday of a couple, 3 weeks ago, because there is frustration on both sides. And that is what happens when you allow those things to happen.

And I will tell you that we are very concerned, Mr. Dombeck, about the extension of that boundary, because once you start that, how far does it come, and how much is it going to impact the livestock industry and, yes, human health in the Gardner area in the Yellowstone Valley and the water quality? We are concerned about those things.

Everybody thinks all the great things about your forests and how they are supposed to look and all the great things that have been done on care and capacity and all the things done by the Government.

Folks, I am here to tell you none has been done by the Government had it not been for people in the private sector that understood grasslands and grazing and natural resources.

So I just want to fire that little shot across the bow. I will probably fight like a bearcat, because there has to be some kind of management of that herd inside that park. And we cannot do it by expanding boundaries.

And that is going to concern you and the Forest Service, and I am not real sure that you have some authority to do that unless it takes legislative action.

I have to make another appointment here. Senator Craig.

Senator CRAIG [presiding]. My apologies, gentlemen, for racing in and out. Other committees were pulling me away, but I did want to get back to ask a variety of questions. And Mike, Jim, David, thank you for being with us today.

I think you can sense by the kind of questions and the passion with which they are expressed that there are probably fewer issues in some of our Western States where you have a very large presence that do not draw more emotion in our citizens' minds and concerns than how our forests are managed, no matter what your perspective of them.

I will only suggest to you the concern that Senator Burns has about brucellosis in the buffalo herd. It is very difficult for anyone to understand the impact of it unless you have been there. A good number of years ago, before I came to Congress, my father and I operated a sizeable ranch and a sizeable herd of cattle.

One day we sold some cows. We got a notice that one of them tested positive for brucellosis. This had been after a concentrated effort on our part for decades to keep a clean herd.

We immediately tracked it and found out that it was an animal we had purchased. That was not the point. The point was our herd was quarantined. All economics on our ranch stopped.

And we spent over a month spending a lot of money, running a lot of cattle down a chute and testing them at expense to our business and certainly at a cost of gain to the cattle and health of the cattle.

Some of these animals were pregnant, and you always risk aborting a calf if you move them and shove them and all of that kind of thing through the kind of facility that we have to do these tests.

I know there are a lot of people that say, "Well, we have to run the wildlife in a natural way."

That is true if man does not exist or there is no interface with man. In this instance there is. In this instance it is cattle. And there can be human health involved.

The Federal Government can cost by inaction the private sector a phenomenal amount of money. And it is not just a Montana issue. As you know, it is a regional Western issue because of the nature of the park and the States that abound it.

And that is what we have to be concerned about. I do not know any other way to express my sensitivity toward the issue than a revolution that would take place in that three-State area if the Federal Government does not do their job right. You do have an obligation to manage that herd in a managed way, not a natural way.

There are other wildlife that do not have relationships with domesticated animals that would transfer disease. But in this instance we have one.

And I know the crisis that our business went through and the cost we subjected ourselves to, because it was a mistake of our own doing. But if it had been a mistake of the Federal Government, we would have been at war with the Government, because it was the Government who worked with us historically to build this kind of a situation where we did not have brucellosis with the testing programs of USDA and the State departments.

So this is all very critical. I express that to you. Few people have that perspective, especially from your level unless you were born and raised in a livestock setting where you understand the critical nature of this. But out where I live everybody understands it pretty clearly.

But somebody who is now playing the business of management of the Federal level by the book and has a vision of a different kind of management, that is, natural, in this instance it does not work. And it is very important that we understand that.

SAWTOOTH RANGE MANAGEMENT

Mike, let me thank you for the time and the cooperation you gave the Idaho delegation the other day in a concern that we have on the Sawtooth National Forest. And that concern is ongoing as we attempt to deal with how decisions are made and how plans come together and how we operate as it relates to all of our publics and all of our resource users.

In the conversation that you and Dave and I had along with Dale Bosworth, our regional forester, the other day, as it relates to the grazing proposal that Supervisor Levere has put forth, in his testimony before a House subcommittee under the chairmanship of Congresswoman Helen Chenoweth, made a statement that really causes me great frustration, especially when I look at the record. His statement was, in essence, in his ability to manage the permits and grazing, on these critical ranges and habitats, with a range budget that had declined by approximately 30 percent in recent years.

He did not have the money necessary. So he was trying a new approach, somewhat sweeping, fairly dramatic. Obviously, it has everybody on their toes out there and everybody back here on their toes.

I went back and looked at our appropriation record in the area of grazing, and I found—I think I mentioned at the time in our discussions that it had gone up some and progressively over time. But I did not realize that it had gone up as much as it had.

In 1994, we appropriated \$16.3 million. In 1995, \$18.5 million; in 1996, \$27 million; and in 1997, \$38 million. Now I understand there were some NEPA concerns in there as it relates to working that program. But that is a 133-percent increase in appropriations to manage grazing.

And we are all sensitive to it here, because we know the importance of public grazing in our Western States. But we also want it done in an environmentally sound consistent way. And that is what our figures show.

I then have to ask this fundamental question: What happened to the money on the Sawtooth, or what has happened to the money as it relates to grazing inside the system, if we have increased it 133 percent, or somewhere in that area, from 1994 to 1997, and is not on the ground working its will?

And, therefore, supervisors make broad and sweeping decisions because they do not have the personnel or the time or the money, they say, to go in and manage the individual that permit these relationships as they are, by the plan, intended to do.

Can you deal with that issue for me?

Mr. DOMBECK. What I can do is ask Steve, who knows the numbers, to comment on that. But I want to assure you one of my objectives is, as I mentioned the other day, to look at our processes and get as much money to the ground as possible. We have got to, we have just got to.

Senator CRAIG. Yes.

Mr. DOMBECK. And I think there is complete agreement on that. I am going to be pushing hard to accomplish that. Let me just ask Steve to give you a rundown of some of those numbers.

Mr. SATTERFIELD. Senator, to begin with there was a major budget reform in fiscal year 1995. And the number you referred to in 1994 was adjusted to that reform. It was reformed too much.

And in 1995, we reprogrammed \$16 million from other accounts in the National Forest System appropriation to the range line item. In 1996, I believe we reprogrammed another \$9 million.

So what we have here is basically a flat line total. I believe if we had added \$9 million to the 1996 appropriation, it would have brought it up to about \$36 million.

Senator CRAIG. So you are saying 1996 was \$36 million?

Mr. SATTERFIELD. It would have been approximately \$36 million.

Senator CRAIG. Instead of the \$27 million that I quoted.

Mr. SATTERFIELD. We can get you—yes. The Congress—the appropriation included \$27 million in that budget line item. We did reprogram another \$9 million into that line item later.

Senator CRAIG. Was that for NEPA?

Mr. SATTERFIELD. It was for NEPA and grazing management both.

Senator CRAIG. So there was actually more money than my figure showed.

Mr. SATTERFIELD. Well, there would have about a total of about \$36 million.

Senator CRAIG. What was 1997 then?

Mr. SATTERFIELD. It is \$38 million.

Senator CRAIG. \$38 million. I was right on that then.

Mr. SATTERFIELD. Yes, sir.

Senator CRAIG. So there is actually a bigger increase than I had suggested by my figures.

Mr. SATTERFIELD. Well, we are about flat from 1996 to 1997 in real terms.

Senator CRAIG. Yes; well, Mike, would I be correct in assuming that a great deal of range management funds appropriated to the Forest Service were diverted to other initiatives outside grazing?

Mr. DOMBECK. I am not sure of that. Let me ask Steve again. He follows the region by region budgets very closely.

Mr. SATTERFIELD. To get real precise, we would have to get more precise than I can be right here, but—

Senator CRAIG. OK. Well, we are going to ask you to get real precise on this one because—

Mr. SATTERFIELD. But generally no.

Senator CRAIG [continuing]. It is raising havoc out there.

Mr. SATTERFIELD. There is a lot of discussion in the budget restructuring system about money being moved out of range into other things. We have corrected it. We have moved it back. We think—we do not believe it has gone to other things.

Senator CRAIG. Nothing went to the east side eco-study?

Mr. SATTERFIELD. It would have been various assessments against various line items for things like—

Senator CRAIG. You are suggesting it could have.

Mr. SATTERFIELD. It could have.

Senator CRAIG. One of the other areas that Supervisor Levere spoke to was the diversion of time for his range conservationists to deal with the adjudication of the Snake River basin water.

WATER RIGHTS

There has been a tremendous over filing out there by the Forest Service on water rights, 1,700 or somewhere near that, I think he told us. I guess that is a management decision.

But, Mike, do you know if the Forest Service or the forester at the regional level suggested that the Sawtooth over file on all these water rights and acquire water rights on all those water areas?

Mr. DOMBECK. I do not know that. A request was made by Dale Bosworth. I could ask, Janice or Dave on the history of that particular issue.

Mr. UNGER. Senator Craig, we feel that we are filing claims for the water that is required to carry out the purposes of the national forests.

Clearly, it takes a good deal of time of people who need to be knowledgeable on what they are talking about, which is why some of our range conservationists are so intimately involved in that.

And it is a judgment that has been made by the forest and by the region that a management necessity has to be balanced with all the other management necessities.

Senator CRAIG. Even though the Forest Service has operated out there since its beginning and had adequate water and supplied those needs and filed appropriately when it felt it needed water with the State, why all of a sudden this massive over filing?

Mr. UNGER. Well, I do not know that they would consider it over filing. But at one time, when an adjudication goes on, decisions are made for a long period of time to bring all this together in one decision.

Senator CRAIG. Was there a budget consideration, therefore, made as it relates to this decision?

Mr. UNGER. I do not know, but I would hope that the region has certainly looked at this. I know that in other cases where we have had adjudications, we have tried to supplement funds available so that there would be adequate funds for the forests and for the region to do that.

Senator CRAIG. Well, we are obviously going to take a much closer look at this, because it is not only frustrating, as you know, it is more than that. It is angering when this Congress recognizes the sensitivity of grazing to the environment, but the importance of grazing as a part of our public land resource use out there.

We appropriate the money, and then the money does not get to the ground. And, therefore, the kind of very arbitrary and, I think, capricious kind of decisionmaking that the supervisor of the Sawtooth got himself involved in at this moment ends up, or at least that becomes the excuse. And that should not be that.

TRAILS

Jim, I had mentioned to you in a conversation a month or so ago, when we were both attending an event here in town, of an activity going on in the panhandle that is important to the West, Idaho and Montana, that we had been moving in the direction of gearing the panhandle up to spend some money. And they are now doing it.

And, Mr. Chairman, what I am talking about is a unique opportunity that we have in the area of recreation. You spent a good

deal of time this morning talking about recreational increases in demand.

This item is what is known as the Route of the Hiawatha, which is the old rail bed of the Milwaukee Railroad. It is a 45-mile long Idaho/Montana crossing under the Bitterroot Divide, 11 tunnels, 9 trestles, a 1.8 mile tunnel that has our greatest attraction at the moment, known as Taft Tunnel, that goes directly under the divide itself.

What I am told by all of the experts in this area of recreation, primarily mountain biking and hiking, is that this will not only be unique, it will be the world-class opportunity for about 2,500 miles of trail for mountain biking organized.

But the stretch we are talking about, the 45-mile stretch, is unique because it is rail grade, and it can span an age group that is just phenomenal, right up through our senior citizens to enjoy this unique, beautiful section.

In fiscal 1995, we appropriated some money for survey and design. In fiscal 1997, an additional \$450,000. In 1998, we need about \$750,000, not currently shown in the President's budget, to deal with Taft Tunnel, which will then open it wide open and begin to serve, because that is the connecting link.

And, Jim, as I say, I mentioned this to you. I am going to be working on this very closely with the chairman and others, because if the Forest Service wants to premier some recreational opportunity, this is one that has a bi-State, regional impact.

It is very close the chairman's State, just a few miles away from the Washington border. And we are working on bike paths coming out of the Spokane Valley that literally could take us all the way into that system and make that one of the great mountain biking areas of the world, not just the West, but the world.

So that is something that I will be watching and working with our chairman on to resolve.

One last thing, Mr. Chairman. All of you today, especially you, I think, Mike, and Jim, have talked about large increases in recreational demand. How do you get that measurement?

Mr. LYONS. The numbers we have cited, Senator, come from the forest estimates of recreation visitor days, which is basically a 12-hour—it is measured in 12-hour increments.

Senator CRAIG. Yes; I understand the method, but how do they measure, campground occupancy, passes sold?

Mr. LYONS. I believe it is done primarily through surveys of Forest Service users, although I am not familiar with the particular methods.

Senator CRAIG. Do you have a sampling system by which you arrive at those numbers?

Mr. LYONS. You know, I am going to have to check with research.

Senator CRAIG. I want you to check, because here is what I think you will find the answer to be: You do not have one. And that while we all believe there is increased recreational use, that about 15 years ago you departed from any sampling system approach, and you are now in the business of guesstimating. And, yes, it is probably up a couple percent each year.

Now, I am not going to be too critical of that other than to suggest that if you were driving your budget by certain numbers, they ought to be accurate numbers.

Mr. LYONS. I agree.

Senator CRAIG. And my guess is you are on a forest-by-forest, region-by-region basis in the business of guesstimation. Now it may be reasonably accurate guesstimation, but do you have sampling systems that can determine the levels of accuracy as to rates of growth?

Mr. LYONS. Let me follow up with you, Senator, and give you a detailed explanation of how those numbers are generated.

Senator CRAIG. Well, I would really appreciate that, because it is a factor important. Do we want to redirect dollars, or do we want to change structure as it relates to that?

[The information follows:]

RECREATION VISITOR DAYS

The Forest Service tracks recreation use by Recreation Visitor Days (RVD's) and by Visits. A RVD is a statistical reporting unit consisting of 12 visitor hours. A visitor hour is the presence of a person on an area of land or water for the purpose of engaging in one or more recreation activities during the period of time aggregating 60 minutes. A visit is the entry of one person upon a national forest for the purpose of participating in one or more recreation activities for an unspecified period of time.

Both RVD's and Visits are estimated by Forest Service field units and reported through a computerized reporting system. Field estimates are based on the application of sampling techniques, traffic counters and other observation methods. There are various ways available to display the information gathered: by region and by State, by activity, and by year.

The Forest Service is also experimenting with methods to improve recreation use estimates. A prototype process is currently being tested. It is intended to provide improved statistical estimate of recreation use on the national forests.

FOREST MANAGEMENT

Senator CRAIG. Mr. Chairman, just one last item, and it is merely a comment because of the discussion that has gone on this morning amongst a good many of our members of this committee. I, as you know, chair another committee that is directly involved, at least from the authorizing point of view with the Forest Service. And I have been working on a major piece of legislation.

Mr. Chairman, I say this for the value of the committee, because I thought it was a valuable statement made at the last workshop I held out West on forest management and why we may be in such conflict today in so many of our areas of management on the forests.

The policy under which you are managing today by law is largely directing at a multiple use approach toward management. But there is no doubt that it appears that the Forest Service is moving toward management by biodiversity and not by multiple use.

And in that, if that is true, and I believe it is based on the research we have done, then we are in for more conflict because you cannot get to where you need to get from a biodiversity point of view if the law suggests that you do it through multiple use. And, therefore, we look at it through the eyes and the glasses of multiple use.

Now, I am not saying that critically. I am just simply saying that as a point of observation. Maybe we ought to change. And if we

change, we change a variety of the indices that drive not only budgets, but thinking.

And how we get there, I am not sure, but it is one of the areas that I am going to look at it as we deal with legislation to revise or amend some of the management processes of the Forest Services. My guess is it will change the—the Forest Service is caught in that juxtapose right now as it relates to whether it is management for multiple use or management by biodiversity.

And one is not necessarily compatible with the other in many instances, or the changes significant enough to move us from multiple to biodiversity clearly impact a variety of user constituencies on the ground.

Mr. Chairman, thank you very much.

FIRE EQUIPMENT

Senator GORTON [presiding]. Thank you.

For both of you, Bruce Evans has handed me a letter written to me about 10 days ago from two disabled veterans in California, who have serious problems with respect to their agreements for the rental of emergency fire equipment in which they think they have been discriminated against.

Senator Domenici has brought this letter to my attention. Copies of it went to every member of the subcommittee, as I see it here.

I am going to submit this letter to you and ask you whether or not you can promptly get us an answer so that we can respond to them.

[The letters follow:]

LETTER FROM JOHN RYAN AND DONALD WALSH

APRIL 7, 1997.

Hon. SLADE GORTON,
Chairman, Interior Appropriations Subcommittee,
U.S. Senate, Washington, DC.

DEAR MR. GORTON AND SUBCOMMITTEE MEMBERS: We are both Disabled Veterans who are in the wild land fire fighting business, providing fire-ready bulldozers and water trucks to federal, state and local agencies for wild land fire suppression work. For many years, we have entered into written emergency fire equipment rental agreements (EERAs) with the USDA Forest Service. These agreements must be renewed every three years, most recently in 1996. During the 1996 EERA renewal process, Don Walsh raised the issue of 41 CFR Chapter 60, Section 250 which provides that Disabled Veterans specifically benefit during hiring. What resulted was an attempt by Forest Service contracting personnel to refuse to renew Don Walsh's EERA.

There were numerous large wildfires in California's national forests in 1996. John Ryan was not hired at any of those fires, Don Walsh was hired at only one. During said fires, we contacted the contracting people at each forest involved as well as personnel at Pacific Southwest Region headquarters in San Francisco. Unfortunately, the Forest Service personnel we contacted did not choose to acknowledge that Disabled Veterans are entitled to the same preferences in hiring which they bestow on other groups and individuals.

In August 1996, we contacted Allen Amaro, Legislative Representative for the Disabled American Veterans (DAV), Department of California. After numerous contacts with Forest Service's Pacific Southwest Region office, Mr. Amaro arranged a meeting which was held on March 5, 1997 at the California Department of Veterans Affairs offices in Sacramento. In attendance were Douglas Lee, Assistant Regional Forester and David Allasia, Contracting Officer, both from Forest Service's Pacific Southwest Region, Tom Langley from California Department of Veterans Affairs, Allen Amaro from DAV, John Ryan, Don Walsh and Warren Walsh.

At said meeting we asked Douglas Lee if the Disabled Veterans hiring issue could be resolved prior to the Interior Appropriations Subcommittee hearing on April 17, 1997. Mr. Lee stated that was unlikely and we should proceed with this course of action. He later confirmed this in a letter dated March 10, 1997. This is why we believe we had no choice but to bring this issue to the Interior Appropriations Subcommittee.

As Disabled Veterans of the Korean conflict, we have endured four decades of discrimination by employers, labor unions, health insurance companies and others. Now, we have to endure discrimination by Forest Service bureaucrats who would rather hire their "good old buddies," some of whom are retired Forest Service personnel, during emergency equipment hires. We are not asking for welfare or a hand-out, we are only asking to benefit from the programs which were legislated by a grateful nation as indemnification for our sacrifices. No additional funds will be required to implement 41 CFR Chapter 60-250 during emergency equipment hires.

We ask you to place control language in USDA Forest Service's budget which would require compliance with 41 CFR Chapter 60-250 for Disabled Veterans who are prequalified under an EERA during emergency equipment hires. If USDA Forest Service refuses to comply, we ask you to withhold a portion of their budget. We would be happy to provide further testimony to the Subcommittee or individual Subcommittee Members if necessary. We had hoped to appear personally to testify, but no formal outside witness hearing was allowed. Therefore, we request a copy of the minutes of the hearings, and any correspondence with USDA Forest Service on the issue.

We thank you for your assistance in this matter.

Sincerely,

JOHN RYAN,
Water Trucks, So. Lake Tahoe, CA.
DONALD L. WALSH,
Bulldozer Service, San Martin, CA.

LETTER FROM MIKE DOMBECK

Re Fire Equipment.

U.S. DEPARTMENT OF AGRICULTURE,
FOREST SERVICE,
Washington, DC, May 9, 1997.

Hon. SLADE GORTON,
Chairman, Subcommittee on Interior and Related Agencies, Committee on Appropriations, U.S. Senate, Washington, DC.

DEAR SENATOR GORTON: This letter is in response to your inquiry concerning a matter raised by Mr. Donald Walsh and Mr. John Ryan, veterans of the Korean conflict. These individuals expressed concern about their not being provided preference in the ordering of equipment by the Forest Service in support of wildland fire suppression efforts.

Mr. Walsh and Mr. Ryan referenced 41 CFR, Chapter 60, Section 250 as the basis of their concern. That particular Federal Regulation pertains to preference to veterans for the purposes of hiring. The issue raised by the two gentlemen has to do with entitlement to preferential status when the Forest Service hires equipment under Emergency Equipment Rental Agreements in support of firefighting efforts.

Mr. Walsh and Mr. Ryan raised this issue with our Regional Office, Procurement Staff in San Francisco, California, previously. In the response from that office, it was explained that 41 CFR, Chapter 60, Section 250 pertained to employment practices, not contracting actions. The response also explained that there is a provision in the Emergency Equipment Rental Agreement providing for preference in subcontracting with veterans. This provision is directed at the prime contractor, and encourages subcontracting with veterans.

As explained in the Region's response, there are no statutory or regulatory requirements that preference be given to veterans in ordering equipment in support of our fire suppression efforts. Our policy on placing orders for equipment under the Emergency Equipment Rental Agreement is one of ordering the closest available resource meeting the requirements of the suppression effort. This policy is necessary in order to respond as quickly and efficiently as possible in efforts to protect life and property that is threatened in wildland fire situations.

I have included a copy of the Regional Office's earlier response to Mr. Walsh and Mr. Ryan for your information. Thank you for your interest in this matter. If I can be of further assistance, please do not hesitate to contact me.

Sincerely,

MIKE DOMBECK, *Chief*.

REMARKS OF SENATOR PATRICK LEAHY

Senator GORTON. With that, Senator Leahy, you know by the time at which this started that this hearing has gone on for quite a while. I had to miss quite a bit of it and have a fairly extensive series of additional questions. So at this point, I am going to defer to you and let you make whatever statement you would like and ask whatever questions that you have.

Senator LEAHY. I will be very brief because I am supposed to be also at two other committee hearings.

It is good to have Mr. Dombeck here as the Chief of the U.S. Forest Service to guide our national forests into the next century. I have been a strong supporter and a great admirer of the traditions and the missions of the Forest Service.

I have confidence that it has the statutory and administrative ability to maintain the balance between multiple-use and sustained yield management of our forests.

I have respect for the knowledge and skills of the people who work for it.

But I do have the concerns I have expressed before that as the Forest Service faces pressure to maintain timber production, expand recreational opportunities, we could compromise that debt that we owe to our children. The debt, of course, is to conserve those forests for their use and enjoyment.

We feel some of the same pressures, Mr. Chairman, even by private landowners in the Northeast. The northern forest region has seen some of the similar changes to its social and economic structures as they have had in the Pacific Northwest, different types of forests, similar pressures.

Thousands of people live in the region and how do they maintain their economies and provide the jobs and preserve the environment that makes that region such a special place? I initiated the Northern Forest Lands Council as a way of looking at this and last week introduced the Northern Forest Stewardship Act to implement the Council's recommendations. The act has strong bipartisan support throughout our region, because it lets the communities decide and gives them a great deal of discretion within the 26 million acre northern forest.

Mr. Lyons has been to Vermont. He has seen this. He has discussed it with our Governor and with others throughout the Northeast. The bill embodies the conservation ethic of the 1990's, non-regulatory incentives in support of community-based goals for sustainable economic and environmental prosperity. Mr. Lyons and the Forest Service has made a great effort to share the vision these communities have.

So I look forward to working with you, Chief, to implement these solutions and welcome you to come on up to Vermont sometime, as your predecessors have. We can show you a beautiful area but also show you an interesting thing on the small communities dealing with big problems and doing it very well.

STATE AND PRIVATE FORESTRY PROGRAMS

I have only one question. I will submit the rest for the record, if I might, Mr. Chairman.

But Chief, I would ask you: With timber harvests on public lands declining, the pressure on private forest lands to provide more of the Nation's wood supply is increasing, not only in the northern forest but, my understanding is, across the country.

Would you agree that more attention within the Forest Service should be focused on State and private forestry programs? And if so, how are we going to do that, either in expanding funding or programs?

Mr. DOMBECK. Yes; as a matter of fact, in the little over 3 months I have been on the job I have spent a significant amount of time learning about the State and private program, because some 70 percent of our forests are in private ownership.

I have had dialog with the State foresters. In fact, the president of the National Association of State Foresters is in essence a voting member of the management team of the Forest Service.

From the standpoint of the State foresters, some of the monitoring technologies, the wide variety of stewardship programs, the Forest Legacy Programs, and so on, are programs that in spite of some of the unpopular things we have talked about this morning, that are very much in demand, very popular, and very important. These are programs that we need to bolster.

Senator LEAHY. The 1998 request reduces, among other things, the economic action programs. What happens to rural development through the forestry initiative under this? Does it disappear or do we get smacked up along side of the head and shoulders?

Mr. DOMBECK. Let me ask—

Senator LEAHY. That is a technical term.

Mr. DOMBECK. Yes; let me ask our Deputy Chief for State and Private Forestry to talk about some of those details.

Ms. COMANOR. Senator Leahy, you have long been a supporter of State and private forestry programs, and I and my staff appreciate that very much.

As we looked at the options we had within a constrained budget, we were successful in maintaining the overall funding for State and private comparable to the 1997 appropriation.

What we did is look hard at legacy and have proposed an increase in the Forest Legacy Program. It is a successful tool to use to deal with many of the issues in your part of the country and most recently in Senator Gorton's home State.

We also looked at increasing, once again, the President's proposal for stewardships incentives funding to cost share with private land-owners so they can make investments in their lands so we will have well managed forests into the future.

So within those choices and the other commitments we had in the Northwest, the Economic Assistance Program took a little downturn, as you are observing. We would have a comparable spread within the Rural Assistance Program for those programs that we have been conducting proportionate to the available funds that we received.

Senator LEAHY. Does that mean they go up?

Ms. COMANOR. It depends on what the appropriation brings us. But we would continue a comparable spread among the different elements within the Rural Assistance Program proportion to what they have been, at whatever level of funding we receive.

Senator LEAHY. We will work with you on that as we go through the appropriation process. And I will be quite interested in it.

Mr. Chairman, I will submit my other questions, if I might, for the record.

SALVAGE SALE PROGRAM

Senator GORTON. Fine. Thank you, Senator Leahy.

I appreciate the patience of all of you here to all of the questions you have been asked and to my own unavoidable absence. A number of the questions that I would have dealt with have been submitted to you already by other members of the subcommittee, but I do have a number of additional ones.

I would like to start by discussing the Timber Salvage Program. An important aspect of your Forest Health Program appears to be a proposal to split the timber salvage fund into two parts with the new fund being called the forest ecosystem restoration and maintenance fund. Am I correct in that assumption?

Mr. LYONS. That is correct.

Senator GORTON. Will the sale of timber be an important aspect of this new fund?

Mr. LYONS. The fund is dedicated primarily, or is proposed to be dedicated—obviously we would need statutory authority—to those other ecosystem restoration and maintenance activities that would help to support both improve forest health and timber supply, thinning, salvage, road obliteration, revegetation, et cetera.

So the primary focus of forest ecosystem restoration and maintenance fund [FERM] would not be commercial timber production, but rather those other factors that frankly represent investments.

Senator GORTON. So any timber sales would be incidental with respect to this fund.

Mr. LYONS. I would say that, sir.

Senator GORTON. OK. Under the present timber salvage fund, the timber offering target for fiscal year 1998 is 1.3 billion board feet. How would that number be stratified or divided between the two funds if this proposal were in existence today?

Mr. LYONS. I am hesitating only because I think Mr. Satterfield knows how the actual breakdown would occur. But in essence, our program would remain essentially timber produced from the salvage program, as well as the component that is the green program. That would be where our commercial timber program would come from.

And Mr. Satterfield just informed me that the split is volume neutral.

Senator GORTON. So the overall target would remain 1.3 billion board feet.

Mr. LYONS. Yes, sir.

Senator GORTON. Now let me specifically discuss the timber salvage rider as a part of the Rescission Act. On December 13 of last year, Mr. Lyons, the agency issued direction to withhold all further advertisements of sales under the Rescissions Act.

You stated at the time of that direction that the 4.1 billion board feet sold as of November 30, and I quote, "represents 91 percent of the original commitment, well within the 25-percent range included in the correspondence between the administration and Congress."

It is clear that the agency committed to offering salvage volume in accordance with the Rescissions Act, but could well have exceeded the figure of 4.5 billion board feet in the amount of 25 percent. As a consequence, the statement is somewhat bothersome.

Should this lead this subcommittee to assume in the future that any time we fund a program, a 91-percent accomplishment level is acceptable?

Mr. LYONS. No, sir; you should expect 110-percent effort. And let me explain the rationale for the policy decision and direction that I provided.

First of all, we knew that our bookkeeping was not quite up to date at that point in December. Our accomplishment reports indicated that we were doing better than was reflected by the numbers we had at that point in time.

Our final report to the Congress from the salvage program indicated that we achieved 4.6 billion board feet of salvage volume under the salvage rider, in contrast to the 4.5 billion board foot target. So it was not 110 percent, but it was in excess of 100 percent.

But we faced a difficulty which was the result of transitioning the program, the salvage program, back to the regular order of business on January 1. We had a number of sales in the pipeline that had been prepared under the salvage rider and then a number of other sales that we faced at the end of the year. And the questions coming back from the field were: How do we prepare to offer new sales on January 1?

So we made a decision basically to finish everything that had already been prepared and was about to be offered, have it offered under the salvage program, but not at that point begin new offers.

There was a third element to this, and I want to be clear about it. There was a great deal of concern, as you are well aware, among the public and others about the program. And we worked our way through this over time.

But there was a perception. I do not think it was reality, but I think there was a perception that there was a rush to get sales out the door at the last minute under the salvage rider so as to dissuade the public of any perception that there was, as it was characterized by some critics, a Christmas sale underway to rush these things out the door.

We said let us terminate things here, let us provide for an orderly transition, and let us get things done. I think by our estimates the impact in terms of volume, the additional volume that could have been offered in that period from December 13, or whatever it was, to the end of the year, was not significant. I think it was on the order of maybe 100 million feet would have been affected.

And those sales are going to be offered under the regular program, or have been already.

Senator GORTON. Now that you are looking back on most of that, have the sales of the other activities under the salvage amendment reduced fuel loads and reduced your expected suppression costs?

Mr. LYONS. We have a great deal more work to do, Mr. Chairman. Chief Dombeck spoke to what our needs are as opposed to the resources we have to deal with them.

So I would say in those places where we were able to implement sales in a strategic way, certainly it helped. But there is a still great deal more work to be done.

Senator GORTON. Oh, I am certain that that is true. So future salvage sales will be directed, at least in part, to those same ends.

Mr. LYONS. Yes, sir.

COLUMBIA BASIN ECOSYSTEM

Senator GORTON. Now I would like to ask some questions that I hope do not duplicate what Senator Craig did with respect to the BLM East Side Columbia Basin Ecosystem Management Project.

In this project you cooperated, obviously, with BLM to combine up to 74 land and resource management plans for 45 units. I gather your draft environmental impact statement are scheduled for imminent release sometime this spring?

Fish and Wildlife and National Marine Fisheries Service are also a part of it, but those two agencies have specific missions that do not reflect any target such as timber production.

Mr. Dombeck, this question is for you. Have the differing missions of the Fish and Wildlife Service and the National Marine Fisheries Service affected the planning effort, specifically the commodity targets which the Forest Service and BLM, to the extent that you know about BLM, may produce?

Mr. DOMBECK. From the standpoint of the specific effects in numbers, I cannot give you that specific information here and now. But what I will say is that I think the important thing is we are working this up front.

In the past, we have run into a gridlock in litigation and things like that. Hopefully that is behind us with the agencies working in parallel, and together on these issues up front.

I have to say, and I am sure Jim will want to comment on this as well, some of the things we have learned, through better coordination and working up front, is from the consultation backlog in the Pacific Northwest where we had as many as 100 or more.

Ms. MCDUGLE. We had 1,700.

Mr. DOMBECK. A backlog of 1,700. That backlog has been eliminated. We are doing everything we can to push the agencies to work together in a more cost-effective manner. Our hope is that is what is being accomplished here.

Senator GORTON. Probably you anticipate my next question, which is for one or both of you to put on the record what this project has to show for the \$35 million of taxpayer money that has been spent on it and an estimate, if you can, of how much more will be spent before it is completed.

Mr. LYONS. We will certainly have to provide you that for the record, Mr. Chairman. Let me, if I could, give a followup comment to what Chief Dombeck said.

There was obviously a lot of criticism and concern about the salvage program and the salvage rider in particular. But one of the things we learned through that was, and I think one of our successes in achieving the goals that we set, was the coordination and collaboration among the land management agencies, Fish and Wildlife, NMFS, and EPA.

We brought them altogether on the ground in what we call level one teams. And in fact the interagency report that evaluated the program highlighted that as the most effective and more efficient way of doing business so as to avoid backlogs and consultations, et cetera.

What I hope the Columbia River Basin Program will do, we cannot measure just today. We are not done with that effort.

What we hope it will do is provide greater certainty for the region as a whole in terms of an understanding of the goods and services that will be produced by the Forest Service and BLM management units there, as well as provide us greater scientific certainty so that when there are questions or challenges to particular management actions, we are able to fend off those challenges because we have a sounder foundation from which to work.

Finally, our ultimate goal is to make sure the communities in that area have a clear understanding of what the future holds because they have been part of the process. They can in fact then determine where they want to make investments as communities as they grow and develop and deal with the economic challenges they face.

[The information follows:]

INTERIOR COLUMBIA BASIN ECOSYSTEM MANAGEMENT PROJECT

In fiscal years 1994 through 1997 (estimated) the Forest Service and the Bureau of Land Management will have spent a total of about \$35 million on work associated with the Interior Columbia Basin Ecosystem Management Project (ICBEMP). In fiscal year 1998 about \$5 million is needed to complete the Final Environmental Impact Statements (EIS) and Record(s) of Decision (ROD). Neither the FS nor the BLM included funds to begin ICBEMP implementation in the fiscal year 1998 President's Budget. Fiscal year 1999 would be the first year funds might be requested for implementation, but final decisions are not anticipated until the Summer (third fiscal year quarter) of fiscal year 1998, following public review of the Draft EIS's.

Several benefits are associated with the ICBEMP. The Forest Service expects that decisions from the Project will streamline the Land and Resources Management Plan revision process for the affected National Forests. Broad scale social issues are being addressed in a consistent manner. Other broad scale issues such as forest health, range health, and fish and wildlife protection, transcend administrative boundaries and will be a primary focus of the decisions (based on the EIS's).

Further benefits include: more effective analysis of cumulative effects of land management activities than when attempted unit-by-unit, reduced vulnerability to legal challenges because of increased consistency across the region of plans and management, and, more favorable regulatory agency consultations. If each administrative unit acted independently in addressing anadromous fish, for example, the FWS and NMFS might assume worst case conditions in adjacent areas because of a lack of overriding context or coordination of individual agency plans.

In terms of "products", the ICBEMP has released a "Framework for Ecosystem Management", "Scientific Assessment for Ecosystem Management (on BLM/NFS lands) in the Interior Columbia River Basin", "Draft Eastside Environmental Impact Statement", "Draft Upper Columbia River Basin EIS", and "Scientific Evaluation of Alternatives".

LAW ENFORCEMENT

Senator GORTON. Another subject—and this, Mr. Lyons, is for you—last year in August, demonstrators were finally cleared from a timber protest area in the Willamette National Forest.

I was informed that when law enforcement officers initiated action a month earlier to remove the demonstrators, the Secretary's office intervened and delayed the action.

Why? And why was so much damage to Forest Service land allowed to take place without law enforcement action occurring?

Mr. LYONS. Mr. Chairman, I cannot speak to the extent of damage that occurred. I think it was rather restricted. There was concern on the part of the Secretary's office as to ensuring the health and safety of Forest Service employees, as well as to ensure that the protesters were handled in an appropriate manner.

I think some time was spent trying to ensure that law enforcement, local law enforcement, and State officials were in agreement about how to proceed with those actions. Ultimately those protesters were removed from the site. And in fact this year, anticipating protests on the Willamette and other places, I have had some conversations with Forest Supervisor Kenops about that potential.

We intend to sit down early with the FBI and with State officials to make sure we are prepared in advance to handle this.

Senator GORTON. You certainly did anticipate my followup on that. Do you think you will be able to deal better with any demonstrations of that sort this year as a result of your experience last year?

Mr. LYONS. I believe so. There is renewed confidence within the administration and certainly with the Forest Service's handling of the situations last year that the incident command teams can move forward and deal with this aggressively.

Senator GORTON. Good. I am very pleased to hear that. I hope it works out on the ground.

Mr. LYONS. We hope so, too.

TIMBER SALE TARGETS

Senator GORTON. Your current timber sale target for the country is just under 4.2 billion board feet. Mr. Dombeck, will you reach that goal? And specifically in a parochial fashion, will you reach the 1 billion board foot goal from the Pacific Northwest?

Mr. DOMBECK. Yes.

Senator GORTON. That is a wonderful answer. You do not need to add to it.

During the fiscal year 1997 hearings, Mr. Lyons and then Chief Thomas stated that there were insufficient resources to accomplish a complete substitution of volume for the section 318 sales and to meet the requirements of the President's Northwest plan.

The committee understands that additional resources were to be provided to the agency's Pacific Northwest region to bring timber sales forward in the pipeline to accomplish both the substitution and the requirements of the President's plan. Have those resources been so allocated?

Mr. LYONS. Yes, sir; they have. All parties to the settlement agreement are pleased with where things stand and the progress that is being made.

Senator GORTON. So in fiscal year 1998 you are confident that we will be able to meet those goals.

Mr. LYONS. Yes, sir.

Senator GORTON. OK. The administration entered into a settlement agreement with a number of the purchasers to buy out their old timber sales contracts. Can you tell me what the total cost of these agreements is and how you are going pay for them?

Mr. DOMBECK. Let me ask Steve to correct me if I am wrong, but as I recall, what we know now is about \$21 million. And I might ask Steve to elaborate on where he is going to find the money since he is the keeper of the books.

Senator GORTON. Yes; we are quite interested in that.

Mr. SATTERFIELD. I am kind of interested in where I am going to find the money, too. Well, there are two pieces. Of course there is the Ketchikan one where the Department of Agriculture general counsel has written a letter to the Treasury making the argument that we should not be required to reimburse the judgment fund. So that would be up to Treasury to get reimbursed, if that was the case.

The remainder, the \$20 million, we have not resolved yet. We obviously do not have any direct appropriations for that. In the end, if we have to reimburse the judgment fund from where those claims are being paid initially, then we will just have to take it out of every other National Forest System program.

Senator GORTON. Jim, in this connection, that is a very good answer. That is a fair amount of money, and you do not have it just in pocket change.

We are only talking about 7,000 acres of sales in Oregon and Washington combined. It was your view that the sales would have jeopardized the balance in the President's Northwest forest plan.

Can you explain in lay terms why 7,000 acres, either these or exchanged acres, out of 24 million acres out there could really have been significant and required that being bought out, rather than exchanged for an equivalent harvest elsewhere?

Mr. LYONS. Well, let me say at the outset, Mr. Chairman, that our preference is to find alternative volume. And we have had some circumstances where we have been able to succeed in doing that, as you know.

Senator GORTON. Yes; I do understand that.

Mr. LYONS. As to why 7,000 acres should be so significant, it is not a judgment I can render except to say that we asked both the regional ecosystem office, as well as the keepers of the plan, who are the regional executives, to look at these issues.

Certainly where there are endangered species impacts, that is a concern. Where there could be impacts on aquatic resources, which has been the case with some of these sales, that has been a concern.

Our overall concern is the cumulative effect of these sales, maybe 7,000 acres today, maybe adding up to more tomorrow, could have a detrimental effect on the plan overall. The plan strikes a careful

balance, although you and I have had many discussions about whether or not that is an appropriate balance.

We are doing our best to ensure that we stick with the concepts and the proposals incorporated in that plan. And I think at least a benefit to this point in time is our ability to fend off legal challenge and proceed to harvest timber in the matrix as proposed, to begin work in the adaptive management areas and to expand our opportunities there, and also to make the watershed improvements and in fact develop operations in the late successional reserves in accordance with the prescriptions and guidelines included in the plan.

Senator GORTON. And it is worth \$20 million even if you have to scramble for it out of other appropriations?

Mr. LYONS. Well, Mr. Chairman, I understand your point. Here is my concern, though. If in fact harvesting those units cause some harm to the plan or ran the risk of the plan being challenged, I dare say the cost to the region would be far in excess of \$20 million. And that is the judgment we have to make.

WESTERN DIRECTOR OFFICE

Senator GORTON. Now, Jim, I have another subject. It is a small one, but it has gone on and on and on. In the fiscal year 1996 appropriations bill, the Department was directed to eliminate the Office of Forestry and Economic Development in Portland. This was done in response by the administration by renaming it the Office of Forestry and Economic Assistance.

In the current appropriations bill, the Department was directed to eliminate this office, and we withheld funding for any successor office. Leon Panetta agreed to this on behalf of the President.

Now we are informed that the Secretary has directed the establishment of an office to house the Western Director for the Office of the Secretary. Lo and behold, we have the same person in all three of these offices, who remains in Portland.

Some 50 percent of the office's funding is to come from the Forest Service subject to a reprogramming request that I understand will soon be submitted. How can you explain this as anything other than a direct defiance of the expressed will of Congress?

Obviously it is a successor office. What do we have to do if we do not want that office to be there?

Mr. LYONS. Mr. Chairman, the Secretary created this Western Director position because of the high number of controversial issues affecting the Department and the Forest Service in the Pacific Northwest.

Tom Tuckman, who you were referring to, has served in various capacities out there, is a very able and talented individual. And I know you know him personally.

His responsibilities have changed over time. For example, Tom right now is involved in the headwaters exchange and is involved in working on the Tahoe basin event, which Senator Reid alluded to earlier in the day. He is also involved in ensuring that we meet our goals and commitments in accordance with the President's forest plan but reports directly to the chief of staff for the Secretary.

I believe the Secretary's intent is to make sure that we can be as responsive as possible to the needs of the Congress and in par-

ticular the members of the Pacific Northwest and feels that it is important to have that presence there so as to ensure that we are fulfilling the direction that we receive.

Senator GORTON. From my perspective, Jim, this is much less about an individual than it is about whether or not the instructions of Congress are going to be followed. You are sitting there without a smile on your face telling me that this is not a successor office and not just a way around what Congress for 2 straight years has ordered you to do?

Mr. LYONS. I am trying to give you the best answer I can, Senator.

Senator GORTON. If it is really so important to the Secretary, why does he not pay for it through the agricultural appropriation?

Mr. LYONS. I cannot answer that question, sir.

Senator GORTON. Well, do not be surprised to see another order with respect to that office.

FLOOD FUNDING

Mr. Dombek, as you know, the administration has proposed that \$38 million be appropriated to the Forest Service for construction and restoration projects in the supplemental due to recent severe flooding in the Pacific Northwest and Midwest.

You asked for more than twice that amount, as I remember. What is that impact going to be? How are you going to set priorities? What very important things are going to end up undone?

Mr. DOMBECK. Well, first of all, I believe the House mark on that was \$69 million?

I believe the assessment that we made was about \$80 million. And from the standpoint of what things are not going to be done—

Senator GORTON. Well, if you get that \$69 million, are you going to be able to do essentially everything you need to do?

Mr. DOMBECK. Well, what we will do is take a look at the entire package of things that need to be done. I am told that we still may not have a complete assessment because of access and snow and that sort of thing. But we will start with the highest priorities first, you know, the areas most in need of repair and work our way.

Senator GORTON. Have you given us a priority list so that we can understand on our part over here what gets cut off at any given level of appropriation?

Mr. DOMBECK. Let me ask Steve if a specific project list has been submitted. Not to my knowledge.

Mr. SATTERFIELD. The problem we have, Senator, is that these are very approximate estimates on part of the field. They cannot get into a lot of the areas. Region 1 in particular is under snow.

So based on general experience with these kinds of things and what they can observe, they have made estimates. They have not had a chance to really sort out if they get \$69 million, just which individual projects will not be done. But as the Chief said, they will work that through as carefully as they can.

Mr. DOMBECK. Janice apparently—

Senator GORTON. So you are guesstimating and we are guesstimating, to use Senator Craig's word?

Mr. SATTERFIELD. In this situation, yes. I think Janice might have some more information.

Senator GORTON. Good.

Ms. McDOUGLE. One of the things that we are working on right now, Mr. Chairman, is a partnership with our sister agency, NRCS, to look at opportunities to jointly review projects associated with flooding impacts.

What we have discovered is that the Forest Service has authorities to do things on National Forest System lands. The NRCS has authorities to do improvements and restoration efforts on private lands downstream.

And what we hope is that collectively we will come up with priorities for work that make sense for us to do together so that one does not cancel out the others.

We are working on that right now. And it is an opportunity to leverage dollars as well.

Senator GORTON. Thank you. Thank you very much.

Any help you can give us between now and the time that the supplemental comes up on this will both add to our knowledge and I think to our ability to help you. We recognize that these losses did take place, and we want to allow you to get to work on them as soon as possible.

Mr. LYONS. Thank you.

ISSUES IN WASHINGTON STATE

Senator GORTON. I have a few parochial questions with respect to the State of Washington now, if I may submit them to you. I understand that region 6 has asked for \$500,000 from headquarters accounts to process the land exchange with Plum Creek in the Wenatchee National Forest. Funding for this project will be used for technical and environmental work that must be completed during the course of this fiscal year.

What is the status of that request?

Mr. LYONS. I will ask Steve to give us the exact numbers. What I understand, as I checked into that before I visited you on Monday, is that this is a priority, and is something that we are proceeding with as best we can with the resources we have.

What is the exact disposition of that money, Steve?

Mr. SATTERFIELD. I think that is to be determined, too. What we have is a lot of requests from around the country with considerable urgency. And what we are trying to do right now is to balance those. What we would propose and what we would have to offset. And in some of these cases, I am not sure, I think this one—many of them will require reprogramming.

So we are in the process of working that through right now.

Mr. LYONS. Let me assure you, though, Mr. Chairman, that this remains a priority for the administration and a tremendous opportunity, I think.

Senator GORTON. It is a high priority for me. The idea of the kind of blocking up that you are doing there is, I think, progressive, something that is entirely win-win. And I do want to advise on you the interest this chairman has in that subject.

One more; 15 years ago, the Congress authorized the Mount Saint Helens National Volcanic Monument. The exchange of sur-

face and minerals with private landowners was to be completed within 1 year after the act was signed into law. Approximately 10,000 acres of private mineral rights, however, remains stranded in the monument area.

I understand that the companies involved, Weyerhaeuser and Burlington Resources, are working with the Forest Service and the BLM to resolve the situation. I am really planning to introduce legislation to address the issue and wonder if you could give me a progress report.

What is going on? What kind of additional authority might you need? When are we going to get it done?

Mr. LYONS. I do not see any heads nodding here of people that are real familiar with the issue. I know that I am not. But what we will do is we will provide a detailed answer to that for the record.

[The information follows:]

MOUNT SAINT HELENS MINERAL RIGHTS

The proposal: Approximately 10,750 acres of mineral estate within the Mount Saint Helens National Volcanic Monument remain in Burlington Resources and Weyerhaeuser ownership. The proposal by the companies is to pursue legislation with the idea to make it simple, to incorporate full consultation from all parties, minimize surface administration and costs, provide solutions for acquisition, and establish time frames for completion. The new legislation would amend the existing Act by directing the Secretary of the Interior to complete the exchange by using "bidding scrip" in lieu of Federal land or minerals.

The "bidding scrip" concept would grant a dollar for dollar basis to compensate the company for valuation of their mineral estate in the Monument. It could be used as credits towards bidding rights, royalties, and/or bonus payments. Credits would be administered by USDI and subject to existing laws and regulations.

What is the current status of negotiations between the Companies and Agencies?

On April 22, Burlington Resources, Weyerhaeuser, Forest Service and Bureau of Land Management met to review the proposal and to discuss areas of agreement and areas of concern. The concept of using "bidding scrip" as compensation appears to be a viable alternative to complete the congressionally mandated exchange. The primary concern of the BLM and FS is reaching agreement on the value of the severed mineral estate (particularly the geothermal resource). Burlington and Weyerhaeuser agreed to do a thorough search for additional valuation data and geothermal sales. All parties are currently collecting and reviewing the additional valuation data. The valuation negotiations will continue on May 28.

NATIONAL MONUMENT

Senator GORTON. All right. Again, after 15 years and my own interest as the primary sponsor of creating that national monument in the first place and trying to work out these private and public interests, I would be very gratified to see the work completed.

And the more we feel there is real cooperation between the Forest Service and the Congress, the better we are going to be able to help you.

That is why things like the Tuckman office come up, Jim. I will just be very blunt with you. I do not know how it could be worth it to you to keep that aggravation going with the Congress that has made the kind of decisions on it that it has.

You know, there are obviously going to be some major policy differences, and we understand those differences. But we should have as close and cooperative a working arrangement with one another as it is possible to create.

I do want to give you one last expression of concern. On December 11 of last year, Senator Byrd and I, Chairman Regula and Mr. Yates wrote to the secretary. While I will not go into the detail about the actions that prompted that letter, I want to let you know that I remain concerned about the relationship, as I have just said, between the subcommittee and the Department.

We really have got to be able to count on the Department to adhere to well-established practices and procedures, the most important of which are reprogramming guidelines. The only alternative we have is to write a lot of the things that we do less formally into the law as we create an appropriation.

I do not want to do that. That is frustrating, and it is not particularly flexible. If we can get the kind of cooperation I have been talking about, which is obviously the intent of Congress, it is a much, much better way in which to work.

I do want to say thank you to both of you and to your associates, some of whom are to be congratulated on new positions. Dave, I also will join in thanks for your many years of service. And I am quite sure you are not just going to go to seed. You are going to find something else to do that will be interesting and will use the knowledge that you have gained.

Mr. UNGER. I trust that will be the case, Senator.

Senator GORTON. And I wish for you great success in that as well. Your responses here today have been thoughtful and reasonably complete. Let us keep going on that, and let us get rid of some of these differences and exacerbations that really do not need to exist and that end up frustrating both sides of this table.

Mr. DOMBECK. Senator, if I might, I would just like to respond and say that in my 3½ months in this job that you have articulated the spirit in which I want to work.

And that I realize the issues of national forest management and resource management in general for all agencies in a changing society can be very tenacious. But yet there are many, many positive areas that I hope that we can focus on together to move forward and build relationships. As we do that, I believe that some of the more tenacious issues will become easier to deal with.

I look forward to a long positive working relationship with you and your staff as all of the members of the committee.

Senator GORTON. Very good. Jim, I will see you on the trail.

Mr. LYONS. I look forward to that, Senator. And I just want to second what Mike said and indicate that I have appreciated your help in working through some very difficult issues.

We have had our differences over time, but I have always appreciated your open door and the opportunity to sit down and discuss differences of philosophy and work together most importantly to protect the resources of the United States, which I know you care dearly for as well.

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. Thank you very much. I have a large number of other questions of significance, but perhaps it is not the best use of the time of all of the people in this room to go through them orally here. We will submit them to you, together with Senator

Leahy's questions and those of any other members who have questions in writing.

I would urge you to answer them as promptly and completely as you can. I simply have to return to my earlier remarks. Like the last few years, this is likely to be a tough year.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

ADDITIONAL COMMITTEE QUESTIONS

STATE AND PRIVATE FORESTRY

Suppression of insects and diseases

Suppression of insects and diseases on Federal and tribal lands is an important part of Forest Health management.

Question. Are there significant insect and disease suppression efforts which may not occur under the President's budget? If so, please explain?

Answer. Specific pest outbreaks are difficult to forecast this far in advance. Pest like southern pine beetle and gypsy moth can increase suddenly with little warning. If increases occur in several pests simultaneously, it is conceivable that significant insect and disease suppression efforts may not occur under the President's budget.

Question. Is the suppression program being affected adversely by the appeals process in a manner similar to the effect on the timber program? Are cooperative efforts with states hampered by the appeals process?

Answer. The insect and disease suppression program on Federal, state or private lands is not being hampered by the appeals process.

Question. The Department of the Interior has raised significant concern regarding the spread of the Brown Tree Snake across the South Pacific and potentially into the Pacific Southwest states. In terms of non-indigenous pests and diseases, is forest health potentially affected by such "Brown Tree Snakes?"

Answer. The brown tree snake is mildly poisonous to humans, grows up to 8 feet in length, and would adversely affect recreational uses of forests and parks. Its primary negative effect would be on bird populations and biodiversity; nine native bird species have gone extinct on Guam following the snake's introduction. The loss of native biodiversity is a forest health concern.

FOREST STEWARDSHIP PROGRAM

The President's budget proposes a level Forest Stewardship Program and increase in the Stewardship Incentive Program of \$5.7 million which doubles it size.

Question. To what degree has the Forest Stewardship Program enhanced the long term sustainability of timber production from private lands.

Answer. The Forest Stewardship Program has enhanced the long term sustainability of timber production in the following ways:

The owners of nonindustrial private forest lands that are enrolled in the program and have an approved forest stewardship plan agree to implement approved activities for a period of not less than 10 years.

The Stewardship budget line item provides \$2,805,000 for seedlings, nursery, and tree improvement. Without the low costs of genetically improved forest planting stock, many stewardship owners would not be encouraged to plant trees.

Because, forester assisted timber sales provide double the income from unassisted sales twice the number of trees are left in the stand. This improves the long term sustainability of timber production and significantly enhances wildlife habitat. The Forest Stewardship Program through its collaborative stewardship approach contributed over \$6 million dollars to the income of consultant foresters through the landowners and has encouraged the start up of many new consulting businesses which tend to increase professional non-government technical assistance available to nonindustrial private forest land owners.

The Forest Stewardship program, not only enhances the long-term productivity of timber, but encourages the long-term stewardship of nonindustrial private forest lands by assisting owners of such lands to more actively manage and enhance fish and wildlife habitat, water quality, wetlands, recreational resources, and the aesthetic value of forest lands.

Question. Approximately 50 percent of all sawlog volume exists on the National Forests. With the timber program declining, what specific actions will enable increased production from nonindustrial private lands?

Answer. In recent decades technical assistance and financial incentives (cost sharing) provided by Federal Government forestry programs, such as the Forestry Incentive Program (FIP), the Environmental Quality Incentives Program (EQUIP); formerly the Agricultural Conservation Program (ACP), and the Stewardship Incentive Program (SIP) have accounted for between one-third and one-half of all tree planting on nonindustrial private forest lands.

Through State and Private Forestry programs professional assistance is made available to nonindustrial private forestland owners to implement Best (forestry) Management Practices to help landowners achieve their resource management objectives while maintaining or improving the quality of the Nation's environment and supply forest products.

We are increasingly focusing on working with private landowners to develop Forest Stewardship Plans.

The President's budget maintains, at the fiscal year 1997 level, funding for technical and financial assistance to nonindustrial private forest landowners to develop long-term Forest Stewardship Plans to guide the management of their forests and related resources. The President's budget significantly increases the level of financial assistance available to nonindustrial private forest landowners to implement multi-resource forest management practices, including reforestation and forest improvement practices.

Questions. (a) What was the state by state breakdown of funds provided under the Stewardship Incentive Program for fiscal year 1995-97? (b) What is the planned aggregation of fiscal year 1998 funds? (c) Based on projections, what are the long term effects on future timber production from this program which are attributable to the increase in requested funding? (d) How many additional landowners will benefit from the proposed increased funding level?

Answers. (a) Refer to attached data tables that show the fiscal year 1995-97 breakdown. (b) The planned allocation of fiscal year 1998 funds will include: (1) a base funding level based on the number of States in each Forest Service Region and the Northeastern Area, and (2) a distribution based on the number of nonindustrial private forest land owners and acres in each state. (c) The Stewardship Incentive Program (SIP) has nine approved practices of which several are very critical for future timber production. The first practice (SIP-1) is Management Plan Development which provides cost share incentive to landowners to develop a management plan for their forest land. This is important because it educates landowners about the need to harvest timber along with the management of other resources on their land. Over one-third of Stewardship landowners have stated that if it had not been for the broad based appeal of the overall Forest Stewardship Program, they would not have harvested timber. The second practice (SIP-2) Reforestation and Afforestation and the third practice (SIP-3) Forest and Agroforest Improvement are both critical to future timber production and directly result in increased timber volume. The tree planting practice will help insure a continuous supply of forest products and the forest improvement practice will help insure forest stands are growing quality timber and fully utilizing the site.

The proposed SIP budget will allow the Forest Service to fulfill part of the larger demand for cost-sharing assistance to implement multi-resource practices on non-industrial private forest (NIPF) lands. Multi-resource practices will be implemented on over 277,850 acres of NIPF lands, including 26,700 acres of tree planting and 26,865 acres of timber stand improvement practices. Sixty percent of the funding will go for tree planting and forest stand improvement which contribute to long term timber productivity on NIPF lands. [d] Approximately 3,900 additional landowners will benefit from the increased funding level.

Question. The Administration is placing significant emphasis on Forest Health. How will this emphasis translate to program emphasis in fiscal year 1998 versus emphasis 5 years ago? In other words, specific programs and funding levels existed 5 years ago as compared to the fiscal year 1998 budget proposal, for those significant Forest Health programs?

Answer. In the past, pest prevention and suppression activities have been the primary focus of our Forest Health Management program. Today, we have a broader focus for forest health programs. In fiscal year 1998, we will continue to emphasize our surveys and technical assistances, including the Forest Health Monitoring program. A high priority will be to have better information on forest health problems and influence implementation of resource management decisions that will restore the health of the nation's forests, emphasize prevention and reduce suppression needs in the long run. Our past success in eliminating frequent low-intensity

wildfires has led to conditions of dense accumulation of underbrush and over-crowded stands. These conditions render forests highly susceptible to large damaging fires, insects, and diseases. We intend to substantially increase fuels management and thinning in these areas.

Question. The American Forest and Paper Association states that 59 percent of timberland is in private ownership (not including timber industry ownership). What statistics are available to identify how the Stewardship Incentive program improved productivity from these lands?

Answer. Timber harvesting without adequate consideration for regeneration is the single greatest threat to productivity on nonindustrial private forest (NIPF) ownerships. The Stewardship Incentive program increases the participation of nonindustrial private forestry land owners in reforestation, afforestation, and preharvest planning. It helps them do forest stand improvement activities, which includes: thinning; weed control; the use of prescribed fire; hazardous fuel reduction; insect and disease protection; and stand regeneration.

The landowners activity under SIP also helps protect watersheds, water quality, forest health, aesthetics, and helps meet short and long-term national demands for wood products in a sustainable manner.

FOREST LEGACY PROGRAM

The Forest Legacy Program is proposed for a \$4 million increase, which is double the fiscal year 1997 amount.

Question. How will passage of the 1996 Farm Bill directly affect this program? Will there be a significant amount of easements or purchases which will be vested in State or local governments? Is the requested increase solely attributable to passage of the 1996 Farm Bill, or are there other initiatives planned for this increase?

Answer. The passage of the 1996 Farm Bill greatly increased the flexibility of the Forest Legacy Program and strengthened the partnerships that are essential to its effectiveness. Many States are using the 1996 Farm Bill authority to take over and complete acquisitions begun by the Forest Service. It appears that most future projects will be done under State acquisition authority with the assistance of a federal Forest Legacy grant. Prior to the 1996 Farm Bill passage there was demand for funding in excess of what was available, and this remains true today. There are no other initiatives planned for this increase in funding. The funds will be used to complete identified projects, most often using the State grant option available under the 1996 Farm Bill.

FOREST AND RANGELAND RESEARCH

The agency's budget proposal for this program remains at the approximate funding level received in the past two years.

Question. What significant research activities will be forgone as a result of this budget proposal?

Answer. The Forest Service Research program is leveling out from the turmoil resulting from the fiscal year 1996 reduction. We have been able to maintain the highest priority research needs to address the Nation's natural resources.

Question. How have the priorities for the research budget changed from that proposed in Fiscal 1997?

Answer. The Forest Service remains committed to maintaining a strong research base capable of addressing the Nation's many competing priorities. Because most of our research is long-term, making significant changes in our priorities in 1 year is difficult.

Question. Approximately 15 percent of Research funds are utilized for Grants and Agreements. How has this percentage changed over the past 5 years? What are the priority emphasis themes for projects being financed through grants?

Answer. Our extramural research funding levels are determined by two major factors, the work needed to accomplish our mission in a given year and the level of funds available for that year. Over the past 5 years our extramural research level has decreased.

Even with an overall reduction in the extramural program, records from the Current Research Information System (CRIS) indicate that while less research is being conducted in field of biological science (54 percent in fiscal year 1992 vs. 49 percent in fiscal year 1996) there is a corresponding increase in the field of environmental biology (27 percent in fiscal year 1992 vs. 31 percent in fiscal year 1996) and a slight increase in sociology (1 percent in fiscal year 1992 vs. 3 percent in fiscal year 1996).

Question. The forest inventory program currently operates on a 10–12 cycle. What would the cost be to the program of conducting the inventory on a 5-year cycle? An 8-year cycle?

Answer. The current Forest Inventory and Analysis (FIA) program is on a 12-year national cycle with funding of \$16 million dollars. The funding required to achieve a 5 year cycle is \$38 million dollars. The funding required to achieve an 8 year cycle is \$24 million dollars.

Question. What has been the historic 5 year expenditure in each of the following programs: forest inventory; global climate change; and forest health monitoring.

Answer. Figures for forest inventory (FIA), global climate change (GC), and forest health monitoring (FHM) are as follows:

[In millions of dollars]

Fiscal year	FIA	GC	FHM
1993	16.2	24.2	2.3
1994	16.3	24.2	2.6
1995	15.9	24.2	2.6
1996	16.4	17.5	1.6
1997	16.4	16.9	1.6

In addition, the Forest Health Monitoring (FHM) program receives support from other appropriations in the Forest Service as follows:

[In millions of dollars]

Fiscal year	Federal lands	Co-op lands
1993		0.6
1994	0.6	.7
1995	1.0	.7
19965	.7
1997	1.2	3.2

Question. The development of remote sensing and satellite technologies have the potential to transform the Forest Inventory and Analysis data collection process. What plans are underway for the Forest Service to work collaboratively with the Department of Energy, National Aeronautic and Space Administration (NASA), and the National Oceanic and Atmospheric Administration (NOAA) in deploying and utilizing their technological advancement and applied research to forest inventory?

Answer. FIA is currently pursuing many promising possibilities in the area of remote sensing. The Department of Agriculture is purchasing 30 meter Thematic Mapper (TM) data sets for the 1970's, 80's, and 90's. This data can be used in the first phase of our inventories to estimate forest area. In several States we are working with the Fish and Wildlife Service GAP program. The GAP program is a program of the National Biological Survey to identify where gaps in habitat type exist. In Alaska, we are working with Earth Resources Observation Systems (EROS) data center to investigate opportunities for more efficient inventories. We are also reviewing techniques used in the NOAA Coast Watch program to evaluate cooperative opportunities. We have scientists at the Northeastern and Rocky Mountain Research Stations looking at ways to link our ground-based point data to remote sensing data to develop ground registered maps as a spatial analysis tool.

Other promising opportunities include scheduled meetings with the Navy to assess aerial based Synthetic Aperture Radar and with NASA to look at Vegetation Canopy Lidar (low-power laser technology) to develop a 3-dimensional vegetation profile for estimating biomass.

Question. The budget justification discusses the continued demand for wood fiber by referring to “the residential building industry, which is dependent on forest products.” In addition, the committee has received testimony relative to the need to increase utilization of metal and wood sites for construction purposes. To what degree is Forest Service Research involved in the development of alternative wood products research (plastic/wood composites, metal framing, etc.) which if developed could contribute to America’s environmental health while stabilizing demand? What is the long term prognosis for the use of such products?

Answer. Forest Service Research, through the Forest Products Laboratory in Madison, Wisconsin and other field laboratories, is contributing to improving America's environmental health through our recycling research program. Research is contributing significantly to mitigating increased demand for wood products by providing for reuse and recycling of wood and paper. We are developing new technologies, such as composites made from recycled wood and paper, in combination with plastics or inorganic compounds, to produce products that can be used in housing. Not only does recycling decrease use of raw wood products, but it also reduces the need for solid waste disposal space.

The forest resource is changing. Many of the forests consist of dense, overstocked stands with smaller diameters and of mixed species and quality than traditionally used. Particularly in the West, many of these stands are at risk from insect and disease infestation and from intense wildfires. New ways of using this low-value timber to produce wood-based products for housing, such as composite panels and lumber, are also helping to defray the costs of ecosystem restoration. Some specific examples include: (1) Evaluating the potential to use small diameter material for structural systems such as trusses, laminated veneer lumber, and oriented strand board; (2) Developing new methods of connecting smaller pieces of wood together to make larger dimension lumber; (3) Developing appropriately-scaled technologies for drying and processing this low-valued material in cost effective ways.

Cost comparison of wood framing versus steel framing indicates that steel becomes competitive when lumber is generally above \$500/mbf. Steel systems in residential construction have been boosted by the inclusion of light-gauge steel framing prescriptive standards in some codes. However, some analysis indicates that if increased insulation costs for steel framing is considered, steel studs may not be cost-effective. Although some builders are moving to steel studs, others have switched back to wood when lumber prices fell below \$500/mbf. The wood/plastic composites market is expected to be speciality products, instead of commodity products. We anticipate that wood/plastic composites will be used in housing applications primarily in doors and windows, interior molding and trim, on interiors and perhaps in siding and roofing. We estimate that wood/plastic composites will occupy about 10 to 15 percent of this wood market by 2000. Other new composites for housing expected to make major advances are wood I-joists and laminated veneer lumber (LVL).

Question. Significant forest and rangeland research is performed by industry and universities in addition to the Forest Service. What amount of funding by the Forest Service is involved in cooperation with industry and universities in performance of the many important research functions? Is information uniformly shared with these agencies?

Answer. The research needed to complete our mission and the appropriation level we receive play major roles in determining the funds available for our extramural research efforts. Extramural research expenditures averaged \$24 million dollars the past 5 years, approximately 13 percent of annual appropriations.

Information developed as a result of our cooperative efforts is available to the public in formats such as publications, symposia, meetings and the internet.

The USDA Current Research Information System (CRIS) contains synopses of all federally funded research. CRIS can be accessed electronically by anyone. One use of CRIS information is to minimize duplication in research activities.

Question. As a result of budget reductions the agency obtained Reduction in Force (RIF) authority to significantly reduce the size of the Research organization. To what degree did expected reductions occur? Was a RIF actually implemented? If not, what actions were taken to bring program spending in line with spending authorizations? Are units with the agency possibly facing RIF?

Answer. The Forest Service Research (FSR) organization has decreased its workforce by approximately 9 percent since the beginning of fiscal year 1996. On October 1, 1995, the work force numbered approximately 3,104 employees, an estimated 78 percent of which were permanent and the remaining 22 percent in temporary appointments such as term and post doctoral. As of April 1, 1997, the work force is comprised of approximately 2,765 employees, with the ratio between the permanent and temporary work force remaining essentially unchanged.

Due to an 8 percent reduction (\$15.5 million) in the Forest and Rangeland Research appropriation in fiscal year 1996, FSR anticipated a Reduction in Force (RIF) of approximately 70 people. Only 13 people were actually terminated through the RIF process. FSR avoided other RIF actions and reduced the size of its work force through an aggressive and organized outplacement effort which included use of the Agency's Employee Placement System, early out and buyout authorities as incentives to retire, directed reassignments, and outplacement to other government agencies and the private sector.

Given the President's Budget funding level, we anticipate the possibility of using RIF authority in one additional case during fiscal year 1997 (at the North Central Station headquartered in St. Paul, MN).

The effort to bring program spending in line with spending authorizations also included reductions in travel, training, awards, and minor purchases; leaving funded positions vacant; and closing or consolidating offices. During fiscal year 1996 offices were closed in Fairbanks, AK; Bend, OR; Carbondale, IL; Orono, ME; Macon, GA; Gulfport, MS; and Gainesville, FL. Offices were consolidated in Oxford, MS, and New Orleans, LA. In fiscal year 1996, we projected costs associated with the closures and consolidations to be about \$702,500. This includes the costs of transfers of station, building repairs and maintenance in anticipation of transfers or sales, and administrative costs of transfers of ownership.

Any changes to the President's Budget will have immediate personnel consequences. Each \$1 million reduction will affect 19 people, up from 15 people 3 years ago—a reflection that non-personnel costs have already been aggressively reduced.

NATIONAL FOREST SYSTEM

Forest health

Forest Health is a major emphasis item for the Forest Service.

Question. How is this emphasis [forest health] compatible with and how does it contrast with restoring and preserving the economic health of communities which rely on the National Forests?

Answer. An emphasis on forest health is not only compatible with restoring and preserving economic health of forest-dependent communities, it is essential to the long-term sustainability of such communities. A clear example is the reduced risk of catastrophic wildfire associated with improved forest health in many areas, which can eliminate major parts of the resource base of the community as well as threaten its very existence. Reducing the risk of fire will often involve removal of commercially valuable timber which can be of direct benefit to the local economy.

Likewise, the social, economic, and environmental condition of local communities directly influences the health of the Nation's forests. Many communities depend on forest resources to maintain and improve their economic well-being. In order to use resources wisely and understand the integral connections between the bio-physical and the socio-economic worlds, many community-based organizations are taking an active role in the discussions and actions aimed at improving forest health.

Through the Economic Action Programs (EAP), the Forest Service is working with hundreds of rural communities to develop job skills, technology, businesses, educational and leadership programs, and collaborative methods for community-based stewardship of natural, cultural, and historic resources. Through local action teams and the Economic Recovery program, a component of the EAP, the Forest Service is using a strategic approach to assist rural communities throughout the country to develop broad-based plans and to take an active role in natural resource issues on private as well as federal lands. The capacity building in the communities results in more effective interaction with natural resource managers as well as economic diversification and increased self-sufficiency.

Question. How does the term "Forest Health" imply management actions which are different than past practices of sound land stewardship? What specific land management actions will occur under the Forest Health initiative that would not otherwise have occurred as a normal course of business over the past 5 years?

Answer. Management actions taken by the Forest Service to enhance forest health, now and in the future, will be consistent with sound ecosystem management principles. In some areas in the western United States, our past success in eliminating frequent low-intensity wildfires has led to conditions of dense accumulation of underbrush and over-crowded stands. These conditions render forests highly susceptible to large damaging fires, insects, and diseases. We intend to substantially increase fuels management and thinning in these areas.

LAND MANAGEMENT PLANNING

Land management planning is proposed for a \$3.9 million increase. Beginning with 1998 the National Forests are beginning the process of land management plan revision.

Question. The fiscal year 1998 budget proposal will support the revision of 4 national forest plans and the initiation of revision for 58 additional forest plans. With 81 of the 123 total national forest plans facing revision by 2002, how will future land management planning budget requests be affected?

Answer. Based on the earliest experiences the Forest Service has had with Forest Plan revisions in the National Forests of Texas, the Francis Marion (SC), the Black Hills (SD), the Targhee (ID), and the Rio Grande (CO), estimated costs per revision are about \$500,000 per year for 4 years. Between fiscal year 2000 and fiscal year 2002 we expect to have some 70 revisions underway each year. Future budgets will continue to reflect the best balance of priorities.

Question. Federal court rulings based on the Federal Advisory Committee Act have resulted in delays to such significant "eco-region" planning efforts as the President's Northwest Plan and the Sierra Nevada Ecosystem Project. Other projects such as the Tongass Land Use Management Plan and the Interior Columbia Basin Ecosystem Management Project may be affected. What other significant projects could also be affected?

Answer. No perceived delay was realized as a result of the December 31, 1996 District of Columbia Appeals Court ruling that the Sierra Nevada Ecosystem Project was subject to the requirements of the Federal Advisory Committee Act. The Sierra Nevada Ecosystem Project Report was released in June of 1996.

The Forest Service intends to conduct activities related to the Tongass Forest Plan, the Interior Columbia Basin Ecosystem Management Project, and others in such a manner that Federal Advisory Committee Act provisions will not be violated. Federal Advisory Committees will be chartered when it is appropriate to do so.

Questions. (a) Can it be expected that larger "eco-region" planning efforts will reduce the number and complexity of forest plans which will require revisions? (b) If so, what are the anticipated effects and efficiencies?

Answers. (a) These large planning efforts which often result in multiple forest plan amendments, will not reduce the number or eliminate the requirement to revise forest plans on a 10-year cycle or at least every 15 years as required under NFMA. Ecosystem assessments will, however, reduce the complexity of the forest planning effort. (b) The major efficiency is that cumulative effects questions are largely addressed by the assessment. This allows forest planning efforts to focus on how the individual plan fits within the broader context identified by the assessment. Assessments now provide this perspective, and reduce the burden on individual forests to address cumulative effects.

Other major effects from assessments include the efficiency of collecting common data for the participating land ownerships in the project and the active support of key science personnel in reviewing federal management strategies. Collection of common data is usually a first step to enable different land entities to effectively communicate and develop management approaches based on a common framework. The involvement of key scientists on the assessment teams also ensures the assessment itself will have scientific credibility in addressing key questions.

Within the past year, final reports have been issued by the three major eco-regional assessments which have been ongoing for several years. These reports are the Interior Columbia Basin Ecosystem Management Project Report, the Sierra Nevada Ecosystem Project Report, and the Southern Appalachian Assessment Report.

Question. How has the Forest Service begun to incorporate the information contained in these reports into Forest Plans within the areas covered by these reports?

Answer. Two draft environmental impact statements have been prepared utilizing information from the Interior Columbia Basin Ecosystem Management Project Report. Future decisions associated with these two statements will amend up to 74 Forest Service and BLM management plans. These two documents were distributed the week of June 9 of this year, with final documents expected 1 year later.

Available information from the Sierra Nevada Ecosystem Project was considered in the development of the California Spotted Owl preliminary Revised Draft Environmental Impact Statement, which will significantly amend ten forest plans.

Information contained in the Southern Appalachian Assessment is currently being utilized in the revision of five forest plans. Information in this assessment will form the basis for the issues and forest plan decisions that will be examined during the plan revision process.

Question. How have project plans and management activities changed because of these reports?

Answer. Ecosystem assessments have brought about a major change in project planning as a result of focusing increased attention and concern for the ultimate condition of the ecosystem. In the past, projects were usually designed primarily to accomplish a particular goal of delivering goods and services to the public with a disclosure of environmental effects. Today, projects are designed with a major consideration of how long-term ecosystem health will be affected by the project, while also providing certain goods and services. Assessments have highlighted the effects that certain kinds of projects and activities may have on the ecosystem. Assessments have aided understanding of relationships among forests within similar

ecosystems and across ownerships. They have provided managers with vital resource information for informed decisionmaking.

Question. How does the Forest Service plan to incorporate the findings of these reports into its daily management and planning activities?

Answer. The results of the assessments will be used as a management tool that will help guide, as appropriate, the daily management and planning activities in two ways: (1) change or affirm management direction in land and resource management plans; and (2) reconsider or validate appropriate site-specific projects to implement plan direction. In the first case, land and resource management plans may be amended (or in the case of the Southern Appalachian Assessment, revised) to change or add goals, objectives, standards, or guidelines that set the framework for future site-specific, project-level management activities. These plan level decisions may affect the type, design, location, and timing of projects proposed to implement the new plan direction.

In the second case, land and resource management plan direction may be compatible with the results of the assessment, but new information about how the ecosystem responds to particular management activities may be helpful in improving the method, design, or timing of projects proposed to implement plan direction.

Question. Salmon recovery is a major issue in the Pacific Northwest. What cooperative efforts and through what specific programs is the agency assisting other federal, state and local agencies in this recovery program? How much funding has been spent relative to salmon recovery in the past 3 years?

Answer. The Forest Service uses a number of cooperative efforts to accomplish salmon recovery in the Pacific Northwest. The Northwest Forest Plan (NFP) includes a comprehensive watershed restoration strategy designed to improve entire watersheds inhabited by salmon. The NFP places strong emphasis on Federal/State agency cooperation and on local coordination and involvement in whole watershed restoration. A second major cooperative effort for salmon recovery is the Northwest Power Planning Council's Columbia River Basin Salmon recovery program. The Council's effort affects 10 National Forests. Through the Columbia River Basin Andromous Fish Policy (1992), the FS committed to helping achieve a doubling of salmon runs in the basin and is involved in cooperative planning, restoration and monitoring/evaluation. Finally the FS is an active partner in a variety of State sponsored restoration initiatives. The most notable recent example is the Oregon Coastal Salmon Restoration Initiative developed to recover coastal stocks of coho salmon. This was an interagency effort spearheaded by Oregon Governor Kitzhaber. The FS has been actively involved in its development and has made a number of commitments including active participation and cooperation in the restoration of coastal watersheds. Similar efforts are soon expected to broaden the scope of this effort to most of Oregon and Washington.

On a local level, many District and Forest fishery biologists provide technical support to watershed councils. Watershed councils are increasingly viewed as the key to generating grassroots support for salmon recovery.

The FS, Pacific Northwest Region has expended approximately \$23,000,000 per each of the last 3 years for salmon habitat restoration activities.

The Table below illustrates the approximate distribution of these funds by broad program area. The table includes Trust Funds (for example, KV) that contribute to meeting restoration objectives. Not included are a variety of funds, which indirectly benefit salmon habitat restoration, such as funds for road/trail and recreation maintenance and construction, land acquisition, etc.

PACIFIC—NORTHWEST REGION

Program area	Expenditures by fiscal year—		
	1995	1996	1997
Coordination and habitat management	\$4,505,000	\$3,695,000	\$3,420,000
Jobs in the Woods	11,100,000	11,000,000	11,176,000
Mid/Upper Columbia River restoration	2,350,000	1,300,000	1,900,000
Subtotal	17,955,000	15,995,000	16,496,000
Trust Fund Program	¹ 6,500,000	6,890,000	6,715,000
Total	24,455,000	22,885,000	23,211,000

¹ Estimated expenditures for trust funds for fiscal year 1995.

Question. During the fiscal year 1997 appropriations hearing, Mr. Lyons stated that in the year 2000, recreation will contribute \$97.8 billion to the U.S. economy, while timber will contribute only \$3.5 billion. The Subcommittee staff has reviewed a January 1997 report from three PhD.s with natural resource economics expertise which strongly disputes this contention. The report states that timber related functions will provide 2.25 times the economic contribution that recreation, wildlife and fish programs combined will provide. Please provide a detailed analysis of this report with specific attention to the contribution of timber to the Gross Domestic Product versus the contribution of Recreation. Please identify the basis for the statements made by Mr. Lyons and specifically how his contentions differ from those presented in the January 1997 report.

Answer. The basis for Mr. Lyons' statements about the contributions of recreation and timber to the gross domestic product is the economic analysis of job and income effects displayed in the Draft 1995 Forest and Rangeland Renewable Resources Planning Act (RPA) Program. This analysis estimated the jobs and income (defined as contributions to gross domestic product) that can reasonably be associated with Forest Service activities and outputs from the National Forests, as anticipated for the future based on the proposal in the Draft 1995 RPA Program. The January 1997 report referred to by the Subcommittee differs from the Forest Service analysis in three main areas: 1) the analysis in the January 1997 report includes only a fraction of the anticipated Forest Service recreation use (assumed recreation use estimates are too high, reduced local use, and reduced use based on the assumption that use would decrease if a fair market value fee was charged); 2) timber effects are all calculated at end use in residential construction, rather than at the sawmill or pulp-mill (Forest Service estimates about 60 percent of volume harvested is used in housing construction); and 3) the timber effects are estimated in a national model. Regarding the first two points, we believe the assumptions and procedures used in the Forest Service analysis for the Draft 1995 RPA Program were appropriate given the purpose and focus of that analysis. Regarding the third point, we do plan to use a national model for estimating timber impacts for the Recommended RPA Program. The Subcommittee has been provided a paper that provides a more detailed evaluation of the January 1997 report and how they differ from the Forest Service approach used in the analysis of the Draft 1995 RPA Program.

The economic impact analysis of the Draft 1995 RPA Program provides measures of the total value or importance of economic activities associated with Forest Service resource outputs. We believe it is important to stress that neither of the economic impact analyses should be used as the basis for budget allocation or investment decisions, since these analyses were not designed for those purposes. Nor does the analysis suggest that production of a variety of uses is not compatible or desirable. Other types of analysis are needed to inform investment and budget allocation decisions, such as marginal analysis that looks at the effects of changes in levels of investment. All Forest Service programs have value and importance to the Nation and to local communities. Various measures are needed to represent such values and importance.

FOREST SERVICE DECISION MAKING PROCESS

The Forest Service's decision making process is a critical function; but it is costly. In the past 20 years, the Forest Service has spent over \$20 million developing multiyear plans for managing timber production, livestock grazing, recreation, fish and wildlife habitat, and other legislatively mandated uses on national forests. The Forest Service also spends about \$250 million per year for environmental studies to support individual projects. However, according to an internal Forest Service report (Final Report of Recommendations: Project-level Analysis Re-engineering Team 11/17/95), inefficiencies within this process cost up to \$100 million per year at the project level alone. Critics state that by the time the agency has completed its decision making process, it is often unable to carry out the plans because of changes in natural conditions and funding, or new information and events.

Question. What actions were recommended in the internal Forest Service study to reduce the inefficiencies within its decision making process?

Answer. The NEPA Re-engineering study was a Region 8 and 9 effort completed in November of 1995. This report was presented as a draft report for use by the agency as a whole. The Forest Service has used this study in guiding improvements to the NEPA process. The report contains ten recommendations as follows:

1. Limit NEPA analysis to discretionary Forest Service actions that may have an effect on the quality of the physical and biological environment.
2. Address landscape issues at appropriate levels and incorporate analyses into either Forest Plan or project-level decisions.

3. Maintain a centralized system of environmental information that is useful and easily accessible to project analysis teams.
4. Eliminate redundant analyses; focus on what is new.
5. Use existing analyses to support new decisions when possible.
6. Develop alternatives in environmental assessments only when there are unresolved conflicts.
7. Expand categorical exclusions and develop new categories based on ecological units and thresholds of acceptable change.
8. Accept appeals as legitimate way to resolve substantive conflicts.
9. Limit appeal standing and appeal points to substantive issues raised in written comments during public comment periods.
10. Use litigation proactively to support Forest Service NEPA policy.

Current laws provide the authority to implement each of these recommendations, with the possible exception of recommendation number 9.

Question. Has the Forest Service acted on the recommendations in the internal study?

Answer. The following actions are being taken by the Forest Service based on the internal study recommendations:

1. Link NEPA analysis to discretionary FS actions (i.e. those actions for which we have primary authority, as opposed to those actions for which we provide input to other federal agencies but do not have primary authority.)

The FS Manual and Handbooks are being changed to reflect what environmental analysis and documentation is required and not required for many agency activities. Examples are: (1) special use permit re-issuance, (2) use of roads by contractors, (3) road maintenance by State agencies, (4) granting rights-of-ways across NF lands, (5) FERC re-licensing, and (6) grazing permit issuance.

2. Address landscape issues at appropriate scales (e.g., an issue pertinent to an entire region should be addressed at a regional scale, while one pertinent only to a smaller geographic area should be addressed at that scale)

A number of landscape assessments have been or are being prepared over the next few years. These assessments will serve as a basis for environmental analyses that can be incorporated by reference into Forest Plan and project analyses. These Ecoregional Assessments include: Interior Columbia River Basin, Sierra Nevada, Ozark-Ouachita Highlands, Great Lakes, Northern Great Plains and Southern Appalachian.

3. Maintain a centralized system of environmental information. The FS has initiated a number of initiatives to improve availability and useability of information. The Resource Inventory and Monitoring Institute is now housed in Ft. Collins, CO to develop better procedures for integrating monitoring and inventory into decision making. A Common Survey Data Structure (CSDS) effort is underway to standardize data protocols for resource information throughout the agency. The protocols from the Monitoring Institute and CSDS will allow integrated data bases to be shared among Regions and agencies. Additionally, a pilot CD ROM test is being performed in fiscal year 1997 to organize a centralized collection of administrative appeal decisions, NEPA case law, and NEPA "good" examples for use by the field.

4. Eliminate redundant analyses. As the FS moves towards full use of the new 615 computer equipment and network, it will be possible to immediately share and retrieve environmental analysis done anywhere within the agency. The 615 technology is being tested on the Kootenai National Forest to demonstrate efficiencies gained in environmental analysis and documentation. The pilot testing includes Geographical Information System (GIS) analyses, direct transfer of analysis tables, matrices, and graphics to environmental document, and realtime public review of computer analyses. The Kootenai has estimated considerable savings in document preparation time, as much as 20 to 40 percent.

5. Use existing analyses to support decisions. The agency has developed a Decision Protocol that incorporates this action item. Pilot applications of the Protocol within each Region are showing reductions in information gathering costs as high as 40 percent.

6. Develop a more limited set of alternatives. The Agency's Decision Protocol incorporates this action item. The environmental issues are addressed through mitigation where possible, unresolved conflicts about resource allocations are being used to focus the alternatives. Regional offices also are working with forests on ways of reducing the number of alternatives without compromising quality environmental analysis.

7. Expand Categorical Exclusions. The NEPA Handbook is being changed to: (1) expand the scope of categorical exclusions; (2) clarify the application of extraordinary circumstances; and (3) permit Regions to establish categories specific to local conditions. The categorical exclusions are being coordinated with the BLM to ensure

greater consistency between the two land management agencies. A draft of proposed categorical exclusions is scheduled for fall 1997.

8. Accept appeals as a way to resolve conflict. Alternative dispute resolution is being tested in connection with range appeals to allow for better communication, than our current system allows, between the Forest Service and appellants. This technique may be tried in other areas depending on the nature of success.

9. Limit appeal standing and points of appeal to substantive conflicts. No action to date. Concerns exist that this will not be in conformance with the Administrative Appeal Law and would require a change in legislation for the Forest Service.

10. Use litigation proactively to support NEPA policy. The Office of General Counsel has written a number of papers that spell out the legal strategy to support forest planning, project planning, tiering, and unavailable and incomplete information. The OGC has engaged in a series of discussions with CEQ and DOJ on the scope of Forest Plans, application and timing of ESA with NEPA and application to Forest Plans. This dialogue will continue.

Question. If actions have been taken on the recommendations in the internal study, how much has the Forest Service saved in terms of appropriations and time as a result of implementing the recommendations?

Answer. Savings and efficiencies are being made as improvements are implemented. Initial estimates of savings on environmental analysis have been estimated as high as 20 to 40 percent depending on the project. Improvements address many different aspects of the environmental analysis and project approval, including how we process special use applications, how we address range allotment analyses, earlier and streamlined consultation with regulatory agencies, consideration of increasing situations where Categorical Exclusions are appropriate and limiting the purpose and need for action. It is difficult to assess cost or time savings from any one action. We will continue to make improvements and over time will be able to estimate savings in a meaningful way.

INTERIOR COLUMBIA BASIN ECOSYSTEM MANAGEMENT PROJECT

This effort has required extensive collaboration between agencies. The Draft Environmental Impact Statements are scheduled for release in early 1997.

Question. What permanent cooperative arrangements can be expected between the Forest Service and the Bureau of Land Management which will reduce costs and promote efficiency?

Answer. No permanent cooperative arrangements have been put in place at this time. While it is premature to know the specifics of what topics will be subject to any cooperative agreements, we expect some attention will be focused on field monitoring and data collection and storage; on watershed analysis and sub-basin reviews as part of implementation of this strategy, long-term consistency in application of standards and objectives, and that in some cases the agencies will share personnel.

Questions. (a) How have the respective missions of the Fish and Wildlife Service and the National Marine Fisheries Service benefitted this process? (b) Have there been any negatives to this cooperative effort?

Answers. (a) The involvement of these two agencies and the Environmental Protection Agency has been to ensure that broad-scale ecosystem management strategies comply with environmental laws like the Clean Water Act and the Endangered Species Act. A second benefit has been to develop interagency partnerships that will facilitate future implementation. (b) No. While the draft EISs took longer than expected to produce, we believe the documents are much stronger than they would be otherwise, and there is a stronger commitment from all involved agencies.

Question. What level of participation has occurred with State and local governments in the planning process?

Answer. Early involvement of other federal agencies and county and state governments is a highlight of this project. Counties and States have been involved from the early stages. Four state associations of counties formed the Eastside Ecosystem Coalition of Counties in 1994 to keep informed and involved in the project and its progress. A memorandum of understanding between the Project Managers and Eastside Ecosystem Coalition of Counties was signed in 1995. Mutual benefits have been gained from sharing different perspectives, data, and information. A June 30, 1995 letter to U.S. Senator Mark Hatfield, the Association of Oregon Counties states:

"This is the first time a multi-state county group has participated directly and from the beginning in a significant federal resource management planning process. There will likely be a positive impact on the federal work product, and a foundation has been laid for genuine, long-term improvements in federal/county communica-

tion. The National Association of Counties is following progress closely, because EECC is creating the model for county involvement in other regions.”

Other key developments from this project are new relationships established with tribal governments. Significant time and energy has gone into building trust and working relationships with more than 20 separate tribal governments in the project area. Past experiences have made these tribes skeptical of the ability of this project to produce results. Tribes have not been involved in early stages of a project in the past, and were not prepared with money or people to react quickly. The benefits of the relationships established are valuable and necessary for the future.

The project involved state, tribal and local governments and Resource Advisory Councils and Province Advisory Committees in a process to help identify the preferred alternative. Meetings and presentations to these governments and advisory groups occurred beginning in the summer of 1996, and continued into the winter of 1997. These relationships form the basis for cooperation which can depolarize divided opinions about conservation and management that now exists.

Question. Within the alternatives being considered please identify the commodity outputs being analyzed under each alternative.

Answer. The potential outputs from the various alternatives are displayed below. While potential outputs are displayed, the decisions for the ICBEMP will not change the outputs identified in current land management plans; such changes will occur, as needed, in future plan revisions.

COMMODITY OUTPUTS FOR EASTERN OREGON AND EASTERN WASHINGTON

[Eastside draft]

	Estimated—

RECREATION

The focus of the recreation program in fiscal year 1998 centers on universal designs for accessibility; the heritage program; implementing new legislation on permit fees for ski areas and the Recreation Fee Demonstration sites; emphasis on special recreation areas including wilderness and wild and scenic rivers; preparing for the 2002 winter Olympics; and testing the Public-Private Venture concept.

Question. Please provide a listing of the cooperative recreation projects which the Forest Service intends to spend \$15 million to perform in fiscal year 1998; and an identification of the sources for the estimated \$32.5 million in cooperative funds.

Answer. Although we have not identified fiscal year 1998 partners for specific projects, the following list provides a few examples of current projects types and partners:

Georgia, North Broad River Recreation Restoration

- Reconstruct campsites; construct trails, interpretive signs, and accessible fishing deck; relocate road; stabilize streambank; and enhance fish habitat.
- Partners: Georgia Department of Natural Resources, Trout Unlimited, and Wish to Fish (physically challenged group).
- Funding: FS \$9,500 Partners \$9,600.

Colorado, Colorado Fourteeners Initiative

- Construct sustainable high country trails, reclaim erosion areas, install information kiosks at two trailheads, and build a new parking area.
- Partners: The American Mountain Foundation, Volunteers for Outdoor Colorado, Great Outdoors Colorado, Outward Bound, The Colorado Mountain Club, and Colorado Fourteeners Initiative.
- Funding: FS \$53,900 Partners \$62,800.

Alaska, On Your Knees Cave

- Construct entry gate, trail, and tent platform; continue research; develop a stewardship plan; develop and implement interpretive and education programs for a newly discovered cave and archaeological site of international significance.
- Partners: Community Volunteers Association, Denver Museum of Natural History, Port Protection Association, and National Geographic Society.
- Funding: FS \$42,900 Partners \$72,320.

Utah, Huntington Watershed Restoration

- Reconstruct 67 camping sites, construct three restrooms, close and rehabilitate 25 camping sites, improve angler trails, expand the group campground, and re-establish streamside vegetation.
- Partners: Genwal Resources, Inc., Castle Country Travel Council, Carbon County, Sanpete County, Canyonlands Natural History Association, Emery County, State of Utah (Division of Wildlife Resources, Department of transportation, and Parks and Recreation), Trout Unlimited, and local Energy/Mining interests.
- Funding: FS \$90,000 Partners: \$90,000.

North Carolina, Carolina Hemlock Campground

- Drill new well; install new pump, chlorinator, and distribution system; and construct eight ADA accessible water fountains and hose bibs.
- Partners: Cradle Of Forestry Interpretive Association.
- Funding: FS \$40,000 Partner: \$40,000.

Montana, Path of the Grizzly Interpretive Trail

- Construct one half mile of trail; install benches, kiosks, and bike racks; design, fabricate and install interpretive media; and design and print education material.
- Partners: Blackfeet Nation, Meridian Aggregate, Montana Department of Transportation, Northwest Interpretive Association, Wildlife Forever, Montana Fish, Wildlife, and Parks, and The Nature Conservancy.
- Funding: FS \$13,000 Partners: \$79,000.

Oregon, Pine Ridge Day Use Mitigation

- Construct access road, 45 car trailhead and OHV staging area, restrooms, well, drainfield, and utilities.
- Partners: Oregon Department of Transportation.
- Funding: FS \$175,000 Partner \$445,000.

California, Lake Tahoe Heritage Preservation and Interpretation

- Stabilize the Newhall House, historic structure; preserve and interpret structures related to Chinese Encampment, develop and install interpretive signing on a National Recreation Trail, one of original routes into Basin, and at an historic gazebo.
- Partners: Tahoe Heritage Foundation.
- Funding: FS \$5,550 Partner \$9,750.

New Mexico, Tres Piedras Trail 41

- Construct two new one-half mile sections of trail; sign 16 miles of access roads; and stabilize, drain, revegetate, and put to bed one mile of existing road.
- Partners: Chuckwagon Trailriders, Rocky Mountain Youth Corps, and New Mexico Wildlife Federation.
- Funding: FS \$6,100 Partners \$9,460.

Wisconsin, Wilson Flowage Dike Reconstruction

- Reconstruction of two dikes on a premier waterfowl flowage with trophy northern pike fishery.
- Partners: Ducks Unlimited, Great Lakes Indian Fish and Wildlife Commission, National Fish and Wildlife Foundation, and Wisconsin Department of Natural Resources.
- Funding: FS \$20,000 Partners \$250,000.

Question. The fiscal year 1998 Explanatory Notes do not provide much detail on the costs of planning and investment in facilities and infrastructure for the 2002 Winter Olympics in Utah. What major efforts will be underway in fiscal year 1998 relative to the 2002 Winter Olympics?

Answer. Funding is provided for the following major efforts: A 4-person team to manage, guide, interface, and partner with the myriad of local, national, and international organizations to develop and implement annual plans so that Forest Service representation in the 2002 Winter Olympics is fully visible with appropriate representation. Work also continues with the Snowbasin land exchange. (\$300,000)

Salt Palace visitor information partnership; Anderson Cove/Lodgepole Campgrounds-PPV, NEPA, planning; Snowbasin land exchange; venue preparation, and natural resources conservation education. (\$426,000)

50 percent of the Regions Capital Investment Construction/Reconstruction program. (\$1.1 million)

Trail re/construction. (\$400,000)

Questions. A December 1996 GAO report stated that the Forest Service has failed to collect fair market value for a multitude of commercial and non-commercial special use permits. This issue was recently highlighted in an NBC News "Fleecing of America" episode. In that episode NBC stated that the Forest Service refused to comment about the validity of the GAO report. The agency budget justification states that recreation special uses generate \$47.5 million for the U.S. Treasury, but it does not address any changes to the system which might provide for increased revenue's on a scale comparable to similar state owned uses as referred to by GAO. The budget justification speaks to updating recreation residence fair market value by 1999 and to implementing new ski resort fee system legislation. Is it the agency's

contention that these initiatives will adequately address issues raised by GAO? Has the agency responded to the GAO report?

Answers. The Forest Service generally agrees with the report's conclusions and has so stated in its response to GAO. Many holders of special use authorizations do not pay fair market value for the right and privilege of use and occupancy of National Forest System lands. The Forest Service recognizes the importance of obtaining a better return for the use of public resources and to recover the costs for providing these recreation opportunities. It endorses the concept of placing the special use authorization program on a more business-like basis.

The Forest Service is updating its fee systems to better reflect fair market value. The question mentions recreation residence and ski resort fees as two examples. Recreation residence appraisals should be completed in fiscal year 2002. The recently passed ski fee legislation will be implemented this summer. The challenge with any fee system is balancing the benefits of retaining its currency with the administrative costs of doing so. In many cases, the Forest Service is indexing fee schedule rates to retain some degree of fair market value currency between periodically scheduled (and costly) fee structure updates. The Ski Fee legislation calls for a review in 1999 to determine if it indeed meets fair market return.

The Forest Service is developing Cost Recovery regulations as recommended by GAO. Once implemented, these regulations would recover from the permittee costs borne by the Forest Service in responding to, processing and administering permits. Implementation is anticipated in the fall of 1997.

We cannot yet predict what change our current initiatives will make on receipts to the U.S. Treasury. To do that we first need to conduct appraisal and market rent studies to determine values for the various types of uses we authorize.

Question. The agency's performance indicator for wilderness management is miles of trail available. This indicator does not speak to a measure for the amount of use by the public. What is the history of wilderness use over the past 5 years? What is the increase in number of wilderness areas created and managed over the past 5 years? As the average age of the US population increases, is wilderness use declining? How are the 26,610 miles of trail categorized in terms type of trail? Some wilderness philosophy speaks to eliminating many trails within Wilderness to make the areas even more primitive. Is the agency affected by this philosophy in terms of a standard for "miles of trail available?"

Answer. Wilderness use over last 5 years increased about 9 percent, from 13,272 Recreation Visitor Days (RVDs) in fiscal year 1992 to 14,512 RVDs in fiscal year 1996. Wilderness use appears to be maintaining a reasonably constant, to slightly increasing, level. Wilderness use is not declining as a result of an increase in average age of the population; instead, wilderness visitors are becoming more reflective of the diverse American public. Studies conducted by the Aldo Leopold Wilderness Research Institute from 1972 through 1991 note the following changes in wilderness visitors: wilderness visitors today tend to be older than those who used wilderness in the past, there is a higher percentage of women using wilderness, the educational level of wilderness users is higher than in the past, and although racial minorities are still not well represented among wilderness users, this user segment continues to grow (Cole, Watson, Roggenbuck, 1995).

From 1991 through 1995, 17 wildernesses were designated on National Forest System lands. This added 944,882 acres to the National Wilderness Preservation System, and increased the acreage of wilderness managed by the Forest Service by approximately 3 percent. While these areas are certainly worthy additions to the National Wilderness Preservation System, the change in total wilderness areas and acres managed by the Forest Service does not seem a viable indicator of management performance. The job is not to create or encourage new wildernesses, but to appropriately steward those lands under our administration.

As displayed in the budget, the 26,610 miles of trail are miles available within wilderness, in addition to 87,466 miles available outside of wilderness. The Forest Service does not have a national objective of the trail program to eliminate trails within wilderness to make the areas more primitive. Instead, trail densities and travel planning in wilderness are determined, with public participation, by resource protection and wilderness use objectives. The Forest Service is currently developing wilderness performance measures in the following areas: ecological integrity, wilderness values, public use, and special provisions and administration.

Question. The agency cites an increase in use of concessionaires by 70 percent over the past decade. What affect will this amount of recreation concessionaires have on the Recreation Fee Demonstration program? How will potential receipts be affected?

Answer. Concessionaires will continue to play a significant role in the delivery of national forest recreation services. The existing concession program will not have a

significant impact on the recreation fee demonstration program or potential receipts. The fee demonstration program encompasses only 100 projects across the entire National Forest System. More than enough project diversity exists to let the Fee Demo test a wide range of projects. Many of the projects consist of developed sites that are not concession managed. The test should enable the Agency to make a better estimate of fee potential from all sites.

As the Agency has implemented the fee demo, firm emphasis has been placed on the value of collaboratively working on demonstration project proposals with concessionaires as these projects can have an affect on the concessions business. With a significant part of the recreation opportunities on national forest land being carried out by cooperators, it is vital that we work closely with them. These cooperators not only provide direct services to our customers, maintain sites under permit, but as private businesses they also return millions of dollars into local rural economies.

Flaming Gorge NRA is an example of this collaboration. In the NRA more than 24 permit holders and the Forest Service collectively carry out the extensive level of customer services which occur at this high use site. By focusing on collaborative relationships, the NRA has successfully implemented a fee demo project with full support of every permittee—critical support in that these permittees serve common customers, return benefits to local economies, and have political representation.

In summary the Forest Service is managing both these contemporary tools—concessions and the fee demo—to compliment one another. However, these are the types of issues that the fee demo test will provide valuable information on.

Question. The Recreation Fee Demo project allows use of collections to perform recreation facility reconstruction and construction. To what degree will such collections be utilized for this purpose? What has the public's reaction been to the use of funds for this purpose?

Answer. The Agency has a vast array of projects operating under the fee demo. Some are small, others are very large. Many focus on direct customer services and facility enhancements—with a focus on repair and reconstruction of old run down facilities. However, due to the relatively short implementation period to date, few actual reconstruction projects have started. In many cases, clean up activities, painting, and cleaner restrooms are examples of immediate actions the demo projects are doing to show fee paying customers a quick benefit.

Each demonstration project has a business plan that includes a priority list of needs—how, where, and when expected fee revenue will be used for specific tasks. Also, every project has a communication plan, outlining each step needed to keep their customers informed, reach community acceptance, and help keep Congress informed of these items.

To-date the Agency is experiencing a high level of community acceptance of projects and new fees. We feel our extensive efforts to communicate and educate our customers has been critical to the success of the program.

Question. The fee demonstration program was implemented with a 3 year test period and extended for 1 year. Are projects being brought on line as scheduled? What projects, if any, that were originally planned for recreation fee demonstration may not be brought into the program due to delays?

Answer. Most projects are coming on line very close to projected start dates. Two have been dropped—one due to liability concerns associated with charging a fee in an area with known fatalities (Rim Lakes,—Apache-Sitgraves N.F.—Ariz) and one because the Poudre River Complex—Arapahoe-Roosevelt N.F., Colorado, decided to concession instead. Some projects have been delayed due to major proposal modifications based on public feedback. We expect to have 40 projects from the first 50 collecting fees by July 1, 1997. The others plan to come on line later in fiscal year 1997 or early in fiscal year 1998. The Regions are currently submitting proposals for the next 50 projects and we expect that some of these will also be ready to come on line in fiscal year 1997, and early fiscal year 1998.

Question. The recreation fee demonstration project will involve the collection of significant sums of money in several areas. What plans has the agency made to protect these funds from theft? What plans have been made to protect the safety of employees making these collections?

Answer. The Forest Service has been collecting fees in developed sites for many years. Existing Agency fiscal requirements for handling money will continue to be applied to the Fee Demo projects. Theft and employee protection are included in current procedures. Employee safety will not be jeopardized. In some projects, the volumes of cash collections are significantly larger than the Agency has experienced in those locations in the past. We are beginning to explore the use of new avenues for payment with the use of credit cards /debit payments etc. Developing innovative solutions to address the increased volume and new processes are also part of the test. Some of the areas being explored include: increased use of credit cards and

vendor sales to reduce cash handling, armored car services for cash transfer, automated vending machine pass purchase, audit and accountability guidelines for these new tools/processes, and increased law enforcement coordination.

Question. How are payments of fees being enforced at demonstration sites? What actions are being taken with individuals who refuse to or who are uncooperative in paying fees?

Answer. Local compliance programs are being established for each Fee Demo project. Most units are taking a light handed approach to fee compliance during the start up phase. "Fix-It Tickets" are being used in some places—buy your pass and no fine is assessed. A high level of compliance is critical to the success of the fee Demo program. If a significant number of visitors do not pay, visitors that do pay will not be pleased. During start-up activities at all sites, widespread communication, education and signage will be the focus. As a last resort, the law gives each Agency the authority to issue tickets with a fine of up to \$100.

Question. A recent news article (Oregonian, 3/22/97) spoke of a fee structure at the Mt. St. Helens Visitor Centers, which only allows for a multi-day pass as opposed to a single day pass. How are fee structures established at local fee sites? Is maximum flexibility being offered to the public for both short and extended stays?

Answer. The intent of the fee demo pilot is to test various fee methods and public reaction and acceptance. Each project can experiment with various fee levels and procedures. Short and long term stays are addressed in most areas by having a short stay pass of some sort—one to seven days seems to be the range, and annual passes.

At Mt. St. Helens, we are experimenting with a Monument Pass. Originally this Monument Pass was only good for one day. Based upon information received during the public collaborative process, the Monument decided that this Monument Pass would be good for an additional two days at no extra cost. This is consistent with other business approaches around the Nation. Disneyland is advertising the same concept. When you purchase the pass it will get you in the extra days for free, thereby giving them more value to the pass.

Question. What are some examples of "showcase" accessibility projects and what types of facilities were these projects developed for? What is the cost of these accessibility projects by type? What type of cooperative contributions in terms of services or funds can be directly related to accessibility projects?

Answer. The Agency has completed a number of award winning efforts in the field of Universal Access, having pioneered guidelines for outdoor recreation environments. The focus of this effort was to insure that outdoor recreation environments and activities are designed and carried out in a manner which is responsive to a diverse country, responsive to all ages, abilities, and cultures. At the same time, respecting the outdoor environment, and not taking away from this diverse user group the adventure, challenge, and enjoyment found in a spectrum of outdoor settings. This award winning effort was co-authored by the Forest Service and published in the book "Universal Access To Outdoor Recreation: A Design Guide." This publication now serves as the standard in the federal government and throughout the recreation industry for design of outdoor sites, facilities and services. This effort itself was completed through partnerships, saving the taxpayer about a quarter of a million dollars.

Similar cooperative projects have been completed in partnership with our private service providers, assisting them to develop guidelines for their service areas. These products include: Universal Access to Outfitting and Guide Services; Universal Access to Ski Areas; Universal Access Trail Evaluations; Universal Access to Wildernesses, Balancing The American's With Disabilities Act with the 1964 Wilderness Act.

These products have guided the design of new, and the reconstruction of existing facilities, and have shaped direction with cooperators permits.

Showcase examples are best found at new installations such as the El Portal Visitor Center in Puerto Rico and the South East Visitor Center in Ketchikan Alaska, where integration of Universal Access is simply a way of doing business and at no cost increase, in that it is part of the design for the facility. Other examples include sites which require retrofitting. This can be costly when replacing facilities. However, this can be combined with other reconstruction plans to resolve health and safety issues. Examples can be found at areas across the country where existing developed recreation facilities are being upgraded. While these upgraded facilities may themselves not stand out as stellar, to a youngster, parent, or adult who in the past could not participate in outdoor recreation activities because basic facilities such as restrooms were unavailable, these modest site reconstruction activities are indeed life changing and stellar!

Much of the work getting done locally is through partnerships, agreements, by volunteers, and through concessionaire site reinvestments. Also, some of the identified projects to be enhanced through the Recreation Fee Demonstration Program address accessibility items. We do not track costs separately for accessibility modifications, and these changes are seldom done alone. It is a part of the cost of the entire reconstruction project.

WILDLIFE AND FISHERIES HABITAT MANAGEMENT

Threatened and endangered species

Threatened and endangered species programs continue to be critical to the agency's mission, but controversial and challenging. The administration is requesting a \$5.5 million increase in this program.

Question. The agency budget justification speaks to "prioritizing" candidate plant, wildlife, and aquatic species and habitats. Based on agency knowledge of this process, what additional plants or animals may potentially be listed as threatened or endangered which could have a significant effect on agency programs similar to Northern/Western Spotted Owls, Marbled Murrelet, etc.?

Answer. There are 47 species proposed for listing as threatened or endangered under the Endangered Species Act that have habitat on national forests and grasslands. Twenty-seven of these are plants, most with narrow ranges. There are an additional 182 Candidate species for which the Forest Service is evaluating the distribution on national forest system lands. Species with the most potential to be impacted by our management activities such as mineral extraction, timber harvest, grazing, or recreation are wide-ranging aquatic species. The proposed or candidate species that currently are of greatest concern are the bull trout and certain stocks of inland cutthroat trout and chinook salmon.

Question. Are there species of plants or animals [sic] could soon be "de-listed" which could also have an effect on agency programs?

Answer. Two species which are moving toward delisting in all or part of their ranges are the peregrine falcon and grizzly bear. Several plant species have been delisted. After de-listing, the Forest Service and the listing agency continue with identified conservation responsibilities. Monitoring is required for 5 years following de-listing. Additionally, close cooperation with the responsible State agencies is crucial after de-listing to assure that conservation is being achieved. Impacts to the agency will come to a large extent through a reduction in the amount of time and effort spent on procedural compliance associated with section 7 consultation.

Question. On March 19 the Supreme Court issued a ruling that people whose economic interests are affected by the Endangered Species Act can bring suit against the government to stop implementation of actions to protect species or plants. How might this ruling affect some agency accomplishments, operations, and budget allocations in fiscal year 1998?

Answer. There is no way to accurately project the impact of this ruling on agency accomplishments, operations, and budget allocations in fiscal year 1998. Additional litigation may result, which carries a burden of expenses associated with technical support to legal staff as well as potential delay of projects associated with conservation of species.

ANADROMOUS AND INLAND FISHERIES HABITAT MANAGEMENT

A budget increase of \$3.9 million is requested for these programs.

Question. The agency budget justification speaks to emphasis in Region 10. What are the principle habitat restoration projects planned throughout the Forest Service for these funds? (i.e., increase of \$3.9 million within the anadromous and inland fisheries habitat management expanded budget line items.)

Answer. The increase in funding will be targeted at increasing opportunities for public use and enjoyment of inland and anadromous fisheries resources. This will be accomplished through habitat restoration and enhancement that increases the number of fish national forest streams and lakes can produce, and through improvements of angler access, fish viewing, and interpretation opportunities. Specific examples include:

- construction of fishways at salmon migration barriers;
- construction of dams to create fish ponds/reservoirs;
- liming and/or fertilization of lakes to increase productivity;
- removing or stocking fish in cooperation with states;
- construction of fishing docks/piers and boat launches;
- installation of interpretive signs and viewing areas; and
- hosting of National Fishing Week and other aquatic education events.

The majority of the increase (\$2.4 million) is within the inland fish habitat management expanded budget line item. Inland fish habitats support 90 percent of the 36.5 million days of angler effort on National Forest System lands each year. Use of inland fish resources on the national forests and grasslands generates about \$1.6 billion and provides 57,000 jobs. Additional inland fish angling opportunities can be provided at a cost of \$1–10 per angler visit, while generating local economic benefits of about \$50 per angler visit.

The smaller increase (\$1.5 million) within the anadromous fish habitat management expanded budget line item will primarily be directed to Alaska and Great Lake states where cost effective opportunities exist to increase recreational, commercial, and subsistence fishing opportunities. Although some of the increase will be directed to other geographic areas, programs are primarily focused on restoration and recovery of imperiled salmon stocks.

Question. What specific results can be expected from this increase in terms of habitat restoration?

Answer. We estimate that the increase in appropriations will result in restoration of: (1) more than 100 miles of inland fish stream habitat; (2) about 900 acres of inland fish lake habitat; and (3) nearly 100 miles of anadromous fish stream habitat.

Question. How has agency involvement in National Fishing Week changed since the program began?

Answer. The Forest Service has historically led all Federal agencies in the number of events hosted during National Fishing Week. The program is immensely popular with the public we serve and provides a unique forum to: convey a message about the importance of ensuring the health and productivity of streams and lakes; share our commitment to increasing recreational fishing opportunities; instill a shared sense of ownership and responsibility for management of public waters; and to build and strengthen partnerships.

In 1996, the agency and its partners hosted about 321 events that were attended by nearly 64,295 people. This represents a slight decrease in the number of events hosted, however, while the number of participants continues to increase. The decrease in number of events hosted is directly related to the decrease in inland and anadromous fish appropriations.

RANGELAND MANAGEMENT

The agency received an increase of \$6.5 million from fiscal year 1996 to fiscal year 1997. It is requesting an increase of \$7 million in fiscal year 1998.

Question. According to agency explanatory notes for fiscal year 1997 and fiscal year 1998 there was no change in grazing lands considered to be in unsatisfactory condition or in need of further analysis (23.5 million acres). Agency budget requests stated that increased funds will be used primarily for NEPA evaluation and implementation which could be expected to better quantify rangelands in unsatisfactory condition. Why has there been no change in this classification? What percent of allotments were evaluated in fiscal year 1997? With the agency's stated intent to complete the allotment evaluation of 2,516 allotments by the end of fiscal year 1998, what can the Committee realistically expect regarding funding requests in fiscal year 1999 and beyond for the rangeland management appropriation?

Answer. When the agency's fiscal year 1998 Explanatory Notes were prepared the final report on status of National Forest System (NFS) rangelands was not complete. The previous year's data were incorporated with the intent of substituting current data before final publication. Due to an oversight the 1996 data were not inserted into the final document. The 1996 data show that 7.8 million acres are not meeting or moving towards forest plan objectives and 13.5 million acres need further evaluation to determine status, bringing the aggregate to 21.3 million acres. This is a decrease of 2.2 million acres in these categories from 1995. Acreage figures for 1997 will not be available until late this fall.

It is estimated that NEPA analyses will be completed on 805 grazing allotments in fiscal year 1997. This represents 32 percent of the 2,516 analyses scheduled for analysis in Fiscal years 1996–98. NEPA analyses were completed on 581 allotments in fiscal year 1996. The sum of fiscal year 1996 analyses completed and fiscal year 1997 analyses projected is 1,386, leaving 1,130 analyses to complete in fiscal year 1998 to meet the fiscal years 1996–98 objective. The agency will make its best effort to accomplish this task. Several factors will affect the number of analyses the agency completes in fiscal year 1998 and future years. As analyses are completed more funds are required for implementing decisions and conducting project level administration and effectiveness monitoring. Increasing complexity of issues is driving up the cost of some analyses and ultimately the cost of project implementation, issue mitigation, administration and monitoring. If the range budget remains stable in fis-

cal year 1998 and beyond, annual accomplishment of NEPA analyses will steadily decrease but acres of rangeland reported in satisfactory condition would increase as implementation proceeds.

It is apparent that the Forest Service will have difficulty meeting the first 3 year benchmark of 2,516 NEPA analyses at the requested level. More funds must be directed towards implementation, administration and effectiveness monitoring as NEPA analyses are completed. The Committee can anticipate continued requests for additional range management funding until the program provides adequate resources to balance resource stewardship and compliance with environmental laws.

FORESTLAND MANAGEMENT

The Administration has requested an increase of \$18 million in the Forestland Management Program. The timber sale volume to be offered will decline by 400 million board feet.

Question. The Administration requested \$14.6 million more for timber sales management, than the agency requested. For what specific functions will this \$14.6 million be used? What specific accomplishments will occur?

Answer. The original request from the agency did not provide for full implementation of the President's Plan for the PNW. The additional \$14.6 million is for funding the President's Plan for the Pacific Northwest. fiscal year 1997 was the first year of full implementation of the PNW Plan. The additional funding for fiscal year 1998 is to: 1) fund the additional harvest administration resulting from meeting the volume levels in fiscal year 1997; 2) sustain the full implementation level; and 3) reflect the actual cost of meeting requirements of the PNW Plan. fiscal year 1997 is the first year that we will meet the probable sale quantity (PSQ), and we are now able to determine the actual cost of meeting the plan.

Rather than reduce the fiscal year 1998 agency requested allocations to regions and forests not covered by the PNW Plan, the Administration chose to maintain those levels and to request an additional \$14.6 million to fully implement the PNW Plan.

The additional \$14.6 million will provide an additional 140 million board feet of timber offered for sale from forests covered by the President's Plan for the PNW.

Question. The Administration increased timber sales management funds by \$14.6 million, and salvage funds by \$3.0 million over the agency request. However it reduced the agency's request for road construction funds by 19.2 million, and reduced the agency road maintenance request by 7.7 million. In light of this action, how will the agency modify it's planned timber program to meet it's timber sale target?

Answer. Funds for timber roads are adequate to administer road work on existing sales and to prepare surveys and designs for the green sale program of 2.5 BBF in fiscal year 1998. The shift of funds from road construction made by the Administration to balance competing resource priorities will affect our ability to conduct engineering support in planning for the transportation needs for future timber sales beyond fiscal year 1998.

The roads support for salvage sales is funded from salvage sale funds, thus that program is not affected by the reduction of road funds.

The reduction in road maintenance funding will not affect the timber program, but will reduce our ability to manage and maintain the permanent road system.

Question. The agency has a timber sell target of 4.18 billion board feet in fiscal year 1997. Is this volume actually selling? Please provide a comparison of the volume offered to the volume sold for fiscal years 1994-96.

Answer. The timber volume of 4.18 billion board feet for fiscal year 1997 is actually our planned volume to be offered for sale given the available funding. The intent of the Forest Service is to sell all the volume that is offered. However, market conditions influence whether people are willing to purchase all timber sales. About 13 percent of the volume offered over the last three fiscal years was not sold. The following table shows each fiscal year.

TIMBER VOLUME

[Volume in billion board feet]

	Fiscal year—		
	1994	1995	1996
Volume offered	3.41	4.01	4.02
Volume sold in year of offer	2.56	2.49	2.45

TIMBER VOLUME—Continued

[Volume in billion board feet]

	Fiscal year—		
	1994	1995	1996
Volume sold following fiscal year40	.81	¹ 1.78
Long-term contract volume released ²18	.14	.19
Total sold/released	3.14	3.44	3.42
Volume not sold27	.57	.60
Percent of offer not sold	8	14	15

¹Through March 31, 1997.²Volume released from long-term contracts in region 10 is not counted toward sold volume since this volume was previously recorded as sold in the 1950's when the contracts were initiated.

Question. The Independent Forest Products Association states that the proportional amount of sawtimber sold as a percentage of total timber sold, is decreasing substantially. What percent, for the past 5 years of the total volume accomplishment, has been from saw timber and what percent has been from other products? Please be specific regarding the other products.

Answer. The table below provides our data related to this question, which comes from the Automated Timber Sale Accounting System. As can be seen, there has been no substantial decline in the proportion of sawtimber versus the total volume sold over the past 5 years. Other products, besides sawtimber, that are sold include the categories of pulpwood, poles, pilings, posts, fuelwood, excelsior wood, cooperage bolts, miscellaneous, and cull logs. The highest volume categories of other products are provided in the table.

HIGHEST VOLUME CATEGORIES OF OTHER PRODUCTS

[All volumes in MMBF]

Fiscal year	Volume sold		Percent sawtimber	Other products volume sold			
	Sawtimber	Total		Pulpwood	Fuelwood	Cull	All other
1992	2,688	4,458	60.3	1,134	381	108	147
1993	2,672	4,515	59.2	1,108	445	80	210
1994	1,578	3,056	51.6	936	343	49	150
1995	1,448	2,885	50.2	877	303	39	218
1996	1,943	3,384	57.4	746	247	33	415

Question. What is the status of implementation of the General Accounting Office recommendations regarding timber theft prevention?

Answer. It was the Office of Inspector General of the Department of Agriculture that conducted a review of timber theft problems in the National Forests. The recommendations of the audit have been implemented and the Office of Inspector General has closed the audit.

Question. The agency operates a total of 11 nurseries which are funded through the working capital fund. With the combined production of seedlings declining by 38 percent, how have the costs of maintaining these nurseries been affected?

Answer. As Working Capital Fund (WCF) facilities, Forest Service nurseries must annually establish a selling price for seedlings that covers the production costs associated with growing the seedlings. Declining production levels at Forest Service nurseries have resulted in higher seedling costs because the fixed costs of running these facilities must be absorbed by a reduced level of seedling orders. Any cost increases are ultimately borne by the customer in the price they pay for the seedlings grown at these facilities. Because of this, Forest Service nursery managers work hard to hold the line on selling price increases. In recent years they have been doing this by reducing personnel at these facilities and by seeking ways to increase the efficiency of their operations. These efforts have helped to keep cost increases to a minimum. For example, the J. Herbert Stone Nursery charged \$185 per thousand for 2-0 bareroot conifer seedlings in fiscal year 1994. This selling price increased to \$186 per thousand in fiscal year 1995, and rose to \$198 per thousand in fiscal

year 1996. This equates to a 7 percent rise in selling prices despite a decline in seedling production of roughly 47 percent (from 21.2 million seedlings in fiscal year 1994 to 11.3 million seedlings in fiscal year 1996). Despite the decrease in production, the nursery managed to cover production costs without pricing itself out of the market.

The Agency is committed to maintaining cost-efficient nursery operations. In December, 1995, following a careful analysis of anticipated future seedling orders at 7 Forest Service nurseries in the Western U.S., the decision was made to close 3 of these facilities by the year 2000. We believe that this action, coupled with other measures to maintain cost-effective nursery operations, will provide for a National Forest Nursery System that is well-tailored to meet resource management needs for the foreseeable future.

Question. The agency states that combined production of bareroot seedlings and containerized stock will be reduced by 38 percent from fiscal year 1997 to fiscal year 1998 primarily due to the reduced timber program. In order to reduce operating costs and fully utilize nursery capacity, can cooperative work with states and private operators result in improved reforestation on state, private, and local government lands?

Answer. Yes, we believe it can. The Granger-Thye Act of 1950 provides for the sale of forest-tree seed and nursery stock to States and political subdivisions in each State. This Act prohibits the sale or exchange to these entities of ornamental or other stock for landscape planting of types commonly grown by established commercial nurseries. To varying degrees, all of our nurseries are working with other Federal and State agencies to more fully utilize nursery capacity and to provide for the growing stock needed by other governmental entities. In fiscal year 1996, Forest Service nurseries produced about 4.8 million bareroot seedlings for other agencies, representing about 8 percent of all bareroot production nationally. The percentage of seedling orders grown for other agencies in relation to total seedling production has risen over the past few years at most Forest Service nurseries.

Question. Does the Forest Service mutually cooperate with State Foresters in the use of respective nurseries for the growth of planting stock? If so, what is the number of nurseries and the amount of funds involved in cooperative efforts?

Answer. The Forest Service cooperates with State Foresters and U.S. Territorial forestry agencies mainly by providing technical and financial assistance through its State & Private Forestry (S&PF) programs. Funding for the S&PF Seedling, Nursery, and Tree Improvement Program totalled \$2.659 million in fiscal year 1997. These funds were used to provide technical and financial assistance to 69 State and 4 Territorial nurseries which produced 396 million seedlings in 1995 (the most recent year national data is available). Additional technical assistance to these nurseries was provided by the Forest Service's National Tree Seed Laboratory in Macon, Georgia. The Laboratory provides seed-testing services, serves as a seed bank for national and international research needs, and provides technical information and training on all aspects of forest tree and shrub seed harvesting and utilization. Funding for the National Tree Seed Laboratory was \$263,000 in fiscal year 1997.

State nurseries sell only small amounts of seedlings to the Forest Service. Many State nurseries are prohibited from submitting bids on these contracts by State statutory or regulatory requirements. Market conditions also play a factor. Many State nurseries have recently been operating at or near full capacity to supply seedlings for non-Federal customers.

Question. The Congressional Budget Office estimates that eliminating deficit timber sales would save \$185 million in federal funds over a 5-year period. The General Accounting Office states that deficit timber sales occur in 3 of 9 regions. Based on the GAO methodology, what would be the impacts of eliminating timber sales that fail to produce income in excess of preparation costs.

Answer. The study we believe is being referred to in the question is the 1995 GAO Report entitled "Forest Service—Distribution of Timber Sale Receipts fiscal years 1992–94." That study had a very specific objective, namely to compare the costs of sale preparation with the sale revenues returned to the General Fund of the U.S. Treasury. Consistent with this goal, in determining when a deficit situation existed, the study did not count as income either purchaser road credits, or purchaser deposits for such things as reforestation, road maintenance, and brush disposal. According to the figures in that study, only about 10 percent of all National Forest timber sale receipts ultimately end up in the General Fund—the other 90 percent are either not received in the form of cash (e.g., purchaser road credits), or goes into some special Congressionally authorized account (e.g., the K-V and NFS funds). The Forest Service has not based the benefits of selling National Forest System timber solely on revenues returned to the U.S. treasury. Some important reasons why are:

National forest timber sales are not only a means of producing fiber to help meet the nation's demand for wood, they are also an important tool for managing national forest ecosystems. It is vital to recognize that national forest timber is sold and harvested for essentially three reasons:

1. To help meet the nation's demand for wood, thereby reducing pressures on private forest lands and the need for foreign imports. Sales made primarily for this purpose are called "timber purpose" sales.

2. To help achieve non-timber management objectives that require manipulating the existing vegetation—e.g., reducing forest fuels, improving forest health, and creating habitat desired by certain species of wildlife. Sales made primarily for this purpose are called "forest stewardship" sales.

3. To provide fuelwood, posts, Christmas trees, and other forest products to individuals for their own use. Sales made primarily for this purpose are called "personal use" sales.

Most below-cost timber sales fall into the last two of the preceding categories. Accordingly, one important effect of eliminating such sales is that we would greatly compromise our ability to use timber sales as a tool for achieving various land stewardship goals. This would almost certainly be detrimental for the Federal Treasury as well. Often the net costs (i.e., revenues—expenditures) associated with using other treatment options (e.g., prescribed burning, use of chemical herbicides, or cut and leave) are greater than those associated with using a timber sale because these other options do not generate any revenue to help offset the costs of their application.

National forest timber sales are important to the economies of many local communities, especially in the western U.S. The latest Timber Sale Program Annual Report (i.e., TSPIRS Report) shows that between fiscal year 1991 and fiscal year 1995, the number of jobs supported by the harvesting and processing of national forest timber dropped by 38 percent—from 103,151 jobs to 63,623 jobs. During this same period, the timber sale program's estimated contributions to regional income and federal tax receipts also fell—in these instances by 58 percent. Specifically, regional income is estimated to have dropped from \$5.3 to \$2.2 billion, and federal tax revenues from \$749.4 to \$336.8 million. To some degree these economic impacts have undoubtedly been offset by increased harvesting from private forest lands, but to the extent that this has occurred—most of the beneficiaries are in the South, not in the West. Eliminating deficit timber sales will only compound the economic and social hardships that now confront many rural western communities.

National forest timber cannot always be priced at a level high enough to cover the agency's costs of production. The Forest Service, as a matter of law and policy, assumes many costs not incurred by private timber producers: adhering to stricter regulations for environmental assessment and analysis; involving the public in sale planning and allowing for administrative appeals. At the same time, however, we sell our timber in an open market where most purchasers have a choice of buying either from public or private sources. So, should we decide that national forest system must be priced to fully cover production costs, the result will be that we price ourselves out of the market. This could result in paying higher costs to manage timber stands for stewardship objectives than we would spend using timber harvest as a management tool.

Question. What is the current status of pipeline timber sale volume? How much volume planned for sale in fiscal year 1998 is currently completed through the NEPA process? Is the overall status of the pipeline sufficient to assure accomplishment of the future planned timber sale program?

Answer. As of March 31, 1997, there is approximately 1.3 billion board feet of timber sale volume prepared through the NEPA process for future years. NEPA documentation has been completed on 800 million board feet of timber volume for the fiscal year 1998 timber sales program. The agency goal in timber sale pipeline is to have about 70 percent of NEPA work completed and a substantial amount of the field layout completed for the fiscal year at the start of the fiscal year. This would require having about 2.7 billion board feet through NEPA at the start of fiscal year 1998. Currently about 30 percent of the desired pipeline volume for fiscal year 1998 sales is through NEPA.

Question. Many "other" forest products are sold by the Forest Service. These include mushrooms, bear grass, mosses, etc. What is the value of these products in terms of income for the past 5 years? Do sales of these products affect timber volume offered targets?

Answer. The following table displays the total value of miscellaneous non-convertible forest products and Christmas trees. Non-convertible forest products represent such items as; mushrooms, transplants, vines, pine straw bear grass, mosses, and

many others. It does not include products that can be converted to a volume estimate such as, fuelwood, posts, poles.

Value of miscellaneous nonconvertible forest products and Christmas trees

Fiscal year:	<i>In thousands</i>
1996	\$3,261.8
1995	2,935.1
1994	3,138.3
1993	2,791.4
1992	2,423.0
Total	14,549.6

As a whole, these special forest products are a considerable business in many locales. The sales of these products do not directly affect the timber volume offered. However, the cost associated with administering this business is included in the timber sales management line item.

Question. In recent years a significant number of highly qualified and seasoned timber sale administrators left the agency. What has been done to replace these needed skills? In some regions of the country, this critical task is performed by employees with temporary appointments. Has FTE ceiling prohibited the permanent placement of employees in timber sale administration functions?

Answer. The Forest Service has lost many skilled sale administrators as a result of the decrease in the size of the timber sale program and through downsizing the overall workforce. In many cases, people with less experience have taken over these responsibilities. Forests and regions have increased the training programs for sale administrators to assure people administering sales have the skills they need. Depending on what happens to the size of the sale program, we could face a problem in the future with having enough trained and experienced people to carry out the program. At this point, the budget is the driving force, not FTE ceilings, in limiting the size of the sale administration staffs.

LIABILITY FOR SUSPENDED AND CANCELLED TIMBER SALE CONTRACTS

The Forest Service has incurred considerable liability for timber sale contracts which have been suspended or cancelled because of threatened or endangered species. Two instruments are available that would limit the Forest Service's future liability for timber sale contracts that need to be suspended or cancelled because of threatened or endangered species—(1) regulations which state the settlement timber purchasers' are entitled to when a timber sale contract is suspended or cancelled because of threatened or endangered species and (2) a new timber sale contract that specifies settlement in these situations and provides the Forest Service more flexibility to modify contracts and delete timber areas affected by threatened or endangered species. Since the late 1980's, the Forest Service has been working on revising these two instruments, yet work is still incomplete.

Question. Does the Forest Service intend to publish proposed regulations on the settlement that will be provided when timber sale contracts are suspended or cancelled because of threatened or endangered species? If so, when?

Answer. The Forest Service published a proposed rule concerning contract cancellations on December 30, 1996. The comment period ended on February 13. Presently, the comments are being analyzed to determine what the final rule might be.

Question. Does the Forest Service have a plan to issue for public comment a revised timber sale contract? If so, when?

Answer. The Forest Service plans on publishing a proposed contract for public comment this coming summer. Presently, the proposal is being reviewed by OMB.

TIMBER SALVAGE SALES

The salvage program will involve the preparation of 1.3 billion board feet, as part of the overall timber offer target of 3.8 billion.

Question. The report titled "Interagency Salvage Program Review" discussed collaborative efforts by the Forest Service, Bureau of Land Management, National Marine Fisheries Service, Environmental Protection Agency, and the Fish and Wildlife Service relative to accomplishments under the Rescissions Act. The report found the definition of salvage was not clearly defined and that in the case of the Forest Service, there was a tendency to broadly label sales as salvage in order to capture funds for forest-health related activities. The report recommendations state that the Forest Service and BLM should establish an interagency group to define salvage for use

following the Rescissions Act. What is the status of this recommendation? What potential effect could this initiative have on the current definition of salvage as used by the Forest Service today?

The report also addressed the need for continued collaboration between agencies as the cumbersome timber sale planning and preparation effort proceeds. What efforts will the Forest Service make to assure such collaboration in the future with expiration of mandates such as the Rescissions Act?

Answer. The interagency team has developed a draft action plan associated with the review report you cite, and the agencies are currently evaluating the draft action items. With respect to the salvage definition, there have been various options developed in association with the proposed Forest Ecosystem Restoration and Maintenance (FERM) fund. Those options range from using the current definition to one which would only include dead or dying trees. Any change in the definition or the way it is applied and/or any limitations applied to the salvage sale fund will have a direct effect on the amount of salvage volume sold. The primary objectives of reviewing the salvage definition, as outlined in the review report, are to “* * * ensure that the intent of projects will be clearly articulated to the public * * *” and to “* * * consider criteria for identifying salvage situations where there is a need to expedite the sale preparation process” (page 17). The agencies are continuing to evaluate the definition options and work towards implementation of this recommendation.

The Rescissions Act itself did not mandate interagency collaboration. The collaborative processes were established through the Administration’s Interagency Memorandum of Agreement (MOA) in response to the requirements of the Act. In fact, the interagency processes of early collaborative involvement used in the MOA were initially implemented under the Pacific Northwest Forest Plan and were well underway before the passage of the Act. The MOA helped to expand interagency collaboration beyond the Pacific Northwest. The Forest Service and its sister agencies are continuing to refine these ongoing processes to assure efficient and effective project planning.

The report also addressed the need for continued collaboration between agencies as the cumbersome timber sale planning and preparation effort proceeds. What efforts will the Forest Service make to assure such collaboration in the future with expiration of mandates such as the Rescission Act?

Question. The GAO report (GAO/RCED-97-53) on salvage sale accomplishments under the Rescissions Act, states that the agency “does not know whether the current estimate of salvage timber capable of being harvested is more or less than the previous estimate of 13 billion board feet, which was previously estimated as the accessible timber for harvesting.” Does the agency now have an estimate of their backlog inventory?

Answer. The Forest Service does not routinely track the amount of merchantable volume that could be salvaged. The estimates noted by the GAO in their report were calculated for an effects statement on the emergency salvage bill when it was initially proposed. The estimates were obtained from individual national forests responding to a series of hypothetical situations (e.g., what amount of merchantable salvage timber would be available for harvest if Forest Plan standards and guidelines weren’t incorporated into sale design?).

Question. The GAO report states that provisions of the Act designed to expedite the sale of salvage sales had little effect on the timetable. If this is true, what factors allowed the agency to make these accomplishments?

Answer. Many of the sales covered by the Rescissions Act were well into the sale preparation process when the Act was passed. As a result of the intense fires during the summer of 1994, the agency had already placed a high priority on timber salvage. In addition, severe storms during the winter of 1995/1996 and more fires during the summer of 1996 added to the salvage opportunities. In some cases, excluding administrative appeals and limiting judicial review decreased time frames. In other cases, the controversies resulted in more litigation than is normally experienced. Based upon experience of the national forests reviewed by GAO, few appeals or legal challenges normally occur when selling salvage timber.

Question. When will the expected Administration proposal to divide the salvage sale fund into two parts be received? What effect will this proposal have on salvage sale volume sold?

Answer. We do not have an anticipated date for transmitting the proposal. Various options are being reviewed, including administrative changes to current programs. The fiscal year 1998 budget was developed with a given volume planned to be prepared and offered for sale. There are no plans to change this volume unless our final appropriation is different from the President’s budget request.

Question. An agency briefing paper on the new Forest Ecosystem Restoration and Maintenance Fund, states that funds will be used to finance those management activities that are identified as being of high priority for ecosystem restoration and maintenance. How does this compliment or conflict with the ability to perform work of this nature through the KV program?

Answer. KV expenditures are: (1) limited to the timber sale from which they were collected, (2) dependent on sufficient revenues being generated by the sale to finance the activities, (3) limited to projects within the timber sale area boundary, and (4) available for up to 5 years from sale closure. Activities accomplished from the proposed Forest Ecosystem Restoration and Maintenance Fund would not be subject to these restrictions and would compliment the use of KV on lands not associated with a timber sale.

Question. Will timber be sold as part of management activities performed from this new fund?

Answer. Final decisions have not been made as to what legislation will be proposed and the activities to be included.

Question. Over the past 20 years the importance of the salvage timber program has increased significantly when compared to the green timber program with regard to the volume of timber offered for sale. For example, in fiscal year 1977 the volume of salvage timber harvested was less than 8 percent of the total volume of timber harvested by the Forest Service, while in fiscal year 1996 the volume of salvage timber harvested was almost 50 percent of the total volume of timber harvested by the Forest Service. What has the Forest Service done to accurately determine the volume of salvage timber on national forest lands that can be offered for sale? What type of salvage volume inventory, if any, of salvage timber does the Forest Service maintain?

Answer. Salvage has become an important component of the timber program on a percentage basis. The annual amount of salvage is determined by each field unit following events which kill or weaken trees, such as insect epidemics, fires, windstorms, and snow damage. Once the damage is determined, salvage sales are based on these salvage opportunities. Each "opportunity" must have sufficient salvage present to prompt a salvage sale effort. The actual salvage volume included is the amount that can be economically removed and still meet other environmental considerations such as riparian, wildlife, and visual needs. Additionally, in a regular green sale there are usually incidental amounts of salvage that are marked and included for harvest if they are not needed for other environmental purposes. Salvage efforts also vary depending on market factors. When there is a depressed market for small logs and chip material, we do not prepare this size salvage for sale. Field units continually survey for dead and damaged timber as a normal part of management. However, there is not an inventory of salvage because when a salvage opportunity is identified, it is addressed quickly to prevent deterioration of the products involved.

PRESIDENT'S NORTHWEST FOREST PLAN

Questions. The jobs-in-the-woods program as addressed in the President's Northwest plan speaks to the performance of "short-term jobs * * * to restore the region's watersheds to environmentally sustainable conditions." (a) What is the inventory of such projects? (b) How do wages for these projects equate wages that displace forest products workers had previously received? (c) Does the jobs-in-the-woods program delay what is ultimately the economic demise of the small rural communities of the Northwest due to reduced timber productions?

Answers. (a) Restoration needs and priorities are identified when watershed analyses are completed. Thus, the inventory of needs continues to grow as more and more analyses are completed. At current funding levels, we estimate at least 10 years of priority restoration needs have been identified. Large natural events can and have increased overall needs for watershed restoration (e.g., Northwest flooding in 1996 and 1997) compared to the initial watershed analyses. The project planning aspects (specifications, etc.) of these needs are completed 12-18 months ahead of implementation given current staffing and funding. (b) The analysis for the jobs-in-the-woods program for fiscal year 1995 indicated that the average wage and benefit for workers in the program was approximately \$17.50 per hour. While this level exceeds the states' definition of a "family wage", it is below the level historically paid to primary timber workers. A primary difference between the two is the level and extent of benefits received. While the total compensation is below the historical level, this program has enabled workers to remain in their communities and obtain livelihoods by working in the woods. (c) Absolutely Not! The jobs-in-the-woods program for the Forest Service has been a \$14-16 million a year program. Except for the first year,

fiscal year 1994, this program has not involved new money. The overall magnitude/significance of injecting \$14–16 million of funds into communities (over 500 residents) across the area of the NW Forest Plan has not been at a level that would prevent the “economic demise” of these communities.

However, there has been three significant aspects of the jobs-in-the-woods program: (1) Jobs-in-the-woods program has provided the opportunity for many communities to develop new and improved skills for restoration related work so that they can locally respond to future restoration needs. (2) Jobs-in-the-woods has enabled the agency and the communities to better understand, appreciate, and capitalize on the opportunities to improve the quality of local jobs across all programs areas by working collaboratively. It's no longer simply how we use the jobs-in-the-woods funding to improve quality of jobs, but rather, how we design and manage our overall programs to best utilize and capitalize on the skills and abilities of local workers. (3) Jobs-in-the-woods is only one program within the Northwest Economic Adjustment Initiative assisting communities in transition. In conjunction with jobs-in-the-woods, the Forest Service has fully utilized its Rural Community Assistance program to assist communities to diversify their economic conditions. Some of this economic diversification has been aimed at bringing in completely new businesses but also has been aimed at designing new economic opportunities associated with the new natural resource management policies—e.g., creating new industries for small diameter products, utilization of special forest products, tourism, new recreation opportunities, etc. But the eventual success of these initiatives are generally dependent upon healthy watersheds. Both of these programs have provided the tools and wherewithal to assist in this transition (both programs working hand-in-hand) and the agency and communities are making the best out of them. If the watershed restoration/jobs-in-the-woods program was eliminated, it would cause additional and immediate economic problems to these affected communities with the loss the jobs associated with this level of financial investment (as would be the case of the elimination of any economic activity). But more critical is the loss of ability for the agency to restore and/or maintain the health and vitality of these watersheds. Without an active restoration program full recovery will be significantly delayed and will affect the local communities' ability to derive economic opportunities that are associated with healthy watersheds.

Question. The agency will offer 763 mmbf as part of the President's Northwest Forest Plan. This volume (except that being offered by Region 5) is included in the planned total Region 6 planned offering of 1.025 bbf. Is this target on track?

Answer. The 763 mmbf you reference includes the probable sale quantity (PSQ) of 694 mmbf plus 10 percent “other wood” as defined by the Pacific Northwest Forest Plan. The Region 6 portion of the estimated volume is 586 mmbf (533 mmbf in PSQ plus 10 percent other wood). The 586 mmbf is included in the 1.025 bbf planned offering for all of Region 6. At this time, the sale preparation work is on track and the region expects to offer the full 1.025 bbf in fiscal year 1997.

Question. The document entitled “The Northwest Forest Plan, A Report to the President and Congress,” dated 12/96 cites examples of cooperation between the Forest Service, Bureau of Land Management, and the Fish and Wildlife Service, that helped reduce the required Endangered Species Act consultation from 114 days to 30 days in the area covered by the Plan. Is this same degree of cooperation occurring elsewhere in the United States for specific species which are affecting timber sales and other management actions? Has this cooperation had an affect on the appeals process? What action is being taken to “institutionalize” this degree of cooperation outside the Pacific Northwest?

Answer. The streamlined consultation process has been a success. Where the teams focused on early interagency involvement, cooperated fully and were supported by decision-makers in their efforts, timeframes were greatly reduced and the resulting projects were better designed. In the summary produced for fiscal year 1996 by the Interagency Streamlining Consultation Group for Oregon, Washington, Idaho, Montana, and California, informal consultations were completed between one and 30 days with the an average of 17 days. Formal consultations were completed between one and 71 days, with an average of 46.5 days.

Elsewhere in the country the consultation process varies in timeframe. In the Southeastern Region informal consultation averages about 30 days and formal consultations may take 4 months. Outside the northwestern states consultation times are not specifically tracked.

The Forest Service is engaged in a number of important interagency efforts related to consultation. An interagency Memorandum of Agreement is being prepared for streamlining program level consultations. This will save time and effort and lessen the need for additional formal consultations on projects such as timber sales and grazing permits. Additionally, the continued work of the interagency streamlined

consultation teams in several regions has reduced timelines for consultation while assuring better designed projects. Our interagency cooperation, because it results in better designed projects, should reduce the need for appeals. However, the agency would have to design a systematic method to track and analyze this over time.

SOIL, WATER, AND AIR MANAGEMENT

The Soil, Water, and Air Management program is proposed for an increase of \$7.6 million including \$2.5 million for operations and \$5.1 million for improvements.

Question. What impact has the harsh weather in the West and Midwest had on the planned Soil and Water Program? How might this affect the scope of the budget request for fiscal year 1998 and 1999?

Answer. The extensive rain, snow, wind, and flood damage in the West and Midwest will require Forests to adjust many work priorities for the coming fiscal years. If emergency supplemental funding authorizations fall short of identified needs, normal program funds will be re-directed to address pressing repair needs to bring the Forests back to full public safety. This will require Forests to delay normal programmed watershed improvements into future years. Similar adjustments may also occur in related programs such as wildlife and fisheries, recreation, and engineering.

Question. How has the program been affected by water rights adjudication issues? Has the cost of involvement in and support to adjudication issues resulted in less attention to other resource management issues?

Answer. The Forest Service is a water user and a party in 44 adjudications in 8 western States. About 14 percent of the total Soil Water and Air (NFSO) Expanded Budget Line Item (EBLI) has been used to pay for associated water adjudication activities in recent years.

Adjudication issues have diverted time, staffing, and resources away from other resource management issues in regions where water right adjudications are active. Cost for adjudications are multi-function financed, using the benefitting function concept. In most adjudications, the NFSO EBLI pays 50 percent; the remaining 50 percent is normally spread among recreation, timber and wildlife/fisheries accounts.

Question. The interagency initiative to reclaim abandoned mines will focus on watersheds in Colorado and Montana. What is the inventory of other such projects throughout the United States? What is the specific cost of the three projects mentioned for which the fiscal year 1998 increased funding will be used?

Answer. Of the approximately 38,000 abandoned and inactive mine sites on lands managed by the Forest Service, we estimate that about 4,100 sites contribute to non-Comprehensive Environmental Response Compensation and Liability Act (CERCLA), water quality problems. This figure may increase slightly when our inventory is completed in fiscal year 1998.

Working in concert with states and other initiative partners, we are prioritizing watersheds to be addressed as funding becomes available. While figures are incomplete at this time, we estimate that Colorado and Montana will both receive about \$2 million to finalize preparatory work and institute cleanup projects.

The Forest Service and its USDI partner agencies have tentatively chosen Arizona as the third state in which to begin this program. While a final figure is not definite at this time, we estimate the preliminary work in the the third state will require between \$500,000—\$600,000 to Arizona to begin assembling relevant data, working with partners to delineate and prioritize watersheds, and begin needed water quality assessments prior to remediation efforts.

Question. What specific changes are planned in this program as a result of storm damage in the West over the past 2 years?

Answer. To respond to storm damages, resource professionals will shift work priorities into project design and contract administration. This will cause a de-emphasis on watershed analysis and input to other project work to some degree.

Watershed improvements will focus on problems causing direct and indirect effects on riparian areas, anadromous and other key fisheries, habitat for Threatened and Endangered species, and watersheds not meeting state water quality standards.

Watershed professionals will use knowledge gained from the recent flood events to assess cause/effect relationships between land management practices and damages, and work to revise management to minimize future problems.

Watershed professionals are currently planning a specific effort to streamline methods to more quickly and efficiently evaluate damages and repair needs from floods and other natural disasters, provide consistent interpretation of findings, and coordinate with other agencies and local officials. This process will have strong parallels to our highly successful Burned Area Emergency Rehabilitation (BAER) program that deals with results of severe wildfires.

In order to repair damages from severe storms in the Winter of 1995–1996, Congress appropriated \$87.4 million in fiscal year 1996. The Forest Service allocated these funds to seven of nine Regions to perform a wide range of repair activities including watershed restoration, fisheries habitat repair, road and trail reconstruction, repair of recreation facilities, and similar actions. Request for additional emergency supplemental funds are currently before Congress to repair damages from storms over the 1996–1997 winter.

MINERALS AND GEOLOGY

Question. What significant litigation has occurred in recent years regarding liability relative to abandoned mines on National Forest System land?

Answer. The Forest Service has been involved in three significant cases related to abandoned mines on National Forest System land. These cases involved claims by the United States against potentially responsible parties for environmental damages and cleanup costs pursuant to the Comprehensive Environmental Response, Compensation, and Recovery Act (CERCLA) and other applicable environmental laws. The three cases are as follows.

Shiny Rock (Amalgamated) Mill Site.—In May 1997, the United States Department of Justice (DOJ) filed a Consent Decree related to the Shiny Rock (Amalgamated) Mill Site in Oregon. The Consent Decree will require Persis Corporation to conduct a remedial action, including removal of tailings deposited adjacent to Battle Ax Creek, upstream of the water supply of Salem, Oregon. The site is located in the recently designated Opal Creek Scenic Recreation Area. Persis Corporation is the parent corporation of Shiny Rock Mining Company, which controlled the site and the surrounding area from 1973–1992.

Bunker Hill Superfund Site.—In March 1996, DOJ filed suit in federal district court on behalf of the United States Department of Agriculture (USDA), the United States Department of the Interior (DOI), and the United States Environmental Protection Agency (EPA) against eight mining companies for extensive environmental damage in the Coeur d'Alene Basin in Northern Idaho. The suit, known as *United States v. ASARCO et al.*, was brought under CERCLA and the Clean Water Act (CWA) both for natural resource damages and cleanup costs. The complaint alleges that decades of mining and smelting activity in the Coeur d'Alene basin and at the Bunker Hill smelting site have resulted in extensive environmental damages to the natural resources of the region, including wildlife, soils, and vegetation. The Coeur d'Alene Indian Tribe has also filed suit and joined the United States as a co-plaintiff in the litigation. The litigation itself is in the discovery stage and no trial date has been set yet by the Court.

Blackbird Mine Site.—This litigation was initiated in 1983 by the State of Idaho, who sued the owners of the Blackbird Mine under CERCLA and state laws. In 1990, the current owners of the Blackbird Mine, the Blackbird Mining Company, sued past owners and operators and also named DOI and USDA as third party defendants. In 1993, the United States sued the Blackbird Mining Company and previous owners and operators of the site under CERCLA, the CWA, and the Endangered Species Act. The United States' action and the State of Idaho's action were consolidated soon thereafter. In 1994, the United States District Court for the District of Idaho ruled in favor of the United States and the State of Idaho, finding the past and current mine owners and operators liable, while dismissing all claims against the Forest Service. In April 1995, the federal government reached an agreement with the mining companies in a Consent Decree covering both response actions and natural resource damages. The mining companies are conducting an "Early Action" response action at Blackbird Mine pursuant to an Administrative Order on Consent (AOC) negotiated with EPA, and are undertaking natural resources restoration action pursuant to the Consent Decree. In November 1995, the mining companies appealed the dismissal of their claims against the United States to the Ninth Circuit. That appeal has been stayed while the parties attempt to negotiate a settlement of the claims not resolved in the Consent Decree and the AOC.

LANDOWNERSHIP MANAGEMENT

A \$2 million increase is proposed in the Landownership program including \$1 million in real estate management and \$1 million in Land Line Location.

Question. When can it be expected that the new fee schedule to obtain fair market value for communication sites will be implemented? The agency budget justification says implementation will be delayed. What level of funding is necessary to assure prompt implementation of the fee schedule?

Answer. The FS started implementing its new fee schedule for communications uses (in the western Regions of the United States) in Calendar Year 1996. Imple-

mentation was initiated following an extensive series of on-site training sessions during 1996. The agency is now conducting a series of follow-up visits to a sample of administrative units, to monitor fee schedule implementation, and to assure that it is being done accurately and consistently. Over 90 percent of our administrative units in the West (Regions 1 thru 6) have implemented the new fee schedule. The fees for a significant percentage of existing facilities will increase dramatically as a result. Many permit holders qualify for the fee phase-in provisions of our policy. Therefore, we don't expect to capture the full market value for facilities under a fee phase-in until Calendar Year 2002.

In fiscal year 1997, the FS intends to make our communication use fee schedule for the western United States applicable to all NFS lands. We will begin with a public notice and comment process, with final adoption occurring later this year or in early 1998. Implementation of the fee schedule in the Eastern, Southern, and Alaska Regions of the FS is expected to occur beginning in CY 1998.

Question. What portion of real estate management funds are being used to exchange lands within wilderness areas? What is the future wilderness land exchange program in terms of funds planned and parcels covered?

Answer. We estimate that 5 percent of Agency real estate management funds are being used to process exchanges in which the United States will acquire lands within designated wilderness areas. As long as real estate management funds remain consistent, it is expected that the 5 percent will remain constant.

Question. During discussions regarding fiscal year 1997 appropriations, the agency noted that many small hydroelectric project applications are being delayed due to the complexity of analysis requirements. Specifically mentioned was Martin Creek. Please provide an update of the status of the hydroelectric application process including an inventory of applications and a comparative status of the analysis process over the past 3 years.

Answer. Attached is an inventory of hydropower project applications affecting NFS lands over the past 3 years including the status of each project and an indication of whether the project was delayed due to the complexity of issues related to the project. To answer your questions, we queried each of our nine regions. Based on each region's response, we found that many forests have been able to respond in a timely manner to project proposal over the past 3 years but only with a great deal of time and effort expended by the Forest Service staff. At the same time, a number of project proposals have been delayed on various forests due to the complex issues related to project analysis. In addition to the complexity of issues, the regions cite other delaying factors, including: the FS administrative appeals process, litigation, disagreements between FERC and the FS during joint NEPA analyses, FERC backlog of projects, lack of communication from FERC during key points in the analysis process, lack of skilled personnel and lack of sufficient funding to effectively run the hydropower program.

As shown in the attached table, most delays have occurred in regions 5 and 6 where the bulk of hydropower licensing and relicensing proposals are pending. These delays primarily occur during the time the FS and FERC are preparing cooperative NEPA documents. Delays have occurred on 28 of the 67 projects (40 percent) the FS has worked on over the past 3 years due to the complex issues involved with analyzing these projects.

STATUS OF HYDROPOWER LICENSING AND RELICENSING APPLICATION
BY REGION 1994-97

Number	Project name	Application type	Status	Forest Service delays
Region 1 (Northern Region)				
2188	Missouri-Madison	Relicense	FS/FERC almost ready for DEIS issuance	No
2075	Noxon Rapidsdo	Relicensing started in 1995/FS and other agencies negotiating settlement agreement w/Licensee.	No.
2058	Cabinet Gorgedodo	No.
1991	Moyie Riverdo	FS involved in Stage 1 consultation	No.
Region 2 (Rocky Mountain Region)				
2187	Georgetowndo	FS/FERC completed EA/license issued	Yes.
2035	Gross Reservoirdo	FS involved in preapplication consultation	No.
2275	Salidado	FS/FERC completed EA-license issued	Yes.
2032	Strawberrydo	FS in preapplication consultation	No.

STATUS OF HYDROPOWER LICENSING AND RELICENSING APPLICATION
BY REGION 1994–97—Continued

Num-ber	Project name	Application type	Status	Forest Service delays
Region 3 (Southwest Region)				
2069	Childs-Irving	..do	FS/FERC preparing EA—draft EA about to be issued ..	Yes.
Region 4 (Intermountain Region)				
1994	Snake Creek	..do	FS in preapplication consultation	No.
1517	Monroe	..do	..do	No.
Region 5 (Pacific Southwest Region)				
137	Mokelumne	..do	FS reviewing amended application	No.
184	Ed Dorado	..do	FS involved in Stage I consultation	No.
1388	Lee Vining	..do	FS administration appeal pending	Yes.
1389	Rush Creek	..do	..do	Yes.
1390	Lundy	..do	..do	Yes.
1394	Bishop Creek	..do	Litigation recently resolved in DC Circuit Court	Yes.
2661	Hat Creek	..do	FS providing comments on application	No.
2687	Pit 1	..do	..do	No.
1962	Rock Creek	..do	FS coop. agency in FERC EIS	No.
2105	Beldon Siphon	Amendment	FS administration appeal recently resolved	Yes.
1932	Lytte Creek	Relicense	FS providing preliminary 4(e) conditions	No.
1933	Santa Ana	..do	FS providing 4(e) conditions	No.
1934	Mill Creek	..do	..do	No.
372	Lower Tule	..do	FS beginning to review proposal	No.
1333	Tule River	..do	DC Circuit Court decision on litigation issued recently.	Yes.
1930	Kern River 1	..do	Coop. EA in progress—preliminary 4(e)s issued	No.
2290	Kern River 3	..do	FS admin. appeals pending	Yes.
1354	Crane Valley	..do	..do	Yes.
1988	Haas-Kings	..do	..do	Yes.
2017	Big Creek	..do	FS involved in preapplication consultation	No.
2085	Mammoth Pool	..do	EA in progress	No.
1061	Phoenix	..do	FS administration appeal pending	Yes.
3258	Pine Creek	New application	License denied litigation in DC Circuit Court resolved recently.	Yes.
6188	Red Mt.-Tinemaha	..do	License issued. Licensee recently filed lawsuit against FS in state court re: water rights issue.	Yes.
11543	Lewiston	..do	FS reviewing application	No.
11452	Angels	Transfer of license	FS working on NEPA w/FERC	No.
11477	Utica	..do	..do	No.
10081	Clavey	New Application	Application withdrawn in 1995 FS was coop. w/FERC on EIS.	No.
Region 6 (Pacific Southwest Region)				
1927	N. Umpqua	Relicense	FS working on NEPA analysis	No.
460	Cushman	..do	FS participating in NEPA analysis	No.
2042	Box Canyon	..do	FS beginning to review application	No.
2225	Sullivan	Amendment	FS working on NEPA document	No.
2016	Mayfield-Mossy Rock	Relicense	FS beginning consultation	No.
2071	Yale	..do	..do	No.
2342	Condit	..do	FS analyzing proposal	No.
1862	Nisqually	..do	FS working on NEPA document	No.
3721	Nooksack	New application	Part of river basin cumulative EIS. FS was coop. agency w/FERC but withdrew due to disagreements over information needs. FS commented on DEIS in 1995. FEIS not yet issued.	Yes.
4282	Deadhorse Creek	..do	Part of river basin EIS. (See discussion for Nooksack Falls Project on previous page).	Yes.
4312	Canyon Creek	..do	..do	Yes.
4376	Rocky Creek	..do	..do	Yes.
4437	Diobsud Creek	..do	..do	Yes.
4628	Wells Creek	..do	..do	Yes.
4738	Glacier Creek	..do	..do	Yes.
10100	Irene Creek	..do	..do	Yes.

STATUS OF HYDROPOWER LICENSING AND RELICENSING APPLICATION
BY REGION 1994-97—Continued

Region 10				
420	Ketchikan Lakesdo	FS involved in preconsultation process	No.
11077	Goat Lake	New application ...	FS involved in joint NEPA w/FERC	No.

Questions. Additional challenges are occurring as a result of urban encroachment adjacent to NF Lands. (a) How has this affected the land line location program? (b) Is an increasing amount of funds being used to support litigation relative to private land encroachment? (c) How has this affected the timber sale program on lands adjacent to private ownership?

Answers. (a) Urban encroachment on NFS lands is occurring at a rate faster than funding for the Landline Location program allows us to survey the boundaries. The majority of urban interface encroachments are occurring in areas with the highest real estate prices, areas of high demand for private ownership, and areas with high development potential because they provide easy access to the public lands. Areas around Los Angeles, CA; Lake Tahoe, NV; Jackson, WY; Aspen, Vail, and the Front Range of Colorado are heavily impacted. This increasing need to survey, mark, and maintain the NFS boundaries in and adjacent to urban development has refocused the direction of the Landline Location program. The program in the past was focused almost exclusively on physically marking the lines where resource management activities were occurring. In the past these land and resource activities were occurring faster than the forest surveyor could establish or mark the property lines. Consequently only the most serious encroachments and trespasses were acted upon. The Landline Location program in recent years has become more focused on providing a complete stewardship responsibility of the public estate, including the survey and marking of these urban interface boundary lines to prevent occupancy of NFS lands, and to support land and resource management activities. Included in this responsibility is the resolution of property line conflicts with our adjoining landowners as well as the defense of the public estate. We now place greater emphasis on protecting the boundary lines previously marked, and marking boundary lines where there is a greater likelihood of urban interface encroachment onto the public estate.

(b) There does not appear to be a significant increase in the amount of funds used to support litigation to resolve private land encroachments on NFS lands. This is due in part to efforts on the part of the FS to resolve encroachments and trespass cases without the use of litigation, using the various public laws and authorities available to resolve encroachments on NFS lands. This effort to resolve encroachments before litigation develops is considered a lands stewardship responsibility and is generally funded and/or supported with a combination of Landline Location (NFL), Real Estate Management (NFLA), and benefitting function funds. Often the potential for litigation encourages the FS and the encroaching adjoiner to seek an amicable and legally acceptable resolution.

(c) The FS policy is to survey and mark all NFS boundaries prior to any resource management activity occurring on NFS lands adjacent to non-NFS lands (private, corporate, state, or other federal agency lands). These land surveys, performed prior to the resource management activities usually identify encroachments on the public estate, as well as mark the boundary lines of the NFS. The discovery of encroachments on NFS lands may in some cases lead to the exclusion of land and resource

management activities within the strip of encroachment until such time as the encroachment is resolved.

INFRASTRUCTURE MANAGEMENT

An increase of \$3.2 million is planned for Infrastructure Management, including \$1.9 million for road maintenance and \$1.3 million for maintenance of facilities.

Question. Up to \$5 million of road maintenance funds have been authorized for use in obliterating forest roads. In what regions have such funds been spent in? What criteria are employed to determine which roads should be obliterated?

Answer. In fiscal year 1996, all Regions obligated road maintenance funds for road obliteration. The amount of road maintenance funds obligated in each Region for road obliteration in fiscal year 1996 is summarized below.

Fiscal year 1996 road maintenance funds obligated for road obliteration

<i>Region</i>	<i>Thousands</i>
1	10.8
2	35.0
3	72.6
4	7.5
5	162.5
6	548.1
8	24.1
9	1.7
10	30.0
<hr/>	
Total	892.3

Land managers at the field level decide which roads should be obliterated based on forest plan objectives and resource management and protection needs. Road obliteration decisions are made based on the long term need of a road to manage and protect resources; the need to reduce erosion or limit road density to enhance wild-life management; or the need to meet other ecosystem management objectives.

Predominately, the roads being obliterated are un-engineered roads that are causing serious environmental damage due to poor location, steep grades, and lack of proper drainage. They are mostly old skid trails, off-road vehicle tracks, and timber or mining roads constructed without the benefit of proper design. Many have already been closed to vehicle use. In a few cases, they are Forest Development Roads no longer needed due to changed resource management objectives.

Question. Despite a slightly more than 2 percent increase in road maintenance funding request, there is no increase in accomplishment. How will the increased funds be used?

Answer. The requested funding is sufficient to fully maintain approximately 40 percent of roads and associated structures at a level consistent with current use. We expect little change in the percent of roads fully maintained since the 2 percent increase is roughly equivalent to inflation.

Question. As the agency reduces its employees, how has this translated to a reduction in facilities that must be maintained for the employees? Are costly facilities able to be eliminated?

Answer. Many Forest Service offices are in leased facilities. As facility leases come up for renewal, we consider moving to government-owned facilities or reducing the square footage needed in the new lease.

Some Forests have looked for opportunities to make unused space available through sharing arrangements with other agencies. Forests have also turned back unused space to the General Services Administration for reassignment to other agencies.

Some examples of efforts to eliminate or reduce facilities include:

Region 1.—Six offices co-located into three with four additional offices planned for co-location in the near future.

Region 4.—Updated a forest facilities master plan calling for the elimination of 120 buildings.

Region 5.—After co-locating ranger districts, three leased facilities are being eliminated and two district office facilities are recommended for disposition. One administrative unit moved from a leased facility to a government-owned facility and an old ranger house used for administrative purposes is planned for disposal. Also, space for a Forest Supervisor's Office will be reduced when contracting for a new lease.

Region 6/Pacific Northwest Station.—A warehouse and a residence will be exchanged for riparian resource land. A Research lab has been transferred to a state university. A guard station was transferred to a town for use as a city park. Collocation of Forest Service and BLM personnel is in progress in several locations across the Region. Sites not currently in use where long-term need by FS has not been determined have been made available for use by others via special use permits using the Granger-Thye authority. Where recreation is the preferred activity, some facilities such as fire lookout towers are being made available for rental using the Granger-Thye authority.

Region 8.—District consolidations in South Carolina, Mississippi, and Texas and a forest consolidation in Virginia (George Washington-Jefferson NFs) will lead to reductions in facilities. Regional Office downsizing has reduced the amount of leased space required.

Region 10.—Minor consolidation of leased space on two national forests has led to minor consolidation of leased space.

In the case of Research, many of our laboratories are federally owned. We are collocated with a number of Universities on their campuses and in some cases the space is free.

Budget reductions in fiscal year 1996 have caused us to close seven locations. Each closure has different circumstances to address. In some cases the facilities are still being maintained due to leases and contract stipulations. One facility has been transferred to a community college as a result of Congressional direction. No savings have occurred to date due to transfer of station costs and utility/general maintenance contracts which need to be continued until facilities are eliminated.

LAW ENFORCEMENT

The Administration proposes an increase of \$2.3 million to this program.

Question. The Forest Service and Department requested \$69 million for law enforcement operations. The administration reduced this amount in spite of an agency appeal. Now the Forest Service faces eliminating more than 60 law enforcement employees. What amount of funding will prevent the elimination of these positions?

Answer. In the Administration's 1998 budget for law enforcement there is an increase of \$2.3 million from the previous fiscal year. In recent years, the approval and passage of laws specifically related to increased law enforcement salaries, including Title 5, U.S.C. Section 5545 (a) Law Enforcement Availability Pay for criminal investigators, and (c) Administratively Uncontrollable Overtime for law enforcement officers, and approval of early retirement for LEOs has continued to increase base program costs. This \$2.3 million will cover increased base costs for a reduced level of law enforcement employees.

Law enforcement personnel are more expensive to fund than normal agency personnel because of the laws and benefits listed above. These higher base costs plus the additional costs to maintain specialized training requirements along with certifications and specialized equipment needed in the performance of their duties contribute to an estimated costs for a Law Enforcement Officer to be around \$75,000 per individual. After fixed costs are reduced from the budget for law enforcement (fleet equipment, support, and cooperative law enforcement) 90 percent of the remaining amount goes directly to salary and associated costs.

Presidential direction last year directed the Agency to place an additional 20 law enforcement officers on the California/Mexico border to address the increased resource violations created by illegal aliens. This direction has further impacted the Forest Service law enforcement program. In order to meet this special direction, we are detailing officers from regular duty stations service-wide to this special problem area. The FS has requested reimbursement from INS for these operations, both those already provided and those that will continue in fiscal year 1998.

Continued refinement of information has identified that added costs could create a shortfall in funding for some occupied positions. Approximately, 50 occupied positions could be affected. All of these positions are considered important to maintain a professional effective program. Costs associated with a reduction of 50 positions is estimated at \$3.7 million. However, a higher funding level for this program would require an offset of providing lower funding for other Agency program areas.

Question. Results from an independent study of the law enforcement organization seemed to indicate that it was too early to determine the effectiveness of the "straight-line reporting structure." The report states that the organization is still evolving. What steps is the agency going to take to assure full evolution and operation as a professional law enforcement organization?

Answer. The Forest Service fully supports the implementation of the straight-line reporting structure for the law enforcement program. The program now has inves-

tigative independence and is free from allegations of interference and improprieties. Also professional standards and guidelines are now in place which improve the program's role in supporting resource management activities and ecosystem protection. The following steps will be taken to continue the evolution of this important program:

1. Continue to evaluate the level of organizational structure needed and implement standards of performance for LE&I personnel that will heighten the professionalism of LE&I.

2. Emphasize training, both initial and in-service, which is an inherent part of any professional organization.

3. Examine the need to streamline and update Title 36, Code of Federal Regulations, as it relates to FS LE&I activities and prohibitions.

Question. The President has directed the Forest Service to station 20 officers on the Cleveland National Forest for the purpose of conducting border operations. These operations have resulted in the apprehension of thousands of illegal aliens. What authority does the Forest Service have to conduct such operations? How much has the President's direction cost?

Answer. The authorities for the protection of the resources are contained in 16 U.S.C. 551, 559, 559b, 559c, and 559d. 16 U.S.C. 553 allows officers from the Forest Service to "aid the other Federal bureaus and departments on request from them, in the performance of the duties imposed on them by law." At the direction of the President, the Forest Service has provided additional law enforcement personnel on the southern areas of the Cleveland National Forest. These additional officers have been provided to increase the protection of the using public, employees and the resources. The role of the Forest Service is not the apprehension of illegal aliens. If individuals are contacted while law enforcement personnel are performing their core mission, they are detained for the United States Border Patrol.

During fiscal year 1996, costs for the Cleveland operations that were above normal Law Enforcement activity costs amounted to \$1,048,000. This amount covers the extra travel/per diem/lodging and overtime for the officers detailed to this special operation. Officers base salaries are not included.

Costs above normal activity levels for this fiscal year through March 31, 1997, are estimated at approximately \$556,000.

WILDLAND FIRE MANAGEMENT AND BRUSH DISPOSAL

A significant budget restructuring is being proposed for the Wildland Fire Management program. The Administration is also proposing to establish a government-wide emergency contingency account to support operations for major national emergencies. Under the Brush Disposal program, the agency proposes to accomplish 33.7 thousand acres less of treatment.

Question. The agency recently initiated an effort referred to as "Fire 21" to address issues of safety, planning, role of fire, wildland urban interface, preparedness, and accountability. What significant improvements have occurred in these areas as a result of "Fire 21?"

Answer. "Fire 21" is a long term strategy to provide a safe and more effective wildland fire protection program. It has provided a communication tool for identifying the priorities in wildland fire management. This has helped managers and employees focus efforts on the critical jobs to be done. A line officer team and a network of fire management officers are working together for the first time in a national effort to facilitate implementation of Fire 21. A Fire 21 Cadre Implementation Plan is being developed to direct the training and development of the workforce in the skills required to meet future challenges.

Question. What specific measures have been implemented to make fire suppression and preparedness more efficient and cost effective?

Answer. Comparative analyses are made of different mixes of firefighting resources to determine the least cost and most effective combinations for a given area. National, regional, and forest reviews examine budget implementation and preparedness activities on a regularly scheduled basis to improve accountability. Opportunities where resources can be shared have been implemented with consolidation of facilities where appropriate. Contracts for support services are made through a competitive bid process.

Question. What procedures are used by the Forest Service for projecting and allocating wildfire suppression resources among wildfires in order to control, and possibly reduce, wildfire suppression costs?

Answer. The National Interagency Fire Center coordinates the efficient mobilization of resources at the national level. This assignment of resources is made on a priority basis for large fires in competition with each other. Priorities are set by a

multi-agency coordination group based on values at risk. Costs are considered in terms of mobilization and transport of closest available resources. Similar procedures are used by Geographic Area Coordination Centers around the country for regional and local decisions.

Question. How well do the cooperative agreements for allocating wildfire suppression resources between the Forest Service and other federal, state and local agencies work? Are improvements needed in how the allocation of suppression resources is accomplished?

Answer. Cooperative fire protection agreements between federal and state agencies promote the effective use of fire resources between organizations. There has been a significant effort between federal, state and local fire agencies to establish new and update old cooperative fire protection agreements, particularly in areas with wildland/urban interface fire challenges. This process will improve the effective and efficient use of interagency fire suppression resources.

Question. How does the Forest Service estimate, document and account for wildfire suppression costs? Is an Incident Cost Accounting Report (ICAR) prepared for each wildfire? If not, why not?

Answer. The National Fire Management Analysis System allows projections of average annual suppression costs for national forest system lands. The suppression cost of each wildfire is estimated by use of an Escaped Fire Situation Analysis used at the local level. Incident Management Teams assigned to large wildfires track and monitor suppression costs of each incident daily and develop final fire cost packages for the agency. Agency Comptrollers monitor expenditures and provide advice for cost control measures to local line officers.

The size and complexity of the fire determine if an Incident Cost Accounting Report or equivalent is prepared. There are no set factors for its use. Examples of some determinants for the use of an Incident Cost Accounting Report are multiagency jurisdiction, public concerns, threat to resources and property, etc.

Question. What level of preparedness funding would be necessary in fiscal year 1998 to operate at 90 percent MEL?

Answer. Preparedness funding at 90 percent MEL would mean a level of \$351 million.

Question. The agency budget justification states that there is a greater risk to public and firefighter safety with funding below 100 percent of the MEL index (most efficient level). How is safety specifically affected by a lack of 100 percent funding?

Answer. The National Fire Management Analysis System is used to determine the Most Efficient Level (MEL) for wildfire suppression. The MEL quantifies the organizations and budget needed to safely and effectively fight wildfire. MEL is based on historical wildfire occurrence, size and difficulty of control in specific locations. At funding levels less than MEL, there are fewer firefighters and equipment available. Less firefighters for initial attack often results in larger, more intense wildfires. To the extent that there are larger, more dangerous fires, firefighters and public safety become of paramount concern.

Question. The agency established a goal of "red carding" 75 percent of all Forest Service employees? How successful has this effort been so far?

Answer. The goal is to increase support for fire suppression, especially during periods of severe fire activity. This also includes non-redcarded personnel. Several Regions have already required fire support requirements be placed in every person's (both redcard and non-redcard personnel) position description which has increased the pool of available personnel.

Some units have reported a red-card success rate as high as 85 percent.

Question. In combination with Brush Disposal funds, what is the overall status of the hazardous fuels inventory? Is this inventory declining or increasing?

Answer. We estimate that there are approximately 58 million acres having naturally occurring fuels that are predisposed to stand replacement fire, i.e., fire which will totally consume all the vegetation. This, by far, outshadows any level of fuels generated specifically by timber sale activities and which qualify for brush disposal funds. This acreage predisposed to stand replacement fire is constantly growing, especially as commodity production levels decrease.

Question. The agency budget justification states that hazardous fuels reduction activities which were previously funded under the Preparedness and Fire Use budget line item have been moved to the Suppression Operations budget line item. A review of the President's budget does not indicate how actual planned expenditures for this function will be affected by the change. What specific expenditures are planned for hazardous fuels reduction as compared to the past 5 years of expenditures? What gains will be realized from this change?

Answer. The new budget structure moves hazardous fuels reduction activities from the Preparedness and Fire Use budget line item (renamed Preparedness) to

the Suppression Operations budget line item (renamed Fire Operations). This allows flexibility in funding hazardous fuels activities to more effectively address the health of the Nation's forests without detracting from the capability to prevent forest fires and to take prompt, effective initial attack suppression action on wildfires.

The proposed budget level will allow funding for hazardous fuels reduction at a level of between \$30-\$50 million. Depending on weather conditions this funding level will allow treatment of between 850,000 and 1,300,000 acres in high priority areas where the risk of wildfire and long-term damage to resources can be reduced through fuels management.

Question. The brush disposal accomplishments for fiscal year 1996 and fiscal year 1997 are higher than those proposed for fiscal year 1998. Does this indicate that progress is being made in reducing the backlog of untreated acres?

Answer. No. The brush disposal line item is a permanent appropriation for the treatment of debris resulting from a timber sale. National forest timber sale contracts require treatment of debris created by timber sale operators. This work can be performed by the timber purchaser, the purchaser can request the Forest Service to do the work by depositing funds to cover the cost of the work, or the Forest Service can require mandatory deposits and the agency complete the work. The reduction of brush disposal acres is in response to the decline in timber sales over the past several years. Hazardous fuels reduction is part of the Fire Operations line item and provides for all hazardous fuel reduction program activities. These activities are conducted in high priority areas where the risk of wildfire and long-term damage to resources can be reduced through fuel management. The President's budget would allow funding for hazardous fuels reduction at a level of between \$30 and \$50 million. Depending on suitable weather conditions, this funding level will allow treatment of between 850,000 and 1,300,000 acres which is an increase of between 100,000 and 550,000 acres from the level planned for fiscal year 1997.

Question. What is the status of the Brush Disposal fund nationwide in terms of cash on hand and to be collected, versus the cost of work to be accomplished with brush disposal funds?

Answer. As of September 30, 1996, the Brush Disposal fund had an unobligated cash balance of \$39 million, and anticipated collections during fiscal year 1997 are estimated to be approximately \$16 million (this is an updated anticipated collection figure subsequent to the President's Budget.) The planned program level for fiscal year 1997 is for treating 185,000 acres at a cost of \$45.6 million. There are adequate funds available to complete planned brush disposal in fiscal year 1997.

Question. Smokey Bear is an integral part of the Forest Service fire prevention message. Smokey is uniformly recognized by school children throughout the United States as an icon that can be trusted. Critics say Smokey Bear's use is over zealously protected by the Fire Prevention Establishment to be used exclusively for the prevention of fire. What is the agency's position on the expanded use of Smokey Bear in other critical national initiatives such as "just say no to drugs" campaign, or a national violence prevention program?

Answer. Congress established Smokey Bear as the National Forest Fire Prevention Symbol with Public Law 82-359. The law states clearly that Smokey is to promote "Forest Fire Prevention". It further takes him out of the public domain and places him under the direction of the Secretary of Agriculture in cooperation with the National Association of State Foresters and the Advertising Council. In 1974, Smokey's responsibility to Forest Fire Prevention was further reinforced by Public Law 93-318.

Studies conducted through the Advertising Council show Smokey's high recognition level and success is due to his simplicity of message. Almost 70 percent of school children can recognize his message of "Remember, Only You Can Prevent Forest Fires". To confuse his message with drugs, violence, ecology, pollution or any other national campaign is to dilute his message and violate his intended use.

RECONSTRUCTION AND CONSTRUCTION

Facilities construction and reconstruction

The administration proposes to decrease funds to support facilities by a total of \$27.7 million including a reduction of \$26.5 million for recreation facilities.

Question. The agency proposes to change appropriation language to authorize the expenditure of up to \$250,000 for minor construction. How would funds be generated to perform the assumed increase in minor construction? What program accomplishments would be affected by diverting funds from other line items for the purpose of minor construction? Would the performance of this minor construction be managed in such a manner as to assure other program accomplishment does not suffer? An agency briefing paper dated February 7, 1997 states that if the limit

were increased to \$250,000, a total of 85 percent of all Research and FA&O facility reconstruction or construction projects could be accomplished. If this change were enacted, what timetable would the agency follow to bring facilities to current standard without affecting program accomplishments? What percent of the recreation backlog would be applicable to this new \$250,000 limit?

Answer. We do not intend to increase significantly the total number of dollars spent for minor construction. Therefore, program accomplishments in funds tapped for minor construction will not be affected significantly.

Raising the minor construction authority would provide another tool to give line officers more flexibility to meet their priority needs. Some program funds could be focused on a Region-wide basis for minor construction of replacement facilities rather than continued remodeling or renovations of old structures. For example, additions could be constructed to replace aging mobile homes used for temporary office space or crew quarters.

A summary of minor construction projects completed in fiscal year 1996, planned for fiscal year 1997, and estimated for fiscal year 1998, based on raising the minor construction authority, is shown in Table A. The total number of projects completed will be reduced with the average cost of individual projects expected to increase.

TABLE A—FA&O MINOR CONSTRUCTION PROJECTS

Fiscal year	Number of projects	Total in millions	Average cost/ project
1996 (completed)	90	\$3.9	\$43,000
1997 (planned)	65	3.3	51,000
1998 (estimated):			
Less than \$100,000	28	1.7	61,000
\$100,000 to \$250,000	11	1.6	146,000

If the change is enacted and the Regions do not increase the amount of benefitting funds for minor construction, the construction and reconstruction backlog will continue to grow. The 85 percent refers to the number of projects that have a total individual project cost under \$250,000. Projects under \$250,000 account for 27 percent of the total estimated FA&O facility backlog cost. Because this proposal does not intend to raise capital investment funding, the backlog will continue to grow. Therefore, no timetable for bringing existing facilities up to current standards can be set.

The recreation facility backlog, now in excess of \$818 million, is not expected to change significantly with this increase in authority.

Question. What portion of the reconstruction backlog is applicable to the current "minor" reconstruction limit of \$100,000?

Answer. About 50 percent of the total number of projects on the Fire, Administrative, and Other (FA&O) facilities reconstruction and construction backlog could be accomplished under the current minor construction authority of \$100,000.

Question. Recently the Oakridge Ranger Station, Willamette National Forest was destroyed by arson. What effort has been undertaken to reconstruct this facility? When will this task be accomplished? Why was this project not included in the fiscal year 1998 construction plans? If it were now included, what projects would be dropped from the plan if there were no increase in appropriation?

Answer. The Forest Service is proceeding expeditiously in assessing options of reprogramming or transferring funds to provide approximately \$3.9 million in fiscal year 1997 to reconstruct the Oakridge Ranger Station. Once funds are available, it could take up to 2 years to complete construction since outside work cannot proceed during the winter months at the site.

The Oakridge project was not included in the fiscal year 1998 program since it was the intent of the Forest Service to submit the reprogramming request in fiscal year 1997. It is important to note that if the \$3.9 million Oakridge project is included in the project list for the current \$8.196 million total FA&O request, each Region's share could be reduced more than half, from \$841,000 to about \$379,000. The allocation to the Northeastern Station would be reduced from \$394,000 to \$252,000.

The projects in the FA&O Reconstruction and Construction Project Listing in the Forest Service's explanatory notes are listed in priority order by Region. The following list shows projects that probably would be dropped or receive substantially reduced funding based on the decreased allocations to Regions if Oakridge is included without an increase in this line item. Some adjustments in the final list of projects

may also be needed since it is unlikely across-the-board reductions would result in a viable project in all cases. Some minor adjustments in the planning and design projects may be possible but large reductions would most likely result in loss of personnel and capability to accomplish planning and design work.

State	Forest	Project name	Project dropped	Reduced funding
Montana	Lolo	Ninemile RS utilities	X	
Do	Lewis & Clark	Hannon Gulch/Little Snowies WC	X	
Do	Flathead	Spotted bear fourplex, phase 2		X
Colorado	GM/UNC/Gunn	Norwood Bunkhouse	X

West Virginia	Morgantown	Morgantown Annes construction	X	

Question. How has the Challenge Cost-share and other partnership programs specifically assisted in the reconstruction and construction of recreation facilities?

Answer. The Challenge Cost-share and other partnership programs assist in the reconstruction and construction of a wide range of recreation facilities, specifically in the areas of: Developed sites, trails, interpretation and education, fishing, and heritage. The following are examples of typical projects:

Region 1, Montana, Flathead River Access: Reconstruction of rest rooms, boat ramp, and parking lot.

Region 2, Colorado, Maroon Valley: Reconstruction of three campgrounds, entrance station, three trailheads, trails, parking lots, signs, and shelters.

Region 3, Arizona, Sabino Canyon Interpretive Sites: Reconstruction of the parking lot and the environmental education and interpretive facilities.

Region 4, Utah, Great Western Trail: Construction of five trail segments, trailhead, signs, revegetation, and interpretation.

Region 5, California, Taylor Creek Stream Profile Chamber: Reconstruction of the building to conform with the Americans With Disabilities Act, revision of the interpretive exhibits, and rehabilitation of the trail.

Region 6, Washington, Johnston Ridge Observatory Exhibits: Construction of interpretive and educational exhibits in the Mount St. Helens National Volcanic Monument.

Region 8, Texas, Cagle Sanitation: Construction of a sewer treatment facility for a new recreation complex.

Region 9, West Virginia, Seneca Rocks Excavation: Excavation of prehistoric site and development of the interpretive plans for proposed construction of a Visitor Center.

Region 10, Alaska, Starrigavan ATV Trail: Construction of two loop trails and a parking lot; rehabilitation of existing logging roads; and replacement of a bridge.

ROAD CONSTRUCTION AND RECONSTRUCTION

The administration proposes to reduce funds for road construction and reconstruction by \$6.7 million.

Question. The Agency reports a road reconstruction backlog which is estimated to be between \$4 and \$5 billion. The most urgent roads in need of reconstruction total approximately \$403 million. Despite this backlog, the administration proposed a funding level of \$86.3 million which is less than the lowest increment proposed by the agency. Concurrently the administration proposes a \$17.6 million dollar increase in the timber sales management and salvage programs over the agency request. This appears to be inconsistent. How can the agency meet future timber offer goals

if the volume is prepared for sale but the road system is not in condition to support the volume removal?

Answer. Funding for roads backlog must be balanced against the need for funds for other Forest Service programs and the need to balance the budget.

The proposed budget assumes fewer sales in roadless areas and the need for less timber road support funding.

Funds for timber roads are adequate to administer road work on existing sales and to prepare surveys and designs for fiscal year 1998 green sale program of 2,505 MMBF. Engineering support needed for out year sales, including transportation planning, design, rights of way and bridge reconstruction and construction, will be provided to the extent possible. The sale program will be located to the extent possible to minimize road requirements. While every effort will be made to meet planned sale levels, some out year sales may be delayed.

Roads support for salvage sales is funded from salvage sale funds so that program is not affected by the reduction of road funds.

Preparation and administration of timber sale road maintenance is a relatively small portion of the road maintenance program and the actual maintenance is funded as part of the timber sale appraisal. The reduction in road maintenance funding is not expected to impact the timber program in fiscal year 1998.

Question. The agency budget justification states that direction is to "minimize entry into roadless areas." In July 1996, the Secretary placed restriction on salvage sale preparation which excluded volume in inventoried roadless areas. Why is the Administration continuing to avoid development and management of roadless areas which are available for timber production and which are considered as timber lands in the Forest planning process?

Answer. First, in regard to the Secretary's July 1996 restriction, the restriction applied to only those sales that were not considered emergency. The prohibition did not apply if salvage sales qualified under the definition of "imminently susceptible to fire." Trees "imminently susceptible to fire" were trees located in areas with high fuel loading or where there was a high fire risk rating for the specific habitat type, and near local communities or occupied structures. Proposed sales in areas with high fuel loading or where there is a high fire risk rating for the specific habitat type, but that are not near local communities or occupied structures, are to receive priority consideration for offering under the normal timber program authorities according to the July, 1996 direction.

Regarding the budget justification statement, the Forest Service is placing a high priority on regaining trust by the public by collaborating with them as timber sales are proposed. We know that roadless area entry is often controversial, so the focus is on areas outside the roadless area for the most part to increase the likelihood of rebuilding trust. As noted in the statement however, entry into roadless areas will continue.

Question. The agency's request for road construction funds was reduced \$19.2 million by the Administration. How does this action by the Administration affect road construction plans in fiscal year 1998? Will access to specific roadless areas not occur due to this action? If so, what areas?

Answer. Funding for the recreation and general roads programs is adequate to serve the immediate needs for these programs. However, a large backlog of road and bridge reconstruction needs exist in these areas. This backlog is expected to increase in fiscal year 1998.

The proposed budget assumes fewer timber sales in roadless areas. Agency direction is to minimize entry into roadless areas. The impact on access to specific roadless areas has not yet been determined.

Question. In response to subcommittee questions for the fiscal year 1997 process, the agency stated that it is no longer tracking the status of maintenance backlog. The fiscal year 1997 testimony provided data on road construction and reconstruction backlog for fiscal year 1994. No data was provided for fiscal year 1995 because the elimination of backlog data in favor of developing an "infrastructure data base." However, a February 7, 1997 briefing paper states that this data base will be able to provide an updated shortfall estimate for all but the roads component. In view of this statement, how will the agency track backlog for the road component and be able to provide the appropriate level of backlog information for the Subcommittee?

Answer. At present, the Infrastructure team is developing a Travel Routes module for the new IBM platform. The intent of Travel Routes is to provide an integrated information management environment for managing the inventory database of national forest system roads and trails. The Travel Routes module prototype is planned to be made available for testing in August 1997. It should be released for use in 1998. The Travel Routes module will include information fields to track back-

log data for roads. Travel Routes will be the information management system used to provide backlog information, however additional time will be necessary to allow Forests to input field data before the system is fully operational and can provide meaningful reports and summaries.

Question. The agency refers to an increasing number of roads being obliterated. What has been the predominant use of these roads (timber, fire, recreation, etc)? Will the recreation public be impacted by the obliteration of these roads?

Answer. Predominately, the roads being obliterated are un-engineered roads that are causing serious environmental damage due to poor location, steep grades, and lack of proper drainage. They are mostly old skid trails, off-road vehicle tracks, and timber or mining roads constructed by operators to access and remove the resource without the benefit of current design standards for public safety and environmental protection. Many have been closed to vehicle use already. They are not needed for the management of NFS lands and are being obliterated to reduce erosion and to enhance ecosystem management.

The impacts to the motoring public is generally expected to be minimal because most of the roads to be obliterated are already closed to motor vehicle use. Some obliterated roads will still serve non-vehicular uses such as hiking or horse riding.

Question. Recent storm damage in the western states caused significant damage to watersheds as a result of road failures. How does the agency budget proposal address road system modification to avoid future significant damage of this kind? Will current design standards and costs be affected by findings from an assessment of this storm damage?

Answer. The budget was developed to implement the best available low volume road design technology and to meet the standards and guidelines of the Northwest Forest Plan and similar regional planning efforts in the Columbia Basin. These strategies seek to minimize the influence of roads on hillslope hydrology, fisheries, and downstream values. Lessons learned from recent flooding will be incorporated in design standards.

We are studying the impacts of these recent floods to see how we can prevent damage in the future. Region 1 is conducting landslide assessments which will provide tools for better road planning and location and will also identify roads for obliteration. Region 6 is cooperating with the State of Oregon in flood damage assessment to identify road location, design, and construction factors related to storm damage. A Water/Roads Steering Committee was formed to guide selection of technology development projects related to water and roads interaction. Environmental standards for drainage, culverts, and bridge construction dictate increased design lives for reduced environmental impact. Risk assessments and Access and Travel Management planning are identifying and prioritizing roads not needed for long term forest access so they can be obliterated.

TRAIL CONSTRUCTION

The Administration proposes an increase in trail construction funds of \$5.5 million.

Question. The agency says 90 percent of all trail funds will be used for trail reconstruction. Assuming the President's budget is allocated for construction, what is the comparison of planned fund use between wilderness and non-wilderness trails? What is the cost per mile for trail reconstruction in the wilderness versus non-wilderness?

Answer. Ninety percent of trail re/construction funds were indicated to be used for reconstruction and addressing the backlog of deferred maintenance. The ratio for reconstruction of trails inside and outside wilderness will be determined by the forests in each region. We estimate that wilderness trail miles to be reconstructed will be 15–25 percent of the total trail miles, and will receive approximately 25–40 percent of the trail re/construction funds. The average cost per mile for trail re/construction is \$7,000 in the eastern U.S., \$20,000 in the western U.S., and \$142,500 in Alaska, with costs varying depending on the type of soil or rock, the number and type of bridges, culverts, water bars, or other structures, and the accessibility to trail sections. Costs for operation, maintenance and re/construction in wilderness can be approximately 60 percent higher due to the remoteness of work sites within wilderness and requirements by the Wilderness Act that non-motorized, primitive tools and techniques be used in wilderness administration. The nature of wilderness activities results in increased travel and person time to operate and maintain.

Question. The agency budget justification refers to a reconstruction backlog of \$267 million. The fiscal year 1997 agency testimony to the Subcommittee also refers to a backlog of \$267 million. With the President's budget not being met in fiscal

year 1997 can it be assumed there was no additional backlog during fiscal year 1997? Agency trail reconstruction backlog was listed as \$267 million in Fiscal years 1996 and 1994. Please update the backlog figure or explain why it has remained level.

Answer. Backlog continues to accumulate. You are correct that the backlog figures have not been updated since 1994. The Forest Service is instead, concentrating our limited resources (both dollars and people) on implementing a new infrastructure data base which should give an accurate picture of Agency backlogs.

Question. The agency justification refers to hiking and backpacking as the two fastest growing outdoor activities. What percentage of use occurs between wilderness and non-wilderness hiking experiences?

Answer. In "Outdoor Recreation in the United States" (Cordell and Super, April 1997), hiking increased 93.5 percent and backpacking increased 72.7 percent. The Forest Service does not maintain separate figures for wilderness versus non-wilderness hiking experiences.

Question. How much of the proposed increase in trail construction funds are planned as a result of expected increases in recreation use attributable to the 2002 Olympics? What specific partnerships have been developed for this effort?

Answer. The Intermountain Region, which includes Utah, has a fiscal year 1998 initial allocation of \$2.6 million in trail re/construction funds—about a half million more than fiscal year 1997. The Region estimates approximately \$400,000 of the fiscal year 1998 trail re/construction budget will be used for trail associated with the 2002 Olympics. Partners contributing cash, materials, or labor in kind or all three include: Snowbasin Ski Resort; Utah State University; Uinta Visitor Association; Utah Dept. of Natural Resources; ISTEAs funds; Idaho Department of Transportation, and Blaine County Recreation District for the Boulder Mountain Trail, and potentially the Great Western Trail Association for the Upper Goosberry Trail.

Question. What portion of trail construction and reconstruction funds are specifically targeted for persons with disabilities? What is the past 3-year history for this type of expenditure?

Answer. Typically an average of 10 percent of trail re/construction funds are targeted for universal access, including such improvements as hardened surfaces, access to fishing, parking lot and toilet improvements at trailheads, and access to interpretive trails.

PURCHASER ROAD CREDIT PROGRAM

The administration proposes to eliminate the use of purchaser road credits.

Question. A letter from the National Association of Counties states that the Forest Service proposal to eliminate purchaser road credits will reduce county revenue by an estimated \$12.5 million. Is it true that by eliminating use of purchaser road credits, less funds will be available for distribution to states and counties? If so, what steps can be taken to mitigate this problem?

Answer. In fiscal year 1996 the purchaser road credits was \$41,290,899; therefore, eliminating the purchaser road credits program would reduce the payment to the states (counties) by estimated \$10,322,724 per year. However, the Administration is very concerned about the effects on payments to states and support holding the states and counties harmless from any reductions.

MIDWIN TALL GRASS PRAIRIE

Question. The formal transfer of land from the military to the Forest Service did not occur until recently. What is the current status of management plans to open the Midwin to public use. How will such use be phased in? Is attention being given to those functions which will provide the most service to the public and which will maximize receipts?

Answer. A comprehensive management plan for the Prairie is in progress that will address public access and use. In the meantime, a business plan to implement a Recreation Fee Demonstration Pilot at Midwin has been completed and submitted for approval by the Regional Forester. Prior to construction of visitor facilities, public use will be under permit for such activities as wildlife viewing tours and limited forms of hunting. As construction of appropriate facilities is completed, these areas will also be opened to public use under the fee program. Service to the public is being provided where possible by those functions that are not in conflict with the basic purposes for which the Midwin National Tall Grass Prairie was established.

Question. What is the status of the Midwin's organization in terms of staffing which will serve the public users? Is the Regional Office in Milwaukee providing the full range of support services?

Answer. The Midewin is currently staffed with 18 persons from the Forest Service, Illinois Department of Natural Resources, and Will County Forest Preserve District. The FS employment includes the Prairie Supervisor, the Prairie Parklands Macrosite Coordinator, Law Enforcement Officer, Public Affairs Officer, Recreation/Lands Officer, Horticulturist, Planner, Clerk, Computer Specialist, and 4 not-to-exceed positions (receptionist, Computer Tech, Biology Tech and Volunteer Coordinator). Detailers also supply Midewin with services in order to accomplish the program of work. Actions are currently underway to fill a few vacant positions.

The Shawnee National Forest, the Eastern Regional Office, and the Southern Region are providing administrative services to the Midewin. Kent Austin, Midewin Supervisor reports directly to the Regional Forester and the Regional Office works with Midewin like other Forest units to ensure program accomplishment. The majority of personnel, computer, purchasing and procurement services are provided by the Shawnee NF with technical assistance from the Regional Office, when necessary. The Eastern Regional Office also provides technical assistance in the lands, engineering, and law enforcement programs, and the Southern Region provides some contracting services. This shared services approach is in line with the Eastern Region's plan to streamline processes and cross boundaries where practical to provide Midewin with administrative services that are both more efficient and effective.

Question. What is the estimated percent of lands from the Midewin which will be allocated to non-public uses such as agriculture, recreation residences, and other exclusive uses? What are the estimated receipts for these purposes?

Answer. There will be no recreation residences or other similar exclusive uses located at the Midewin. The primary purpose of the Midewin National Tall Grass Prairie is to manage the land in a manner that will conserve and enhance the native populations and habitats of fish, wildlife, and plants. Until the planning process is completed, an estimate of the percent of lands that will have restricted public use will not be known.

Question. Assuming the Recreation Fee Demonstration project is retained; when Midewin unit is fully functional, can it be expected that operations will be able to occur solely based on fees paid by the using public? What are operations cost estimates for this unit? What are income projections? What are the predominant expected uses?

Answer. When fully operational, our objective is for Midewin to be able to function based entirely on user fees. The operations costs, income projections, and predominant expected uses will be highly variable until the planning process is completed, consequently estimates at this time would not be prudent.

KV FUNDS

Question. What is the status of the KV fund nationwide in terms of cash on hand and to be collected, versus the cost of work to be accomplished with brush disposal funds?

Answer. The cash on hand in Knutson-Vandenberg (K-V) Trust Fund accounts as of the end of fiscal year 1996 totalled approximately \$106 million. In fiscal year 1997, \$202 million was repaid to the K-V Trust Fund as partial repayment for K-V advances for emergency firefighting purposes. Additionally, we anticipate about \$151 million from K-V collections from timber harvest during fiscal year 1997 bringing the total available balance to about \$459 million. We assume that the second half of your question is aimed at knowing the cost of the K-V work to be accomplished in fiscal year 1997, rather than brush disposal work. We anticipate K-V expenditures for renewable resource work specified on sale area improvement plans will total approximately \$218 million in fiscal year 1997.

Question. What is the status of money "borrowed" from the KV fund for use in fighting fires during the 1996 fire season?

Answer. Fiscal year 1996 began with a balance of \$420 million owed to the KV trust fund for prior year fire fighting costs. During fiscal year 1996, an additional \$225 million was borrowed for emergency fire suppression.

In fiscal year 1997, Congress appropriated \$550 million in emergency funds which could be used to help replenish the KV fund. The President released \$300 million thus far. Of this amount, \$202 million was transferred to the KV fund. The other \$98 million was retained in the emergency firefighting account to cover fiscal year 1996 obligations. Approximately \$443 million is still owed the KV fund.

LAND ACQUISITION AND LAND EXCHANGE

Question. The Forest Service and Plum Creek Timber Company have apparently agreed on an exchange of land near the Alpine Lakes Wilderness Area. Based on

the need to coordinate extensively with local publics what indicators do you have regarding the potential success of implementing this exchange?

Answer. The Forest Service and Plum Creek Timber Company (PCTC) have signed an Agreement To Initiate a proposed land exchange in the I-90 corridor near the Alpine Lakes Wilderness.

There is significant support from the environmental community for this exchange proposal. Most parties agree that Federal acquisition of many of the PCTC inholdings are in the public interest to protect endangered species habitat, and water quality; improve ecosystem management and provide recreation opportunities. There is also major support from Mountains to Sound Greenway Trust organization. This is an organization of key leaders from County Government, industry, environmental organizations and various other organizations in the Seattle area.

Kittitas County has concern about losing additional tax base within the County. Almost all of the PCTC lands are within the County. However, recent conversations between the County Commissioners, Forest Service and Plum Creek indicate that the County may not oppose this exchange if revenue losses to the County are minimized.

The Exchange proposal includes lands involving fourteen federally recognized tribes. There may be an issue with the tribes in regards to Treaty rights on the federal lands proposed to be exchanged.

Forest Service and Plum Creek are starting the scoping and public involvement process. A letter with maps of the proposed exchange has been mailed to over 4,000 individuals and organizations asking for public input to this proposal. In addition, four public meetings will be held over the next three weeks to gather public comments on the exchange proposal. The agency will have a better feel of how supportive or non supportive the public is of this exchange proposal when we have completed the public scoping process.

GENERAL QUESTIONS

Question. The General Accounting Office states (GAO/OCG-97-2) that significant savings are not likely to occur when the Forest Service, Bureau of Land Management, National Park Service, and Fish and Wildlife Service share resources. The Congressional Budget Office states that significant savings can only occur when operational functions are consolidated. The Forest Service and BLM have collocated some offices and shared some space. What actual consolidation of functions are being considered by the two agencies? Is there any active consideration of functional consolidation occurring involving the 4 land management agencies?

Answer. The Forest Service is evaluating and searching for ways to consolidate functions with other land management agencies, where feasible. Most consolidations of functions have been on a local scale with the Bureau of Land Management. For example, the BLM and FS may jointly fund the salary and expenses of a wildlife biologist to conduct work on both FS and BLM lands.

The Fire and Aviation Staff in the Pacific Northwest Region has consolidated with the BLM Fire Staff to provide regional leadership for both agencies. Another example is on the Fremont National Forest, where the FS, BLM, USF&WL, and State of Oregon are operating a consolidated Interagency Fire Center. The fire organizations in the four land management agencies also work together by sharing information and resources.

There are numerous examples of current and proposed consolidations of functions between BLM and FS. Specific examples are:

Northern Region—the Idaho Panhandle National Forest receives range management expertise from BLM while the Forest provides engineering assistance to the BLM. These agencies also share Geographic Information Systems information. The Nez Perce National Forest provides cadastral, design, construction, and inspection engineering support for BLM.

Rocky Mountain Region—in the next 3 to 5 years, the White River National Forest is considering a proposal to consolidate the functions of three Districts with BLM lands and will manage both BLM and National Forest system lands from these offices. The Forest may also create an Associate Forest Supervisor position who will oversee BLM interests, collocate the headquarters offices in Glenwood Springs (FS) and Meeker (BLM), integrate leadership teams, co-manage range allotments, share road maintenance equipment, share project or watershed level planning, develop common communications between agencies, monitoring standards, interagency map and integrate GIS.

The San Juan/Rio Grande National Forest currently share four line officers who are delegated the authority to do business for both the FS and BLM. One is both the Associate Forest Supervisor (FS) and the Area Manager for the San Juan Re-

source Area of the Montrose District of BLM. The other three line officers, located in the San Luis Valley, have the full authority to manage respective geographic parcels of both FS and BLM Lands. The Forest also has a joint campground concessionaire contract with BLM that is administered by one agency.

The FS provides all fire suppression and prevention for the San Luis Resource Area of the BLM and on some isolated parcels near Pagosa Springs. The BLM provides the Minerals expertise for all the FS lands in the San Luis Valley.

BLM and FS are cooperating to build an Integrated Resource Inventory of the five million acres in southwest Colorado. An integrated Geographic Information System is also in the early phases and will allow a number of agencies to make decisions based on broad landscape level rather than individual parcels.

The Forest Health Management Staff provides services to all federal land management agencies (BLM, DOD, NPS, BIA, and state foresters) in regard to detection, evaluation, suppression of forest insect and diseases. The Gunnison Service Center is jointly housed with NPS and BLM.

The Pike/San Isabel National Forest's "Trading Post" with the BLM involves the sharing of office space, professional expertise, administrative support, telephones, data general computers, copy machines, typewriters. Many functions have been consolidated.

Southwest Region.—The region, BLM, and NPS are involved in sharing fire control resources, including integrated buying teams, incident command system teams, dispatch, etc. The Region also shares training expertise and facilities with other land management agencies. The Santa Fe Supervisor's Office and the BLM also share office space and some common services.

Intermountain Region.—The Region has numerous shared or consolidated functions with BLM. Agency engineers help design BLM offices and a growing number of joint Visitor Centers are shared with BLM.

FS and BLM employees work together on efforts such as shared monitoring and inventory crews with states and BLM. The region is also involved in sharing other resources with BLM, such as road maintenance (including equipment), law enforcement, fire suppression activities with the National Inter-agency Fire Center in Boise, shared Dispatch Centers in Utah, Nevada and Idaho, and fire suppression property. A large effort is also ongoing with the Geometronics Service Center to share mapping services.

Data bases, primarily resource, are shared with the states and Interior federal agencies. This includes shared research surveys with other agencies including BLM.

Pacific Southwest Region.—The region is currently involved in sharing radio facilities, equipment, and other expertise with BLM. The Modoc National Forest provides a forklift and a conference room to BLM.

Pacific Northwest.—The Rogue River National Forest shares computer equipment, realty appraiser, and road maintenance work and equipment with BLM and NPS. The Forest also provides excess property services, office space, and stream surveys for BLM.

The Umpqua National Forest shares geotechnical engineering, engineering/resource geology, engineering design reviews of bridges, roadway structures and road designs, some heavy equipment, road maintenance, with Roseburg BLM Office. The Forest shares a recreation position with Eugene BLM and office space with Roseburg BLM.

The Malheur NF shares office/reception with BLM/NPS/APHIS and shares GIS services with NPS, and provides fleet maintenance for BLM and NPS. The Forest shares a tribal liaison, trails manager, range conservationist, and archeologist with BLM, along with many other services.

The Central Oregon Interagency Dispatch Center includes the FS, BLM, and Oregon Department of Forestry employees.

The BLM, as well as the Deschutes and Ochoco National Forest archaeologists are working together to manage the heritage resources and customer service events, such as the Passport in Time, for the Deschutes Province as a seamless unit between FS and BLM.

The Prineville BLM District and the Ochoco and Deschutes National Forests have collectively hired a person who works as the Tribal Liaison Officer for both FS and BLM.

The Ochoco National Forest Fire Management Officer is a BLM employee who manages both the FS and BLM Fire program. The Administrative Officer for BLM is a FS employee who also continues to serve as the Ochoco National Forest Administrative Officer.

The Prineville BLM District has approximately 13 FS employees performing work for the District, and the Ochoco National Forest has 2 BLM employees working on FS work.

The FS and the BLM are working on developing a single firewood permit for all of Central Oregon's public lands; an interagency cooperative approach to range management; an interagency cooperative effort to manage the Federal Recreation services in Central Oregon; and we are studying shared administrative services, fleets, engineering services and leadership.

The Regional Ecosystem Office is a joint interagency (BLM, FS, NMFS, EPA, BIA, NPS) consolidated office for implementing the President's Northwest Forest Plan.

Eastern Region.—The region supports the "America's Outdoors: Center for Conservation, Recreation and Resources", an interagency natural resource center, located at the Eastern Regional Office in Milwaukee, Wisconsin. The center is jointly funded and managed by the Forest Service, Bureau of Land Management, and National Park Service. The center provides "one-stop shopping" for natural resource information, including trip planning, environmental education, and conservation projects. America's Outdoors was awarded the Vice President's Hammer Award in 1996 in recognition of its accomplishment in reinventing government.

The Minnesota Interagency Fire Center, located in Grand Rapids, Minnesota, is multi-funded and managed by the Forest Service, National Park Service, and U.S. Fish & Wildlife Service, as well as the Bureau of Indian Affairs and the State of Minnesota. The Center provides coordination of emergency support for fires, floods, and other disasters within Minnesota and nationwide, on request, including fire-fighting crews, aircraft, supplies, and other needs. The Center also operates the Smokey Bear National distribution center.

Research.—The Forestry Sciences Laboratory in Athens, GA, is sharing survey research technology, data sets, and report development with BLM and NPS.

Question. In February 1997 the Department issued a report on Civil Rights at the Department of Agriculture. This report called for development of actions to alleviate real and perceived discrimination. (1) What action is the Forest Service taking to implement findings of this report? (2)(a) What action is the Forest Service taking to eliminate the large backlog of civil rights complaints? (2)(b) Some statements at recent listening sessions alleged that the Agency and Department are paying large sums of money to "settle" cases before they are properly adjudicated. What is agency position on settlement of EEO cases prior to full adjudication? (3) What are statistics for the past 5 years on agency payments for EEO complaint resolution (including civil settlements) and the number of complaints resolved as part of those settlements? What is the past 5 year data on pending complaints at the end of each fiscal year?

Answer. The Forest Service is taking the following actions to implement recommendations in the Civil Rights report:

In the next few months there will be considerable work done to implement the Secretary's Civil Rights Action Plan (CRAT). The USDA has 31 active teams currently assigned to implement the recommendations in the Secretary's civil rights report. Forest Service employees are serving on 16 of those teams which will provide the framework for all USDA agencies' implementation responses. Tom Thompson, Deputy Regional Forester for Resources from the Rocky Mountain Region, has been appointed to lead an Incident Command Team. The concept for this team is to mobilize resources to implement the report recommendations. Several Forest Service focus work teams have been chartered, under the direction of Tom Thompson, to develop implementation plans for specific portions of the CRAT report. Most of the specific actions identified in the CRAT report need to be implemented by the Forest Service. Some actions will require significant work while others may need minor civil rights program shifts and adjustments. The Forest Service is moving ahead with the implementation plans by working closely with CRAT teams in the Department.

The Chief has met with all Regional Foresters and Station Directors and directed that they become personally involved in resolving all complaints within their authority. The Department has teams looking at employee and program delivery complaints. The goal is to resolve all complaints by the latter part of June 1997. The Forest Service is actively helping the Department achieve this goal and has assigned several employees to the Department's complaint team.

Each Region and Station has established a "rapid response" team to seek resolution of its EEO complaints. The work of these teams is coordinated by the Washington Office Civil Rights Director and they are working in cooperation with the Department's Office of Civil Rights.

The agency position on settlement of claims before adjudication is to work diligently with the Department to resolve all complaints to the satisfaction of the complainant and for the benefit of the government, when possible. Due to the length of time and costs involved in adjudicating complaints, our policy is to resolve complaints before adjudication, when possible. In cases where the complaint can be set-

tled with little or no money involved and where continuing the case would further deteriorate relationships and incur substantial costs, settlement may occur prior to adjudication.

Formal complaints are handled at the Department level. The Department coordinates with Forest Service units on settlement agreement terms, including payments. Compensatory damage claims over \$2500 have been adjudicated by the Department of Agriculture. Settlement agreements have been signed with the understanding that documentation of claims would occur after the settlement. The documentation of claims, the investigation of claims, and the adjudication of claims have frequently taken months and even years to reach closure. The Forest Service, therefore, does not have all of the information needed to respond with any degree of accuracy regarding costs of settlement agreements.

The number of formal EEO complaints filed, by fiscal year, are as follows:

Fiscal year:	
1992	104
1993	194
1994	249
1995	250
1996	194

According to Department of Agriculture reports, the Forest Service has resolved 307 formal EEO complaints through settlement agreements during the period of fiscal years 1992—1996. However, data is not available by fiscal year.

Question. In your January 6, 1997, remarks to Forest Service employees you stated that “our financial and administrative houses must be in order.” Many comments have been made about the negative state of the agency’s financial records, including some members of the Senate who say the agency’s records are “a mess.” What actions are you taking to get your financial house in order? How has your reduction of employment in the Washington Office affected this problem and the ability to fix it?

Answer. Specific actions being taken include a joint effort between the Forest Service, the USDA Office of the Chief Financial Officer, and the USDA Office of the Inspector General, working as a team to address the issues necessary to correct deficiencies identified in the 1995 financial audit. A detailed action plan was developed by the team in December 1996, which the Forest Service began implementing in January 1997. These actions, combined with the implementation of revised general ledger software by the USDA and inputting data into the Forest Service automated real property information system, will address the issues identified by the OIG.

The reduction of staffing in the Washington Office has resulted in the remaining workforce simultaneously dealing with the ongoing, current workload while integrating necessary changes to bring the Forest Service financial house in order. At the Washington Office, field personnel from throughout the Agency have been called upon to assist in making necessary changes and improvements.

Question. What is the status of implementation of the IBM computer equipment to replace the Data General? How far behind schedule is this effort? In light of the very fast transformation of information technology, will the equipment still have a reasonably functional life once fully implemented?

Answer. The Forest Service requested a waiver from the USDA Information Technology Investment Moratorium on April 18, 1997, to proceed with implementation of Project 615. The waiver was received on May 1, 1997, and orders were submitted to IBM to begin implementation.

We are now back on schedule to be fully implemented by fiscal year 1999. The delay caused by the USDA Moratorium can be regained this fiscal year by expediting orders through the summer. The combined orders, when added to the installed base of 5000 workstations, will equip about 16,000 total employees by the end of fiscal year 1997. In fiscal years 1998 and 1999, we will provide access for approximately 7,000 users per year to complete the implementation.

We have continued contract updates with IBM ensuring that the technology is regularly refreshed and is providing a technology and price/performance level better than that originally provided in the contract. This approach ensures that the contract contains up-to-date technology appropriate to the requirements of the Forest Service. In addition, we are integrating personal computers into the IBM system architecture bringing it up to contemporary standards. By taking advantage of this well-integrated technology, the Forest Service will have the broadest range of modern technology to meet its business requirements.

Question. The Forest Service has invested a great deal of funding in re-engineering processes. What specific reductions in FTE’s can be attributed to specific re-engineering of administrative processes.

Answer. The reengineering efforts for the Agency are aimed at reducing overhead costs by consolidating some Forest administrative offices, and at improving efficiencies by improving work processes and delegations to enable us to effectively accomplish our mission. However, FTE reductions have not been tied directly to reengineering efforts, but more so in response to the Administration's (NPR) overall direction to reduce the number of administrative positions. Since 1992, the Forest Service has reduced its administrative workforce by 15 percent.

Question. Despite numerous efforts to reduce field level personnel organizations, fully operational Personnel Management organizations exist on most National Forests and in every region. Extensive efforts to streamline the organization has failed to consolidate functions and reduce Personnel Office substantially. What is the current level of FTEs in the Personnel Management function by series for the past 5 years, and what is the number of full service personnel offices comparatively for the past 5 years? With general administration funds being reduced, why does the agency continue to maintain this number of offices?

Answer. Many forests no longer have personnel offices. The agency is continuing to explore opportunities to reduce personnel offices, personnel employment, and costs. Since 1993, employment in the personnel disciplines has declined from 1,150 full-time equivalents (FTEs) to 930 FTEs—an 18 percent reduction.

The 5-year FTE employment for personnel disciplines follows:

Series	Title	1993	1994	1995	1996	1997
201	Personnel management specialist	346	319	302	304	300
203	Personnel clerk/assistant	496	444	401	383	368
212	Staffing specialist	26	19	19	20	17
221	Position classification specialist	17	13	13	10	8
223	Salary/wage administration	3	3	4	5	4
230	Employee relations specialist	32	26	31	33	32
233	Labor relations specialist	6	6	5	8	6
235	Employee development specialist	33	35	28	24	23
260	Equal employment opportunity	70	65	64	58	57
	Other personnel related support, such as reception, typing, computer, et cetera	121	118	113	120	124
	Total	1150	1048	980	965	939

The number of personnel offices for the past 5 years follows:

Number of personnel offices

1993	115
1994	114
1995	117
1996	126
1997	104

The agency is actively reducing the number of personnel offices and saving money, and will take every practical opportunity to continue with these efforts. The cost associated with transfers, reduction-in-force, or retraining employees is often greater than the savings realized through consolidation, not to mention the adverse effects it would have on morale and productivity. In the past year, we closed 22 personnel offices. We expect this trend to continue at minimal expense to the taxpayer.

Question. What specific action will be taken to improve financial management weaknesses identified by the General Accounting Office and the Office of the Inspector General?

Answer. Specific actions which will, or have been taken to address shortcomings in financial management at the Forest Service occur in several broad areas. To date, we have made much progress, including:

Formation of the Financial Health Task Group comprised of staff from the Forest Service, the Office of the Chief Financial Officer, the Office of the Inspector General, and occasionally including a representative of the General Accounting Office. This group provides continuing oversight to assure that actions occur.

The Financial Health Task Group caused the creation of a financial health plan covering broad areas, and published that document during December 1996. That plan was supplemented by all of the Regions and Stations during February and

March, and is the basis for on-going monitoring visits by the OIG consultants tasked by the Financial Health Task Group.

The Financial Health Task Group also caused the creation and publication of a Desk Guide to be used by the Forest Service staff in addressing the areas of weakness. That guide was distributed during June, 1997, and provides in one concise document all of the information necessary for staff working on improving the quality of financial management information.

In the area of Accounts Payable, and Accounts Receivable, permanent solution is not possible until the Department's Foundation Financial Information System (FFIS) is operational. This system will begin pilot testing in one-third of the Forest Service units on October 1, 1997. If it is successful, it will be expanded to the remainder of the Service on October 1, 1998. In the interim, the Financial Health Desk Guide provides detailed instructions on how to properly handle both payables and receivables.

In the area of Revenue and Reimbursements there have been several changes. Part of Forest Service's data quality problems came from an automated process used in prior years at year end. That process has been discontinued as it created more difficulties than it solved. The publication of the desk guide referred to above provides detailed instructions as to how to code these types of transactions properly, and that has been distributed to all units. Finally, considerable attention has been given to making certain that the units get their records corrected and current.

In the area of Property, Plant, and Equipment, there have been several actions taken to improve data quality and systems. The USDA will shortly issue revised instructions as to the capitalization threshold for Real Property. Forest Service is in the final stages of creating an automated subsidiary ledger (INFRA) which will capture information on all constructed features on a national forest. This data will include both cost and depreciation information. We expect that this system will be operational beginning in fiscal year 1998, and will have accurate, inventoried data by the end of that fiscal year.

Personal Property is currently being inventoried, and we are expecting that by the close of fiscal year 1997, all of our inventories will be up-to-date. The Department has published a change to the capitalization threshold to \$5,000, which has been implemented by the Forest Service.

As stated above, the Financial Health Task Group has engaged the OIG as consultants to monitor and report back on the progress being made by the field units. The Inspector General reported to the Chief of the Forest Service in July that the results of the monitoring visits on three regions had shown "significant improvement" in the quality of information. These visits will continue until mid-August, at which time they will have visited each Region and Station in the Service. We have continuing discussions on the progress of the work, and expect the OIG to issue a final consulting report shortly after completion of the visits.

Question. There are reports that payments for workplace disabilities (OWCP payments) cost the agency several million dollars per year. How much money is being paid for OWCP currently? What is the past 3-year history? What action is the agency taking to provide employment to former employees who are receiving OWCP payments in jobs they can perform? What specific savings have resulted from these actions? What action is the agency taking to eliminate current and former employee fraud relative to OWCP claims?

Answer. We estimate that fiscal year 1997 OWCP costs for the agency will be \$27,130,846. The costs for the 3 previous years were \$25,665,054 (FY 1996), \$26,924,938 (FY 1995), and \$27,997,611 (FY 1994).

The agency's OWCP program is designed to identify claimants who are likely to fully recover from their injury/illness, place them in positions they can perform while recuperating, and later return them to their original jobs. This program ensures that a position is reserved and offered when claimants recover. We have also established four full-time Workers' Compensation Program Manager positions in the field. These positions focus on reducing long-term claims and costs through rehabilitation and reemployment of claimants. We continue to try to place the employees in positions that they can perform.

Our Workers' Compensation Program Managers are actively working with claimants and personnelists to eliminate current and former employee fraud by reviewing all long-term claims, controverting claims that are not clearly job-related, and ensuring, when appropriate, that third party recovery is made. In the past 3 years, it is estimated that these cost reduction efforts have saved \$2.5 million.

Question. How has the agency integrated the Government Performance and Results Act into its performance measures for accomplishment in the fiscal year 1998 budget process? There does not appear to be a direct tie between accomplishments planned as part of the agency budget justification and the agency's draft fiscal year

1998 GPRA Performance Plan. For example, there is a difference in comparing fuel treatment acres in the budget justification, which plans accomplishment of 1,000 acres (total of brush disposal and hazardous fuels reduction), versus the GPRA action plan which proposes to treat 1,250 acres. In the recreation management program there appears to be no tie between accomplishment measures in the agency justification vs emphasis in the GPRA action plan.

Answer. In July 1996, the Forest Service submitted to the Department of Agriculture a list of performance goals and indicators with planned accomplishment levels consistent with its Agency Request (i.e., highest budget request level). These goals, indicators and planned accomplishment levels were incorporated into the agency's draft annual performance plan for fiscal year 1998. At the same time, planned accomplishments for these indicators were being adjusted to reflect the program funding levels in the fiscal year 1998 President's Budget. These adjusted planned accomplishment levels were displayed in the agency's Budget Explanatory Notes. This is the source of the discrepancy between some of the numbers in the Explanatory Notes and the Draft Performance Plan.

Question. With the intent to implement GPRA in fiscal year 1999, will the tie between GPRA and the annual budget justification be readily apparent?

Answer. Yes. It is the agency's intent to integrate GPRA performance goals and indicators into all steps of the budget process including budget justification.

Question. With full implementation of GPRA, will the agency realize any efficiencies by reducing work on other planning or accomplishment efforts?

Answer. We feel that the strategic planning and annual reporting processes required by GPRA are quite compatible with similar requirements the agency has under the Forest and Rangeland Renewable Resources Planning Act (RPA). The GPRA requirement to develop an annual performance plan has also been integrated into the agency's budget process. As a result, existing staffs should be able to handle the GPRA workload but we expect no budgetary or personnel savings from this effort.

Question. What are the anticipated effects of the Administration's initiative to place former welfare recipients in Forest Service positions? Will field level accomplishments be affected?

Answer. The Forest Service estimates that we can hire at least 37 welfare workers per year from the welfare rolls for the next four (4) fiscal years. This is not expected to affect field level accomplishments.

QUESTIONS SUBMITTED BY SENATOR BEN NIGHORSE CAMPBELL

Question. It appears that the USFS is phasing out the Timber Salvage Sale program in favor of a new Forest Ecosystem Restoration and Maintenance Fund. What does this mean for the timber industry? Do you plan to utilize more controlled burning to restore forest health at the expense of using timber sales to remove salvageable timber?

Answer. There is no intent to phase out the salvage sale program. Rather, the objective is to create a tool to better manage the entire land base.

Question. How will your Wildland Fire Management program improve the control of wildfires that seem to be increasing in number and intensity in western forests.

Answer. We have focused a major portion of the wildland protection program at increasing the funding and treated acreage of hazardous fuel reduction. The large build-up of fuels throughout the western forests increases the probability for large, catastrophic fire. Reducing fuels, through mechanical treatments or the use of prescribed fire will result in smaller, less intense fires. This emphasis will require many years of fuel treatments to realize the benefits of such a program. It is also necessary to maintain a strong preparedness organization to quickly and effectively suppress fires, thereby preventing them from becoming large.

Question. It appears that the elimination of the "Purchaser Credit Program" will require that timber companies will be responsible as usual for the cost of construction of roads. However, the requirement that they pay these costs up-front may cause serious financial problems for smaller operators. Don't you think this will cause even more of these small family businesses to be unable to compete for timber? This will also result in lower bids on timber sales. Won't this also reduce the payments going back into the county governments in lieu of taxes?

Answer. The administration's proposal would both retain the Purchaser Election Program for small purchases and hold the states harmless from any losses in payments as a result of the elimination of the Purchaser Credit Program. We urge the Congress to adopt these proposals.

Question. I am concerned that the increased funding going to the President's Forest Plan for the Pacific Northwest is taking funds away from other Regions. Region 2 Regional Forester, Elizabeth Estill, has indicated the need for additional funding to rebuild the timber sale pipeline in her Region. I understand that you are further reducing the proposed timber harvest in Colorado which already is having a difficulty maintaining an industry. Are you diverting funds from Region 2 to go to the Pacific Northwest?

Answer. No. The fiscal year 1998 agency request did not reduce the allocations to regions and forests not covered by the PNW Plan in order to meet the PSQ in the PNW Plan. The Administration recognized this cost and chose to provide additional funding in the President's Budget versus not meeting the PNW Plan or reducing other regions and forests to pay for meeting the PNW Plan.

Question. Why is USFS research in Colorado being downsized?

Answer. During fiscal year 1996, Rocky Mountain Station reorganized the four ecological RWU's in Fort Collins, Colorado into two units. This was done for two reasons; (1) to reduce the number of supervisory positions (Project Leaders) needed from four to two, thus freeing up more funds for actual research; (2) to create multidisciplinary units, more suited to addressing the complex questions that need to be answered in taking an ecosystem approach to wildland management. Because the whole Station has only two forest entomologists and two forest pathologists, and because of significant insect and disease problems in both the Southwest and the Central Rockies, during the reorganization, we matched scientists to research needs by relocating one entomologist and one pathologist from Fort Collins to the Flagstaff Arizona, Forestry Sciences Lab. To support this move, \$340,000 in funds were reassigned from Colorado to Arizona.

Prior to the reorganization, one scientist and one technician, who were located in Arizona, had actually been assigned to an ecological research unit in Fort Collins, and thus their funding was shown in Colorado even though they worked out of Arizona. As part of the reorganization, we reassigned them and \$196,000 to a unit in Flagstaff Arizona.

Another \$28,000 reduction covers Rocky Mountain Station's share of increased support to accelerate research in President's Northwest Forest Plan. The final reduction of \$75,000 in RWU-4803 reflects reassignment of the last of the Southwestern Consortium funds from the Station's headquarters to laboratory in Albuquerque New Mexico. No personnel moves were associated with these funds.

Total Reduction: \$639,000.

Question. What is the methodology utilized by the USFS to determine the number of recreational user days?

Answer. The Forest Service tracks recreation use by Recreation Visitor Days (RVD's) and by Visits. A RVD is a statistical reporting unit consisting of 12 visitor hours. A visitor hour is the presence of a person on an area of land or water for the purpose of engaging in one or more recreation activities during the period of time aggregating 60 minutes. A Visit is the entry of one person upon a national forest for the purpose of participating in one or more recreation activities for an unspecified period of time.

Both RVD's and visits estimated by Forest Service field units and reported through a computerized reporting system. Various ways exist to display the information gathered: by Region and by State, by activity, and by year. Field estimates are based on the application of sampling techniques, traffic counters and other observation methods.

The Forest Service is also experimenting with methods to improve recreation use estimates. A prototype process is currently being tested. It is intended to provide improved statistical estimate of recreation use on the national forests.

QUESTIONS SUBMITTED BY SENATOR CONRAD BURNS

Question. Do agencies expect to meet this target in fiscal year 1997 as scheduled?

Answer. The USDA Office of Forestry and Economic Assistance recently provided information relevant to this question in the report "The Northwest Forest Plan: A Report to the President and Congress" (issued December, 1996). The 1.053 billion board foot level included the initial probable sale quantity (PSQ) of 958 million board feet plus an additional 10 percent of "other wood." As noted in the 1994 Final Supplemental Environmental Impact Statement, "sustainable sale estimates will be made using more refined data and procedures available when Draft Forest and District Plans are completed or current plans are revised." (FSEIS, page 3&4-267). Some individual national forest and BLM district plans have been completed since implementation of the Pacific Northwest Forest Plan and the PSQ has been revised

as a result. The December, 1996 Report to the President and Congress now sets the PSQ at 868 mmbf, and total projected levels at 954 mmbf if you include "other wood" (page 103). It notes that further adjustments could be made as more plans are revised in the future. The Forest Service intends to fully meet its part of the current PSQ projections in fiscal year 1997.

Question. What are your plans to meet the decade target?

Answer. The report "The Northwest Forest Plan-A Report to the President and Congress" also addresses your question relative to the "decadal target." At page 103, it states that "the agencies expect to meet the average annual probable sale-quantity goals over the 10-year life of the Plan because the volume that wasn't offered during the first 3 years of the Plan, as the agencies were reestablishing the program, can be offered over the remaining 7 years." Please keep in mind that the PSQ could be further modified as forest plans in Oregon and Washington are revised, which would affect the total volume offered over the decade.

FOREST HEALTH AND SALVAGE

Question. Are funds available in the Forest Service budget to aggressively prepare and offer salvage sales in fiscal year 1997? How much salvage volume has been offered under the salvage law to date and how much do you project will be offered by the end of this fiscal year?

Answer. Yes, there are currently sufficient funds in the Salvage Sale Fund to continue the program. The increase in salvage expenditures from the emergency salvage sale provisions did reduce the fund to a low level; however, the receipts from additional volume sold is replenishing the fund. The recent decline in timber prices has also reduced collections. Regions 1, 3, 4, and 5 started fiscal year 1997 with less than desirable cash balances. Projections indicate that 1997 collections will be sufficient to maintain the program in fiscal year 1997. Even though our policy is to limit each region's fiscal year expenditures to their previous fiscal year-ending, unobligated balance, Regions 4 and 5 have requested approval to use a portion of their fiscal year 1997 collections for salvage sale preparation in fiscal year 1997. We are looking at these requests to see whether remaining collections in fiscal year 1997 will be sufficient for these two regions such that their ending fiscal year 1997 balances are sufficient to support a reasonable salvage program in fiscal year 1998. If there are unexpected additional expenditures in fiscal year 1997, and continued low stumpage prices, then this could cause problems in the unobligated cash balances for fiscal year 1998.

A total of 4.606 billion board feet of salvage was offered under the salvage amendment, including 818 million board feet which was offered the first quarter of fiscal year 1997. The amendment expired on December 31, 1996.

Though the salvage amendment has expired, an additional 600 million board feet of salvage will be offered under current authorities during the rest of the fiscal year.

Question. Do you share Secretary Babbitt's view that all we need to do is more prescribed burning and can we solve the forest health crisis on our national forests?

Answer. Acting on the recommendations of the Federal Fire Policy Review in 1996 the Forest Service is expanding the fuels reduction programs. We agree that the use of prescribed fire is one of the most effective tools in restoring the health of our forests and rangeland. The Forest Service is working toward a target in the year 2005 of applying hazardous fuels reduction treatment on 3,500,000 acres. In fiscal year 1998, we plan to accomplish between 850,000 and 1,300,000 acres of fuel treatment. This represents a significant increase from 1996 and 1997. Although a vast majority of these acres are expected to be treated with fire, some areas will need some type of mechanical treatment before fire can be safely utilized.

Question. Has your agency evaluated the number of days in the year when forest fuel and air quality conditions are right to do prescribed burning and given those limitations can your agency accomplish Secretary Babbitt's optimistic targets?

Answer. We anticipate that we will be able to carry out our fiscal year 1998 program of work for hazardous fuels reduction while meeting air quality standards. Local Forest Service fire managers and local authorities work successfully together to accomplish fire and land management objectives, resolve conflicts with smoke emissions, and comply with air quality standards. In addition, planning is underway to design larger and more efficient prescribed fire projects that take advantage of optimum burning conditions while significantly increasing acres treated.

The Forest Service is also working with officials from the Environmental Protection Agency to assure compliance with air quality standards.

Question. Has your agency assessed the risk of increasing the prescribed fire program on escaped burns, public safety, and financial liability?

Answer. Every prescribed burn goes through a rigorous process which includes a risk assessment and prescribed burn plan which is approved by the local line officer. Public and firefighter safety are the agency's greatest concern. The risks and outcomes of wildfire far outweigh the risks associated with well planned prescribed fire. Prescribed fire will, in the long term, reduce the risk to public safety as well as the liabilities of additional prescribed fire applications.

Question. The Administration is recommending changing the FS definition of salvage—the same definition that the agency has used for years. This, in my opinion, would have the affect of giving less flexibility and decision making authority to professionals in the field. Why do you want to do that?

Answer. The salvage definition was changed by the Forest Service a couple of years ago to reflect the ecosystem management approach. It was tied to ecosystem improvement and rehabilitation by including dead, dying, damaged, and associated trees at high risk of spreading disease or insect epidemics. The new definition also clarified that salvage may include trees imminently susceptible to insect attack because of drought-related stress and trees lacking characteristics of a healthy and viable ecosystem. This definition is consistent with the National Forest Management Act. The salvage definition was also changed by the Recissions Act by including trees imminently susceptible to fire. This broadened the authority for using salvage during the period of the Rescissions Act.

The Interagency Salvage Program Review team found that the definition of salvage was confusing to the public, and that the interpretation and application was not uniform across national forests and BLM districts. The proposed change would be to more clearly articulate the intent of salvage projects to the public and to provide consistent application.

FOREST RESEARCH

Question. The 1992 Blue Ribbon Coalition Report called for a 5-year inventory and analysis cycle. Since the 1992 report was issued the inventory cycle has gone in the opposite direction and has increased to an average of 10 years. What are the primary factors that have contributed to the lengthening rather than shortening of the inventory cycle?

Answer. The current national FIA inventory cycle is now 12 plus years. The cycle is controlled by three main factors; (1) a mandated accuracy requirement which determines the amount of data to be collected, (2) funding for personnel and equipment which determines the speed at which the data are collected, (3) funding for technology research and application which can increase efficiency and reduce the collection burden on personnel and equipment without sacrificing accuracy.

The first controlling factor, accuracy, is required and necessary to provide quality information to make sound management decisions.

The second controlling factor, funding, is the central issue. Since 1995, overall Forest Service Research program funding has declined 10 percent. During this same time period, FIA field program funding has increased by 3 percent. Clearly FIA is still a priority research program within the Agency but the modest increase in FIA funds have not been sufficient to offset the increased cost of getting personnel and equipment into the field. Continued funding at current levels will further erode the cycle unless new technology can bridge the gap.

The third controlling factor, technology research, is difficult to maintain when cycles slip and demand for current information rises. However, scientifically sound research is critical to the application of any new technology or data collection method. With constrained budgets, FIA strives to maintain a balance between the potential gains in efficiency from development and application of new technology and the demand for shorter current cycles.

INTERIOR COLUMBIA BASIN ECOSYSTEM MANAGEMENT PLAN

Questions. (a) How do you intend to incorporate the findings of the scientific assessment into management direction for on-the-ground activities? (b) Will the scientific information go through the NEPA process before being applied to the ground?

Answers. (a) The Bureau of Land Management and the Forest Service have incorporated the findings of the scientific assessment into management direction in the Eastside Draft EIS and the Upper Columbia River Basin Draft EIS. Science underlies the construction of various alternatives. In addition, the agency field units are receiving training on the scientific assessment and its findings so that ongoing and planned activities will take the information into account during project-specific NEPA analysis. (b) Yes. The first place this occurs is in the draft EISs that were released in late May. Additionally, site specific NEPA review will occur when projects are developed for implementation by field units.

Question. In a February 3rd letter to Regional Forester Hal Salwasser, the Eastside Ecosystem Coalition of Counties (EECC) state that due to the regulatory agencies involvement late last year, change to the draft EIS approved by the project's executive committee are "unacceptable" and "the EECC cannot support the Project in the direction it is currently headed." The Coalition stated that they would withdraw their support if the Project does not "significantly redirect" itself and have at least one alternative that truly directs active management without lengthy and burdensome processes. What changes in the draft EIS are being explored to address the counties' concerns?

Answer. Several meetings which identified specific concerns, were held this year between Project representatives and Coalition members. In addition, Regional Executives met with the Idaho Association of Counties and listened to their concerns, along with numerous subsequent personal contacts with EECC members. In response to a February 3 letter from the EECC and these meetings, the Regional Executives: 1) decided to delay identifying a preferred alternative until concerns of County governments could be addressed; 2) responded to the counties by letter (dated February 24, 1997) with specific responses to the county concerns, including both clarification intent on some of the issues, and some changes to the draft EISs to address the counties' concerns.

The Regional Executives and the EECC agreed to the following changes at a March 6 meeting: (1) rewrite one of the grazing standards; (2) differentiate between the forest riparian "zones" with respect to management objectives of forested riparian conservation areas and permitted activities therein for each zone; (3) refine definitions of the words "protect" and "maintain" as they apply in the draft EIS's; and (4) add language to the standard in the draft EIS's that specifies that road condition/risk inventories can be conducted in a manner appropriate for the scale of analysis (watershed scale v. larger subbasin scale) being completed. In addition, numerous clarifying changes were made in response to EECC comments.

REAL ESTATE MANAGEMENT

Question. What is the current status of applications from inholders for access authorization to NFS lands for construction and/or use of roads? What has been the history of funding for processing of these applications in recent years?

Answer. The Forest Service annually receives several thousand applications for new uses and occupancies of National Forest System lands. They include applications for access to inholdings within the National Forests. The agency has a significant backlog of applications from inholders for authorizations for the construction of access facilities (i.e., primarily roads) across National Forest System lands. The agency has no current mechanism by which it catalogues or tracks the number of such applications currently on file and backlogged. Applicants for authorizations who have demonstrated a statutory right of access across National Forest System lands (to an inholding) have generally been provided a higher priority for processing and evaluation than those applications for uses not associated with such a right. Funding levels in recent years have been such that the agency has been able to properly administer only existing authorizations. We have been able to process only the highest priority applications for new authorizations. Generally, the agency is able to process applications when the applicant pays for some of the processing costs.

FOREST ROADS

Question. What impact will the elimination of Purchaser Road Credits have on the ability to meet the timber sale targets under the President's Northwest Forest Plan and meet your objectives for improving forest health?

Answer. There will be little to no effects on our ability to meet timber sale targets or to meet our objectives for improving forest health, since the amount of road access is not affected.

Question. Do you have enough funds to repair all the forest roads damaged by last year's record rainfall and flooding? If not, what impact will these unrepaired roads have on salmon habitat, fire prevention and suppression, recreation access, and timber sale access?

Answer. Funds for emergency repair of Forest Service roads are made available through two sources: the Federal Highway Administration Emergency Relief Federally Owned (ERFO) road program and appropriated road funds in the Forest Service budget. Preliminary estimates of road damage indicates ERFO needs of \$90 million to repair forest roads to pre-flood condition, needs of \$12 million for road repairs that are not covered by ERFO, and needs of \$10 million to fund additional road maintenance work caused by last years storms. As snow melts in the high country,

we can access the damaged areas to do the field work necessary to complete the damage reports and provide better estimates for necessary road repairs. Additional damage reports are being prepared for roads damaged by more recent floods in South Dakota.

Preliminary estimates of ERFO needs have been provided to the Federal Highway Administration and we are waiting for their decision on the funding. There is some question as to annual ERFO funding authority being sufficient to cover the total qualified work. Without funding approval, we will not be able to perform the work.

Funding for non-ERFO repair needs were not included in the current year's budget. Congress recently approved a supplemental appropriation of \$39,677,000 for the National Forest System (NFS) and \$27,685,000 in reconstruction and construction funds for emergency expenses resulting from flooding. Without the supplemental appropriation, we would not have been able to complete the additional flood damage repairs without causing major disruptions to our regular program of work. Supplemental appropriations are adequate to cover 85 percent of the highest priority needs for NFS damage identified as of May 1, 1997, including road maintenance, and the 71 percent of the highest priority needs for reconstruction and construction identified as of May 1, 1997, including road repairs. The determination of road priorities in relation to other repair needs will be made at the regional level and may vary from region to region.

Funding for our regular road maintenance program is provided through normal FS appropriated funds. Under the current funding levels we are able to maintain only forty percent of the forest system roads to the standards established for the current use. Funding the additional road maintenance needs caused by the floods from our regular appropriation would severely impact our already limited routine maintenance program.

Without additional funds, repair of damaged roads will be delayed or left undone. Sediment derived from roads is the single largest source of non-point pollution in managed forests. Failure to properly maintain roads increases erosion and sediment inputs, particularly fine sands and silts which damage fish spawning and rearing areas for critical salmonids.

Reduced access for fire prevention and suppression could require the expenditure of additional fire fighting funds to open roads for fire access. This will cause delays in response time, resulting in more acres burned by wildfires, unnecessary resource losses, and additional threats to life and property on-site and downstream.

Roads posing significant safety or resource concerns will be closed until repairs can be made. This will cause lost recreational opportunities, continued erosion and resultant sediment impact on streams, lakes, riparian areas, and related fisheries and wildlife resources. Quantifying specific impacts is not possible within funding and time constraints provided.

Question. You are recommending a \$12 million cut in appropriated funds for roads and an elimination of the purchaser road credit program. This will cut the timber sale program by approximately 25 percent. Is this your intention?

Answer. No, this is not our intention, and it will not cut the timber sale program by 25 percent. The proposed budget assumes fewer sales in roadless areas and the consequent need for less timber road support funding. Agency direction is to minimize entry into roadless areas, and proceed only where determined necessary through the NEPA process and public involvement.

Funds for timber roads are adequate to administer road work on existing sales and to prepare surveys and designs for the fiscal year 1998 green sale program of 2.505 MMBF. This is the planned green sale volume for fiscal year 1998.

QUESTIONS SUBMITTED BY SENATOR PETE DOMENICI

“Attitude shift away from timber production”: Historically, the Forest Service has concentrated its resources on the production and sale of timber and pulp wood. Over the past decade, the number and size of timber sales has declined, and the Forest Service has shifted its focus to other activities such as recreation and wildlife management.

Question. What steps has the Forest Service taken to accommodate this shift in emphasis away from its historic reliance on timber production and sales from National Forests?

Answer. While timber management and timber sales are still important agency programs, the Forest Service has adopted an ecosystem management approach. Sustaining and restoring the health, productivity, and diversity of the ecosystem is essential to our ability to continue to provide multiple benefits from public lands.

Question. Does the Forest Service expect recreation and related activities to continue to play an increasingly important role in forest management?

Answer. Yes. Recreation use projections clearly show increasing demand for recreation opportunities on the national forests. Recreation use is expected to top 1.2 billion visits by the year 2040. Recreation is one of the key multiple uses provided by the national forests. Several million private sector jobs are associated with recreation on the national forests making it a key component of the National, and many local, economies. The growing importance of recreational opportunities in the national forest is being recognized in overall forest management.

Question. What program and activities does the Forest Service expect to be available for on-the-ground management of renewable resources within the National Forest System?

Answer. We anticipate continuing to provide a full complement of resource management activities on the ground in the future, as we do now, with no specific program deletions or additions being planned. We remain committed to the goals outlined in the Forest Service document "Course to the Future" which affirm the multiple-use principles of sustained-yield management which have guided National Forest System management for the last half of this century. Within that framework, National Forest System management today emphasizes maintenance of ecosystem health as well as restoration of deteriorated ecosystems in order to sustain the production of all the uses, values, products and services which derive from the national forests, including timber, forage, fish and wildlife, recreation, wilderness and water.

Question. What kind of revenue-producing activities does the Forest Service anticipate will replace lost timber sales receipts that have historically supported forest management activities within the National Forest System?

Answer. The agency does not have legislative authorities to use revenues generated from non-timber sale activities for forest management activities except deposits from timber sales to the salvage sale fund and the KV fund. These funds available in these accounts are sufficient to support the current program level.

Question. What is the Forest Service currently doing to assist small rural communities in and near National Forests whose local economies have been devastated by declining timber production on which they have historically depended?

Answer. The Forest Service is in its sixth year of implementing the "National Forest-Dependent Rural Communities Economic Diversification Act" through the Economic Recovery program. Since the beginning of the program in fiscal year 1992, the Agency has gone from assisting 185 natural resource-dependent rural communities annually to over 800 in fiscal year 1996 through Economic Recovery efforts alone. In recent years, the Economic Recovery program for dependent communities has received between 30 to 40 percent of the Economic Action Programs' appropriation. Other Economic Action Programs provided assistance to an additional 760 communities, businesses, or organizations in fiscal year 1996.

From the Forest Service, rural communities have received direct financial and technical assistance to build local capacity to manage the challenges they face and to find sustainable solutions for economic, social, and environmental problems and opportunities. In addition to specific funded programs, the Agency has been able to offer much more assistance due to the presence of its employees and facilities in the communities.

Many stories are being told of progress and change in rural communities around the country which have taken advantage of the Economic Recovery program: forming local, diverse community action teams, even in areas known for past conflict and divisiveness; creating strategic plans for increased self-sufficiency and other collective goals; improving relationships and increasing trust within communities as well as with the Forest Service and other communities, agencies, and interest groups; and taking responsibility for implementing plans and making their visions come true.

FIRE SUPPRESSION, PRESUPPRESSION, AND FUELS MANAGEMENT

The image of Smokey Bear has had a resounding impact on the attitude of the American public as it relates to National Forests and forest fires. The concentration of resources on fire containment and firefighting has resulted in something of a preoccupation with those activities, to the detriment of effective management of fuels that inevitably contribute to the catastrophic nature of many fires. In the President's budget request this year, the Forest Service proposes to consolidate the fuels management account and a considerable portion of the firefighting account.

Question. How does the Forest Service believe this consolidation will improve their ability to reduce the catastrophic nature of wildfires when they occur?

Answer. Changing the budget structure to allow greater flexibility in funding hazardous fuel reduction will allow the agency to take advantage of favorable weather conditions to significantly expand the number of acres treated. Hazardous fuel build-up is the single most important reason for catastrophic fires.

Question. What activities does the Forest Service anticipate will receive increased priority with this consolidation?

Answer. See Answer to No. 166. The primary focus will be to use prescribed fire wherever and whenever possible. However, to further reduce the risks and impacts of smoke associated with prescribed fire, mechanical pre-treatments will be necessary in many instances to allow follow-up treatments using prescribed fire.

Question. How does this consolidation affect the ability of the Forest Service to plan for fire emergencies through the normal budget and appropriations process?

Answer. The new budget structure provides increased flexibility in funding hazardous fuels reduction activities without detracting from the capability to prevent forest fires and to take prompt, effective initial attack suppression action on wild-fire. The result is greater efficiencies, and over the long term, reductions in catastrophic fire and large fire suppression costs.

Question. What impact will the consolidation have on the future need for emergency funding to supplement annual appropriations process?

Answer. Funding needs for fire operations above the appropriated level would be accommodated from the government-wide emergency contingency account.

Question. Does the Forest Service anticipate future emergency funding requests to support fuels management activities as a result of this consolidation?

Answer. In the President's budget, hazardous fuels reduction is included in the Fire Operations budget line item. The proposed budget is estimated at \$30-\$50 million allowing greater flexibility to respond to timely and appropriate applications of fuel treatment prescriptions.

NATIONAL FOREST FOUNDATION

The authorization for National Forest Foundation will expire this year. I intend to introduce legislation in the near future to reauthorize the Foundation, enabling the continuation of the public/private partnerships for projects related to the management and conservation of National Forest resources.

Question. What kinds of activities are supported by the National Forest Foundation?

Answer. The National Forest Foundation (NFF) has supported many projects that benefit the Forest Service. Although the NFF was formed by Congress in 1990, its first full year of active work got underway in 1993 with primary emphasis on Youth Forest Camps. Since the initial year, the NFF's assistance to the Forest Service has increased significantly, ranging from the establishment of a firefighting fund and scholarships giving financial assistance to families who lost relatives fighting forest fires and the support of many reconstruction and restoration projects throughout the agency. A state summary of projects already completed, currently underway or planned by the NFF has been provided to the Subcommittee. This summary contains descriptions for each project funded, including the location, name and work accomplished or planned. Some of these projects were funded entirely by the NFF while many others were funded in partnership with other organizations that include individuals, corporations, not-for-profit organizations and state agencies.

In addition, the NFF has developed five major program emphasis areas of: (1) forest conservation; (2) forest protection; (3) recreation; (4) wildlife and fisheries; and (5) environmental education. Specific projects are listed on the attached sheet entitled "Preserving the Legacy" which has been provided to the Subcommittee. The NFF will launch new initiatives this calendar year within these five program areas which will support additional projects in all regions of the Forest Service.

Question. Over the past 5 years, what is the total amount of private support that has been leveraged by the activities of the National Forest Foundation?

Answer. During the period 1992-1996, the National Forest Foundation has received \$3,695,752 in cash contributions from private donors and \$483,608 in private in-kind contributions for a total of \$4,179,360 to support its mission and projects. During 1992, the first year of the 5-year period, there were no active solicitations of private funds. The National Forest Foundation's incorporation was completed in 1993 which was its first full year of operations.

Question. Does the Forest Service have any recommendations for changes in the National Forest Foundation authorization that would enhance its ability to provide even greater benefit to the Service, its resources, and the American people?

Answer. Yes. There are four recommended changes we would suggest be made to the authorization to add to the Foundation's overall effectiveness. Federal regula-

tions governing disbursement of grants preclude advance funding for administrative or project expenses to the Foundation without regard to when the Foundation incurs these expenses. As a result, the Foundation must submit frequent request to the Forest Service for matching funds when such costs are incurred, causing inefficiencies and delays in funding. To streamline the process and provide funding on the ground in a more timely manner, we recommend that the Act be amended to authorize the transfer of Federal funds to the Foundation in a lump sum.

Section 410(b) of the Act, which authorizes appropriations up to \$1,000,000 annually in Federal funds to be made available to the Foundation to match on a one-to-one basis private contributions made to the Foundation for administrative or project expenses, is scheduled to expire in October 1997. We recommend that appropriations be reauthorized for a 5-year period beginning on October 1, 1997, in the amount of \$5,000,000 annually.

We also recommend adding language to allow the National Forest Foundation to retain any interest or other investment income earned to date and in the future by the Foundation and its subgrantees on Federal funds drawn but not immediately disbursed. This language change would enable the Foundation to use this accrued interest and investment income to support additional Forest Service projects.

Finally, we would recommend adding language that would enable officers and employees of the National Forest Foundation, while travelling on official business of the Foundation, to travel on the same basis as Federal employees, including travel on common carriers at the same rates as Federal employees.

We will be happy to work with you and provide any additional assistance on these suggested changes to the Act.

QUESTIONS SUBMITTED BY SENATOR ROBERT F. BENNETT

Question. As you know, with the arrival of the 2002 Winter Olympics, the Forest Service is under a great deal of pressure to be prepared for the onslaught of visitors to the Cache-Wasatch National Forest. Last year, the Committee provided funding for some of the initial preparations. (1) Please provide me with an update on how those funds appropriated for fiscal year 1997 have been utilized thus far. (2) Is the Forest Service on schedule with the preparations for 2002 Olympics? (3) What impact will Olympic funding have on other programs within the region? (4) Do you anticipate the need for additional funding beyond the analysis provided to the committee last year?

Answer. (1) What has been done to date with \$300,000 in fiscal year 1996 and \$2,533,000 in fiscal year 1997:

The creation of the four-person Olympic Planning Team and the 3-person Venue Preparation Team. These teams have begun the process of establishing communications with the Salt Lake Olympic Organizing Committee, all levels of the Forest Service, the Department of Agriculture, and have embarked on day-to-day monitoring and oversight of the Snowbasin Ski Resort land exchange and attendant implementation of the Master Development Plan.

The establishment of a long-term partnership with the Salt Lake Convention and Visitor Bureau. The partnership to date is resulting in a cooperative effort to staff, operate and provide exhibits at the Salt Lake Regional Visitor Center, with plans currently being laid to cooperate similarly at visitor contact points throughout the greater Salt Lake area.

The recreation construction funding was used to reconstruct 7 major campgrounds in the Wasatch Front area. Most of the 2002 projects are reconstruction of existing recreation facilities and restoration of adjacent damaged riparian habitat/resources. Therefore they will be used and enjoyed by the general public after the Olympics.

Trail construction funding was used to construct/reconstruct over 33 miles of vital trail systems for pre/post Olympic use. These trails will also serve as vital infrastructure to our recreating public.

Seed money to initiate a statewide collaborative effort to streamline and improve delivery of environmental education and visitor services and products.

(2) Yes, the Forest Service is well within budget and timeframe with the Olympics. Our early involvement with the entire process and public involvement has assured us as a major player at the table of public service participants.

(3) There are impacts and consequences for all priority shifts of emphasis within the Region, and the Agency, to accommodate new challenges and opportunities. The Region has set priorities that best balance the needs for the 2002 Olympics with other current Forest Service program needs. The 2002 Olympics are just one of the many funding challenges facing the Agency. However, the Region receives its fair share of the national funding total. The Region has dedicated one-half of its facility

funding on the highly visible facilities most likely to be impacted by the 2002 games. That leaves less funding than in prior years to address the facilities in the rest of the regions. estimated \$818 million in recreation facility backlog.

(4) The Olympic 2002 Planning effort continues to operate within the scope and philosophy of "Option III" of the 2/26/96 "Salt Lake Olympic Budget Strategy" as submitted by request to Senator Bennett (R-Ut) and Representative Hansen (R-Ut) last year.

Subsequent to the 2/26/96 submittal of the budget strategy document, the planning team contracted for intensive research of costs/effects of past winter games, held de-briefings with Forest Service officials involved with the Atlanta Games, and conducted a project-by-project value analysis of the Strategy to validate and refine the costs for Option III. As a result of this effort, Option III costs are now different than the original 2/26/96 costs.

The following chart compares the original Option III numbers with the Value Analysis-driven refinements of Option III, and the available fiscal year 1998 funding in the President's Budget:

OPTION III
[In thousands of dollars]

Fiscal year	Feb. 26, 1996, option III			Revised option III			Fiscal year 1998 funding		
	NFRM	CNRF	CNTR	NFRM	CNRF	CNTR	NFRM	CNRF	CNTR
1998	\$981	\$1,183	\$248	\$1,276	\$1,124	\$400	\$726	\$1,124	\$400
1999	999	1,237	248	1,406	1,124	400	726	1,124	400
2000	1,754	1,458	248	1,416	1,124	400	726	1,124	400
2001	1,779	1,314	248	1,312	1,124	400	726	1,124	400
2002	1,968	1,235	248	1,293	280	726	280
Total	7,481	6,427	1,240	6,703	4,776	1,600	3,630	4,776	1,600
Grand total	15,148			13,079			10,006		

Projected estimates for State and Private Forestry Programs to support the 2002 Olympics are \$13,522 million over 4 years, of which, \$10,405 million would be provided by non-government sources. This means that \$3,117 million will have to come from S&PF funding.

It is important to note that under current funding levels, efforts are underway to use those State and Private Forestry (S&PF) programs that have potential to provide support through community based and regional strategic planning efforts. These efforts provide increased capacity for local governments and organizations to fund high priority projects and initiatives through collaborative planning and partnership building.

Question. Recently, the Committee gave the go-ahead for the consolidation of the Intermountain and Rocky Mountain Research stations in Ogden and Ft. Collins, CO. This action has caused considerable concern among many of my constituents regarding the impact on research within my state, the number of dollars allocated to the Intermountain region and the impact on employees in Ogden. While I was reluctant to allow this consolidation to go forward, I have received a commitment from the good Chairman of this Committee that we will revisit this issue in 1 year to determine if the anticipated savings have been realized. Has the consolidation occurred yet? Please provide to me an analysis of the estimated increased travel costs that will be associated with the consolidation. What assurances can you offer that the new station will continue to provide solid, on the ground research assistance to the constituents within the Intermountain region. Have any employees in the Intermountain station been reassigned or have had a change in responsibilities?

Answer. There are four subquestions imbedded in question no. 175 by Senator Bennett.

A. The merger of the Intermountain and Rocky Mountain Stations occurred on May 5, 1997. The new station is known as the Rocky Mountain Research Station.

B. Travel costs and savings were not used in projections of savings from the consolidation due to: (1) intent to utilize new technologies including replacing some travel with audio and video conferencing; (2) the difficulties of making estimates; and (3) odd and changing transportation costs. For example, the one way govern-

ment rate to fly between Salt Lake City and Missoula is \$282, while the government cost to fly from Denver through Salt Lake City to Missoula is \$283.

Following is an effort to categorize the costs and savings.

Travel Savings: One Director and one Assistant Director for Administration instead of two of each attending required regional and national meetings results in an estimated annual savings of \$12,000.

Travel Cost Increases: Trips between Ogden and Fort Collins by administrative personnel for supervision and coordination. Number of trips needed will be minimized by use of electronic and phone communications but some trips will be needed. The government air fare between Denver and Salt Lake City is currently \$40.00. Travel costs during the transition from two stations to one will temporarily rise as employees are fully involved in implementing the consolidation. We expect the transition to be implemented within 1 year. Perhaps an extra 10 to 15 trips during the transition year will result in an estimated cost increase of \$2,000 during fiscal year 1997.

Travel Cost Offsets: Travel by one Director and one Assistant Director for Administration to field locations offsets the travel made by the second Director and Assistant Director for Administration.

Travel by three Assistant Directors for Research as compared to five Assistant Directors for Research. There should be a long-term cost reduction but not during the transition year.

C. Current support for on-the-ground research assistance to Intermountain constituents will continue because the research program underway will continue. Also, research capability outside of Utah can now be applied to Utah needs. To initiate the additional support we envision after the merger, the Station Director, some of his staff, and several research project leaders met on April 24, 1997, with the Commissioner of Agriculture, the Director of the Utah Agricultural Experiment Station and the Head of the Utah State Forestry Department. The meeting objectives were to describe some key research activities and to initiate stronger communications and coordination among those the attendees. A second a meeting was held at Utah State University to discuss the consolidation and opportunities for increased collaboration between Station and University scientists. This meeting was open to all members of the University community. The Station Director provided information on how research priorities are identified within the Forest Service Research process and invited the various groups present to become involved. Seeking involvement of the Utah officials in research activities occurring outside of Utah but applicable in Utah has already begun also. These and future meetings serve to determine mutual interests and examine ways in which the various organizations can cooperate.

D. No employees in the Intermountain Station have been reassigned or have had a change in responsibilities. Employees will be involved as the two stations develop common procedures for the new station. Through this full employee involvement, changes in responsibilities may occur.

Question. Please provide me with the FS position on the proposed transfer of the Dutch John property in Daggett County, Utah. Is the FS supportive of a transfer of this property? What reservations does the FS have with this proposed land exchange?

Answer. Our understanding is that the proposal now being considered would involve the transfer of jurisdiction of approximately 2,450 acres of National Forest System lands associated with the Dutch John community to the Secretary of Interior, acting through the Bureau of Reclamation. In return, the Secretary of Interior would transfer jurisdiction to lands of equal value containing approximately 2,167 acres to the Secretary of Agriculture, which would become part of the Ashley and Uinta National Forests.

Certain lands, structures, and facilities needed for National Forest administration will be retained.

Also under this proposal, the Bureau of Reclamation would ultimately convey the lands associated with Dutch John community to residents and to Daggett County. The Forest Service would not be involved in the details of how this transaction would occur and we would defer to the Department of Interior on these matters.

As outlined above, the Forest Service does not have any reservations about the proposed transfer of National Forest System lands.

Question. As you know, Congress recently passed the Great Western Trails bill, which I introduced in the Senate. It has been brought to my attention that approximately \$300,000 is needed to conduct the necessary studies to make a recommendations if this Trail should be included as part of the National Trails System. Does the Forest Service intend to utilize funding from within the Region? If so, how will it impact other programs within the region? When will this study be complete?

Answer. The Forest Service has not identified specific funding to do the study at this time. Without additional funds to the Agency, doing this study will be offset with other project work. The study is expected to take a minimum of 2 years to complete.

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

TERMITE RESEARCH

Question. How much of the work conducted at the Starkville, Mississippi, termite control research unit is conducted on new products seeking EPA registration as a termiticide?

Answer. In the fiscal year 1998 President's Budget, about forty-percent of the effort of the termite control research unit is on new products seeking EPA registration as termiticides and/or alternatives to termite control. Sixty-percent of the effort is on basic biology, ecology, and behavior to fill the important knowledge gaps needed for more effective use of current and emerging technologies.

Question. Are any of these activities funded through user fees paid by the registrant?

Answer. Yes. Funds received through agreements from industry cooperators are used for supplies, materials, equipment, and associated travel. Salary and overhead expenses are covered by Forest Research appropriations.

Question. Does EPA reimburse the Forest Service for any of the activities conducted at this unit which are not funded through user fees?

Answer. No. EPA does not reimburse the Forest Service for any of the activities conducted at this unit that are not funded through user fees.

Question. What level of funding is necessary to support this unit's on-going research, fund its activities associated with new termiticide approval, and fund new research on Formosan termite?

Answer. The level of funding in the President's Budget (\$792,000) is adequate to support this unit's on-going research. In the spirit of public-private partnership, we plan to increase the user fee charges for new products seeking EPA registration in order to offset all our costs for testing. This will allow us to better meet industry's needs for unbiased testing of their products for EPA while at the same time allowing the Forest Service to focus appropriated research funds on the biology and ecology of termites and related insects. Ongoing research on Formosan termites costs about \$15,000/year. Many of the research results on native subterranean termites can be applied directly to control of non-native Formosan termites. Additional avenues of funding are being explored for cooperative research with USDA-ARS on behavior of termites.

BEAVER CONTROL

Question. What is the Forest Service's policy on beaver control on national forest system lands?

Answer. On much of the National Forest System beavers are considered an asset. They create wetlands, provide habitat for waterfowl and many other wetland dependent species, and moderate flood events. Their populations are kept in check by demands for pelts or biological controls. It is in the south where most problems occur with beaver. Southern beaver pelts are not as valuable as their northern relatives. Also, the hydrology of many southern wetland systems has been altered to provide better farming conditions and flood protection, thus compounding the effects of beavers.

The agency controls beaver to meet multiple use objectives for the National Forest. The general priorities for beaver control are protecting timber, roads, and infrastructure from damage. We cooperate with States and USDA Animal and Plant Health Inspection Service (APHIS) in their efforts to prevent flooding on adjacent private lands. On most Forests, where control efforts have remained consistent, beaver problems have been held to a minimum.

Memorandums of Understanding between the States and the Forest Service generally recognize the States as the responsible agency for populations of resident wildlife, including beaver, with the Forest Service being responsible for habitat. The USDA APHIS—Animal Damage Control (ADC) has developed a successful partnership with the Forest Service and the States to control beaver populations.

A Memorandum of Understanding (MOU) between the USDA Forest Service and the USDA APHIS—Animal Damage Control, identifies the responsibilities of the respective agencies and fosters a partnership in discharging the Federal obligation under the Animal Damage Control Act of March 2, 1931. This MOU clarifies

APHIS's role in providing technical information on animal damage, management tools and techniques, conducting management programs, and complying with environmental regulations and laws when conducting predator control activities on National Forest System lands.

Forest Service policy defines the roles of these two respective agencies as described in the above-mentioned MOU. Generally speaking, APHIS carries out animal damage management activities on National Forest System lands to minimize livestock losses from predation by coyotes, black bears and other predators. The Forest Service may conduct activities to control animal damage caused by small mammals and other animals to National Forest System resources, such as timber stands and roads. However, it is possible that APHIS may assume these activities. This activity can be determined through coordination between the Forest Supervisor, APHIS personnel, and responsible State agencies.

Question. What is the Forest Service's policy on controlling pests, such as beavers, which affect landowners adjacent to a national forest?

Answer. The States have the responsibility to manage beaver. They frequently work through APHIS to conduct animal control programs. It is the Forest Service policy to cooperate with those having legal responsibility to manage resident wildlife, as in this case the States, to do what we can to be good neighbors.

Question. How much, and under what account, are funds included in the President's budget for beaver control on national forests, and specifically, how much is included for Mississippi?

Answer. In fiscal year 1996 and fiscal year 1997, a successful partnership between the Delta National Forest (MS) and APHIS resulted in the trapping of beaver on the Forest and immediately adjacent to the Forest on private lands. Beaver impoundments were also breached to facilitate removal of standing water from private lands. The allocation within the USDA APHIS budget for fiscal year 1996 and fiscal year 1997 was \$75,000 annually.

No funding is included with the Forest Service budget specifically for beaver control. Any expenditures would be in coordination with resource work directly on National Forest System lands.

Question. What funding level is necessary to control beavers on national forests in Mississippi?

Answer. The estimated annual funding level for USDA APHIS to continue its partnership with the Delta National Forest, and to expand the program to other National Forests in Mississippi, is \$100,000. This amount will allow the beaver population on the Delta National Forest to be held in check, and to expand the control program to other National Forests where the beavers may soon become problematic.

Question. Does the Forest Service recognize a legal liability when its failure to control pests, such as beavers, causes damage to privately-owned land adjacent to a national forest? How are such damages paid?

Answer. The Forest Service has no responsibility for controlling pest such as beaver.

TIMBER SALES

The President's budget proposes that the timber sale level for the Southern region (region 8) be reduced from 835 million board feet in fiscal year 1997 to 675 million board feet in fiscal year 1998.

Question. How much of this decrease is attributable to the following factors: (1) elimination of the purchaser credit program for road construction and reconstruction (2) decreases in Southern pine beetle infestation levels (3) programmatic changes?

Answer. (1) Eliminating the purchaser road credit program did not affect the timber volume. (2) At the time the President's Budget was developed, the Region estimated there would be about a 7 million board feet reduction in salvage sales due to a reduction in southern pine beetle populations. (3) The majority of the reduction, 153 million board feet, is attributable to the region's need to rebuild the timber pipeline. The region has managed to keep their unit cost the lowest in the nation for the past several years. However, this came at a price in that they used their sales prepared for future years to keep the program level volume high and their cost low whenever there was a disruption to the program, such as salvage sale emergencies and western fire crew commitments. This caused the region to deplete their timber sale pipeline. In fiscal year 1998 the region is only capable of producing 602 MMBF without further sacrificing their pipeline at the proposed funding level.

Question. If timber sale levels were not dictated in appropriations legislation, what level of sales would be necessary to adequately manage the national forest system nationally, and specifically, in Mississippi?

Answer. Timber sale levels are determined by available appropriations, management priorities of the individual Forests, and the results of environmental analyses. Because forests change over time, and management needs change in response, there is no one answer to this question.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

WEST VIRGINIA FOREST RESOURCES

Chief, early in my Senate career, I worked with the Forest Service to make sure information would be available to West Virginians to help with management decisions related to our forest resources—conservation, reforestation, stand improvement, and other investments to allow for wise development and use—both for consumptive and non-consumptive purposes.

I recognized that increased employment opportunities would occur over time, as improved forest management contributed to more growth. Today, the forest products industry is the third leading manufacturing industry in my state, up from fifth 10 years ago. West Virginia's forest stands have also improved—growth now averages 6,500 board feet per acre, as compared to about 1,800 board feet per acre less than 40 years ago.

The challenge is to help landowners manage the forest responsibly as well as to discover business opportunities that might contribute to job growth. The Forest Service can help in this regard, with technical assistance programs such as Rural Development Through Forestry and Wood in Transportation, coupled with hardwoods market analysis and economic research. Thus, I am interested in making sure the Forest Service budget maintains its emphasis in these areas. Compared to the funds necessary to manage the national forest system lands, these are relatively small investments that can leverage considerable contributions from other sources.

Question. Chief, what do you see as the most critical role the Forest Service can play in helping West Virginians maximize the diverse benefits of our forest resources?

Answer. The Forest Service provides leadership and expertise that supports sound management to sustain the State's forest resources through research, technology training and transfer, and financial assistance. Through State and Private Forestry, the knowledge of Forest Service experts works to ensure the efficient utilization and scientific management of West Virginia's forest resources.

Question. How are the state and private forestry programs helping to improve our forest management as well as helping to develop alternative markets for lower value wood products?

Answer. State and Private Forestry programs provide technical and financial assistance to communities, non-profit organizations, and businesses through collaborative efforts that address environmental, economic, and social concerns and opportunities. Efforts focus upon advancing manufacturing technologies, especially those associated with hardwoods; the use of wood in transportation; developing new markets domestically and internationally; analyzing resource availability for business expansion and recruitment; and implementing best management practices.

Despite the types of positive improvements which have resulted from the rural development and wood in transportation programs, funding for both of these initiatives is proposed to be reduced in the fiscal year 1998 budget.

Question. Do you believe these programs have fulfilled their objectives, or is there more that can be accomplished if the fiscal year 1997 funding levels are continued in both of these areas?

Answer. While much more can be accomplished in both areas, when placed in perspective with other pressing needs for budget resources, these program areas are a lower priority than others.

HARDWOODS TECHNOLOGY CENTER, PRINCETON, WV

Through my efforts, and with the support of the Forest Service, a hardwoods technology center has been established at Princeton, WV. The purpose of this center is to assist small, independent operators in their efforts to establish a market niche in the secondary hardwoods processing industry. The Center provides training and access to equipment on a time-shared basis—critical elements when there are many opportunities but where capital requirements can be a hindrance to market entry for small businesses and entrepreneurs.

During the last year, as a result of funds I had added to the fiscal year 1997 Interior bill, the Forest Service has been working cooperatively with the Hardwoods

Center to help it achieve and sustain the goal of being self-sufficient in its operations.

Question. Can you provide me with an update of the efforts taken by state and private forestry and research to strengthen the program at Princeton?

Answer. State and Private Forestry assigned a liaison to work between the Center to better coordinate outreach activities; business planning; market development and expansion; and hardwood utilization. In addition, State and Private Forestry provided financial assistance to permit representatives of 20 State Forestry agencies and economic development specialists in each West Virginia county to review the Hardwoods Technology Center. This has encouraged understanding of how the Center can aid the economic development of their States and counties and develop new clients for the Center.

Research has completed an evaluation of the Princeton research program. Two significant changes are currently being implemented that will strengthen the research program and more adequately address the industry's needs. First, part of the Forest Inventory and Analysis (FIA) program will be conducted at Princeton. This will help shorten the FIA cycle throughout the region and expand the number of analyses. Second emphasis will be placed on research that will help the land manager produce higher quality trees and logs in forests impacted by fire, insects, poor harvesting practices or other factors that have reduced the quality of forest trees.

Both State and Private Forestry and Research joined the Center in signing a Memorandum of Understanding (MOU). This MOU provides a general framework to cooperatively implement an "institute concept" to better provide the understanding needed for sound management and practical utilization of the Appalachian hardwood forest resource.

Question. The Forest Service proposed the concept of a "hardwoods institute", wherein the research capabilities at Princeton, the technical assistance and expertise of the State and Private Forestry program, and the Hardwoods Technology Center would be better coordinated and used. What progress has been made in developing this framework? What planning has been completed? Have specific projects been determined?

Answer. The fiscal year 1997 appropriation included funds to implement an "institute" concept between the Center, the Northeastern Area, and the Northeastern Forest Experiment Station to coordinate cooperative projects among the units and promote new business for the Center.

Timesharing agreements with sawmills, furniture companies and allied business are in operation; these companies are using the Center facility to decide if investments in new technology are feasible for them.

Question. What actions has the Forest Service taken to adjust the research mission at Princeton to ensure that information on the Appalachian hardwood resource with respect to growth/production and primary and secondary utilization is gathered? For example, can the lab assist in efforts to gather information about hardwood growth, pricing, grades of logs and lumber, and degradation due to fire and insects and disease? Wouldn't such information be useful to small hardwood businesses and to rural development and economic improvement in Appalachia?

Answer. The research work units at the Princeton lab have historically worked to advance more efficient uses of forest resources, evaluate hardwood use patterns and processing trends, and have studied strategies that will improve the long-term performance and competitiveness of the hardwood products industry. This information has been useful to small hardwood businesses and to rural development and economic improvement in Appalachia. We have recently completed an evaluation of our research program at Princeton in an effort to meet the needs of residents in Appalachia and throughout the region. Decisions have been made that the staff in Princeton will become more involved in the Northeastern Station's inventory and evaluation of the health of forest resources and in providing information to land managers that will help improve tree and log quality. Research efforts will include studies on how to manage forests degraded by fires, insects, or poor harvesting practices in order to obtain the highest quality trees and logs possible. The research will also address how best to convert these trees and logs into products with the highest possible yields. This information will be very useful to small hardwood businesses and land owners in Appalachia.

Question. Are there any conditions which preclude the Princeton research lab from entering into cooperative agreements with the Hardwoods Center for projects that would be mutually beneficial?

Answer. Forest Service Research has several different authorities it can use to enter into cooperative relationships with interested parties. The relationships include cooperative research agreements, cooperative research and development agreements, patents and licensing agreements, and special use permits. Each type of rela-

tionship is for a specific purpose and relies upon a different legislative authority. After Forest Service Research and the interested party have preliminary discussions to outline the nature of the intended relationship, the agency selects the most appropriate legislative authority to create the desired relationship. For example, entering into a cooperative research agreement requires substantial involvement by the Forest Service in planning and conducting the research.

Occasionally, the nature of the relationship desired is sufficiently different from the usual and customary cooperative relationship that we seek advice from legal counsel to assure that we are within the scope of the relevant legal authority.

The Hardwoods Center has been working cooperatively with the Forest Service to obtain use of a facility that is no longer required by the Princeton lab. However, the Forest Service has to date been unable to provide a mechanism by which the Hardwoods Center could use this building.

Question. Why has there been such a delay in resolving this issue? What hindrance precludes the Forest Service from using a cooperative agreement to allow the Hardwood Center to use this facility? If legislative language is necessary to allow such use to occur, please provide language as a drafting service.

Answer. Recently, the Hardwood Training Center sought an agreement whereby it could use Northeastern Station's Materials Testing Building at Princeton for both training and commercial production. The Center's desire to use the facility for commercial purposes is an unusual request, which appears to be prohibited by legislative authorities covering cooperative research agreements. So we explored a licensing agreement and sought review by the USDA Office of the General Counsel. The OGC responded on April 14, 1997, that the proposed licensing agreement would be an unauthorized disposal of government property. Using our conventional cooperative research agreement authority was also addressed by OGC. They concluded that such an agreement might allow Forest Service Research and the Hardwood Center to work cooperatively through the State Forester in developing new technology. However, current law pertaining to cooperative research agreements would not allow the Hardwood Center to charge others to use the Forest Service facility. We have now shifted our attention to special use permit authorities and are discussing with OGC if a special use permit could be issued. Because alternative ways to resolve the issue are still being explored, draft legislative language has not been developed.

The fiscal year 1998 budget continues funding for the Princeton lab at the same level provided in fiscal year 1997. The technical assistance funding, however, is proposed in the budget to be reduced from \$200,000 to \$150,000.

Question. What is the basis for the proposed reduction? Does the Forest Service believe that the objectives at Princeton have been substantially accomplished?

Answer. The Mission of the Center is to improve the quality and efficiency of secondary wood processing industries in West Virginia and throughout the hardwood processing community. The Center has trained industry personnel on state of the art wood processing equipment and provided small businesses with time sharing opportunities. Companies through this time sharing agreement continue to use the facility to determine if new technology is feasible and worth the investment. The Center continues to demonstrate its value to the hardwood industry and the residents of West Virginia.

The reduced level of State and Private Forestry funding for the Center reflects the overall reduction in funding for all components of the Economic Action Programs.

Chief, I am troubled that the Forest Service might be abandoning its commitment to this project prematurely. This is not a huge amount that we are talking about, and I hope the Forest Service will reconsider its position and sustain the current level of effort. I will be working with Senator Gorton to ensure that the efforts to ensure the success and self-sufficiency of the Center are not undermined.

MONONGAHELA NATIONAL FOREST

Chief, you may not be aware of this, but prior to its destruction by fire in 1992, the Seneca Rocks Visitor Center was the busiest Forest Service visitor center in the Northeast/Mid-Atlantic region. Because of the high visitation—about a quarter of a million visitors annually—I have aggressively supported the need for a replacement facility at Seneca Rocks. To that end, this Committee has appropriated \$7.1 million over a 5-year period to allow reconstruction to proceed.

Question. I understand that ground has finally been broken and reconstruction has begun. Can you provide me with an update—is everything on track with respect to the budget and when is the facility expected to be completed and ready for occupancy?

Answer. Construction began April 7, 1997. The building is expected to be completed on July 1, 1998. No additional appropriated funds are required to complete the project. The Monongahela National Forest is working with the USDA Design Center on final exhibit plans, and is looking for opportunities for partnerships to complete the exhibits.

Chief, the recreation that occurs on our national forests is one of the benefits that is most widely recognized by the American public. The Forest Service has recognized the importance of this program by proposing an increase of \$5.1 million for recreation operations in the fiscal year 1998 budget. At the same time, however, the agency has proposed a considerable reduction—minus \$26.5 million, or 55 percent, for the recreation facilities reconstruction and construction program.

Question. Given that the Forest Service already has an enormous backlog of maintenance requirements for recreation facilities—some \$818 million—won't the proposed budget just put the agency further behind in its efforts to provide quality recreation opportunities for the American Public?

Answer. The delivery of recreation opportunities and experiences through the developed sites program within the national forests is a major source of education, information, comfort, and enjoyment for millions of Americans. These developed sites include toilets and bathhouses, camping sites, parking areas, visitor centers, picnic shelters, and water systems, to name just a few. The condition of these facilities and systems plays a significant role in determining the quality of the recreation opportunity that the visitor has on the national forest.

WOOD IN TRANSPORTATION

I understand that the National Park Service is proposing safety improvements along the George Washington Parkway. There have been some concerns expressed, however, about the aesthetics and how the views along the Parkway may change when concrete "jersey barriers" are installed. When the suggestion of using traffic barriers that had more wood components was proposed, however, I understand that such barriers have not been approved for the speeds that exist along some parts of the George Washington Parkway.

Question. Aren't these types of alternative applications the very type of uses that the wood in transportation program seeks to promote?

Answer. Yes. In addition to typical highway and pedestrian bridges, the Wood In Transportation Program promotes additional transportation structures using wood. The program emphasizes products such as guard rails for bridge structures, portable bridges, railroad structures, and retaining walls. Much of this effort is driven by need and demand. Once a focused need has been identified, research efforts begin. Research is followed by demonstration and commercialization of promising results.

Question. What research or demonstration is the Forest Service involved with that seeks to promote the use of timber in roadway devices, such as barriers and median dividers?

Answer. Forest Service research to date has focused on the development of crash-worthy bridge railings. Several designs have been developed and are available for use. Research on crashworthy wood barriers and median dividers has not yet been initiated, although there is a growing need for work in this area.

Question. Are there particular hindrances to more widespread use of wood in transportation applications?

Answer. Yes. Some of the hindrances are as follows:

Lack of knowledge on the part of many engineers and transportation officials concerning the suitability, capability, and longevity of wood structures.

A need to develop new designs and technologies, as well as in-service performance verification, to further improve the efficiency of wood transportation structures.

Lack of knowledge concerning applications that include local resources and new materials that incorporate underutilized species.

Demonstration, technology transfer, and commercialization efforts on recently developed technology are hampered by the constrained budget level.

The Forest Service is currently addressing the hindrances of Wood in Transportation (WIT) through: the combined efforts of the Forest Products Laboratory and the National Wood in Transportation Information Center, located in Morgantown, West Virginia; technology transfer efforts that include WIT information available over the Internet; and by distributing over 41,000 pieces of WIT information per year to communities, business leaders, and the highway and engineering community.

Question. How would such work be affected by the proposed funding level for the wood in transportation program, which overall is decreased \$200,000 below the fiscal year 1997 level?

Answer. A great deal of knowledge has been gained through the program. To fully capture the benefits of this knowledge, the Forest Service is focusing on commercializing specific technologies that have the greatest potential to benefit the public.

Question. What effect would the proposed fiscal year 1998 funding level have on the activities of the Timber Bridge Information Resource Center in Morgantown?

Answer. In fiscal year 1996, the National Wood in Transportation Information Center (Timber Bridge Information Resource Center) distributed approximately 41,000 pieces of information. This was an increase of more than 15 percent from fiscal year 1995. The demand for information provided by the Center continues to increase. The proposed reduction would require the Center to reduce its current level of activity, lessening information available to highway engineers, transportation officials, and community officials.

GENERAL BUDGET

The fiscal year 1998 request for the Forest Service is \$2.4 billion, which is relatively flat with the fiscal year 1997 enacted level, when the emergency appropriations for fire and disasters are excluded. Within the budget, however, a considerable redirection is proposed—national forest system funding is proposed to increase by \$50.1 million, while firefighting is reduced some \$15.7 million and construction and reconstruction is decreased approximately \$34 million.

Question. What consequences would you foresee for the Forest Service if the Congress stayed relatively on par with the distributions between activities that was provided in fiscal year 1997 rather than concurring with your proposed reallocations for fiscal year 1998?

Answer. The President's fiscal year 1998 budget request for the Forest Service has been carefully prioritized and balanced to focus on critical needs within a virtually flat budget level compared to fiscal year 1997. The proposed reallocation is in concert with key budget priorities aimed toward our strategic goals of ensuring healthy ecosystems and sustainable levels of products and services. Our judgement is that redistribution achieves higher priorities in meeting current demand than additional construction or land acquisition which would otherwise be desirable.

Question. If the requested increases in the National Forest System account are not funded in fiscal year 1998, how will this affect management of the Forest Service's 191 million acres?

Answer. Without the requested increases, we would have reduced capability to address our highest health and safety and resource concerns across the 191 million acre National Forest System. The proposed increases would allow us to accomplish more of this high priority work than we could working within our current constraints.

For fiscal year 1998, the Forest Service has established Performance Indicators to measure accomplishments within each Expanded Budget Line Item (EBLI) within the National Forest System. For detailed information about what the requested increases would allow us to accomplish over the fiscal year 1997 level, refer to the Performance Indicator Tables within each (EBLI) discussion in the Forest Service fiscal year 1998 Explanatory Notes.

For example, taking samples from those Tables, the increase would allow us to make non-structural improvements in 10,000 additional acres of rangeland; to make timber stand improvements (TSI) on an additional 55,400 acres; and restore or enhance an additional 109 miles of stream.

Without the increases, we will continue to focus on our highest priorities with the funding we do receive.

Question. Are there certain aspects of the requested increases that are necessary to comply with court orders or settlements? Please provide details.

Answer. At this time the increases requested are not intended to be used to make payments necessary to comply with court orders or settlements. Funding for potential payments resulting from claims and settlements for environmental reasons is currently under review within the Administration. Claims and settlements involving existing timber sales in habitat for marbled murrelet, Mexican spotted owl and salmon, for example, are not included in this request.

FIREFIGHTING

The droughts and pest infestations of recent years have contributed to extensive fire conditions. Despite annual appropriations of approximately \$500 million annually in recent years, Congress has had to provide emergency appropriations for firefighting because of extraordinary expense. In fiscal year 1995, an emergency appropriation of \$450 million was provided, and in the Fy 1997 Omnibus bill, and additional emergency appropriation of \$550 million was provided.

Despite these extraordinary measures, the Forest Service has had to exercise emergency transfer authority to address the immediate needs for fire suppression during the summer season. As a result, \$443 million remains to be repaid to the Knutsen-Vandenburg (K-V) Reforestation account from which it was transferred.

Question. Of the \$550 million appropriated last fall, how much has been released by the President and made available to the Forest Service? What are the Forest Service's expectations with respect to release of the remaining funds?

Answer. In the fiscal year 1997 appropriations Congress established an emergency contingency fund in the amount of \$550 million for the purpose of covering additional fire-fighting needs with the proviso that these funds are also available for repayment for prior advances made from the KV fund for the same purpose. \$202 million of this \$550 million has been released to repay K-V. In addition, \$98 million has been used to cover fiscal year 1996 suppression costs. This leaves \$250 million remaining in the contingency.

If suppression costs exceed available funding in fiscal year 1997, a request could be made to release some or all of the remaining emergency contingency fund.

Question. Even if the full amount yet to be released were provided to repay K-V, would monies still be owed to the reforestation trust fund?

Answer. Even if the full \$250 million was released and provided to repay K-V, an additional \$193 million would still be owed the K-V fund for prior year advances for emergency firefighting.

Question. Does the Administration have a plan for repaying K-V, or do you anticipate carrying this burden over from 1 year to the next for the foreseeable future?

Answer. The Administration is committed to providing the resources necessary for firefighting and for carrying out the KV program of work scheduled for 1998. The adequacy of unobligated balances in the KV fund to achieve these goals is continually monitored.

As part of its fiscal year 1998 Budget, the Administration has proposed a \$5.8 billion contingency account for unanticipated needs/disasters. Among the proposed uses of this account would be Forest Service firefighting.

Question. If this account is not agreed to in the normal appropriations cycle, what impact would this have on the Forest Service firefighting program?

Answer. This contingency fund was intended to be available to cover any additional fire suppression costs above the appropriated amount in fiscal year 1998. However, a budget amendment has recently been submitted to the Congress withdrawing the request for this fund. As a part of the President's Budget, there is however, a provision which allows the Forest Service to utilize other available funds in the event fire fighting costs exceed the appropriated level.

Question. Since your fiscal year 1998 budget is far below the 10 year average for firefighting, if the contingency is not approved, would you anticipate further borrowing from KV?

Answer. If firefighting needs exceed appropriated levels and the contingency is not approved the Forest Service will, first ask to allocate the \$250 million contingency fund. If those funds are not sufficient, we will have to borrow money from the KV fund or other Forest Service programs to cover expected fire-fighting costs.

SENIOR CITIZEN EMPLOYMENT—MONOGAHELA NATIONAL FOREST

The Monongahela National Forest is able to partake in the Department of Labor's Senior Community Service Employment Program (SCSEP). The Monogahela, like many other forests, receives funding which is used in turn to provide a supplement to retired persons who assist in many visitor functions for the agency—staffing of visitor centers, campground hosts, providing information at ranger stations, and other such activities.

Last year, there was some discussion that the Forest Service should be dropped from the SCSEP program as its dollar decreased.

Question. What would be the effect on the Forest Service's ability to provide visitor services to the recreating public if the Department of Labor drops the Forest Service from the program?

Answer. If the FS could no longer continue as a National Sponsor of the Senior Community Service Employment Program (SCSEP), it would have a severe impact on services provided to the recreating public. The SCSEP enrollees play a key role in hosting over 800 million visitors to the National Forests annually. It would mean a loss of over \$20 million in work accomplished that benefits the recreation program. Some campground, building and trails maintenance work would not be accomplished. Visitor information services could be terminated or hours of service reduced. It could result in early closing of some recreation facilities and a reduced level of services during the popular recreating season.

Question. What would be the additional costs to the Forest Service if the activities conducted by these senior enrollees would have to be funded out of Forest Service dollars? Would you reallocate funds in order to maintain the program, or would facilities such as campgrounds and visitor centers be closed due to staffing shortfalls?

Answer. The additional costs to the FS would be equivalent to about \$41 million of appropriated funds, if we lost Department of Labor funding for SCSEP. Since the value of work accomplished by SCSEP enrollees accounts for approximately \$20 million in benefits to the recreation program, this loss of funding might result in possible closures of some facilities such as day use areas and visitor centers. The loss of funds could also affect the level and quality of services provided to the public.

The agency will probably not be able to reallocate funding to continue activities currently provided by the SCSEP.

FOREST SERVICE RESEARCH PROGRAM

Chief, you are aware of my specific interest in the research activities conducted at the three locations in West Virginia. But I would also like to review with you in a more general way that challenges which face the research program at a time when dollars continue to be constrained.

Question. What is the impact on the research program when increased funding is not provided to cover fixed cost increases, such as mandated pay and benefits, space, unemployment benefits and other uncontrollable costs?

Answer. The increased costs of doing our research business, coupled with fixed or reduced funding, has reduced our research capability. The research dollars available for operating budgets decline when fixed costs increase and appropriations are constant.

We have, and are continuing where possible, to reduce our administrative overhead. Also, there are many cases we are not filling vacant positions in order to use the funding to maintain the scientists we retain. Reduced operating budgets and fewer scientists equate to a smaller Forest Service Research program, as well as a reduced program for extramural cooperative research with universities and other partners.

Additionally, fixed/reduced budgets have delayed facility maintenance and limited equipment purchases which are essential to stay at the cutting edge of science. In the long-term, fixed/reduced budgets impairs our ability to perform high quality research and respond to the natural resource research needs required by the Nation.

Question. As the Forest Service budget has been reduced in recent years, what has been the impact on the number of scientists that are supported by the research budget?

Answer. We have been forced to reduce the number of scientists. In fiscal year 1996 we had 548, down 23 percent from the 715 scientists we had in fiscal year 1990. The remaining scientists are dealing with the same problems as other employees who have been through downsizing due to budget reductions.

Question. Has the Forest Service conducted any consolidations within the research program that have resulted in closures of locations?

Answer. Due to budget reductions in fiscal year 1996 we had seven location closures: Fairbanks, AK; Bend, OR; Carbondale, IL; Orono, ME; Macon, Ga; Gulfport, MS; and Gainesville, FL

Question. Has the research program gotten to a point that further budget reductions would result in more facility closures in order to maintain a core capacity in the remaining areas where research is conducted?

Answer. Yes. We anticipate that every \$1 million dollar reduction or redirection impacts 19 people. If the magnitude of the reduction or redirection was very severe we would certainly need to RIF employees and close locations.

QUESTIONS SUBMITTED BY SENATOR BYRON DORGAN

Question. The FS has over 230 million acres of land to supervise and manage. One of the mandates of current law, as interpreted by the courts and the agency itself, is the practice of developing National Environmental Policy Act documentation for every permit issuance, renewal and transfer. While in many instances this is a proper and efficient use of FS resources due to the substantial change in the use of some environmental degradation of the land, this is simply a waste of time and resources in a substantial number of permit renewals and transfers. What proposal is the FS developing, either administratively or in the form of recommended legislative changes, to help alleviate this burden?

Answer. The Forest Service is working on several fronts to address the issues raised in this question.

First, the agency is working on a proposal to expand our application of the categorical exclusion provisions of the regulations that have been promulgated pursuant to the National Environmental Policy Act (NEPA). Specifically, types of uses which qualify as being categorically excluded (from documentation in an environmental analysis or environmental impact statement) will be better defined, and will include the approval, modification, or continuation of a variety of minor uses, of small additions to larger existing uses, and for granting authorizations to applicants who have an existing right to use and occupy National Forest System lands. We intend to prepare a revised set of categorical exclusions for public notice, comment, and response later this calendar year.

Second, we are working at streamlining our application procedures through revisions to the regulations at 36 CFR 251, Subpart B. Specifically, we intend to establish a procedure whereby proposals for new uses must meet a series of pre-application criteria before they will be accepted by the agency and processed as an application. This procedure will allow the Forest Service to more readily reject unacceptable proposals, and to more efficiently process accepted applications.

Last, the agency has been steadily increasing its issuance of authorizations having a longer tenure than in the past. Doing so will reduce the number of applications which are now regularly expiring (generally, at 5 or 10 year intervals), and which require reconsideration and possible NEPA evaluation when they do. For example, we recently started issuing communications use leases at most of our communications site with tenures of 20 or 30 years, rather than a traditional 10-year permit. We are also issuing long-term easements, some for as long as the easement is needed for the purpose which it was issued, others for periods of 30–50 years. Over time, this will significantly reduce the number of authorizations that will be expiring annually, and which need to be evaluated in the reissuance process. None of the above require legislation.

Question. Currently, the Forest Service is engaged in creating a revised Forest Plan which includes the grasslands in North Dakota. I have received continued reassurances from the Forest Service that the ranchers and environmentalists from my state would be consulted as the plan is developed. However, up to this point the grazing associations, whose involvement with the land is so critical to the long term health and sustainability of the land, have not been involved.

What is the Forest Service's plan to integrate interested parties into the planning process in an ongoing, meaningful and productive way?

Answer. The Plan revision process for the Northern Great Plains encompasses three national forests and multiple national grasslands within Wyoming, Nebraska, and both North and South Dakota. The stewardship goal of the effort involves extensive collaboration with people and communities across the four States. To date, the planning team has reported multiple involvements with grazing associations through presentations, visits, and other communications by District Rangers, Forest staff, and the planning team. The engagement of people in this process is ongoing and open. As a special event, the week of June 9–13, the North Dakota National Grasslands will be hosting a series of public open houses across the State. Grazing associations not involved to date may contact the Planning Team to discuss further opportunities for meaningful and productive participation.

Question. For many years, there has been substantial concern among permit holders on the National Grasslands in my state, and in many National Forests across the country, about the growing problem of noxious, and non-native weeds. In North Dakota, we have had a considerable problem with Leafy Spurge, costing ranchers a great deal in lost revenue. What is the Forest Service currently doing to help deal with this problem and other noxious weed problems, and what are your plans for the future to coordinate the protection of federal lands from this continuing problem?

Answer. Aside from efforts to eradicate leafy spurge, the Northern Region of the Forest Service (FS) is working with the State of North Dakota Weed Coordinator to implement a weed-seed-free forage program in North Dakota. This program would prohibit the sale and distribution of forage products within North Dakota unless they were certified as weed-seed-free. The restriction would apply equally to imported forage and forage produced within North Dakota. In support of this effort the Custer National Forest will prohibit the use of forage not certified as weed-seed-free on National Grasslands in North Dakota once the program is fully implemented. North Dakota has established inspection and certification procedures for producers; however, few local forage producers have come forward to sign up for the program. The FS is cooperating with the State to educate publics and outreach to forest users and forage producers about the need for the program.

Last year, the FS implemented a national noxious weed strategy which outlines the Agency's goals and actions for prevention and management of noxious weeds

across the National Forests and Grasslands. Priority has been given to prevention and rapid response to new infestations. The primary prevention action is to expand the weed-seed-free forage program to include all National Forest System (NFS) lands. The requirement that all visitors and permittees on NFS lands use weed-seed-free forage is only instituted after working with the State to develop a weed-seed-free forage certification program. This program is run by the State with voluntary participation by forage producers. Forest closures are in effect in Montana, Idaho, Utah, Nebraska, Wyoming and Colorado.

The FS is involved in other cooperative efforts with State and private partners at the national level. The Agency is a member of the Federal Interagency Committee for Management of Noxious and Exotic Weeds (FICMNEW), which has worked with State and private partners to develop Pulling Together: A National Strategy for Invasive Plant Management. The National Strategy was announced at a Congressional briefing April 29, 1997, with over 100 organizational supporters. The National Strategy is a unifying conceptual document in which the supporters have agreed to prevent, control and restore affected areas, using education, research and partnerships to achieve the goals.

The new Pulling Together Partnerships initiative is the first step in implementing the National Strategy and the first round of 24 winning proposals have been selected. The program was jointly set up by USDA, USDI and the National Fish and Wildlife Foundation (NFWF), as a cost-share challenge grant program to use pooled Federal funds with matching local funds for multijurisdictional noxious weed management. The net result of this new program will be the leveraged use of funds; local decision-making based on community priorities; and the shared knowledge and experience among partners.

QUESTIONS SUBMITTED BY SENATOR PATRICK J. LEAHY

Question. With timber harvest on public lands declining, the pressure on private forest lands to provide more of the nation's wood supply is increasing not only in the Northern Forest but across the country. Would you agree that more attention within the Forest Service should be focused on State and Private Forestry Programs? What can we expect not only in new funding, but also in expanded programs? Over the past 10 years, how has funding for State and Private Forestry changed as a percentage of the overall Forest Service budget? How has it changed if you do not include the federal lands forest health management programs?

Answer. The stewardship of the nation's nonindustrial private forest lands and the well-being of urban and natural resource dependent rural communities is a high priority for the Administration. Considering the many program priorities facing the Forest Service in fiscal year 1998, the President's budget proposal is formulated to balance different areas of necessary work, and is based on the priority of the State and Private Forestry programs among all discretionary programs. The President's budget for State and Private Forestry provides increased funding, compared to fiscal year 1997, for the following programs within the Forest Health Management Budget Line Item (BLI): Federal Lands Forest Health Management and Cooperative Lands Forest Health Management. Increases in these programs will allow resources to be focused on the protection of the health of the nation's forests through increased forest health monitoring and pest prevention and suppression. There will be increased technical assistance to federal land managers, Tribal governments, and State and private land managers in planning and implementing on-the-ground forest health management projects designed to improve the health of the Nation's forests. Forest Health monitoring will provide full coverage of 60 percent of forestlands in the contiguous United States, compared to a projection of 53 percent in fiscal year 1997.

The President's budget also includes increases in the Cooperative Forestry BLI for the Stewardship Incentives Program and the Forest Legacy programs. These programs emphasize forest stewardship through landowner assistance programs to enable the 9.9 million nonindustrial private forest landowners to better manage, protect and use their natural resources through forest stewardship programs. The increase in funding for the Stewardship Incentives Program will allow the Forest Service to fulfill part of the large demand for cost-sharing assistance to implement multi-resource practices on nonindustrial private forest lands. The increase in Forest Legacy nearly doubles the level of funding available to conserve environmentally important forests threatened by fragmentation and development.

In the fiscal year 1998 President's budget, the S&PF budget share represents 6.6 percent of the total Forest Service discretionary funds. From 1987-1990 the S&PF budget averaged 4.25 percent of the Forest Service budget and from 1991-1997 the S&PF budget averaged 7 percent of the total Forest Service budget. The S&PF

budget from 1960–1997 represents an average of 6 percent of the total Forest Service budget. In fiscal year 1997 the S&PF share of the Forest Service budget, without the Federal Health Management dollars was 5 percent.

Question. At the proposed level, what level of funding will the Rural Development Through Forestry Initiative receive?

Answer. Currently, the President's budget includes \$9.0 million for the Economic Action Programs. Of this amount \$6.0 million will be provided to the Northeastern Area to continue their Rural Development through Forestry Initiative.

Question. What was the allocation of the fiscal year 1997 funding per State?

Answer. In fiscal year 1997 the Northeastern Area was allocated \$3.01 million to continue the Rural Development through Forestry (RDTF) Initiative. Of this amount about \$2.47 million is allocated for use by the 20 states in the Northeast and Midwest. Of the \$2.47 million, \$2.058 million is already allocated to states for specific projects. Table 1 displays this allocation. The remaining \$408,000 is to be allocated to multi-state projects in June of 1997.

TABLE 1.—RDTF ALLOCATION TO STATES, FISCAL YEAR 1997

State	Technical assistance	State level special projects	State total
Connecticut	\$20,000	\$15,000	\$35,000
Delaware	20,000	15,000	35,000
Illinois	20,000	50,000	70,000
Indiana	20,000	50,000	70,000
Iowa	20,000	280,000	300,000
Maine	20,000	96,000	116,000
Maryland	20,000	30,000	50,000
Massachusetts	20,000	30,000	50,000
Michigan	20,000	88,000	108,000
Missouri	20,000	70,000	90,000
Minnesota	20,000	72,000	92,000
New Hampshire	20,000	50,000	70,000
New Jersey	20,000	20,000	40,000
New York	20,000	80,000	100,000
Ohio	20,000	40,000	60,000
Pennsylvania	20,000	250,000	270,000
Rhode Island	20,000	15,000	35,000
Vermont	20,000	100,000	120,000
Wisconsin	20,000	77,000	97,000
West Virginia	20,000	230,000	250,000
Total	400,000	1,658,000	2,058,000

Question. How many Forest Legacy parcels are currently being negotiated; how much federal funding would be necessary to complete these projects; how many acres are involved; and where are they located?

Answer. There are 41 parcels in various stages of negotiation which are not funded with fiscal year 1997 or prior federal funds. A summary by State shows the acres and the estimated federal funds needed:

FOREST LEGACY PROJECTS (NOT CURRENTLY FUNDED)

State	Number of parcels	Acres	Estimate Federal funds needed
Connecticut	3	367	\$380,000
Massachusetts	10	1,148	1,734,000
Maryland	7	1,358	3,430,000
Maine	3	20,381	3,000,000
New Hampshire	4	14,369	5,450,000
New Jersey	1	145	412,000
New York	5	2,048	768,000

FOREST LEGACY PROJECTS (NOT CURRENTLY FUNDED)—Continued

State	Number of parcels	Acres	Estimate Federal funds needed
Rhode Island	4	555	1,098,000
Vermont	1	6,000	1,500,000
Washington	3	460	2,050,000
Total	41	46,832	19,822,000

In addition, other projects are currently under way using fiscal year 1997 and prior year funds. It is also anticipated that Utah, which recently joined the program, will be identifying parcels for acquisition in the near future.

Question. In 1996 and 1997, how many fires started or crossed into the urban-wildland interface? How was funding from the Cooperative Lands Fire Management program used to fight these fires?

Answer. Our current fire statistical data base does not specifically identify wildland-urban fires unless there was structural loss. In 1996, interface fires burned a total of 774 structures. The 1997 statistics are not yet available.

Cooperative Lands Fire Management funds leverage state and local fire agency funds to increase and insure compatability in training, organization, and equipment. Increased state and local capability, in cooperation with all other wildland firefighting agencies, increase the nation's ability to take fast effective initial attack on all fires, including those in the wildland urban area.

Question. What is the status of the Timber Bridge Initiative? How many demonstration timber bridges have been constructed? What are the estimates for rural development impacts of this program?

Answer. To date, 279 demonstration projects have been completed. Rural development improvements are seen by improved access to rural areas and increased employment. For example, in Kenai Borough, Alaska, a demonstration project assisted in the development of an innovative preservative treatment facility for local timber species. The facility, which created six jobs in a Native American village of 143 people, treats timber products that will be used for transportation structures. The Federal share of this project was \$50,000, while cooperators provided \$465,000.

Question. Last year, the Forest Service pooled approximately \$8.9 million from various accounts to support AmeriCorps program if Congressional approval was granted. How much of that funding remains? What has that funding been used for and does the Forest Service have plans to use some of the funds to support youth conservation corps programs?

Answer. In accordance with congressional direction the Forest Service did not operate an AmeriCorps program in fiscal year 1997. The AmeriCorps funds have been redirected primarily back to the respective program areas and allocated as follows:

	<i>Amount</i>
Recreation funds for recreation fee demo pilot project	\$4,684,000
Fish and Wildlife funds for collaboration with the National Fish & Wildlife Foundation and the National Forest Foundation	2,078,000
Timber/Road Reconstruction funds for timber replacement volume in the Pacific Northwest as agreed to in Court settlement	1,424,000
Soil/Water funds for soil/water restoration, stabilization, and monitoring in Southern California due to impacts of illegal immigrants	135,000
Soil/Water funds for determination of source pollution of water in the Upper Animas Watershed in southern Colorado	100,000
Reprogramming of additional Grazing, Soil/Water, Land Line, and Road Maintenance funds to fund replacement timber volume in the Pacific Northwest	330,000
Permanent and trust funds remain in field units	149,000

Question. Has the Forest Service estimated the savings to be gained from the timber purchaser credits road program initiative?

Answer. There will not be any direct savings to the agency.

Question. In 1995 and 1996, how much funding has been used for trail construction within the national forests from ISTEAs enhancement program funds?

Answer. The Forest Service does not maintain a national list of trails work completed through the ISTEAs Enhancement or National Recreation Trails Fund (NRTF) programs. National figures can be obtained from the Federal Highway Administra-

tion which is the agency which maintains the programs. Responses from Regional Offices show an estimate of \$200,000 per Region from NRTF on NFS lands.

Question. Has State and Private Forestry considered establishing a training center for federal, state, and private foresters on conservation stewardship practices? Is there currently a similar training program within the Forest Service or operated by a non-profit foundation of a private enterprise?

Answer. State and Private Forestry, working closely with the Cooperative States Research, Education and Extension Service, State Foresters, and other public and private partners, engages regularly in training state service foresters and consulting foresters in forestry and related conservation stewardship practices. In addition, we and NRCs operate a National Agroforestry Center in Lincoln, NE that provides training to field foresters on agroforestry conservation practices such as establishing and protecting riparian areas, windbreaks, and field shelterbelts. The Society of American Foresters and the Association of Consulting Foresters also engage regularly in continuing education in forestry and conservation stewardship practices for their members.

Question. Within the NFS, which national forests have the greatest backlog of willing sellers of forest inholdings? Which forests have the largest number of acres left to acquire within their authorized boundaries? Which forests have the largest number of acres remaining within their acquisition targets? What is the existing backlog at the Green Mountain NF and how much funding is necessary to eliminate the backlog?

Answer. Most NFs do not keep a record of the willing sellers of private land inholdings. These records would be difficult to keep current and would serve little purpose considering the limited level of land acquisition funding.

There are over 40 million acres of non-NFS land (inholdings) within our boundaries. Several forests contain over one million acres of inholdings. The Chugach and Mark Twain NFs, each with over 1.5 million acres of inholdings, have the largest number of acres of inholdings. The Green Mountain NF has approximately 450,000 acres of inholdings. It is not our goal to acquire all inholdings. Land acquisition targets are not based on the acreage of inholdings. Targets are set each year after funds are appropriated.

Another consideration is the percentage of inholdings within the forest boundary. As a general rule, the forests in our eastern regions have the highest percentage of inholdings. The Wayne NF has the highest percentage of inholdings with the percentage exceeding 70 percent. On the Green Mountain NF, over 50 percent of the land within the boundary consists of inholdings.

The existing backlog of land available for acquisition on the Green Mountain NF is valued at near \$25,000,000, comprised of approximately 100 cases and 48,000 acres. Included in this total is the entire 18,000 acre New England Power Company tract with an estimated value of \$10,000,000. To complete these acquisitions, we would need an additional 10 percent of the land value to pay for associated costs.

Question. If a large parcel of land within a NF goes on the market unexpectedly, what authority or funding sources, other than Land and Water Conservation Fund, are available to acquire significant land under emergency circumstances?

Answer. There is no other authority or funding sources to acquire lands.

Question. How many national forests, and in which regions, will initiate their forest plan revision in the next 2 years?

Answer. A total of 81 national forests will initiate land and resource management plan revisions in the next 2 years. This includes: 13 in R-1; 7 in R-2; 10 in R-3; 13 in R-4; 7 in R-5; 1 in R-6; 13 in R-8; 16 in R-9; and 1 in R-10.

Question. Do all the forests face similar challenges and outreach strategies for revising their plans?

Answer. Land and resource management plan revisions have the same requirements as the development and approval of the initial plans, including appropriate public participation activities and coordination with other public planning efforts. Individual national forests may address any number of public issues and management concerns in the revision effort, depending on the unique situation for that national forest. While some plan revision efforts may address similar issues or concerns, the level of intensity or controversy involved with these may be different.

Question. What are some of the major differences?

Answer. One example of a similar issue that all revision efforts will be addressing, but for which different levels of intensity or controversy may exist is in the evaluation of roadless areas. National forests with a great number of inventoried roadless areas may face a more complex analysis than those with very few roadless areas. Grazing may be a very important issue to address for national forests in the west, but not an issue at all for some eastern national forests. The same may be said for other potential issues such as the allowable sale quantity, critical habitat for threat-

ened and endangered species, insect and disease outbreaks that pose a forest health issue, weather related resource condition problems associated with hurricanes or major landslides caused by excessive snowmelt or other precipitation events, the demand and supply potential for providing an integrated mix of goods and services, etc. Each land and resource management plan revision effort will be unique.

Question. What are the estimated budget needs to revise these plans?

Answer. Based upon the experiences of recently completed land and resource management plan revision efforts, estimated costs for these revisions are \$500,000 per year for four years, or an average total cost of \$2,000,000 per plan revision.

Question. The forest inventory program is targeted to survey different regions of the country on a 10-year cycle. This cycle was designed to provide the various regions of the country with essential information on growth, harvest and condition of our forest resources. What factors have delayed the Forest Service in meeting this target in different Regions? What is the status of the forest inventory in the Northeast? Is the Forest Service required to use federal employees to do the data collection for these surveys? Has the Forest Service used contractors to do data collection in any region? If so, what kind of arrangement was made and was there associated cost savings? Would the Forest Service need additional authority to contract with state or private foresters to conduct the forest inventory?

Answer. Factors causing delay:

The current national Forest Inventory Analysis (FIA) inventory cycle is now 12+ years. The cycle is controlled by three main factors; (1) a mandated accuracy requirement which determines the amount of data to be collected, (2) funding for personnel and equipment which determines the speed at which the data are collected, (3) funding for technology research and application which can increase efficiency and reduce the collection burden on personnel and equipment without sacrificing accuracy.

The first controlling factor, accuracy, is required and necessary to provide quality information to make sound management decisions. The second controlling factor, funding, is the central issue. Since 1995, overall Forest Service Research program funding has declined 10 percent. During this same time period, FIA field program funding has increased by 3 percent. Clearly FIA is still a priority research program within the Agency but the modest increase in FIA funds have not been sufficient to offset the increased cost of getting personnel and equipment into the field. Continued funding at current levels will further erode the cycle unless new technology can bridge the gap.

The third controlling factor, technology research, is difficult to maintain when cycles slip and demand for current information rises. However, scientifically sound research is critical to the application of any new technology or data collection method. With constrained budgets, FIA strives to maintain a balance between the potential gains in efficiency from development and application of new technology and the demand for shorter current cycles.

Why did we fail to shorten the cycle? In the face of deep cuts in the Forest Service research budget the Agency did maintain FIA as a high priority (no overall reduction) but was unable to downgrade other critical research priorities to provide significant additional funding.

NORTHEAST STATUS

The FIA cycle in the Northeast is currently about 13 years.

Contractors/Non-Federal employees

The FIA program has traditionally relied upon considerable direct and in-kind support from cooperators as we conduct Statewide inventories. In 1996, 13 percent of the FIA program came from State, private, and other federal cooperators. While we do not believe additional authorities would be needed to contract outside personnel, we do have concerns about quality assurance. Under any contractual arrangement, the FIA program must have complete control of the quality assurance process to insure that sampling design specifications and quality standards are met and are consistent across all ownerships and State lines. Additionally, FIA costs include training, data compilation, editing, processing, analysis, and reporting. These costs would be retained by FIA whether contractors were used or not. Our limited experience where contractors have been used indicate little difference between our cost for data collection only and contractor cost for data collection (including contract administration costs). We continue to be open to discussion on this issue and new annualized inventory designs like Annual Forest Inventory System (AFIS) and Southern Annual Forest Inventory System (SAFIS) will rely heavily on cooperator field support.

Question. The Green Mountain National Forest is currently leasing its headquarters facility in Rutland, VT. If the Forest Service was to move to smaller space that it would purchase, what cost saving could be expected?

Answer. The Green Mountain National Forest headquarters is currently located in Rutland, Vermont, in a leased facility. This leased facility is comprised of 17,056 square feet of office space and a 2,700 square foot garage. The present annual least cost, which includes building and grounds maintenance, is \$205,000.

As the result of streamlining of the Forest organization, which has included a substantial reduction in the headquarters staffing level, the Forest headquarters has reduced its office space needs to approximately 13,000 square feet.

The Forest is beginning the process of exploring alternatives to their current lease. These alternatives include: a possible renegotiation of the current lease, taking into consideration the reduced space needs; the purchase of an existing or new facility; and the construction of a new facility. Each alternative for office space would be based on the projected need of approximately 13,000 square feet.

Part of the process of exploring alternatives to the current lease will be the completion of a comprehensive cost analysis. This analysis will be completed utilizing the OMB Circular A-94 life cycle cost methodology. Because this cost analysis has not yet been completed, we do not yet know what cost saving could be expected if the Forest would move to smaller space that it would purchase or construct. In order to accurately determine the benefit/cost of relocating the Green Mountain SO, a pre-construction analysis of alternatives needs to be completed. The estimated cost of this analysis is \$35,000.

Question. Which national forests are estimated to have the highest visitor use? Which forests have the highest recreation use per acre?

Answer. We do not currently have information on recreation use per acre by national forest. Due to the multiple use nature of the activities, goods and services provided by national forest system lands, we are unsure the conclusions would be accurate based on the data. For example, a forest that has large acreage, but relatively few developed recreation use areas may still receive very high recreation use. However, the high impact on the recreational areas would be masked by the total forest acreage.

We do, however, have information on which forests have the highest recreation use. In fiscal year 1992 and fiscal year 1995 the Regions were asked to submit their top 5 forests. The top 12 in fiscal year 1995 and the top 10 in fiscal year 1992 follow:

NATIONAL FORESTS RANKED BY AMOUNT OF RECREATION USE IN FISCAL YEAR 1995

[Thousands]

Forest name and State	Rank	Regions	Recreation visitor days ¹	Visits ²
Wasatch-Cache/Uinta—UT-WY	³ 1	4	10,518.2	32,520.1
Tonto—AZ	2	3	10,507.3	38,184.5
Coronado—AZ	3	3	9,903.9	11,305.0
Inyo—CA	4	5	9,839.2	29,985.2
Angeles—CA	5	5	9,815.9	29,579.2
White River—CO	6	2	8,045.0	10,136.7
Gifford Pinchot—WA	7	6	7,690.1	34,780.1
Pike/San Isabel—CO	³ 8	2	7,325.0	15,311.0
National forests in North Carolina—NC	³ 9	8	6,756.3	19,905.8
Coconino—AZ	10	3	6,628.7	8,500.0
Mount Baker-Snoqualmie—WA	³ 11	6	6,551.8	23,070.8
San Bernardino—CA	12	5	6,353.4	1,852.0

¹ A recreation visitor day (RVD) is a statistical reporting unit consisting of 12 visitor hours. A visitor hour is the presence of a person on an area of land or water for the purpose of engaging in one or more recreation activities during a period of time aggregating 60 minutes.

² Visits an entry of one person upon a National Forest for the purpose of participating in one or more recreation activities for an unspecified period of time. Only the "primary" activity of the recreation visitor is recorded.

³ Multiple forests.

NATIONAL FORESTS RANKED BY AMOUNT OF RECREATION USE IN FISCAL YEAR 1992

[Thousands]

Forest name and State	Rank	Region	Recreation visitor days
Tonto—AZ	1	3	9,247.4
Angeles—CA	2	5	9,158.0
Inyo—CA	3	5	8,376.3
White River—CO	4	2	8,232.3
Dixie—UT	5	4	6,175.6
Coconino—AZ	6	3	5,788.4
National forests in North Carolina—NC	¹ 7	8	5,767.3
Pike San Isabel—CO	8	2	5,590.3
San Bernardino—CA	9	5	5,501.1
Mount Baker-Snoqualmie—OR	¹ 10	6	5,498.3

¹ Multiple forests.

Question. What were the criteria used and how were they weighted under the new budget allocation process for fiscal year 1997 operating funds? Was there regional flexibility in applying or weighting these criteria? How much flexibility does an individual forest have in reprogramming funds between budget lines once the allocation has been made? Within Region 9 and for the Green Mountain National Forest, which budget line items saw the largest increase and decrease in funding levels from the previous year? Has the Forest Service compared these funding levels to the activity priorities in individual Forest Plans? Is the Forest Service going to revisit these criteria during the fiscal year 1998 allocation?

Answer. The Forest Service has been using a criteria-based approach for allocating funds in the agency's budget process for several years. The development and refinement of criteria has been an on-going effort involving Washington Office and Regional resource and budget staffs. NFS and Construction staffs have particularly focused on refining and using allocation criteria.

For fiscal year 1997, the criteria were used as a starting point for the initial and final allocations to field units in the Program Budget Advice. The criteria used for the NFS and Construction appropriations differed from program to program, but they basically measured the resource base, workload or accomplishments and complexity. For most programs, Regional and Washington Office staffs developed options and reached consensus on allocation criteria and their weights.

For any given region, three factors would have led to increases or decreases in funding for a line item in fiscal year 1997: total funding appropriated, the amount of funds needed to operate the National headquarters, and the criteria used. Since moving to a criteria-based approach could result in significant shifts in program funding among units, an adjustment or "bridge" was applied to all regions to limit an increase or decrease of no more than 10 percent in a region's percent share of the available funding from 1 year to the next. For fiscal year 1997 Region 9 implemented a similar allocation process for distributing funds to its National Forests. Region 9 provided each forest with a base level of funding to support basic management needs and then allocated the remaining funding using criteria.

Allocation criteria will continue to be used in fiscal year 1998. For some programs, the criteria used for fiscal year 1997 were or will be revised for fiscal year 1998. Given the complexity of managing natural resources, no set of criteria will yield a perfect allocation. Review and possible adjustments to the results of criteria application will continue to be necessary to address emerging issues and changed conditions.

Question. In 1990, the National Research Council made a number of recommendations for the Forest Service program. Has the Forest Service implemented any of the recommendations?

Answer. Yes. USDA Forest Service Research (FSR) has included the NRC's "Forestry Research: A Mandate for Change" to strategically plan its program of research since it was issued in 1990. We believe we have implemented in various degrees a number of the recommendations.

In their executive summary, the National Research Council (NRC) identified recommendations under (1) the Status of Forestry Research, (2) Support for Forestry Research, (3) Maximizing the Benefits from Forestry Research. Some of recommendations pertained to Forest Service Research, others to forestry research con-

ducted by universities, industry, or others. Specific recommendations implemented by Forest Service Research (FSR) are:

1. The Status of Forestry Research:

Provide vastly expanded competitive funding.—FSR use of competitive funding mechanisms increased after 1990. However, the “vastly expanded” competition envisioned in the report has not materialized. For example, the global change research program provided several competitive opportunities in fiscal year 1992–1995. Since then, global change funds have been allocated to extend and complete projects initiated competitively. An 8 percent FSR budget reduction in fiscal year 1996 coupled with lack of funding increases to cover inflation, have made it difficult to expand competitive funding.

Create centers of scientific emphasis supported by public and private research organizations.—FSR is involved in several centers of excellence, working closely with universities, state governments, industries, and private forestry groups. These centers broadened FSR’s research capabilities through establishing strong partnerships. Research addressed under the auspices of these centers are tied to regional and national research issues. For example, the Alabama Consortium (SRS–4107, Alabama A&M University, and Auburn University) entered into a collaborative endeavor incorporating the expertise of scientists, forest managers, and forest owners. The Consortium seeks to create new information through research, to utilize existing knowledge, and to expand education and technology transfer for the benefit of land managers. Another example, the FSR is exploring, with the Bureau of Land Management, National Park Service, and others, creation of “Cooperative Ecosystem Study Units” in several regions. The intent of these units is to create interagency and multi-university centers of emphasis in natural resources research and education. As budgets decline and downsizing progresses FSR continues to merge units into larger integrated units of research. FSR has research facilities located on or adjacent to 42 university campuses which enhance our ability to collaborate with university centers of excellence.

Increase the quality of forestry research by opening it up to the broader scientific community.—We have taken advantage of opportunities to engage in scientific exchange and collaboration with other research organizations. For example, we have strengthened ties with the Ecological Society of America and the Society for Conservation Biology to expand the range of expertises available to work in complex issues. In addition, many of our researchers are members or officers of related scientific and professional societies, such as the American Economics Association and the Soil Science Society. Society activities have brought new thinking and skills to forestry research.

Establish research-management collaborations at large spatial scales.—FSR has worked with the National Forest System to create “Adaptive Management Areas.” Successful studies are underway in North Carolina, Georgia, and Arkansas in addition to Oregon and Washington. In fiscal year 1994 FSR initiated 20 large-scale ecosystem management projects across the entire United States and Puerto Rico. Many of these long term studies are in progress and involve collaborative efforts with universities, industry and the NFS.

Develop a cadre of forest and related scientists that reflect the national, and global population composition and that are equipped to solve domestic, international, and global problems.—FSR has the same distribution of ethnicities (within 0.5 percent in each category) among its total employee pool in 1997 as it did in 1990.

Establish a National Forestry Research Council.—In response to this recommendation, USDA proposed the establishment of a subcommittee to coordinate forestry research, through the Office of Science and Technology Policy (OSTP) and the Federal Coordinating Council for Science, Engineering and Technology (FCCSET). A forestry subcommittee was near charter and constitution stages at about the time the Executive Branch changed administrations. The subcommittee was not formed and the new administration has been directing science planning through a new structure, the National Science and Technology Council (NSTC) and the Office of Science and Technology Policy. FSR has been involved in this planning effort. In April, 1993, USDA chartered the Forestry Research Advisory Council (FRAC). FRAC replaces the Cooperative Forestry Research Advisory Council, which existed to serve the Cooperative Forestry Research Program (McIntire-Stennis) only. FRAC’s charge is broadened to include all forestry research supported through USDA and addresses a broader range of national forestry research issues.

Other recommendations.—To support basic forestry teaching and research through NFRF, to strengthen teaching, to establish long-term forestry research grants, and to establish competitive graduate fellowships—have not been implemented. Most of these require action by groups other than FSR or additional funding beyond that made available since 1994.

2. Support for Forestry Research:

Increase FSR budget by 10 percent per year, for the next 5 years.—Between fiscal year 1990, when the NRC report was issued, and fiscal year 1995, appropriations rose from \$150.9 million to a peak of \$193.5 million (nominal dollars). Since 1995, FSR appropriations have declined to \$179.8 million today. Complete fulfillment of the NRC recommendation would have resulted in an FSR budget of \$243 million in 1995. The nominal funding increase from fiscal year 1990 to 1995 amounted to slightly more than a 5 percent annual increase. When the effects of inflation are factored in using 1995 dollars, the fiscal year 1990 budget was \$172.5 million (1995 constant dollars) leading to a 2.3 percent annual increase from fiscal year 1990 to fiscal year 1995. Compared to the fiscal year 1990 constant dollar level, the fiscal year 1997 level of \$172.6 million (1995 constant dollars) shows no change.

Conduct a national assessment of current status of forestry facilities and equipment.—As part of the 1995 Farm bill, a national assessment of agricultural research facilities is in progress (USDA Facilities Review Team). Federal and university forestry laboratories are part of this assessment. No national assessment of forestry research equipment has been conducted.

Other recommendations.—Increase competitive grant funding for forestry research in the USDA in the National Research Initiative to \$100 million annually and increase McIntire-Stennis funds to 50 percent of the FSR budget—have not been implemented. The current funding level in the NRI for forestry research is less than \$20 million and the McIntire-Stennis funding level is less than 15 percent of FSR funding. On average, 12.3 percent of the FSR is committed to extramural research, most of this to grants and agreements with our university partners. Decreasing budgets and downsizing have limited and resulted in a decrease over the past 2 years.

3. Maximizing the Benefits from Forestry Research:

Encourage scientists to assume a leadership role in communicating their knowledge to policy makers.—“Forest Service Ethics and Course to the Future” emphasizes that one of the keys to our effectiveness as a conservation leader is expanding collaboration between scientists and practitioners and better integrating science into policy issues. Researchers have played important roles in major regional assessments, such as FEMAT, the Southern Appalachian Assessment, the Sierra-Nevada Ecosystem Project, and the Columbia River Basin study, communicating their knowledge to policymakers. FSR also co-hosted two high-level workshops to explore why we have been successful in certain efforts and less successful in others in bringing science to policy making (“Navigating Into the Future, Rensselaerville Roundtable: Investigating Science and Policymaking”). Guidelines from these workshops (currently in draft form) will be disseminated agencywide.

Establish a professional reward system for scientist that acknowledges the validity of efforts involved in outreach.—In 1996, FSR completed the first major revision since the mid-1980s in its policies and guidelines for evaluating research scientists. Much greater emphasis was placed on outreach activities in the revised guidelines so scientists who engage in outreach and coaching users on implementing research findings will get promoted faster.

Communicate research results to a broader range of clients.—In the revised scientist evaluation guidelines, discussed above, increased emphasis has been placed on communicating research results to a broader range of clients and coaching users on efficient implementation of research findings. FSR has also been taking advantage of computer technology, such as the Internet and CD-Roms, for disseminating research results. These media often reach people faster and easier than journal articles or publications.

Question. Describe the Forest Service research budget in constant dollars since 1990. How does this compare to overall trends in the Forest Service budget?

Answer. In 1990 constant dollars:

FOREST SERVICE RESEARCH BUDGET

[Dollars in millions]

Fiscal year	Forest Service ¹	Research	Percent
1990	\$2,544	\$151	6
1991	2,225	160	7
1992	2,293	168	7
1993	2,254	166	7
1994	2,391	172	7

FOREST SERVICE RESEARCH BUDGET—Continued

[Dollars in millions]

Fiscal year	Forest Service ¹	Research	Percent
1995	2,063	169	8
1996	2,127	153	7

¹ Total discretionary appropriations.

Question. What are the trends for number of scientists employed directly and in cooperative research units?

Answer. The trend for number of scientists employed directly by the Forest Service is down from 715 in fiscal year 1990 to 548 in fiscal year 1996. We are not familiar with the term “cooperative research units.”

Question. What percentage of the Forest Service budget is used for cooperative research?

Answer. When we speak about cooperative research we generally mean extramural research. The percentage of extramural research is determined by two factors, the work needed to accomplish our mission and the level of funds available for that year. Extramural research averaged 24 million dollars the past 5 years, approximately 13 percent of annual appropriations.

Question. What percentage of forest Service research is focused on timber production vs. other management activities of the Forest Service?

Answer. We estimate that 28 percent of the Forest Service research budget is focused on timber production. In addition, the research accomplished by our Forest Products Lab and other forest products, utilization and wood processing research, an additional 9 percent of the budget, contributes to improved and expanded ways to use wood fiber including material that needs to be removed to improve forest health through utilization of small diameter trees.

Question. Has the Forest Service ever conducted a study looking at the impact on estate taxes on private forestland, specifically looking at the number of large parcels sold due to estate taxes?

Answer. No. The Forest Service shares this concern and the Cooperative Forestry Staff has a study of this issue proposed for fiscal year 1998. However, we believe the issue is broader than just forestland and there should be a USDA effort to look at the effects of estate, gift, and capital gains on farmers, ranchers, and forest landowners and the conversion/fragmentation of their land holdings attributable to estate taxes.

SUBCOMMITTEE RECESS

Senator GORTON. The subcommittee will stand in recess until 9:30 a.m., Thursday, April 24, when we will receive testimony from the National Endowments for the Arts and the Humanities.

[Whereupon, at 11:42 a.m., Thursday, April 17, the subcommittee was recessed, to reconvene at 9:30 a.m., Thursday, April 24.]

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, APRIL 24, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9:30 a.m., in room SD-192, Dirksen Senate Office Building, Hon. Slade Gorton (chairman) presiding.

Present: Senators Gorton, Stevens, Cochran, Burns, Bennett, Gregg, Campbell, Bumpers, Dorgan, and Boxer.

NATIONAL ENDOWMENT FOR THE ARTS

STATEMENT OF JANE ALEXANDER, CHAIRMAN

BUDGET REQUEST

Senator GORTON. This subcommittee hearing will come to order. We are going to hear this morning from the Chairmen of both the National Endowment for the Arts and the National Endowment for the Humanities and review with them their proposed budgets for the coming fiscal year.

Ms. Alexander and Dr. Hackney began their tenures at the two Endowments almost 4 years ago. Since that time, each has been in the unenviable position of having to execute substantial budget cuts for their agencies enacted by Congress in an effort to address the budget deficit.

As chairman of this subcommittee, I have a keen appreciation of their situation. The amount of budget authority available to fund the many agencies within the jurisdiction of the Interior bill has declined by about \$1 billion since 1995, when I assumed the chairmanship.

For the current year, the National Endowment for the Arts is funded at \$99.5 million, the National Endowment for the Humanities at \$110 million. Both agency budgets include proposed increases in their fiscal year 1998 programs that would provide a funding level of \$136 million for each, thereby partially restoring the cuts that were made in 1996 and sustained in the current fiscal year.

I believe I can say with great certainty, though I do have the chairman of the overall committee here, that I do not anticipate that there will be an increase of similar magnitude in this subcommittee's budget allocation. Instead, my expectation is that we may face a further decline in available dollars. As a result, that

will mean that for each increase provided for one agency budget a corresponding decrease will have to be taken in another.

At the same time, I think it is appropriate to say that the debate over the continuation of the two Endowments which has been so prominent in the House of Representatives is much less prominent here in the Senate. There has been in each of the past 2 years, and I am sure will continue to be, substantial support for the Endowments and for their continuation.

That does not make finding money for them any easier, and whether or not there will be even the slightest increase in allocation for this subcommittee will depend largely on budget negotiations which now seem to me to be reaching a climax.

Ms. Alexander, and for all of the audience here, I will explain the chart or the display that we have there [indicating].

[The information follows:]

Interior programs fiscal year 1997 enacted

Land management programs:	
Forest Service	\$2,361,000,000
National Park Service	1,414,000,000
Bureau of Land Management	1,090,000,000
Fish and Wildlife Service	653,000,000
Total	<u>5,517,000,000</u>
Indian programs:	
Indian Health Service	2,054,000,000
Bureau of Indian Affairs	1,606,000,000
Navajo-Hopi/LAIA/special trustee/Indian gaming/Indian education	119,000,000
Total	<u>3,779,000,000</u>
Science and minerals management programs:	
Geological Survey	739,000,000
Office of Surface Mining [OSM]	272,000,000
Minerals Management Service [MMS]	163,000,000
Total	<u>1,174,000,000</u>
Energy programs:	
Energy conservation R&D	570,000,000
Fossil energy R&D	365,000,000
Naval petroleum NPR/reserves	144,000,000
Energy information administration/economic regulation	69,000,000
Alternative fuels production	- 4,000,000
Clean coal technology	- 123,000,000
Total	<u>1,020,000,000</u>
Cultural programs:	
Smithsonian Institution	370,000,000
National Endowment for the Humanities	110,000,000
National Endowment for the Arts	99,000,000
National Gallery of Art	60,000,000
Holocaust Memorial	31,000,000
Institute of Museum Services	22,000,000
Memorials	41,000,000
Total	<u>733,000,000</u>
Interior departmental offices:	
Interior affairs	88,000,000

Interior programs fiscal year 1997 enacted—Continued

Departmental management	58,000,000
Solicitor	35,000,000
Inspector general	25,000,000
Total	<u>207,000,000</u>
Total bill	<u>12,430,000,000</u>

DISTRIBUTION OF FUNDS APPROPRIATED THROUGH SUBCOMMITTEE

Senator GORTON. That display indicates the distribution of the funds in the current year that are appropriated through this subcommittee. The green on the left are land management agencies; the blue are the Indian programs; and the much smaller additional ones have to do with minerals management, energy programs, and the like.

Cultural programs and the Endowments are the next to the last, next to the right, and as you can see even within the context of this bill, they represent a relatively modest amount of our appropriation. Within those cultural institutions, however, are the Smithsonian Institution, the National Gallery of Art, and a number of other institutions for which we are almost solely responsible as opposed to the arts of the country taken as a whole.

SUPPORT FOR CONTINUATION OF ENDOWMENT

I do want to emphasize that wherever we come out on funding in fiscal year 1998, the subcommittee clearly supports the continuation of the two Endowments. This hearing today is intended primarily to provide subcommittee members with the opportunity once again to demonstrate that support and to ask questions rather than to debate the future existence of either the Endowment that you head or the National Endowment for the Humanities.

It has been 1 year since you appeared before this subcommittee. In the intervening months the most significant issues that you faced have not changed a great deal, but you have represented a very strong and eloquent voice for the National Endowment for the Arts.

Ms. Alexander, we will start with you today.

Senator CAMPBELL. Mr. Chairman, are we going to be allowed to make opening statements?

Senator GORTON. You certainly are. We are going to give each member of the subcommittee an opportunity to speak. Senator Stevens is the chairman of the overall committee as well. He said he did not have an opening statement earlier, but I am going to ask him again whether he does want to say anything.

Senator STEVENS. No; thank you.

Senator GORTON. OK. We will pass. Senator Boxer.

OPENING REMARKS OF SENATOR BARBARA BOXER

Senator BOXER. Thank you very much, Mr. Chairman.

I want to start off with an apology, because I am on the Budget Committee and there is a briefing at the White House, and without a budget it is very hard for your subcommittee and all the sub-

committees and for Chairman Stevens to do his work, so I am going to have to run out, but my heart is here with the people who believe that it is crucial for our Nation to dedicate some of its treasure to the arts.

I think it is absolutely extraordinary that there would even be an argument, and I think our chairman has pointed out that the argument over the existence of the NEA is more of an argument in the House, in which I served for many years, although it came rather late in the game when the leadership changed hands.

But I have to say that we spend 38 cents per person on the arts in this country. If anyone thinks that is too much, I would say to them they ought to think about what it all means. I think the modest increase put forth by the President is just that. I would like to even do more than that, because I have seen the effect of the arts on children. I know that when you make these small investments they are leveraged mightily. I know that they are leveraged in such a way that they help bring economic development to communities and it is a tremendous community experience to see a small amount of money at work.

Now, the funding that the President requested—\$272 million for the arts and humanities—is a mere one one-hundredth of 1 percent of the entire Federal budget. It does get leveraged in the community. That is important. But it is one one-hundredth of 1 percent of the total budget, and millions of Americans across the country have an opportunity to view history in arts that otherwise would be inaccessible.

PRESIDENT'S REQUEST FOR NEH

The President's request of \$136 million for fiscal year 1998 for the NEH will enable the Endowment to continue to support many activities, including the cataloging of Presidential papers and the preservation of newspapers of the Nation's early history. No country can survive if they cannot learn from history. This is very important.

In the last 5 years, institutions and individuals in my home State of California have received \$63 million from the NEH and the California Council of Humanities for projects that help preserve the Nation's cultural heritage, foster lifelong learning, and encourage civic involvement.

Of note, the Fowler Museum of Cultural History at UCLA received \$450,000 for the Royal Tomes of Saipan, an exhibit of artifacts from ancient Peru that drew 100,000 visitors from California and more than 1.2 million visitors nationwide. All of those visitors come and they stay there and they walk down the street, they go to the restaurants, and they bring business. They go to the stores.

IMPORTANCE OF NEA TO CALIFORNIA

Now, on the NEA, for 32 years the NEA has led the way in making art accessible to Americans throughout the country. Arts education, theater projects, dance troupes, opera companies that nurture young artists and strengthen communities. Those are funded by the NEA, by NEA grants.

Now, I just want to say straight out not every single grant is perfect. I do not agree with every single grant. It is very subjective, and a couple of them get people upset. Now, I think we have to realize that we are all human beings. Mistakes will be made and judgments may be flawed when looking at it from one's perspective and one's own values and culture, but what has always interested me is that those who yell the loudest are the ones who look the longest at the very projects that they say are so terrible.

I say we are born with a neck. You can turn your head away, and you can criticize, and I encourage that criticism. I think it is healthy to criticize. If you think that a grant is wrong, say it. I think some are as well, and I say it, too, but it does not mean that you just say, well, therefore, we cannot have this program. It means that we work with you, and Jane Alexander you have been extraordinary, I think, to work with, and you make sure that mistakes are the fewest that they can be.

Recently in my State the Endowment granted \$150,000 to the Los Angeles County Music and Performing Arts Commission for a cultural tourism development program. This is one of several regional cultural tourism forums funded throughout the country. The NEA has awarded \$30,000 to the Balboa Art Conservation Center in San Diego for improving the collections storage needs of midsize and small museums throughout California.

Mr. Chairman, I am at the end of my statement. I feel very, very strongly that the President's proposal for NEA funding will broaden public access to the arts for all Americans to participate in and enjoy, in order to improve the quality of life for our children and our families. And again, I am so sorry that I cannot stay for this entire hearing, but, Mr. Chairman, I hope that we can work together so that we have a good bipartisan agreement at the end of the debate.

Senator GORTON. If you have any questions, we will be happy to submit them.

Senator BOXER. Thank you, Mr. Chairman.

Senator GORTON. Senator Burns.

PREPARED STATEMENT OF SENATOR BURNS

Senator BURNS. I just have a statement that I would like to submit for the record, sir.

[The statement follows:]

PREPARED STATEMENT OF SENATOR CONRAD BURNS

Thank you, Chairman Gorton, for holding this hearing today.

I'd like to welcome Ms. Alexander and Mr. Hackney here today. We appreciate your coming in to talk about your agencies. I had the pleasure of discussing old movies from my wrangler days with Ms. Alexander yesterday afternoon. I worked on *The Rare Breed*, but unfortunately not *Calamity Jane*.

Both of you have done well running your agencies under tough circumstances. The battles certainly aren't over, but at the same time we may be approaching the signing of a truce. From what I see and hear, support for the arts and humanities remains strong in Montana and around the country.

I look forward to hearing how efficiently your agencies are running and what each of you is doing to raise funds from private sources, and if those efforts are having success.

Thank you again for being here this morning.

OPENING REMARKS OF SENATOR CAMPBELL

Senator GORTON. OK. Senator Campbell.

Senator CAMPBELL. Thank you, Mr. Chairman.

I am prompted to make an opening statement really based on a letter that I saw from a colleague who happens to be a terrific friend of mine from the House side, which I will explain a bit later.

PRESERVATION OF CULTURAL TREASURES

I would like to direct the attention of the committee and people who are here to those wonderful baskets over there in those glass cases, or this one that was provided by one of my staffers on the Indian Affairs Committee, that were made so tight they will actually hold water with no glue or anything. It is just wonderful creative work of Indian culture.

I would like to certainly identify myself with the comments that Senator Boxer made. I think the arts serve an extremely important role. You can look at it from a lot of different viewpoints, certainly in Santa Fe, Jackson, places like that, it becomes part of the basis for their economy, but the point I would like to make, I guess, is that I think there is a place where we need to define the real importance of preserving cultural treasures that are in the art world, not only visual ones like this but song, dance, storytelling, and a lot of other things, too.

I lived in Japan for a number of years, as you know, and I went to a Japanese university. In Japan, the Federal Government actually gives a title to people who have spent their whole life in a certain art form, perhaps bonsai—you know, the little miniature trees—things of that nature.

As they reach a certain degree of skill the Federal Government gives them a title of living cultural treasure, and in fact gives them a stipend, gives these wonderful people a stipend to keep that skill alive. That is why in Japan you have things that were practiced as far back as the 15th century that may not have any, you know, visual economic use, but they are still practiced today because the Government has recognized the importance of preserving cultural treasures.

I would certainly like to see that in this country, too, and that probably will never happen, but at least I think we have an obligation to define the things that are fast disappearing.

These baskets are just an example. They came out of the Southwest, but if any of you are ever in the State of California, Senator Boxer's State, and have the opportunity to go to the State Indian Museum, which is located right behind Sutter's Fort in Sacramento, CA, there are examples of baskets, believe it or not, that were woven so small they are on pinheads. They are in a glass case like that one over there.

They have a big magnifying glass. You have to look through the glass to be able to see the finest of those baskets. Some of them were woven out of the feathers from humming bird's chests. Some of them they cannot even weave any more because it is a dying art. There are very few people who know how to do it, the Pomos, the Washos, some of the California tribes.

Some weavers have given up because under the Endangered Species Act there are certain things they cannot collect, certain grasses, certain leaves, certain feathers, certain pieces of fur and so on, so they cannot do it, but they actually have baskets in that museum that were woven from the hair of a fern, a fern's hair, if you can imagine how fine that is.

NEA AND THE PRESERVATION OF NATIVE AMERICAN CULTURE

I wanted to point that out today because I know in some places there is a problem with some of the funding that goes through the NEA. We have all heard about Mapplethorpe over and over, ad nauseam, I guess.

I have a lady who came to one of my town meetings a couple of years ago in Colorado suggest that we disband the NEA and NEH both because of some of the money that has filtered down through the National Endowments.

I pointed out to her—that was during the debate of the \$1,000 coffee pots and \$800 hammers that the Air Force was buying, and I suggested to her that maybe we ought to just delete all the money for military defense because somebody made a dumb mistake, and in that context I think she understood why we should not use a sort of all-or-nothing phrase when talking about the National Endowment for the Arts because there were a few grants that went out that most Americans would disagree with.

But my friend and colleague on the House side, who I have known for many years and who I think is a very fine man, Congressman Wally Herger from Senator Boxer's State—I have great respect for him and I do not mean to single him out, but he did recently send out a Dear Colleague letter saying—the title was, "NEA Funds Basket Weavers," as if to imply that basket-weaving is, you know, just kind of a pastime and not important, and one of those things most Americans would think was frivolous and we ought to get rid of the funding for that.

It was a \$60,000 grant, in fact, that the NEA gave to California basket weavers for a statewide gathering of basket-weavers, and western regional Indian basket weavers, to try to preserve that art form.

I want to also bring a couple of pictures of some of them that are blown up, if you can see them—I hope you can. These are traditions—you know, if you paid a person to weave this they would probably get 20 cents an hour or something. There is no money in this, very little.

Only a few of the very famous potters and weavers of rugs and so on can actually make money, but these things are not from the standpoint of making a living for people. You just do not.

And how many children, how many babies in Indian country are still carried in these baby bassinets? Very few. Some of the traditional people do, but a lot of women keep that skill alive simply to preserve it as a cultural heritage, important to them. This is something that is handed down from mother to daughter, grandmother to granddaughter, and it just seems to me that it comes under the same category as perhaps wood carvings in Appalachia, or some of the other things that we often think of that have come down, that has made our country have a fabric that binds us all together.

These happen to be made by American Indians, but certainly the richness of the skills belong to all of us as Americans, and I think we have an obligation to try to keep them alive, and I just wanted to bring them in and let my colleagues see how easily we can get sidetracked when we are talking in these deficit times, when we have to watch every buck, that we might end up doing something that we would really regret centuries from now, if we inadvertently, through our inability or inaction in trying to help the arts, kill the tradition that belongs to all of us.

PREPARED STATEMENT

I thank you, Mr. Chairman. I might also recommend to anybody who would like to look into some of those very, very fine baskets that I mentioned that are done on pinheads and with very fine materials, this wonderful book on California Indian basketmaking that I am sure Senator Boxer already has.

Thank you for your time, Mr. Chairman. Please include my prepared statement in the record.

Senator GORTON. Thank you, Senator Campbell.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BEN NIGHTHORSE CAMPBELL

Mr. Chairman, members of the committee, I would like to take this opportunity to offer a few brief comments on the National Endowment for the Arts and the National Endowment for the Humanities.

Let me begin by saying that I'm glad the anti-arts folks haven't dampened the committee's spirit regarding the arts.

Among the many important functions of both Endowments, I want to highlight the critical role they play in sustaining our national treasures. The argument that the arts should be privately funded, not federally funded, essentially translates into the argument that the Federal Government has no business in sustaining our national treasures. I wholeheartedly disagree.

As we do with everything in Congress, I feel obliged to define "national treasure." Quite simply, a national treasure is something that, if allowed to die out, be forgotten, or even ignored, will make us guilty of robbing our children of a piece of their heritage. National treasures include languages and paintings, sun dances and sculpture, cultural gatherings and functional art.

As you may know, I lived for several years in Japan and was able to experience their high regard for the arts. The Japanese government actually has a national living treasure designation for masters of various cultural arts. They have seen fit to maintain, as an honor, artistic traditions and treasures dating back to the 15th Century.

It is true that there is not widespread agreement on the definition of "national treasure," or art or the humanities. It is also true that there may have been projects funded with federal dollars which, in retrospect, may not have been appropriate to fund.

During a recent town meeting I posed this question to a Coloradan who shouted that I should disband the NEA and NEH, "Are you suggesting, then, that we eliminate the Department of Defense because they spent \$800 on a hammer and \$1,000 on a coffee pot?"

Although federal funding of the arts comprises only a small fraction of its overall funding, many states, including my own, would suffer a serious blow from the elimination of federal funding. It is a little publicized fact that four states and the District of Columbia receive over half of the privately funded foundation grants for the arts. That doesn't leave much for the other forty-six states.

In closing, I would like to call the Subcommittee's attention to a Dear Colleague letter that was recently circulated on the House side by Congressman Wally Herger. I have known and respected Wally Herger for many years, so I am not singling him out with any malice. Rather, I would like to use his letter as an example of the misinformation and misunderstanding surrounding the arts.

The Dear Colleague is titled, "NEA Funds Basketweavers," lists the amount and recipient of the grant, and closes with, "It's Time to Eliminate the NEA." The Cali-

ifornia Indian Basketweavers Association's receipt of a \$60,000 grant to support the seventh and eighth statewide gathering of Indian Basketweavers, and the first Western Regional Basketweavers Gathering, is presented in the letter as an obvious reason for the elimination of the NEA.

Indian Basketweavers in California, as well as all other basketweavers across the country, are artists in the purest sense of the word. The value of the intricately woven, detailed, and often functional baskets Indians weave is tremendous, in both the cultural and monetary sense. Indian basketweaving is not a hobby or frivolity to be demeaned or insulted. It is an important part of Indian history and culture, and as such should be treated with the respect it deserves. Without the grants provided by the NEA, the protection and promotion of an art form such as this is at risk. As a country, we run the risk of losing a national treasure if we target these programs as frivolous.

I recommend that my Senate colleagues visit the California State Indian Museum in Sacramento. They have baskets there that fit on the head of a pin, woven with feathers from the chests of hummingbirds.

On a personal note, I should tell you that my Staff Director of the Indian Affairs Committee has a Pima basket hanging on an eighth floor wall of the Hart Senate Office Building. It was woven by his grandmother with willow reeds and devil's claw, and won a First Premium Prize at the Arizona State Fair in 1968. In her eyes and in mine, it is the embodiment of heritage, family and artistic achievement, and a tangible treasure to be handed down from mother to daughter.

In the way of proof, I have several baskets here for you to view. I thank Sally McClendon for bringing them in.

Thank you, Mr. Chairman.

OPENING REMARKS OF SENATOR DALE BUMPERS

Senator BUMPERS. Mr. Chairman, unlike you I intend—and you are chairman, so you will probably have your way, but I certainly intend to do everything—I would like to double or triple what the President asked for for NEA and NEH both.

I have done a lot of work on the F-22 fighter—that is, trying to kill it—over the last 4 months, and I just made a quick calculation. If we gave NEA the entire \$136 million the President requested, that would be roughly two-thirds of the cost of one F-22 fighter, and I invite everybody to use your imaginations as to where I would go if I had the time on that one.

I can tell you that this society of ours—Justice Holmes said it one time. You pay taxes. Taxes are what you pay in order to live in a civilized society. That is a very profound statement, and the other day on tax day when everybody was saying we ought to abolish the IRS and all taxes, I pointed out that I do not enjoy paying taxes. I coughed up a big chunk last week, for me—not for some people, but it was a lot for me, and I did not enjoy it, but I do not begrudge it.

SOCIETY'S NEED FOR THE ARTS

While I do not enjoy paying taxes I do enjoy living in a reasonably civilized society, in what we all profess to believe is the greatest Nation on Earth, but I can tell you, one of the things that will cause this Nation to deteriorate and degenerate faster than anything I can think of is to literally turn your back on the arts and the humanities. They go right to the heart of the kind of country we are.

You can tie the crime rate to this. The U.S. Government pays approximately \$24,000 per inmate a year to house 106,000 people in Federal prisons, and many times that amount in State prisons.

Now, Jane, you have heard me make this speech before, but when I was Governor and would go to the penitentiary and have lunch with the inmates—it took me a long time just to get up my nerve to even go down there, because killings were fairly prevalent, and I thought I might be the next one.

But I visited with the inmates in the dining room, had lunch with them, and in all the 4 years I was Governor and all the inmates I interviewed, I never ran across one that played in the high school band. I never ran across one that had a role in the senior class play. I never ran across one that had a college degree, though there were a few of them—not many—and so I could go on and on with those kinds of illustrations.

What does that tell you? That is as graphic and as compelling an argument as I can think of for this program. It is about one-half what it was 4 or 5 years ago.

We do not benefit greatly. I have some trouble with the funding formula, because a poor State like Arkansas—but we have a great repertory theater. We have got an amazing orchestra for a city the size of Little Rock, the concerts are all full. People enjoy it immensely. So you know, it is not all lost.

My administrative assistant and I were driving to work this morning and she had been intending to go to New York last week to the opera. The only ticket left was \$200, and that cooled her zeal for going to the opera, but she said that her brother had tried to get tickets and the entire Metropolitan season is sold out. There is not a seat left.

Now, that speaks well for New York, and it speaks well for the country in a way, but I firmly believe that the National Endowment for the Arts is as essential to this Nation almost as our defense system, and I can tell you, if we were spending 10 times more than we are spending you would see a much more civilized society.

Those are my sentiments, Mr. Chairman.

Senator GORTON. Thank you, Senator Bumpers.

Senator Cochran.

OPENING REMARKS OF SENATOR COCHRAN

Senator COCHRAN. Mr. Chairman, let me join you in welcoming Ms. Alexander to our hearing and to thank her for her continued cooperation and good efforts in the job she has, which is one of the most difficult, I think, given the high visibility and a lot of the controversies that have swirled around the decisions made by the Endowment in the past.

I think she has brought a keen understanding and a dedication to this job and its importance in our society; she has instituted a lot of changes, some welcome, some criticized. But the fact is there are new policies in place that have helped avoid some of the embarrassments of past grantmaking by the agency, but at the same time nurtured and encouraged creative talents throughout our country, particularly in small towns and rural areas of my State and others, which I think is something that is often overlooked by those who want to criticize or actually destroy the Endowment.

I suppose I have been on this subcommittee longer than anybody has been on this subcommittee now, except maybe Senator Stevens or somebody on the other side of the aisle. One of the controversies

I recall in my first Congress serving on this subcommittee is whether we would continue to make grants to individual artists, and we had a rollcall vote in this committee to overturn a recommendation by the new chairman of the subcommittee on that subject.

So controversy is not new to this subcommittee. We have made a lot of decisions and tried to improve the operation of the Endowment and make it sensitive to the values that many people have about the appropriateness of certain kinds of projects that are federally funded or federally supported. But my conclusion is that Ms. Alexander has done a tremendous job, and we ought to commend her and thank her for her perseverance and her continued grace and dedication to doing the great job that is required of the chairman of the National Endowment for the Arts.

Thank you.

Senator GORTON. Ms. Alexander, perhaps the best compliment you have been given here is that there has already been a quorum of this subcommittee present. None of my previous hearings of this subcommittee have had more than three members, and in most of those cases, except for perhaps 5 minutes, I was there alone.

I should also tell you there is another subcommittee of the Appropriations Committee meeting now. I know that both Senator Stevens and Senator Burns have felt that they have to be there, and each of the two of us also is missing a hearing of the Commerce Committee. So we are happy to have you here, and this attendance is an indication of the interest in your subject.

At this point we have talked a lot. We will be happy to listen to your opening statement.

SUMMARY STATEMENT OF JANE ALEXANDER

Ms. ALEXANDER. Thank you, Mr. Chairman and members of the subcommittee. I am pleased to come before you today to speak in behalf of an agency that I think has had a remarkably successful 32-year history, and an agency to which I owe my own career as an actress, and to which I am eternally grateful for its existence.

I would like to respond if I may to some of the Senators' fine remarks with regard to the agency and submit my testimony for the record.

Senator GORTON. It will be included in the record.

Ms. ALEXANDER. Thank you.

FEDERAL ROLE IN THE ARTS

The investment that the Endowment has made over 32 years in the creative and imaginative life of our communities and our citizens everywhere and the quality of life in the communities and the economic development and vitality of some of those communities has been significant, specifically in its ability to leverage other public and private moneys and to provide opportunity and access for all. That has been the agenda for the Endowment for the Arts for all of its citizens.

That commitment, that investment, is in jeopardy right now. We have had, as you know, almost a 40-percent budget cut in the past 2 years, and this has resulted in fully 1,000 organizations nation-

wide that in the past received NEA grants not being given one this year.

The fallout from that is significant. They are not able to leverage the money in the private sector. The States are not able to make up the difference, nor are the local arts organizations, and on and on. There is a real domino effect that happens here.

A lot of people say, well, the Endowment's investment monetarily is a very small portion of what happens with regard to the non-profit arts and how they are funded in the United States. That is true. Most of the nonprofit arts in the United States are funded by individual citizens, but there comes a point when we must say, how much more can we ask of these citizens?

NEA MAKES THE ARTS ACCESSIBLE

You brought up the Metropolitan Opera and the ticket prices of the opera are indeed very high. What the Endowment helps do is make that Metropolitan Opera accessible through broadcast—and some of you may have seen on public television last night Andre Chénier was broadcast. The Endowment helped make that program possible so that people all across America could see that opera.

Indeed, we continue to help support NPR in its broadcast of the Met on Saturday afternoons, which has been going on for ever and ever, and my own immigrant mother-in-law from Russia would never miss a Saturday broadcast of the opera, and there are many people who are unable to afford that \$200 ticket who are able to have access to the Metropolitan Opera through the National Endowment for the Arts and other funders. The Endowment, again, plays that critical role of leveraging private funds.

PRIVATE SECTOR FUNDING OF THE ARTS

Let me talk for a minute about other than individual giving, which as I say makes up the bulk of giving to the nonprofit arts in the United States. Corporations have actually been declining in their giving to the arts. We think that we can encourage them to give more to the arts. Although they have increased nonprofit giving in general to the arts, it has remained fairly static. The same is true of the foundations, which say they cannot make up the difference.

NEA continues to be the single largest donor to the nonprofit arts in the United States. We have been concerned with the fallout in funding from the Federal Government, so we began an initiative last year called American Canvas, which seeks to encourage communities to build an arts infrastructure. We will feed them information with regard to models elsewhere that may be replicated in their community, and try to identify dedicated sources of revenue for the arts that may not have been tapped to date.

Some people have said: "Why doesn't the commercial entertainment industry come in and pay the cost of the nonprofit arts in America?" First of all, I feel that that is a particular elitist view in that this is really an agency that belongs to all the people in America, and if you ask only the few very wealthy individuals some of our critics have been saying should fund it, you are actually becoming more elitist, I feel.

Perhaps the corporate commercial popular entertainment sector could chip in more on that. We are working on that. It has not happened today, but I would like to point out that many individual celebrities do already give a great deal of money to the Federal Government in taxes. They also are supporting independently, through volunteering and philanthropy, arts organizations.

VALUE OF THE ARTS TO SOCIETY

But the NEA remains the agency that works well for all citizens. It is very difficult to quantify the value of arts to our society, but some of you may know, and have been hearing about, what the arts mean to early childhood development.

There are evaluative studies that are going on now, and we will be seeing that the arts play more and more of a role in increasing brain power for not only our earliest, youngest citizens in society, but also for those who are elderly.

New studies on Alzheimer's show we need to keep them thinking, keep them creative. The arts play a role there, and the NEA plays a role as well.

Business knows the value of the arts. Business knows that they want the most creative thinkers right now going into business because things are changing so fast in the new technologies and in the world of communications in particular.

As the wealthiest Nation on Earth, I have to say I continue to be mystified that the Federal Government of the United States does not invest more in the arts, in the future of its citizens. It is to my mind a win-win situation for everybody for the quality of life, for education of our young people and continuing education for our elderly, for economic development of communities, for creative thinking, for creative and critical thinking for all of our citizens, and for that amorphous thing we call the soul, which really cannot be quantified—inspiration.

NEED FOR GOVERNMENT INVESTMENT IN THE ARTS

The United States is wealthy in many, many ways, and certainly financially. It is wealthy in the variety and the beauty of its land. It is probably most wealthy in its human resources, in the variety and diverse peoples that make up the United States of America.

Although we are very proud to be Americans, it is the mix of our backgrounds, our coming together, our very differences that keep us vital, that keep us alive, that make America great. It is the celebration of the different heritages of our cultural identities that keeps us thinking, that keeps life interesting and meaningful, and it is the arts that celebrate that part of ourselves.

It is in fact embarrassing to me that our Government does not invest more in the arts, that it in fact seems to be retreating from the recognition of the value of the arts to our Nation and the enhancement of the arts which so define and express who we are.

At this time in particular, which is the close of one century, the beginning of another—in fact, the beginning of a millennium, certainly a marker for us in the Western World—I feel we should be expanding our commitment to the arts and humanities as our fellow nations worldwide, the major nations, are.

PREPARED STATEMENT

Not long ago one of your colleagues was visited by two pig farmers who were sitting in the reception area waiting to see the Senator and picked up some information about the National Endowment for the Arts, and when they went to see the Senator, the first thing they said was, "We only give 38 cents per person to the arts in America at the Federal level?" The Senator said: "Yes, we do," and the pig farmers said: "When we invest so little, how can we be the best?"

Now, I think it takes a farmer to understand what an investment means, but if we do not invest today in this Federal commitment to the arts we are really robbing our children's future.

Thank you very much. I will entertain any questions.

[The statement follows:]

PREPARED STATEMENT OF JANE ALEXANDER

Thank you Mr. Chairman and Members of the Interior Subcommittee. I appreciate the opportunity to testify today about the importance of the National Endowment for the Arts.

Today, Mr. Chairman, our longstanding Federal commitment to supporting arts and culture for the American people stands at a crossroads. For thirty-two years, the National Endowment for the Arts has led the way in making art accessible to average Americans in every city, small town and rural area of the United States. Now the issue before you is clear—will the Federal government continue to be a partner in preserving the cultural heritage of this nation—will it continue to invest in the creative potential of its citizens, and future generations?

Or will we be the only major nation on earth to deny a Federal role in our country's artistic endeavors?

The \$99.5 million contributed to the arts and culture each year by the Federal government through the National Endowment for the Arts is a relative pittance—less than one-one hundredth of one percent of the Federal budget—less than 38 cents from each American. Yet its impact is felt throughout the land, and an overwhelming majority of Americans have repeatedly said they want it continued.

Mr. Chairman, I understand that this committee and a healthy majority of the United States Senate supports Federal funding for the arts. As you know, however, there are a few who are extraordinarily adamant in their desire to eliminate the National Endowment. They have undertaken a relentless campaign against the agency. They are rehashing old arguments and they are dredging up even older controversies. Two weeks ago they used a \$750 grant that had been awarded in 1968, almost thirty years ago, as the centerpiece of their attack on the NEA.

They criticized us for a grant the agency awarded a few months ago to the California Indian Basket Weavers Association, as if this world-renowned form of traditional art mastered by Native Americans was somehow not worthy of support.

You will hear many arguments in the coming months about whether funding for the arts should continue. As Chairman, I have made the agency more accountable in accomplishing its fundamental mission of connecting Americans everywhere to the best art. Last year, in response to a 39 percent cut in our budget, I reorganized the agency in order to operate more efficiently with a drastically reduced staff. I restructured the entire grant review process from top to bottom, limiting most organizations to only one grant and consolidating our support for state arts agencies and regional organizations into streamlined Partnership grants.

Despite this hardship, we have awarded 1,029 grants in 1997. Two weeks ago, we announced new grants totaling almost \$67 million, drawing to a completion the agency's first funding cycle under the new structure. We made 494 grants to organizations totaling almost \$23.5 million in the area of Creation & Presentation for a wide range of projects that include music and theater festivals, design workshops, composition and choreography commissions, nationwide dance tours, major museum exhibitions, and hundreds of other projects. They ranged from a \$50,000 grant for the Anchorage Concert Association to support a series of dance residencies with the world-famous Paul Taylor Dance Company in Alaska to a grant for Monadnock Music in Peterborough, New Hampshire, to support eighteen free concerts in New Hampshire's rural towns and villages.

In the area of Planning & Stabilization, 125 grants totaling almost \$10.5 million will help many of America's arts organizations achieve greater financial stability. These projects address many needs, from raising earned income and endowments to conducting feasibility studies, or adapting technology to develop new audiences. For example, the Cumberland County Playhouse in Crossville, Tennessee, which already serves more than 100,000 rural citizens and visitors, will reach out even further with a new cultural tourism campaign. The Artist Trust of Seattle will receive \$100,000 to support the establishment of a self-sustaining endowment. Thirty thousand dollars awarded to the Balboa Art Conservation Center in San Diego will go to improving the collections storage needs of small to mid-sized museums throughout California, Arizona, Washington and Oregon. Seventy-five thousand dollars will help the Santa Fe Chamber Music Festival establish a cash reserve.

By statute, 35 percent of the Endowment's program dollars are awarded each year through Partnership grants to the state and regional arts organizations creating a strong interrelated Federal, state and local system of support for the arts in communities throughout the United States. Sixty-two Partnership grants totaling \$30 million were awarded two weeks ago, as were forty Creative Writing Fellowships, one of the few types of support to individuals still offered by the Endowment.

We supported fifteen Leadership collaborations with other public and private organizations. These are projects of national importance that would not happen without the Federal government's commitment of resources and leadership, and they include such initiatives as Creative Partnerships for Prevention, a youth program run with the Department of Education offering the arts and humanities as an alternative to drugs and violence. Another award will support the Fund for U.S. Artists at International Festivals and Exhibitions.

One of our most successful Leadership Initiatives is the ongoing Mayors' Institute on City Design which is dedicated to improving the design and livability of America's cities. Each year, the Institute holds a series of two-and-one-half day symposiums organized around presentations and round-table discussions. At each meeting, mayors and designers discuss specific problems facing cities and examine a broad range of ideas, precedents, and improvement strategies. Each mayor presents a case study of a critical issue from his or her city, and members of the resource team—nationally known architects, planners, and urban development experts—identify issues, offer suggestions, and discuss solutions. The interchange between mayors and designers sparks lively debate, opens new perspectives, and generates creative ideas. Since its inception in 1986, more than 300 mayors have participated in the meetings.

A few months ago, in December, we announced the first grants made under our other two funding categories, Heritage & Preservation and Education & Access. In the area of Heritage & Preservation we approved 121 grants totalling \$6.1 million for projects to preserve America's significant and unique artistic accomplishments for the benefit of our future generations—projects like the one sponsored by Cornerstones Community Foundation in Santa Fe, New Mexico, to help preserve the historic buildings native to the area, particularly the region's historic adobe churches.

We supported important folk arts projects like the one sponsored by the Alabama Folklife Association to publish and document primitive Baptist hymns, and the one by the Cedarburg Corporation to help celebrate Wisconsin's sesquicentennial through a traveling exhibition of Wisconsin folk art. We supported statewide apprenticeship and support programs in West Virginia, Alaska, North Dakota, Hawaii and other states. We gave a grant to an organization in Falls Church, Virginia, that is using innovative technologies to safeguard and preserve our dance heritage. Finally, Mr. Chairman, we will continue to sponsor, as we have for many years, the annual Fourth of July concert and radio broadcast held on the grounds of the Washington Monument.

Indeed, in December, we also awarded our first grants in the area of Education & Access, where priority is assigned specifically to arts education, and other projects that broaden the arts experience of millions of Americans. Many of the people who benefit from these grants have not always had the opportunity to participate in the enterprise of creating art or simply experiencing art as it is created by others, be it a night at the symphony, a children's festival, a concert in the park or a creative writing program.

We awarded almost half of our Education & Access grants to performing arts organizations that are reaching out into their communities. The Chicago Theatre Group received \$125,000 to support the Goodman Theater's student subscription series, giving many thousands of high school students the opportunity to attend free matinee performances. Similarly, the Houston Grand Opera will undertake a major audience development project with the help of a \$200,000 NEA Education & Access grant, which they will match with one million additional dollars of their own. They

are planning free performances of *Carmen* and *Madame Butterfly*, and will place young opera singers in the public school classrooms as artists-in-residence. They will reduce ticket prices and perform in over one hundred public schools in the region. Mr. Chairman and members of the Subcommittee, young Texans will have the opportunity to appreciate opera as they never have before.

Through our Education & Access grants we are also continuing to support projects in many small towns like the Bloomsburg Theatre Ensemble's traveling educational project in Pennsylvania's elementary and middle schools, and West Liberty, Ohio's, Mad River Theater Works' development of a new play based on the local history of Champaign County. We are continuing to support Pittsburgh's Manchester Craftsmen's Guild, an exemplary inner-city community development center that uses the arts to provide young people with a safe haven and important job training skills. The corporate offices and laboratories of western Pennsylvania are filled with young, productive Americans who found their way in life with the help of strong mentors at the Manchester Craftsmen's Guild. If you are ever in Pittsburgh, you must visit the Guild. As a matter of fact, they are now the proud recipient of a Grammy Award for their first CD for Jazz at the Manchester Craftsmen's Guild.

While I am confident that the Endowment has funded the best projects, I am disappointed that many excellent and extremely worthy projects were necessarily rejected due to the lack of adequate funding. Many applications submitted by some of America's finest arts institutions—large and small, in little towns and big cities—were necessarily rejected. That is the sad situation we face in our reduced funding state.

And so, I am deeply concerned, Mr. Chairman, about the financial state of the nonprofit arts industry in the United States today. Grants from the Federal government are only part of a complex system of funding that includes ticket sales, program advertisements, corporate and foundation giving, gift shops, membership fees and other creative fundraising techniques. While earned income is a substantial part of any organization's budget, the cost of producing art for public consumption exceeds income for all but the most popular ventures. According to a study published last year by the President's Committee on the Arts and Humanities in conjunction with the Rockefeller Foundation, private and corporate foundations already give over \$1 billion to the arts each year. They say they will not and they can not give more. In any case, corporate and foundation dollars are given locally, concentrating on the largest, most prestigious institutions, often in response to capital campaigns that include government support. Those dollars most often do not reach into small cities and rural areas. It is the Federal dollars that reach into those areas, and the Federal imprimatur which the NEA represents in the arts which attracts other monies.

By government standards, the National Endowment for the Arts is a tiny agency. But it is also the largest single source of funding for the non-commercial arts in the country. It is the engine that drives other public and private investment in the arts, and it is not a drain on the economy by any standard of measurement.

I agree with many Members of Congress and others who say that the commercial entertainment industry could do more to support the nonprofit arts. We are, after all, the incubator of artistic skills. Each year hundreds of directors, actors, set and costume designers, writers, producers, musicians and others who get their training and experience in the nonprofit sector make the jump to the big commercial entertainment companies. I have had some conversations with entertainment executives on this subject, but have not been particularly successful in persuading them to support the arts on a corporate level.

In this respect, it is important to make a distinction between what the large entertainment companies do, and what individuals like Robert Redford, Steven Spielberg, and many, many others have contributed over the years. These individuals certainly have done their part in terms of contributing time and resources toward the furtherance of young artists and important art forms. And in this respect, I do not believe it is fair to criticize them or other influential individuals who come to Washington to advocate in behalf of Federal funding for the arts. They pay a considerable share of taxes like other citizens, and surely they have the right to advocate for the programs they care about.

Mr. Chairman, as part of my effort to create a more holistic synergy between the arts and the communities in which they flourish, the Endowment in 1996 launched American Canvas, a year-long effort to bring together people from all walks of society to gain a better understanding of how the arts transform communities, and how they may be supported better. Funded almost entirely from private contributions, the Endowment convened forums in seven cities across the United States. Through these meetings, artists together with educators, businesspeople, clergy, elected offi-

cials, and many others worked together to develop new strategies for supporting the cultural infrastructure that every healthy community needs to have.

The major objective of American Canvas, and the report we are working on now, is to give communities tools for understanding the value of their cultural attractions, and tools for preserving and enhancing those attractions. Mayors and other local leaders know culture has more to it than aesthetics. Culture makes cities livable and attractive. Cultural institutions can be the difference between winning or losing the competition for economic development.

Mr. Chairman, I could go on about the many things we are working to accomplish, but I want to take a moment to consider some of the things that we are not able to do. Prior to 1996, the National Endowment for the Arts was averaging approximately 4,000 grants each year. In fiscal 1996, a transition year in which we were cut by 39 percent, we made approximately 2,000 grants under both the old and the new systems. In 1997, the first year in which new system was in place for the entire grant-making cycle, we expect to make about 1,100 grants. Many arts institutions that received grants in the past no longer do. And as you know, we are not permitted to make grants to individual artists at all, except in a few limited circumstances.

Prior to 1996, the application-to-grant success ratio for organizations averaged about 60 percent. Today that ratio stands at about 35 percent, and there are many disappointed people as a result of it. In fact, they are quite skilled in making their displeasure known. They write to their elected representatives who write to me wanting to know why their constituents were rejected for funding. In many cases, I can only respond that we lack sufficient funds, and it is difficult to draw the line between projects that are all exemplary. We try to be as fair as we can.

Finally, Mr. Chairman, I wish to assure you that President Clinton strongly supports the National Endowment for the Arts. The President's powerful and eloquent remarks about the arts and culture were unmistakable when he appeared before Congress in his State of the Union Address a few months ago. I would like to repeat his words today:

The enduring worth of our nation lies in our shared values and our soaring spirit. So instead of cutting back on our modest efforts to support the arts and humanities, I believe we should stand by them and challenge our artists, musicians and writers—challenge our museums, libraries and theaters. We should challenge all Americans in the arts and humanities to join with their fellow citizens to make the year 2000 a national celebration of the American spirit in every community, a celebration of our common culture in the century that is past and in the new one to come in a new millennium so that we can remain the world's beacon not only of liberty but of creativity long after the fireworks have faded.

Today, I am here to support the President's request of \$136 million for the programs of the National Endowment for the Arts in fiscal year 1998. We believe the increase in funding will permit us a modest increase in the work we are doing to support arts education projects, access and outreach to underserved communities, new technologies, the coming millennium celebration, and finally, the help we give to arts organizations in every part of the United States to preserve our heritage and invest in our future. The National Endowment for the Arts remains committed to bringing the most excellent art to the most Americans. Mr. Chairman and members of the subcommittee, I hope I can count on your support.

Again, I am pleased to have this opportunity to speak with you.

BIOGRAPHICAL SKETCH OF JANE ALEXANDER

Jane Alexander was nominated by President Clinton to become the sixth Chairman of the National Endowment for the Arts in the summer of 1993. After unanimous confirmation by the U.S. Senate, she was sworn into office by Supreme Court Justice Sandra Day O'Connor on October 8, 1993.

Since becoming Chairman, Ms. Alexander has visited more than 200 communities in all 50 states and Puerto Rico. In over 300 public speeches, she has outlined her vision for the agency with thousands of people. She has met personally with Members of Congress, governors, mayors, state legislators, artists, administrators, and corporate, education and community leaders throughout the nation. Taking up the challenge of President Clinton to "renew America," Chairman Alexander has spoken out about how the arts can contribute to better schools, more vibrant local economy, and stronger communities.

As part of the Clinton Administration's efforts, she has strengthened some 30 partnerships with other Federal agencies. Under Chairman Alexander's leadership, the Arts Endowment began a partnership with the Department of Justice serving

at-risk youth through the arts. The Endowment has also formed partnerships with the Department of Education for improved arts education research and development.

Six months after taking office, Chairman Alexander convened the first national arts conference organized by the Federal government, "Art 21: Art Reaches into the 21st Century." From this foundation, she has developed her priorities for investing in communities, education, new technology, preservation of our heritage, and partnerships for the arts. In 1996, the Endowment launched "The American Canvas," a series of community forums to find systemic ways of supporting the arts. As part of the agency's efforts, Chairman Alexander established the Office of Enterprise Development to seek new ways to support the arts.

In the face of Congressional budget cutbacks, she has successfully completed a total reorganization of the Arts Endowment, emphasizing partnerships and cross-disciplinary initiatives, including a category for Millennium Projects to celebrate American art at the turn of the century. Chairman Alexander has created new tools for public access to the agency, including the Arts Endowment's World Wide Web site, and she has initiated a \$1 million leadership initiative with the Benton Foundation to increase opportunities for artists and small arts organizations to improve communications through the Internet.

For her leadership, Ms. Alexander has received a number of honors, including the 1995 Montblanc de Culture North American Award, the Common Wealth Award, the Crystal Award and the Sara Lee Frontrunner Award for her bringing the arts to the American people. She is a much sought-after public speaker and has given commencement addresses at The Juilliard School, the UCLA School of the Arts, North Carolina School for the Arts, the University of Pennsylvania, Princeton University, Washington University of St. Louis, the New York High School for the Performing Arts, the College of Santa Fe, and Duke University.

Ms. Alexander, a native of Brookline, Massachusetts, has been active in the arts for all of her adult life as an award-winning actress, producer, and author. In addition to appearances in 40 films and television programs, she has performed in over 100 plays on stages across the country. Ms. Alexander received six Tony Award nominations, four Academy Award nominations, and five Emmy Award nominations, and she received a Tony Award for *The Great White Hope* and an Emmy Award for *Playing for Time*. She also received the Television Critics' Circle Award for her portrayal of Eleanor Roosevelt in *Eleanor and Franklin: The White House Years*.

Ms. Alexander has produced three films, including the acclaimed *A Marriage: Georgia O'Keeffe and Alfred Stieglitz* for PBS's "American Playhouse." She has narrated documentaries, short stories and books, and is co-author of an adaptation of Henrik Ibsen's *The Master Builder* and co-author of *The Bluefish Cookbook*.

Prior to becoming Chairman, Ms. Alexander served as an effective and articulate advocate for a number of worthwhile causes, including Women's Action for New Directions, the Wildlife Conservation Society, and the National Stroke Association. In recognition of her leadership, she received the Living Legacy: Jehan Sadat Peace Award in 1988.

Ms. Alexander attended Sarah Lawrence College and the University of Edinburgh. She was born on October 28, 1939 in Boston, the daughter of surgeon Thomas B. Quigley, one of the pioneers in the field of sports medicine and Ruth Pearson, a nurse in neurosurgery. Her grandfather Daniel Quigley was Buffalo Bill's personal physician in North Platte, Nebraska. Ms. Alexander is married to director Ed Sherin. Her son, Jace Alexander, is a stage and film director.

ROMANOV EXHIBIT

Senator GORTON. Ms. Alexander, I would like to ask you a question about an incident related to the arts and/or the humanities that has been on the front pages of our newspapers here for the last 2 or 3 days. Through the Arts and Artifacts Indemnity Act, do you have anything to do with the large van that has been sitting out on the street here and is now at the Russian Embassy?

Ms. ALEXANDER. No; that is one controversy we will not take credit for. [Laughter.]

We did not indemnify the Romanov exhibit.

Senator GORTON. Well, I am sorry to hear that. I was looking forward to your comments on that one. [Laughter.]

In spite of my opening remarks, there still is a debate continuing on the existence of the National Endowment for the Arts itself, as I said, primarily in the House of Representatives. Could you, for our information, and in reaching our decisions here in this Appropriations Committee, give us a status report on your discussions with Members of the House on this subject? Do you have any reason to believe that our counterpart in the House will include an appropriation for the National Endowment?

STATUS OF NEA APPROPRIATION IN THE HOUSE

Ms. ALEXANDER. We do not know the answer to that, although we are speaking with Chairman Regula fairly often. We do not know what he intends to do, or what the subcommittee intends to do with regard to appropriations. What we fear is a zero appropriation, and then that does not leave a lot of negotiating room for the Senate and for the administration.

At \$99.5 million, Mr. Chairman, we really cannot go lower, and in fact we are losing ground even if we were level-funded, because of cost-of-living increases and administrative costs. We have to make up the difference.

Senator GORTON. When you are faced with arguments about elimination, do they stem in your view primarily because of criticism of particular grants, or primarily from the argument that this is not an appropriate role for the Federal Government whatever the grants are?

Ms. ALEXANDER. A little of both. I think that there are some of our critics who just feel that we have been funding a lot of controversial works, which, by the way, is not true, and others who simply do not think that it is an appropriate Federal role. I disagree with that, of course. I think it is the most appropriate Federal role.

Senator GORTON. So you have to deal constantly with both of those arguments?

Ms. ALEXANDER. Yes, indeed.

Senator GORTON. Now, it looks as though the sympathy you have in the Senate may very well result in at least the report of a reauthorization bill from the Senate Labor and Human Resources Committee. Can you comment on that? Are you looking for any significant changes in your authorization here?

STATUS OF NEA REAUTHORIZATION

Ms. ALEXANDER. I do have a hearing before the Senate Labor and Human Resources Committee next week with regard to reauthorization. We do not know exactly what that means yet. We will be looking for a 5-year reauthorization of the agency, which has not been reauthorized since 1993.

Senator GORTON. Would you be relatively content just to have a 5-year reauthorization based on the present statute?

Ms. ALEXANDER. That is correct.

POSSIBLE CONSOLIDATION OF ENDOWMENTS

Senator GORTON. On another subject that you have discussed before, I would like your current remarks. It is the proposal to con-

solidate the two Endowments. Would you share with us your views on it? Are there any pluses that it might have from an administrative standpoint, or obstacles that might be encountered due to inconsistency with different goals?

Ms. ALEXANDER. Yes; I would be glad to. We did explore a merging of the two agencies at Congress' request 2 years ago, and we continue to look at how we might merge the administrative functions, but right now we are pretty bottom line, both of us, and there would be no cost savings in merging the two agencies.

We share as much as we can already, and we share library space and some of the staff and so on, but we do not see any savings to the Federal Government emerging at this time.

REORGANIZATION OF NEA

Senator GORTON. One more subject and then I am going to defer to my colleagues. During last year's hearing you had just reorganized the agency from 17 different disciplines into four broad categories. Can you tell us now how this is working, and whether or not you are satisfied with the change?

Ms. ALEXANDER. Yes; our four categories seem to be working very well. It was a hard learning curve for our arts organizations this year because they were restricted legislatively from applying for seasonal support and had to apply for project support only, and they had a very short time line in which to accomplish this.

We feel that this coming year will be easier for everybody, that they know the process somewhat. Our staff, which as you know I had to reduce by about 45 percent, is now understanding the process better as well, and they are spending more time than ever on the phone with the constituents across the country.

APPLICATION AND GRANT STATISTICS

Senator GORTON. Is it going to mean, or has it meant an increase or a decrease in the number of applications and the number of applicants?

Ms. ALEXANDER. Yes; we sought a decrease in the number of applications, asking organizations only to apply for one category, one grant.

Senator GORTON. Decrease in the number of applications? Is there a decrease in the number of applicants?

Ms. ALEXANDER. Applicants? Yes, indeed. Well, the bulk of them came when there was a prohibition against funding individual artists, with the exception of literature. We reduced our applicants by about 9,000 right there, and we now have applications from about 3,000, and we funded 1,000.

NEA PARTNERSHIPS WITH STATES

Senator GORTON. As part of that new program structure State grants were consolidated into State partnerships. Has that created a favorable response from State arts agencies?

Ms. ALEXANDER. Yes; I think so. We are very pleased with our partnership meetings with the States. We already had a real partnership with the States, but what we wanted to do was look at the States State-by-State, if you will. So now every 2 years we bring

in a State in a small colloquy of about five to six other States and we discuss our mutual problems with regards to serving the arts constituency in that State. It seems to be working very well.

Senator GORTON. Good. At this point, while I have more questions, I think I will defer to my colleagues, who may or may not have as much time as I have.

Senator BUMPERS, have you any questions?

Senator BUMPERS. Mr. Chairman, I do not have any questions.

Ms. Alexander, I would like to echo Senator Cochran's words. I think you have done an excellent job under very difficult circumstances, Ms. Alexander.

Ms. ALEXANDER. Thank you.

Senator BUMPERS. You have my undying gratitude, and I am sure I do not just speak for myself but many others.

Ms. ALEXANDER. Thank you, Senator.

Senator GORTON. Thank you, Senator.

Senator Campbell.

Senator CAMPBELL. I was just musing about the arts here while listening to Ms. Alexander, Mr. Chairman. I used to teach art. I was involved in it pretty deeply for years and years, as you probably know, and I have a friend in Washington here, a lady, who is awful. She paints, and she showed me a picture the other day, a portrait of the late Rock Hudson that looked suspiciously like Quasimodo. [Laughter.]

But you know, I do not have to like the result to support the effort, and I am convinced that with enough training and effort, that her future portraits of Rock Hudson will look at least like John Wayne. She is getting better. [Laughter.]

I want also to associate myself with the comments of Senator Bumpers when he talked about prisons. I think you mentioned \$26,000 a year.

Senator BUMPERS. No; \$24,000.

IMPORTANCE OF THE ARTS IN PENAL SYSTEMS

Senator CAMPBELL. \$24,000 a year is spent to house convicts in prison. I understand also it is about \$1 million a cell to build them, and they are going up at about twice the rate of our college population. If you were to graph it, not in total numbers, but if you were to graph the last 10 years there are one-half million more new convicts, and I am very well aware of what you are talking about, since I was once a counselor, a volunteer counselor in Folsom Penitentiary in California, Senator Boxer's State.

But I just wanted to mention that prisons have seen a great number of people who have gotten involved in the arts when they were in prison. Almost every Federal penitentiary that I know of now has a prison art show every year. They have a store, a craft store where prisoners can sell their arts and crafts, and it gives them an opportunity to raise a little bit of extra money from doing laundry, making license plates, or whatever else they do in prisons.

When I was at Folsom, a couple of times I judged the Folsom Prison art show. I was amazed at some of the talent that they have, and obviously they have some talents that went the wrong way or I guess obviously they would not be in there, but I was amazed at that.

And when I was a counselor I was also working in a half-way house that helps get convicts back into the mainstream, get them jobs to stay out of trouble, and a number of them that got out of prison those years I was doing that ended up making a living in arts, being painters or jewelers or something, so I know there is a connection there.

Senator BUMPERS. Senator Campbell, would you yield for just a little personal vignette?

Senator CAMPBELL. Yes, sir.

Senator BUMPERS. I was Governor of Arkansas in 1972, and Betty Bumpers, who was an art major, got a \$50,000 grant from Nancy Hanks, who was then head of the National Endowment for the Arts, and the \$50,000 was to do some pilot programs of teaching art in the first grade of the elementary schools. I do not know, it was maybe 20 schools, or 30 or more, and she had a little money left over. She took it down to Cummings Prison and did a little art program down there, and those inmates flocked in to participate in that. Betty said it was absolutely remarkable how talented some of those people were.

The point of the story being, if there had been early intervention in the form of finding that talent among those children, they would have been challenged in the first grade and had a chance to demonstrate their art. They would not have been there.

Senator CAMPBELL. The reason I made that comment is because I know that every questionable grant the NEA gives gets a heated debate started, as you might imagine. I do not know if you are giving any for prisoners or not, but if you give any for prisoners we are going to start getting mail on that.

I think as Senator Bumpers said there is some real value in arts for people who are incarcerated. It has been proven many times. People in hospitals who have psychotic problems, even, the arts help, so it is a much broader issue than we normally view here.

ECONOMIC CONSEQUENCES OF AGENCY ELIMINATION

I just wanted to ask you maybe a couple of questions. You mentioned the economics of the arts, but I was trying to put a dollar figure on that. Do you have any guesstimates about if the funding of the NEA were cut off what would the economic consequences be, because you mentioned corporate money is drying up, State money, they are reluctant to give any money if we do not help out with grants and things of that nature, but do you have a dollar figure?

Ms. ALEXANDER. It is hard to quantify because there are always so many partners that go into funding the nonprofit arts. Some of the studies that have been done independently in places like New York and New Jersey, show that the impact on the metropolitan area from the arts at large, including the commercial sector, is absolutely enormous—billions of dollars.

It is very hard to be able to say what it would mean. All I can tell you is that we reach people through the public sector that are not covered by the private sector, such as your eloquent testimony with regard to the basket-makers. What corporate sponsor is going to pick up the California Indian Basket-Makers Association?

So I think it would amount to billions of dollars, but I have no way of actually knowing.

GEOGRAPHIC DISTRIBUTION OF NEA MONEY

Senator CAMPBELL. Another thing I am interested in is, we hear there is something like 50 percent of all of the grants go to just a couple of States. New York is an example, a lot to the District of Columbia also, and the further away it gets from the east coast, particularly in the rural areas and poorer areas, the less they get. How does the National Endowment for the Arts respond to the needs of those rural, kind of out-of-the-way places? I know that they have in this case, but let us say, Appalachia or somewhere else.

Ms. ALEXANDER. Well, I am very glad that you brought that up, because in fact although we do give a lot of money to New York, of course we get the bulk of our applications from New York and California, the two main talent pools, if you will, for almost all the arts, everything from design to music, and so on.

But as I pointed out with the Metropolitan Opera and the broadcasts, what we try to do is facilitate through our New York grantees national impact, and there are many, from broadcasts on NPR and PBS to the Paul Taylor Dance Co., which tours the country, to Alliance for Young Artists and Writers that tours the country, and so on.

So our New York grantees, we must keep in mind, are not just going to stay in New York for the most part. They are going to tour. Their impact also serves the tourists that come from out of town to New York.

We reach rural areas to the very best of our ability, and we were very pleased in our latest grant round that fully 25 percent of our grants went to organizations with budgets under \$250,000, so that means we are reaching the small arts organizations, the ones that may be in Telluride or small communities everywhere.

NEA PROGRAMS FOR AT-RISK YOUTH

I would like to bring your attention, since you were talking about prevention and what the arts can do for those who are incarcerated or have other problems. This is one of our newest publications, called Art Works—you may have it in front of you—Prevention Programs for Youth and Communities.

One of the most outstanding organizations in New Orleans, called Young Artists, Young Aspirations, began as a visual arts program for kids after school at a visual arts gallery called Ya-Ya in New Orleans.

To make a long story short, last year they received a very fine commission to create the fabric for the United Nations, and this is a copy of some of the slipcover fabric that they created for the chairs in the United Nations. These young people all have careers now in the arts, and they began with after-school programs for kids who were kind of hanging around.

Senator CAMPBELL. And they got part of their initial funding through the National Endowment for the Arts?

Ms. ALEXANDER. Through the National Endowment for the Arts, correct.

Senator CAMPBELL. That is a good graphic illustration.

Thank you, Mr. Chairman.

Senator GORTON. Thank you. Senator Cochran.

Senator COCHRAN. Mr. Chairman, I noticed in Ms. Alexander's statement the reference to the Creative Partnerships for Prevention Program, a youth program run with the Department of Education offering the arts and the humanities as an alternative to drugs and violence.

I wonder, this collaboration with other organizations like this, is this something that you have had an opportunity to judge in terms of whether there are success stories, or has it just been started? Do you know any of the results that you could pass on to the committee?

Ms. ALEXANDER. The evaluative studies about the importance of arts in helping our young people in particular are ongoing currently, and one of the partnerships that we have with the Department of Justice is just that.

It is an evaluative study to understand quantifiably what the arts do for young people, and to follow them after these programs. I think that is very important for us to begin to know whether they are going to sustain the arts in their life, whether it impacts their thinking about how they relate to society, and so on.

So that is one of the partnerships we have going with the Department of Justice in this regard.

AMERICAN CANVAS

Senator COCHRAN. Another new initiative that I noticed in your statement was the American Canvas, where you are working with local communities to identify cultural assets and how they can be used to enrich the lives of the citizens there and be contributors to the economic progress of those communities.

Tell us how that is working. Are there any anecdotal items of evidence that you can pass along for our hearing record?

Ms. ALEXANDER. Senator, we went into six cities. We went into Charlotte, NC, and Rock Hill, SC, which was one visit. Rock Hill, SC, is a very small area that has revitalized itself through the arts, and Charlotte, NC, of course, is a pretty large city now, and it has totally transformed itself with a great deal of money going into the arts in their community.

We visited Salt Lake City, we visited Los Angeles, we visited San Antonio, TX, we visited Columbus, OH, and we visited Miami as well, and we held day-long or 2-day forums about the value of the arts to their communities and how they intended to sustain them for the future. We are concerned that there is not a solid infrastructure for the arts in the United States, as there is, and growing, for our natural resources.

We do fund our parks and almost every city funds parks and recreation, but there is not a dedicated source of revenue in a community—in all communities for our cultural resources—so that is what we were trying to build and to discuss and to explore. We will have a report out, our American Canvas report, and also an action plan for communities everywhere, sometime in June.

Senator COCHRAN. Thank you very much. Thank you, Mr. Chairman.

Senator GORTON. Thank you. Senator Bennett.

Senator BENNETT. Thank you, Mr. Chairman. I recognize the special session or executive session is convening and, therefore, I need to be brief but I did want to welcome Ms. Alexander to the committee and to thank her publicly for coming to Salt Lake City. She made a big hit there, as she always does wherever she goes, and I want to thank her for her general leadership in this area as a whole.

I do also want to wish Sheldon Hackney well in his new activities as he moves on, and have the unfortunate responsibility of commenting that the director of the Humanities Council in the State of Utah, Delmond Oswald, unexpectedly and tragically died recently, which leaves for us in Utah a fairly significant hole in our leadership.

But we are trying to do what we can to see to it that we continue the tradition that goes all the way back to Brigham Young and the founders of the State of appropriate public support for the arts and humanities. I will do what I can at the Federal level to see that the appropriate support is continued.

With that, Mr. Chairman, I suppose we all want to be off to find out more about chemical weapons. Maybe we already know enough, but that is where I am going to have to go.

Senator GORTON. Thank you. Senator Gregg.

Senator GREGG. I will associate myself with the comments of the Senator from Utah, which I think are very appropriate, and allow us to adjourn.

Senator GORTON. Oh, we are not going to adjourn. You can leave if you wish, but we do have quite a bit more to go.

Senator GREGG. Well, in that case I could take the next hour and give you my thoughts on this subject. [Laughter.]

Let me just say that I do believe that Government funding for the arts and humanities makes sense. As Governor, I actually increased funding for those programs during a time of serious recession, because I felt it had a positive effect on the culture of the State, and I believe it has a positive effect on the culture of the country.

We all recognize that the NEA funding has been controversial. Art is by nature controversial. I do think the leadership of the NEA has tried to be sensitive to the fact that these are tax dollars and should be managed effectively, and should be managed with some sensitivity to the fact that you are dealing with tax dollars and not with private money. Thus, aggressiveness which can be used in funding has to be muted to some degree, but I think on balance these organizations have done a good job, and I believe they deserve our support.

I will pass on questions.

Senator GORTON. One more comment, Ms. Alexander. I commented on the attendance here today. It has now increased. My roster indicates that 10 of the 17 members of the subcommittee have attended.

I have a note here from Senator Domenici asking me to apologize for his absence. He is chairing the other subcommittee on appropriations that is meeting right now that so many of us, myself included, are members of, and of course I cannot avoid that. Many

of the Democrats, as Senator Boxer said, are at the White House to discuss the budget.

STATES SUPPORT OF THE ARTS

But you have had a very impressive turnout here, and I have quite a number more questions, but most of them will be submitted to you in writing. I would like you for the record to indicate the overall level of public support for the arts in the United States. Do you know approximately how much State appropriations are for the purpose, and how much local government contributes to the arts, so that we have an overall long-term picture?

Ms. ALEXANDER. I do have those figures, but they are not right at my fingertips.

Senator GORTON. Well, let me read my notes to see if they are accurate. My notes are just over \$265 million through State art agencies in 1995, and an estimate of around \$650 million from local government allocations. Does that comport with your figures?

Ms. ALEXANDER. Yes; that is correct.

Senator GORTON. Have these been constant, or have they been going up?

Ms. ALEXANDER. It is State by State. The State appropriations actually have gone up in the last few years, but they are still not where they were in 1990. As for locals, I do not know the answer to that.

Senator GORTON. Now, is it your view that much of the State and local support is engendered by the fact that there is an NEA, that there is an overall national leader? What role do you play in this process?

Ms. ALEXANDER. Senator, I do not think that State appropriations are specifically tied to the National Endowment for the Arts, but what I want to stress is that this is a partnership that works, that really, really works. We are able together to leverage even more resources than we could do separately. We are proud of our partnership with the States. We feel it is important to continue, and that we play a very important role for them.

CHAIRMAN'S ACTION GRANTS

Senator GORTON. Under the law, the authorization, 10 percent of funds can be awarded by the Chairman without any prior review, just simply on your own. Do you do any of that?

Ms. ALEXANDER. Very, very rarely. Very rarely, and as a matter of fact this year maybe I have made two or three independent grants.

Senator GORTON. What would be the circumstances for that decision?

Ms. ALEXANDER. Where somebody was in real danger of having some real problems with a project, not controversial problems, but that just needed a little boost for something that was very, very important, for an organization that we really believed in, that somehow missed the deadline or something like that.

It is so rare, and this year because of our decline in our program funds, I am not going to do it at all.

NEA SUPPORT OF AMERICAN ARTISTS ABROAD

Senator GORTON. On another subject, has NEA played any role in supporting an American artistic presence abroad?

Ms. ALEXANDER. We do play a role. To my chagrin it is paltry compared to the other nations, who import a lot of our artists. When I meet with fellow ministers of culture or Ambassadors it is clear that we are not doing enough in this regard.

As the Greek Cultural Minister said to me only a few weeks ago, he said, "Thessalonike is the cultural capital of Europe this year, and they are having a long summer arts festival, and the United States is severely underrepresented," and asked what could I do about it, and I had to reply that there was really very little I could do about it.

But we do maintain some of our international programs. Our international program is an \$800,000 program, and it is hardly enough to send our major artists abroad.

INCOME RECOVERY POLICY

Senator GORTON. Finally, the National Endowment for the Humanities has an income recovery policy from particularly successful projects. Does NEA have anything comparable?

Ms. ALEXANDER. We have the ability to recover some funds, but I would like to point out that the individual artists that we funded in the past, which is where one might garner money for the future when they become successful, most of them remain in the nonprofit art world and they do not make a lot of money.

I mean, a Pulitzer Prize winner does not necessarily translate into a big marketplace book that is going to be a windfall for that individual writer for the rest of his or her life, although the NEA has funded a great many fellowships that then go on to be Pulitzer Prize winners, book or prize winners and so on.

With regard to organizations, for example, an organization like the Public Theater in New York, which has a current hit in "Bring in Da Noise, Bring in Da Funk" on Broadway, a very successful musical, or in the past had a megahit in "Chorus Line," that money is plowed back right into the nonprofit organization, and just creates more opportunity for people to have theater for everybody, so we do not think it would be particularly an effective mechanism.

Senator GORTON. Ms. Alexander, as always you have spoken eloquently on behalf of your Endowment. We appreciate it, and we will certainly be calling on you as we attempt to determine what we can come up with and how it ought to be divided up.

Ms. ALEXANDER. Thank you very much, Mr. Chairman and members of the committee.

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. Thank you very much. There will be some additional questions which will be submitted for your response in the record.

[The following questions were not asked at the hearing, but were submitted to the Endowment for response subsequent to the hearing:]

ADDITIONAL COMMITTEE QUESTIONS

AGENCY MISSION

Question. Since its founding, NEA has played a major role in the decentralization of the arts. State arts agencies and local arts councils have been established in all fifty states and the arts have been made available to a much broader constituency throughout the country.

Has NEA's success in making the arts more accessible to all Americans resulted in redefining the role of the federal endowment vis-a-vis the states? Does an established state network of arts agencies bring with it a different set of requirements that are sought from the national endowment than were needed as the network was being created?

Answer. The Arts Endowment and state arts agencies have long played critical and often complementary roles in making the arts more accessible. For example: state arts agencies often assist in the development of emerging local groups that later receive Endowment support for projects of regional, national or major field significance; state arts agencies often assist community groups that present touring events created with Endowment assistance; and state arts agencies provide the link between the Endowment's arts education initiatives and the classrooms or community venues in which they come to fruition. Progress in making the arts more accessible has not—in itself—changed the role of the Arts Endowment in relation to the states. However, a partnership between state arts agencies and a strong national arts agency continues to be essential to the goal of making the best art available to the greatest number of people.

It has been many years since the network of state arts agencies required the kind of "hands on" technical assistance that was needed as these agencies were being created in the late 1960's and early 1970's. However, in other respects there has not been much change with regard to what these agencies require of their federal partner. Even though aggregate state arts appropriations have grown, the federal dollars are still critical. For seven agencies, the Endowment's support still exceeds the amount of the state appropriation, and for thirteen, the federal support amounts to more than a third of their budget. Even for states with large appropriations, the federal funding provides much needed flexibility. While state arts agencies look to the Endowment for national leadership in arts education and other areas, the two now operate as true partners. Many state arts agency directors and commissioners have stated that without the example and incentive provided by the Arts Endowment, some agencies would lose their state support, and the working network of state arts agencies would be greatly weakened or cease to exist.

Question. Has the agency's mission, or the execution of it, changed over the years? If you had the opportunity to redefine the NEA's mission, are there ways in which you would change it? Or do you believe that mandate under which you've operated over the years remains relevant?

Answer. The mission of the National Endowment for the Arts is to foster the excellence, diversity, and vitality of the arts in the United States, and to help broaden public access to the arts. Throughout our 32-year history, beneficiaries of our mission have been the participants, audiences, and communities who are provided access to the best contemporary and traditional American art and opportunities for lifelong learning in and through the arts. Our service, while focused primarily on grantmaking, also includes leadership activities such as technical assistance, research and dissemination of information on the arts of national importance, and providing a forum for addressing national and regional issues in the arts.

The National Endowment for the Arts is unique in that it is the only federal agency established expressly to nurture and support arts and artists of the highest quality. Further, in establishing the Endowment, Congress declared that "the arts and the humanities belong to all the people of the United States," and the Arts Endowment was founded to help ensure that all Americans indeed had access to artistic activity of excellence and merit. In meeting this charge, not only have Endowment grants reached into all 50 states, but the agency supports projects having the potential to serve the entire nation. Through its programs, the Endowment has helped support the arts and cultural activities of the more than 170 different ethnic groups that live in every corner of the United States.

The Endowment serves as a catalyst, the national identifier of artistic excellence and merit, and the leader in helping arts organizations and regional, state, and local arts agencies obtain access to potential governmental partners. For example, without the Endowment, federal programming in literature with national organizations such as the YMCA and the American Library Association would cease. Identifying and funding programs which help assure accessibility to arts activities for disabled

people across the country would suffer. Leadership in convening over 100 representatives in the arts, education, business, and other sectors toward achieving a national strategy to implement locally arts education standards as a part of Goals 2000 would be missing.

The Endowment also helps leverage private funding for the arts. Grants from the Arts Endowment require recipient organizations to match their awards 1:1 or 3:1, depending upon the program. The credibility of the Endowment as the national identifier of artistic excellence and merit has proven to be an important tool for grantees.

Public arts funding at the state and local levels does not bring the national leadership and leveraging capability that results in partnerships and collaborations with the Endowment. Further, a 1994 survey revealed the central role of the Endowment in building a national infrastructure of support for American folk and traditional arts, and in leveraging an increasing annual level of private and local support for traditional American art.

The Endowment provides national coordination to the Federal/state/local partnership. Prior to the inception of the Endowment, only five state arts councils existed. The Endowment helped create arts agencies in all 50 states and the six special jurisdictions, and subsequently nurtured the federal/state/local infrastructure in support of the arts. Fully one-third of the Endowment's budget goes to these state arts councils, but only after careful review by a national level panel of their annual plans for programs supporting the arts in their communities. This enhances the effectiveness of inter-and intra-state programs.

Additionally, it is the leadership provided by the Endowment that helps sustain the country's artistic and cultural heritage by supporting traditional and contemporary art forms often not funded or underfunded at the state or local level or by the private sector. For instance, only six of the 56 state and jurisdictional arts councils have dedicated programs and staff in literature. Independent literary publishers exist in a specific community, but their audience is national. And certain art forms, such as design, are not funded by most states (in the case of design, 75 percent of state agencies have no such funding category). Touring across state lines in art forms such as dance occurs because of the Endowment's leadership, and its involvement further assures that the touring reaches small and rural communities. Because its perspective is national, the Endowment is positioned to identify and serve traditionally underserved (geographically isolated rural, inner-city poor, and certain ethnic) populations as well as senior citizens, disabled people, and people living in institutions. Its leadership in such areas has instilled awareness and responsiveness to these populations at the state and local levels and in the private sector.

As demonstrated through the examples given above, the mission under which the agency has operated continues to be relevant because the country continues to change—demographically, economically, culturally, socially, aesthetically—and, using its national vantage point and federal authority, the Endowment is able to respond to the changes to ensure that American art flourishes and benefits the American public. A review of the mission in 1994 reaffirmed the dynamic application of its principles. The Endowment's mission is never finished; rather, it is woven into the fabric of American life.

FISCAL YEAR 1998 BUDGET PRIORITIES

Question. \$136 million has been requested by the President for NEA activities in fiscal year 1998. However, it is doubtful that the Subcommittee will be able to provide the agency with an increase over their fiscal year 1997 budget. If this is the case, would you advocate that the appropriation of funds remain the same for the various budget lines of direct grants, state partnerships, and administration? Or do you see a need to allocate the resources differently and, if so, how and for what reasons?

Answer. If the Senate Subcommittee is unable to provide the Arts Endowment with any increase for fiscal year 1998 over its fiscal year 1997 budget, minor adjustments would be needed in the allocation of funds among direct grants, state partnerships, and administration.

We would ask that the funds for the Policy, Research, and Technology office (OPRT), currently counted against the administrative account, be returned to the direct grants account. Funds expended by OPRT are solely for grants and/or cooperative agreements, primarily for the Endowment's research activities, not for its staff or other administrative costs. These research activities are authorized against the Endowment's programmatic budget, not its administrative budget, and until about 12 years ago were not counted as administration. However, in the mid-to-late 70's and 80's, the Endowment supported 6–12 "Regional Representatives," in different

parts of the country, whose role was to serve as two-way communications links between their regions and the Endowment. The funds for these "Reps" were carried as part of the then called Policy, Planning, and Research Office (now OPRT). Feeling that Regional Representative costs were closer to administrative ("quasi-staff") than programmatic, the Congress in fiscal year 1985 moved that account to administration. But the Regional Representatives program ended in fiscal year 1992. Thus, the reason for OPRT's being counted against administration ceased to be, and its current activities are covered by a program, not administrative, portion of our legislation [Section 954(c)(10)]. We would ask, therefore, that these activities once again be considered part of our direct grants account.

In addition, we would need a very modest amount to cover increases in uncontrollable costs (e.g., Congressionally-mandated pay increases, GSA-decided rent increases, GPO-decided printing increases). If there were no increase in the Endowment's total budget, there would need to be small decreases in its other accounts as necessary to balance the required increase in the administrative account.

ARTS AND ARTIFACTS INDEMNITY ACT

Question. NEA administers the Arts and Artifacts Indemnity Act for the purpose of minimizing the costs of insuring international exhibitions. Eligibility under the program includes loans from abroad on exhibit in the U.S. and U.S. exhibitions travelling abroad. Eligibility was expanded recently to include domestic loans on exhibit here in the U.S. when they are part of an exhibition from abroad.

Over the last few years, there has been some discussion of expanding the Arts and Artifacts Indemnity Act to include general coverage of domestic exhibitions. The Federal Council on the Arts and Humanities has been unanimously opposed to this suggestion. However, the President's Committee for the Arts and Humanities urges the exploration of legislation to adopt this expanded language. Can you provide the subcommittee with some insight as to the difference in viewpoints between the two groups?

Answer. The authors of "Creative America," the President's Committee on the Arts and Humanities report, did not solicit our view or discuss with the members of the Federal Council their recommendation to explore legislation for a domestic version of the Arts and Artifacts Indemnity Act prior to printing the report. First, we would have corrected the error in the report which states that a new domestic version of the legislation "could also indemnify works of art and other artifacts from American museums for exhibition abroad." In fact, the current indemnity law permits this coverage.

More importantly, we would have cited our previous study of this issue and our day-to-day experience with the Indemnity Program, which reveals that a domestic version of the Act is neither desirable nor necessary. One of the principal reasons that the Federal Council members are opposed to domestic indemnity is that the risks to the U.S. Treasury would increase dramatically if exhibitions consisting solely of U.S. loans were eligible for coverage. The number of eligible exhibitions would greatly increase, thus exposing the Treasury to significantly higher dollar amounts. And, the more exhibitions in circulation, the greater the chance for claims for loss or damage. When the Association of Art Museum Directors membership was polled on this matter in 1989, they reported more than 50 claims per year from an average of 579 domestic exhibitions insured privately. In the history of the U.S. Government's Indemnity Program, which is limited to coverage of international exhibitions, there have been only two (2) claims paid in 22 years. The total number of exhibitions indemnified since 1975 is 533.

Implementation of a domestic indemnity program would require a much higher authorized ceiling than the present level of \$3 billion. We estimate at least \$6 billion would be necessary to accommodate domestic exhibitions. It would also be necessary to appropriate monies from which to pay claims. Currently, there is a set aside of \$275,000 from which to pay certified claims if they do not exceed \$100,000. To pay the increased numbers of claims for loss and damage which would occur if domestic exhibitions were indemnified, an appropriation of perhaps as much as \$1,000,000 annually would be necessary. And, the administrative costs of staff and panel review would be considerably higher than the current annual expenditure of approximately \$75,000. A possible benefit to the American public might be the opportunity to see more exhibitions of arts from American collections. However, the AAMD study showed that the costs of insuring such exhibitions privately is not prohibitive and is therefore not a deterrent to organizing exhibitions.

While the Federal Council members believe that the adverse impact on the budget alone is sufficient cause to reject a domestic indemnity program, we would further

question whether it is the proper role of the federal government to displace the private insurance companies which provide this coverage now to American museums.

The Federal Council was pleased to amend the Indemnity Program Regulations in September 1995 to expand coverage to include U.S.-owned loans when they are part of international exhibitions. Applications have been received under three deadlines, and at the last, 5 out of 16 applicants requested coverage for both foreign and U.S.-owned loans. The Council believes that this new provision is an acceptable increase in risk to the Treasury which provides additional assistance to American museums and thereby benefits the museum-going American public.

Question. Last year, NEA provided an estimate to the subcommittee that it would require as many as 10 additional staff to operate an expanded indemnity program, where anticipated applications would be expected to number between 500 and 600. Currently one staff member has responsibility for processing 40–50 applications annually. Would it be correct to assume that even if you were given authority to operate a broader program, current budget restrictions on staffing would not make it feasible in practice?

Answer. Yes, the estimate for the need of 10 additional staff to properly conduct an expanded indemnity program still holds. This additional staff would greatly add to the cost of the program.

THE ARTS AND RURAL COMMUNITIES AGREEMENT

Question. The Art and Rural Communities Assistance Agreement is an inter-agency partnership between NEA and the Forest Service to support arts-based community development projects. What role does the Forest Service play in this partnership? What, if any, is their financial contribution? Does NEA operate the program or does the Forest Service? What have been the results of this program to date?

Answer. The Endowment transferred \$300,000 to the Forest Service for two rounds of awards under the Art in Rural Communities Assistance Initiative. The Forest Service provided an additional \$300,000 in funds and administered the application and grant process. Both the Forest Service and the Arts Endowment publicized the Initiative, but applications were submitted to and the grants awarded by the Forest Service.

In the first round, there were 19 grants awarded for projects in small, rural communities in 14 states; in the second round, there were 17 grants awarded for projects in 15 states. The 36 grants in a total of 23 states went to local arts agencies, state arts agencies, heritage centers, tribes, performing arts organizations, museums, a school district, development organizations, and colleges.

The grants were for a wide variety of projects including, for example:

- Cooperative marketing of arts and crafts in New Mexico and Puerto Rico.
- Apprenticeships in traditional arts in Puerto Rico, Arizona, and New Mexico.
- Heritage tour development in Washington and Tennessee; regional heritage area development in Ohio; African-American heritage tourism development in North Carolina; marketing the performing arts in Virginia's Shenandoah Valley.
- Documentation of folk and traditional arts in Colorado, Nevada, and Montana.
- Exhibitions relating the arts and natural resources in California, Hawaii, New Hampshire and West Virginia.
- Festivals in Colorado, Idaho, Maine, New Hampshire and Utah.
- Design plans for the restoration of an opera house in South Carolina.
- A community theater residency in Kentucky.
- An original play about the Nez Perce tribe.

OFFICE OF ENTERPRISE DEVELOPMENT

Question. NEA established this office as a means of exploring new methods for supporting the non-profit arts in America. It is charged with searching out ways to augment the agency's budget through authorized contributions and to expand the funding pool for the arts.

How productive has this office been in the past year? What accomplishments can you point to? What pitfalls, if any, have you encountered? What conclusions can you draw from this office's successes or failures to date?

Answer. The National Endowment for the Arts, as a grantmaking agency of the United States government, has never been recognized as a charity. The NEA has construed its mission as grantor rather than collector of funds. The Office of Enterprise Development has looked outside that context and attempted to assess the merits, feasibility and potential of various revenue generating activities. The OED does not define itself as a fundraising office for the NEA but rather as a hub for the agency's efforts to expand the overall funding pool for the arts. Consistent with that

purpose, the OED has adhered to a commitment not to engage in activities which would divert funds that would otherwise go directly to artists or arts organizations. While there have been some notable accomplishments in the form of direct contributions to the agency (the H. J. Heinz Company gave \$450,000, the largest corporate contribution to the NEA to date; a gift of stock valued at \$95,000 from a private citizen marked the largest individual donation in the agency's history), the productivity of the office can not be measured in dollars brought in to the agency itself.

The most consistent success has been in finding partners for agency supported projects. Corporate partners such as the Coca-Cola Company, Chase Manhattan, Nissan Motors, Atlantic Ridgefield, Dunwoodie Communications and others have contributed to the support of specific projects like American Canvas, the WritersCorps Project and the Oklahoma Rebuild Project. Very recently, Microsoft committed \$250,000 to the Benton Foundation, the Endowment's partner in the NEA conceived and initiated internet access project "Open Studio."

The nature of the Endowment itself dictates certain parameters for the Office of Enterprise Development. First, the NEA is a federal agency and, in many instances, individuals, corporations and foundations will not, or can not by charter, give money to the government. They consider that their taxes already serve that purpose. Second, the agency is recognized as a grant making body. It would require a massive public relations campaign to shift that perception and spotlight the NEA as a recipient organization. Even if the Endowment had the authority to solicit and invest, such a shift would demand a major reassignment of both staff and financial resources to accommodate an ongoing capital campaign. Third, unlike the Smithsonian or the Library of Congress, the NEA does not own or generate product. The only thing approximating product which the NEA has is its reputation and brand recognition. Government ethics preclude the agency from using its name and logo, arguably its only marketable commodity, to enter into cause-related marketing ventures. The OED has found opportunities to enter into entrepreneurial fundraising activities such as affinity cards and product identification schemes but has been unable to pursue them because of these restrictions.

MILLENNIUM INITIATIVE

Question. In a recently issued report entitled Creative America, the President's Committee on the Arts and the Humanities calls for a Millennium Initiative in which both Endowments, as well as other agencies, are urged to participate.

Please describe this initiative's purpose in greater detail for the subcommittee. Does NEA have plans to follow this recommendation that you can share with the subcommittee now? Are there any collaborative efforts with other agencies planned, as the report encouraged?

Answer. Under the leadership of Chairman Jane Alexander, the Arts Endowment has for some time encouraged applicant organizations to propose projects that celebrate the Millennium. During the summer of 1996, the Endowment announced that support was available for a limited number of artistically excellent, high-visibility projects that celebrate and showcase artistic achievements of the past century and that encourage innovative thinking about the future of the arts as we enter the 21st century. Eligible applications were reviewed by an advisory panel that included such individuals as radio personality Garrison Keillor; retired Montana Congressman Pat Williams; and Eugenia Zuckerman, internationally acclaimed flutist and regular commentator on CBS: Sunday Morning. Nineteen projects ultimately were approved for funding, including the commissioning of new dances by the American Dance Festival of Durham, NC; American Music Theater Festival's 100 Years of American Musical Theater: Past Legacy and Future Visions in Philadelphia, PA; and a nationwide effort by Chamber Music America that will present more than one hundred jazz, chamber, and new music groups through a project called American Ensembles: A Musical Celebration of the Millennium.

The Endowment takes seriously President Clinton's challenge in his most recent State of the Union Address that "all Americans in the arts and humanities * * * join with their fellow citizens to make the year 2000 a national celebration of the American spirit in every community, a celebration of our common culture in the century that is past and in the new one to come." The problem is a lack of appropriate levels of funding. As plans are underway for continued support for millennium projects, many alternatives are being discussed, including developing a more targeted, proactive approach. Consideration also is being given to supporting a few stellar projects that would provide opportunities for artists and audiences across the country. Any of these activities would be undertaken concurrently with the partnership activities that the Endowment develops with other federal agencies, as well as state and local arts agencies.

Question. What portion of your budget will be committed to this initiative? How will support for the millennium project impact your core programs when it is not anticipated that a corresponding increase can be provided in future budgets?

Answer. Approximately \$4.8 million of fiscal year 1997 funds will be supporting more than 20 leadership projects for the millennium, in response to nearly 300 initial letters of intent totalling \$66.8 million. Contingent on appropriations, the Endowment will commit \$4-\$4.5 million to these types of special leadership projects again in fiscal year 1998. In addition, many of the agency's other direct grants reflect a growing focus on celebrating the Millennium.

AMERICAN CANVAS

Question. This effort was organized by NEA to bring together local and national leaders in the arts, education, business, government, civic and consumer organizations, religious groups, and foundations to determine how to build a solid infrastructure for the nonprofit arts in America's communities. Both local and national representatives from these sectors had the opportunity to participate in this program through a series of six community forums and a national meeting.

An Action Plan that would analyze the information gathered at these meetings, identify what works and recommend strategies is due out in the spring. At this time, can you summarize its findings for this subcommittee?

Answer. During 1996, the National Endowment for the Arts convened a nationwide initiative of regional and community forums called American Canvas. These forums brought together more than 150 national leaders as panel participants representing the arts, education, business, government, consumer organizations, civic groups, religious organizations, and foundations to determine the value of the arts in communities and how to build a solid infrastructure for the arts in America's communities. Each of the six privately funded forums explored a different aspect of the successful integration of the arts into communities. The hosting communities were chosen for their leadership in the development of innovative strategies for supporting the arts.

As a result of the dialogue that took place at the various sites, a national steering committee formulated ten "Calls to Action," one relating to each of the six forum topics and four which emerged as general concerns in all six forums. In January 1997, a committee of 100 leaders representing a variety of sectors reviewed the Calls to Action and discussed specific ways in which their organizations and sectors could work together nationwide to assist communities in ensuring an arts legacy for future generations. All of the above-mentioned activities will be discussed and combined to create the American Canvas report which will be published in the Fall of 1997.

American Canvas participants identified a number of revenue sources for the arts across the country, many of which may be suitable for replication elsewhere. Just as traditional percent-for-art programs (in which a small portion of federal, state, or local construction expenses are earmarked for the incorporation of artworks and other cultural amenities) have brought millions of dollars to the arts, other dedicated revenue streams are being developed, often tapping "nonarts" funds in the public sector to fund cultural activities. These include from hotel/motel taxes and entertainment/recreation taxes; revenues from lotteries and gambling taxes; vanity license plate sales; and sales taxes (where a percentage of the sales tax is dedicated to the arts).

Additionally, American Canvas participants identified cultural tourism as an important way in which cities attract visitors and are thus devoting a portion of their convention and visitors funds to cultural activities. Cities have also used cultural facilities as community revitalization tools and are able to secure economic development, housing, and transportation funding to support these activities.

These and other federal programs, such as the funding for arts in rural areas through the Forest Service and the Department of Agriculture and funding for job training in the arts through the Department of Labor, along with many private sector programs, were all ways which the American Canvas participants believed helped strengthen a community's infrastructure around its nonprofit arts. These ideas, and others, as well as strategies for their implementation will be the focus of the American Canvas report.

CULTURAL TOURISM

Question. Another interagency initiative is a partnership of the NEA, NEH, the Institute of Museum Services, and the President's Committee on the Arts and the Humanities, with the support of six national museum, humanities, arts, and historic

preservation organizations. Its purpose is to encourage cultural organizations and the commercial travel and tourism industry to develop cultural tourism projects.

How much has NEA contributed to this partnership? How does cultural tourism differ from tourism as we traditionally know it? Is the travel industry contributing resources to this effort? What about state and local governments? Chambers of Commerce? What makes this an area that merits special emphasis? Are there specific results from this initiative that you can point to at this time?

Answer. Cultural tourism—"travel directed toward experiencing the arts, heritage, and special character of a place"—differs from the mass tourism market in its focus on cultural experiences as part of tourism. The travel and tourism industry in the United States has traditionally marketed natural resources (beaches, mountains, lakes), recreation (golf, skiing, fishing) and attractions (theme parks, casinos) whereas European nations have aggressively marketed their history and their arts as travel motivators. Given the Endowment's reduced budget level, encouraging the development of cultural tourism is an important way for the agency to help cultural organizations increase their earned income and demonstrate their importance in local and state economies.

The National Endowment for the Arts contributed \$50,000 to the Cultural Tourism Leadership Initiative. The National Endowment for the Humanities contributed \$50,000 and the Institute of Museum and Library Services contributed \$5,000. Through the President's Committee on the Arts and the Humanities, the American Express Foundation became the major travel and tourism industry contributor, donating a total of \$35,000. Other travel and tourism industry organizations including state tourism offices, convention and visitor bureaus, travel magazines, airlines, and hotels, provided support.

The American Association of Museums (AAM), the Federal agencies' cooperators, organized "Partners in Tourism," composed of the Federal partners and eight national cultural organizations: the AAM, the National Assembly of State Arts Agencies, the Federation of State Humanities Councils, Americans for the Arts (formerly the National Assembly of Local Arts Agencies and the American Council for the Arts), the National Conference of State Historic Preservation Officers, the National Trust for Historic Preservation, the National Association for African American Heritage Preservation and the National Center for Heritage Development.

The Cultural Tourism Leadership Initiative sponsored a series of regional forums: Mid-Atlantic (Annapolis, Maryland); Mid-Western (Indianapolis, Indiana); Southeastern (Chapel Hill, North Carolina); Far Western (Los Angeles, California); and Rocky Mountain and Plains States (Denver, Colorado). In New England, cultural organizations sponsored a half-day session on cultural tourism at a meeting of Discover New England, the region's tourism promotion organization.

The Forums attracted more than 900 participants representing a wide variety of both travel and tourism industry (e.g., state travel offices, convention and visitor bureaus, hotels, tour operators) and cultural interests (e.g., state arts agencies, state humanities councils, local arts agencies, state historic preservation officers, heritage area coordinators).

The focus of the Forums was the development of state action plans. Most states decided to form committees back home to expand and implement the plans. At least two states have held statewide cultural tourism conferences based on the Forum model; several states indicated their intention to pursue state funding for cultural tourism initiatives.

As the last Forum was held in May, the Federal agencies involved are currently reviewing the Forum results to determine what further steps should be taken at the national level.

LEADERSHIP INITIATIVES

Question. Beginning in fiscal year 1996, funds were set aside to support Leadership Initiatives. Last year, you were in the process of developing a structure for identifying and evaluating possible leadership initiatives and it was anticipated that information would be distributed in the months ahead.

Can you share that information with the subcommittee now? What defines a leadership initiative grant and how does it differ from grants awarded through your other program categories? Are grants selected through the normal channels or is there a separate process of selection?

Answer. Leadership Initiatives, in addition to the Millennium Initiatives discussed earlier, are awarded through grants or through cooperative agreements, and are undertaken in response to an identified need in the field, or to take advantage of a particular opportunity where the Endowment's catalytic national role can make a difference. All awards, whether grants or cooperative agreements, are subject to

review and recommendation by the National Council on the Arts with ultimate approval by the Endowment's Chairman.

Question. To date, what has been accomplished with this initiative? Have the first grants been awarded?

Answer. Several Leadership Initiatives have yielded rich returns in terms of benefits to the arts and to citizens in communities across the United States. The Mayors' Institute on City Design, for example, brings together mayors and design professionals to improve the way cities solve their problems. Over two days of intensive discussions, the group works to analyze a number of design issues currently pending in the mayors' own cities. Recent participants included the mayors of Salt Lake City, UT; Tacoma, WA; Macon, GA; Charlotte, NC; Akron, OH; Shreveport, LA; and Lewiston, ME.

A unique opportunity presented itself last year for the Endowment to help make possible the national expansion of The Writer's Voice, an extremely successful project of the YMCA in New York City. Endowment support will help to establish at least 25 new centers across the country over three years through a national arts training initiative that will provide YMCA staff with training workshops and publications to help them start centers at their local Y's. Writer's Voice centers make the literary arts more accessible to people of all ages, with a special focus on youth between the ages of 3 and 18.

An innovative pairing of jazz and sports was the focus of another Leadership Initiative grant. The Thelonious Monk Institute of Jazz in Washington, DC, was awarded a grant to support the artistic development of young jazz students. The Monk Institute, the Endowment, the Los Angeles Lakers, Nissan Motor Corporation USA, and the National Association of Music Merchants have entered into a partnership that will provide after school and Saturday instrument training, master classes, mini-concerts, and other performance opportunities to aspiring musicians at two South Central Los Angeles high schools. Recently, jazz bands from the two schools began performing prior to Lakers home games with renowned jazz artists sitting in. The project has enormous potential as a national model, demonstrating how schools, corporations, and professional sports teams can utilize their respective strengths in developing young people into serious musicians.

NEA WEB SITE

Question. NEA Launched its Web Page on the Internet last spring. What sort of feed back have you gotten to date? Can you assess the web site's value to date in promoting NEA programs and providing greater public access?

Answer. Internet traffic to the Endowment Website has more than tripled during the past year, with nearly 3 million hits to date, and a clear trend-line toward increased usage. Over 130,000 of the hits on our Website have come from other countries. The average visitor to the site spends 15 minutes viewing the information provided. More than a thousand prospective grant applicants have downloaded Endowment funding guidelines and application forms. Hundreds of other agencies and arts organizations have linked to our site, and Endowment staff have communicated through the Website with many US citizens living abroad. Positive press coverage has come from USA Today and several major daily newspapers throughout the country.

It is too early to assess the value of the Website in specific dollar terms, but the increasing usage of the site, and the length of time spent by each visitor are very encouraging. Certainly the Website has saved valuable staff resources in permitting NEA staff to respond to requests for information electronically and allowing the public to access information over the Internet. In conjunction with Open Studio, an national internet access and training partnership with the Benton Foundation, the Website is clearly expanding access to information about the arts for the American public.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

BUDGET REQUEST

Question. The fiscal year 1998 budget request is almost 37 percent above the fiscal year 1997 allocation. Given the current budgetary climate, and given the uncertain reauthorization status of the NEA, how did the Administration determine that \$136 million was an appropriate funding level for the NEA?

Answer. The request for \$136 million, if realized, would still leave the Arts Endowment at a level 16 percent below our fiscal year 1995 appropriation of \$162.3 million. The \$136 request is seen as partial restoration of funds that the Adminis-

tration believes represents a modest but vital investment in our Nation's cultural heritage and its citizens' access to their rich and diverse artistic legacy.

Question. What does the 37 percent increase buy for the American people?

Answer. The 37 percent increase buys for the American people increased opportunities to experience and participate in the arts, a richer and more diverse choice of artistic works and traditions, education in the arts for children and people of all ages, and an endorsement of our citizens' belief that the arts should be nourished and shared with all people.

Question. What would be your programmatic priorities at the increased funding level?

Answer. Programmatic priorities were established as part of the agency's drastic downsizing and restructuring; they are reflected in our fiscal year 1998 budget request—direct grants for the four categories and leadership initiatives, and partnership agreements with the state arts agencies and their regional organizations. These would remain our priorities at the increased funding level.

Question. Would your priorities remain the same if funding were to be decreased?

Answer. In general, the agency's priorities are, as noted above, reflected in our fiscal year 1998 budget request. It is difficult to speculate with any surety on what our priorities would be "if funding were to be decreased," as the response would probably hinge at least partly on the nature and extent of any additional decrease, remembering that the agency has already sustained a massive decrease and totally reorganized the way it does business.

Question. How does your annual budget request reflect your arts education priority?

Answer. Our annual budget request reflects our arts education priority in each of our budget components: Direct grants include our Education & Access category, specific to education, and funds in each of the other three categories (Heritage & Preservation, Creation & Presentation, and Planning & Stabilization) are also being used, in many of the grants, for projects having educational components. The Direct grants area also encompasses our Leadership Initiatives, several of which reflect educational aims and priorities. The State Partnerships, in addition, includes a priority for arts education programs conducted and supported in all of the states throughout the country.

Question. Describe the impact on arts education for children which would occur if the agency were not reauthorized.

Answer. The impact on arts education for children would be substantial if no funds were appropriated for the agency. If the agency were eliminated due to lack of funds, all of the direct grants and partnership agreement funds for arts education projects and programs would be gone, as would the Endowment's vital leadership role in working to establish the arts as part of the basic curriculum in America's schools. We believe that many of the arts education programs now being carried out by the state arts agencies, and by arts organizations such as museums, orchestras, and opera companies, would be reduced or eliminated, negatively affecting hundreds of thousands of our children. Though the Arts Endowment's funds are modest and represent only a portion of most program's total costs, they are crucial in establishing a priority for arts education and drawing together a complex network of partners from both public and private sectors. With so much concern evident about our children's education, it would be ironic indeed—and tragic, we believe—if this vital endeavor, built so painstakingly over the years, were to be dismantled.

Question. Please describe any long term investments or new initiatives that are currently being developed. What effect would new initiatives have on existing grantees if funding is not increased?

Answer. We view virtually all of our funding as long term investments. The artistic life and legacy of a Nation is a vast and vital reflection of its roots, its present, and, often, its future. Arts endeavors—be they the creation of a new symphony or painting, the teaching of art to young children, the broadcast of ballet on television, the publishing of poetry or fiction—are investments whose results may be seen immediately or years hence. As a complement to these investments, new initiatives are vital to the lifeblood of any funder in the arts, as the arts themselves constantly reinvent and reshape themselves, and as our nation continually changes demographically, ethnically, educationally, and economically.

These two interrelated facts and philosophies are the underpinning of our new structure, which includes ongoing categories of project support to organizations and agencies, as well as leadership initiatives that enable the Endowment to effect specific, targeted outcomes. The new structure was created with both elements firmly in place so that they would complement each other and not impact negatively on existing grantees. Negative impact on existing grantees would be attributable not to new initiatives but rather to our drastically reduced budget.

GOVERNMENT PERFORMANCE AND RESULTS ACT (GPRA)

Question. Please describe your progress and milestone toward preparing a strategic plan, including consultation with interested parties.

Answer. The agency's strategic plan is moving forward, guided by an agency-wide staff planning group and a committee of the National Council on the Arts. We are beginning our review with the Office of Management and Budget and are discussing preliminary thinking with some of our advisory panels—private citizens from around the country—as well.

Question. Given the current budgetary climate, and given the uncertain reauthorization status of the NEA, how are you addressing funding and authorization issues in the development of GPRA goals and the strategic plan?

Answer. Development of the strategic plan, required by law to cover five years, is particularly challenging for an agency whose future currently appears to be as cloudy as ours. We are having to set these issues somewhat to the side for now, and are trying to focus on the fact that a five-year strategic plan is required, regardless of our status, unless the Congress eliminates the agency. Development of a five-year plan involves a very great deal of staff effort and time; the level of frustration is fueled by the prospect of our five-year plan being “due” before even our one-year future is known.

Question. What are the grant-making priorities for the agency in the next year, for the next 5 years?

Answer. Contingent, of course, on our continuing existence, and an appropriation not slashed yet again nor encumbered by additional earmarking, the grant-making priorities for the agency for the next five years are basically those reflected in our fiscal year 1998 budget request. We do not foresee, at present, major shifts or changes.

Question. What are the organizational priorities for the agency for the next year, for the next 5 years?

Answer. Our organizational priorities for the agency for the next five years are to continue to do everything within our power and available resources to serve the American people by carrying forward our programmatic goals.

GRANT-MAKING

Question. Within the request, direct program grants increase by 51 percent over fiscal year 1997. How do you propose to allocate the requested increase among the different grant categories established by the NEA?

Answer. The Arts Endowment has not allocated the requested increase for fiscal year 1998 among the four grant categories and leadership initiatives. If the increase were to be appropriated, the Endowment would apply the increase against the four interdisciplinary categories as warranted by the numbers and quality of the applications, and against leadership initiatives as well, with an emphasis on millennium projects. Increased funds would also be available to the state arts agencies through the State and Regional and Underserved Set-Aside accounts.

Question. Although there is a request for 24 percent more funds in the Underserved Set-Aside allocation, the Underserved Set-Aside request is a smaller percentage of the total budget request in fiscal year 1998 than that allocated in fiscal year 1997. Are the needs of the underserved community decreasing such that less emphasis is being placed on that portion of the NEA funding?

Answer. No, the needs among artistically underserved communities are not decreasing. Two points need to be kept in mind in responding to this question:

—Underserved communities are served not only by the Underserved Set-Aside (grants to state arts agencies for underserved communities) but also by projects funded under the Direct grants (including leadership) categories as well.

—The authorizing legislation as amended in November 1990, established a percent-of-funds formula to be set aside beginning in fiscal year 1992 for state arts agencies' underserved programs. The amount reflected in our request is in accordance with that percent.

A few examples of underserved projects funded this year under our direct grants appropriation:

—A grant to Grass Roots Art and Community Efforts in Hardwick, Vermont, to support publication of 20 years of G.R.A.C.E.—An Inside View, a collection of work and biographies of self-taught artists in northern rural Vermont.

—A grant to the Hiddenite Center in Hiddenite, North Carolina to present touring artists in rural, ethnically diverse and other underserved populations in communities in Alabama, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, and Tennessee.

- A grant to the Lakota Fund in Kyle, South Dakota, to support the production of *Oyate Ta Olowan* (Songs of the People), a series of half-hour radio programs featuring traditional Native American music.
- A grant to Music at Angel Fire, Inc., in Angel Fire, New Mexico, to support performances in Angel Fire, Raton, Taos, and Las Vegas, New Mexico, as well as youth concerts in Taos and Colfax Counties.
- A grant to the Network for Local Arts in Washington State in Olympia, Washington, to support the Rural Touring Arts Initiative that will develop two ongoing rural touring circuits, one in southeastern Washington and the Olympic Peninsula, and the other—the applicant’s stated priority—for local communities in central-northwestern Washington.
- A grant to Appalshop, Inc. on behalf of the American Festival Project in Whitesburg, Kentucky, for its Community Capacity Building Initiative which engages people who have had little access to the arts in community arts collaborations.
- A grant to Atlatl in Phoenix, Arizona, to support the Native Arts Network Associates consortium and strengthen the development of Native American arts.
- A grant to Davis & Elkins College in Elkins, West Virginia, to support the statewide West Virginia Folk Arts Apprenticeship Program.
- A grant to El Teatro Campesino in San Juan Bautista, California, to support the presentation of “La Pastorela,” a religious drama and Christmas tradition involving members of the community.
- A grant to the Vigilante Players, Inc. in Bozeman, Montana, to support touring to small communities in six rural Northwest states.
- A grant to the Clay Studio in Philadelphia, Pennsylvania, to circulate the “Claymobile,” a traveling ceramics class in a van, to inner-city and low-income communities.

In addition, a number of the Arts Endowment’s direct grants or cooperative agreements for leadership initiatives directly reach underserved communities; for example:

- Funds to Chamber Music America in New York have brought chamber music and jazz ensembles to live, teach, and perform in rural areas including in the Arkansas communities of Blytheville and Osceola; King City, CA; the Georgia communities of Fitzgerald, Tifton, and Moultrie; the Iowa communities of Jesup, Fayette, and Decorah; the Kansas communities of Dodge City, Garden City, and Liberal; the Kentucky communities of Bowling Green, Prestonburg, Paintersville, and Salyerville; South Bristol, ME; Roseburg, OR; the Pennsylvania communities of Somerset, Indiana, and Johnson; and Big Sandy, TX.
- Funds from a joint program of the Arts Endowment and the U.S. Forest Service to the Augusta Heritage Center in Elkins, West Virginia are supporting public programs with demonstrations of the work of traditional crafts people; the programs will be accompanied by apprenticeships, the Forest Festival, and a Fiddlers’ Reunion.
- Funds from the same initiative (NEA/Forest Service) to the Homer Council on the Arts/Pratt Museum in Homer, Alaska to support “Exploring our Place from Forest to Sea,” a series of events including summer story telling, outdoor sculpture, and performances; a fall “Gathering of Native Tradition” on nature arts; a winter program on Eskimo songs, dances and masks which will travel to nearby communities; and a spring exhibition on the “Tongass: Alaska’s Magnificent Rainforest.”

Question. For fiscal year 1998, what are the approximate targets for the allocation of funds to the 4 funding categories and Leadership Initiatives?

Answer. We have not yet established targets for the allocation of the 4 funding categories and Leadership Initiatives for fiscal year 1998, as the uncertainties about our future at the very least raise questions about the level of funds that might be available for these purposes. Nonetheless, it appears that the proportion of applications just received for fiscal year 1998 funds is similar to last year’s among the 4 categories, which is one guidepost for us, and, as advisory panels meet throughout this summer and fall, we will have a good idea of their quality and viability. Leadership Initiatives will probably receive an allocation similar to last year’s, again contingent on appropriations.

Question. When grant monies are used to establish or maintain endowments, how much of the federal funds are permitted to be used for administrative costs of operating the endowment?

Answer. Federal and matching funds must be placed in the endowment corpus. These funds may not be used for administrative costs of operating the endowment.

Question. What kind of technical assistance does the Endowment provide to arts institutions in the area of business planning and grant-application preparation?

Answer. The drastic budget reduction of fiscal year 1997 forced the Endowment to discontinue one of its most valuable programs, the Advancement Program. Participants in Advancement were the beneficiaries of year-long one-on-one consultancies with experts in all areas of business and the arts, from board development, to fundraising, to investing. At the end of the consultancy, the organizations submitted a strategic plan that was evaluated before grant monies were awarded. Advancement grants were matched on a three-to-one basis with non-federal funds. The Endowment currently has no ability to provide that type of service to its constituents.

Applicants to the Planning & Stabilization category are subject to management assessments by outside contractors who provide information to help evaluate applications. The applicants are provided with the assessments at the end of the application review period. Planning & Stabilization grants are intended to strengthen organizations' ability to realize their artistic and public service goals. Planning offers assistance to organizations to assess carefully their strengths, weaknesses, and financial health. Stabilization helps organizations strengthen their own institutional capacity; adapt to the realities of their potential audiences and communities by determining and realizing an appropriate size; maximize and diversify their resources; or enhance their abilities to serve or strengthen their arts field.

Endowment staff in the various artistic disciplines are well versed in the agency's guidelines, and spend many hours assisting applicants on the telephone and in personal meetings. In addition, Endowment representatives often hold sessions at the meetings of arts service organizations, college and university development officers, and other pertinent conferences in order to introduce prospective applicants to the agency, help them determine their eligibility, and select the appropriate category to which an application might be submitted.

Question. What role does receipt of an NEA grant play in influencing private support of arts organizations?

Answer. Grants to organizations from the National Endowment for the Arts require recipients to match their awards 1:1 or 3:1, depending upon the program, thus helping to leverage private funding for the arts. The credibility of the Endowment as the national identifier of artistic excellence and merit has proven to be an important tool for grantees, since most indicate that they raise private money well beyond the required match.

Additionally, it is important not to overlook the "big picture" influence of federal funding for the arts, which not only affects the private sector but state and local government arts funding as well. The most recent statistics from the AAFRC Trust for Philanthropy printed in their Giving USA 1996 report indicate a strong upward trend in private giving to the arts, culture and humanities from 1965 to 1992, but a downward trend from 1992 to 1995. Private giving to the arts, culture, and humanities sector (which includes giving to institutions such as science and history museums, public television, and other cultural institutions as well as performing and visual arts institutions) increased from \$2.31 billion to \$10.23 billion from 1965 to 1992, after adjustment for inflation; however, between 1992 and 1995, private giving fell to \$9.96 billion. Furthermore, arts and cultural giving declined to only 6.9 percent of total charitable giving in 1995 compared to 7.6 percent in 1992. Federal dollars to the arts, specifically from the National Endowment for the Arts, also rose steadily over the same time period and peaked in 1992 at \$175.9 million.

After 1992, the agency's budget declined yearly to reach \$162.3 million in 1995. In sum, the most recent four-year downward trend in private giving to the arts (1992 to 1995) coincides with a four-year downward trend in federal support for the arts, suggesting that declines in federal funding are having a negative impact on private giving to the arts. In contrast, over the previous two and one-half decades, rising federal funds coincided with increased private giving to the arts.

State government contributions rose steadily between 1965 and 1990, as did funding at the federal level. The increased federal/state partnership also resulted in state arts agencies supporting the development of local arts agencies throughout their states. The aggregate budgets for state arts agencies peaked at \$292.3 million in 1990, dropped for three consecutive years and, in 1994, began to rise again and reached \$262.2 million in 1996. After adjustment for inflation, aggregate state arts agency budgets have dropped by 25 percent since 1990. Over this same time period, the National Endowment for the Arts budget dropped by 52 percent, after adjustment for inflation.

While the estimates of local government funding for the arts cannot be calculated as easily or as accurately as state and national data, Americans for the Arts estimates local government funding for the arts at \$600 million in 1992, \$650 million in 1995, and \$675 million is estimated for 1997. This growth in aggregate local support was not sufficient to keep pace with inflation over the time period, but more

importantly was a dramatic change from the large increases posted from 1983 to 1992, when the total contributions doubled—from \$300 million to \$600 million. (1983 is the first year that data are available on local government support.)

Question. The Endowment is about to conclude its first year of grant-making in the grant funding categories established during 1996. Describe the manner in which the new categories meet the needs of the Endowment, the applicants, the grantees.

Answer. When the Endowment received the devastating budget cut of fiscal year 1996, it was impossible to maintain the specialized categories of support that had existed for years. There was neither the money nor the staff to do so. The four broad categories were instituted as a realistic means of supporting all of the relevant activities of organizations involved in the arts under broad umbrellas. It was—and is—our belief that the categories provide opportunities for all aspects of the arts to be supported at the federal level.

Much has changed for applicants to the four categories. Applicants now may submit only one application per funding cycle, necessitating a difficult choice for many of them. If they are entering into an endowment drive, for example, should they risk creative programming to apply for a Planning & Stabilization grant in this round? There also is the choice of which project to select for an application, as all support is now project-specific and no longer seasonal in nature. The Endowment staff has helped applicants through these questions as much as possible, and continues to provide outstanding service to the field.

Many applications had to be rejected even though they were of a quality that would have been supported were more funding available. Projects that were supported, however, received substantial amounts in many cases. The Endowment has rewarded the best applicants with large percentages of their requests, providing significant support to the best projects in the country.

Question. What changes do you anticipate making in the grant guidelines before the next round of funding?

Answer. The primary guidelines, for Grants to Organizations, were modified between fiscal year 1997 and 98 to clarify matters that seemed in need of attention following the first round of applications (for fiscal year 1997). Very few substantive changes were made. The fiscal year 1998 guidelines were distributed to the field in December 1996 for application deadlines in April 1997. We are currently reviewing those guidelines again, for fiscal year 1999, seeking continually to streamline and clarify.

The Arts Endowment's other guidelines, such as those for Literature Fellowships, American Jazz Masters, Heritage Fellowships in the Folk and Traditional Arts, and Partnership Agreements for State Arts Agencies and Regional Arts Organizations, are also reviewed annually and modified as warranted. Only the last of these guidelines, for Partnership Agreements, represented much change in fiscal year 1997, due to the streamlining and consolidation of several grant programs into single Partnership Agreements. We anticipate no major changes in the coming year.

Question. Will streamlining your grant review process from a four-step process to the use of a single-level advisory panel process allow any savings in staff time necessary to review the applications?

Answer. The same level of staff review is required for all applications submitted to the Endowment, regardless of the levels of review. Staff check the application for completeness, adherence to appropriate deadlines and guidelines, and eligibility. They then prepare the applications for review by panels. Doing away with the combined arts panel level of review will save staff time, however, in that there will be fewer panel meetings.

Question. How does the single-level advisory panel reduce the four-step process?

Answer. There were four levels of review in the last funding cycle: a discipline specific review (e.g. dance, theater, opera, etc.); a combined arts panel made up of representatives from many disciplines plus generalists and lay persons; the National Council on the Arts; and the Chairman of the National Endowment for the Arts.

The current round combines the first two levels into one panel review. While panels are now grounded in specific disciplines or fields, they have been broadened to include generalists and other individuals who represent allied fields that could bring valuable contributions to the review of arts applications. Every panel also includes at least one knowledgeable lay person. Post panel evaluation is still done by the National Council, which has the authority to recommend applications for funding or to reject them. Final decisions on all grants to be awarded rest with the Endowment's Chairman.

Question. When is the single-level advisory panel system anticipated to be in place for use in the review of applications?

Answer. Panel meetings began on June 19 and will continue throughout the year. Periodic meetings of the National Council review the work of the panels.

Question. Are advisory panels considered to be peer review, or are the panels composed of NEA staff members?

Answer. Panels are not composed of NEA staff members. As described above, they are composed of experts in the various arts disciplines and fields, generalists and individuals from professions outside of but connected to the arts, and lay persons.

REORGANIZATION

Question. How has the 1996 reorganization affected the daily operations of the NEA?

Answer. The 1996 reorganization had a substantial impact on the daily operations of the NEA. Following the month-long period of government shut-downs and snow closings, coupled with the loss of 89 employees and major reduction and total overhauling of office space, the staff needed to adjust to new working surroundings, a new way of handling applications (in the 4 new categories), and, for some of them, new jobs resulting from RIF-caused shifts. Additionally, there was a four-level review process for applications, one of which, the Combined Arts Panels, was also new. Nearly all of the agency's systems and procedures needed to be revised; and there was a confused and concerned constituency needing assistance. An agency-wide assessment, and recommended retooling, of our information management and computer systems was in its early stages; and there were numerous inquiries from the Congress, the media, and the public.

The Endowment's staff's hard work, intelligence, creativity, resilience and dedication throughout 1996 and up to the present have been models of the best of public service.

Question. What lessons have you learned from the reorganization?

Answer. We have learned from the reorganization that notwithstanding the suddenness and extent of the cuts, both in funds and in staff, the agency's resilience and commitment resulted in continued responsible and responsive service to the fields and the American people. We learned as well that our revised structure and guidelines, though a major change for our fields, brought forward many outstanding proposals, new partnerships, and newcomers to our applicant pool. We learned that our reduced level of funding and staff creates serious limitations in our ability to respond to the fields and the public compared with prior years, as evidenced by the many worthy proposals we are now unable to support.

Question. Do you have further plans to fine-tune the NEA in terms of organizational structure?

Answer. At the present time, we do not have any major plans to fine-tune our organizational structure; there may be a few minor adjustments, but the structure basically works and we plan to continue it.

CHANGE IN NUMBER AND AMOUNT OF GRANTS

Question. Prior to fiscal year 1996 the NEA was awarding approximately 4,000 grants per year, and in fiscal year 1997 the estimated number of grants will be 1,100 grants. What impact has the decrease in grant numbers had on the arts community?

Answer. The reduction in the number of grants has had a detrimental effect on many aspects of the arts in this country. One must not forget the immediate effect on the American public: fewer opportunities to participate in arts events. This hardship has been necessitated even though a Louis Harris poll indicated recently that 79 percent of the American public supports public funding for the arts; a 57 percent majority favors the federal government's direct support of the arts. The fiscal year 1997 funding level of \$99.5 puts the Endowment approximately at its 1972 level, despite tremendous growth in arts activity and demand for participation in the arts across the country. Arts organizations, like all other businesses, must pay 1997 prices, not 1972 prices.

Grantees have long reported that federal funds are the most useful in raising private funds. As we have reported in past years, Endowment grants are matched many times over with private funds that often come as a result of the Endowment's imprimatur and stringent review process. Such private giving will decrease or disappear for many arts organizations that no longer receive Endowment support.

Even those organizations that received funding from the Endowment in fiscal year 1997 were faced with many months of uncertainty leading up to their awards. They realized that the continued excellence of their programs would not be enough this year, and that many applications would be rejected for lack of funds. This uncertainty made it difficult to plan for projects in the coming months.

Many of the grants awarded prior to fiscal year 1996 were to individual artists such as composers, choreographers, playwrights, and designers. Those grants now

are precluded by legislation. Only fellowships in literature and awards to jazz masters and folk and traditional artists are available from the Arts Endowment. Consequently, dance companies, orchestras, theaters, and other arts organizations will, over time, have less work to present. New work is at the heart of artistic activity; without it organizations will stagnate.

Question. Are there organizations which previously were recipients of grants that are no longer in operation for which their decline is attributable to the decrease in available funding?

Answer. Because we are in only the first year of grants under the new structure and reduced funding, it cannot yet be documented that organizations have closed as a direct result of the cuts. We do know, however, that arts organizations have long been in a precarious position, and cannot sustain themselves for long without funding. For example, some 23 theaters have closed in the past five years. Dance companies are closing because they cannot find enough venues in which to tour. The Endowment has received clear and moving letters and telephone calls from organizations, many of which have been supported with federal funds for many years, stating that the withdrawal of funding this year puts their very existence in jeopardy.

LEVERAGING FEDERAL FUNDS WITH MATCHING GRANTS

Question. Describe the matching requirements for recipients of NEA grants.

Answer. The law requires that all Arts Endowment grants to organizations, with few exceptions, must be matched at least dollar for dollar, i.e., a one-to-one match. Many projects that we are supporting with fiscal year 1997 funds evidence a greater match. In addition, in our Planning & Stabilization category, all grants between \$75,001 and \$500,000 will require a match of at least 3 to 1.

Question. Are the matching requirements a challenge for applicants to meet?

Answer. The matching requirements are a challenge for many of our applicants, particularly the mid-size to smaller organizations and those of any size that have been having major fund-raising or accumulated deficit problems. In all instances, grantees report that Arts Endowment funds are an important catalyst in securing funds from the private sector.

Question. Do the matching requirements limit the numbers of applicants?

Answer. The matching requirements, particularly the 3 to 1 match, do limit the numbers of applicants. Probably a greater limiting factor (on the number of applications to the Planning & Stabilization category) is the Arts Endowment's prohibition on more than one application per year to the four categories: in the past, applicants to our Challenge Grant and Advancement Programs (precursors of Planning & Stabilization) were allowed to apply each year both for that type of grant and for a grant under another category or categories. Now, the applicant has to choose between, for example, an application to Planning & Stabilization or an application to Education & Access. This is a difficult choice for many organizations.

Question. Have the requirements for the percent of match required of grantees remained constant?

Answer. The matching requirements did change from our fiscal year 1997 to our fiscal year 1998 guidelines, but only in the Planning & Stabilization category. Fiscal year 1997, three levels of match were described in the guidelines, 1-1, 3-1, and 5-1, depending on the size of the grant. For fiscal year 1998, this changed to two levels: 1-1 and 3-1. The very largest organizations, it was seen, will tend to match at or above the 5-1 match, especially if they are mounting major capital campaigns for endowments. For the mid-sized and smaller organizations, the 5-1 requirement was seen as discouraging worthy groups from applying for what they truly needed and could reasonably be expected to match.

Question. Must the grantees be able to prove/show in their applications that there is a high likelihood of raising the matching funds needed to secure the NEA grant?

Answer. When organizations apply to the Arts Endowment, they must reflect the amount and source(s) of matching funds in their applications. Since applications in the four categories are currently submitted 7-11 months in advance of notification of grant award or rejection, many applicants are able only to estimate the match. But once applicants are successful and become grantees, they are monitored by several methods—revised budget requests, progress reports, cash requests—to insure that the match is valid and secure. Recipients of Planning & Stabilization funds for cash reserve and/or endowment purposes are monitored even more closely throughout and following the grant period.

Question. How do the applicants for grants show the Endowment that they can provide the matching funds required with the NEA grant?

Answer. Applicants for grants provide, as part of the project budget section on the application form, specific information on the total match expected toward the project for which they are requesting support.

UNDERSERVED COMMUNITIES

Question. If most corporate and foundation dollars are given locally, and if the largest and most prestigious organizations often receive those scarce gifts, how do the small organizations cities and rural areas and the organizations located there raise their matching funds?

Answer. Because the amounts of the grant requests of organizations in small and rural areas tend to be relatively low, in keeping with their likelihood of being small to mid-sized organizations, matching resources often can be garnered from a combination of existing and new sources of revenue. For instance, grantees that have been awarded \$15,000 for a strategic planning process can match the Endowment's money by utilizing \$5,000 in earned income increases over the previous year's budget, \$2,500 from accumulated surplus, \$5,000 from a board contribution specifically for the purpose, and \$2,500 of operating income used to support the staff salaries for participants in the planning effort. Since the amounts from each source are relatively small in and of themselves, small organizations can stretch existing sources to support the grant activity. That is not to say, however, that, in directing these resources for the grant purposes, the organizations may not be sacrificing other priorities.

Some rural organizations propose marketing/audience outreach projects with the intention of raising matching funds from the results of the grant project itself, which might last as long as two years. For example, one rural organization applied for funding to participate in a regional tourism promotion, and anticipated enough new dollars from higher attendance to help meet the match.

Many rural grantees time their grant projects to coincide with a larger campaign that will bring in sufficient dollars to match the Endowment funding. Such events as anniversary celebrations or, in a recent case, the retirement of the founding director, provide opportunities to go to donors for increases in their usual levels of contributions.

Collaborations of organizations in rural areas are another source of match. For instance, a shared touring initiative or planning effort can generate revenue from a variety of sources—perhaps small amounts individually but significant when combined to meet the match.

While it is often difficult for organizations in small and rural areas to raise foundation and corporate gifts, they are sometimes successful in this regard, at times receiving one-time awards for special projects. Some rural organizations are national in reach and can tap into more traditional funding sources. Artists' colonies, for example, may be relatively small and isolated; however, within their artistic field, they have access to a few discipline specific foundations and even some specialized corporate funding. And small rural festivals have had success selling advertising to local businesses.

Question. How does the per capita receipt of grant funds by organizations in rural areas and small towns compare with those received by organizations in urban areas?

Answer. Of the eight states having a population of under 1 million (Wyoming, Vermont, Alaska, North Dakota, Rhode Island, Delaware, South Dakota, and Montana), the per capita receipt of grant funds ranged from a high of \$1.10 (Wyoming and Alaska) to a low of \$.68 (Montana). On average, these states received \$.90 per capita. The eight states having the largest populations (all over 9 million) (Michigan, Ohio, Illinois, Pennsylvania, Florida, New York, Texas, and California) averaged a per capita receipt of grant funds of \$.30. California, with the largest population (of over 31 million) received \$.26 per capita, and Michigan (the smallest of the eight with a population of 9.5 million) received \$.11 per capita.

Question. Is this difference attributable not to population, but due to the scarceness of funds necessary to meet the matching requirements?

Answer. The figures indicate that, regardless of whatever difficulty organizations in small and rural communities may have in meeting the grant matching requirements, their success rate at the Endowment is quite good. While the eight smallest states represent less than 3 percent of the Endowment's total number of applications, they comprise 4 percent of the total number of awards (and over 5 percent of total dollars awarded). Individually, these states averaged awards of just over 50 percent of applications they submitted. South Dakota had the highest success rate, with more than 83 percent of its applications funded, and Delaware and North Dakota each had more than 70 percent of their applications funded. Vermont was low-

est, with 33 percent of its applications funded. The average success rate for the country is 33.75 percent.

FUNDING SOURCES OTHER THAN FEDERAL

Question. What percentage of your annual direct grantmaking capabilities comes from private sources?

Answer. Only a minuscule percentage of the Arts Endowment's grantmaking capabilities is supported by non-Federal funds. For instance, in fiscal year 1995 less than 0.0033 percent of the Arts Endowment's grantmaking capabilities came from non-Federal, or private, sources; in fiscal year 1996 the amount was less than 0.12 percent.

Question. What dollar amount of private, state, and/or local funds was used to meet the matching requirements for NEA grants? How do these matching funds compare with total funding available for the arts? How does the amount of federal funding for the arts compare with the annual total investment in the arts made by all entities in the US?

Answer. Exclusive of matching funds for the Challenge Program (which requires a 3:1 match), in fiscal year 1996, 1,615 organizations met Endowment matching requirements, on average, with \$10 for every \$1 awarded by the Endowment, a dollar amount of \$559 million. In fiscal year 1996, the Endowment had a grantmaking budget of \$80,734,000, out of a total budget of \$99,470,000.

As noted previously, the most recent Giving USA report indicates that about \$6.6 billion total private giving to the arts in 1995. (Private giving figures are not yet available for 1996.) The National Assembly of State Arts Agencies reports that, in fiscal year 1995, the total legislative appropriation for the 56 state arts agencies was \$265,558,735. Americans for the Arts (formerly the National Assembly of Local Arts Agencies) estimates local government funding for the arts at \$650 million in 1995. The figures for state and local government funding are inclusive of program and administrative funding. In that same year, the grantmaking portion of the Endowment's budget was \$137,512,000, out of a total budget of \$162,311,000.

Question. When a donor targets a gift to a specific field, does the NEA use the gift funds to replace appropriated funds that would normally be used in making the grant in that field, or is the gift used in addition to the appropriated funds?

Answer. When a donor targets a gift to a specific field, the gift is used in addition to the appropriated funds, and not in place of appropriated funds. This is done to maximize the Arts Endowment's grantmaking funds. In light of the small amount of funds actually available through donations, as the figures in the prior answer indicate, few grants are made with donated funds in comparison to grant awards using appropriated funds.

Question. If the gift is used to replace appropriated funds, are the donors aware that their gifts may not be buying an increase in overall program level for that area?

Answer. Please see the answer to the previous question.

Question. Gift giving to the NEA was \$953,000 in fiscal year 1994, \$766,000 in fiscal year 1995 and \$960,000 in fiscal year 1996. What leads the NEA to conclude that giving will be lower in fiscal year 1997 and fiscal year 1998, at an estimated level of \$700,000?

Answer. In fiscal year 1994, the Arts Endowment convened its ART-21 Conference in Chicago, drawing participants from all over the country. The private funds received for the purpose of underwriting the ART-21 Conference are reflected in the total gift amount for that year, boosting that figure to \$953,000. In fiscal year 1995, the Arts Endowment focused on its own downsizing and reorganization. The Agency did not sponsor or convene any large events, as reflected in the total amount of gifts received in that year, only \$766,000. In fiscal year 1996, the Arts Endowment convened American Canvas, a series of six community-based meetings across the country, bringing together the arts community with civic, business, religious, government, education and community representatives to discuss topics designed to elicit concrete suggestions for how communities might best support arts at the local level in an era of dwindling public resources. The private funds received for the purpose of underwriting the American Canvas series are reflected in the total gift amount for that year, boosting that figure to \$960,000.

The Arts Endowment is not planning convocations similar to ART-21 or American Canvas for fiscal years 1997 and 1998. Prudence, therefore, dictates that the gift projections for fiscal years 1997 and 1998 should be closer to that of fiscal year 1995 than that of fiscal year 1994 or fiscal year 1996.

Question. What changes in legislative authority would be needed by the Endowment to solicit and invest private funds?

Answer. At a minimum, the Endowment's authorizing statute should specifically provide "solicit and invest" authority. At present, this statute allows only gift acceptance. Based on its gift acceptance authority, the Endowment has implied solicitation authority for seeking private funds. However, the Endowment at present has no investment authority.

Additional changes in legislative authority would be necessary in order to enable the Endowment to generate earned income (such as through operation of a gift shop, licensing of Endowment-related products, or other agreements with corporate donors to generate additional revenue).

Question. The Institute of Museum and Library Services was last year permitted to "solicit and invest" private gift receipts. Is the NEA proposing any language which would give it the authority to do the same?

Answer. The NEA has engaged in limited efforts to solicit funds since at least the early 1980's, and donations have been accepted since the creation of the agency. The ability to both solicit and invest would greatly enhance the agency's ability to attract private dollars to supplement the federal appropriation. The agency would welcome language such as that provided for the IMLS last year.

PARTNERSHIPS

Question. Describe your efforts to leverage federal funds through partnerships with other federal agencies, as well as state and local organizations.

Answer. At the beginning of fiscal year 1997, the National Endowment for the Arts had 25 formal agreements with other Federal agencies to participate in collaborative partnerships. Among these agencies are the Departments of Agriculture, Commerce, Education, Housing and Urban Development, Justice, State, Transportation, Health and Human Services, the General Services Administration, and the U.S. Information Agency. These partnerships are supported by \$3.859 million in funds from the other Federal agencies and \$2.069 million in NEA funds.

The Arts Endowment seeks to expand support for artists and arts organizations through Federal interagency collaborations to develop programs that specifically include the arts and that are jointly funded by the Arts Endowment and its Federal partner. Recent initiatives have notably involved "non traditional" Federal funding partners and a focus on the role of the arts in meeting the economic and social needs of communities.

In these cases the collaborations involve a pooling of resources for specific purposes. Examples of joint funding ventures include the partnership between the Arts Endowment and the United States Information Agency to support the Fund for U.S. Artists at International Festivals and Exhibitions; Pathways to Success, a collaboration with the Department of Justice, that supports after-school and weekend programs for at-risk youth, their families, and their community; and The Arts and Rural Development Assistance Agreement, a partnership between the Endowment and the Department of Agriculture's Forest Service that supports arts-based rural community development projects.

The majority of the jointly-funded interagency partnerships are supported by funds from other Federal agencies that exceed the amount of funds contributed by the Arts Endowment.

Question. Are you planning on starting any new interagency efforts in fiscal year 1998?

Answer. The number and focus of interagency agreements, the sources of their funding support, and the methods for their implementation vary from fiscal year to fiscal year. The program priorities of the Arts Endowment, the identified needs of artists and arts organizations, and unanticipated opportunities within the Federal sector all influence the development of interagency collaborations. Consequently it is difficult to predict the extent to which new Federal partnerships will be initiated in fiscal year 1998.

Under a new Federal partnership that will commence in late fiscal year 1997 and early fiscal year 1998, the Arts Endowment will be collaborating with the U.S. Department of Education's Safe and Drug Free Schools Program in Creative Partnerships for Prevention, a Drug and Violence Prevention Program for Youth Using the Arts and Humanities. This program includes development of a Resource Guide for use in schools and community programs; a national awareness campaign; a World Wide Web site; and demonstration sites establishing and modeling arts-based prevention programs using a collaborative approach. Support from the Arts Endowment will enable an additional seven youth arts programs to participate with the eight original arts and humanities programs as demonstration sites. Arts organizations, school personnel, community organizations, youth, and their families will be involved in activities supported by this partnership.

At the January 30, 1997, American Canvas National Forum, Secretary of Education Richard W. Riley announced five actions that the U.S. Department of Education and its partners are taking to support our schools through arts education and the Endowment's arts education initiatives that will continue in fiscal year 1998. They are:

- Two publications to provide information and ideas about how schools can more fully integrate the arts into their curriculum. Transforming Ideas for Teaching and Learning the Arts is an idea book about improving education in general and arts education in particular. The Guide for Arts Education and School Improvement Resources to help teachers, principals, local school leaders, parents' groups, and local and state arts leaders to learn about funding sources for arts education programs.
- An extension of the Department's partnership with the Arts Endowment to continue the work of the Goals 2000 Arts Education Partnership to the year 2000.
- An annual awards program to honor arts education and business partnerships to support quality arts education at the state and local levels and to encourage more of them.
- The recognition of outstanding schools, through the Department's Blue Ribbon Schools Program, that have used the arts to lift their school and their students to new levels of achievement and that are examples of excellence in instruction and student achievement.
- The creation of a task force with parents, educators, researchers, and the arts community to explore ways in which art and music can help young children and families reach the America Reads Challenge.

INTERNET ACCESS TO THE ARTS

Question. How will the NEA computer systems replacement project enhance the world wide web/internet capacity of the NEA?

Answer. Currently, the agency has virtually no telecommunications capability (e-mail or Internet access). Our Wang-based telecommunications system is outdated, outmoded, and limited to a few offices, and it has no direct link to any external networks. The computer systems replacement project spurred the launch of our World Wide Web site, which has been an extremely successful public information tool. Upon completion of the agency's local area network, the Endowment staff will eventually be provided with e-mail and access to the Internet. Access to the Internet most likely will be undertaken in collaboration with the National Endowment for the Humanities, which will defray costs for both agencies.

Question. What do you see as the future of arts access on the Internet? Are any of the arts education funds in the Department of Education budget used for this purpose?

Answer. The Internet will provide extraordinary opportunities for the public to have access to the arts through exhibitions, online workshops and classes, and other interactive programming. Along with the Department of Education and the Kennedy Center for the Performing Arts, the Endowment established and supports ArtsEdge, a national arts education network on the Internet. The Department of Education also supports GOALS 2000—which include the arts as part of a basic curriculum—and support materials on the Internet.

Question. Is access to the arts improving through the use of the Internet?

Answer. Yes, but further progress is needed in two areas: more people need access to the Internet—most people cannot are without it at this time—and more arts resources must be developed and made available on the Net. Many arts organizations have begun to move online with Websites and other Internet resources, but most don't even know how to begin. Open Studio, an Endowment initiative with the Benton Foundation, is placing free public access sites in cultural organizations in all 50 states. The initiative is also establishing 10 national web mentoring centers throughout the country, training hundreds of arts organizations and artists to become content providers for the Internet. The NEA's own Website has received nearly 3 million hits since its launch in April 1996, and usage is increasing dramatically.

Question. Is the Internet used by the NEA or its grantees as a way to reach underserved communities?

Answer. Yes. Open Studio is placing access sites in all 50 states, with an emphasis on communities in rural and inner city neighborhoods traditionally defined as underserved. Furthermore, by establishing web sites, our grantees are making their programming available to anyone with access to a computer and connection to the Internet. We have had people accessing the Endowment's web site from all 50 states and around the world and our supposition is that some of those visitors are from underserved communities.

Question. Do you coordinate any grant monies with the Institute for Library and Museum Services in their grant programs?

Answer. We work with the Institute for Library and Museum Services to insure that both agencies are not providing funds for the same projects. In addition, our application form specifies that applicants may not use other Federal grants as match for our grants.

INITIATIVES

Question. The foundation for the American Canvas project was that communities must take the primary responsibility to support their nonprofit arts. What benefits have the communities which participated in American Canvas seen to date? How will the communities continue to leverage their new knowledge and relationships?

Answer. The American Canvas forums brought together more than 150 national leaders as panel participants representing the arts, education, business, government, consumer organizations, civic groups, religious organizations, and foundations to determine the value of the arts in communities and how to build a solid infrastructure for the arts in America's communities. Each of the six privately funded forums explored a different aspect of the successful integration of the arts into communities. The hosting communities were chosen for their leadership in the development of innovative strategies for supporting the arts.

As a result of the dialogue that took place at the various sites, a national steering committee formulated ten "Calls to Action," one relating to each of the six forum topics and four which emerged as general concerns in all six forums. In January 1997, a committee of 100 leaders representing a variety of sectors reviewed the Calls to Action and discussed specific ways in which their organizations and sectors could work together nationwide to assist communities in ensuring an arts legacy for future generations.

American Canvas participants identified a number of revenue sources for the arts across the country, many of which may be suitable for replication elsewhere. Just as traditional percent-for-art programs (in which a small portion of federal, state, or local construction expenses are earmarked for the incorporation of artworks and other cultural amenities) have brought millions of dollars to the arts, other dedicated revenue streams are being developed, often tapping "nonarts" funds in the public sector to fund cultural activities. These include hotel/motel taxes and entertainment/recreation taxes; revenues from lotteries and gambling taxes; vanity license plate sales; and sales taxes (where a percentage of the sales tax is dedicated to the arts).

Additionally, American Canvas participants identified cultural tourism as an important way in which cities attract visitors and are thus devoting a portion of their convention and visitors funds to cultural activities. Cities have also used cultural facilities as community revitalization tools and are able to secure economic development, housing, and transportation funding to support these activities.

These and other federal programs, such as the funding for arts in rural areas through the Forest Service and the Department of Agriculture and funding for job training in the arts through the Department of Labor, along with many private sector programs, were all ways the American Canvas participants believed would help to strengthen a community's infrastructure around its nonprofit arts. These ideas, and others, and strategies for implementation are being shared with the participating communities and others. Most important, however, for the participating communities is that a cross-sector dialogue was begun at American Canvas which can be built upon and enhanced for the purpose of creating a broad and sustaining infrastructure for the community's nonprofit arts.

Question. Since the program began in 1986, over 300 cities have been represented at the Mayors' Institute. Briefly, please describe the impact the Mayors' Institute has had on those cities.

Answer. The Mayors' Institute on City Design introduces mayors to the cultural and economic value of good design in the public realm and teaches them effective techniques for promoting wise public and private sector investment in their cities' built environment. The Institute also addresses the design process as an exercise in participatory democracy, which can give citizens an opportunity to work together to determine the future of their collective home. The following are just a few examples:

—Former Fort Worth, TX, mayor Kay Granger (now a member of the U.S. House of Representatives) gained the confidence in her own design judgment necessary to veto a proposal for an addition to the city's main public library that she thought looked like "a chain store in a strip shopping center." She insisted on a process through which citizens could express their opinions about "what a li-

brary should be and how it should function.” Eventually, the city built a facility that the mayor reported “fit our downtown, fit our vision; this public building is beautiful and the people are proud of it.”

- Mayor Jan Laverty Jones of Las Vegas, NV, asked the Institute for guidance in creating a “gateway” to the city’s historic downtown and revitalizing Fremont Street, birthplace of Las Vegas’s casino industry. The mayor was advised that it takes more than a gateway to make people go through it, and that she should concentrate on creating a destination that reflected the city’s unique character. The result was the “Fremont Street Experience,” a multimedia sound and light show that has attracted millions of dollars of new investment in the surrounding area. Whereas only 20 percent of visitors to Las Vegas once visited downtown, now 80 percent do.
 - Only a few weeks ago the City of Boise, ID,—at the urging of Mayor Brent Coles, who participated in the Mayors’ Institute in 1994—sponsored a retreat for elected officials in the region of Idaho known as the Treasure Valley. The Treasure Valley is experiencing dynamic population growth that is putting extreme pressure on public resources while threatening the region’s quality of life. The format of the retreat was based on that of the Mayors’ Institute and resulted in a signed partnership agreement, drafted by the officials themselves, that promised cooperation among the communities in the Treasure Valley in developing plans that will allow new development while protecting those qualities that make the region special to those who call it home.
- Other reports from Mayors’ Institute alumni include:
- Mayor Bill Johnson of Rochester, NY, is transforming an abandoned super-market building in a low-income neighborhood into an anchor for a mixed-use commercial development that will create a new neighborhood center.
 - Mayor Nancy Graham was recently featured in the New York Times for her efforts to revitalize West Palm Beach—efforts to which she credits her Institute experience.
 - The Civil Rights District of Birmingham, AL, was honored by the National Trust for Historic Preservation, in recognition of a project that evolved from Mayor Richard Arrington, Jr.’s participation in the Mayors’ Institute.
 - Mayor Rick Mystrom of Anchorage, AK, is using a museum expansion as a catalyst for downtown revitalization.

ESTABLISHING ARTS ENDOWMENTS

Question. Please explain how NEA funds are used to assist grantees in establishing self-sustaining endowments or to establish cash reserves.

Answer. The National Endowment for the Arts awards Stabilization grants to create or augment endowments and cash reserves. These grants assist arts organizations in two ways: Federal funds are used to create or augment the endowment or cash reserve; and, Federal funds are used to leverage matching funds. Typically, grant recipients are conducting large, multi-year capital campaigns. The traditional capital campaign model has two phases, leadership (sometimes referred to as the quiet phase) and public. Solicitations in the leadership phase are made to board and capital campaign committee members as well as close friends of the institution. The public phase involves solicitations of individuals and organizations less closely allied with the cultural institution. Generally, the public phase of a capital campaign is the most challenging and difficult stage. Stabilization grants can be very effective in leveraging non-traditional donors to give at a significant level.

Due to the technical nature of endowments and cash reserves, the agency takes additional measures in the review of such applications and grants. Independent management assessments are conducted on all Stabilization applications recommended by discipline panels. This assessment analyzes non-artistic factors of the application which relate to the applicant’s ability to carry out the project as well as the potential impact of the proposed grant. Staff members with expertise in non-profit accounting monitor endowment and cash reserve grants. In addition, it is required that grantees take the necessary legal measures to ensure that endowments and cash reserves will be held intact for ten years following the grant end date. These legal documents are reviewed by the agency’s Office of General Counsel.

TRUE ENDOWMENT FOR NEA

Question. Has the NEA sought a federal endowment for itself?

Answer. NEA supports the concept of establishing a true endowment at the Federal level. Testimony offered by witnesses in a 1995 Senator Labor and Human Resources Committee hearing suggested that to maintain the at-that-time current level of NEA grantmaking (\$130 million per year) would require a corpus of about

\$2 billion to \$4 billion, depending on projected long-range rates of inflation and interest. NEA would support the capitalization of such an endowment either through the appropriations process or by means of dedicated funding sources such as the reception of a portion of copyright fees or proceeds from a national lottery.

The agency strongly supports the efforts of individual state arts councils to establish self-supporting endowments. The state of Delaware, for instance, recently completed a multi-million capital campaign to establish such a permanent endowment, and the NEA provided a \$750,000 Challenge Grant early on as seed money.

Question. Does the Endowment seek to learn from and offer insights to executives and staff from other endowment and philanthropic entities in the form of details and exchanges?

Answer. There are many occasions, both formal and informal, in which various members of the Endowment staff are in communication with executives and staff from other endowment and philanthropic entities. Periodic meetings with groups of grantmakers have been held at the Endowment with the Chairman and senior staff. Staff members have attended regular meetings of Grantmakers in the Arts. Individual meetings on specific issues and questions take place regularly. There is communication and an exchange of ideas and experiences on a continuing basis.

NATIONAL ENDOWMENT FOR THE HUMANITIES

STATEMENT OF SHELDON HACKNEY, CHAIRMAN

BUDGET REQUEST

Senator GORTON. We will now hear from Dr. Hackney of the National Endowment for the Humanities.

Dr. Hackney, you have suffered the fate of almost all second witnesses.

Dr. HACKNEY. I am used to it, Mr. Chairman.

Senator GORTON. In committee hearings, the attendance is not as great now. You are nonetheless, of course, welcome, and I want to join in the comments of some of my colleagues earlier in expressing our regret at your departure.

I am sure you have always regarded yourself more as a teacher than anything else, and you will look forward to going back to that career and we hope and wish for you great success there, and we thank you for your service to the National Endowment for the Humanities.

But before you go, we would like to hear from you today. We would especially like to hear from you about your search during this difficult period of time for different, better, and more effective ways of carrying out the functions of the Endowment, so that we will be happy to listen to your opening statement.

SUMMARY STATEMENT OF DR. SHELDON HACKNEY

Dr. HACKNEY. Thank you very much, Mr. Chairman. I appreciate very much the opportunity to come and speak with you this morning.

I am leaving Washington at the end of my term at the end of July, so I have been thinking perhaps a little bit more than usual about what the last 4 years has meant to me, and what we have been able to do at the NEH.

Given the shortage of time, I would prefer not to read my statement.

Senator GORTON. Your statement will be included in the record.

Dr. HACKNEY. Thank you very much, and I will even be very brief in my oral remarks, so perhaps we can talk about the things that are of most interest to you. But I would like to say a word about the National Conversation on American Pluralism and Identity, and also maybe a brief word about a couple of the other priority programs that the NEH has been engaged in recently.

The National Conversation on American Pluralism and Identity is the most significant special project that we carried out during my tenure. It is one in which I was deeply interested myself, and it is a project that has stimulated now 3 million Americans to think

more carefully about the meaning of being an American, about what values hold us together as a country.

Most of those people were brought together on the Internet and by television and radio, but the meat and potatoes of humanities program are reading and discussion groups, and about 80,000 Americans have been engaged with each other in reading and discussion groups in intensive face-to-face conversations.

The need for the National Conversation was apparent to me at the outset of my tenure here at the National Endowment for the Humanities, and I believe this need is felt by most Americans today. That is, a sense of fragmentation, a sense that as a society we have been drifting apart from each other, that the bonds that tie us to each other, bonds of mutual responsibility, have been loosening of late. It was that sense of atomization that made me think that one thing the NEH could do was to use the power of the humanities to bring people together and to inform their thought about their connections with each other and about the meaning of their society, and we have done that.

Let me say, this drifting apart is something that has been going on in America for 25 or more years. It has gone on through economic cycles, up cycles and down cycles. It has gone through Republican and Democratic administrations in Washington. It is not related, basically, to those. It is responding to more fundamental forces in our society.

I will not give you my 50-minute lecture that I am going to be authorized to do soon about why we have been having this sense of fragmentation for the past 25 or more years, but briefly it is in response to the social revolutions that occurred in the 1960's, both the good aspects of those rights movements and also some of the darker aspects of the sixties, the friction that occurred in society.

But more fundamentally, it is society responding to the new situation in the world, to the technological revolution that we are still living through, to the global marketplace that makes us all feel uncertain about our jobs in the future, and to the end of the cold war that makes the geopolitical situation less predictable than it was.

For all those reasons, those four collections of reasons, if you will, we have been sort of drifting apart from each other. And public opinion polls show that. Lou Harris, for instance, has a poll in which he asks respondents whether they have little confidence, some confidence, or a lot of confidence in a long list of American institutions—the Presidency, the Congress, the press, universities, the clergy, and so on.

What is interesting about that poll is not the particular pecking order of institutions within American life, but the fact that the level of confidence that Americans feel in those American institutions rise and fall together. They started falling precipitously in the 1960's. They drifted down further through the 1970's. There was a brief spike upward in the first Reagan administration in the early eighties, then they resumed their decline through the late eighties to today.

Now, I think that decline is something to worry about, but we ought not to think that it is because of the performance of any of those institutional sectors of American life. That is a surrogate

measure, if you will, of something that is more fundamental that is going on in American life.

One other bit of evidence of that is that we know from polls as well that Americans are less trustful of each other than they were 25 or 30 years ago. We have polling data that shows that.

THE NATIONAL CONVERSATION AND CIVIL SOCIETY

So this sense of fragmentation has been going on for a long time. NEH launched the National Conversation on American Pluralism and Identity to bring Americans together to talk and think and listen to each other about what pulls us together in our very diverse society. We were doing this before Robert Putnam, the Harvard professor who made himself and the issue famous in his article called "Bowling Alone," in which he quantified the drop in American participation in voluntary organizations.

And, thus, civil society as a concept became very interesting to intellectuals and journalists, and a great debate, a healthy debate has been going on since that time about civil society—that is, the nongovernmental, nonprivate, noncommercial sector of American life. The National Conversation is in that sector, and we have been bringing Americans together.

Now, I think the good news from the conversation is that Americans are eager to talk to each other about what holds us together and about what divides us, as well. They are eager to work with each other across all of the usual divides of our culture—that is, race, class, gender, ethnicity. All of those dividing lines find Americans willing to leap across to work with other Americans from different backgrounds on common problems or on mutual understanding. That, I think, is very good news.

Americans, as our conversation results show, like the fact that we are a diverse country, but they worry as Americans frequently have, about our cohesiveness. I think that is a healthy worry, because it means that in this traditional tension between individualism and community in America, that Americans now are worrying that we are not paying enough attention to community, and I think that is good.

The bad news is that we know also from polling data and from participation in the National Conversation that there are worryingly large levels of negative stereotyping in America. People in each group, each cultural heritage group, have negative stereotypes of members of other cultural heritage groups. When one speaks of race in America these days, one cannot simply mean black-white relationships. It is a multicultural problem, if you will, and multipolar, as well.

Americans want there to be a common identity that all Americans have, and have equally. They want an arena, a large area of American life in which all Americans come just as Americans, and in which they are judged by the same criteria as all other Americans.

At the same time, they want to honor their own particular cultural heritage. They want to be both and that is the sort of thinking that we have to learn to do in the future.

THE CONVERSATION AND AMERICAN VALUES

It is clear from the conversation, and as one would learn as a student of American history, that the core of the values that hold us together as a society are those values that were enunciated by the Founding Fathers in the Constitution and the Declaration of Independence. They are the values of self-rule and the values not only of individual rights but also of democracy.

It is America as an idea of democracy. It is the fact that we committed ourselves as a nation at the outset to both liberty and equality. Those two things do not always pull in the same direction, and they change their meaning as new circumstances occur, so it is the working out of the meaning of liberty and equality in American life that is the great challenge of the future.

Let me bring to your attention a young, phenomenal golf pro named Tiger Woods who has caused a good bit of a stir lately, having just won the masters at the age of 21, the youngest champion ever. He is interesting, because he is frequently spoken of as an African-American, yet he has now begun to remind reporters that that is not an accurate description of him.

His mother is Thai, a Thai-American. His father is African-American and American Indian and some Irish, so he is a multicultural American, and he wants not to be known by any one of those components but by all of them. He wants to be an American and all of those other things at the same time. That is something that most Americans agree to and think is right and proper.

So I find the meaning of America that comes out of the National Conversation to be our commitment to the idea of democracy. I think that is broadly and widely shared, but it needs to be brought to the surface by Americans, among Americans as they think about the meaning of their lives and what holds them together.

To be sure, there are other common traits that Americans have that we could probably have difficulty identifying and agreeing upon, but they are there. Most Americans, and certainly foreigners, recognize Americans all the time by their behavior and by the things that they hold dear: by their individualism, for instance, and by their self-reliance, and by their tolerance. Those things are characteristics that go into an American national character.

So I think the National Conversation has been enormously successful as well as valuable for the country, and I am pleased that we did it. I am in the midst of preparing—it is almost completed—a report to the Nation that will be published before I leave NEH. You can hurry right now and make your reservations at the Government Printing Office for your copy. It should be interesting, and it really is an extended essay as well as a statistical report on the conversation.

TRANSITION TO A LOWER BUDGET

Finally, let me say that despite the fact that our budget was cut dramatically in 1996 by 36 percent, we have made the transition to the lower level with a great deal of pain, but also with a great deal of pride as well.

We have been able to do some new things, to focus anew on the quality of humanities education, and on getting the humanities

into the new technological era, into the digital age, if you will, in various ways.

PREPARED STATEMENT

We have been doing that with great imagination. We are not doing business as usual. We have been finding partners outside the Endowment to help fund programs that we think are important. We will continue to do that, and we have begun to operate even a little bit differently within the Endowment.

So even though we are smaller we are no less important to the humanities and the Nation, and I thank you for your support, Mr. Chairman.

Senator GORTON. Thank you, Dr. Hackney. That was as fascinating an opening statement as I have heard in some time, and I solicit from you the full 50-minutes worth when it is in print. I will be delighted to read it.

Dr. HACKNEY. Thank you.
[The statement follows:]

PREPARED STATEMENT OF SHELDON HACKNEY

Mr. Chairman and Members of the Committee: It is an honor to appear before this Committee once again to speak on behalf of the National Endowment for the Humanities. I welcome this opportunity to discuss the agency's fiscal year 1998 budget request and to speak with you about some of the ways the Endowment contributes to the educational and cultural life of the Nation.

I would first like to tell you how pleased we at the Endowment were for President Clinton's strong statement of support in his State of the Union Message to Congress in February. Speaking of the importance of building a vital national community, the President reminded us that "the enduring worth of our nation lies in our shared values and our soaring spirit" and called for continued support of the federal government's efforts to advance the humanities and the arts. I know that this Committee, as it has shown over the years, also shares both the President's affirmation of the importance of the humanities and of the role the Endowment plays in providing a national focus to efforts to help promote them.

The American people have every reason to be proud of NEH's more than three decades of accomplishments in pursuit of its mission. Those accomplishments would not have been possible without the strong bipartisan support of Congress. The Endowment's grants to educators, scholars, and institutions across the Nation have helped to preserve and strengthen our cultural heritage. NEH exists to encourage humanities activities of truly national significance. Among the many outstanding examples of projects that Federal funding of the humanities has made possible are the documentary editions of the papers of presidents of the United States, summer seminars and institutes for teachers to revitalize their teaching of the humanities, educational films for television like Ken Burns's pathbreaking series on the Civil War, touring museum exhibitions like the recent "Splendors of Imperial China" show at the National Gallery of Art, efforts to preserve historically important brittle books and newspapers, and the work of the individual state humanities councils across the country that, in partnership with NEH, annually enrich the lives of millions of Americans.

We are pleased that the President has requested an appropriation of \$136 million for the agency for fiscal year 1998. While this request represents an increase over our current funding of \$110 million, it is still far below the \$172 million budget the agency had just 2 years ago. The cumulative effect of these 2 years of reduced funds has been to place an extraordinary strain on the Endowment's programming and operations—the number of grants we have been able to make has plummeted by about two-thirds and the award amounts for most of the projects we have been able to support have had to be pared down considerably. Make no mistake: This deep cut in the NEH budget has resulted in a dramatic reduction in the availability of high quality humanities projects and programs for the American people and is eroding the humanities infrastructure that NEH worked hard to help build over the last 30 years. The fiscal year 1998 funding request we have presented to Congress is de-

signed to restore part of what we lost and to address specific needs in the humanities.

Despite the present dire state of our funding resources, I want to assure you that the Endowment remains a vital national proponent and supporter of the humanities, that we are eager for the future, and that we will continue to search actively for ways we can better serve the American people. In recent years, for example, we have recast our relationship with the state humanities councils into a new Federal/State Partnership that has opened up fresh opportunities for the Endowment and the individual humanities councils to work more closely together in our shared mission of providing thoughtful, stimulating humanities programming for all the nation's citizens, reaching into every community in all 50 States and six special jurisdictions.

Our budget justification describes in some detail our current activities and our plans for fiscal year 1998 and the coming years. I'd like to take a moment of the Committee's time to discuss a few of these items with you today.

One critical way the Endowment helps to preserve and to extend access to our cultural heritage is through the financial support we provide for teams of scholars to produce documentary editions of the papers of important people and seminal events in our Nation's history. By searching out and drawing together documents from thousands of repositories nationwide, editions projects make available important materials for the first time. Included among these projects are editions of the papers of Benjamin Franklin, Thomas Edison, Dwight Eisenhower, and Martin Luther King, Jr. Such large-scale editorial projects have a tremendous intellectual impact and are truly the building blocks of research. For example, historians have used the NEH-supported multi-volume edition of the Journals of Lewis and Clark to publish more than 20 books on different aspects of the expedition. Similarly, NEH support for the publication of 32 volumes of the papers of George Washington has helped to make these essential primary source materials more widely available to students and scholars of Washington and the American Revolution. Indeed, the eminent historian of the nation's early period, Edmund S. Morgan, has hailed the editions of the papers of the "founding fathers"—which have been made possible, in part, by funding from NEH—as the "major scholarly achievement of American historical scholarship in this century."

Because of drastic cuts in funding for NEH, however, we find ourselves in the difficult position of not being able to support a number of worthy editions projects we have been supporting over the years. These are projects that make up an important part of our American Legacy. The nation thus will lose not only the investment we have already put into them, but will also forfeit their rich compilation of knowledge.

To address this situation, we are proposing at our \$136 million fiscal year 1998 budget request level to implement an American Legacy Editions special initiative that would more than double the amount we are now able to provide to these projects, which would help ensure the continuation of these important undertakings. Under this special competition, projects would be provided with a combination of outright grants and the offer of "matching grants" from the Endowment, which would help support operating costs and greatly speed the projects to completion, and endowment-building Challenge Grants, which would help projects invest funds that would generate future operating income. We estimate that if this initiative were continued at this higher funding level for the next decade, these projects could be sustained and placed on a sound financial footing.

Another area that is commanding a great deal of our attention and our creative thinking involves the relationship between the humanities and the new electronic information technologies. While NEH has long supported innovative humanities projects that use CD-ROM's, the Internet, and other digital formats, the additional funding the agency is requesting for fiscal year 1998 will enhance our national leadership role in preserving, digitizing, and disseminating important cultural and historical materials. We are in fact currently drafting a special report on the humanities and technology, which we expect to issue later this spring, but I would like to mention one or two examples of the kinds of things the Endowment is now doing and plans to do more of in the future.

In 1996, the Endowment launched a special three-year special initiative, Teaching with Technology, that is helping to develop and introduce students to rich humanities content via CD-ROMs, the Internet, and other electronic technologies. The first grant deadline of this programming initiative yielded more than 300 proposals from schools and organizations across the nation, but scarcity of funds limited us to funding only a small number of projects. Included among the grants we were able to make was a project at Northwestern University in Evanston, Illinois to develop and deploy a multimedia database on the history of the United States Supreme Court. Recently included on the World Wide Web, <<http://oyez.at.nwu.edu/oyez.html>>, the

project is enabling students from around the country, and the world, to learn more about this nation's highest court. The project reports that "visits" or "hits" at this web site are averaging a stunning 250,000 per month. The Endowment also supported a project under this initiative at Miami University in Ohio that is helping teachers of Latin use electronic resources in their classrooms and a project at the University of Virginia involving the use of CD-ROMs and the Internet to teach the history of the American Civil War. With the funds requested for fiscal year 1998, we would be able to build on these successes by putting in place another special programming effort for projects that will jump start the process by which schools and their teachers become more competent, and comfortable, with these new humanities materials and technologies.

In this context, I know that the Committee will also be excited to hear about a major new partnership the Endowment has just entered into with the MCI Communications Corporation and the Council for Great City Schools (CGCS). MCI has committed \$500,000 over two years to help create a new website, called "EdSiteMent," that will provide one-stop shopping for teachers, students, and parents who are searching for high quality educational materials in the humanities on the Internet. Drawing on the Endowment's acknowledged experience in supporting projects in this area and using our respected peer review process, a Blue-Ribbon panel composed of leaders in government, business, and education and parent organizations will select the materials for inclusion on the "EdSiteMent" website. NEH will also develop teacher guides for using the website in the classroom and the Council of Great City Schools will set up a hotline for teachers in need of assistance. We hope this public/private partnership will be a model for many other such endeavors in the future.

The Endowment also intends to continue and to extend the national leadership we provide for efforts to digitize and make more accessible such important humanities texts and documents as the Dead Sea Scrolls manuscripts, ancient Egyptian papyrus fragments, the entire surviving corpus of ancient Greek texts, and the works of Shakespeare. Such projects will ultimately offer students, researchers, educators, and the general public electronic access to a rich array of original texts and supporting documentation pertaining to the roots of Western Civilization.

Shifting gears slightly now, I would also like to tell you briefly about another programming initiative called My History is America's History. The Endowment's new Office of Enterprise, which is serving as a focal point for NEH's efforts to extend the reach of its programs, is coordinating the development of this effort. The initiative is designed to encourage Americans to learn more about the history of their families and to relate this history to the broad sweep of events and trends in American history and world history and will serve as a wonderful record of community history. We think this program has the potential of bringing the humanities into the lives of a broad segment of the public, which has been one of my primary objectives as Chairman of NEH. I should also mention that our Enterprise Office has been active on a number of other fronts, particularly our efforts to build partnerships with other organizations to promote the humanities like the MCI/NEH/CGCS "EdSiteMent" website I have already mentioned and the joint arrangement we made last year with the Andrew W. Mellon Foundation to support humanities fellowships at independent research centers.

In addition to this sampling of some of the special features of our fiscal year 1998 budget submission, I want to stress to you that the Endowment will also be continuing the support we provide for areas of the humanities where the need is greatest and where our leadership can continue to have the greatest impact: humanities education, the preservation of endangered research resources and artifacts, scholarly research, public programming, and the leveraging of private contributions to humanities projects and institutions.

We will continue to help improve the quality of education in America by providing opportunities for teachers of the humanities to renew and strengthen their knowledge in their fields. The Endowment believes, and has long operated on the premise, that there can be no more productive use of the nation's resources than to invest in quality education. Each year, in fact, NEH supports a broad array of seminars and institutes that are attended by thousands of school teachers and college teachers from all over the country. The ultimate beneficiaries of such seminars and institutes are the hundreds of thousands of American students—in rural, inner-city, and other classrooms, as well as in colleges and universities—who annually are taught by these teachers. In the past twenty years, NEH seminars and institutes in the humanities have reached more than 50,000 teachers in every state of the union; these teachers have in turn reached more than 7.5 million students in the first year after their seminar, not to count subsequent students who will also benefit.

The Endowment's projects that advance learning in the humanities make a profound and sustained impact on the lives of teachers and, by extension, on their students. Every year in fact we receive many statements from teachers who have attended NEH-supported seminars or institutes testifying to the impact of this experience on their teaching. For example, a public school teacher from New Jersey who attended last summer's seminar at Kenyon College in Gambier, Ohio, on "The Poetry of Wordsworth and Keats" recently wrote: "I could have read Wordsworth and Keats for an entire lifetime in my own home and I would not have been able to gain the knowledge that I acquired during the four weeks that I spent at Kenyon College * * * [I]t has had a great impact on my performance in the classroom overall. I have been rejuvenated [and] my children are still excited when I tell them about it. In an area that does not value education as much as it should, I can see that my love of learning and my quest for knowledge has had an impact on their way of thinking."

The effectiveness and impact of the Endowment's comprehensive efforts to preserve and broaden access to historical materials vital to our cultural heritage have also been broadly recognized. NEH is in fact the acknowledged national leader in the movement to preserve cultural resources that are in danger of being lost forever because of the high-acid content of the paper on which they are printed or the improper way they have been stored and handled. This effort has produced impressive results: Over the years, NEH has helped to preserve 750,000 brittle books and 55 million pages of American newspapers on microfilm and to improve the storage of 27 million objects of archaeological, ethnographic, and historical importance held in American libraries, museums, and archives.

In recognition of our importance as a national coordinator of preservation efforts, the Board of Directors of the Association of Research Libraries recently commended "the overwhelming success of the NEH preservation program in preserving the nation's heritage and culture" and hailed the Endowment's effort "as a critically important program to ensure the preservation of and access to important * * * materials that are vital to our nation's ability to function as a democracy." The fiscal year 1998 NEH budget request would help NEH quicken the pace of these preservation efforts that have slowed considerably in the last two years because of reductions in the agency's budget.

The Endowment is also a critical national source of support for important research and scholarship in the humanities. NEH grants to American scholars have resulted in thousands of books and articles that have added to our storehouse of knowledge of the past and have garnered hundreds of nationally recognized awards, such as Pulitzer Prizes, including the recently announced 1997 Pulitzer Prize for History; Bancroft Prizes; and National Book Awards.

NEH has long been a crucial funder of such major scholarly undertakings as the compilation of dictionaries, historical and linguistic atlases, and encyclopedias. These complex projects—which will serve as intellectual tools for future scholars, students, and general readers alike—do not have ready access to corporate, private, state, and local sources of funding and thus must rely on NEH support to continue their work. One such project that received a good deal of publicity recently is the NEH-supported archaeological team in Virginia that discovered and excavated the original Jamestown fort constructed by English settlers soon after their arrival in the New world in 1607. This fort, long thought to have been destroyed by erosion, shows promise of adding to our knowledge and understanding not only of the aspirations of the English in the New World, but also about their encounter with Native American groups. The Jamestown archaeology project serves to remind us that collaborative research in the humanities, as in the sciences, typically involves substantial start-up costs and requires sustained support over many years. The project also is a model of how NEH matching funds can be used to leverage third-party funding—in this case, from the National Geographic Society—in support of basic research.

One of the most rewarding experiences of my tenure as Chairman of NEH has been to observe firsthand the many ways the agency helps Americans learn more about their heritage, their culture, their past. Each year, for example, the individual state humanities councils, working in partnership with NEH, reach millions of people in libraries, Chautauqua-style tents, historical societies, grange halls, church basements, and senior citizen centers with quality humanities programs and presentations.

Additional millions of Americans are also touched by national projects supported directly by NEH. Our funding makes possible such critically acclaimed television documentaries as the Ken Burns films and biographies of presidents Eisenhower, LBJ, and FDR. Three of the four blockbuster series that opened last fall's PBS television line-up were NEH-funded films: "The West," which recently won a coveted

George Foster Peabody Award, "The Great War and the Shaping of the Twentieth Century," and the four-hour documentary on the life of President Theodore Roosevelt. The Endowment also supports media projects that illuminate other aspects of our national heritage, such as an award we made recently to the Institute of Language and Culture in Alabama to develop a six-hour radio series—*In Their Own Voices: The WPA Ex-Slave Narratives*—which is drawing on the more than 2,000 interviews of ex-slaves gathered through the 1930's WPA Writers Project.

The fact that the Endowment's public programming efforts have a distinct impact on the cultural life of America is also demonstrated by the millions of Americans who annually visit or participate in NEH-supported humanities projects and by the geographic breadth and diversity of these projects. Currently, there are 147 educational exhibitions on humanities subjects and themes open to the public that will be seen during the course of their travels at more than 400 small and large museums, libraries, and other cultural institutions nationwide. The Anchorage Museum of History and Art and the Coastal Yukon Mayors Association, for example, received funding to mount a traveling exhibition of Yup'ik Eskimo masks drawn from the Arctic collections of major American and European museums. This exhibition, which explores the use of the masks in dance and ceremony, opened in the small rural Eskimo village of Toksook Bay in Alaska, traveled to the regional center of Bethel, and then went to Anchorage, where it was seen by nearly 200,000 museum visitors. It is now en route to museums in New York City, Washington, D.C., and Seattle.

Another example of the way NEH brings an essential national perspective to public humanities programming is the exhibition, "Barn Again!," which examines the barn as an agricultural structure, a monument on the American landscape, and a symbol of community and rural life. With funding from the Endowment and spearheaded by the Utah Humanities Council in cooperation with the humanities councils in Alabama, Georgia, Oregon, Ohio, West Virginia, Illinois, and Missouri, the exhibition and allied public programs are being presented at thirty-two small rural museums throughout these states, including the West Virginia communities of Mannington, Point Pleasant, Weston, and Elkins.

As part of the agency's overall efforts to broaden Americans' access to the humanities, in fiscal year 1998 the NEH Challenge Grants program will sponsor a special initiative for public libraries to help them build endowments to strengthen their humanities programming. To make fund-raising more feasible for these institutions, particularly for public libraries located in rural areas or inner cities, the program will require only a two-to-one match under this initiative, rather than our standard three-or four-to-one match. NEH Challenge Grants are the Endowment's principle means for leveraging private support for the humanities.

The Endowment remains the catalyst nationwide for private support for the humanities. When NEH awards a grant, by virtue of our rigorous merit review process, it also certifies to other potential funders the high quality of the project. As the Secretary of the Andrew W. Mellon Foundation, one of the nation's largest independent foundations, has stated: "[T]here is little doubt that many non-federal donors welcome the opportunity for joint support of projects with NEH * * *. Far from discouraging non-federal support for the humanities, NEH has stimulated private philanthropy."

Finally, I thought the Committee would be interested in a progress report on the national conversation. NEH's role in the initiative, as a funder, has drawn to a close, and we are now preparing a comprehensive report to the nation. This report will be not so much a statistical or quantitative assessment, although there will be much of that in it, but rather it will try to convey a sense of what was said in the conversations that took place in the more than 140 communities in 42 states, the Virgin Islands, and the District of Columbia over the life of the initiative and what conclusions one can make about Americans' many thoughts and opinions about the pluralistic nature and identity of their nation. We will publish and widely distribute the report sometime this summer.

In closing, I must return once again to the issue of money. While the Endowment continues to forge ahead and to think creatively about ways we can continue serving the American people, it is also true that we need sufficient financial muscle to bring our plans to fruition. As small as NEH's budget is, the Endowment is still the single largest national source of funding for the humanities. The Endowment's work is a necessity, not a luxury. Indeed, many recent studies and public commentaries have indicated that the private sector and foundations can not and will not shoulder the burden for a diminished NEH. Our fiscal year 1998 budget request, which is tailored to the plans and program emphases I have discussed in this statement, represents a prudent investment that a great nation such as ours must make in activities that support the unglamorous but critical task of preserving America's heritage and sharing it with the American people. I can think of no nobler purpose.

PREPARED STATEMENT OF SENATOR COCHRAN

Senator GORTON. Due to a previous commitment, Senator Cochran was unable to attend the hearing, I have a prepared statement which will be inserted into the record at this point.

[The statement follows:]

PREPARED STATEMENT OF SENATOR COCHRAN

Mr. Chairman, I join you in welcoming Dr. Sheldon Hackney and I congratulate Dr. Hackney, and take this time to let him know we have appreciated his service as Chairman of the National Endowment for the Humanities. This week he announced his intention to return to the University of Pennsylvania to teach history.

The National Endowment for the Humanities is better for his tenure. A scholar in history, he is sensitive to the importance of not only the study and preservation of our past, but making sure that study is modern, and that we cultivate our foundation for the future. The Teaching With Technology Grants, first awarded last year, will aid in the new development of materials for classroom use with state-of-the-art equipment. This is an important contribution to our society. We need innovative support such as this, in order to keep up with the technology, train our teachers, and prepare our students.

This is vision. Dr. Hackney has provided excellent guidance and good vision. I thank him, and wish him well.

PUBLIC SERVICE AND THE TEMPER OF THE TIMES

Senator GORTON. With that, Senator Bumpers, with all of your patience I will let you ask any questions that you have now.

Senator BUMPERS. Since I am the only one who has stayed with you?

Senator GORTON. Yes. [Laughter.]

Dr. HACKNEY. There is a metaphor there, I think. [Laughter.]

Senator BUMPERS. Dr. Hackney, first of all let me say that Mrs. Bumpers and I wish you and Lucy the very best in your future and to tell you that we are both deeply grieved, as I think most Members of Congress are, about your departure.

Dr. HACKNEY. Thank you.

Senator BUMPERS. When I hear you and Jane Alexander deliver your opening statements this morning I am much encouraged, because I have become about as cynical as the rest of America on a lot of scores, and one is, of course, how increasingly difficult it is to get people to serve and to accept public service.

I have done a little recruiting in my own party trying to find people to run, and we have been lucky to find a lot of really talented people, but I can tell you it is becoming increasingly difficult to get people to give up a reasonably good life with their families, good incomes and so on, and then come into such a hostile, meanspirited environment as this, where political differences are becoming criminal offenses. You touched on that to some extent in your opening statement, and I appreciated that very much.

So under the most difficult circumstances you have done a remarkably fine job, and we are grateful to you for taking out the time in your life to accept this responsibility and do an outstanding job, as I see it, under very difficult circumstances, so we wish you the very best.

Having said that, I have tried to plumb my own mind and try to figure out what is it about this Nation that must, indeed, be different? I am a student of American history, and yet I know there

is much that I do not understand. I do not understand our culture now.

I do not understand the hostility that people feel about everything, and I think that has been reduced somewhat by the fact that the economy is performing well, the crime rate is down—I think the economy plays a role in that. I hate to say this, but I think building prisons and locking up repeat offenders who have repeatedly shown that they cannot live in a free society has an impact.

But I am not sure of the underlying causes of the crime, the sudden crime surge in this country, or the hostility and the meanspiritedness right here in Washington, right in the U.S. Congress and right in the U.S. Senate.

The comity that existed when I came here does not exist any more. I was a trial lawyer, and people were always talking about how trial lawyers fight in the courtroom and then go out and have lunch together, and we did because we liked each other personally. It had nothing to do with the savage fight we had in the courtroom.

But one of the reasons I am such a strong champion of the arts and humanities is because I think it plays a major role, and that is the reason I say if it can play a major role with such a small amount of money I can only guess what it would do if you were well-funded, and yet people—you know, we do things by exception around here, not the rule. Somebody can find Mapplethorpe or something like that and trade on it forever, which neglects the larger problem.

You mentioned Tiger Woods, and I do not know, it might have been Charles Krauthammer in the Post the other day who was talking about Tiger Woods, and I agree with it. I think the phenomenon of Tiger Woods and the immense respect and admiration the American people have for him is not necessarily because he is African-American or Asian-American. I notice he used some term on the Oprah Winfrey show to cover Indians and everything else the other day.

And it is not because he is a superlative golfer. My No. 1 son, who is a golf junkie, told me a year ago that he would wind up being the greatest golfer in the history of this country.

But you see, I still do not think that is America's fascination with him. I think it is his respectful attitude, that he speaks well, that he smiles easily, and you never see unbecoming conduct out of him, and when we think about him as an African-American or Asian-American, and you think about where did all this conduct in sports—when did it get so mean, and I do not know either.

Ilie Nastase, Jimmy Connors, and John McEnroe were not my ideas of role models for this country, and they sort of made it acceptable to a very, what shall I say, very gullible young group of people in this country that it is OK to spit in the referee's face, the umpire's face. I will spit in his face the first time he crosses me. These people are role models.

Tiger Woods understands that. I think he understands that. I think he is just a genuinely fine person.

I heard one man interviewed saying I did not come to see him play golf. I just came because I enjoy his mannerisms and his conduct.

Well, that is my lecture on incivility, which you already covered much more eloquently than I could.

SUMMER SEMINARS FOR SCHOOLTEACHERS

But to go on to a more specific item, in 1988 or 1989 I read in *Newsweek* that the Carnegie Foundation was funding summer seminars for schoolteachers, not a math teacher to improve her math skills, but for teachers to learn something about Virgil's *Aeneid*, for example, because teachers, a lot of things fall off of teachers in the classroom other than math or history, whatever they are teaching, so this was the concept, and all of the six programs that they funded one summer were vastly oversubscribed.

I thought it was a dynamite idea, because there is a simple principle that I adhere to and really strongly believe. That is, if our children are not learning it is because they are not being taught, and they are not going to learn as long as the same people who are not teaching continue not to teach.

Now, I do not mean that to denigrate teachers. I married a fifth grade teacher, and so I get humility lessons every evening at my house on this subject. But anyway, I then began to try to get a bill passed to make this a giant program, as a part of the Department of Education in this country and got virtually nowhere with it.

So since the National Endowment for the Humanities had a program similar to it, I then started trying to get that program funded at a higher level at NEH, without an awful lot of luck, and now my staff tells me in a memo I got this morning that the number of teachers who are qualifying for these summer seminars, and these are seminars of all kinds under NEH, has dropped by 50 percent. Is that due specifically to funding?

Dr. HACKNEY. It is the funding level, yes.

Senator BUMPERS. Well, all I can say is, that is a mass tragedy. I think that program ought to be so big that any teacher in this country who wants to improve her skills even in her own discipline or something else ought to have the opportunity.

The first one I saw was at the University of Texas. They had 244 slots, and they had 4,400 teachers apply for those 244 slots. Do you still have that kind of response?

Dr. HACKNEY. Oh, we do, yes. I think the summer seminars and summer institutes that we do are the very best things we do, the core of our programs. Seminars and Institutes, along with fellowships, are the two things that we do that really have to be done to keep the humanities alive, and they are a high priority for us. We protected those when our budget was cut. That close to 50-percent drop is occurring even though we have protected those two programs.

Before 1996, before the cut, teachers who had been in an NEH seminar taught 500,000 students in the first year after their seminar experience. That is, 500,000 students every year were being taught by a teacher whose life had just been refreshed and whose enthusiasm for teaching had been renewed by this experience of studying for 6 weeks or 8 weeks on a college campus with a master of the subject.

Our niche in this is content. It is high quality substance, and not pedagogy. These are all—the institutes are focused on curriculum

and teaching materials, but the seminars, which are more numerous, are focused on the knowledge in that area.

Teachers frankly do not get a chance to spend a lot of time thinking about or studying or reading during the year. They are so heavily worked in their high schools and in their colleges that they really need this period of being able to learn more and to refresh their knowledge and their enthusiasm.

Senator BUMPERS. How much money is in the summer seminar program?

Dr. HACKNEY. That is a very good question. Let me fish that up quickly.

It is about \$5.7 million for seminars and institutes.

Senator BUMPERS. \$9.7?

Dr. HACKNEY. \$5.7 million.

Senator BUMPERS. Well, that is a little more than it was—no, wait, it is less than it was about 3 years ago.

Dr. HACKNEY. Yes.

Senator BUMPERS. I thought I finally got that up to around \$9 million.

Dr. HACKNEY. We are spending now about \$10 million for education programs in total, and that is down considerably from what it was previously. At the fiscal year 1998 budget request level of \$136 million, \$8.5 million is allocated for seminars and institutes.

That is all because of the cut that came in fiscal year 1996.

Senator BUMPERS. What a tragedy. I tell you, maybe that is another reason people do not want to come here. Maybe I should not pursue that.

I have always been a great student and devotee of the Constitution. I agree with Arthur Schlesinger, who says it was put together by the greatest assemblage of minds ever in the history of the world. I believe that.

I voted for one constitutional amendment since I have been here, and I have voted against probably 40. I hope I have the courage to continue to vote against them, but I am always troubled by how little people understand constitutional Government and why we are a democracy, how we are free and that sort of thing, and yet in this body, in the U.S. Senate especially, every single problem that has any emotional or political appeal winds up being offered as a constitutional amendment.

We have only had 11,500 constitutional amendment resolutions, and if you take the Bill of Rights out we have only adopted 17, so that speaks well for Congress and the people of this country.

But you know, when I think about people who have never read "The Federalist Papers," tinkering with the work of James Madison and Alexander Hamilton, it is so galling to me that I cannot tell you. It is not that the Constitution should not be amended, but we do not have an appreciation for it, and the reason we do not is because people are not being taught the value of it and what it means.

And you touched on where we are, how we got here, and why there is this distrust and hostility toward each other. When you ask people, did you ever do this, did you ever do that, they do not know, I always tell Betty the reason they do not know is because

nobody ever told them. That is the reason those summer seminars are so vitally important.

But I am not going to pursue my sermon on the Constitution, but Sheldon, again, we appreciate the work you have done and wish you well.

Dr. HACKNEY. Thank you very much.

Senator BUMPERS. Thank you, Mr. Chairman.

ADVICE FOR NEXT NEH CHAIRMAN

Senator GORTON. Thank you, Senator Bumpers.

Dr. Hackney, if your successor asks you for one single piece of advice, the most important single piece that you could give to him or her, what will it be? What will it be? Just one.

Dr. HACKNEY. Only one. I can think of several, but I would say that the most important thing that my successor can do is to tell the story of the NEH.

The NEH has a proud tradition 32 years long of doing good things for the American people. For most of those years we have simply assumed that because we got an annual appropriation that we did not need to be well-known, that we could continue to do the unglamorous but necessary work of keeping the culture alive and preserved, but it has been proven that that is not true.

One of the things that I have been trying to do and that I think the humanities community in general has done a much better job of in the last 3 years is telling the story of the humanities and of the NEH to the public and to the Members of Congress. That is absolutely necessary in this society, so we need to continue to do that in dramatic ways.

MAINTAINING A NONPARTISAN NEH

Senator GORTON. As you announced your resignation or your retirement from this position a number of people gave you credit for depoliticizing the National Endowment for the Humanities. At the same time, obviously one's views on the humanities and our history has a philosophical, a political philosophical context.

Where does the balance lie in the National Endowment for the Humanities, that is quite broad in its charter, and the very real ideas that an administration that appoints it and for which it works has with respect to many of these ideas? How do you create that balance?

Dr. HACKNEY. That is a really good question. There are senses that theorists would have that everything you do is ideological, because there is a sense in which it is connected to a view of the world and what is good and what is not good, but that is not what you were talking about nor what I am talking about.

It is my firm belief that the NEH needs to be a domain clearly nonpartisan but also nonideological. It should be funding programs that are of very high quality and that contain ideas that need to be discussed by the American public. It needs to be balanced, in other words.

We have a conscious rule in our public programs area that applies in other areas as well, which says that we do not fund programs that advocate a particular point of view, whose thrust is to

convince an audience of a particular truth or a particular way of looking at a problem.

Those programs must be balanced. If they are controversial they must contain all of the different points of view that pertain to that subject, and they should not be advocacy programs nor celebratory programs, frankly. They should be serious examinations of issues that are open to all of the points of view that are available, so I think the Endowment really does need to remain both nonpartisan and nonideological.

MERGING OF NEH AND NEA

Senator GORTON. I must say, you seem to have done very well in creating that balance, and then following the rules that you outlined here, and you deserve congratulations for just that.

Briefly, would you like to comment on the question that you heard me ask Ms. Alexander about the various proposals to combine or to consolidate the two Endowments?

Dr. HACKNEY. Surely. The NEA and the NEH serve very different constituencies and audiences. We operate in different ways, and putting them together would be quite awkward, so I do not see that it is going to solve any problems.

I agree with Ms. Alexander that we have been thinking about how we might combine support functions, for instance, and save money, but we have not been able to identify any significant savings that way.

Frankly, I also would worry that in any combined agency—a cultural agency that funded both the arts and the humanities—that over time, even with good intentions, the humanities would drift toward the bottom of the priority list because we are inherently less glamorous. What we do is less visible. The people who do it are less visible. They are not celebrities, by and large. There is an occasional Doris Kearns Goodwin who wrote the bestseller on the Roosevelt White House during World War II.

Senator GORTON. You do not get quite as much ink as Ms. Alexander, do you?

Dr. HACKNEY. Exactly right. Now, I am not sensitive on the subject. [Laughter.]

She deserves it. This is not the first hearing in which everyone has left after she got up. [Laughter.]

But I think that actually is inherent to areas of life. The arts are in part performances. They are individuals performing for a public. Entertainment is not a bad word, because entertainment makes you think and gives you a different view of life. It is very worthy material, but it is very different from what the humanities do.

STATE HUMANITIES COUNCILS COMPARED TO STATE ARTS AGENCIES

Senator GORTON. I suppose is that not reflected in the rather different structure of States humanities councils and your relationship with them as against the arts? Is it not true that many or most of them are not official State agencies, even though some get support from the States?

Dr. HACKNEY. Some get support. None of them is a State agency, though. They are all 501(c)(3) organizations, and I think the different levels of funding for the arts from the States as compared

to what humanities organizations get from States is a measure of the different level of visibility and glamour.

Senator GORTON. So in other words the State support for them is far lower than it is for the States arts councils?

Dr. HACKNEY. Much lower, yes.

Senator GORTON. Does that mean that your encouragement and the funding that you have is more significant or at least is very significant in preserving and enhancing those States humanities councils?

Dr. HACKNEY. Oh, yes; I think so. One of the things I am most proud of in my tenure at the NEH has been that we have transformed the relationship between the State humanities councils and the NEH.

Senator GORTON. Why don't you describe that for us?

Dr. HACKNEY. Traditionally, our office that managed our relationship with the State humanities councils operated as if it were a grantmaking program. State councils applied to us for an annual grant. Even though there is a formula in our authorizing legislation that describes how much is to be distributed to the States and a formula for distributing it, we still behaved as if it were a grant, and there was an oversight function that was quite rigorous.

As State humanities councils have matured over the last 20 years—they started in the early 1970's—they have gotten quite significant. They do very good work, high quality work, and we have now begun to think of them as our frontline, if you will, our local affiliates, bringing the humanities in a different way to local populations.

We have begun to divide up the territory a little bit, to divide the labor. We have also dramatically cut the size of our office and renamed it. It is now the Office of Federal/State Partnership. It is much smaller.

It is not a grantmaking operation. We are in the midst now of redefining and redesigning with the State humanities councils the accrediting function, if you will, the oversight or quality control function. That will be very different from what we did before.

The relationship is good. Communications are good. I am really pleased with it.

NEH AND AMERICAN HERITAGE RIVERS INITIATIVE

Senator GORTON. On another subject, you may be involved in an area that can be highly controversial, and it may or may not have been without your conscious early participation.

In his State of the Union Address President Clinton announced a new American heritage rivers initiative. The Chair of the Council on Environmental Quality talked about particular communities being targeted to receive Federal assistance and so on that would come from brownfields money, farm bill money, and the two national Endowments.

I can tell you in many parts of the country, like mine, this kind of proposal creates a great deal of fear of another set of Federal agencies coming in to tell people how to live their lives. I hope that is not true, but can you tell me, were you part of the original planning? Are you a part of it now?

Supposedly the various Federal agencies were to report back to the President within 90 days on more detailed plans. Can you tell me anything about those plans and your participation in them?

Dr. HACKNEY. We were one of 25 Federal agencies that were invited to plan this project, which as I understand it is an effort to coordinate the various programs run by Federal agencies in designated areas. It has not been completely designated yet, so our participation, or our role here is simply to do what we normally do, but to communicate perhaps a bit more effectively with other Federal agencies so that our programs can mesh with theirs more.

We support some projects that are particularly designed for river areas. One that I remember with great affection was actually supported by my predecessor but was very effective. It was called always a river.

It was a grant to six State humanities councils to put a historical exhibit on a barge on the Ohio River and float it down—West Virginia, Ohio, Pennsylvania, Illinois, Indiana, and Kentucky were involved in this—the river, stopping, obviously, now and then, tying up to the local docks and inviting people from that community on to see a really exciting exhibit of the cultural history of that river area.

Well, we support projects like that. We do those through our regular grant process and will continue to do them.

Senator GORTON. Well, no one is going to be anything other than pleased at that kind of activity, but do you know anything at this point about the progress of this American heritage rivers initiative project?

Dr. HACKNEY. I think it is going forward, and we are involved in the groups that come together to discuss it.

I think the plans are to designate some of the areas within which coordination is to take place. It is coming soon. Let me turn to my deputy and see who has been represented.

September 1 is apparently the date on which the first five river areas will be designated.

I should say there are no new funds going to this program, as I understand it, certainly no new funds from us or, as I understand it, from the other Federal agencies.

NATIONAL TRUST FOR THE HUMANITIES

Senator GORTON. Thank you. We will look forward to September 1.

Tell me about the National Trust for the Humanities. Do you think that this will be a successful way of getting additional private sector funds, and what will its relationship be with NEH?

Dr. HACKNEY. I do think it will be a significant factor in making our programs much more available to the public than now.

The National Trust for the Humanities is a 501(c)(3) organization that is chartered here in the District. It is up, organized, and running now but does not yet have a staff. It already has raised a little modest money.

Its directors are people interested in the humanities from around the country. We are not doing this. We are not directing it. It is an independent organization. It is one of the ways in which the humanities community must operate in a different mode in the fu-

ture. It will be able to attract private funds and be the partner in any partnership that handles the money for programs.

One can imagine the national trust raising funds that would, for instance, put in every high school in the country a collection of the films, the documentary films that NEH has made possible, or has funded over the years. Most of them, except for the Ken Burns films and other super successful ones, are now sitting on someone's shelf gathering dust, not doing anyone any good, when they are extraordinarily valuable as educational tools. We do not have the money now within our appropriation to give them away.

One of the projects that I think the national trust might undertake is raising private funds either from corporations that might want to have their name attached to that sort of effort, or from a philanthropist or foundations to purchase and send packages of those films to schools throughout the country. In that way I think they can find new audiences, and extend the audience for work that we are already doing.

It is important to realize, though, that if the national trust is wildly successful, in my view it will be raising \$3, \$4, \$5 million within 5 years to sort of supplement the work of the NEH. It can never replace the funds that come from the Congress.

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. Dr. Hackney, I want to thank you for your testimony. We have a number of other questions that we will submit to you in writing about specific programs, and would appreciate your answer to them.

I think you have done great credit to the Endowment during very difficult times, and for, I believe, the entire subcommittee and, I hope, the Senate I want to thank you for your service. I realize it has a few more months left to go. You have been most eloquent, and I do look forward to reading your philosophical comments.

Dr. HACKNEY. Thank you. I do want to say, Mr. Chairman, not only that I appreciate your support through the years here, but this service to me has been the most exciting and rewarding experience of my professional life, so I do not regret coming.

Senator GORTON. That is wonderful. Thank you.

[The following questions were not asked at the hearing, but were submitted to the Endowment for response subsequent to the hearing.]

ADDITIONAL COMMITTEE QUESTIONS

BUDGET PRIORITIES

Question. \$136 million has been requested by the President for NEH activities in fiscal year 1998. However, it is doubtful that the subcommittee will be able to provide the agency with an increase over the fiscal year 1997 budget. If this is the case, would you advocate that the appropriation of funds remain the same for the various budget lines for grant divisions, state programs and administration?

Answer. Yes.

Question. Or do you see a need to allocate the resources differently, and, if so, how and why?

Answer. If the fiscal year 1997 appropriation is again \$110 million, the fiscal year 1996 breakdown is a good distribution of funding among our budget lines.

STATE HUMANITIES COUNCILS FUNDING

Question. All 56 state humanities councils are non-profit, private organizations, not state government agencies. However, according to information provided in the fiscal year 1998 budget request, almost half of state councils do receive some state support in addition to federal dollars.

Does the National Endowment in any way provide a financial incentive for state governments to contribute to the work of the state councils?

Answer. In addition to an outright grant—which by law comes with a 50 percent cost-share requirement—NEH awards each of the councils supplementary matching funds for the purpose of leveraging non-federal, third-party contributions. Any funds that the councils receive from state governments can be used to satisfy the fund-raising requirement that these NEH matching grants entail. Thus, by contributing to the councils, state governments can help them leverage additional federal support.

Question. Are state contributions, or the lack thereof, a determining factor in the apportionment of federal dollars to local humanities councils?

Answer. No.

Question. What factors can you point to that would explain why over one half of the state humanities councils do not receive state support? Why do you believe such a disparity exists between the state humanities councils, which receive approximately \$4 million annually, and state arts agencies that receive an estimated \$265 million yearly in state support?

Answer. Historically, the arts councils have been state government agencies, while the state humanities councils have remained private, non-profit organizations. The arts councils have been the primary vehicle by which the states channel support to the arts. State governments have typically chosen to support the humanities councils on an ad hoc basis, through project grants and special appropriations. In recent years, the state councils' efforts to attract state government support have met with increasing success. Moreover, state support for the humanities is at least as great as what they provide for the arts. For example, total state support for public education at all levels now exceeds \$150 billion annually, some not-inconsiderable part of which supports teaching and scholarship in history, literature, government, philosophy, and other humanities subjects and disciplines.

The legislation that governs NEH support of the state humanities councils provides that state governments are to be given the option of either: (1) designating the existing private council as a state agency, then matching 50 percent of the federal minimum grant or 25 percent of the total federal outright grant, whichever is larger, and reconstituting the council membership with gubernatorial appointees; or (2) appointing six members to the existing private council, or a maximum of 25 percent of its membership. Each year, the Endowment informs each state governor of the state's option to convert the existing council into a state agency. To date, no state has chosen to designate a humanities agency, even though several now provide their council more than 50 percent of the Endowment's Federal/State Partnership grant.

Question. Individual state humanities councils can fund no more than one-half the cost of any one project, with the remainder coming from local contributions. If the states were to receive a larger percentage of the total amount Congress appropriates to the NEH for all humanities programs, including state councils, what is the likelihood that local resources could be raised to meet the necessary increased matches? At what point, because of limited local funds, will federal support fail to be a catalyst for raising matching funds?

Answer. The state councils and the organizations and individuals they support can match the outright grant funds awarded through the Federal/State Partnership with either cash or in-kind contributions. In addition to third-party contributions, costs incurred by the project sponsors themselves are counted toward this matching requirement. In recent years, the imputed value of all cash and in-kind contributions to the state councils and the recipients of their project support has exceeded the required 50 percent cost-share by approximately \$18 million.

The state councils are not unique in this respect; all NEH grantees contribute a share toward the costs of their project that, on average, amounts to \$1.30 for each federal dollar of their grant. The potential contributor response to additional federal funding for the humanities is very large in all areas that the Endowment supports. But, the funds now provided through the Federal/State Partnership are sufficient to permit the councils to support more than half of the funding proposals they receive, while NEH must turn away five of six of its grant applicants.

OFFICE OF ENTERPRISE

Question. This office was formed in recent years to extend and expand the Endowment's assets and to facilitate its work in a more entrepreneurial manner. It has been given responsibility for seeking new financial resources, as well as sponsoring all projects that cross over divisional lines within the agency.

Can you tell us how successful this office has been in accomplishing its mission to date? What strides have been made since its creation and how is its work stretching available federal dollars?

Answer. The Enterprise Office, in its first full year of operation, has been highly successful. The Enterprise Office developed two major financial partnerships—one with the Mellon Foundation and one with the MCI Foundation. Combining \$1.25 million of NEH funding for each of two years with \$2.5 million of Mellon Foundation support for each of two years will enable nine research centers throughout the country to support a significant number of fellowships. Funding for research centers and fellowships was cut sharply as a result of the budget reductions in fiscal year 1996, and this renewed commitment will help to continue the critical work of research to create new knowledge in the humanities.

Under the auspices of the Enterprise Office, the MCI Foundation and NEH formed a partnership to create EdSiteMent, a new website designed to help teachers, parents, and students find the best education websites on the Internet. MCI's commitment of \$500,000 to this project represents the first corporate partnership for NEH, and we expect to build upon that success in coming years.

In addition, the Enterprise Office has worked with other NEH divisions to extend the reach of Endowment projects. This includes creating new exhibit space in the Old Post Office Pavilion to showcase previously funded NEH exhibits to the more than 3.5 million people who visit the building each year. In addition, the Enterprise Office has provided a modest amount of funding to enable these exhibits to travel to places in the country where the exhibits have not previously been seen. Plans are underway to extend this initiative to major NEH-funded exhibits so that more Americans will have access to the rich historical information embodied in these exhibits.

Finally, the Enterprise Office has provided support for major proposals coming to NEH that do not fit neatly into one particular division, but that would make a major contribution to the advancement of the humanities. This includes the Disaster Recovery Kit, a kit designed to provide critical information to museums, libraries, and educational institutions about the steps that need to be taken immediately to preserve books and other important cultural materials in the wake of natural disasters like floods, fires, and hurricanes.

Question. Are new collaborative efforts with partners such as the Mellon Foundation and MCI the result of efforts by this office? Please describe these cooperative arrangements in greater detail for the subcommittee.

Answer. The partnerships formed with Mellon and MCI were the result of a collaborative effort between Enterprise and another NEH division. The Mellon partnership began with discussions between the NEH Chairman and the director of NEH's Division of Research and Education about what could be done to support critical research in the wake of the 60 percent reduction in research funding as a result of the fiscal year 1996 budget cuts. Mellon was encouraged to make a major financial commitment with the assurance that NEH would also make a commitment to support research centers. NEH funds are provided directly to research centers as are Mellon funds.

The MCI project began with an inquiry from MCI to Enterprise about how we might combine the technological expertise of MCI with the education expertise at NEH to improve education in the classroom. As a result of these discussions, NEH put together a proposal for EdSiteMent, a new Website to identify the best education websites on the Internet. The MCI's commitment of \$500,000 is being used to support the new website, create teacher guides for use in the classroom, and for partnership efforts with schools to incorporate EdSiteMent into the classroom. As part of its contribution to the partnership, NEH used its rigorous peer panel review system to evaluate the quality of websites and make recommendations for inclusion on EdSiteMent.

Question. How much of the \$12,416,000 appropriated to the Division of Public Programs and Enterprise in fiscal year 1997 is designated or anticipated to be used specifically for Office of Enterprise activities?

Answer. Including the \$1.25 million commitment to the Mellon Foundation partnership, the fiscal year 1997 budget for the Enterprise Office is \$2.138 million.

HUMANITIES IN EDUCATION

Question. Traditionally, the humanities have been considered part of a core educational curriculum for students. Do you believe this is still the case or has there been a decline of interest in studying the humanities today? How does NEH attempt to convey to students the relevance of a liberal arts education in an increasingly technology-oriented world? Is there greater emphasis now on vocational or pre-professional degrees than in the past?

Answer. The data we have—both empirical and anecdotal—indicate that interest in the humanities among college students is on the rise after a long period of decline. The number of bachelor's degrees conferred in humanities disciplines has rebounded sharply from the low levels seen in the 1970's and 1980's. A similar resurgence of interest is being seen in the nation's graduate schools, where the number of students pursuing advanced degrees in the humanities has been moving upward since the late eighties. Some of the new interest may have been fueled by an expansion of general education (or "core") requirements by a significant number of American institutions of higher education. More often than not, general education includes a healthy dose of humanities subjects.

Through our programs and through our rhetoric, we attempt to convey to students the importance of sustained, thoughtful study of the humanities. Such study is the foundation for understanding important contemporary issues as well as enduring questions of human existence. The humanities raise issues that are central to life in a democratic society and provide resources for engaging issues with intelligence and wisdom. Quite simply, our message is this: While vocational, technological, and pre-professional education help prepare students for their first jobs, a humanities-centered education prepares students for a lifetime of many different jobs.

Question. Alternatively, turning to the other side of the desk, what progress has the Endowment made in fostering the development of better teachers, as well as attracting qualified, committed candidates to this important profession?

Answer. Over the course of its history, one of the primary missions of the National Endowment for the Humanities has been to help school and college teachers in the United States improve their teaching of the humanities. Particularly noteworthy are the grants the Endowment makes annually in its summer seminars and institutes program, the country's leading faculty development program in the humanities, which are designed to provide school teachers and college faculty members with opportunities to study fundamental texts and significant topics in the humanities. Each year, the hundreds of humanities teachers who attend NEH-sponsored seminars and institutes return to their home institutions intellectually revitalized and thus more effective instructors of the tens of thousands of students who fill their classrooms.

NEH humanities education grants are not designed, per se, to attract new teachers to the humanities. We suspect, however, that there may be instances where a student becomes interested in pursuing a teaching career in the humanities as a result of having been exposed to an instructor whose teaching had been reinvigorated after attending an NEH seminar or institute.

Question. What, if any, role does the U.S. Department of Education assume in serving to encourage and enhance instruction in the humanities in our schools? How much do their funding and programs complement the kinds of work you support for teachers and students?

Answer. The Department of Education provides support for humanities instruction in two main areas: "Goals 2000," which encourages efforts at the state and local level to establish high academic standards in the core academic subjects (the humanities among them); and the Eisenhower Professional Development Program, which assists state and local education agencies with efforts to enhance the professional development of teachers.

NEH's education programs complement but do not overlap with those of the Department of Education (ED). We provide a modest amount of support for materials and curriculum development in humanities subjects (for which there is no ED analog), and we support the professional development of humanities teachers by providing them with opportunities to engage in intensive summer study of important texts and topics in the humanities. Although at first glance it might appear that there is substantial overlap between the two agencies' teacher training programs, they are in fact quite distinct. The Department's Eisenhower program differs from NEH's offerings in two key respects:

(1) Eisenhower is for the most part a formula-grant program that permits significant flexibility among states and localities in the design and execution of teacher training programs. What this means in practice is that professional development opportunities are relatively short in duration (often a week or less) and focused on

pedagogical rather than substantive concerns. NEH's seminars and institutes, on the other hand, offer teachers in-depth study opportunities lasting four to six weeks. Such programs are led by many of the nation's top scholars and are focused on content rather than pedagogy.

(2) Although the Eisenhower program nominally targets all core subject areas, the program's funding mechanism in fact favors math and science education. Eisenhower's enabling legislation includes a trigger mechanism that has the effect of reserving the first \$250,000,000 of the annual appropriation for math and science training. For fiscal year 1997, this has meant that a relatively small sum remains for all other subjects. Conversely, all NEH funding is reserved for professional development in humanities subjects.

TEACHING WITH TECHNOLOGY INITIATIVE

Question. The initial funding proposal for this three-year initiative was \$4 million in the fiscal year 1996 budget request. Congress was unable to fund this increase, but the initiative moved forward without the requested dollars. Was the program scaled back from the original plans when funds were not appropriated, or was the \$4 million found from among NEH's existing programs? What other programs were reduced in order to advance this effort? What accomplishments can you point to?

Answer. The fiscal year 1996 NEH budget submission to Congress included a request of \$4 million in funding for a "Technology and the Humanities" special initiative. The purpose of this special request was to enhance the Endowment's ability to make humanities resources and programs more available and accessible on the developing digital information superhighway; the initiative was also designed to include all of the agency's major program areas—preservation, education, research, and public programming. However, when Congress ended up slashing NEH's budget by 36 percent below fiscal year 1995, it effectively cut off any possibility of fully implementing the agency-wide "Technology and the Humanities" initiative.

The Endowment was intent on trying to salvage at least one component of the initiative, albeit with considerably scaled down funding, and in fiscal year 1996 we announced that we would support "Teaching with Technology" projects within our humanities education grant programs. At the first "Teaching with Technology" grant deadline, we received more than 300 proposals but were limited, because of severe budget constraints, to making only 12 awards despite the fact that the overall quality of the proposals was so high that we could easily have funded four times this number. Included among these first grants were such "accomplishments" as a project at Northwestern University to develop and deploy a database on the Internet on the history of the U.S. Supreme Court, a project at Miami University in Ohio that is helping teachers of Latin use electronic resources in their classrooms, and a project at the University of Virginia involving the use of CD-ROM's and the Internet to teach the history of the American Civil War.

FOLLOW-UP INITIATIVE

Question. The Teaching with Technology initiative has led to the development of another new three-year initiative that will be offered by NEH. This project will help schools and their teachers become competent and comfortable with newly developed electronic materials and the technologies with which to teach with them. Specifically what will this training program do and how much will it cost? To what degree do you anticipate that the emphasis will necessarily be on familiarizing teachers with basic computer technology? How will you assure that the humanities receives an appropriate focus in this initiative?

Answer. The aim of the Endowment's follow-up to the Teaching with Technology initiative—"Schools for a New Millennium"—will be to jump start the process by which schools and their teachers become competent, and comfortable, with new humanities materials and technologies. The extent to which schools and teachers are proficient in using electronic materials and formats will directly affect the level of student learning and achievement. Projects to be supported under this new initiative would: involve a whole school and require commitments from teachers, the principal, and the Parent-Teacher Association; leverage public-private funding partnerships and establish links with parents, local colleges, and universities; focus on challenging substantive questions in the humanities that could be addressed by the use of rigorous interactive educational software; support hands-on training for a school's teachers and provide enough time to develop both confidence with the technology and the materials and to create challenging and engaging classroom uses that would enrich the school's curriculum; and exploit the potential of the Internet not only to link participants in a single project but also to trigger rapid fire, nationwide dissemination and participation. At the Endowment's \$136 million fiscal year 1998 re-

quest level, we estimate that about \$2 million would be set aside for these types of technology projects.

While the thrust of these projects will be to help teachers and schools integrate rich, high quality humanities materials in digital formats into their classrooms, we anticipate that some projects also may also involve some effort to developing some teachers' computer skills. We are confident, however, that "the humanities" will be the focus of the initiative: Because the Endowment requires all applicants to describe in detail the humanities content and significance of their projects in their grant applications, projects that are not thoroughly grounded in the humanities would not, and could not, receive support from NEH.

Question. Is there any broad-based effort that NEH is aware of to assist teachers who are less skilled technologically than the students they teach? Is this a widespread problem?

Answer. We are only aware of one such effort: the 21st Century Teachers initiative, which is part of President Clinton's Call to Action for American Education in the 21st Century. Under this initiative, the National School Boards Association, the National PTA, the National Education Association, the American Federation of Teachers, and many other business and professional organizations are recruiting thousands of teacher volunteers, each of whom will work to improve his or her own understanding of education technology and will then share his or her expertise with at least five colleagues in the coming school year.

Providing state-of-the-art technological training for teachers remains a significant challenge for the nation. A recent survey found that only thirteen percent of public schools required that teachers be trained in advanced telecommunications. And although thirty-one percent of schools reported that incentives were provided to encourage teachers to obtain such training, another fifty-one percent indicated that it was left up to teachers to initiate participation in this kind of training.

Question. Approximately one-half of our public schools have computer access, according to a recent estimate, with many more to be added in the near future. For those students who have computer availability, a wide array of information is readily available. In the meantime, is the student population without access to computer technology being left at a significant disadvantage academically? Is this an area of concern? Or, in the case of humanities studies, are traditional methods equally effective in teaching students?

Answer. With technological change occurring at such a rapid pace, and with schools being wired and equipped at an equally vigorous rate, it is difficult to know for how long any one population of students will be disadvantaged by lack of access to a particular kind of technology. For the humanities, however, these issues are secondary—technology will always be a handmaiden to content. The thoughtful teaching of significant texts will remain students' primary access to the humanities' enduring themes.

AMERICAN LEGACY EDITIONS

Question. Among the special initiatives included in the budget request is the American Legacy Editions, a special competition designed to help complete more than fifty ongoing scholarly editions of the collected writings of U.S. presidents and other major American historical and literary figures. The Editions projects have been a core part of NEH programs since the Endowment was created. How does this initiative differ from the traditional program?

Answer. The American Legacy Editions initiative is intended to give a chance of survival and completion to a number of scholarly editions projects, the dismantling of which for lack of money would constitute a national tragedy. These include documentary editions of the papers of U.S. presidents, as well as prominent writers and others who influenced the course of our history or the content of our culture. Due to insufficient funds, it now appears likely that the Endowment this year will turn down a number of major editing projects that have been funded for many years. Moreover, to stretch our scarce funding as far as possible, of the editions projects we will be able to support, we have to cut project budgets sharply, to the bone in some cases.

The initiative would provide approximately double the amount of funding we are now able to devote to these projects plus set up innovative financial arrangements to get more bang for our buck: i.e., by making extensive use of offers of matching funds, by building in incentives for technological innovation and speedy progress, and by providing flexible financial arrangements such as depletable endowments, NEH hopes to make possible an alternative to the shameful cultural tragedy that now looms.

Question. The Division of Research and Education, through which this initiative would be funded, is proposed to receive a \$9 million increase in fiscal year 1998. Current funding for the editions program is approximately \$1.5 million. Is a portion of the requested increase targeted for the American Legacy Editions and, if so, how much?

Answer. About \$3.5 million would be set aside for ALE projects within the Endowment's fiscal year 1998 request of \$136 million.

Question. How much support would it require to get these projects on sound financial footing? Without an increase for the editions project in fiscal year 1998, what can be accomplished? Can the program survive as it is currently defined and at current funding levels?

Answer. If the initiative were continued at the proposed requested funding level for the next ten years, we estimate that all current projects could achieve sound financial footing that would significantly reduce their need for continued NEH support.

The initiative is tied to the Endowment's \$136 million request level. If the Endowment's budget were held at the current \$110 million level or at an amount that is significantly lower than \$136 million, we would only be able to provide grants to a small fraction of these projects. Because most projects rely on continued NEH support, many of those that do not receive grants may be forced to curtail their operations dramatically or to close down their projects entirely.

An alternate funding strategy NEH might adopt would be equally untenable: that is, to provide only nominal funding to keep as many projects as possible alive. This approach would mean that many American Legacy Editions would have to cut back on their work, which would significantly slow the completion of their projects.

Question. Have other financial resources in addition to the Endowment traditionally been available to support the program and could greater responsibility for program funding be sought there?

Answer. Another traditional source of funding for these projects has been through the National Historical Publications and Records Commission (NHPRC) at the National Archives. Like NEH, however, NHPRC's budget is limited and the program must support other worthy activities and projects in addition to scholarly editions.

CULTURAL TOURISM

Question. Cultural tourism has been promoted as a means to provide opportunities for the traveler to experience and learn about the history, culture and the people that give a place its distinctive character. Both the Arts and Humanities Endowments, as well as the Institute of Museum Services, have demonstrated interest in promoting this effort.

NEH has committed staff and invested \$50,000 in a broad-based national initiative that is meant to foster cultural heritage tourism partnerships throughout the United States. Would you please describe for the subcommittee the specifics of this program. How does it work and what do you hope to achieve? How do you believe this program will help to advance the humanities? Do you intend to commit additional funds to this initiative in the future?

Answer. Since September 1994, an informal interagency working group, composed of staff members from NEH, NEA, the President's Committee on the Arts and the Humanities, and the Institute of Museum and Library Services, has been exploring means by which cultural organizations might assume a more active and visible presence in the nation's travel and tourism industry. Particular emphasis has been placed on identifying an appropriate role for the federal cultural agencies in this effort. It is our hope that by involving such agencies in the work of the cultural tourism industry, the arts and humanities can become a central and meaningful part of many travelers' experiences.

This effort got underway in earnest in the spring of 1995, when more than thirty humanities, arts, and historic preservation organizations joined with the agencies to plan for a visible presence of cultural tourism at the White House Conference on Travel and Tourism that was to take place later that year. This alliance helped develop and distribute a position paper on cultural tourism for the conference, arranged for Garrison Keillor to speak at one of the main conference luncheons, and planned "Culture and Commerce: Partners in Tourism," a cultural tourism "debriefing" held following the conference.

Largely as a result of the interagency group's efforts, the final report from the White House conference included as its fourth objective, "to preserve our natural historic and cultural resources for future generations ... through a national strategy for fostering environmental and cultural travel and tourism." The report also recommended the convening of "Natural and Cultural Regional Summits" to identify

policy and management strategies to meet the unique needs of each region of the country.

Stemming from the recommendations of this report, and with support provided by the cooperating federal agencies and by interested parties at the national and local levels, a series of regional forums have been conducted at sites across the country. More than sixty organizations and government entities have contributed funds in support of these meetings, ranging from Ford Motor Company to the Western Museum Association. To date the forums have drawn approximately 1,000 participants, whose work has led to the development of specific action plans to advance cultural heritage tourism in nearly every state.

At this point the Endowment has committed no further funding to the cultural tourism effort, as the initiative has now acquired a momentum of its own. We remain ready, however, to provide encouragement and guidance to groups agents who seek to extend the reach of cultural tourism.

Question. According to your brochure on the economic impact of NEH, the U.S. travel market is experiencing a dramatic growth in cultural tourism, fueled in part by the Endowment. Is the travel market itself contributing to these projects? Are state and local governments?

Answer. As mentioned in the answer to the previous question, a variety of public and private entities are contributing to the cultural tourism initiative. The regional summits, for example, drew substantial support from corporations (among them BellSouth, Ford Motor Company, and Ameritech), state and local tourism offices (including Maryland, Indiana, Colorado, Texas, and Wyoming), cultural organizations (among them the Historic Landmarks Foundation and the Colorado Historical Society), and the travel industry itself (United Airlines and Travel and Leisure magazine, for example).

OTHER SPECIAL INITIATIVES

Question. A good number of special initiatives are listed throughout the 1998 budget request. Given the decline in available dollars, how does the Endowment attempt to strike a balance between crucial support for continuing core programs and new special initiatives? What can be achieved by diverting funds to a special initiative that can not be achieved through the usual grant channels?

Answer. Considering the current budgetary climate, it is indeed difficult to strike a balance between funding core programs and launching new initiatives. Yet despite our funding situation, the Endowment is determined to remain a vital national proponent and leader in the humanities and to continue searching actively for ways we can better serve the American people. The various special initiatives and program emphases detailed in the fiscal year 1998 budget request are designed to address specific needs and new opportunities in the humanities.

PRESERVATION AND ACCESS

Question. The Division of Preservation and Access was provided with a funding level of \$18,000,000 in fiscal year 1997. Among the functions for which this division has responsibility is a significant effort to preserve brittle books, archival collections, newspapers, and the like, as well as to fund projects that provide the tools for increased access to the humanities—the creation of dictionaries, atlases, encyclopedias, and other reference works, as well as digitization programs.

The effort to microfilm brittle books and the U.S. newspaper microfilm program are both significant undertakings of this division. Approximately how much of the total \$18,000,000 appropriation for this division is dedicated to these projects?

Answer. The Preservation and Access division supports a variety of projects that are designed to help address the preservation problem in the United States. Because of variations in the sizes and grant periods of these different kinds of projects, the proportion of the division's funding that is obligated for them tends to fluctuate from year to year. Funding for projects to microfilm brittle books and U.S. newspapers, for example, typically accounts for about 35 percent of the division's funds, but in fiscal year 1997, these projects will receive about 21 percent of the Preservation and Access budget.

Question. Are significant inroads being made with this preservation work?

Answer. Yes. Over the years, NEH grants have helped preserve on microfilm more than 750,000 of the projected 3 million important brittle books that are targeted for preservation in American libraries and archives. Substantial progress has also been made in the nationwide effort lead by NEH to identify, catalog, and microfilm historically significant American newspapers: records for approximately 127,500 newspaper titles are now available in a national data base accessible through computer terminals at more than 22,600 institutions in the U.S. and abroad, and 55 million

newspaper pages have been microfilmed that would otherwise have been lost to future generations.

Question. Do the state councils place an emphasis on preservation at the local level or is it more of a national effort?

Answer. No, the state humanities councils are concerned primarily with public programming in the humanities in their states; they do not support nationally significant preservation projects like those funded through NEH. In fact, the Endowment is the acknowledged leader in national effort to preserve deteriorating books, documents, periodicals, artifacts, and other materials that collectively make up an essential part of our country's cultural inheritance. Only a truly national entity like NEH can provide the coordinated leadership and the level of funding that are needed to ensure that historically significant materials are identified and preserved and that there is no wasteful duplication of effort, which would occur if a more decentralized mechanism were used.

Question. Approximately one-fourth of the funds for this division are dedicated to the National Heritage Preservation Program, which facilitates the preservation of material culture objects. Given the broad range of important activities that comprise this division, this appears to be a significant funding emphasis. Is the interest expressed by applicants for this program larger than other program categories in the division?

Answer. Applicant interest in the NHP program is strong but not necessarily larger than other preservation activities. We believe, however, that the proposed distribution of funds among all the division efforts is the best use of the limited funding available.

Question. What types of awards are made to preserve material objects? Do you provide funds to preserve or restore the objects themselves or the environment in which they exist?

Answer. Through the National Heritage Preservation program, the Endowment helps support the efforts of American museums, archives, libraries, and other repositories to stabilize material culture collections that are important to the humanities. This support may include improvements in the housing and storage of the collection; the improvement of environmental conditions; and the installation of security, lighting, and fire-prevention systems. Under this program, NEH does not support the restoration or preservation of the objects themselves.

Question. "Slow Fires: On the Preservation of the Human Record" is a documentary film, made with NEH assistance, that focuses on the crisis of preservation. Its purpose is to help raise nonfederal support for substantial costs involved in preserving endangered materials. According to the budget presentation, this film has been viewed by a large audience both here and abroad. Please describe what, if any, impact the film has had on fund raising efforts in this area, to date. In your experience, is the private sector a generous supporter of preservation work, or is this an activity where federal funding is more critical than some others?

Answer. While we cannot document a direct cause and effect relationship between "Slow Fires" and "fund raising efforts," there can be no question that a consequence of increasing public awareness of the preservation crisis is to encourage greater support for preservation.

The Endowment itself has played a direct role in stimulating nonfederal funding for preservation, though. Since the establishment of NEH's Office of Preservation in 1986, projects supported by the Endowment have leveraged over \$10.9 million in gifts from private donors and foundations. Moreover, the division's grants in the last three years generated cost-sharing from grantees totalling \$41.6 million. Essentially, however, through NEH the federal government is providing vital funding and national leadership in an area where private sector or other nonfederal support is limited.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

BUDGET REQUEST

Question. The fiscal year 1998 budget request is almost 24 percent above the fiscal year 1997 allocation. Given the current budgetary climate, how did the Administration determine that \$136 million was an appropriate funding level for NEH?

Answer. The NEH budget request for fiscal year 1998 is a modest but forward-looking budget that would permit us to regain about half of the ground we lost in fiscal year 1996 due to Congress's massive 36 percent reduction in our funding. A budget of \$136 million is a reasonable amount of public funds to invest in humanities activities that will yield both immediate and long-term returns to the nation.

The request acknowledges the extraordinary pressures the federal government faces in trying to balance the goal of reducing the financial burden on taxpayers with the necessity of maintaining an adequate level of services for the American people. With this budget, we signal our commitment to make sacrifices to help control the overall level of federal spending. At the same time, it is also a budget that would not undermine our fundamental ability and obligation to carry out our legislated mission to advance the humanities in the United States.

Question. What does the 24-percent increase buy for the American people?

Answer. Compared to NEH's current funding of \$110 million, a budget of \$136 million in fiscal year 1998 would enable the Endowment to help advance the nation's educational and cultural life by supporting several special initiatives and by increasing the number of high quality projects that we are able to fund. Specifically, funding at the fiscal year 1998 request level would improve humanities education for America's students, help teachers make better use of new information technologies in their classrooms, preserve documents and other materials vital to the nation's cultural heritage, foster basic research and scholarship that expand our knowledge and understanding of the humanities, provide opportunities for Americans to engage in a lifetime of learning in the humanities, and increase third-party support for humanities projects and institutions.

Question. What would be your programmatic priorities at the increased funding level?

Answer. At the request level, our priorities are to try to regain some buying power in our core programs, which were cut substantially in fiscal year 1996, and to proceed with the special program initiatives and emphases we describe in our budget submission, such as American Legacy Editions, Teaching with Technology, "My History is America's History," and special support for small public libraries in the Challenge Grants program.

Question. Would your priorities remain the same if funding were to be decreased?

Answer. Yes, we would try to follow-through with our programming priorities even if our budget request were not forthcoming. If that were the case, however, we would need to reassess our programming in light of available resources and the tenets that guided our restructuring efforts in fiscal year 1996. That is, out of any future appropriated sum we will first try to ensure adequate support for those activities that are best done at the national level, have long-term impact, have few other sources of support, strengthen the institutional base of the humanities, and reach broad sectors of the American public.

Much would depend on the magnitude of the reduction. For example, Challenge Grants awarded in prior years would need to be matched during fiscal year 1998 as grantees raise the required gift funds; but at some level of budget reduction we would probably cease awarding any new challenge awards. Because the state councils depend on the federal government for the greater part of their operating support, we have tried to cushion the effect of NEH budget cuts on these unique organizations. But funding for the Federal/State Partnership has already risen from a little over 20 percent of the Endowment's budget to over 30 percent. Further cuts would undoubtedly require progressively steeper reductions in the councils' funding if the Endowment is to continue the national programs that support such important activities as humanities research, the preservation of brittle books, teacher seminars and institutes, and major documentary films for television.

Question. Please describe any long term investments or new initiatives that are currently being developed. What effect would new initiatives have on existing grantees if funding is not increased?

Answer. As described in our official fiscal year 1998 appropriation submission, special features and initiative of the NEH budget request include:

- Continuation of the agency's Teaching with Technology special initiative that is helping teachers incorporate new information technologies such as CD-ROMs and the Internet into their classrooms. The fiscal year 1998 request would also enable NEH to build on the successes of this initiative by putting in place a new multi-year special effort to help schools prepare to take better advantage of the new electronic materials and technologies.
- Support for other technology projects that will help to speed the inclusion of humanities materials onto the new information superhighway and provide wider access to these materials for all Americans.
- A new American Legacy Editions special initiative to help ensure the continuation of projects that are compiling documentary editions of the papers and writings of U.S. Presidents and other important literary and historical figures;
- A new special initiative, which we are calling My History is America's History, that will encourage Americans to learn more about the history of their families

and to relate this history to the broad sweep of events and trends in American and world history;

- Fiscal year 1998 will mark the third year of the agency's three-year cooperative partnership with the Andrew W. Mellon Foundation to bolster funding for fellowship programs sponsored by independent centers for advanced study in the humanities; and
- Special challenge grants for public libraries, particularly those that are located in rural areas and inner cities, that will help these institutions build endowments to strengthen their humanities programming.

As noted in the answer to the previous question, if our budget is not increased in fiscal year 1998, we would try to implement as many of our planned initiatives as possible while still maintaining support for our core program activities.

GOVERNMENT PERFORMANCE AND RESULTS ACT (GPRA)

Question. Please describe your progress and milestones toward preparing a strategic plan, including consultation with interested parties.

Answer. The first draft of NEH's strategic plan was prepared almost two years ago. Through an iterative process of review and revision, new drafts have been developed in the succeeding months. At various stages these drafts have been circulated to the Office of Management and Budget, to NEH's National Council on the Humanities, and to more than 100 of the agency's "stakeholders."

The latest draft of NEH's strategic plan was recently submitted to our Congressional oversight committees for their review and comment. Feedback we receive from this stage of the process will inform the final submission that is due to Congress in September of this year.

Question. Given the current budgetary climate, how are you addressing funding and authorization issues in the development of GPRA goals and the strategic plan?

Answer. Since the Endowment's restructuring in 1995, the agency's budget has remained relatively steady at approximately \$110 million. Early indications are that this level of appropriations will again hold for the coming fiscal year, so we have tailored our GPRA goals and objectives to fit this new reality. Should funding or authorization developments warrant a different course of action on the part of the agency, we will amend our five-year strategic plan accordingly.

Question. How will the NEH measure the short-term and long-term impact of its programs?

Answer. We are in the process of developing performance goals and indicators for all of our funding programs. The goals will articulate what we hope to achieve through our programs, and the indicators will then describe the measures we will take to determine whether or not we are actually achieving our goals. In developing our indicators we will be looking for ways to determine whether or not our programs are accomplishing their intended purposes (i.e., we will be assessing short-term program outcomes), and we will also seek to develop measures of the indirect effects or consequences of our funded work (a longer-term assessment of program impact).

Question. What are the grant-making priorities for the agency in the next year, for the next 5 years?

Answer. In addition to our ongoing programmatic priorities, we will feature the following special emphases in the coming year:

- The beginning of a multi-year special effort to help schools prepare to take better advantage of the new electronic materials and technologies.
- Support for other technology projects that will help to speed the inclusion of humanities materials onto the new information superhighway and provide wider access to these materials for all Americans.
- A new American Legacy Editions special initiative to help ensure the continuation of projects that are compiling documentary editions of the papers and writings of U.S. Presidents and other important literary and historical figures.
- A new special initiative, which we are calling My History is America's History, that will encourage Americans to learn more about the history of their families and to relate this history to the broad sweep of events and trends in American and world history.

Over the next five years, NEH's grant-making priorities will focus on: preserving and increasing the availability of cultural and intellectual resources essential to the people of the United States; strengthening teaching and learning in the humanities in schools and colleges across the nation; facilitating basic research and original scholarship in the humanities; providing opportunities for Americans to engage in lifelong learning in the humanities; strengthening the institutional base of the humanities; maintaining and strengthening partnerships with the state humanities councils; establishing collaborative partnerships with public and private institutions

and organizations in support of the humanities; and creating new programs and initiatives that respond to emerging needs and opportunities in American society.

Question. What are the organizational priorities for the agency for the next year, for the next 5 years?

Answer. The Endowment is aggressively supporting the National Performance Review goal of creating a government that works better and costs less. In furtherance of this goal, the agency will focus on the following priorities in the coming years: the installation of a relational data base capable of systematically capturing and reporting on a variety of agency records; the continued refinement of NEH's customer service standards, with the ultimate goal of weaving these standards into the fabric of the agency's daily work; standardizing and clarifying the agency's application guidelines to make them more "user-friendly" to prospective applicants; streamlining the review process for proposals submitted to the Endowment; and developing better systems for monitoring the performance of the agency's funding programs.

GRANT-MAKING

Question. Within the request, grant program funding increases by over 26 percent over fiscal year 1997. Yet at the same time the FTE/staffing level remains constant. Will you have enough staff to enable the Endowment to award all of the funds in a timely manner?

Answer. Our FTE level of 170 should provide enough staffing support to administer increased grant funds at the fiscal year 1999 funding level. In fiscal year 1995 we reduced the number of divisions that administer grant programs from 6 to 3, which provided the most effective and efficient organization possible. There is enough flexibility within that structure to process a range of applications; thus applications processed within the increased fiscal year 1999 funding request can be accommodated effectively using our existing staff.

Also, some of the fiscal year 1999 increase is for the Federal/State Partnership program, which should not require any additional staff effort because those funds are distributed on a formula basis, without the need for additional panel reviews.

Question. The budget request includes an increase of nearly 100 percent for the Research and Education sub-category of Education Development and Demonstration. Please describe how this increase will be used and what the impact will be.

Answer. The funding increase we are requesting for the Research and Education division for fiscal year 1998 must be placed in proper context. That is, when Congress radically reduced the NEH budget in fiscal year 1996, the program activities represented by this division were devastated: funding dropped precipitously from \$51.324 million in fiscal year 1995 to the current fiscal year 1997 funding level of \$21.584 million. In fact, this division came into existence as a result of the reorganization of the Endowment that the budget reductions necessitated: In fiscal year 1996, the agency restructured three major program divisions with 24 discrete grant programs into one new Research and Education division containing only four grant programs.

The fiscal year 1998 funding request for the Research and Education division is needed to breathe some life back into these two key components of the Endowment's mission—that is, support for scholarly research and education in the humanities. The Research and Education division is also the home of two major special program initiatives the agency is proposing at our fiscal year 1998 request level of \$136 million: the American Legacy Editions initiative, which will help ensure the continuation of projects that are compiling documentary editions of the papers and writings of U.S. presidents and other important literary and historical figures and NEH's "Schools for a New Millennium" special program emphasis, which will extend the Endowment's recent efforts and successes in helping teachers and schools incorporate new information technologies involving the humanities into the nation's classrooms. The funding increase requested for Research and Education for fiscal year 1998 would enable the Endowment to implement fully these initiatives, which are addressing important needs in the humanities.

Question. The Special Projects sub-category of Public and Enterprise grants is proposed to increase by nearly 350 percent. Please describe how these funds will be used and what the impact will be.

Answer. The Special Projects category is designed to support activities that encompass a variety of formats and venues not readily accommodated within the guidelines of other programs in the Public Programs and Enterprise division. In fiscal year 1996, Special Programs awarded 2 grants under its regular guidelines and 9 grants as part of a special competition related to the Endowment's national conversation on American Pluralism and Identity. The national conversation initiative concluded in fiscal year 1996, though projects that address the themes of the initia-

tive will continue to be eligible for support throughout the Endowment's regular programs. With the funds we are requesting for fiscal year 1998, we would expect to award 9 grants under the regular Special Projects guidelines.

Question. In fiscal year 1996 the Endowment realigned its grant programs from 31 to 9. Describe the manner in which the new categories meet the needs of the Endowment, the applicants, the grantees, and the humanities community.

Answer. In order to adjust to a fiscal year 1996 budget reduction of 36 percent, we reinvented the Endowment as a leaner, more focused, and flexible agency. Getting smaller was certainly not our idea, but getting sleeker was. Our efforts are now more explicitly directed to those activities that are best done at the national level, that have long-term impact, that have few other sources of support, and that strengthen the institutional base of the humanities. Within a greatly simplified organizational structure, NEH staff increasingly work collaboratively, often forming ad hoc project teams. Much as they may be dismayed by the magnitude of the reductions in funding available to the Endowment for awarding grants, members of the humanities community have generally responded favorably to our new, consolidated structure, typically finding it is less confusing and more amenable to "one-stop shopping." Finally, we have accelerated implementation of computer and communications technologies that are making information much more accessible to applicants, grantees, and the public.

Question. What changes do you anticipate making in the grant guidelines before the next round of funding?

Answer. We are now in the process of streamlining and standardizing all of our programs' application guidelines. We are developing standard language for those sections of our guidelines that are common to all programs, and we are establishing a common structure for all guidelines booklets. In these ways we hope to make the process of applying for NEH support even simpler.

Question. Please describe the peer-review process used to evaluate applications for funding.

Answer. While "peer review" is the most important component of NEH's multi-tiered review system, it is neither the only nor the final determinant of an applicant's status. Except in the case of Challenge Grants and grants awarded by Federal/State Partnership, the Endowment makes awards for specific projects in the humanities. To apply, an individual or organization submits a proposal for a project to one of the Endowment's funding categories. A final decision on the proposal is normally made about eight months after the application deadline.

Each grant application to the Endowment is evaluated by knowledgeable persons outside the agency who are asked for their judgments about the quality and significance of the proposed project. Hundreds of scholars, humanities professionals, and other experts annually serve on NEH ad hoc panels, which are convened throughout the course of the year. Panelists represent a diversity of disciplinary, institutional, regional, and cultural backgrounds. In some programs, the judgment of panelists is supplemented by individual reviews solicited from specialists who have extensive knowledge of the specific subject area or technical aspects of the application under review.

The advice of evaluators is assembled by the staff of the Endowment who comment on matters of fact or on significant issues that might otherwise be missing from the review. These materials are then presented for consideration to the 26-member National Council on the Humanities, which meets three times each year to advise the Chairman of the agency. The NEH Chairman takes into account the advice provided by this review process and, by law, makes the final decision about funding.

It is the highest priority of NEH to provide sufficient funds to operate an effective review system. Our overriding goal is to ensure that the projects that ultimately receive federal support will be those that are judged to be most likely to make significant contributions to the humanities.

Question. When Challenge Grant monies are used to create or augment endowments, how much of the federal funds are permitted to be used for administrative costs of operating the endowments?

Answer. Up to 10 percent of the federal award may be applied toward fund-raising costs specifically related to the purposes to be endowed by the grant.

Question. Has the NEH sought a federal endowment for itself?

Answer. NEH does not have legislative authority to solicit and invest private contributions, which would be a pre-requisite to establishing a true "federal endowment." A bill recently introduced by the Senate Labor and Human Resources Committee, S. 1020, would provide such authority. We believe that the humanities would benefit greatly were we to receive this authority. As we have proven with our extensive track record in securing private support for our funded projects, NEH is

capable of leveraging a significant amount of nonfederal funds for humanities activities. We would mention, however, that a huge amount of capital would need to be invested in an endowment over a significant period of time before NEH would be able to support the level of humanities projects and activities that it now provides with annual appropriations from Congress.

Question. What kind of technical assistance does the Endowment provide to institutions and individuals in the area of business planning and grant-application preparation?

Answer. NEH challenge grants are designed to strengthen the management of humanities institutions as well as their finances and facilities. As part of their application for a challenge grant, institutions must draft a plan for the long-range future of their humanities programs in light of the history, objectives, and anticipated financial resources of their organization. Then, to meet the Endowment's demanding matching offer, challenge grant recipients typically augment their professional fund-raising capabilities, in some cases developing such resources for the first time.

Applicants to any of the Endowment's programs may take advantage of several kinds of assistance in the preparation of their funding proposal. Prior to submitting a proposal, prospective applicants are invited to get in touch with an NEH program officer in the relevant program (by letter, phone, or e-mail) to discuss their project. At this stage, NEH staff routinely offer suggestions on how to prepare a competitive funding proposal. Applicants may also submit a preliminary proposal for staff comment in advance of the competition deadline. Every year, NEH staff hold public, grant-preparation workshops in various parts of the country, usually in conjunction with a project site visit. Finally, applicants who are unsuccessful in a particular competitive round may request a synopsis of the review panelists' comments on their proposal, which they may revise and resubmit at the next application deadline—and to a newly constituted review panel—without prejudice to their chances of getting a grant.

LEVERAGING FEDERAL FUNDS WITH MATCHING GRANTS

Question. Describe the matching requirements for recipients of NEH grants.

Answer. Conventional "matching grants" are awarded in most programs of the Endowment to support discrete humanities projects approved through the normal competitive process. The recipient of a matching grant, usually an institution of sufficient scale and administrative sophistication to undertake fund-raising, is offered a federal award conditioned upon attracting an equivalent amount of third-party, cash contributions from non-federal sources. An offer of matching funds may comprise the entire amount of the Endowment's grant, but more often it is combined with an outright award that enables the project to proceed while fund-raising is getting underway. In fiscal year 1996, the Endowment awarded \$10.3 million in matching grants.

Challenge grants are awarded in the program of that name to underwrite long-term institutional needs such as endowment building. First-time challenge grant recipients must raise \$3 in cash contributions for each federal dollar of their award, and recipients of a subsequent challenge grant must raise \$4. In fiscal year 1998, the Endowment will offer a special challenge grant initiative for public libraries that will require only \$2 of fund-raising for each federal dollar. In fiscal year 1996, the Endowment awarded \$9.9 million in challenge grants, leveraging approximately \$35 million in non-federal contributions.

In addition, most NEH project grants awarded to institutions entail substantial cost-sharing in the form of contributions of cash or in-kind services. Even individual grant recipients, such as NEH fellows, often receive supplementary support from their home institution. In a typical year, project cost-sharing by grant recipients—in addition to matching—averages—about 95 cents for each federal \$1 we award.

Question. Are the matching requirements a challenge for applicants to meet?

Answer. Matching awards have proven to be a very effective way to leverage non-federal contributions for the humanities. In the 20 years of existence, the Challenge Grants program has generated over \$1.15 billion in contributions. Only 2.5 percent of the challenge grant funding on offers during that time has been forfeited for lack of fund-raising success. Since NEH was founded, matching grants for humanities projects have stimulated an additional \$333 million in third-party support. Approximately three quarters of these grants that conclude within a given year are completely successful in that they leverage the entire amount of federal funds offered. Project matching awards are usually offered in conjunction with an outright grant and, to some extent, constitute a source of supplementary funding. Nevertheless, well under 10 percent of the recipients of these grants fail to raise at least enough contributions to claim some portion of their matching award.

The high success rate of both challenge grants and project matching grants owes a great deal to the selectivity of the Endowment's award process. A feasible fund-raising plan is an essential part of a successful application for a challenge grant, and the Endowment does not incorporate a matching requirement in a project grant unless our staff are satisfied that the grant recipient will have a high probability of funding-raising success. It is important to realize that most NEH grants do not entail a third-party matching requirement, even if they do usually require cost sharing by the recipient institution. In fiscal year 1996, just 22 percent of the Endowment's grant obligations were for matching. In fiscal year 1998, we hope to extend the challenge grant concept to a category of institutions for whom a 3:1 or 4:1 funding-raising requirement might be an insurmountable hurdle; the Endowment will offer public libraries a chance to receive one federal dollar for each two contributor dollars.

The recent budget cuts are having an adverse effect on the success rate of NEH matching grants, however. In order to allocate the Endowment's scarce funds for matching in a way that is efficient and fair, we have had to deny most requests for an extension of the grant period stipulated for fund-raising. Some institutional recipients of a matching grant that in the past might have had better success with more time must now abandon their fund-raising campaign at a point short of completion.

Question. Do the matching requirements limit the number of applicants?

Answer. Matching is a requirement only in the Challenge Grants program. Certainly the matching required by a challenge grant, ordinarily three or four contributor dollars for each federal dollar, does limit the number of applicants. Some institutions that do valuable work in the humanities lack the scale, administrative sophistication, or contributor base to conduct the kind of fund-raising campaign a challenge would require. In fiscal year 1988, we hope to reach some of these institutions with a challenge grant initiative for public libraries that will require only \$2 in contributions for each \$1 in federal support. A matching requirement is not imposed on the recipient of a project grant unless NEH staff are satisfied that the institution is likely to be a successful fund-raiser; and, even then, our matching offer is usually accompanied by an award of outright funding.

Question. Must the grantees be able to prove/show in the applications that there is a high likelihood of raising the matching funds needed to secure a grant?

Answer. Applicants proposing large projects are encouraged to request at least partial matching support and to specify potential donors in their application submission to the Endowment. The feasibility of an applicant institution's fund-raising plan is an essential criterion in the review of a proposal for a challenge grant.

Question. How do the applicants for grants show the Endowment they can provide the matching funds required?

Answer. Most NEH project grants do not entail a matching requirement. Institutions proposing large and costly projects are expected to discuss fund-raising possibilities in their application submission, however. Applicants for a challenge grant are expected to address such issues as the long-term financial stability of the institution; the feasibility of their fund-raising plan; and the adequacy of staff and other administrative resources to conduct a fund-raising campaign.

FUNDING SOURCES OTHER THAN FEDERAL

Question. Does the NEH receive funding for grant-making from private sources?

Answer. The Endowment's Office of Enterprise was established expressly for the purpose of forging partnerships with outside funders. For example, NEH and the Andrew W. Mellon Foundation are collaborating on a three-year, joint-funding effort to ensure that the nation's centers for advanced study in the humanities can continue to support scholarship at an adequate level; and the Endowment, MCI corporation, and the Council of the Great City Schools are collaborating on the development of EDSITEment, a "one-stop-shopping" gateway to educational content on the internet. Neither of these partnerships will entail using private contributions for making grants, however. NEH and its private partners will be working in parallel.

Every year, NEH matching and challenge grants help humanities institutions leverage private sources of support. These contributions go directly to the grantee institutions, not to the Endowment. The only recent instance when an outside funder provided private monies for making NEH grants was the DeWitt-Wallace Readers Digest Foundation's five-year, \$2.5 million participation in the Endowment's Teacher-Scholar program.

Question. How much did the NEH receive in donations in fiscal year 1996; what is the estimate for fiscal year 1997 and fiscal year 1998?

Answer. The Endowment received nearly \$99 thousand in donations in fiscal year 1996. We estimate donations of \$100 thousand in fiscal year 1997 and in fiscal year 1998.

(These donations are in addition to the funds generated by our Challenge Grants program and by our matching program for humanities projects. In fiscal year 1996, these two efforts raised almost \$46 million.)

Question. Does the Endowment anticipate seeking authority to solicit and invest private funds?

Answer. As noted in an answer to a previous question, the Senate Labor and Human Resources Committee has introduced a bill, S. 1020, that would provide "solicit and invest" authority for NEH.

Question. What changes in legislative authority would be needed to permit the Endowment to solicit and invest private funds?

Answer. Basically, NEH needs to have express authority to raise and invest non-federal funds for endowment-building purposes and to use any income that would accrue from this endowment to support projects and programs in the humanities.

Question. What dollar amount of private, state, and/or local funds was used to meet the matching requirements for NEH grants? How do these matching funds compare with total funding available for the humanities? How does the amount of federal investment in the humanities compare with the total annual investment made in the humanities by all sources in the United States?

Answer. In fiscal year 1996, NEH matching requirements leveraged approximately \$46 million in nonfederal funds. In addition, we estimate that cost-sharing requirements on NEH grants generated another \$90 million in nonfederal support. The sum—\$136 million—appears to be significantly greater than the amount available for the humanities from all other sources. In 1994 (the most recent year for which data are available), private foundations contributed \$35 million to the humanities, representing less than one percent of all of their giving that year. Although similar figures for corporate and individual giving are not available, we know from previous research that neither sector has a strong track record in giving to the humanities.

In sum, NEH grants, together with the nonfederal funding leveraged by those grants, represent a significant share of all funding available for the humanities. As the president of one major foundation once said, "NEH is by far the most important external source of funding for the humanities in the United States. It is no exaggeration to say that the decisions made concerning the budget for the NEH ... have an absolutely decisive impact on the health and character of the humanities in America."

PARTNERSHIPS AND ADMINISTRATION

Question. Describe the support that the NEH provides to the Institute for Museum and Library Services.

Answer. An interagency agreement between NEH and IMLS authorizes the Endowment to provide to IMLS certain administrative services. Using its own staff and resources, NEH provides specific accounting, audit, automatic data processing, budget, equal employment opportunity, legal, administrative, and personnel services. This method of providing services is far less expensive than it would otherwise be for a small agency like IMLS to create additional staffing, space, and equipment to perform the same services in-house.

Under the terms of the interagency agreement between the two agencies, IMLS reimburses NEH for the actual cost of services provided.

Question. Describe NEH efforts to leverage federal funds through partnerships with other federal agencies.

Answer. In recent years the Endowment has entered into partnerships with a variety of federal agencies [in pursuit of common goals?]:

- In 1996 and again in 1997, NEH joined with the Voice of America to support a national essay contest on themes related to NEH's National Conversation initiative.
- Last year we entered into a short-term working agreement with the Library of Congress to share our expertise on the design and execution of peer-reviewed grant competitions.
- We have recently joined forces with the Federal Emergency Management Agency to produce a Disaster Recovery Kit, which is designed to provide cultural institutions with guidance on the preservation of cultural materials that are susceptible to damage as a result of floods, fires, hurricanes, and other natural disasters.

—For the past twenty years NEH has been joining with other federal agencies to support a number of national data collection projects. Among the projects NEH has funded in this way are the Survey of Earned Doctorates, the National Museum Survey, and the National Study of Postsecondary Faculty.

Although not all of these projects involve the leveraging of additional funds, each represents a concerted effort to advance common goals through mutually beneficial partnership arrangements. In this way the reach of federal dollars is greatly extended.

Question. Does the NEH coordinate its materials preservation training with other federal agencies engaged in similar work? Briefly, please describe any interagency training efforts.

Answer. We are not aware of any other preservation education and training programs similar to the type NEH supports. Indeed, the Endowment's support for these activities is intended to address clear needs in the preservation field that are not being met by other federal agencies. In addition, NEH is also unique in providing support to regional field service organizations around the country that offer a rich array of preservation educational training services and information to libraries, museums, and other humanities-oriented institutions in their respective areas.

Question. Please describe the Endowment's efforts to generate non-federal support for preservation activities for endangered materials.

Answer. The Endowment has played a direct role in stimulating nonfederal funding for preservation. Since the establishment of NEH's Office of Preservation in 1986, projects supported by the Endowment have leveraged over \$10.9 million in gifts from private donors and foundations. Moreover, the division's grants in the last three years generated cost-sharing from grantees totalling \$41.6 million. Essentially, however, through NEH the federal government is providing vital funding and national leadership in an area where private sector or other nonfederal support is limited.

Question. Do you anticipate starting any new interagency efforts in fiscal year 1998?

Answer. One of the key objectives of the Endowment is to forge new partnerships with public and private institutions in support of the humanities. We do not now, however, have any specific plans to develop new collaborations with other agencies of the federal government in fiscal year 1998.

Question. How has the fiscal year 1996 reduction in staffing and reorganization from 6 programming divisions to 3 affected the daily operations of the NEH?

Answer. With dramatically fewer internal administrative divisions, NEH staff are now routinely working collaboratively, often in ad hoc project teams. We believe our new structure is helping us make the most efficient and creative use of our drastically reduced resources for making grants.

Question. What lessons have you learned from this streamlining?

Answer. We have learned to be more collaborative, innovative, and flexible. These changes in our procedures and habits of mind probably outweigh the changes in our administrative structure.

Question. Do you have further plans to fine-tune the NEH in terms of organizational structure?

Answer. We are conducting a strategic planning exercise in conjunction with our implementation of the Government Performance and Results Act (GPRA). All aspects of the Endowment's operations are being reviewed exhaustively. However, at present we have no immediate plans to alter our current structure.

Question. Does the NEH seek to learn from and offer insights to executives and staff of other endowment and philanthropic organizations in the form of details and exchanges?

Answer. For many years the Endowment took advantage of personnel exchange opportunities made possible under the Intergovernmental Personnel Act. Under the IPA we were able to bring the fresh perspectives of outsiders to the work of the agency, while also permitting other organizations to benefit from the Washington-based knowledge of our NEH employees. In recent years we were also able to make several of our best employees available to the National Performance Review for its government-wide review of agency functions and operations. In the wake of the significant down-sizing of the agency in 1995, however, we have not had the resources necessary to continue such exchanges and details.

INTERNET AND THE NEH

Question. How does the NEH benefit from its relationship with the Institute of Museum and Library Services? Does this IMLS support include a transfer of knowledge of internet programming and access to the NEH?

Answer. Actually, according to a long-standing arrangement, NEH provides certain computer and internet services to IMLS. More importantly, the programs of NEH and IMLS complement each other in many ways, including their use of the new communications technologies to make the resources of libraries and museums more accessible to the public. For example, IMLS makes grants to state library agencies to support the acquisition of computer systems and telecommunications technologies, the development of electronic linkages among libraries and other cultural institutions, and the provision of information services to underserved communities. All of these activities help NEH reach a wider and more diverse audience with the education software, digitized archival collections, and virtual museum sites on the Internet whose development our grants have sponsored.

Question. What do you see as the future of the humanities on the internet?

Answer. We recently released a special report, NEH in the Digital Age, that describes in considerable detail the role we envision for the new information technologies in fostering scholarship and learning in the humanities.

The Endowment has joined a public-private partnership with MCI Communications Corp. and the Council of Great City Schools to create "EDSITEment," a new website that, when it premieres in September 1997, will provide one-stop shopping for teachers, students, and parents who are searching for high quality humanities resources on the Internet. MCI has pledged \$500,000 toward the EDSITEment, which will offer the best humanities education websites to anyone with internet access. In addition, the project will target special programs to 800 high schools in 23 Great City School cities, where teachers will receive additional help in integrating the resources on EDSITEment into their classroom instruction.

The Endowment has completed the second year of a three-year Teaching With Technology initiative designed to support the development and implementation in humanities education of a wide array of innovative technological applications, including digital audio, video and imaging, hypertext and hypermedia, video-conferencing, speech processing, and Internet sites. In the first round of grants awarded last year, for example:

- Northwestern University received \$185,000 for a multimedia relational database on the history of the United States Supreme Court. Recently made available on the World Wide Web, "Oyez, Oyez, Oyez" enables students anywhere to access summary and full-text versions of the Court's most significant cases, an audio archive of oral arguments in 500 Court cases, audio and video materials about all justices since 1920, and much else.

- The University of Virginia received \$215,000 to develop CD-ROM and Internet versions of "In the Valley of the Shadow," an interactive program that enables students to learn about the lives of ordinary people during the Civil War. An extensive archive of documents—including newspapers, photographs, census and tax records, letters, diaries, photographs, and music—will enable students to research daily life during the Civil War in two Shenandoah Valley counties located on either side of Mason-Dixon Line.

- Tufts University received \$215,000 to develop a digital library on ancient Roman culture that will be available both on CD-ROM and on the World Wide Web. High school Latin students and undergraduates will be able to access texts of all major Roman authors up through the death of Augustus either in the original or in translation, as well as a virtual museum of maps and objects.

In fiscal year 1998, the Endowment will launch a successor initiative to Teaching with Technology. Called "Schools for a New Millennium," it will support efforts to help humanities teachers become proficient in the use of the new electronic materials and formats.

The Endowment has long been at the forefront of the national effort to bring humanities scholarship into the digital age, sponsoring, among other things, the development of technical standards for digitally encoding texts and the conversion of invaluable research resources into digital form accessible on CD-ROM's and the Internet. For example, NEH support helped launch the University of California's monumental Thesaurus Linguae Graecae project, which has produced a CD-ROM that contains the entire extant corpus of ancient Greek texts. Through the use of infrared scanning technology, the Ancient Biblical Manuscript Center in Claremont, California, is creating digitized images of the Dead Sea Scrolls. Because of this NEH-sponsored project, these rarest and fragilest of texts will soon be accessible to scholars world-wide via CD-ROM and the Internet. Another project recently funded by the Endowment is creating a complete facsimile edition of the legal papers of Abraham Lincoln on CD-ROM.

Increasingly, NEH-sponsored programs for the general public are reaching bigger audiences in a more engaging and accessible way through the use of such rapidly evolving technological innovations as virtual museums on the Internet, interactive

computer displays, CD-ROM's, and videodisks. The Denver Public Library, with NEH support, has digitized 35,000 photographs from its Western American Collection. This unique photo archive is currently accessible on computer workstations at the library; but it will one day be available to the whole nation, and to world, via the Internet. The Montana Community Foundation recently received an NEH grant to plan development of a multimedia CD-ROM on the Lewis and Clark expedition. Intended for use either by individuals or by museums and libraries, "Discovering Lewis and Clark" will incorporate selections from The Journals of Lewis and Clark, moving pictures, topographical animations, and audio material.

Question. Are any funds in the Department of Education used for this purpose?

Answer. The Department of Education supports some activities that are complementary to what NEH is doing.

The Department's Technology Literacy Challenge Fund (fiscal year 1997, \$200 million), which provides formula grants to state education agencies, and Technology Innovation Challenge Grants (fiscal year 1997, \$75 million), which provide matching grants to locally based public-private consortia, both support the acquisition of computers and telecommunications technologies and the development of technology-based curricula. In one such example, the Technology Innovation Challenge Grants program has already helped an urban school system on the Great Plains to connect its classrooms via the Internet to major museums across the country and to develop networked learning content that integrates the arts with core subjects including, history, mathematics, science, reading, and writing. A variety of other Department of Education programs are also contributing to the technology challenge grant initiative, including Title I of the Improving America's Schools Act, the Eisenhower Professional Development Program, School-to-Work Opportunities, Star Schools, the Regional Technology for Education Consortia, and the Regional Educational Laboratories.

Question. Is the internet used by the NEH or its grantees as a way to reach underserved communities?

Answer. Communities that are separated by location or economics from the nation's educational and research resources and its cultural amenities probably stand to gain the most from the encyclopedic, distance-annihilating potential of the Internet. For example, "EDSITEment", which the Endowment is developing in a partnership with MCI, will make the latest and best in history, literature, and foreign language sites available to any school, parent, or student with access to an Internet connection. MCI is helping to connect 800 schools in 23 cities as part of this project. In fiscal year 1998, our "NEH Cyberschools" program will help humanities teachers become proficient in the use of the new electronic materials and formats. This initiative is explicitly designed to exploit the potential of the Internet not only to link participating teachers in a single project but also to trigger rapid fire, nationwide dissemination and participation.

INITIATIVES

Question. Describe the My History is America's History project and the projected impact it will have in terms of numbers of participants.

Answer. NEH is planning an initiative that will encourage Americans of all ages to explore their family history and its relationship to the larger pattern of community life, migration, settlement, and interaction that together make up the nation's history. The role NEH will play in this initiative is a new one. Under the auspices of the Endowment's Enterprise Office, we will act primarily as a broker of partnerships among public and private entities to achieve shared goals rather than as a funder of individual projects. Our plans are to join with historical societies, archives, libraries, genealogical societies, and other repositories of historical information to create national Partnerships for America's Story. At a minimum, we would expect to contribute \$200,000 toward a total project cost of at least \$1 million. At the same time, we will continue to support humanities research, scholarship, education, and public programs on American history through our regular grant programs.

The dimensions of this effort are potentially very large. For example, we plan to publish and distribute a family history "kit" along the lines of our National Conversation Kit, which reached nearly 10,000 community-based organizations. We will know more about the likely audience impact of this effort when we have assembled a roster of participating organizations and funders.

Question. Within the funding category of Research and Education, you have proposed increasing the funding for American Legacy Editions by greater than double its current level of funding. What are some of the projects planned for this increase in funding? Are there enough projects in the pipeline that all of the funds would be able to be used in fiscal year 1998?

Answer. The American Legacy Editions initiative is designed to ensure the survival of some of the most important projects now being conducted across the country that are preserving and making available cultural and intellectual resources essential to the people of the United States. Among the projects that would be included under the American Legacy Editions rubric are: the papers and writings of several U.S. presidents, including Washington, Jefferson, Madison, Grant, and Eisenhower, as well as the papers and writings of other important figures in American history, including Franklin, Twain, Thoreau, Elizabeth Cady Stanton and Susan B. Anthony, and Martin Luther King, Jr. Other significant documentary editions that would fall within the initiative's scope include documents on the ratification of the U.S. Constitution and the Bill of Rights, the records of the First Federal Congress, the journals of the Lewis and Clark expedition, and documents relating to the history of emancipation. Considering that there are approximately 50 ongoing documentary editing projects that the Endowment has supported in recent years, which would make up the corpus of American Legacy Editions, there are indeed enough projects "in the pipeline" to use all of the funding requested for this initiative in fiscal year 1998.

Question. Is the Teaching with Technology program coordinated with the Department of Education?

Answer. Because NEH's Teaching with Technology program—which provides grants for discrete, content-rich projects that help teachers use new electronic technologies to enhance students' understanding of the humanities—is distinct from the types of education programs supported by the Department of Education, there is really no need to "coordinate" the program with DOE. Staff at NEH and DOE do, however, often exchange information about various programs and projects, which helps to insure that there is no duplication of effort in the federal government's humanities education programming.

Question. How will the report on A National Conversation on American Pluralism and Identity be made available to the public?

Answer. The report on the National Conversation—One America, Indivisible—was published in July and is available from NEH free of charge. News of the report's publication was circulated widely, ranging from the Chairman's nationally broadcast speech at the National Press Club to a feature on the NEH website. Interested listeners and readers are invited to call, write, or e-mail their requests for complimentary copies.

SUBCOMMITTEE RECESS

Senator GORTON. The subcommittee will stand in recess until 9 a.m., Thursday, May 1, when we will receive testimony on the fiscal year 1998 budget from the Secretary of the Interior, Hon. Bruce Babbitt.

[Whereupon, at 11:20 a.m., Thursday, April 24, the subcommittee was recessed, to reconvene at 9 a.m., Thursday, May 1.]

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, MAY 20, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9:02 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Slade Gorton (chairman) presiding.

Present: Senators Gorton, Stevens, Cochran, Domenici, Burns, Bennett, Campbell, Byrd, Leahy, Bumpers, Reid, and Dorgan.

Also present: Senator Bond.

DEPARTMENT OF THE INTERIOR

OFFICE OF THE SECRETARY

STATEMENT OF HON. BRUCE BABBITT, SECRETARY OF THE INTERIOR

BUDGET REQUEST

Senator GORTON. The subcommittee will come to order.

We are here today to hear testimony in support of the 1998 budget request of the Department of the Interior, the principal department funded by the subcommittee. We are delighted that the Secretary has been able to be with us here today, and I would just like for him and for members of the subcommittee once again to refer to the chart there on my left.

[The information follows:]

Interior programs fiscal year 1997 enacted

Land management programs:	
Forest Service	\$2,361,000,000
National Park Service	1,414,000,000
Bureau of Land Management	1,090,000,000
Fish and Wildlife Service	653,000,000
Total	<u>5,517,000,000</u>
Indian programs:	
Indian Health Service	2,054,000,000
Bureau of Indian Affairs	1,606,000,000
Navajo-Hopi/IAIA/special trustee/Indian gaming/Indian education	119,000,000
Total	<u>3,779,000,000</u>
Science and minerals management programs:	
Geological Survey	739,000,000

Interior programs fiscal year 1997 enacted—Continued

Office of Surface Mining [OSM]	272,000,000
Minerals Management Service [MMS]	163,000,000
Total	<u>1,174,000,000</u>
Energy programs:	
Energy conservation R&D	570,000,000
Fossil energy R&D	365,000,000
Naval petroleum NPR/reserves	144,000,000
Energy information administration/economic regulation	69,000,000
Alternative fuels production	-4,000,000
Clean coal technology	-123,000,000
Total	<u>1,020,000,000</u>
Cultural programs:	
Smithsonian Institution	370,000,000
National Endowment for the Humanities	110,000,000
National Endowment for the Arts	99,000,000
National Gallery of Art	60,000,000
Holocaust Memorial	31,000,000
Institute of Museum Services	22,000,000
Memorials	41,000,000
Total	<u>733,000,000</u>
Interior departmental offices:	
Interior affairs	88,000,000
Departmental management	58,000,000
Solicitor	35,000,000
Inspector general	25,000,000
Total	<u>207,000,000</u>
Total	<u>12,430,000,000</u>

COMMITTEE FUNDING

Senator GORTON. It shows where we are for the current 1997 fiscal year, about \$12.5 billion, just over one-half of which goes to the Department of the Interior itself. The largest part of our money, of course, that green line, goes to the four land management agencies, three of which are under the Secretary's jurisdiction, and the Forest Service that is not.

Another very large portion, the second-largest portion, is comprised of programs for the benefit of Native Americans, primarily the Indian Health Service and the Bureau of Indian Affairs. The Indian Health Service is a particularly demanding responsibility of the subcommittee because the cost of simply maintaining existing levels of medical services increases at a rate that is in excess of inflation by a substantial amount.

The third major grouping of agencies are the cultural agencies, the Smithsonian, the National Gallery of Art, the Kennedy Center, and the two Endowments. While these agencies account for a smaller portion of the total funds appropriated in the Interior bill, they are in most cases the agencies responsible for the care and protection of our Nation's heritage. These programs get very vocal support from across the country and from many Senators on both sides. In fact, when we had our hearing on the National Endow-

ment for the Arts, I did not hear a single Senator on either side of the aisle who objected to continued funding of those agencies.

The fourth group includes agencies that regulate minerals development out of our Nation's lands and those that produce the science and support management of those lands.

The fifth grouping is programs within the Department of Energy, including energy conservation, research and development programs that are a high priority of the administration.

So, Mr. Secretary, you are up with very, very tough competition. We have now agreed on an overall budget agreement through the year 2002. The Senate just last night passed a budget resolution that reflects that agreement. The increase in request on the part of the President is for just over 6 percent above the 1997 levels. The budget resolution will allow for an increase, but not an increase of that amount. So some reductions are going to have to be made, and we are going to need your help in setting priorities within your areas.

You have got a wide range of responsibilities, some of which are multiagency such as the everglades restoration project and my own Interior Columbia basin ecosystem management project, not to mention the results of storm damage in Yosemite and elsewhere, and I understand you were there just in the course of the last couple of days.

Some of the priority elements in the budget agreement do relate to programs under this subcommittee's jurisdiction. There are some of them that I am not completely in sympathy with. But I am a strong supporter of the bipartisan budget, and as far as I am concerned this subcommittee will meet the obligations that have been agreed to between the President and the congressional leadership in that connection. That leaves many other areas in this appropriations bill unprotected, and those priorities will have to be determined by the committee with, we hope, your help.

With that, I would like to turn to my friend and guide in many of these things, Senator Byrd.

OPENING REMARKS OF SENATOR BYRD

Senator BYRD. Mr. Chairman, you will not proceed with questions until the Secretary has made his statement?

Senator GORTON. We will let the Secretary make his statement.

Senator BYRD. Well, I just share your sentiments in most of what you said. I am not onboard with respect to the so-called bipartisan budget agreement because I did not have anything to do with it. I did not have any voice in it, and so I am not buying onto it yet. But aside from that, the Senator has done yeoman's work on it in the budget committee, and I compliment him on that.

I am glad to be here this morning with Secretary Babbitt, who has done a fine, fine job as Secretary. He has had limitations on appropriations and this has certainly been a problem for him and the people in his department. I compliment him on his good work, and I am delighted to be here, Mr. Secretary, this morning with you, and I look forward to hearing your statement.

Senator GORTON. Senator Stevens, do you have an opening statement?

Senator STEVENS. No; I share Senator Byrd's statement. I will have some questions later, but I have no opening statement.

Senator GORTON. Thank you.

Senator Reid.

Senator REID. I will save my time for questions.

Senator GORTON. Thank you.

Senator Bond.

OPENING REMARKS OF SENATOR BOND

Senator BOND. Thank you, Mr. Chairman, for allowing me to join you today. We have in Missouri an ongoing interest in the Forest Service, the National Park Service, and the Fish and Wildlife Service, but I am here today to talk with the Secretary briefly about an area in which the State of Missouri has been drawn into a matter with the Interior Department against their will. And that is the filing of the petition by the Eastern Shawnee Tribe of Oklahoma to take land in southwest Missouri that they have purchased into Federal trust for the stated purpose of class III gaming.

The application is now pending before the Secretary. I have had very productive discussions with the Secretary about it. The people of southwest Missouri are overwhelmingly opposed. The Missouri General Assembly has overwhelmingly adopted resolutions opposing it, State officials are opposed to it, in straw votes or opinion votes taken in the area they are opposed to it, and I just want to explore with the Secretary briefly the protections a State may have against the imposition of this kind of an activity in an area where it is totally inappropriate.

Thank you for giving me the chance to be with you.

Senator GORTON. Welcome to the club, Senator Bond.

Senator Burns.

Senator BURNS. That was my line.

Thank you, Mr. Chairman with your permission I will forgo my statement. It focuses mostly with the Park Service, and I will await the Secretary. I will await his statement, and I will do mine in the form of questions. Thank you very much.

Senator GORTON. Senator Campbell.

Senator CAMPBELL. Thanks, Mr. Chairman. I have no opening statement. I do have maybe a couple of questions relating to parks and several other things, but the Secretary will be pleased to know that I am not going to ask him anything or buttonhole him about the Animas La Plata today.

Secretary BABBITT. I do not believe it. [Laughter.]

Senator GORTON. Mr. Secretary, it is up to you to give us your opening statement now.

Senator REID. I am going to ask the questions for him.

Senator GORTON. I will say for my members here we have got a good attendance here, and I know that many of the members of this subcommittee have other duties, so I will defer my own questions until last, and allow my colleagues to ask theirs as soon as you have completed your opening statement.

So please, Mr. Secretary, go forward.

SUMMARY STATEMENT OF SECRETARY BABBITT

Secretary BABBITT. Senator and committee members, thank you very much. In the spirit of this waiving of statements, I propose simply to summarize my opening statement.

Senator GORTON. Your full statement will be included in the record.

Secretary BABBITT. Thank you.

I am pleased to come before the committee today in the spirit of the budget agreement which has been reached between the Congress and the administration, and I am optimistic that we are now, in terms of the Department of the Interior and these committees, way beyond the divisions of 2 years ago when we spent a lot of time in very antagonistic positions debating riders and debating fundamental differences over funding priorities. I am hopeful that we can work these issues out in a spirit of cooperation and bipartisanship, as indeed I think we for the most part succeeded in doing last year, to the substantial benefit of the Department and our various programs.

I would at the outset, just briefly once again, underline the fundamental operative fact of our budget and operations in the Interior Department, and that is that our budget is about personnel and salaries. We have the highest percentage of personnel costs relative to total budget of any agency in the U.S. Government with the exception of the military and the Justice Department. And that, of course, means that as we begin the budget process each year we swallow 3 to 4 percent of fixed costs in terms of salaries, retirement, and benefits. That, in turn, has led us to substantial personnel reductions. During my tenure as Secretary we have reduced the payroll of the Interior Department by 12 percent, including a 15-percent cut in overhead in Washington and in other management positions. That is the largest percentage cut in personnel of any of the domestic cabinet agencies.

INTERIOR PROGRAM DIRECTION

Now, just a brief word about the nature of the program evolution in the Department. At the beginning of this second Clinton administration it might be helpful, very briefly, to suggest what the year-to-year additions, changes, and subtractions add up to in terms of overall direction. What we have been doing, I think consistently and with considerable success, is recognizing that in the West and elsewhere, in areas of our jurisdiction, we solve problems best by looking at the large picture, by looking beyond boundaries, by looking beyond the boundaries of agencies, by recognizing that increasingly in this complex interrelated world it is very difficult to solve problems one at a time. We, in fact, provide more conservation values and more resource development possibilities by looking across the landscape, bringing in all of the stakeholders, many of the Federal agencies, and attempting to craft larger solutions.

That, of course, explains the emerging success in evolution of the Florida Everglades ecosystem restoration efforts. It is the theory that motivated the President's forest plan in an attempt to find an appropriate balance on the landscapes of the Pacific Northwest. It is being worked out now in the context of the issues in the Califor-

nia bay delta, where we are dealing with resource use, fish and wildlife, agriculture, the urban water supplies of California communities from San Francisco down to the Mexican border.

There are a number of other efforts under way which have received less attention but I think are equally promising in their possibilities. I would mention just three. There is a large interstate effort under way in the Colorado River Basin now, designed to adjust and maximize the water supply resources for all of the conflicting claimants in the seven States that are covered by that basin. Senator Reid is well aware of the implications of that for Nevada. There are major changes under way in southern California involving urban users, agriculture with major impacts in Colorado and the upper basin States. But the important thing is that those efforts involve a comprehensive attempt to deal with ground water resources for the city of Albuquerque, fish and wildlife issues in Colorado, agricultural needs of the Navajo Indians, the administration of parks, the Endangered Species Act, water supply, as I mentioned, in Nevada, California, and Arizona.

We will be in Denver probably in the next couple of weeks to join with the Governors of Colorado, Wyoming, and Nebraska for a major settlement involving the administration of the water resources of the entire Platte River basin. Senator Gorton mentioned the East Side Columbia environmental impact statement process. The two environmental impact statements relating to the Columbia River basin will be released within the next few weeks. They will begin a year-long process, a very public process involving all of the stakeholders of State and local governments, in an attempt to see if we can find the right management prescription for the Federal lands in the Columbia River basin. This will have large implications for timber harvest, grazing, the protection of fish, the development of lands, and the economies in all of the rural areas that are impacted. I have been carefully through the studies in the preliminary environmental impact statements. I believe we have a major opportunity to reach an important consensus about the future of the Federal lands in the four States that are impacted in the Pacific Northwest.

LAND MANAGEMENT AGENCIES

Next, I would like to just say a word specifically about the budgets of the land management agencies. We have worked well with you in past years on these budgets, and I anticipate a productive year again this year. With respect to the National Park Service I would like to say three things.

FEE DEMONSTRATION PROJECT

First of all, the fee demonstration program that was authorized by this committee, and indeed pressed upon me with considerable vigor by Senator Gorton, who in months leading up to the 1996 election called me regularly saying: "why have you not raised fees in national parks on the eve of this election?"

Well, the happy bottom line is that we have raised fees, and the public response has been overwhelmingly positive. We have had virtually no negative feedback, because I think the public under-

stands that these fee increases are going to bring tangible improvements in the National Park System. The cause and effect relationship makes a lot of sense, and that is exactly what we are seeing. That program is now being expanded pursuant to the direction of this committee, and I am very pleased at your willingness to support that, and indeed to move us along at a rapid pace.

YOSEMITE FLOOD DAMAGE

Senator Gorton mentioned the Yosemite flood, the destruction in the valley and our response in the form of the supplemental. Let me just say that the Park Service has done a splendid job in getting that park back open. As of the end of this week, all of the major access routes into Yosemite, from Fresno, Merced, and the northern communities, will be open. We still have a major reconstruction task. You can see it in the park, and you can see on the roads going in, and in all of the infrastructure.

TRANSPORTATION IN PARKS

Third, with respect to the parks, I think it is important that we seize the next 4-year period to deal with transportation issues as much as we possibly can. Yosemite, Grand Canyon, Zion, many of the parks are simply jamming up, and the problem is not too many people, it is too many cars. That is leading us to a series of management proposals for Yosemite, and for Grand Canyon, which I will take briefly as an example.

The Grand Canyon management plan will be out shortly with a proposal that visitors will park their cars at the entrance to Grand Canyon National Park and move from the entrance into Grand Canyon Village on a mass transit system, possibly a light rail system. The economics look pretty good. It looks like we could actually put out a concession contract and finance that kind of system using a combination of the authority we now have for entrance fees and financing proposals of that nature.

ENDANGERED SPECIES ACT

Let me say a brief word about the Fish and Wildlife Service. The major issue of the Fish and Wildlife Service obviously is the Endangered Species Act. There are discussions going on under the leadership of Senator Kempthorne and Senator Chafee that have made considerable progress. I do not know where that will end. I would simply say that we are aggressively involved in those discussions, and I think that the possibility there reflects the success that we have had in diffusing most of the issues—not all of them, but certainly most of the issues—relating to the Endangered Species Act through the use of habitat conservation plans, the evolution of the no surprises policy, and the innovations that we have put on the ground administratively using the Endangered Species Act are reflected in the budget proposals. I would urge you to look carefully at those proposals, because the budget requests are crucial to keeping the momentum going to resolve these problems rather than letting them drift into the courts, and ultimately to keep the successes going which I believe provide the framework for finding consensus on reauthorization.

NATIONAL WILDLIFE REFUGES

There has been a considerable discussion increasingly in the national press about the issues in the national wildlife refuges. Those issues are reflected in a budget increase of approximately 6 or 7 percent. It is an important issue just to keep the refuge system moving.

BUREAU OF LAND MANAGEMENT

A word about BLM. There is, Senator Bennett, an increase of approximately \$5 million for the administration of the Grand Staircase-Escalante National Monument, and it has components which involve participation by the local communities and the play-out of a very intensive 3-year management plan.

The budget has provisions relating to our efforts with the Forest Service to step up our treatment of forest lands through the use of thinning and prescribed fire. I will not get into that except to say that I believe it represents a major departure, and remarkably, an area of emerging consensus that has brought together the environmental community, the resource users, and the local communities, and I would direct your attention to that.

INDIAN PROGRAMS

Last, a word about the Indian programs. I would make just two or three points. First of all, we ought to recognize that we have together made genuine progress in reshaping the Bureau of Indian Affairs. It is not widely acknowledged, but the fact is that we have downsized the Bureau of Indian Affairs more than any other agency in the Department. We have reduced the personnel in the BIA by 20 percent—20 percent—in the last 4 years in the nonpolice and nonteacher categories. As a result of that, 91 percent of the funding in the Interior Department for Indian Affairs flows through directly to the Tribes themselves, teachers, and policemen. The administrative overhead of the Bureau of Indian Affairs has now been reduced to 9 percent. The process is working.

PREPARED STATEMENT

The request for Tribal priority allocation is earmarked, I believe, in the budget agreement as a reflection of our concern for those issues. The remaining issue is the role of the special trustee. I would, rather than going through that in detail, be happy to respond to questions. I have expressed publicly my concerns about the direction that some of the trustee's efforts are taking. I have laid those out in writing. I would be happy to provide the committee with a copy of that. It is an urgent issue. It needs attention, and I think that it absolutely requires the close involvement of this committee, because the trustee has a statutory charge that is in some degree independent of my oversight. That is the reason that I want to very emphatically flag it, because I think we are jointly responsible for the outcome of this exercise and that it needs a great deal of very careful oversight and supervision.

Mr. Chairman, committee members, thank you.

[The statement follows:]

PREPARED STATEMENT OF HON. BRUCE BABBITT

I am pleased to again appear before the Subcommittee on Interior and Related Agencies. As the Chairman and senior members know, this is my fifth annual appearance before the Subcommittee as Secretary.

I testify today in support of the fiscal year 1998 budget request for the Department of the Interior with cautious optimism. Two years ago we were deeply divided over funding priorities and over the inclusion of controversial legislative riders in the Interior Appropriations bill. Last year, at the end, we were able to come together on a bill that was satisfactory in most respects to all of us. At the same time, agreement was reached on the authorizing side on the important 1996 Omnibus Parks Act and on other natural resource legislation, including the California Bay-Delta Environmental Enhancement and Water Security Act.

In the context of an overall budget that reaches balance by 2002, the President's 1998 request for the Department builds on the foundation of our 1997 agreement. The President's request seeks a total of \$7.5 billion for the Department in funds subject to annual appropriation by the Congress. An additional \$2.3 billion will be provided by permanent appropriations.

For Department programs under the jurisdiction of this Subcommittee, the request for annual appropriations is \$6.6 billion for 1998. This is an increase of \$389 million in current budget authority over the regular appropriations provided in the 1997 Interior and Related Agencies Appropriations Act. It is an increase of \$290 million in current authority over total 1997 appropriations available to date, including emergency funding released by the President.

Within these totals, we propose the funding necessary for our operational and on-the-ground requirements to ensure that we meet our continuing commitments:

- to the restoration of America's natural and cultural heritage through regional partnerships with other Federal agencies, State and local governments, community groups, and the private sector;
- to the millions of Americans who use the National Parks, National Wildlife Refuges, and public lands every year, and to an Endangered Species Act that works;
- to protecting and encouraging Indian self-determination and meeting Federal trust responsibilities to American Indians; and
- to a program of scientific research that contributes to describing and resolving the Nation's resource and environmental issues.

Our ability to propose a budget that protects these priorities is due to the President's commitment to the environment and programs for Native Americans and to our aggressive efforts over the last three years to streamline the Department, reducing headquarters staffs and management layers, and to reengineer our processes and improve the efficiency and effectiveness of our customer services.

As of the end of fiscal 1996, we had reduced our overall employment level by nearly 12 percent below 1993. The largest reductions have been in headquarters and overhead staffs, so that Interior employment in the Washington, D.C. area has been reduced by 15 percent. Our Department-wide reduction is second only to the Defense Department among large cabinet agencies.

Partnerships for restoration.—As I look back across the budgets I have presented to the Subcommittee, the most striking trend is the increasing recognition that natural resource issues cannot be resolved on the basis of jurisdictional boundaries or by the work of single levels of government, let alone individual agencies. For decades, the tendency was to think of natural resources in terms of a conservation approach: set aside the "back forty" as a nature preserve and it will take care of itself. Modern science and modern ecology have taught us that the natural world does not work that way. Landscapes are complex, living, and integrated systems.

Three principles must guide our approach to the most pressing natural resource problems. First, we cannot solve these problems by treating individual symptoms. We must treat them on a landscape scale. Second, in seeking solutions we must look across, and beyond, agency boundaries. We need to involve all the relevant Federal agencies, as well as States, local and tribal governments, industry, non-profit groups, and concerned ordinary citizens. Third, our goal should be restoration, so as to ensure the long term ecological and economic health of communities.

These three principles are reflected in some of our most important 1998 proposals:

- Congress authorized the Everglades National Park to preserve the sawgrass prairies, mangrove forests, and abundant wildlife of the largest remaining subtropical wilderness in the coterminous United States. The Park has since been complemented by the establishment of the Big Cypress National Preserve and several national wildlife refuges. But this "back forty" is not thriving. Man-made changes have profoundly altered the flow of water from the Kissimmee

River to Florida Bay. Water quality has been degraded, wading bird populations in Everglades National Park have declined by nearly 90 percent, commercial fisheries in Florida Bay have collapsed, and non-native and exotic plants and animals have proliferated, overwhelming some indigenous species.

Four years ago, we joined together with a broad group of Federal, State, tribal, county, municipal, and special purpose agencies to save the Everglades. This group is motivated by a consensus that restoration of natural hydrologic functions in South Florida is essential not only for the parks and refuges in the region, but also for the continued health and vibrancy of the economy of South Florida.

The State of Florida has committed major resources to restoration of the Everglades. In this budget, we again propose to establish an Everglades Restoration Fund. Funding of \$100 million is sought in 1998, with advance appropriations of the same amount that would become available in 1999, 2000, and 2001 for a total of \$400 million. These amounts, together with the \$200 million plus provided by the 1996 Farm Bill, will provide an assured funding stream for critical elements of watershed restoration, including land acquisition, construction of the Modified Water Delivery project for Everglades National Park, and scientific research.

—On the other side of the country in the California Bay-Delta, our budget addresses another, very similar problem of a stressed landscape. Although not within the jurisdiction of this Subcommittee, our request for the Bay-Delta demonstrates the necessity for comprehensive, long-term approaches to the complex and interrelated problems of an entire landscape.

The region where the Sacramento and San Joaquin Rivers meet the San Francisco Bay once sheltered a stunning variety of fish and wildlife and still provides habitat for 120 species, including some listed as threatened or endangered. The region is also critical to California's economy, providing water to two-thirds of all homes and businesses in the State and irrigating more than four million acres of farmland where, among other crops, 45 percent of the Nation's fruits and vegetables grow.

For the past 150 years, dredging and channelization, flood control, unscreened diversions, pollution, and large-scale water exports have contributed to the degradation of the Bay-Delta ecosystem. As a result, the Bay-Delta has reached the point where it cannot reliably meet the water needs of California residents, businesses, and agriculture while protecting environmental resources.

In 1994, Federal and State officials signed the historic Bay-Delta Accord. The Accord recognizes that a comprehensive package of actions is required to strike a fair balance among competing uses, restoring and protecting the Bay-Delta ecosystem while strengthening the State's long-term economic health. Last September, the President signed the California Bay-Delta Environmental Enhancement and Water Security Act, which authorizes \$143.3 million a year for three years in additional Federal spending for Bay-Delta ecosystem restoration. The authorization became effective in November 1996 when California voters approved a \$995 million bond issue to cover State cost sharing for activities to restore the Bay-Delta ecosystem and for other water resources activities in California.

Our request for the Bureau of Reclamation in the Energy and Water Development Appropriations bill seeks the \$143.3 million authorized for 1998 in the Bay-Delta Act. The requested funds will be distributed among participating agencies based on plans to be developed by the CALFED group, a consortium of the Federal and State agencies with management and regulatory responsibilities in the Bay-Delta. These funds will match non-Federal funding under the terms of a cost sharing agreement now being developed.

—In the Pacific Northwest, the budget proposes to continue the funding for the President's Forest Plan, the first of our major partnerships for restoration.

At the beginning of this decade the northern spotted owl triggered a crisis in the old growth forests of the Pacific Northwest. Yet, like a sneeze, the owl was only a symptom warning us that the entire Northwest forest system was sick, over stressed, and in need of treatment. Science told us that we needed to prescribe treatment for the whole forest, providing unbroken corridors textured by a mixed canopy of trees varied by age, size, and species, and maintaining wide stream buffers along fish bearing streams, from headwater to tidewater.

The Plan is not just about owls, salmon, and other wildlife. It directly addresses the economic issue: Healthy forests are important for a healthy, forest-based economy. If we destroy our old growth forest, we will lose jobs in salmon fishing and tourism and eventually in our timber industry as well.

Under the Plan, logging has been scaled back from the unsustainable levels of the 1980's. At those cut levels, the forests (and the forest economy) would be destroyed within a generation, just as they were in earlier times in New England and the upper Midwest. By scaling back to a sustainable level, we ensure a steady, predictable supply of timber for loggers and mills in the century ahead. And we ensure that the forest towns will continue to diversify, with new people and new industries seeking the quality of life and the health of the natural landscape.

The Plan is working, with the help of funding provided by the Subcommittee to the Bureau of Land Management and Fish and Wildlife Service. Unemployment in the Northwest forest communities has hit the lowest level in generations. We didn't lose 100,000 jobs, as some critics predicted, we created jobs.

For 1998, we request \$71.1 million, an increase of \$2.9 million over the 1997 enacted level. This level will allow the Bureau of Land Management to meet its 1998 timber target of 211 million board feet, as part of the Plan's overall annual sustainable harvest target of 1.1 billion board feet. It will also allow the Fish and Wildlife Service to continue a streamlined Endangered Species Act consultation process, to negotiate additional habitat conservation plans, and to implement the 4(d) rule, which will relieve spotted owl prohibitions for 30,000 owners of small tracts of land.

In addition to these major initiatives, the budget supports numerous other partnerships across the country, including support for numerous habitat conservation plans outside of the Pacific Northwest, increased funding for partnerships to clean up mine drainage in the Appalachian States, and start-up funding for the nine new heritage areas partnerships authorized by the Omnibus Parks bill. An increase of \$1 million in the Park Service will fund technical assistance partnerships with communities to assess and restore watersheds affected by non-point source pollution and wetlands loss.

Managing fire.—Last year, fires burned over six million acres, including almost five million acres in the public land states of the West and Alaska. As has been the trend in recent years, the wildland fires in forests and on ranges burned hotter, bigger, and faster—growing ever more lethal, destructive, and expensive to fight. Two decades ago, we spent an average of \$100 million each year to put out wildfires; last year we spent \$1 billion.

This explosion of fire—and cost—is in large measure the ironic product of our success over the past 90 years in suppressing fire. Healthy, low-intensity natural fires that once burned across the forest floor have, as a matter of policy, been “out by 10 a.m.”

Last February, Secretary Glickman and I released the Wildland Fire Policy Review directing managers to place greater emphasis on fuels reduction as a tool for protecting forest and rangeland resources. Our 1998 budget addresses the practical problem of implementing this policy. In the Interior wildland fire account, the budget proposes an increase of \$4.8 million for a combination of prescribed fire and mechanical treatment to reduce fuels. This will bring the total Department of the Interior hazardous fuels reduction program to \$12.8 million, which will treat half a million acres. The Forest Service program for 1998 is proposed to total \$30 million and treat at least 800,000 acres. This proposal establishes the foundation for a long-term effort to address our fuels management needs through the budget.

Land management operations.—As has each of our budgets during this Administration, the 1998 budget proposes the funding we believe necessary to adequately operate the National Park Service, Fish and Wildlife Service, and Bureau of Land Management and to preserve our parks, refuges, and public lands so that future generations may have the same opportunity to experience our natural and cultural heritage that we have had.

The increases requested in the budget reflect the continuing popularity of national park and wildlife refuge systems, as well as the public lands in the West; park visitation is projected at over 275 million people in 1998, and hunting, recreation, and other visits to the public lands and wildlife refuges will continue to increase. The increases also reflect the personnel intensive nature of operating and maintaining 374 parks, 509 wildlife refuges, and 200 BLM districts and resource management units. The costs for the staffing necessary to provide services to the public and properly maintain natural and cultural resources range between 50 and 60 percent of land management bureau operational costs, five to six times the average for all Federal agencies.

The budget proposes an increase of \$65.7 million for the Operation of the National Park System account. This increase includes across-the-board increases so that all parks can maintain their current level of services and targeted increases for 63 parks to cover new responsibilities and previously unfunded needs. Among the 63

parks are the five new areas added to the National Park System by the Omnibus Parks Act.

An area of emphasis in the Park Service's operations budget is additional funding to maintain irreplaceable cultural and historic resources of the Park System. Increases are proposed for historic structures stabilization, cultural cyclic maintenance, and museum cataloguing, as well as for a Vanishing Treasures initiative. This initiative recognizes the highly specialized maintenance needs of the Anasazi and other Native American sites in the arid southwest, over 60 percent of which have been severely impacted by weathering and erosion. It will provide \$3.5 million to bring these resources to a point where they can be sustained by routine preservation treatment programs. As part of the initiative, the Park Service will train a new generation of specialists to take over the task of preserving this unique cultural heritage as many of the current specialists retire over the next few years.

For the Fish and Wildlife Service, proposed increases in the Resource Management account include \$13.2 million over 1997 for operation and maintenance of the highest priority units of the National Wildlife Refuge system. This will allow greater opportunities for compatible, wildlife-dependent recreation, reduce operational backlogs, and provide additional habitat restoration. Specific projects have been selected using a ranking system, the Refuge Management Information System, which will ensure the most efficient distribution of limited resources to meet the highest priority refuge needs.

An increase of \$11.8 million in BLM's Management of Land and Resources account emphasizes improvements in recreational programs at highly visited sites such as Red Rock, Nevada, where visitation has grown 13 percent a year for five years, and the strengthening of BLM's resource protection capabilities, including an additional \$3 million for the cleanup of abandoned hardrock mine sites in Montana and Colorado, and an additional \$1 million to combat invasive weed species that threaten the health and productivity of public lands. Funding for the new Grand Staircase-Escalante National Monument is proposed at \$6.4 million, an increase of \$5 million over 1996 base funding for the area, to ensure a planning process that fully involves the people of Utah and other stakeholders, and to provide services for an expected increase in visitors.

Increases in the MLR account are partially offset by decreases in other MLR programs, primarily the Automated Land and Mineral Records System, which is moving from the development phase to the operation and maintenance phase. We intend to give ALMRS its operational test in New Mexico this Spring and are currently planning to bring on-line all of the BLM States over the next 20 months. We have put in place a seasoned management team at this critical juncture, including the appointment of BLM's first chief information officer. The system holds great promise for providing land and mineral information to State and local governments, industry, and the public.

Recreation fees.—In an era of constrained budgets, we cannot expect the general Treasury to meet all of the needs of our public lands. In 1996, the Subcommittee supported in authorizing a demonstration program to test fee collection levels and methods at parks, refuges, and public land sites. We are in the process of implementing that authority. Demonstration fee programs are in place at over 100 sites and an additional 50 sites are in the process of being designated. In 1998, we expect to collect over \$50 million to supplement regular appropriations.

This new revenue will be applied to maintenance and infrastructure needs to improve the quality of the visitor's experience. At the largest parks with the highest visitation, we will be able to achieve dramatic results. At the Grand Canyon, visitors on the busiest days can wait as many as two hours for a parking space. The experience at the Rim of the Canyon is one of urban traffic, not majestic solitude. With demonstration fee revenue, we will help provide a new inter modal transportation hub away from the Rim, along with a light-rail system or a fleet of clean, quiet shuttle buses for visitors.

The President's budget proposes legislation for a permanent fee program based on the demonstration program. The budget also commits the Administration to work with the Congress to reform Park Service concession fees.

Endangered species.—The President's budget proposes \$78.8 million to continue our efforts to administer the Endangered Species Act to provide effective protection for species while minimizing economic effects, assuring fair treatment for landowners, and reducing delay and uncertainty for States, local governments, private industry, and individuals. This is an increase of \$11.4 million from 1997.

With the requested level of funding, the Fish and Wildlife Service will be able to pay for 292 projects to keep declining species off of the endangered and threatened lists and work on 100 habitat conservation plans. The Service will also be able to manage an increasing Section 7 consultation workload, including 38,000 technical

assistance consultations (up nine percent from 1997), 900 formal consultations (up six percent), and 1,500 programmatic consultations (up 76 percent).

Bureau of Indian Affairs Programs.—My biggest disappointment in the otherwise sound compromise on 1997 appropriations was that we were unable to agree on a higher level of funding for programs that support tribal self-determination. The claim of Native Americans to a fair share of attention and resources is very great, and I do not believe that claim was met over the past two years.

The budget requests an increase of \$114.4 million for the Bureau of Indian Affairs. Of this total, \$76.5 million or 67 percent, is for the Tribal Priority Allocations budget activity, the part of the budget that Tribes allocate according to their own locally-based priorities. Among other things, this increase will allow Tribes to maintain an additional 1,250 miles of reservation roads; to hire another 400 law enforcement staff; and to fund an additional 220 child welfare cases each month. However, even with the increase, the overall level of TPA funding will be only two percent higher than it was in 1995.

An increase of \$16.8 million is proposed for elementary and secondary school operations to provide funds for an anticipated three percent increase in enrollment to a total of 52,400 and for statutorily mandated pay increases.

In the President's budget, TPA and education programs together comprise 82 percent of the BIA operating budget. Other reservation-based programs account for nine percent. Only nine percent of the operating budget pays for administration of the Bureau. In 1998, Central and Area Offices and other support functions are funded at a level about \$26 million lower than three years ago, a reduction of more than 20 percent. The BIA's staffing level will continue at its current level, the lowest in 15 years.

Office of the Special Trustee.—The budget proposes to continue efforts to ensure that the Federal Government fulfills its Indian trust management responsibilities. The 1998 request for the Office of the Special Trustee is \$39.3 million, a \$5.2 million increase over the 1997 enacted level. With funds appropriated in 1997, the Special Trustee should initiate reform efforts and begin to make critically needed improvements to Individual Indian Money accounting systems, policies, practices, and procedures. In 1998, a total of \$16.7 million will be available for continued implementation of Indian trust management systems improvements.

The Special Trustee recently submitted his Strategic Plan to reform Indian trust management to the Administration and the Congress for consideration. The plan represents his views, independent from the Department and the Administration. I have significant concerns regarding the plan. Most importantly, it seems to lack a fundamental understanding of the relationship of sovereign tribal governments and Federal trust responsibilities. I am also concerned that the plan expands the Federal Government's investment functions and that it identifies large, new budget outlays without the identification of alternative courses of action and analysis of the cost, benefits, advantages, and disadvantages of alternatives.

While I have concerns regarding the Special Trustee's plan, I do not want these concerns to slow our progress in improving trust systems. The Administration has allocated what we believe to be substantial resources for implementation of trust systems improvements during fiscal year 1997 and 1998. I intend to hold the Special Trustee accountable for implementing improvements. I feel confident that, through careful priority setting, we will be able to make the most critically needed reform efforts.

The work of the Office of the Special Trustee is directed towards improving systems for the present and future. The question of past account deficiencies continues to be addressed separately. The Administration will shortly be sending a comprehensive report outlining our recommendations on settling tribal claims, and within the next few months, it is my expectation that we will submit a legislative proposal to the Congress that would establish a comprehensive process to provide for a fair settlement of these claims. The proposed legislation is a direct outcome of the five-year tribal reconciliation project initiated, funded, and overseen by the Subcommittee. As you know, the reconciliation effort did not extend to Individual Indian Money Accounts. In this area, we are working closely with the Justice Department to see if we can reach a settlement of a class action suit involving the management of these individual accounts.

Science.—At the beginning of the current fiscal year, we successfully completed consolidation of the former National Biological Service into the U.S. Geological Survey. Over the years, the Department's earth science and biological research have provided the critical science needed for sound resource management. I am confident that the synergy between biological and earth sciences in the "new" USGS will build on and expand this tradition.

The 1998 budget for USGS is a net increase of \$5.3 million over the 1997 level. Within this total, we propose a \$9 million increase in the National Water Quality Assessment program that will use the NAWQA model to provide information on water quality conditions for streams and aquifers of 75 of the Nation's key metropolitan areas, including the largest city in each State, as part of the President's initiative to provide the public information about toxics. Increases are also proposed for better operation and maintenance of the USGS portion of the Global Seismographic Network and for enhanced technical assistance to address priority biological research needs identified by the Department's land managing bureaus. The USGS and its research partners will also refocus \$1.2 million in 1998 to a program to establish historic mapping and modeling databases for the New York, Chicago, Philadelphia, and Portland, Oregon metropolitan regions.

The increases in USGS are partially offset by programmatic decreases resulting from Reinventing Government II initiatives and from scaling back other programs, including the Water Resource Institute program.

CONCLUSION

I believe that the 1998 budget for the Department of the Interior supports priorities on which we can reach consensus. I hope that over the next several months we can have a dialogue to achieve that consensus.

This concludes my statement. I will be happy to answer any questions you may have.

INTERIOR HISTORY

Senator GORTON. Senator Stevens, as chairman of the overall committee, I will defer to you first.

Senator STEVENS. Thank you very much, Mr. Chairman.

Would someone please give the Secretary that one piece of paper?

Mr. Secretary, I must tell you that the last few months have been sort of traumatic, because this is your fifth year, is it not?

Secretary BABBITT. That is correct.

Senator STEVENS. I spent 5 years in the Interior Department.

Secretary BABBITT. And you had the good sense to move on.

Senator STEVENS. No; Mr. Nixon lost an election. [Laughter.]

But while there, I worked on Mission 66, 10-year improvement of the Park Service. I drafted the Fish and Wildlife Coordination Act of 1958, which really opened up the conservation movement for that period of time. I lost an election in 1962 because I was called to be too green. Now I find myself trying to find some way to deal with the issues that affect the future of my State. So I want to show you something.

REVISED STATUTE 2477

This is a map that we had prepared with regard to the State and native lands of Alaska based upon the Revised Statute 2477 problem. The shaded areas are the areas that were withdrawn in 1980 and added to the Park System and the Fish and Wildlife System. The green are the rights-of-way that were identified prior to 1969, when your predecessor Secretary Udall withdrew the whole State and there could be no further rights created after that day under this law.

In 1976, Congress passed an act, the FLPMA Act, that repealed the Revised Statutes. When we did, we added a provision three places in the bill that said valid existing rights were preserved.

In 1994, I was informed that your office had promulgated a new regulation dealing with Revised Statute 2477, and I have asked them to give to you a sheet of paper, and I hope each member of

the committee has one, that shows this. We put a moratorium in the National Highway System Act. It was placed in 1994, but actually it did not become law until 1995. It was a prohibition prohibiting a regulation addressing rights-of-way pursuant to section 2477 as such act was in effect before 1976, October 1976 and that was sunsetted on September 30.

Then we had a general provision in the 1996—September 30, 1996. We had a general provision in the 1996 bill prohibiting use of funds, that is the Interior bill of this committee, and then we had in an omnibus bill that we passed last year, the omnibus consolidated appropriations bill for 1997, there was a general provision with no sunset which said no final rule or regulation of any agency of the Federal Government pertaining to recognition or management or validity of rights-of-way pursuant to Revised Statute 2477 shall take effect unless expressly authorized by act of Congress subsequent to the date of the enactment of this act.

Now, you have not submitted any legislation, have you?

Secretary BABBITT. I have not.

Senator STEVENS. And we have had some up for consideration, but we have not been able to get that out of committee, as I understand it.

The problem now is that, as I understand it, you have now announced a new policy of revision of a 1998 policy that would state that on any of these rights-of-way they are valid only if they were created by vehicular traffic, is that correct?

Secretary BABBITT. Senator, that is not correct.

Senator STEVENS. That is my understanding. What is the difference?

Secretary BABBITT. The only action that I have taken in this respect was to write a letter withdrawing a letter which had been written by Secretary Hodel with which I disagreed and which did not reflect my views on this matter.

Now, if I may clarify, there is, as you well know, a proposed set of regulations which have been prepared in considerable detail and circulated and which have been put on hold by this language. The regulations are currently in limbo pending direction or money or authorization from this committee.

Senator STEVENS. This is a direction to your agency. It is in a letter dated January 1997.

The agency shall evaluate whether the alleged right-of-way constitutes a highway. A highway is a thoroughfare used prior to October 21, 1976, by the public passage of vehicles carrying people or goods from place to place. If the agency determines that the alleged right-of-way does not constitute a highway, the agency will recommend that the Secretary deny the claim.

RIGHTS-OF-WAY

Now, that puts us into a conflicting position, as I see it. We have several rights-of-way that were used by railroads that are now extinct. The Kennicott Railroad, for instance, I take it that we could rebuild it, the Kennicott Railroad, under your letter, but we could not build—let me have those little charts, please.

One of these rights-of-way is out to Hooper Bay, which is out on the west coast of Alaska.

This is Hooper Bay. I have been there several times. It is a very interesting little community. It is not totally ethnic. It is native and non-native. It is basically a fishing community. All of their access is by a road which is across Federal land.

This shows even more how the airport is out here [indicating], and this [indicating] is their road. We want to improve that road. It is a Revised Statute 2477 road. It was created by dogsleds.

We have a whole series of other roads that were created by dogsleds, particularly down in Paminto Flats area. All of these roads that are in here were dogsled trails. As a matter of fact, one of them is the historic Iditarod trail.

Mr. Secretary, the policy that you have announced is guiding upon your land agencies, and accomplishes even more than you would by the regulation. Because it in effect creates a Federal position on a matter that historically has been determined by State law.

The next paragraph of your letter says role of State law: In making its recommendation, the Secretary shall apply State law in effect on October 21, 1976, to the extent it is consistent with Federal law. The agency in no case will recommend approval of claims that do not comply with requirements of applicable State law. But, Mr. Secretary, there is no Federal law.

Secretary BABBITT. Senator, there most certainly is. It is Revised Statute 2477.

Senator STEVENS. Well, Revised Statute 2477 was repealed in 1976.

FEDERAL RIGHTS

Secretary BABBITT. Well, but the rights that vested under it are Federal rights which have accrued and are in effect today pursuant to that law.

Senator STEVENS. But those were only determined by State law up till 1976. There was no Federal law in 1976 other than one sentence which was Revised Statute 2477. It did not have the word vehicular in it. You are now stating in your letter you are only going to recognize vehicular traffic created rights-of-way. That certainly was never involved prior to 1976.

Secretary BABBITT. Well, Senator, I disagree with your interpretation of the Federal law. It is a stand alone Federal law. It does not reflect a Federal policy of deferring to State law. That does not appear in Revised Statute 2477, it does not appear in FLPMA, and it is, in my judgment, not the law as it stands today.

Senator STEVENS. Well, let me ask you this: Let us go back to my first statement. Having spent 5 years in your agency, I find myself now spending years combating with the agency that I really enjoyed serving at. Why is it we cannot get a proposal from you for review by Congress to establish a Federal law, if that is what you want?

Secretary BABBITT. Senator, I believe that our proposal is set out in considerable detail in the proposed regulations.

I would be ready and willing to do either one of two things, get the leave of this committee to promulgate the regulations, or, in the alternative, to use them as the basis for drafting a law to be

passed by the Congress. I am ready and willing to do either one of those.

ROADS IN NATIONAL PARKS

I do not accept the position, and would never support a Federal law which simply deferred this issue to the States. For example, the State of Alaska passed a statute saying there will be rights-of-way under State law along every section line in the State of Alaska. That would create 950,000 miles of roads, including 150,000 miles of new roads in the National Park System. I cannot support that.

Senator STEVENS. Now, Mr. Secretary, you have said that before. No national park in Alaska is surveyed. There are no section lines in any park in the State of Alaska. Did you know that?

Secretary BABBITT. Well, Revised Statute 2477 and the Alaska statute does not turn on that issue. The Alaska claim is section lines, including 150,000 miles in national parks.

Senator STEVENS. But by definition, there are no section lines in national parks because you have never approved surveys in national parks in Alaska.

Secretary BABBITT. Well, Senator, there are section lines. They have not been surveyed in many parks, as indeed they have not been in many parts of Alaska.

Senator STEVENS. There has never been a Revised Statute 2477 right-of-way across a line that was not surveyed. Now, I am an ex-solicitor. You had better check with your solicitor. That is the fact. So I think we are arguing about something, and I would hope you would not accuse me of trying to build 900,000 miles—do you know that all of the U.S. Federal Highway System is 960,000 miles?

Secretary BABBITT. That is precisely my point. That is the reason we oppose Alaska's claims.

Senator STEVENS. Do you believe these gentleman are going to give us money for that? There are Federal highways in Alaska, but do you think we are going to get money for 900,000 miles of road? Mr. Secretary, that is the kind of rhetoric that throws me up a tree. How can I explain to my people at home that I am not bringing home that kind of money? [Laughter.]

Secretary BABBITT. Well, if that constitutes a waiver of Alaska's claim to rights-of-way on unsurveyed section lines, I certainly accept that.

Senator STEVENS. You had better hope, Mr. Secretary, that that State law is upheld. Because if you look at this, you will see that the rights-of-way to get into the national parks are, in fact, Revised Statute 2477 rights-of-way across State and native lands. The Federal Government will own 67 percent of our State when all of the selections are over, and the access to all the Federal lands requires access across the State and native lands. The statute was passed by the State of Alaska to assure that as lands went out of Federal ownership the concept of these lands—they are surveyed when they come out of Federal ownership, and the section lines are created then, and they give you and the people who use Federal lands rights-of-way across State and native lands. As a matter of fact, the Native people are now objecting because they seem to think that

we are creating new rights-of-way across their lands. We are merely preserving rights-of-way.

SUPPLEMENTAL APPROPRIATIONS VETO PROPOSAL

But, Mr. Secretary, here is the problem, and I am taking a lot of time of this committee, I am now chairman of this committee, and I have got a provision that is in this bill which is no different really from the three that were already negotiated. And, as a matter of fact, the only difference is it applies to a statement of policy instead of a rule or regulation. You have informed me by letter that this will be vetoed, that our bill will be vetoed if it stays in there. But it is there because your Department has not proposed, as Congress has directed now since 1995, to create a law with regard to section—to Revised Statute 2477 throughout the West. Not just Alaska, but throughout the West.

RIGHTS-OF-WAY LEGISLATION

I am here this morning to try to see if we can find some way to get, and I use this word advisedly, a commitment from you that you will not pursue that policy, but you will pursue what you have just stated, and that is submitting legislation so that we can review it. It will go through the legislative committees and our committee will not have to be involved in this on a year-to-year basis in order to try to protect the rights of the West, as they see them, from an administrative determination of what is Federal law as compared with what would come. I believe, that we would pass a law which would state very clearly that we are not going to allow national parks to have roads built through them, wildlife refuges to have roads built through them, except to this extent, that they are needed for access to airports, to hospitals, to rivers, to the people who live in rural Alaska and rural America, and that there is no other right-of-way available.

Now, I am perfectly willing to go forward and help support such a law. But I am not willing to go forward and allow an administrative letter to establish a new body of Federal law which, as far as I am concerned, does not exist. Now, would you give us a commitment that if we proceed that you will not pursue this policy administratively until Congress has had a reasonable time to review it? If we cannot get bills through, obviously you are going to have to do something sometime along the line, I am aware of that. That is why we have had these provisions. But that last provision is general law. You cannot issue the rule or regulation. You may be able to issue the policy statement, but I think that would lead to interminable legislation in every State of the West, particularly mine.

Incidentally, Mr. Secretary, we have 1,900 rights-of-way, the State tells me, and the State tells me that 560 of them would probably be pursued by the State. So my State has already eliminated almost three-fourths of the rights-of-way that would qualify under Revised Statute 2477's existing right provision. Now, that may or may not be—you might not even accept the final 560, but we are talking about basic rights of rural people. We do not need these to get to Anchorage or Fairbanks or the airport in Juneau or

Ketchikan. We need to get to them so that we can consolidate four or five villages up there.

There are 50 villages up there in what I call the cusp of the Yukon fan, a separate airport for each one. We could consolidate those with roads, we could have one school instead of four schools, we are forced into a lot of economic changes now in our State. But if you insist that we can only have a road where there was vehicular traffic, we will not have those highways created.

Now, I would like to secure a way right here to, on the basis of a commitment from you not to pursue this policy stated in your letter and to work with us to create a bill—if you draft a bill I will even introduce it, I will tell you that. I will introduce the bill. I may not support it all, but I will introduce it and see that it comes before the Congress and see that we try to get this resolved for the whole West. But I cannot, in due conscience, hold up a bill that has got so many things for people who are disaster victims in the West. You know we have more disasters than any State in the Union. On the other hand, I cannot in good conscience, as Senator from Alaska, take it out until we get some kind of an understanding how we are going to proceed from here.

Secretary BABBITT. Senator, I would be happy to deliver to you today a draft bill. It will consist of the final proposed regulations. I believe it would be an appropriate piece of legislation. I will deliver it to you today.

Senator STEVENS. And if I introduce that today or tomorrow, will you not pursue on your administrative letter and enforce that policy until we have had a reasonable time to consider it?

RIGHTS-OF-WAY POLICY

Secretary BABBITT. Senator, let me explain the purpose of this letter, if I may. It has become a sort of symbolic flashpoint for a lot of abstract disputation. The only significance of this letter is what should I do by way of response to a specific, urgent, we have got to do it now, application. This is not 560 applications from Alaska or 1,000 from Utah. This is a specific we have got to have a right-of-way right now in this township or this county. I need a policy by which to make those judgments. I have not been asked to make any, and my guess is that there will be relatively few.

The reason that I rescinded the Hodel letter is because it said the policy was to pass on those applications by reference to State law. That is not my position.

If I get an application, I will use this policy as an interim guide.

Now, let me just say that if there is a railroad right-of-way or a sled track or whatever in Alaska in the interim that needs my attention as a question not of abstract policy but specific need, I will consider that and I view myself as free to be reasonable. These guidelines talk about recommendations from my agencies. If you have a specific problem with a railroad in Alaska or something like that, I will be happy to respond to you in a spirit of reason designed to solve the problem.

Senator STEVENS. I am not sure I really got an answer yet, Mr. Secretary. We have only had 1 mile—1 mile—of road approved in Alaska as a Revised Statute 2477 application since 1976. Did you

know that? 1 mile. They are all staggered in the Department somewhere seeking approval.

Now, if in the interim your people start denying our applications—and, by the way, most people understand that they are applications of my State for rights-of-way to proceed under the Federal Highway System. Now, I would hope that we—I see here—no, I do not want to get into that. I do not have time for that right now. That is another process. That is a problem with NEPA and all of the rest of it that goes in here, and that is another thing.

But if in the interim your people deny my State's—any of my State's applications based upon this determination, then we have lost. Now, I want an assurance you are not going to deny any State application under Revised Statute 2477 while Congress tries to work out a new Federal law dealing with the subject. If you will give us that, I will introduce the bill today.

Secretary BABBITT. Senator, I cannot give you that. But I think that is an abstract request, because what I am saying is if in the applications submitted by Alaska there are action items that need my attention, I am prepared to personally sit down with you and go through each and every one of them and get a reasonable result.

Senator STEVENS. Mr. Secretary, I was in the Department too long. You have got hundreds of people out there handling these applications. They are out there, out in the BLM office in Nak-Nak or in Fairbanks or down in Utah somewhere, and they have got your letter. And you say you have rescinded that.

By the way, the Hodel letter was prepared by all the agencies. He just signed the letter approving it. You have disapproved a basic memorandum of all the land agencies of Interior that was approved by Secretary Hodel. You did not get something to take its place. What you did was issue a new statement of a Secretary which said none of these old rights-of-way have any validity under State law. That is the way it is being interpreted out there. Now, I understand you are saying that is not what you're saying, but your agencies are turning these down now.

Secretary BABBITT. Senator, I would be happy to straighten out my agencies. No. 1, these issues are not determined pursuant to State law. They are determined pursuant to Federal law. We are ready and willing to pass on them under Federal law, and what I am telling you is I think the policy is reasonable.

Now, if there are specific problems, I am willing to get into them, because if you have legitimate rights-of-way issues my job is to get them out.

Senator STEVENS. Mr. Secretary, I am sorry to say we have wasted our time. And I thank you very much.

Thank you, Mr. Chairman.

Senator GORTON. Senator Byrd.

RIGHTS OF CONGRESS

Senator BYRD. Mr. Chairman, Alexander Pope said—I think he asked a very appropriate question: Who shall decide when doctors disagree? Now, here we have two of my best friends in Government disagreeing, one in the executive branch, one in the legislative, one a Republican and one a Democrat. What am I supposed to do?

Senator STEVENS. You had better protect the rights of the Congress, Senator, however you do that.

NATIONAL CONSERVATION TRAINING CENTER

Senator BYRD. However you do that, to the best of my ability.

Mr. Secretary, rapid progress is being made toward completion of a National Conservation Training Center in Shepherdstown, WV. This is a state-of-the-art training facility that will benefit natural resource professionals of the Fish and Wildlife Service, as well as other resource managers of the Interior Department, and our conservation partners. It is my understanding that the facility will be completed this fall, and I am looking forward to the time when you and I both may be able to dedicate this training center. Is everything still on track with respect to the completion of the facility?

Secretary BABBITT. Senator, I anticipate that the facility will be ready for use in the full sense of the word in September. We have scheduled a dedication, I believe, in early December. I intend to be there, and I can tell you that the staffing is going along well. We are offering courses right now. We will have a full menu of courses.

Senator BYRD. And you have sufficient funds to equip the facility?

Secretary BABBITT. Senator, we have a small additional request in the President's budget. I can give you the detail. I think it is approximately \$4 million for the operational side.

Senator BYRD. And you will be able to award a contract for construction of the third dorm?

Secretary BABBITT. Senator, we anticipate awarding that contract probably about the end of the summer, and that would lead to completion about 1 year from then, in about September 1998.

Senator BYRD. To what extent is the Fish and Wildlife Service already signing up participants to undergo training at the facility once it is opened?

Secretary BABBITT. Senator, I think that is a key question, because the full utilization of this center really depends upon a strong interagency commitment from the Corps of Engineers and the Department of Defense, Forest Service, and marine fisheries. The Forest Service has a full-time program officer now assigned to the center, and that is reflected in the training courses. Obviously, we have high hopes that courses will continue to develop—I believe they will—on a reimbursable basis.

Senator BYRD. I understand that it is already booked to full capacity for fiscal year 1998, for the 100 dorm rooms that will be available. Is that true?

Secretary BABBITT. Senator, I am not absolutely certain, but I will check that out and get back to you. I am satisfied that we have a strong menu of programs and reservations. I am not sure of the exact number.

[The information follows:]

NATIONAL CONSERVATION TRAINING CENTER

The total number of participants scheduled for classes at the National Conservation Training Center (NCTC) in fiscal year 1998 at the present time is approximately 5,064. This translates into approximately 25,320 student days. The NCTC housing capacity for fiscal year 1998 is 100 rooms, which translates into 25,000 student days. Overflow students will be lodged at hotels in Shepherdstown, WV and

will travel to NCTC during the day for courses. Approximately 500 NCTC participants have booked offsite accommodations in fiscal year 1998 at this time.

The NCTC has additional classroom space available, and continues to discuss facility usage opportunities with interested parties, with the understanding that these participants would use offsite lodging. The addition of a third lodging unit will increase the use of these additional facilities. As students begin to arrive in September, we are confident that word of the facility will quickly spread, and customer demands will increase rapidly.

TRAINING

Senator BYRD. You mentioned some of the agencies with which the Fish and Wildlife Service have been working in order to ensure that the training center will be used fully. Will these agencies cover their costs when they use the facility?

Secretary BABBITT. Senator, that is our intention, to, in effect, operate this on a cost-sharing basis, with the agencies reimbursing their proportionate share of room, board, and tuition, if you will.

Senator BYRD. To what extent has the Service already begun outreach and conducted training with the parties that will be using the center once it is completed?

Secretary BABBITT. Well, we are under way with the training curriculum. I might also add that we have had a good response in the nongovernmental community. We have been working with the Conservation Foundation and others to see if we can put up a nongovernmental set of programs. We actually have some of those courses and some utilization under way right now. I think it is an important component.

Senator BYRD. What kind of feedback are you getting from the participants?

Secretary BABBITT. Senator, it is very positive. It is an extraordinary facility, and it is really working very well. One reason is that we actually can get people to the training resources but keep them out of Washington, which is a major benefit. What it means is you can really have a training program rather than people hanging around. There is no where to go when class is over except back to your dorm and to the dining hall, and it is perfect for training, perfect.

Senator BYRD. Mr. Secretary, you are preaching the sermon I have been making for many years here, in the face of some obstinate critics. And I think you and I are both right, as we will prove it at Terrapins Neck in Shepherdstown, which is the oldest city in the State of West Virginia.

CANAAN VALLEY NATIONAL WILDLIFE REFUGE

Let us shift just a moment now to Canaan Valley. In recent years Congress has provided funding at a rate of about \$2 million annually to allow for continued land acquisition in support of this, which is our Nation's 500th national wildlife refuge, located at Canaan Valley. This year there is no funding requested to continue the acquisition program. Has all of the land within the designated boundaries of the refuge been acquired? If not, how many acres remain to be acquired?

Secretary BABBITT. Senator, there is a substantial amount of land to be acquired. I think about 20,000 acres. But as you know, the land acquisition budget is a complex issue. The priorities are

fought over internally, externally, in the appropriation process, and the rank ordering this year does not include acquisition funds. We need, I think, probably about \$40 million to complete the process over the coming years.

Senator BYRD. And at the rate we have been going, that would require 20 years, \$2 million a year. Are there willing sellers interested in selling their land for inclusion in the refuge?

Secretary BABBITT. Yes; there is no problem on that score.

Senator BYRD. If additional funds were provided, then, to continue with the acquisition program, would the Department be able to expend these dollars to acquire additional land for the refuge?

Secretary BABBITT. Yes.

Senator BYRD. An increase of \$85,000 is proposed in the budget to begin habitat evaluation and monitoring. Will the increased funds proposed in the 1998 budget be sufficient to allow a custodial level of refuge operations to be established?

Secretary BABBITT. Senator, that is a difficult question, because we have that question at every single unit of the national wildlife system. The levels of supervision and management at most refuges are premised on a relatively low visitor demand. What we are finding, of course, is that the visitation to refuge units is bumping up very rapidly and we are kind of behind the curve. So I think the answer is we think at the proposed level that we can protect the resource. It is not ideal.

Senator BYRD. What level of funding would be necessary to establish a base staff located closer to the refuge and begin the necessary activities associated with managing a refuge, habitat protection, monitoring of fish and wildlife populations, visitor contacts, and development of partnerships, and so on.

Secretary BABBITT. Senator, I would have to answer that in writing, which I would be happy to do.

[The information follows:]

CANAAN VALLEY NATIONAL WILDLIFE REFUGE

New refuges progress through different activity levels as staff, land, and facilities are acquired over time. New refuges start at a custodial level of operation, providing protection and preservation of a limited number of public trust resources as directed by the station's establishing legislation. Staff initially focus on habitat stabilization, biological inventories, and development of partnership activities with the local communities to support public use and biological management goals. A custodial station has up to three staff, a refuge manager, maintenance worker, and an administrative assistant and may operate from local rented space, or a remodeled building purchased in the course of land acquisition.

Initial start up costs include funds to develop a Comprehensive Management Plan, with full public involvement, baseline biological and Archaeological Resources Protection Act (1979) surveys, as well as office furnishings and refuge signs.

Base funding for Canaan Valley NWR was created by leaving positions vacant at other refuges. Delayed hires at most stations have "spread the pain out," primarily having an impact on public use and habitat restoration programs. Base funds cover only the Refuge Manager's salary and other small office expenses. The office is collocated with the West Virginia Field Office, 35 miles from the refuge in Elkins, WV.

The Service has identified \$500,000 as the level of funding needed for Canaan Valley NWR to operate at full capacity. This level of funding would enable the refuge to hire a maintenance worker, a refuge operations specialist, an administrative assistant, and an outdoor recreation planner. It would provide basic biological equipment, vehicles and office furniture. With these funds the refuge staff would gather basic biological data necessary for the development of a Comprehensive Management Plan, and archaeologists would conduct an initial Archaeological Resources Protection Act survey. The funds would also provide information kiosks and des-

ignated parking areas for hikers, wildlife watchers, and hunters. The funding would enable the Service, with assistance from the State, to establish a more fully functioning refuge by protecting unique natural resources, providing for appropriate public use, and educating the local community and tourists alike about the wetland and wildlife values of Canaan Valley.

CANAAN VALLEY FUNDING

Senator BYRD. If the budget deal provides additional resources but directs them to land acquisition only, how would the Department manage the additional responsibilities that accompany the owning of land if increased operational dollars are not forthcoming in the next several years?

Secretary BABBITT. Senator, it depends on the nature of the land acquisition. To the extent that we are acquiring in-holdings in existing units, it does not necessarily translate into additional administrative expense. To the extent that we deal with the New World Mine issue at Yellowstone, that gets folded into the base of administration in the Gallatin National Forest. To the extent that we do the headwaters deal in California, well, I do not know. That would probably be an additional expense. I think it depends very much on the nature of the land acquisition and whether or not you are creating a new unit or simply folding into an existing one.

HARPER'S FERRY NATIONAL PARK

Senator BYRD. What is the status of the recovery efforts at Harper's Ferry?

Secretary BABBITT. Senator, we are moving along pretty well. I was up there with Mr. Stanton some months ago, and it is by no means finished. But I believe we have sufficient appropriations to in fact finish the job.

GEORGE WASHINGTON PARKWAY

Senator BYRD. In response to concerns about safety along the George Washington Parkway, and I drive it every day, twice, the National Park Service announced a plan to proceed with a number of improvements intended to improve safety, and they are certainly needed. What is the status of the Park Service's efforts to make some of these safety improvements, and have the necessary concurrences been obtained so that the work can proceed?

Secretary BABBITT. Senator, I believe we are under way with the median modifications—that is the barriers. I do not know whether they are jersey barriers. I am not sure it will be nice stonework.

Senator BYRD. Yes; that work is under way.

Secretary BABBITT. That is under way. I think we are OK on that front. We are also stepping up patrols out there, because for reasons I do not fully understand it is a little out of hand. I do not know why that situation developed, but we are attempting to do both things, get the median barriers up and increase the patrols.

Senator BYRD. What funding is necessary to address the safety concerns in a more permanent manner?

Secretary BABBITT. Senator, I cannot answer that. I would be happy to do that in writing.

Senator BYRD. Very well, if you please.

[The information follows:]

GEORGE WASHINGTON MEMORIAL PARKWAY SAFETY IMPROVEMENTS

The George Washington Memorial Parkway needs approximately \$90 million to complete all safety and rehabilitation improvements. This estimate is based on an engineering study of the George Washington Memorial Parkway completed by the Federal Highway Administration in 1989. The estimated cost for improvements in that study totaled \$95,443,832. This figure includes the cost to make improvements between Spout Run and Theodore Roosevelt Bridge at \$6.2 million dollars and permanent safety improvements to the roadway from Spout Run to Route 123 (\$16 million), the area where most of the accidents have occurred. The 1989 study will be updated soon to more accurately reflect the needs and costs since it has been almost 10 years since the study was last completed.

The 1989 study recommended a variety of improvements and rehabilitation that is too lengthy to include. The study is three volumes long and upon request a copy can be made available in a matter of days.

Finally, additional operations funding in the amount of \$650,000 is also needed to increase law enforcement patrols by U.S. Park Police from three patrol units to five. This will enable the Park Police to hire an additional 10 officers to fill critical personnel needs which currently exist at the George Washington Memorial Parkway station. A more consistent police presence would be maintained and monitoring and response to incidents will be increased.

EASTERN SHAWNEE TRIBE TRUST PETITION

Senator BYRD. Mr. Secretary, thank you, and I want to thank the chairman for yielding to other members. It goes to show how much of a responsibility the chairman really has when he stays and listens to all the other members and then has to pose his questions at the last. Thank you very much.

Senator GORTON. Thank you.

Senator Bond.

Senator BOND. Thank you very much, Mr. Chairman.

Mr. Secretary, what is the current status of the trust petition of the Eastern Shawnee Tribe with respect to the land in Missouri?

Secretary BABBITT. Senator, it is under consideration in the Bureau of Indian Affairs.

Senator BOND. Now, what does that mean? Are you going to have—is the decision going to be made there, or are you going to make the decision at your level?

Secretary BABBITT. Senator, let me say the decision will not be made without my careful attention in the device and input.

Senator BOND. What are the key factors that you as Secretary must take into consideration in acting on a petition such as this one?

Secretary BABBITT. Senator, the key factor, of course, is the applicable laws enacted by this Congress. I know you do not take much consolation in that because the laws are not entirely consistent, and they are fairly vague.

The real issue here, it seems to me, is of a law that relates to the acquisition of land to be taken in trust for gaming purposes. If those acquisitions are made after a cutoff date in the law, I believe that gubernatorial concurrence is required.

Senator BOND. Does it also require reference to the views of other public officials and the constituents in the area?

Secretary BABBITT. Senator, there is a series of regulations that the Bureau uses in assessing it, and I believe that is in fact one of the written criteria in the regulations, yes.

Senator BOND. Is it of significance that there are no recognized Indian tribes in Missouri, no land-based casinos in Missouri, and

the Missouri constitution does not allow land-based casinos? Is that a relevant consideration?

Secretary BABBITT. There is not a specific criterion of the nature you describe, but I think it all falls into the Bureau's obligation to assess the opinions of the affected community.

Senator BOND. In our prior discussion, we talked about the desire of the Missouri congressional delegation, particularly my colleague Senator Ashcroft, and the Congressman from the area, Congressman Roy Blunt, to meet with appropriate people in the Department of the Interior prior to a final decision. Can you give us some idea when would be the appropriate time for such a meeting? When will the matter ripen to the stage that we could present our case to the Department?

Secretary BABBITT. Senator, you are speaking to the appropriate official to meet with, and I have committed to you that I will do that. I will get back to you in writing about timelines. This issue is not at the front of the pipeline right now, but I will give you plenty of notice, and we will have a chance to discuss this.

Senator BOND. Good.

Mr. Secretary, I understand after all the discussions we have had, the many, many diverse issues that you have to deal with. And frankly, having talked with several of my colleagues both who serve on this subcommittee and elsewhere, I realize how serious a question this is in many States. And I can tell you that having visited the area concerned around Seneca, MO, and areas around Nixa and Christian County where there have been other purchases by Indian tribes, the fear, the concern, and the outright opposition of the people in those areas to what they view as a real and serious threat to the quality of their life makes this a top priority for me. And from what you have said, and I understand that the statute is vague and not consistent, I look forward to an opportunity to work with my colleagues to draft an improvement to that statute so that with all of the other challenges you face you will not be forced to apply what may be a vague or inconsistent statute in matters where the whole lifestyle of the community, the well being of the community, is at risk.

I think legislation clarifying, tightening up, and making clear the rights of the people to be free of casino gambling is something that we should seek to achieve. We would welcome your input and your guidance on doing it, but I think this is so serious that we also must pursue a legislative solution, based on what you have said.

Secretary BABBITT. Senator, I would only add that you should also be working closely with the Governor, because he does have a veto power under the statute.

Senator BOND. I have no doubt that he will use that.

Thank you very much, Mr. Chairman and members of the committee, I appreciate the time.

Senator GORTON. Senator Reid.

Senator REID. Mr. Chairman, I would also just give a word of advice to my friend, Senator Bond, before he leaves. Good luck with the legislation. We have been trying that for a lot of years.

NEVADA LAND

Mr. Secretary, I say to everyone here Senator Stevens lamented the fact that he would wind up with 63 percent of his State owned by the Federal Government. Of course, as you know, 87 percent of the State of Nevada is now owned by the Federal Government.

Mr. Secretary, I am not going to go into the many things that I think have occurred during your tenure as Secretary of Interior that have been helpful to the State of Nevada. You have been very good to the State of Nevada, and I acknowledge that and appreciate it. I have enjoyed working with you. But I do say that my concern, and I would like to direct your attention and the committee's attention to this, is that we have some things that we need to look at on a funding level.

NEVADA BUREAU OF LAND MANAGEMENT

I am very concerned about the Bureau of Land Management in the State of Nevada. I am concerned because we have the land and realty fund on a national level being reduced, and as you know, with the rapidly growing area of Las Vegas, we simply have not been able to meet the demands of the people in southern Nevada who need things done by the Bureau of Land Management. It is overwhelming, and if there is one negative, I get more complaints about the Bureau of Land Management in Las Vegas than I do the Internal Revenue Service, and the big complaint is they do not have people to do the work.

Processing is behind in not a matter of weeks, months, but years, and I have tried to work with the State office about the understaffing, and this is a quote, "they just do not have enough funds for additional people." But I would direct the Secretary's attention to the fact that there the State office, the office 500 miles from Las Vegas, has been increased by \$2 million, while Las Vegas has not been.

So I would ask that you would personally take a look at the misapplication of funding of the Bureau of Land Management in Las Vegas. Would you do that?

Secretary BABBITT. Certainly.
[The information follows:]

FUNDING ALLOCATIONS TO SOUTHERN NEVADA

Recognizing the importance of being responsive to the increasing demands for services in southern Nevada, the Bureau of Land Management has taken a number of positive steps outlined below:

Organization and Budget.—Through the Nevada reorganization in 1996, the administration of about 4.3 million acres of public land in what was formerly the Caliente Resource Area of the Las Vegas Field Office was transferred to the Ely Field Office. This had a very positive effect on the Las Vegas Field Office in that there were no reductions in Las Vegas personnel as a result of that change, and the Las Vegas Field Office could then focus its efforts on urban issues. Between fiscal year 1995 and fiscal year 1997, the appropriated budget for the Las Vegas Field Office was increased by 22 percent. An additional \$2 million in contributed funding was also utilized to support the Las Vegas Field Office during that timeframe.

Recreation Program.—Las Vegas is initiating fee collection at the Red Rock National Conservation Area. One hundred percent of the revenue that is generated at the fee site will be returned to the Las Vegas District to augment its resources for management of the recreation program.

In fiscal year 1997, \$539,000 was appropriated for the remodeling and upgrading of facilities at the Red Rock Visitor Center. Some of this work being completed with

this funding includes remodeling of the visitor exhibit, audio tour replacement, access road enhancement, gates and new signing, and computer system upgrade. The existing restroom will be remodeled and a new restroom facility added in 1998. Design work has been completed and a plan approved for the phased construction of a new Visitor Center that will enable BLM to accommodate the increasing public use of the facility. Initial work on that facility is expected to begin in 1998 pending the availability of construction funding.

Partnerships continue to play a key role in the public services provided at Red Rock. A partnership with the Clark County School District has allowed BLM to utilize local teachers in providing interpretive programs for area students. The Friends of Red Rock volunteer organization provides valuable assistance to BLM in areas such as signing and trail maintenance and construction. The Red Rock Interpretive Association, which is working with BLM to develop a new visitor's exhibit, continues to play a very important role in providing quality visitor information. Improvement of the space for the Interpretive Association is a very high priority for BLM at the Visitor Center.

Lands Program.—The Las Vegas Field Office has one of the BLM's most complex land and realty programs, given the pressures resulting from the rapid growth in population and associated demands for public land. Much of the casework involves complicated legal issues which frequently require close coordination with the regional solicitor's office.

Seven new positions have been added to the lands staff in the Las Vegas Field Office. Four of those positions have recently been filled, and selection is pending on the remaining three. In addition, Nevada Power has placed an individual in the Las Vegas office full time to assist in the processing of right-of-way applications. Las Vegas will be looking to extend this opportunity to other entities that have numerous applications pending and who may want to assist us in expediting the processing of those actions. Las Vegas also continues to work with its major clients to prioritize pending workloads, so that BLM can be responsive to their individual needs.

Significant progress continues to be made in the processing of lands transactions such as exchanges and Recreation and Public Purposes leases to meet the growing demand for land for community development, schools, and parks. A moratorium was placed on new land exchanges in fiscal year 1997 to enable Las Vegas to concentrate its efforts on six pending high priority exchanges. One major land exchange has been completed, as have the first phases of two others. Close work with Clark County and the other local governments has resulted in increased coordination on land tenure adjustments, data sharing for GIS, flood control and other right-of-way needs.

In anticipation of continuing demands for the disposal of lands in the Las Vegas valley, all lands identified for disposal in the land use plan have been segregated from mineral entry. Similar action is being taken for public lands in the Laughlin and Mesquite areas. The Las Vegas office is also working hard to meet the increasing needs of the local government and the public for sand and gravel for construction purposes.

Process improvements (e.g., programmatic environmental assessment, cultural resource agreement, desert tortoise agreement) continue to be developed within the lands program to expedite case processing and meet customer demands. Increased emphasis is being placed on the use of outside consultants in the preparation of environmental work. In addition, other agencies such as the Forest Service and Fish and Wildlife Service are being tasked with some of the work required to process lands transactions such as exchanges where they are the beneficiary.

Las Vegas expects to have achieved a 50-percent reduction in right-of-way case backlog by the end of this year. This has been accomplished through the diligence of the current staff as well as the efforts of several individuals who were temporarily detailed from other BLM offices to assist. In addition, a GS-13 employee with extensive realty experience was assigned to the Las Vegas for about a year. During fiscal year 1996, \$200,000 was added to Las Vegas' budget to fund these details. State Director priorities for fiscal year 1998 provide for continued assistance from other offices as necessary to further reduce the backlog of realty actions.

WILD HORSES PROGRAM FUNDING VERSUS PARKS FUNDING

Senator REID. I would also say that one of the things, Mr. Secretary, that just—I do not know how else to say it other than we spend \$17 million a year, and I say that to the committee, \$17 million a year on wild horses; over 10 years, \$170 million. We have

problems throughout government dealing—and I understand the importance of wild horses and how difficult the problem is to work with, and I am not diminishing the importance, but we have people—people—that are suffering. We have problems in our national park in Nevada, in our recreation areas, people do not have places to go to the toilet in our recreation areas and our national parks.

I have been trying to get a few dollars each year out of this committee so that we can put in new toilets. I hate to harp on this subject, but when you have an area that is growing by 7,000 people a month and they are going up into Mount Charles and Red Rock and these other recreation areas that we have a responsibility to take care of, and I explained to them we are spending \$17 million a year on horses, wild horses, and we cannot provide money for people to take care of their basic needs, something is wrong with the process.

I do not know what we are going to do. I have devoted tremendous amounts of my time to this wild horse program. We tried these sanctuaries for them. That was a big flop. We have tried doing something on birth control of horses, and that was also a flop. And so for \$17 million a year, we have got to take a look at this program. It just simply is a failure. It is not working. And I know we are now trying to auction the horses, and that may work a little better, but without going into a lot of detail here today, we need you, this Interior Department, to give us some relief on this horse problem.

The reason I am so concerned is the vast majority of the horses, maybe as many as 80 percent of the horses, are in Nevada. And we did not get nearly that much of the \$17 million spent there. I think frankly a lot of the \$17 million goes to other programs than for the wild horses.

So I would hope that we would take a look at the inequality of the distribution of moneys we passed with this committee last year and ask you to come back with a report as to why the inequality was so pronounced. That was knocked out in conference, but I think in fairness you still should have come back to this committee with that information.

I have asked a series of questions, rambling in nature, as much as I hate to acknowledge it, but these are concerns that I have that really need your personal focus.

Secretary BABBITT. Senator, I will do my best to respond. The wild horse and burro issue is very simple. These are very prolific creatures. The fertility rate among the horses in your home State of Nevada is approximately 18 percent.

Senator REID. We have some people that are prolific, too, and they need some money, too.

Secretary BABBITT. Well, the horse issue is very impressive.

There are only two ways of dealing with this issue that have proven to be acceptable to the public, adoption, which is a very complex and very expensive process, and contraception which we are struggling with. I mean, surely, we ought to be able to find an effective contraceptive agent. I will do my best to personally see if I can have a look at these issues. They are complex.

[The information follows:]

WILD HORSE AND BURRO PROGRAM

The Bureau of Land Management places a high priority on ensuring that appropriated funds for the wild horse and burro program be expended in direct support of the program. In February 1997, the Office of the Inspector General (OIG) released its report on "Expenditures Charged to the Wild Horse and Burro Program, Bureau of Land Management" (No. 97-I-375). The purpose of the report was to review and determine whether the BLM expenditures charged to the wild horse and burro program were spent for activities related to the program. In that report, the OIG concluded that BLM had recorded and generally spent funds for program purposes in accordance with its accounting procedures.

In fiscal year 1997, the rangeland management; soil, water and air; and riparian programs provided financial support to facilitate wild horse and burro management. These funds were used to implement gatherings which will aid in restoring rangeland health.

Nevada currently provides habitat for approximately, 56 percent of the wild horses and burros living on public lands (1996 national population: 42,138; 1996 Nevada population: 23,483). This percentage has decreased during the past five years as Nevada makes progress on reducing wild horse and burro populations to within appropriate management levels. Nevada typically is funded to remove 66 percent of the total excess animals removed each year Bureauwide. In all states except Nevada, the wild horse and burro funding covers the cost of field management, gathering, preparing the animals for adoption, and adoption. Nevada receives funding for the management of wild horses and burros on the ground and for gathering of excess animals. The costs for preparing Nevada wild horses and burro for adoption and adopting them are born by other offices. In particular, the Eastern States Office adopts virtually all of the excess animals removed from Nevada rangeland.

Because of the large population of wild horses and burros, Nevada has been and will continue to be the focal point of the program. During the past five years, all BLM funded research on fertility management, development of a population model and studies of birth and mortality rates have been conducted in Nevada.

FUNDING PROBLEM

Senator REID. Without airing all of our linen here before the committee, I also would ask you to take a look at this funding problem we have in the State. It is just simply unfair, unfair to the business community and southern Nevada, and I think unfair to the Federal Government to get so much bad feeling as a result of I think a misapplication of funding.

Senator GORTON. Thank you.

Senator CAMPBELL.

Senator CAMPBELL. Thank you, Mr. Chairman. I have a couple of questions, but time is running on. I would like to submit them to the Secretary, concerning PILT and MMS.

Senator REID. Would the gentleman yield? I also ask permission to submit a number of questions in writing to the Secretary.

Senator GORTON. Each member will have that right.

Senator CAMPBELL. I would like to associate myself with the comments of Senator Reid, and later on with Senator Bond, too.

WILD HORSES

Mr. Secretary, you come from the West, and I do not think anybody needs to tell you how bad the wild horse problem can get. We have sort of a national love affair with the horses. Heck, we raise them on our ranch. I am sure you did, too. And I do not think anyone supports the kind of mistreatment that we have heard about or read about in newspapers, the horse roundups and the abuse of them when they are going to the killers and so on. But by the same token, you go out in that western country, and you said yourself, 18 percent growth rate per year, it is just tearing up a lot of coun-

try, and those wild horses, particularly stallions, can do an awful lot of damage, as you know.

About 5 or 6 years ago, we recommended to the BLM that they initiate a process of neutering at least the stallions. And I do not know if that was ever even implemented, frankly, but my gosh, we do it on our ranch when we are raising horses, and it is not that big of a deal. I cannot understand the amount of money we are spending, \$17 million a year, on this horse problem and it is getting bigger all the time, why we cannot implement that. But I just wanted to throw that in, since Senator Reid had brought that up.

TRIBAL SELF DETERMINATION

I would like to say that I certainly appreciate your mentioning the BIA, and would hope that through your efforts that we prioritize those programs which help tribes become more self sufficient through economic enterprises. And I know that many tribes are doing that, with the help of the Bureau. Some are doing it in spite of the Bureau. But I think that is the new direction that they want.

INDIAN GAMING

I also would like to maybe mention a couple of things concerning Senator Bond's comments, I guess because I chair the Indian Affairs Committee. I am obviously a big supporter of self determination. But the issue Senator Bond is talking about, I really worry about it setting a bad precedent, ending up pitting tribes against tribes, and I think that it really makes the 1988 Indian Gaming Act somewhat unstable. That act required compacts between States and tribes, and it seems to me that the issue that Senator Bond was talking about is the equivalent of one State acquiring land in another State, and then annexing it for the purpose of starting a casino, and there is just something wrong with that, and I hope you take a very careful look at that and recognize it could create some real problems of tribes trying to leapfrog over each other, strictly buying land or getting it in whatever way, putting it in trust for the purpose of starting a casino in downtown Minneapolis or somewhere else. I think that that could create more problems than we want to deal with.

RIM ROCK RUN

I know you are involved all the time in some very, very difficult issues that require an awful lot of study and a lot of difficult decisionmaking. But I had one that is not really probably specific or urgent on your list, but it is on ours. Senator Allard and I are going to have a meeting with the interim head of the Park Service this Wednesday concerning it, but I would like to make you aware of it and see if I could get your help on it.

In Colorado, in the Colorado National Monument, every year for over the last 10 years there has been a marathon run called the Rim Rock Run, and it is similar to the ones that are done in many other places. Here in the District of Columbia we have the Marine Corps Marathon and in Hawaii they have the Iron Man Marathon,

and these things are not really uncommon. The Park Service has lent themselves to these things a number of times.

Well, just this year, rather unexpectedly, the Superintendent decided that this run was not within the mission of the Park Service, and denied the application to the runners that put this run on. This is in Colorado National Monument near Grand Junction. It has been done many, many times, has terrific support by the community, and is a great attraction. It does not damage or degrade the area at all, as near as I can tell, and what we are going to ask is to try to find a solution to this. We do not want to do something that is not in keeping with the Park Service, but since this is done very often we are going to ask the head of the Park Service if he would give them a 1-year conditional approval to run it this year, and on the condition that the runners come up with some kind of a plan, submit a plan, that is compatible with the Park Service for any succeeding permits to run it. Is that something you could support in giving us conditional 1-year interim approval?

Secretary BABBITT. Senator, that seems like an entirely reasonable approach. I think you are correct that this is not an issue of degrading the park resources. As I understand it, this marathon is being run on the main road outside of Grand Junction.

Senator CAMPBELL. On the pavement, that is correct.

Secretary BABBITT. And I think what the Superintendent was concerned about was simply shutting down the access to the public for the time that the marathon was run. I concede that that is the only issue.

Senator CAMPBELL. And that may be true. It might for a few hours. In that country it is great for runners and cyclists. As you might guess, the State of Colorado, as an example, just about 100 miles from there, going from Durango over the top of the Red Mountain Pass, they close the State highway for a half a day for a bicycle marathon. It does not seem to upset many people. I mean, the number of people that are attracted to it and are enjoying it far outweigh the few people that might have been discomforted.

Secretary BABBITT. As long as they are not doing it for motorcycle marathons.

Senator CAMPBELL. Unfortunately, they are not given the same kind of consideration, but bicycles and running seem to get it. But I did want to ask you that, and I wanted you to know that this is not a permanent thing, it would be just a 1-year conditional access to it so we can get this thing done this year and then sit down when we have more time to try and find a solution that is compatible with both the Park Service's mission and to see if we could keep that run going.

Secretary BABBITT. Senator, that is a reasonable request. I would be happy to join you in petitioning the independent sovereign nation of the National Park Service. [Laughter.]

Senator CAMPBELL. Thank you very much, Mr. Secretary.

Thank you, Mr. Chairman. That is the only question I had.

Senator GORTON. Senator Bumpers.

Senator BUMPERS. Thank you, Mr. Chairman.

REVISED STATUTE 2477 HISTORY

Mr. Secretary, first of all, let me say that I regret being late this morning. I understand I missed a very interesting question and answer session. And I just want to say that you are on the side of the angels. I know that the administration does not intend to back away from their opposition to the Revised Statute 2477 concept, and to remind you that we came within two votes of taking that position in the U.S. Senate. Because of extrinsic matters that had nothing to do with that, we lost by two votes. As I say, I know you are going to hang tough on that.

BUDGET RESOLUTION

On another matter, the budget committee has reported out a budget. This budget does not make any reference to what so-called corporate welfare programs, or corporate loopholes, are going to be closed to offset \$50 billion of the gross tax cuts. To rephrase it so the record will be clear, it is my understanding we are going to cut taxes by \$115 billion gross.

Senator GORTON. \$135 billion.

Senator BUMPERS. Oh, that is right, \$135 and a net of \$85, and the difference is going to be made up by reinstating the airline ticket tax and another \$20 billion from somewhere. There is no reference in the budget as to what those might be, not even the airline ticket tax.

MINING ROYALTIES

I assume that during the negotiations between Senator Domenici and some of his colleagues with the President, at some point you were called upon for your input into that whole process. I am curious as to whether or not, if you know, reclamation fees, mining royalties, elimination of the depletion allowance, maintenance fees, I wonder if any of those things were discussed, and where we are going to find this \$50 billion.

Secretary BABBITT. Senator, I really do not know the answer to that question. We have had, obviously, continuing discussions with the Office of Management and Budget about the fiscal implications of reforming the Mining Act of 1872. I am not entirely clear how that translates into the so-called razors in the budget agreement.

Senator BUMPERS. The President's budget requested a 5-percent net smelter royalty on unpatented land which is worth \$175 million. The President also asked for an extension of the claim in maintenance fees, which is worth \$135 million, and elimination of depletion allowance which is worth \$468 million. Now, if the President asked for those things in his budget, it seems only reasonable he would want those items to be used when determining where the \$50 billion in loopholes were going to be closed. Would you agree with that?

Secretary BABBITT. Absolutely.

Senator BUMPERS. And you agree with it?

Secretary BABBITT. The time is surely at hand for dealing with the necessary changes of the Mining Law of 1872.

Senator BUMPERS. In all fairness, Mr. Secretary, a number of Senators from Western States have told me, and hopefully we are

going to meet this week or possibly next week to sit down and see if we can reach some sort of an accommodation on that. I do not want to be derogatory or anything, but they seem really genuinely concerned about trying to work out a solution to this, and certainly I am going to operate in good faith, and I trust that they are, too, and perhaps we will be able to resolve something.

Now, my bill, as you know, adds a reclamation fee which you did not ask for. That is worth \$750 million over the next 5 years.

Well, Mr. Secretary, I am not going to belabor this. I think you are doing an outstanding job. Your tenacity on Revised Statute 2477 lands, on mining, on mining fees, royalties, reclamation, all of those things, is most admirable. And I hear comments around here, well, I do not trust the Secretary. I trust you implicitly and I think you are doing a fine job.

Secretary BABBITT. Thank you.

HOT SPRINGS NATIONAL PARK

Senator BUMPERS. And finally, let me just say, Mr. Chairman, that I have about three parochial questions.

Senator LEAHY. What? What? In this committee? A parochial question. [Laughter.]

Senator BUMPERS. Do not go blabbing that. [Laughter.]

Hot Springs National Park is, I think, the oldest national park in America. They have approximately 55 buildings there. They have had no significant increase in operations funding in the past 10 years, and I am asking the chairman in his mark to give us some small assistance on that.

LOWER MISSISSIPPI DELTA REGION HERITAGE CENTER

I am also asking the chairman to help us do a feasibility study on something that will benefit the lower Mississippi delta region, and at the same time use a facility, Eaker Air Force Base, which was closed by the last BRAC Commission, and that is a small \$65,000 request, to do a feasibility study on a possible archeological heritage center, at the site.

FORT SMITH NATIONAL HISTORIC SITE

And finally, we have begun finally to do a rehabilitation project at the Fort Smith National Historic Site, the site of old Judge Parker's court house and old Fort Smith. It is a magnificent place. It is really surprising to people who see that for the first time how historical it is and how well kept it is. But we have started the first phase of that, and of course, the second phase we hope to begin. We hope to get the money in 1998 to do the second phase at \$3.4 million.

I will submit questions on those three items to you in writing, and ask for your comments.

Secretary BABBITT. I would be happy to respond.

Senator BUMPERS. I will copy you also with a letter, Mr. Chairman.

Senator Domenici.

Senator DOMENICI. I think it is Senator Burns' turn.

Senator BURNS. You go ahead. You are a busier man than I. I will not be done before about 3:30 or 4 p.m. [Laughter.]

Senator DOMENICI. Thank you.

First, I want to welcome the Secretary. Mr. Chairman, I also want to join Senator Byrd in commending you on the handling of the committee, permitting Senator Stevens, our chairman, to proceed first, as he did. I think we on this side, I hope on that side also, are rather thrilled to have Ted Stevens as our chairman. I would suggest that there may be a new era upon us with reference to the appropriators, and in particular our chairman, all of which I think will be for the better for the committee and the country.

BUDGET RESOLUTION—USER FEES

Mr. Secretary, let me answer Senator Bumpers' question, if you would not mind.

Senator Bumpers, just by way of a quick comment regarding budget negotiations and negotiations with reference to user fees. Some of the items you talked about were user fees; those were handled completely separately from the issue of how do we get to the \$135 billion for the gross tax cut. Some user fees are found in the proposal. Many of those recommended by the administration are not found in the proposal. Very few are found in the reconciliation instructions, because most of those not in the reclamation area that were asked for have been proposed for 8, 10, or 12 years and have never been accomplished. So we did not believe we ought to try them again.

The issue of where the committees will find the money within the Tax Code to fill that additional amount beyond the \$85 billion net tax cut is left totally up to the tax-writing committees of jurisdiction. The administration has a long list, and the committees have short lists, but no item was negotiated between the committees and the administration with reference to specific ways to fund that \$50 billion shortfall other than \$30 billion of it would probably come from the extension of the airline ticket tax, which is an event that has already occurred for the rest of this fiscal year.

INDIAN RELATIONSHIP WITH FEDERAL GOVERNMENT

Now, Mr. Secretary, I want to, as quickly as I can, go through three or four things. In the first part, and I hope you will take this as constructive on my part, but I frequently think I represent 21 States because I have my State of New Mexico, and then I have within my State 18 Indian Pueblos who govern themselves and three large Indian reservations, a portion of Navajo being in my State. I respect their governance authority and their relationship directly to the national government.

I believe the Indian relationship with the Federal Government is the worst I have seen in my 25 years in the Senate. I am not laying blame, but it is in a state of chaos, in my opinion. Any notion that the Bureau of Indian Affairs is doing a better job, is false. I tell you, I just met Saturday for 3 hours, Senators, with 15 of these Indian groups. There is a unanimous absolute—everybody agrees that the Bureau of Indian Affairs is in shambles.

I am not going to go beyond these general statements other than to urge that you do a couple of things: Mr. Secretary, you and the President desperately, desperately need an Assistant Secretary in charge of Indian Affairs. You need to send us somebody quickly. If you need help from Republicans, you might ask for suggestions. I told the tribes it probably has to be a Democrat. They raised their hand and said why? We need a manager, they said, of high, high repute in that job.

They are even talking about whether the Department is so big that BIA gets the appropriate attention, and whether the Secretary could even give BIA the kind of attention it deserves. Vacancies are all the way up and down the Bureau of Indian Affairs. I do not know, Mr. Chairman, if you are now aware that the rules of the Bureau of Indian Affairs are found in 43 volumes of Bureau interpretations, by number, and they would probably stretch from you to the end of this table if you put them side by side.

Now, these people that run the Indians' business can find anything to satisfy anything, or to say the opposite, within these 43 volumes. In fact, the Indians are so confused they have asked us to repeal them all—just pass a bill and repeal them all.

I do think we did a couple of things in the budget agreement, Mr. Secretary, that are helpful. I do not know whether our chairman likes it, but we did. If anybody is wondering at whose suggestion, I will tell you, at my suggestion we made the \$757 million in tribal priority funds an absolute priority that the leadership says, Mr. Chairman, you have to fund in your allocation—out of your allocation.

When we told that to the Indian people, they said that is not interesting. If we were to ask the Bureau of Indian Affairs what our share of it is and what we are supposed to get, they told me, Mr. Secretary, that nobody would be able to tell them, or come even close to telling them what they are going to get out of this \$75 million increase in this fund.

I can drop the subject at this point and say I was pleased to tell you this. I hope I did not tell it to you in a way that is intended to fall disproportionately on your shoulders. I did not intend it that way. The whole process has got to be fixed. It will not be fixed until somebody in the administration, perhaps your new Assistant Secretary, just decides that they have got to take on reform, really do something with it, and take a lead.

INDIAN SCHOOLS

I will give you examples of some things you would be embarrassed about—the status, physical status of the schools we run, which serve only about 14 percent of the Indian kids. The backlog of facilities needs is enormous, and the condition of many of the schools are so inferior that if public school kids went there, they would close them down. Somebody has got to grab the attention of the country and the Congress and get something done in these areas.

SOUTHWEST WILLOW FLYCATCHER

I want to ask you if you would do me a favor on another issue. In the State of New Mexico under the Endangered Species Act we have a threatened or endangered songbird called the, Southwest Willow Flycatcher. What has actually happened is that the Fish and Wildlife Service has no specific recommendations about this songbird, in response to BLM's section 7 consultation. The Bureau of Land Management is negotiating with one active group, Sam Hih in New Mexico, whom you know, and his group. They are negotiating with them, and nobody else is in the negotiations. This group is suggesting at least 5 miles around every songbird nest—I see some people nodding incredibly in the audience who know something about it.

I would merely ask if it is possible that BLM would also bring in the other interested parties as they talk about this particular songbird. Would you give that some consideration, Mr. Secretary?

Secretary BABBITT. Certainly.

Senator DOMENICI. I would very much appreciate that.

U.S. GEOLOGICAL SURVEY

With reference to other things in my State, I want to thank you and the USGS. You alluded to that when you were speaking of the macro things that you try to help with, and we are cooperating in putting up our money. USGS is adding to its reputation by going down into this huge basin that supplies water to Albuquerque to try to tell us and everybody what its real nature is. I thank the chairman for helping us with that. U.S. Geological Survey deserves my highest accolades; and they are very professional.

PETROGLYPHS NATIONAL MONUMENT

I have a couple of things that worry me: Petroglyphs National Monument, and I will not talk about the road legislation. We will do that at another time. This park unit has been pending for a long time in terms of land acquisition, and you asked for nothing in this budget. The chairman will give me some money, but maybe your Department could work with OMB. Maybe they leave me out, because nothing in New Mexico got funded in the budget. I do not know, it is very interesting.

Senator GORTON. Except by the chairman.

Senator DOMENICI. Except by the chairman. Maybe it is because I am not your favorite Senator or you are not my favorite cabinet member, I do not know.

Secretary BABBITT. Senator, you are tied for my favorite Senator with 99 others. [Laughter.]

Senator DOMENICI. That is what I figured, and that means I could very well be 100. I understand that. I will not say it is mutual, because I do not feel that way about anybody. But such things as the petroglyphs, when we get not a single administration request when Congress has funded it 2 or 3 years in a row. We have to buy the rest of that land.

SOUTHWEST FISHERIES CENTER

We also have a Southwestern Fisheries Technology Center. It is 85 percent completed. You asked for no money for it. Maybe, again, whoever is putting the budget together, because they do not like it, maybe they figure our good friend the chairman will fund it anyway. This has not been a good year for funding projects in New Mexico.

Nevertheless, I thank you, and I just want you to know that we are getting along pretty well in spite of it. We are coming out of this appropriations process pretty well, even without the recommendations finding themselves in your budget.

SECRETARIAL ACCOLADES

I am going to leave on a positive note, Mr. Secretary. You feel very strongly and have certain philosophies on governance. I do want to say to you, I believe, considering that that is how you feel, that you have become much better at managing those kinds of events. I think you have been more inclusive as you progress through this tenure. I thank you for that—everything from range management to other things that you and I do not see eye to eye on. I think it has come to the point where everybody understands that there is not just one group of Americans that is interested in solving these problems.

Thank you very much, Mr. Chairman.

Senator GORTON. Senator Leahy.

Senator LEAHY. I will try to follow the example of my friend from New Mexico, and I will try not to use the full 5 minutes allotted for the questions. But I found the first 20 minutes of it very instructive, Pete, and I appreciate it. I learned a lot. I will know what to do with our Indian problem now in Vermont.

Senator DOMENICI. Well, you barely made it, so do not complain. [Laughter.]

CONNECTICUT RIVER PARTNERSHIP

Senator LEAHY. I understand that I missed some of the excitement before. We do not have those problems in Vermont. And I want to thank the Secretary for a lot of the attention he has given to States in the Northeast, and some of the areas important to us, especially your help in ensuring the Connecticut River Partnership has continued to receive support from the National Park Service. That has been important to a lot of us. Vermont has only one national park, but the rivers and trails program and the partnership it supports are essential for protecting our special areas, and it improves access to Vermont's trails, lakes, and rivers.

The Connecticut River Partnership demonstrates the commitment that local communities have to protecting the Connecticut River watershed. In fact, I believe the river has been nominated for recognition as an American heritage river under the President's new initiative. I want you to know I wholeheartedly endorse that. The Connecticut River, as you know, comes down and divides between Vermont and that eastern State, New Hampshire. It keeps our western State of Vermont safe. But I think you will find that both New Hampshire and Vermont would support it.

LAND AND WATER CONSERVATION FUND

You have recognized the importance of the two acid deposition monitoring stations in Vermont, and I appreciate that very much, and the funding for the National Atmospheric Deposition Program. The land and water conservation fund is one I have long supported. And I see the budget agreement includes—or I am told—includes increased use of the fund. In the Northeast, we are at a significant disadvantage tapping into it, because we have so little public land. But when it was operational, the State side of the fund was critical in helping. And so I would urge the administration to restart the State side of the land and water conservation fund as part of an effort to bolster the fund, because it helps us protect our streams and our parks and our lakes and so on.

SUPPLEMENTAL APPROPRIATIONS

Now, we are going to pass a supplemental appropriations bill. I am sure there is going to be allocations for Fish and Wildlife Service facilities that were lost or damaged during the floods, and the Department is going to now start moving those out of flood plains. That is a policy that should be implemented nationwide, not just where the most recent floods were.

MISSISQUOI NATIONAL WILDLIFE REFUGE

We have only one national wildlife refuge headquarters sited in our State of Vermont, but it is located in the flood plain of the Missisquoi River—that is M-i-s-s-i-s-q-u-o-i. I know the reporter, the official recorder of these things, would like that.

The facility floods regularly, has no insulation and provides minimal office space.

In fact they have started, the two-person staff, have started holding environmental education programs in a boat shed, because the regular facility is in such poor shape. Now, last year, you included one-quarter of a million dollars for the highest priority operations and maintenance needs to address what is a \$3.3 million backlog. So we have a \$3.3 million backlog; \$250,000 was included to help out on it. By the time it got done, only \$50,000 showed up. Can we get some kind of similar funding in the fiscal year 1998 budget for the Missisquoi?

[The information follows:]

MISSISQUOI NATIONAL WILDLIFE REFUGE

The proposed fiscal year 1998 operations and maintenance budget for Missisquoi National Wildlife Refuge is \$258,000, an increase of \$6,000 over fiscal year 1997. Of this total, approximately \$50,000 will be spent directly on maintenance staff salaries or supplies and materials to perform routine maintenance. Missisquoi NWR, like many other refuges throughout the Nation, has had a shortfall in operations and maintenance funding which is gradually creating a substantial backlog in both areas. The Service plans to continue to address the need for maintenance and improved operational capability at all refuges throughout the Nation by prioritizing the needs of all refuges, selecting those with the greatest need for the earlier funding.

FLOODS

Secretary BABBITT. Senator, I will certainly have a look at it and respond to you. I am not familiar with that particular line item in the request. But I would be happy to look at it.

Senator LEAHY. I do not expect you to know all those line items, Mr. Secretary. I do not know how you keep up with all the things you do. But I had a feeling that if it was mentioned at this hearing, that it might somewhere pop out. I know in the Senate, Senators are merely constitutional impediments to their staffs, and so often we will mention something that the staff will actually look at. So I would hope that yours might on this.

INVASIVE SPECIES

We also have the problem of invasive species into our waters. The U.S. Geological Survey has set aside \$750,000 to address this. In our Lake Champlain, that magnificent lake that goes from Canada, straight down through, and separates Vermont from New York—you know, Vermont likes these waterways that kind of define who we are—we have had the problems of zebra mussels, which is now becoming a serious problem, because it is growing there, not just in the Great Lakes. We also face the spread of sea lamprey and water mill foil. We reauthorized the National Invasive Species Act to address these problems.

Do you know offhand the amount allocated in the USGS budget that would go to fighting aquatic invasive species?

Secretary BABBITT. Senator, it is a very modest amount. I think it is one-half million dollars or something like that. And that is not to deny the seriousness of the problem. I mean you have got purple loosestrife running wild across New England. The zebra mussel you have mentioned, and a whole variety of others. But that is the reality.

Senator LEAHY. I would mention, on Lake Champlain, if you could look carefully at this, outside of the Great Lakes, it is the largest body of fresh water in the United States. That is a very, very significant lake. It has one of the most remarkable biological systems in the lake, with all the different things, but we are being hurt by these particular areas. And if you could have your folks look at it. And I would be glad to meet with anybody from your office that might be doing that.

And my other questions, Mr. Chairman, I will submit for the record.

Senator GORTON. Thank you, Senator Leahy.

Senator LEAHY. Thank you very much. But if we could follow up on that and the Lake Champlain.

Secretary BABBITT. Senator, I will. Thank you.

Senator LEAHY. And I am delighted you are here.

Secretary BABBITT. Thank you.

Senator GORTON. Senator Burns.

Senator BURNS. Is that zebra mussel an endangered specie? [Laughter.]

[The information follows:]

LAKE CHAMPLAIN INVASIVE SPECIES

The Fish and Wildlife Service is involved in efforts to preserve Lake Champlain, as well as other lakes in the northeastern United States, from nonnative aquatic nuisance species such as the zebra mussels. The zebra mussel explosion has reached a critical stage that is becoming an economic and ecological catastrophe. Zebra mussels can have a devastating impact on all aquatic life, birds and mammals by changing water quality, disrupting the food chain and predator-prey relationships, and altering physical habitat.

Zebra mussels are found throughout Lake Champlain at densities of 60,000 to 109,000 mussels per cubic meter, with some concentrations as high as 134,000 mussels per cubic meter which is nearly as high as populations in the Great Lakes. This invasive species poses a serious risk to the water resources of Vermont and New York. It has caused a serious economic burden not only to the industrial and potable water systems along the lake, but also to the entire ecosystem of Lake Champlain.

The Service, other Federal agencies, Vermont and New York's environmental agencies, and many private organizations have joined in the battle to control zebra mussels in Lake Champlain, and have identified the control of zebra mussel as one of their highest priority actions. Current management actions have focused on controlling the mussel's attachment to surfaces and water intake pipes and preventing further spread. The Service's Lake Champlain Fish and Wildlife Resource Office is working with the public and private sector to develop and implement a Comprehensive Management Program for Nuisance Nonnative Aquatic species in the Lake Champlain Basin. The Management Program will evaluate and demonstrate zebra mussel control strategies in order to halt the mussel's uncontrolled spread and impact on the region's economy and fisheries.

NATIONAL PARK SERVICE MAINTENANCE BACKLOG

Senator BURNS. Mr. Secretary, thank you for coming this morning. And I have a couple of questions that I think will require—you will have to respond to in writing. It has to do with the repair work and the infrastructure of our National Park System. I would like some kind of report of the backlog that you have now, as far as infrastructure.

I was in Glacier National Park on Saturday. We dedicated, or recognized, the partnership that has been formed between the local group and Flathead County in the restoration of the chalets in Glacier National Park. It was a very nice affair. We see that when local partnerships are formed, we can do some very positive things about the accommodations of people.

You know we tend to look at parks, and we forgot that we are in the people business. That is just as important as some other things that we do.

If you could supply me with that backlog. I would like to help you with that. Because we have some very serious problems in transportation and roads in Yellowstone Park, and we will try to help you with that situation.

[The information follows:]

RECAPITALIZATION OF THE NATIONAL PARK SYSTEM

[Preliminary list of unfunded capital construction needs, alphabetically by park]

Park	Project title	Gross construction estimate	Package number	Reg.	Objective	Work type
Acadia National Park	Upgrade restrooms, water, sewer, power	5,750,000	232	MAR	1	U
Acadia NP	Rehabilitate historic structures	8,500,000	320	MAR	2	B
Acadia NP	Rehabilitate tour loop roads and bridges	24,000,000	287	MAR	2	R
Acadia NP	Replace visitor center and construct park entrance	16,560,000	233	MAR	4	B
Acadia NP	Improve McFarland Hill Headquarters	9,960,000	234	MAR	3	B
Acadia NP	Alternative transportation modes	1,320,000	2006	MAR	5	R
Adams National Historic Site	Rehabilitate Beale Estate	2,020,000	108	MAR	2	B
Adams National Monument	Construct employee housing and recreation facilities	1,950,000	198	MWR	5	H
Alaska parks (multiple)	Rehabilitate historic/building New Backcountry cabins	3,960,000	135	AKR	2	B
Alibates Flint Quarry NM	Construct visitor contact station	4,320,000	105	SWR	4	B
Allegheny Portage National Historic Site	Staple Bend Tunnel stabilization/development	3,000,000	225	MAR	3	R
Allegheny Portage National Historic Site	ALPO/IOFL Development Program	11,760,000	226	MAR	5	L
Amistad National Recreation Area	Construct visitor contact stations and boat launch	3,000,000	117	SWR	5	B
Amistad NRA	Reconstruct roads	2,640,000	180	SWR	3	R
Antietam National Battlefield	Stabilize/restore historic battle structures	2,400,000	315	NCR	2	B

YUKON-CHARLEY RIVERS NPRES	REHABILITATE HIST. BLDGS. and CONSTRUCT NEW FACILITIES	3,181,000	100CC	AKR	3	B
ZION NP	CONSTRUCT EMPLOYEE HOUSING	8,634,000	178	RMR	3	H
ZION NP	REBUILD PARK ROUTE 7	2,508,000	210	RMR	3	R
Total		5,587,776,410				

Objectives:
 1= Health and safety.
 2= Resource preservation.
 3= Repair/rehabilitation of existing facilities.
 4= New facilities in a new/developing park.
 5= Additional facilities in an older/established park.

Work type:
 B=Buildings: Visitor, park support, et cetera.
 H=Housing: Permanent, seasonal.
 R=Landscape work, site restoration, et cetera.
 U=Roads: PLRP, Non-PLRP, bridges, et cetera.
 U=Utilities: Water and sewer systems, et cetera.

NATIONAL PARK SERVICE LINE-ITEM CONSTRUCTION PROGRAM

 2= Resource protection.
 3= Repair/rehabilitation of existing facilities.
 4= New facilities in a new/developing park.
 5= Additional facilities in an older/established park.

PARK HOUSING

Senator BURNS. One thing that was of concern, I noticed an article in the paper that came out—and you might address this—that they are building some new homes for employees in Yellowstone Park, of which there is a 1,600 square foot home at a cost of around \$300,000. Could you tell me what would inflate the construction of a home, especially in view of the fact that there is no land cost involved in that?

Secretary BABBITT. Senator, I would be happy to give you the facts and figures on that. I am not familiar with the specific issue, but it is a fair question, and I will be happy to give you a response. [The information follows:]

YELLOWSTONE NATIONAL PARK HOUSING COSTS

Yellowstone National Park has not and does not plan to build any 1,600 square foot homes that cost \$300,000. This derived figure was an estimate provided by an outside contractor for an analysis in which Yellowstone managers were deliberately conservative. As such, Yellowstone managers feel that these numbers represent a “worst case scenario,” and that there are several initiatives underway that may significantly reduce these costs.

Notwithstanding these facts, there are several expenses that are included in the construction of a home in Yellowstone National Park that are frequently overlooked when comparing to the cost of a home on the commercial market. Circumstances related to the following components impact the final cost:

Planning and design.—The planning for and design of houses in Yellowstone National Park is more complicated than that of houses in developed communities. The issues that must be addressed during this initial phase range from impacts on cultural and natural resources to ensuring adequate accessibility to minimizing the visual impact of homes on landscapes. This planning often requires time-consuming consultation with State Historic Preservation Offices, particularly when historic areas will be impacted.

Frequently, the costs associated with county planning and designers in non-park homes are recovered by taxes and impact fees and thus not included in the “price” of a house. Yellowstone includes the costs of these components when identifying the price of a structure.

Basic construction.—Basic construction costs are more expensive in many national parks than in surrounding communities. The short construction season, transportation of material and employees, and the lack of adequate contractor housing all inflate these costs. By way of example, concrete delivered to the Old Faithful area in Yellowstone National Park costs \$105 per cubic yard. The same concrete delivered in nearby Bozeman, Montana, is \$65 per cubic yard.

Construction equipment entering the park is pressure washed to prevent the spread of noxious weeds. New housing must also withstand snow weighing as much as 150 pounds/square foot and is designed to withstand zone four earthquakes (the same seismic zone as San Francisco). These stringent requirements, which must be applied to homes for Federal employees, are not necessarily applied to the “comparable” homes outside of the park.

Utility systems.—Housing that can use existing utility systems is considerably cheaper than housing for which utilities must be provided. In many cases utilities are already in place in non-park municipalities.

Landscaping/ revegetation.—Unlike many non-park homes, the Yellowstone housing costs also include the revegetation necessary to prevent erosion and minimize the visual impact on the surrounding landscape.

In the case of any of these cost drivers, there are significant economies of scale when constructing multiple houses. Unfortunately, housing money is typically allocated to Yellowstone incrementally. As a result, “overhead” must be factored into each discrete project and park managers cannot take advantage of these economies.

THREE-STATE AREA

Senator BURNS. We are building in a three-State area, probably, within that Park that would cost less than one-third of the figure that was given on that. And I would like to know what cir-

cumstances or elements figure in the cost of those homes that would drive that cost that high.

Secretary BABBITT. I would be pleased to respond in writing.

PARK INFRASTRUCTURE PRIORITY LIST

Senator BURNS. And if you could respond to me on the backlog of your infrastructure needs on the Park Service, and where the—and I would like to have your priority list on where we should be concentrating our efforts. I think it behooves all of us. I know ours is just a parochial thing, because Glacier and Yellowstone affect us, but I know we have infrastructure in other parts of the country that would be also high on your list, too.

Secretary BABBITT. Senator, I have just one specific observation relative to Glacier, and certainly to Yellowstone, where the road issue is really critical. I suspect that Yellowstone currently has a larger backlog of road construction and maintenance than any other two or three parks put together—certainly in the lower 48 at least. I would hope that we could, together, be looking at the ISTEA reauthorization, at all of the Federal road programs, and just examine what is a fair allocation, fair earmarking, from Federal highway programs to at least assist with some part of this.

YELLOWSTONE NATIONAL PARK—ROADS

Senator BURNS. Well, I think that is a good suggestion. But you know we allocate or we budget so much, and I cannot see that anything has been done for the roads in Yellowstone Park at all. I cannot see anything that is improving that road situation. And of course, it is a park that has quite a lot of traffic, and the pressure is intense. So if I could get some kind of a report. And I would be happy to work with you in the allocation of those infrastructure things.

YELLOWSTONE—BISON

As far as the bison thing, you know I have talked about the bison thing 100 times. You knew it was going to come up today. And I am going to beat up on it. But I have beat up on you on that because—have you read this letter, the April 24 letter that was written to John Tarburton, the President of the National Association of State Departments of Agriculture, from the White House?

Secretary BABBITT. Senator, I am not certain. I do not think so.

Senator BURNS. I think that the White House was—and I would like to put this in the record, Mr. Chairman, if I could. It was a response, I think, to Mr. Tarburton with regard to animal health and the impact that we might have on certain statuses of parks and the wildlife that is contained in those parks.

Senator GORTON. The letter will be included in the record.

[The letter follows:]

LETTER FROM PRESIDENT BILL CLINTON

THE WHITE HOUSE,
Washington, DC, April 24, 1997.

Mr. JOHN F. TARBURTON,
President, National Association of State Departments of Agriculture,
Washington, DC.

DEAR JOHN: Thank you for your letter regarding the management of bison in Yellowstone National Park. I understand your concerns.

On March 19, 1997, the National Park Service, the U.S. Forest Service, and the Animal and Plant Health Inspection Service met with representatives of the State of Montana to continue development of a long-range bison management plan. A number of alternatives are being considered, with the understanding that any viable alternative must, among other things, address bison population size and distribution; clearly define a boundary line beyond which bison will not be tolerated; address the risk that bison pose to public safety and private property; protect livestock from the risk of brucellosis; protect the state of Montana from any risk to its brucellosis-free status; and commit to the eradication of brucellosis from bison and other wildlife.

I hope this adequately addresses your concerns. Thanks again for writing.

Sincerely,

BILL CLINTON.

BISON MANAGEMENT PLAN

Senator BURNS. It says:

On March 19, the National Park Service, the United States Forest Service and the Animal Plant and Health Inspection Service met with representatives of the State of Montana to continue development of the long-range bison management plan. A number of alternatives are being considered, with the understanding that any viable alternative must, among other things, address the bison population size and distribution, clearly define a boundary line between which bison will not be tolerated, address the risk that bison pose to public safety and private property, protect livestock from the risk of brucellosis, protect the State of Montana from any risk to its brucellosis-free status, and commit to the eradication of brucellosis from bison and other wildlife.

I hope this adequately addresses your concerns, and thanks again.

And it is signed by the President.

This letter would indicate that you are at odds, then, with your present policy; you are at odds with the White House. Is that not a correct assumption?

Secretary BABBITT. I do not think that is likely. It is a large organization. Whoever wrote that letter probably did not talk with me. I certainly do not remember it. I suspect that any differences in nuance or language is because it may have been written by 1 of the 20-somethings in the White House correspondence unit. It is entirely possible.

Senator BURNS. It has been suggested by your friends that the national regulation plan you have for parks, some of those plans are not working. With this in mind, can you explain to the committee how and why we continue to put forth a failed policy of natural regulation of wildlife in Yellowstone Park?

Secretary BABBITT. Well, I do not consider it a failed policy. We could discuss that today or elsewhere. I think it is indeed a well considered and productive and successful policy.

Senator BURNS. 1,400 bison will starve to death this winter. Is that the policy?

Secretary BABBITT. Well, I do not know of any policy in this administration or elsewhere which is directed at making sure that animals do not starve.

Senator BURNS. Well, I guess that is the difference in the way we look at things, is it not?

Secretary BABBITT. No; I think our differences, frankly, go much beyond that. For example, I am on the record as being adamantly opposed to the continuing slaughter of these animals.

Senator BURNS. Mr. Secretary, we are not talking about slaughter of animals. We are talking about a park service that has allowed 1,400 bison to starve to death. That was not done by anybody.

Secretary BABBITT. Well, Senator, the plain fact is that several thousand animals were slaughtered by the State of Montana, and we are opposed to that.

Senator BURNS. The slaughter has been inside that park.

Secretary BABBITT. Well, the 2,000 I am talking about—

Senator BURNS. And that figure outside the park does not even approach that figure.

Secretary BABBITT. Well, it does.

Senator BURNS. It does not even approach it. And I am wondering what we are going to do inside the park to prevent this.

Secretary BABBITT. Well, Senator, we obviously—

Senator BURNS. We could prevent all of this.

Secretary BABBITT. We obviously differ. Your position is that the animals should not be allowed outside the park. I disagree with that. The land outside the park is public land. I believe the people of the United States support the notion that these animals should be, under the circumstances, allowed on public land, owned by the people of the United States. And, that we should terminate this policy of slaughtering them when they walk across an artificial line, separating Yellowstone National Park from the adjoining national forest.

Senator BURNS. Does not the park belong to the people, too?

Secretary BABBITT. Absolutely.

Senator BURNS. You are not going to take any responsibility for that?

BISON ON FEDERAL LAND

Secretary BABBITT. Senator, those animals would not be starving in the park if we had a rational policy which would allow them to seek forage in the lower elevations on Federal land adjacent to the park. Of course, we should find a better balance for this bison herd. But we cannot do that as long as you insist that those animals should be left in the high altitudes rather than being allowed, in the right circumstances, off the boundary of the park, onto adjoining public lands, where, in my judgment, they have every right to be.

That would prevent the starvation. But it is not possible because the State of Montana is slaughtering those animals as they move down into the lower elevations. And we disagree on that policy.

Senator BURNS. Is it not the responsibility of the Park Service to maintain some sort of range condition for winter forage?

Secretary BABBITT. The plain fact is that these animals need more winter range. It is available on public land, except for the policies of the State of Montana.

Senator BURNS. I would say that the public lands that you are looking at for winter range is probably the same altitude as the park.

Secretary BABBITT. Well, I disagree. That is not correct.

Senator BURNS. Well, you can look at your elevations and everything, but in other words, you are absolving the Park Service's responsibility to maintain range conditions that would sustain the number of bison that it can carry in there; is that not correct?

Secretary BABBITT. Senator, Yellowstone National Park is high summer range land. Historically, animals have all migrated off that high land, down onto winter range. The elk do that. And it seems to me perfectly appropriate. That happens in every national park in the United States. Bison should be treated exactly the same way.

Senator BURNS. I would say that the forage outside of that park is probably primarily on private land. Would you conclude that?

Secretary BABBITT. There are millions of acres of adjacent forest land which are appropriate winter range for wildlife owned by the people of the United States. That includes bison. This notion that they should be kept inside Yellowstone National Park, at high altitudes, during bad winters, at gun point, I think is a badly mistaken philosophy.

Senator BURNS. We, as private landowners and grazers and people in the livestock industry, are committed to keeping our animals on our land and maintaining range conditions that would sustain the number of animal units that we can properly take care of.

Secretary BABBITT. Senator, I am not talking about private land. I am talking about public land, owned by the people of the United States of America.

Senator BURNS. What difference whether it is a public herd owned by the public or a private manager trying to maintain his own area? Should not the same practices—is the same good neighbor policy the same?

Secretary BABBITT. Senator, a private landowner has every right to exclude bison from his or her private land. That is not what we are talking about. We are talking about a policy which says these animals will be slaughtered as they move onto lower altitudes onto national forest land. I believe that is mistaken, unnecessary, and wrong.

BISON HERD MANAGEMENT

Senator BURNS. I would support the idea that the numbers cut back can be shipped to any other part of the country, if we can clean up this idea of a disease. We have no problem with that, Mr. Secretary. No problem at all.

Secretary BABBITT. Senator I believe the present policy is fundamentally wrong.

Senator BURNS. What I am saying is that to be a good neighbor, I mean, to abide by some rules and regulations that were written naturally many, many years ago, that we could accomplish that then. We cannot do it without the cooperation of the Park Service.

Secretary BABBITT. Senator, I cannot be a party to a policy which says bison in search of winter range are going to be slaughtered

when they cross from Yellowstone National Park into the adjoining national forest. I do not support that policy.

Senator BURNS. Then what I would suggest is that we manage the herd in the park to where we have sustained forage and sustained range, and work with the States in order to manage the herd and clean up a diseased herd, and take care of those things and we will be able to do that.

Secretary BABBITT. Senator, you are not advocating that for elk.

Senator BURNS. But elk have different social habits. You do not have near the problem with elk.

Secretary BABBITT. They have a social habit shared by bison, and that is that they are wildlife owned by the people of the United States, which ought to be managed on a public land base, including the U.S. National Forest System.

Senator BURNS. But the fact is the winter herds of elk, the vast majority of them, winter on private property. And they graze on private property. Very happily so. We have very few problems. And you know the social problems that we are talking about. Elk do not have the same cycles as buffalo do, or bison do.

There is a lot of this that maybe the American people do not understand, but do not use the inflammatory words of Montana slaughtering those animals, when you, the Park Service, allowed this abominable management of a herd to starve to death when you had it in your power to control the numbers and provide the forage and the management. And you have the technique. You have it.

And I understand that maybe we need to do some ongoing research. Maybe you can supply me with the amount of research that the Park Service is doing. I will be happy to take that—but in recommended management problems. Now, that is the fact. That is the fact that the Park Service policy starved these animals. And you can use all the inflammatory language that you like, all of that; we are going to continue to protect not only the integrity of that herd, but the integrity of an industry in my State, and we will continue to do that.

But as long as the Park Service embraces this policy, then they must shoulder the concerns of that policy and not try to push it off and blame somebody else. That is it. And I thank you for coming this morning.

NEW WORLD MINE

I want to ask you some questions about the land and conservation with the gold crown situation up there. That was not the deal that was made by the people of Montana on private property, using money to buy out a mine that we use to help the environment of this country, using environmental funds to help the environment in this country, and to allow this. Are you going to complete the EIS so that it tells us that maybe that area should be mined or not mined?

Secretary BABBITT. Senator, the EIS issue really turns, I think, on the acquisition issue.

Senator BURNS. But you are not acquiring the land.

Secretary BABBITT. Well, we have not acquired the land.

Senator BURNS. What?

Secretary BABBITT. We have not acquired, that is correct.

Senator BURNS. That is exactly right.

Secretary BABBITT. That is correct.

Senator BURNS. It is private property. Well, I will have some more things in writing, but we can discuss these in calmer environs. But I do not like the idea of being blamed for some things. It is because of policy set by the Park Service that is creating this whole situation.

So, thank you.

BISON HERD INTEGRITY

Secretary BABBITT. Senator, I appreciate the spirit of your questions. I just want, again, to say that, with all respect, we have a fundamental disagreement. And I am ready and willing to sit down and discuss it at any time.

Senator BURNS. The disagreement is on the policy of how do we maintain the integrity of the herd and of the park.

Secretary BABBITT. That is correct.

Senator BURNS. And to embrace management policies that have been a very, very successful policy all across this country with the exception of here. And that, I find, very intriguing.

Senator GORTON. I did not realize, Mr. Secretary, when I said I would allow every other member of the subcommittee to question first that I would still be waiting somewhat more than 2 hours later.

Senator BURNS. My apologies to the chairman.

Senator GORTON. You were a very small part of it, Senator Burns.

Senator Cochran, who was here, wanted me to mention that he will submit questions to you on the Natchez Trace and on other subjects, and will do so in writing.

ALASKA ROADS

Senator GORTON. And I might say, with respect to the first set of questions by the Senator from Alaska, which I and I suspect other members of the committee, found somewhat frustrating on both sides of the table, Mr. Secretary, I can appreciate a policy of an administration that does not want roads on every section line for 960,000 miles. I do not regard that as an overwhelming threat. I must say, as an outsider, I regard it as equally irresponsible to say that no one is going to be able to build a road unless 1976 motor vehicles or something like it were being used.

If you do not mind, I would ask you to come up and have a private conversation with me on a suggestion that might be able to get both sets out of it when the hearing is over. But I think you ought to also carry back to the administration the proposition that these veto threats, whether they relate to roads in Alaska and Utah or continuing resolutions, do not come free. There are many in the Senate who are operating right on the policy now that we are going to pass one flood supplemental bill and only one and that a veto is going to be a veto of the whole bill and not of a single element of it. That is obviously not a decision that has been taken finally, but there is a very real possibility that that will be the case.

It is something I would regret. You know, we have worked on our part of it for the Department of the Interior in a way that I think is both responsible and generous. You spoke earlier of Yosemite. Obviously it is very important that the Yosemite provisions of that flood supplemental become law and not be hostage to debates on other issues. But I do have a number of questions of my own. I am obviously not going to be able to get through all of them, but let us at least start. And I hope that while we will have some disagreements, we can go through them once each, and I will express my views and you can express yours, and then we will go on to another subject.

INTERIOR COLUMBIA RIVER BASIN STUDY

And I will start with a contentious and partly parochial one, the inner Columbia basin ecosystem study. The Senate Energy Committee had a hearing on that subject last Thursday. And we were faced, it seems to me, with at least the conflicting functions of a number of government agencies. The Bureau of Land Management and the Forest Service have missions that include, though obviously they are not limited to, a commodity production role. The Fish and Wildlife Service has no such function at all.

And it seems to me at least that much of the cost of implementing the Columbia basin study, now estimated to be \$125 million more than present costs, is attributable to meeting the requirements of the Endangered Species Act as interpreted by standards developed by the Fish and Wildlife Service and other science agencies. In the hearing I learned that the environmental impact statement prepared by the Forest Service and the BLM was on its way to be printed when objections from the Fish and Wildlife Service, the National Marine Fisheries Service, and the Environmental Protection Agency, resulted in further delays.

It seemed to me that rather than consultation, we were involved in a dictation on the part of those agencies, with certain tremendous impacts, most of them adverse, on local economies. My first question is: Why did the Fish and Wildlife Service, along with the EPA and the National Marine Fisheries Service, cause the delay in the release of the interior Columbia basin environmental impact statements?

Secretary BABBITT. Well, that in fact happened. The reason is that the regulatory agencies are worrying about the implications of the so-called *Pacific Rivers* decision, which led us to think of these impact statements as something that ought to have the ability, from the front end, to address all regulatory consultations, which usually take place downstream, months or years later. These have been framed in a way that we anticipate the issues would all be cleared out of the way once the plan was implemented. Then local land managers could effectively go about their business without having to reconsult with the regulatory agencies on hundreds of projects across the years.

Now, let me also say that when those objections were raised by the regulatory agencies, we went back to the process, including the local governments, and thrashed it out in a way that I think is fairly satisfactory. I mean the changes were all flagged and discussed. Many of them were resolved, withdrawn, and modified.

Last, one sentence about the projected cost in the outyears, beginning in 1999. A big piece of those costs is the forest health issues, which are not, in most cases, being driven by the Endangered Species Act. The part that deals with stream restoration certainly is being driven by the Fish and Wildlife Service and National Marine Fisheries Service. But I would wager that much of the larger part of those costs is the thinning and prescription treatment and burning of forests.

Senator GORTON. Are those regulatory agencies going to, in effect, have veto power over forest management practices in the region?

Secretary BABBITT. Under the preferred option in the statements as option four—and I believe that the theory behind option four is that the front-end adoption effectively preclears most of the decisions by the land management agencies—there are two categories. There is one category of areas that requires an additional step of watershed analysis. But the lands which have the so-called default standards, I believe, by my understanding and reading of the document, is that the land management decisions would take place without any further consultation.

Senator GORTON. Under the Northwest plan, the President's report stated that the time for consultation was reduced from 114 to 30 days, obviously a significant efficiency. What needs to be done to assure this same level of efficiency in implementing the Columbia basin study and other large eco-region projects?

Secretary BABBITT. I think it is a factor of two things. One is the level of attention being given to this. The reason we reduced the number of days of consultations in my judgment, in the forest plan is because Tom Collier sat on these issues and simply did not let them escape his attention for even 1 day as we went through the process. The remaining question is whether that is now a cultural change that we can count on or whether we will have to stay with it in that kind of detail. Obviously some of it is a function of funding as well.

ECO-REGIONAL PLANS FUNDING

Senator GORTON. Back to the \$125 million cost. Should we expect similar increased costs for other large eco-regional plans when the preferred alternatives are selected? Or is this one going to be a special case?

Secretary BABBITT. Senator, I would counsel some caution about that figure for these reasons. First of all, it is an estimate of the costs, that is out ahead of the EIS process, which you know might be incurred. And second, as I said, a great deal of that cost is forest restoration costs. The pace at which that takes place, I think, is subject to a lot more discussion. The bottom line is, when we are talking about the inland forests of the West, we have a forest ecosystem health problem that is acknowledged by all. And it is going to be expensive to fix it.

The question is on what kind of time line do we move. Not to elaborate, but we have got probably 300 million acres of inland forest in the West. We are doing prescriptive treatment on maybe 2 million or 3 million acres a year right now.

Senator GORTON. So this plan is not going to be unique. There are going to be similar problems with respect to all of the other large regional plans out there?

Secretary BABBITT. This problem is a West-wide problem. It is, in most cases, not being driven by the Endangered Species Act. Those costs are not being forced by regulatory agencies. They are being estimated, at least 50 percent and I would guess probably closer to 75 percent, of those costs are being driven by the forest managers as necessary management, quite apart from regulatory requirements.

Senator GORTON. To the extent that you are responsible for it in BLM, will your 1999 budget request reflect those costs?

Secretary BABBITT. My 1999 budget?

Senator GORTON. 1999.

Secretary BABBITT. Senator, I am not prepared to say because I have not seen these figures scrubbed down. In the EIS process we are going to need an expansive debate about not the stream-specific pieces, which are I think mandated, but about the pace of and cost and alternatives of dealing with these forest issues.

EVERGLADES

Senator GORTON. Another subject, the Everglades. Tell me the overall status of the Everglades restoration effort. We are pretty close. It looks to me like \$1 billion in a 2-year period, when you combine both the State of Florida's contribution and our own. How is it going? How are the agencies working together?

Secretary BABBITT. I think we are pretty much on track. There are, I think, two or three major pieces that are unfolding right now. The restoration work in Taylor Slew, the so-called modified water delivery, is critically important, because it rewaters the southeastern portion of the Everglades. The Corps of Engineers restudy is on track. That is, we have made a big commitment there to a final plan by 1999. It is moving essentially on track.

The third really big piece is the storm water treatment areas up at the top end, where the runoff from the sugar fields is being cycled through these retention areas for natural uptake of the phosphorous. The first large-scale treatment center is now under construction—at least, if they are not turning earth, they will be in the next few weeks. That one dropped a tiny bit behind schedule because of some cash flow issues in the South Florida Water Management District. But they are resolved and ground breaking is under way.

There are still some remaining issues on the Corps of Engineers' 404 water quality permit up there. I think they are being worked out. We are going through the process of disbursing the money that was in the farm bill last year. I think we have a very satisfactory consensus plan, and that money will be disbursed probably by the end of the summer.

BUDGET PRIORITIES

Senator GORTON. Now, I have got a fairly complicated paragraph here on the budget and the way we set our priorities, so try to listen to me and stop me if I need to go over it again for you. The

budget agreement, which looks like it is going to be implemented now, provides about a 2-percent increase in discretionary, non-defense spending in fiscal year 1998. That, if we go a pro rata share, would probably be about \$240 million for this subcommittee. But function 300 natural resources, that makes up a large portion of our bill, seems to be more generously treated, and we could conceivably get up to a 4.5-percent increase, or \$560 million. But not everything is in that function.

So let us start with the figure of \$500 million more than the current appropriations level. The Park Service priorities that are in the budget agreement as priority items are \$83 million of that; for tribal priority allocations—Senator Domenici talked to you about that—another \$77 million; Everglades, \$79 million. If we stop selling oil from the strategic petroleum reserve to finance programs in the Interior bill, and I think it would be responsible to take that action, that is another \$200 million.

Now, that leaves about \$61 million out of that \$500 million for everything else, including other Interior agencies, the Indian Health Service, energy conservation and so on. So most of it is eaten up by these priority matters first. Have you considered the impact on other agencies that absolute protection of these priority programs within a balanced budget might have?

Secretary BABBITT. Senator, I have been a little hesitant to look across the chart for fear of retribution from other agencies. But I understand the import of your question. I would be happy to engage in the kind of dialog that I think we had very successfully last year. I recall that you asked me last year almost an identical question.

Senator GORTON. It was tougher last year. We were going down, if anything.

Secretary BABBITT. I have reason to suspect that if we engage in detail and do this carefully, we can pick our way through it. But I understand the question. What you are saying is we are not home free.

Senator GORTON. That is right.

Secretary BABBITT. And I accept and understand that.

LAND ACQUISITION FUNDING

Senator GORTON. Now, on an allied subject, land acquisition. The budget agreement provides for the expenditure for another \$700 million for land acquisition over the course of the next 4 years, with \$300 million to be available for 1998. Though it is not stated explicitly in the budget agreements, the intent seems to be to provide the \$315 million in 1998 and \$15 million in 1999; for the headwaters forests, \$250 million; and the New World Mine, \$65 million; and to provide an additional \$385 million for other acquisitions in 1999, 2000, and 2001. At least that is our reading here.

Do you agree with that reading?

Secretary BABBITT. Senator, that is essentially my reading. I would not want to be held to the pace of outlays, but as you describe the New World Mine, the headwaters, and the remaining balance essentially unencumbered beyond that, that is my understanding.

Senator GORTON. Now, that is a pretty dramatic increase. Can you efficiently manage that kind of increase, and are there enough—other than the two I named, are there enough quality acquisitions in the pipeline to justify it?

Secretary BABBITT. Senator, yes; the backlog of acquisition proposals is reflected each and every year in the budget process. And the answer is there are plenty of them.

Senator GORTON. Yes; there are plenty of them and yes you could manage them, both?

Secretary BABBITT. Yes.

Senator GORTON. OK. Why has the administration decided not to finance the headwaters acquisition with oil and gas properties as it originally proposed?

Secretary BABBITT. Well, Senator, in all honesty, it was in no small measure due to your letters to the Department reflecting some skepticism about that approach.

Senator GORTON. Well, I ought to quit while I am ahead. [Laughter.]

PARK SERVICE FUNDING

On that one at least. The Park Service, which is a favorite of mine and I suspect of yours, has been treated more generously than most of the rest of your budget last time and this time around. What factors, in your view, exist with respect to the Park Service that do not exist with respect to other agencies funded by this committee, causing it to get the lion's share of these increases?

Secretary BABBITT. Senator, it is real simple, it is called 5 million people a year at Grand Canyon, 4 million people a year at Yosemite, and 3 million people a year at Yellowstone. This land management agency is uniquely, as one of my fervent supporters over here suggested, an agency which deals with people. And that is where the money goes.

Senator GORTON. And what are your three or four top priorities for the Park Service?

Secretary BABBITT. I believe that the issues in the National Park Service are approximately in this order. First, managing the increase in visitation and doing it to separate cars from people, through innovative and thoughtful transportation and management plans. We have a big continuing problem of dealing—I will wander only for one sentence—we still have border problems of incompatible uses impinging on parks. The New World Mine is a good example. The bison issue which so excites Senator Burns and myself is in fact a border management problem that I believe we can resolve, but there are many, many of those.

We have an upstream water issue in Zion, which I think we now have control over. I would say repair and upgrading of infrastructure remains a problem. I believe, in all candor, that we can gradually whittle that away. I do not think there is a dramatic single-shot solution in sight, but we are making some progress. We will be back with some more thoughts. We have not explored all of the alternatives. But I would say those are the three issues.

PRESIDIO

Senator GORTON. Last month I spent something more than half a day at the Presidio just before the members of the trust were appointed. The Park Service is working on a plan under which the trust will end up managing as much as 80 percent of the property. You have referred to the trust activities, and I believe I am quoting you accurately, "as managing a city within a city." I think that gets to the heart of the challenge or the problem that we have here.

It is an absolutely magnificent place obviously, but it is hard for me to shake the belief that it is still primarily a city asset and a city or a regional park. The GAO has said that the expenditures that have been made so far are consistent with the management plan. They gave us as good and as favorable a report as possible. We are still talking about \$25 million for the course of the next year.

So tell me if you can, how soon you expect the Board of Directors of the Presidio Trust to be fully operational, making the basic management decisions about the future of the site? How long should it take the Presidio to generate sufficient revenues to finance its own operations? And what kind of decline in Federal monetary responsibilities do you see as we look forward to, say, the next 5 years or so?

Secretary BABBITT. A couple of thoughts. The Directors, as you know, have been appointed. I am enormously gratified at the quality of the selections that were made. I think we have a real chance at some superb management. There is one—there are actually two issues that that board faces, and I believe that the ramp-down and the success of the basic assumptions are going to depend on.

The board is going to have to make a difficult and important decision about how many of those buildings should be decommissioned and taken down. There is an enormous overhang of maintenance and infrastructure there. Unless a realistic decision is made about what can be utilized at a rational cost with the expectation of self-sufficiency, we are going to have a big problem.

Now, what I am saying in plain words is we cannot treat every structure on that magnificent landscape as a candidate for historic preservation. It is going to be a difficult and sensitive issue, but that is, to me, the key initial decision.

Once we have a realistic grip on what improvements are essential and should be saved, then it becomes a matter of streaming them into something resembling a commercial, historically protected real estate market. I think those are the issues.

Senator GORTON. You cannot give me any estimate, then, as to how long those questions will require not only to make but to implement?

Secretary BABBITT. Well, I think the important front-end decision for this board as it gets under way is to get out a map, do a careful inventory of these buildings, and make the cut on what it is that can be realistically preserved, rehabed, and maintained, with the expectation of self-sufficiency, and those that cannot.

Now, how long will that take? I am not a professional real estate manager, but I can certainly identify that for you as the core question.

Senator GORTON. It is. There actually have already been some successes there. And there are obviously some other buildings that can probably be rehabilitated in a relatively short period of time and make a profit. I am concerned, and I express through you the concern, that the Presidio not end up being a cash cow for social problems in San Francisco. The willingness of this committee, and I think of the Congress as a whole, to provide a very significant level of funding for an extended period is, it seems to me, going to depend very largely on whether or not we are left with the impression that it really is a park, that it is a public facility, open for and useful for people, not just in the immediate area, but all across the United States.

That is simply a comment. If you wish to comment on it, you may.

Secretary BABBITT. Senator, rather than wading straight into that, I would ask you to take judicial notice of the statements of Congresswoman Pelosi and Deputy Secretary Garimendi. They have both been there. They are both creatures of the bay area, and they have been pretty forthright in their responses.

Senator GORTON. I know they have. And I find that quite encouraging.

C&O CANAL

Now, tell me what the status is of the restoration of the Chesapeake & Ohio Canal National Historic Park.

Secretary BABBITT. I think it is a wonderful success story. It is not entirely done, but most of it is, as you can see if you go out for a morning trip along the towpath. The boats are back on the canal in Georgetown. The locks have been restored sufficiently to rewater the portion of the canal at Great Falls, and the boats are back on the canal. The remaining work now, I think, is focussed mostly on some of the outlying canal structures and the historic buildings, not just here but all the way up to Harper's Ferry. The towpath is back in operation. That is the most frequent question I get.

Senator GORTON. How much longer and how much money for full restoration?

Secretary BABBITT. I believe that the vast majority of the restoration will be done across this summer season. I do not anticipate any more requests for funds.

CENTRAL UTAH PROJECT

Senator GORTON. Thank you. Now, the rest of my questions I will submit in writing as well. I do have the questions that are most interesting and absolutely vital to Senator Bennett, so I am going to read these questions to you. But the "I" of the first person will be those of Senator Bennett rather than myself.

I want to discuss with you some serious implications for the central Utah project and other upper basin water projects being created by a preliminary draft biological opinion for the Duchesne River. This preliminary draft issued by the Fish and Wildlife Service proposes, in short, to ignore and undermine the Upper Colorado River basin recovery implementation plan for the razorback sucker.

As you know, the recovery implementation plan [RIP] was developed in March 1988, between the Department of the Interior and the States of Utah, Wyoming and Colorado, to quote, "provide the reasonable and prudent alternatives for projects undergoing section 7 consultation in the upper basin," to meet the needs of the Endangered Species Act. To date, some \$55 million of Federal and State moneys have been spent on various RIP programs to recover the Colorado River endangered fishes.

In fact, Mr. Secretary, your fiscal year 1998 budget request includes roughly \$8 million for the RIP. The Fish and Wildlife Service has been involved in a section 7 consultation to determine the impact of the Spanish Fork Canyon to the NEPHI water pipeline feature of CUP on the razorback sucker habitat in the lower 2½ miles of the Duchesne River. The preliminary draft biological opinion, released on March 14, 1997, abandons the RIP.

It says, and I quote: "The Service has determined that, as of this date, the recovery program has not made sufficient progress toward recovery of the fishes to serve as the reasonable and prudent alternatives to avoid jeopardy."

Mr. Secretary, I hope this draft statement does not represent the current position of the Department concerning the efficacy of the RIP. If it does, I am afraid of the reaction that you will get from the upper basin States, who have worked hard for almost 10 years to recover the fish, under the assumption that the recovery program provides an umbrella of protection under the Endangered Species Act for the upper basin water projects, like CUP.

Is the RIP, in your view, a viable program, which is making sufficient progress to continue to serve as the reasonable and prudent alternative for the upper basin water projects?

Secretary BABBITT. Senator, two thoughts. I do not think that we are on a collision course over these consultation issues in CUP. But I understand your concerns. What I will do is write you a letter, and see if I can outline these issues. But, again, I am pretty confident that we can get this worked out and that, the technicalities aside, there is not an underlying problem here which is going to materially impact the CUP construction schedule.

Senator GORTON. The RIP recovery action plan, RIPRAP, has concentrated resources and prioritized funds to accomplish recovery of the species principally in the Green and Colorado Rivers. The RIP agreement of 1993 specifically says: "Sufficient progress will be evaluated separately for the Colorado and Green Rivers subbasins, but not individual tributaries within each subbasin."

The March preliminary draft opinion, however, is in fundamental contradiction with this provision of the RIP agreement, and proposes monthly flow recommendations for the Duchesne River, a tributary of the Green River. These flow recommendations are based, admittedly, upon little or no historical biological data. Furthermore, the razorback sucker habitat on the lower Duchesne River is controlled, in essence, by the elevation of the Green River. Taking water from the CUP and other upstream projects will have little or not impact upon the depth and velocity of the water in the lower Duchesne habitat.

It appears to us, Mr. Secretary, that the goal of this preliminary draft opinion is to take water from CUP and other water projects

in the name of trying to reestablish fish habitat in the lower reach, the small tributary of the Green River. This approach is inconsistent with the RIP and should be withdrawn in favor of an approach which is in harmony with the RIP program. The RIP must continue to serve as the reasonable and prudent alternative for the upper basin projects, like CUP or the upper basin States will abandon the RIP process.

Will you personally acquaint yourself with respect to this preliminary draft biological opinion for the Duchesne River to ensure that the RIP continues to function as a viable program to recover the endangered fish in the upper basin, which can be supported by the State of Utah?

Secretary BABBITT. Senator, I would be happy to do that. I will look into this. Because I genuinely do not think that there is any threat or intent or even any possibility that the water supply of CUP would be impacted. But I understand your concerns. And I will get onto this and get back to you.

[The information follows:]

ADDITIONAL COMMITTEE QUESTIONS

Senator GORTON. There will be some additional questions which will be submitted for your response in the record.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing.]

ADDITIONAL COMMITTEE QUESTIONS

INTERAGENCY ISSUES

Headwaters and new world mine

The Department has been engaged in complex negotiations with Maxxam, Inc. to determine assets that can be exchanged for a portion of the Headwaters Forest. The cost of this deal is upwards of \$250 million.

Question. What is the current status of the negotiations?

Answer. The negotiations referenced above regarding "assets that can be exchanged" ceased with the adoption of the Bipartisan Balanced Budget Agreement (BBA), which calls for \$700 million in additional funding for Federal land acquisitions and exchanges. Up to \$315 million of that amount would be available to finalize priority Federal exchange proposals. Negotiators understood that those exchanges included up to \$250 million for the Headwaters Forest exchange in California and up to \$65 million for the New World Mine exchange outside Yellowstone National Park in Montana.

This Administration is involved in acquiring, exchanging, or withdrawing non-Federal lands in several major deals, including the Headwaters Forest, the Grand Staircase-Escalante National Monument, and the New World Mine. As mentioned, one of the land deals the Administration is working on is the proposed Headwaters Forest exchange in California. The particulars of the proposed deal have been somewhat fluid in the eight months since an agreement was signed between the United States, the State of California, and Maxxam, Inc., the owner of the private forest lands the Department wants to protect.

In early April, this Committee received a letter from Bonnie Cohen, the Assistant Secretary—Policy, Management and Budget. The letter proposed reprogramming \$1.2 million from the Bureau of Land Management (BLM) budget for work on the proposed land exchange. The letter identified the following tasks that would be initiated with the requested funds: (1) appraisal of the privately-held forest properties that the Federal Government wishes to acquire; (2) appraisal of 24 oil and gas leases on public lands in California identified as Federal assets for the deal; (3) establishment of an auction process for the leases; and (4) amendment of the BLM Resources and Management Plan to change the oil and gas mineral estate from retention status to disposal status.

Together Senator Byrd and I decided not to raise an objection to the reprogramming request. We both appreciate the value of protecting old growth timber lands where a deal can be made. However, my approval of the request was not without some concerns, as you know from the letter I sent to you on April 24th. And I know that Chairman Murkowski of the Energy and Natural Resources Committee, another Committee of which I am a member, wrote to you of his concerns. I believe, also, that the House Appropriations Committee also has written to you about their concerns.

Question. Will these tasks be completed with the funds requested? If not, how much more will be necessary from the Federal Government to complete the appraisals and other preliminary work?

Answer. Plans for exchanging subsurface estate and other assets for the Headwaters Forest have been rendered moot under the land exchange negotiations associated with the Balanced Budget Agreement. While the Department appreciates the reprogramming latitude provided by the House and Senate Subcommittees, we cannot now foresee the need to conduct any further activities identified in the April 1997 reprogramming letter.

The majority of the assets identified for exchange are active oil and gas properties in California. I understand the Administration will exchange these properties under the authority of the Federal Lands Policy and Management Act (FIPMA), and that the properties will then be auctioned and the proceeds will be used to compensate Maxxam.

Question. Is this essentially correct?

Answer. Again, plans for exchanging subsurface estate and other assets for the Headwaters Forest have been rendered moot under the land exchange negotiations associated with the BBA. As a priority land exchange, the Headwaters Forest will be acquired from Maxxam for up to \$250 million appropriated from the Land and Water Conservation Fund.

The sale of these oil and gas properties will reduce Federal receipts by about \$100 million.

Question. Does the Administration's budget reflect a reduction in mineral receipts in fiscal year 1998 and beyond as a result of the Headwaters deal? If not, why not?

Answer. The budget reflects no reduction in mineral receipts as a result of the Headwaters land exchange. The fiscal year 1998 budget was prepared before the terms of the exchange had been finalized. The final exchange, as described above, will not reduce mineral receipts since, pursuant to the BBA, funding will be provided from the Land and Water Conservation Fund.

The Administration is pursuing similar negotiations to acquire the New World Mine site near Yellowstone National Park. In this instance, the Administration is proposing to exchange the revenue stream from active oil and gas leases for the property to be acquired. This will require legislation, and as such will trigger the PAYGO provisions of the Budget Act. The Administration's proposed offset for this exchange—an adjustment in the Conservation Reserve Program—has met with fierce opposition.

Question. Why is the Administration using the oil and gas revenue stream in this instance—which requires legislative action—and the oil and gas estate in the Headwaters acquisition—which can apparently be done administratively?

Answer. Under terms of the BBA, neither the revenue stream nor the oil and gas estate will be exchanged by the Federal Government for the New World Mine or Headwaters properties.

Question. Though the magnitude of the two deals are different, is there any appreciable difference between the two deals in terms of the effect on mineral receipts to the U.S. Treasury?

Answer. As mentioned above, under the terms of the BBA, neither the revenue stream nor the oil and gas estate will be exchanged by the Federal Government for the New World Mine or Headwaters properties.

This Committee has been informed that the Administration is relying on authority granted it by FIPMA to execute the Headwaters exchange. The oil and gas properties being used in the exchange are being treated as public lands under FIPMA.

Question. Is the use of producing oil and gas properties for exchanges a well established practice under FIPMA?

Answer. The use of properties for exchange that have been valued under a competitive auction process that establishes a fair market value return to the Government is a well established procedure under FIPMA, the General Exchange Act of 1922, and the Weeks Act.

Question. Are you aware of any previous exchanges of this nature? Of the magnitude of the Headwaters exchange? Can you provide some examples for the record?

Answer. The Department can document numerous exchanges that required asset value appraisal to determine fair market return; none equal the funding magnitude of the Headwaters exchange.

Question. If this has not been common practice, has the Administration produced a legal opinion supporting the use of FIPMA in this manner? If so, please submit for the record.

Answer. Because the use of FIPMA for the Headwaters Exchange has not been under active consideration for several months, a legal opinion on the subject was never signed.

Materials provided by the Department indicate that nearly \$1 billion in annual revenues accrue to the Treasury from Federal onshore oil and gas leases.

Question. Does this Administration plan on using these receipts as a sort of piggy bank from which to draw when it feels a particular property is worth acquiring?

Answer. The Administration never proposed using oil and gas receipts to acquire the property. Rather, initially it proposed exchanging the sub-surface estate at the oil and gas sites for Headwaters—a land for land exchange. The question implies that the Administration planned to draw money from some receipt-based account (i.e., piggy bank) for the acquisition; that was not the case at all.

Question. In theory, couldn't all of these receipts be used for acquisitions like Headwaters without there being any effect on Federal revenues, and therefore any impact on the budget deficit? Does this seem proper to you?

Answer. As stated earlier, no receipts were being used to acquire Headwaters. Prior to the BBA, the acquisition was being established as a land exchange.

Question. Would you support changes to FPLMA that would limit what is in effect the administrative use of a concrete, estimable revenue stream in a manner that requires no budgetary offset?

Answer. The Administration would not support such changes to FIPMA. The exchange contemplated for the Headwaters Forest (and now made moot by use of LWCF funds under the BBA) was only possible because PAYGO neutrality was maintained.

I understand that as part of the Headwaters deal, the Administration has promised to “make whole” the State of California for the share of revenues it will lose from the Federal oil and gas properties to be traded. This could amount to \$100 million.

Question. Does the Administration have any idea how it will fulfill this promise? Do you have any expectation that the Administration will call upon the Appropriations Committee for this purpose?

Answer. Use of up to \$250 million in funds appropriated from the Land and Water Conservation Fund will satisfy the Federal Government's commitment in the Headwaters land exchange; therefore, there will be no need to compensate the State of California since it will not lose revenues.

UNCONTROLLABLE COSTS

It appears that the fiscal year 1998 budgets for different bureaus within the Department are treated differently with respect to uncontrollable costs.

Question. Do the requests for some bureaus include funding for uncontrollable costs while others do not? How does the Department make these determinations? Please provide for the record a table that shows how much of each bureaus' uncontrollable costs are to be funded through increases and how much are to be absorbed.

Answer. In an optimum budget with unlimited resources, each of the bureaus would be requesting increases for uncontrollable costs. While the Department began the formulation process for fiscal year 1998 with that goal in mind, the realities of balancing the budget forced difficult choices about the priorities for program increases and overall funding levels for individual bureaus. As a result, while most bureaus were able to cover uncontrollable costs with funding increase requests, a few (e.g., U.S. Geological Survey, Departmental Management, and Solicitor) were not. The Department's instruction to all bureaus was that “uncontrollable cost changes will be shown and described” in the Justifications.

UNCONTROLLABLE COSTS

[In thousands of dollars]

Bureau	Uncontrollables		Total
	Absorbed or offset by projected savings	Funded in request	
Land Management		14,500	14,500
Minerals Management	2,574	967	3,541
Surface Mining	229	1,169	1,398
Geological Survey	16,048		16,048
Fish and Wildlife	1,191	10,623	11,814
Park Service		22,617	22,617
Indian Affairs	417	18,805	19,222
Departmental Management	1,296		1,296
Insular affairs		87	87
Solicitor	894		894
Inspector General	582	61	643
Special Trustee		499	499
Total Department	23,231	69,328	92,559

Question. Also, please provide for the record a table summarizing the degree to which bureaus' uncontrollable cost increases have been funded or absorbed in fiscal years 1995, 1996, 1997, and 1998.

Answer. The Department does not maintain records showing uncontrollable cost history. The following table has been assembled based on bureau records, the Justification documents, and other analyses on file in the Department's Office of Budget. Note that unlike the previous table, the following one is adjusted to reflect the 1.51 percent increase in CSRS retirement charges, which is now assumed by the balanced budget agreement.

The first line under each bureau shows its estimate of the total amount required to offset that year's changes in uncontrollable costs such as pay, retirement costs, rent, unemployment and workers compensation payments. A negative amount in this line indicates base funding for uncontrollable costs went down.

The second line shows the amount of uncontrollable cost changes absorbed. By "absorbed" we mean that the funds needed to offset the increased costs were: (1) not requested; (2) requested, but paid for out of proposed programmatic reductions or projected efficiency gains in the base program; or (3) requested but not appropriated. For each bureau, if the amount shown on the second line equals the requirement (the amount shown on the first line), then the full amount of uncontrollable costs are absorbed. If it is less, then the uncontrollable costs were partially absorbed for that year. In a few cases, the amount in the second line is greater than the amount required to pay for that year's uncontrollable costs changes, indicating that not only were all new uncontrollable costs absorbed, but the base for paying for uncontrollable costs was also reduced.

FUNDS REQUIRED TO OFFSET UNCONTROLLABLE COST CHANGES AND AMOUNTS
ABSORBED

[In thousands of dollars]

Bureau	1995	1996	1997	1998
Land Management:				
Total requirement	1,124	10,861	5,330	18,049
Amount absorbed	1,124	978	569	3,549
Minerals Management:				
Total requirement	1,822	3,385	3,000	4,456
Amount absorbed	869	3,385	3,000	3,489
Surface Mining:				
Total requirement	526	1,900	1,807	1,804

FUNDS REQUIRED TO OFFSET UNCONTROLLABLE COST CHANGES AND AMOUNTS
ABSORBED—Continued

[In thousands of dollars]

Bureau	1995	1996	1997	1998
Amount absorbed	120	1,900	808	635
Geological Survey:				
Total requirement	12,513	11,722	11,292	20,420
Amount absorbed	5,470	11,515	11,292	20,420
Fish and Wildlife:				
Total requirement	14,706	14,410	12,300	13,907
Amount absorbed	15,587	16,180	12,400	3,284
Park Service:

Department total:				
Total requirement	43,020	108,944	79,076	111,637
Amount absorbed	51,044	82,570	69,566	42,309

Note: Fiscal year 1998 based on the President's Budget request and adjusted for increase in CSRS employer charges. Fiscal year 1995 through fiscal year 1997 are based on the combination of decisions in the President's Budget request and the subsequent appropriations action.

ECOREGION ASSESSMENTS

The Department has been working with the Forest Service on a number of broad, "Ecoregion Assessments," one of which covers the Columbia Basin region. I was recently briefed on the draft Environmental Impact Statement (EIS) for the Columbia Basin assessment, which has been several years and some \$30 million in the making. I understand that the measures outlined in the EIS will cost \$125 million more than current budgets.

Question. What benefits will the American people receive from the \$30 million invested in the Columbia Basin EIS? For other ecoregion assessments in the works?

Answer. For the first time ever, the American people have a comprehensive look at the people and places within the Interior Columbia Basin, and ways to deal with the challenges the people of the region face. For local land managers, this effort will provide them a scientifically sound framework to make local decisions that will improve the health of public lands both locally and regionally.

Consolidating efforts reduces duplication of efforts and provides a catalyst for comprehensive, more defensible assessments, EISs, and decisions by land managers. As a result, a better product is attained for a reduced cost than what could occur using an administrative unit by unit approach.

Thus far the effort has produced:

- A wealth of information found in the scientific assessment that characterizes social, economic and ecological conditions, trends, risks, and opportunities throughout the Interior Columbia River Basin, an area over 145 million acres.
- Over 170 data layers and 20 data bases available to land managers and the public; they will assist in future planning and implementation.
- Strengthened relationships between States, tribal, and county governments.

Finally, this effort should reduce the vulnerability to legal challenges. If the 45 administrative units within the Basin were to address, independent of each other, broad scale issues such as forest and rangeland health, salmon survival, Federal Government treaty responsibilities to Tribes, or impacts to local economies, inevitable inconsistencies would occur creating legal vulnerability.

People within the Columbia Basin who live and work on or near those lands covered by the EIS are concerned that the ecoregion planning process will result in a “one size fits all” approach to land management that will not reflect the particular needs of individual watersheds, forests, etc.

Question. How do you respond to this concern?

Answer. We have developed a consistent but not a one size fits all approach. The scientific assessment has shown us that a one size fits all approach will not lead to the restoration of public lands because of the variability across the Basin. However, consistent approaches on how we analyze problems and implement strategies to remedy these problems will.

The Draft EISs have a combination of process standards as well as prescriptive standards. Process standards provide the “how to” in going from the broad scale to an on-the-ground project. Prescriptive standards describe what should be done factoring in variations in vegetation and the lay of the land. Adjustments to prescriptive standards can and should be made when they are not meeting objectives due to local conditions. The mechanism to adjust standards to meet local conditions is part of the overall strategy.

Question. If the ecoregion planning process is truly flexible enough to accommodate local management requirements, what additional benefit do the assessments provide above that which would accrue from a more local planning process?

Answer. The scientific assessment provides local managers a wealth of information that is consistent across the basin but can be used in local planning processes. It would have been more difficult and expensive to collect and analyze this information on an administrative unit by unit basis. This information is important to local managers in developing cumulative effect analyses, important in their planning and decision processes.

The Draft EISs focuses on issues that are more efficiently and effectively addressed using a broad scale approach. They do not attempt to resolve issues that are more effectively addressed at the local level. The draft EISs provide the context for local managers to make decisions with a better understanding of the larger issues.

NATIONAL PETROLEUM RESERVE—ALASKA

The Department of the Interior recently announced that it is beginning to develop an “integrated activity plan” and EIS for about 4.6 million acres in the northeast corner of the National Petroleum Reserve-Alaska (NPR-A).

Question. Please tell the Committee what types of issues and matters will be studied in the “integrated activity plan.”

Answer. The Integrated Activity Plan (IAP)/EIS will address the full range of BLM management responsibilities in the planning area. Besides oil and gas development, BLM will look to update its management strategies for fish and wildlife, recreation, realty, hazardous materials, soil, water, air, and the protection of cultural and subsistence resources. The NPR-A is closed by law to mineral development other than oil and gas, so management of those resources will not be discussed.

Question. How long will this process take?

Answer. We plan to issue a Record of Decision for the IAP/EIS by August 1998.

Question. How much is it expected to cost?

Answer. Total cost of the project is projected to be \$8 million. This cost will be shared by BLM (\$4.6 million) and the Minerals Management Service (MMS) (\$3.4 million). The project is divided into two parts. The IAP/EIS portion of the project will cost \$4.4 million. The oil and gas evaluation and preparation for a potential lease sale will cost \$3.6 million. These costs include both labor and operational costs.

Question. From which agency budgets will the funds for this plan come?

Answer. Both MMS and BLM will fund components of this plan. Each agency will absorb personnel costs. All operational expenses, including travel, printing, and purchase of industry seismic data, will be borne by BLM.

Question. Does the budget request for fiscal year 1998 contain amounts for the work needed?

Answer. The costs for fiscal year 1998 will be funded from within the amount requested in the President's fiscal year 1998 Budget.

Committee staff have heard that, in order to do the work on the NPR-A, personnel from MMS would be brought over to help and that, potentially, some Outer Continental Shelf (OCS) lease sales in Alaska could be delayed. The delay of OCS lease sales costs the Federal Government and the State of Alaska—in the loss or delay of royalties. The NPR-A will be a long time in coming to fruition, so it is not an equal trade-off.

Question. Can you tell us more about exactly how the Department intends to do the NPR-A work?

Answer. The BLM has entered into a Cooperative Agreement with MMS to do part of the work for this IAP/EIS. Although BLM personnel are involved with all aspect of the IAP/EIS, MMS has primary responsibility for describing the affected environment, including the oil and gas resources, and for describing the environmental consequences. Their personnel have also been central to providing a reasonable, foreseeable development scenario for oil and gas development.

Question. Are OCS lease sales in Alaska being delayed? Is the State of Alaska comfortable with the delay?

Answer. Only Sale 173, Cook Inlet, will be delayed. This sale, originally scheduled for 1999, will be delayed until 2001 so that MMS efforts can be devoted to the resource and environmental evaluation of NPR-A. The State of Alaska is anxious for the NPR-A effort to proceed and has not voiced any objections about the delay of Sale 173.

Much of the reason there was little interest in previous NPR-A lease sales was due to the fact that industry was not comfortable with the lease terms available under regulations promulgated by BLM, including those addressing unitization or suspension of leases. Lease suspension and unitization are permitted on other Federal lands under the Mineral Leasing Act. However, the Department's Solicitor concluded in a 1981 opinion that the NPR-A leasing authority, because it was contained in the Interior Appropriations Act for fiscal year 1981, constituted new and independent leasing authority, and that the terms of the Mineral Leasing Act do not apply.

Question. What is the Department doing to ensure that if a lease sale is recommended at the end of the IAP/EIS process the lease terms and conditions are such that industry will be interested in leasing in NPR-A?

Answer. In 1982 and 1983, BLM held three oil and gas lease sales in NPR-A. The sales totaled approximately 1,350,000 acres and yielded the Government \$106.5 million in bids and rentals. In 1984, a fourth lease sale obtained no bids. Contributing to the lack of bids in that sale was the inherently poorer quality of the lease tracts offered for sale, heightened interest in oil and gas exploration in the Arctic National Wildlife Refuge (ANWR), and industry concerns about lease terms. Since the last lease sale, the Department has reexamined the applicable law. The Department believes it has the authority to issue new regulations to address unitization and clarify suspension, if necessary. We anticipate having necessary regulations in place prior to any leasing which may result from the IAP/EIS effort. By law, lease blocks can be up to 60,000 acres. We anticipate that the concerns regarding consolidation and the size of lease blocks will be addressed within the context of unitization regulations.

At the request of Senator Stevens last year, we were going to try to add an amendment to the fiscal year 1997 Interior bill to make certain terms of the Mineral Leasing Act applicable to the NPR-A. I understand that the Department supported this amendment, which provides for environmentally-responsible unitization of leases by the oil companies so that fewer wells have to be drilled.

Question. Is it still the Department's opinion that legislation is needed to allow unitization?

Answer. No. The Department plans to issue regulations addressing unitization.

Question. Will the Department support the addition of language in the fiscal year 1998 bill, if it is requested by members, that it supported last year to allow unitization in the NPR-A?

Answer. Legislation is unnecessary since the Department has the administrative authority to address unitization in regulations.

The Naval Petroleum Reserves Production Act of 1976 directed that several reports be prepared on the NPR-A, including one regarding the "development, produc-

tion, transportation, and distribution of petroleum resources” and another on the “value, best use, and appropriate designation of the lands” within the reserve.

Later, in the Department of the Interior Appropriations Act for fiscal year 1981, Congress appropriated \$107 million for, among other things, an EIS on competitive oil and gas leasing in the reserve.

Question. Can you tell the Committee what the IAP and EIS will accomplish that the previous studies, reports, and EIS did not?

Answer. As the Committee notes, there have been a number of studies of NPR-A. The current planning effort will make use of the data derived as part of these studies, as well as the results of more recent investigations. The IAP/EIS, however, will address issues and utilize knowledge and information which was not pertinent or available in the 1970s and early 1980s. Furthermore, there have been regulatory changes which make the 1983 EIS (which was done pursuant to the fiscal year 1981 Interior Appropriations Act) outdated. Since that EIS was drafted, the Federal Government has assumed a greater responsibility for management of subsistence resources, has promulgated a wetlands policy which affects development in the planning area, and has both de-listed the peregrine falcon and added the spectacled eider and Steller's eider to the list of threatened and endangered species. The new IAP/EIS will address management within the context of these new rules.

Oil development technology has evolved as well. The IAP/EIS will analyze impacts from development, taking into account new oil industry technology which in some instances may lessen those environmental consequences. At the same time, development on the North Slope has matured, and as a consequence we can produce an updated and more accurate picture of cumulative impacts of any further oil and gas development.

There has been considerable additional resource information about the North Slope gathered by the Federal Government, the State of Alaska, the Borough, and others. The IAP/EIS will take advantage of this better understanding of Arctic resources to reexamine our nearly 15 year old oil and gas leasing program and to put in place updated management for all the resources in the planning area.

We also need to update the 1983 EIS because it has some technical flaws (e.g., it lacks a “no action alternative”). These flaws, in addition to its dated nature because of changes in regulations and the on-the-ground situation, make it unlikely any leasing program based on the old EIS could successfully withstand a court challenge.

Question. Will different issues be addressed? If so, what are they? Will you provide the Committee a detailed description of the work to be performed, issues to be analyzed, and matters to be examined as part of the IAP/EIS process?

Answer. The IAP/EIS will follow the standard EIS process, including holding public meetings and soliciting written responses to help define issues and obtain comments on the draft plan, preparing descriptions of the potentially affected environment and the consequences of following a range of alternative future management strategies, responding to the public's concerns, and publishing a final decision.

The public outreach program includes repeated visits to the North Slope villages nearest the planning area, news releases, a series of newsletters, an internet web site, participation on radio call-in shows, and meetings with environmental, industry, Native, and State representatives. A symposium of leading scientists from agencies of the Federal, State, North Slope Borough Governments, universities, private groups, and firms has been held to assure that authors of the IAP/EIS will have the most up-to-date information about development and resources on the North Slope.

The North Slope Borough, State, and the Fish and Wildlife Service (FWS) are represented on a coordinating group to share their concerns with top BLM Alaska managers on the NPR-A effort. The BLM Alaska office has established cooperative agreements with the State and the North Slope Borough and has funded positions to work directly with the planning team. The State's NPR-A staff person has an office with BLM NPR-A staff members at the BLM State Office in Anchorage.

The public has helped identify issues to be addressed in the IAP/EIS. In addition to input concerning possible oil and gas development, wildlife values associated with the region around Teshekpuk Lake and recreation and wildlife values of the Colville River valley are of special concern. While North Slope residents have stated their interest in participating in any economic development in the area, they repeatedly expressed the importance of the availability and accessibility of subsistence resources, such as caribou, waterfowl, fur bearers, and marine mammals. Others are interested in protecting cultural and paleontological resources and adding unique areas, such as the Pik sand dunes, to the Special Areas.

SUPERFUND LIABILITY

The Federal Government is liable just like any other landlord under Superfund as an owner of property where a release of hazardous substances occurred.

Question. To what extent does Interior intend to have the Federal Government pay its fair share at these cleanup sites? How much will that be?

Answer. The Department, as a land owner under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) may be liable as a Potentially Responsible Party (PRP) for a portion of the cleanup costs on our property. This portion may not be recovered from other PRPs. Depending upon the viability of other PRPs, the Department's share may fluctuate above its fair share. Under this circumstance, the Department will always need some level of annual appropriation. This level will vary on an annual basis dependent upon agreements with regulators and with other PRPs and the work scheduled to be performed in that year. Because the Department as a Federal agency is not eligible for money from Superfund, demand for response and remedy always exceeds funds available by many times. Federal costs avoided or recovered on one Interior site often will have to pay for defunct or unidentified PRPs on another site.

The Central Hazardous Material Fund is budgeted at \$14 million for fiscal year 1998. This is roughly the amount spent on average for cleanup at a single site. It does not appear to be an adequate amount given the significant joint and severe liability facing the Federal Government at unpatented abandoned mine sites.

Question. How does the Department plan to fund its liability at these sites?

Answer. Abandoned Mine Lands (AML) on the public lands may contain both physical safety and environmental hazards. Existing data indicates that there are approximately 70,000 AML sites on public lands. The BLM field work has shown that about four percent of AML features are potential environmental hazards, ranging from lack of vegetation to water quality degradation. An AML site will become eligible for Central Hazardous Materials Fund (CHF) funding only after the applicable Interior bureau or the Environmental Protection Agency (EPA), whichever agency has the lead at such a site, has determined that a remedial investigation under CERCLA is called for. Examples of mining-related projects currently budgeted for in the CHF include Atlas Asbestos and Tar Creek. Other mining-related sites have been nominated for CHF funding but have not been considered for such funding due to a Congressional prohibition contained in the fiscal year 1997 budget prohibiting CHF funding of new sites.

Question. To what extent is the Department relying on cost recovery, use of 106 order authority, and abandoned mine fund moneys to satisfy response and natural resource damage costs under Superfund on public lands under Interior jurisdiction?

Answer. Within the context of CERCLA and its application and case law and the revolving fund intent of the Department's CHF, Interior pursues a policy of making polluters pay for the cost of their actions, wherever possible. It is the Department's policy to pursue cost recovery, cost contribution, or cost avoidance strategies with respect to other PRPs associated with the contamination of Departmental lands. Cost contribution involves the identification of specific liability for each PRP with a concomitant cost share. Cost contribution may be a more demanding and costly approach to addressing site liability because it requires the development and negotiation of an allocation among the parties, including Interior, early in the cleanup process, rather than simply suing the other PRPs after funds have been expended and requiring that they divide the liability among themselves vis-a-vis the Department. The Department of Justice has advised Interior that the cost contribution approach, rather than the cost recovery approach, may be required at a number of the Department's CHF projects. The other strategy utilized by the Department to control costs is cost avoidance by having PRPs actually fund and conduct cleanups with participation or/and oversight by the Department.

Interior will cautiously use delegated 106 authority under CERCLA, and only where warranted, to accomplish the cleanup of contaminated sites by bringing PRPs to the table to contribute to the cost of cleanup. Interior, along with other Federal agencies, has been working with Justice and EPA to develop a Memorandum of Understanding (MOU) which will provide guidance for Federal agencies' use of delegated CERCLA 106 order authority. The principles which have governed EPA's previous implementation of 106 authority are incorporated into the MOU. The MOU would provide for use of 106 authority subject to concurrence by EPA and Justice. The MOU has not yet been finalized.

For AML sites, Interior has an AML watershed initiative in which the Department is cooperating with Federal, State, and private partners to identify all sources of funds to clean up abandoned mine sites on public lands.

Question. Does the Department plan to have all Superfund liability at Interior sites covered by the private sector?

Answer. Within the context of CERCLA and its application and case law and the revolving fund intent of Interior's CHF, the Department pursues a policy of making polluters pay for the cost of their actions, wherever possible. It is the policy of the Department to pursue cost recovery, cost contribution, or cost avoidance actions against other PRPs associated with the contamination of Departmental lands. Cost contribution involves the identification of specific liability for each PRP with a concomitant cost share. As noted in our response to the previous question, cost contribution may be a more demanding and costly approach to addressing sites compared to cost recovery because it requires the development and negotiation of an allocation among the parties, including Interior, rather than simply suing the other PRPs after funds have been expended and requiring that they divide the liability among themselves. The Department of Justice has advised the Department that the cost contribution approach, rather than cost recovery, may be required at a number of the Department's CHF projects. The other strategy utilized by the Department to control costs is cost avoidance by having PRPs actually fund and conduct cleanups with participation or/and oversight by the Department.

Interior, as a land owner under CERCLA may have some potential liability as a PRP for a portion of the cleanup costs on our property. There also are situations where illegal dumpers cannot be found or where past contaminators are no longer financially viable or perhaps no longer in existence.

Where imminent hazard or substantial risk are present, the Department takes appropriate action, and then tries to find the parties that caused the pollution. Where more time is available, the Department will often find the responsible parties and get them to take action or to fund or contribute to the cleanup. Because the Department as a Federal agency is not eligible for money from Superfund, demand for response and remedy always exceeds funds available by many times. Federal costs avoided or recovered on one site often will have to pay for defunct or unidentified PRPs on another site.

Under Federal law, Interior must provide a Consolidated Statement of Financial Position by March 7, 1997 that sets out the Department's financial position in a manner consistent with applicable accounting and financial reporting principles, standards, and requirements.

Question. Will Interior be including potential Federal liability under Superfund for both response and natural resource damage costs in its Audited Financial Statement? If not, why not?

Answer. The standards covering the recognition and disclosure of environmental liabilities are effective for fiscal year 1997 financial reporting (due March 1998). The Department will comply with these standards. The Department's Financial Report for fiscal year 1996 includes disclosure of available environmental liability information, including Superfund sites. However this information is more limited than what will be presented in 1997 as procedures were not in place during 1996 to fully gather this data. The Department is currently addressing the data collection process to accurately and fully report this information in accordance with Federal accounting guidelines when the standards become effective in 1997.

Question. Since the Federal Government Superfund liability at many of these sites may be significant by virtue of having owned the lands on which the hazardous substances were released, to what extent is Interior's liability for Natural Resource Damages being accounted for in the Consolidated Financial Statement required by public law?

Answer. Environmental liabilities, including Superfund Liabilities, are to be recognized in the financial statements beginning in fiscal year 1997 when the existence of the liability is probable and the amount is reasonably measurable, provided that the Department is legally liable for the clean-up. The Department is currently evaluating all known sites to determine the extent to which these criteria are met and the range of the potential liability.

The vast majority of the Department's environmental clean-up responsibilities arise from non-Department and non-Federal uses of the lands, such as illegal dumping, landfills, mineral extraction operations and pipelines. In these cases, the Government's responsibility derives solely from the fact that it is the current owner of the land, and the Department is often not "legally liable." Wherever possible, the costs of clean-up will be recovered from responsible parties. In these cases, the standards require that the potential costs to be paid by the Department be discussed in the textual portions of the report (such as the footnotes) but not "recognized" (presented on the face of the balance sheet) as a liability.

The Department will recognize the potential liability for Superfund and other environmental cleanup costs in its fiscal year 1997 audited financial statements in ac-

cordance with standards promulgated by the Federal Accounting Standards Advisory Board. There is no current estimate of the dollar amount of this liability, pending completion of the Department-wide evaluation.

Question. What is your estimate of the Government's total amount of liability for remediation of hazardous substances on Federal lands overseen by Interior? What is Interior's estimate of its liability for Natural Resource Damages?

Answer. Environmental liabilities, including CERCLA liabilities, are to be recognized in the financial statements when both the existence and amount of the liability are probable and reasonably measurable. The Department is currently evaluating all known sites to determine the extent to which these criteria are met and the range of the potential liability.

The vast majority of the environmental clean-up responsibilities arise from non-Department and non-Federal uses of the lands, such as illegal dumping, landfills, mineral extraction operations, and pipelines. In these cases, the Government's responsibility derives solely from the fact that it is the current owner of the land. Wherever possible, the costs of clean-up will be recovered from responsible parties.

The Department will recognize the potential liability under CERCLA for other environmental clean-up costs in its fiscal year 1997 audited financial statements in accordance with standards recently promulgated by the Federal Accounting Standards Advisory Board. There is no current estimate of the dollar amount of this liability.

The Department of Energy produces a report called the Baseline Environmental Management Report that gives Congress important estimates on out-year costs and timetables for addressing hazardous material contaminations. As you probably know, clean-up costs are expected to run into the billions for the Department of Energy.

Question. Does Interior have any similar information available? When does the Department believe it will have completed its inventory of contaminated sites?

Answer. Both the Department and the General Accounting Office (GAO) are reviewing existing inventory data to ascertain the Department's status with regard to potential CERCLA liability. It is understood that GAO will be completing their evaluation of the fiscal year 1997 reporting sometime in fiscal year 1998. The Department has begun developing a financial accounting report of sites likely to result in liability to the Government based upon current information.

PRESCRIBED BURNING

In a recent speech you described your intention to increase the use of prescribed burning for fire suppression. At the same time, EPA and other Federal agencies are forcing grass growers in the Pacific Northwest to eliminate the burning of their fields, ostensibly to protect air quality.

Question. How do you reconcile these two positions?

Answer. Prescribed fire is used in wildlands for fundamentally different reasons than agricultural burning, specifically grass growers. Grass growers have alternative treatments available in the management of their lands. In the wildlands, fire is a natural ecological process for maintaining and sustaining healthy ecosystems. There are no long-term alternatives to burning that accomplish the necessary ecological outcomes. Further, unplanned wildfires will eventually occur, and without periodic treatments with fire, those unplanned wildfires can be catastrophic for forest and rangelands and pose significant threats to public safety. In some locations and conditions harvesting of forest products, grazing, and mechanical removal of fuels will reduce the risks of catastrophic fire, particularly, in areas with exceptionally high levels of fuel. However, the continual build-up of brush, needles, and young unmerchantable dense stands is the primary source of fuels that result in high fire danger and that cause ecological imbalance. The use of periodic, low intensity fire (either from planned ignitions or from natural ignitions) reduces the risk of catastrophic fire and maintains healthy forests and ranges. Ponderosa pine stands, aspen stands, and the excellent big game environments that are a mixture of brush, grass, and forest are examples of the result of the natural role of fire.

By contrast, agricultural burning such as that done by grass growers is conducted as part of an economic activity or industrial process and has alternatives. Agricultural burning is not conducted to maintain and sustain natural forest and range systems.

Nevertheless, burning in wildlands can produce high levels of smoke emissions that must be addressed in air quality programs. Since the wildland fuels will eventually burn anyway, smoke emissions are inevitable though not predictable as to exact time, place, and quantity. Use of planned ignitions can help reduce smoke emissions by setting the time and circumstances to take advantage of favorable atmospheric conditions and to avoid unfavorable conditions. Smoke management tech-

niques are routinely applied and many States have smoke management programs to mitigate the effects of wildland burning. The Department is participating in an EPA-lead effort to work with land managing agencies and State regulatory authorities to develop better procedures to ensure that the public policy objectives of using fire to maintain healthy ecosystems and improving air quality can both be achieved.

Some in the Forest Service have expressed the opinion that you are overselling the potential benefits and uses of prescribed fire, in large part because fuel loading in many parts of the country is too great to allow fire to be used safely without first conducting extensive thinning or salvage logging.

Question. Any comment on this assessment?

Answer. Fire is the only effective option in the long run to restore, maintain, and sustain healthy forests and rangelands. In some areas, especially near human developments and near unique natural resources, mechanical fuels removal may be the safest and most feasible initial treatment. In some cases, vegetation will have to be maintained by continued mechanical thinning; in others, prescribed fire can be used to maintain open stands and low fuel conditions that are first reestablished by mechanical treatments. Extensive stands of open ponderosa pine, mixed conifer, and other forests in which fires burned frequently under natural conditions have become too dense, and have been invaded by non-fire adapted and extremely flammable tree species. The fuel ladders created by these young trees have contributed to the increase in large, catastrophic wildfires in recent years. Other forests, such as the pinyon/juniper in the intermountain west, have also become more dense and have invaded areas that were once open grass/shrub lands or savanna of grass and scattered trees. Such stands would be candidates for mechanical thinning as an initial fuels treatment.

COUNTER TERRORISM

Department of the Interior agencies received emergency supplemental funding in fiscal year 1997 for counter terrorism activities.

Question. Please provide for the record a description of how the various bureaus have spent, or plan to spend, these funds.

Answer. In fiscal year 1997, the Congress appropriated emergency supplemental funding to FWS and the National Park Service (NPS) for operational and construction requirements to address counter terrorism and security concerns. The FWS received \$1.5 million and NPS received \$8.6 million for these activities.

The FWS is using \$1 million to purchase radios to upgrade the current law enforcement communication systems in order to comply with FCC standards and provide encryption capabilities resistant to unauthorized interceptions of transmissions. The remaining \$500,000 is being expended to purchase and upgrade law enforcement computer systems to prevent unauthorized intrusions into law enforcement databases.

The NPS has allocated their funding to four high profile park sites, including Mount Rushmore National Memorial, Jefferson National Expansion Memorial, Independence National Historical Park, and the Monument Core of the National Capital Region (Washington Monument, Jefferson and Lincoln Memorials, Vietnam Veterans Memorial, Lafayette Park, and the Ellipse), to implement security systems, acquire equipment, and hire staff to ensure that these likely targets of any terrorist activity are protected.

WELFARE INITIATIVE

The President recently announced an initiative to increase hiring from welfare rolls for Federal positions.

Question. How will this initiative impact the Department of the Interior?

Answer. The Department of the Interior completely supports the President's initiative to move Americans off the welfare rolls and onto the work rolls. But the President did not ask agencies to create work or provide anything different to employees hired under this initiative. And we do not intend to.

This initiative simply asks agencies to look at what positions they have available or anticipate having available that might possibly be filled with people who are coming off the welfare rolls—people who might have little or no skills. Given that directive, the Department of the Interior is turning to the welfare rolls as an additional recruitment source.

This effort may require that some jobs be restructured. In our Welfare-to-Work Plan we have identified positions such as clerk, laborer, maintenance worker, teachers aide, that are normally filled at lower grades which can easily be restructured, if necessary, to allow applicants with limited skills to qualify.

Since Veteran's preference and career transition regulations are still applicable, and since there were no special authorities or laws that would allow us to give any preference to welfare recipients, we view the welfare-to-work program as only a focused recruitment effort.

Question. How many positions does the Department expect to fill in this manner in fiscal year 1997? fiscal year 1998?

Answer. The Department has set goals for hiring 50 welfare recipients in fiscal year 1997 and 75 in fiscal year 1998. Given that the Department has approximately 70,000 employees and does a great deal of hiring of temporary employees, these are not significant numbers.

Any training or support services provided to these employees will also be available to any other employee who has a similar need. For example, our Employee Assistance Program currently provides referrals for employees who have concerns such as family issues and credit problems. In fact, we see this focus on employing welfare recipients and the types of services that they might need, as a way of enhancing our quality of work life programs for all employees, which is a current focus in the Department.

Question. Will this initiative have any impacts on program funding requirements?

Answer. We do not anticipate the welfare-to-work initiative to have any impact on program funding. We see this as a positive step in leading by example and creating a better work environment for everyone who works for the Department of the Interior.

BUREAU OF LAND MANAGEMENT

OIL AND GAS MANAGEMENT PROGRAM

The BLM proposes to reduce its Oil and Gas Management program by \$500,000 and 7 FTEs in fiscal year 1998. The program request for 1998 is \$52.47 million and 803 FTEs. The reductions are modest, but they illustrate a turning away from extractive uses on the public lands. The reductions will result in the stoppage of low priority lease application processing in Alaska, Arizona, and Idaho.

Question. Given all of the proposed increases in BLM programs, how do you justify these reductions in the oil and gas program?

Answer. The reductions are based on sound business practices, i.e., we will continue to act on applications that provide the most promise of resulting in oil and gas production. Streamlining program activities will also save money and thus there will be no overall diminution of the oil and gas program.

Even though these may be low priority lease applications, they still offer the hope of new discoveries that the Nation needs.

Question. How does the reduction of oil and gas leasing opportunities on public lands help the Nation's growing dependence on imported oil?

Answer. We believe that leasing opportunities on public lands will not be reduced. The number of applications received for lands in Alaska, Arizona, and Idaho is extremely small. In some years we receive none. These applications are expensive to process. By focusing on areas of higher potential the public is well served.

I know that the Interstate Oil and Gas Compact Commission (IOGCC) is negotiating with the oil producing States concerning transfer of certain oil and gas lease management functions to the States.

Question. When do you expect to bring this effort to closure? Will the Department require legislation to implement elements of any such transfer? If so, when do you expect to transmit such legislation to the Congress? Do you expect savings as a result of this transfer?

Answer. At a May 2, 1997, meeting with the IOGCC there was agreement reached to form a steering committee made up of BLM and State representatives which would work to reduce or eliminate duplication, streamline processes, create efficiency, reduce regulatory burdens on operators, and reduce the cost to the taxpayer. At the same meeting, it was agreed that within 90 days (by August 2, 1997) any State wishing to request a delegation would submit a complete proposal or letter declining to participate. States would still be able to request delegations under the provisions of the Federal Oil and Gas Royalty Management Act (FOGRMA) of 1982.

WILD AND SCENIC RIVERS

The House Report accompanying the Fiscal Year 1995 Interior and Related Agencies Appropriations Act directed BLM and the Forest Service to prepare a report on funding for activities associated with wild and scenic rivers.

Question. Was this report ever completed? If so, please transmit a copy of the original report and any updates to the Committee. If it was not completed, why not?

Answer. House Report 103-551 accompanying the 1995 Department of the Interior and Related Agencies Appropriation Act directed BLM to report on: 1) the amount of money spent on Wild and Scenic River (WSR) studies and management plans in fiscal year 1994 and projected to be spent in fiscal year 1995; 2) the status of studies and management plans required by statute and the extent to which statutory obligations under the WSR Act could not be met by existing and planned funding; and 3) the amount of funding necessary for fiscal year 1996 to complete WSR studies and management plans on time.

The following report was completed in 1995.

The BLM WSR program includes implementation of 33 management plans covering 2,022 miles of BLM administered rivers in the National WSR System. The BLM started monitoring specific WSR program expenditures in fiscal year 1995. As of January 30, 1995, BLM has spent \$419,000 on the WSR program, which extrapolates to approximately \$1.3 million for the entire fiscal year. Based on the consistency of the BLM WSR program, funding levels for fiscal year 1994 and fiscal year 1996 are assumed and projected to be approximately the same as those projected for fiscal year 1995.

Section 5(d) of the WSR Act requires that BLM evaluate potentially eligible river segments in conjunction with land use planning, but the WSR Act does not specify a deadline for completion of this work.

The BLM remains in compliance with the WSR Act and will continue to evaluate potential WSRs under its Resource Management Planning process. The fiscal year 1996 funding level for WSRs is consistent with BLM's proposed planning schedule.

The information in that report is still correct. In addition, BLM is currently implementing the management plans that cover all 34 of the BLM administered rivers in the National WSR System. During the completion of Resource Management Plans (RMP) and/or amendments to them, BLM conducts evaluations of rivers and then makes recommendations regarding their suitability for designation as a WSR. The WSR Act does not specify a deadline for such evaluations.

In fiscal year 1995 and 1996, BLM expended \$1.9 million and \$0.9 million respectively, in administering the WSR Program. Expenditures for fiscal year 1997 are projected to be approximately \$1 million.

SALE OF THE ALASKA POWER ADMINISTRATION (APA)

The 1995 Alaska Power Administration Asset Sale and Termination Act directs the Secretary of Energy to sell all APA assets, including two hydroelectric projects and related transmission facilities. The Act also requires other Federal agencies to assist in the sales and conveyances. I understand BLM and the Forest Service are directly involved in the land issues surrounding these sales.

Question. Are sufficient funds requested in the President's fiscal year 1998 budget to complete all remaining tasks with respect to these sales?

Answer. Yes, there are sufficient funds in the President's fiscal year 1998 Budget for BLM to complete its work related to these sales. These sales are scheduled to be completed in fiscal year 1998.

HELIUM

With passage of the Helium Privatization Act, BLM should be able to reduce its number of FTEs by 23 positions in fiscal year 1998. However, BLM absorbs these FTEs and puts them into traditional programs. Congress passed the Helium Privatization Act in part to reduce the size of government.

Question. Does the Department anticipate any savings, as Congress had intended?

Answer. The President's Budget shows a direct savings of 23 FTEs and \$7 million in the cost to operate the helium program. From 1996 to the end of fiscal year 1998, there will be a reduction of in excess of 100 positions. During the phase-out period, large severance payment costs will be incurred in 1998, however, significant savings will be realized in future years as intended by the passage of the Helium Privatization Act.

GRAND STAIRCASE-ESCALANTE NATIONAL MONUMENT

The very first thing BLM highlights in its overview is a justification for requesting \$5 million of new budget authority to be used in the creation of the Grand Staircase-Escalante National Monument. This is added to the \$1.6 million that BLM was already spending in this area. The creation of a national Monument is tantamount to the creation of a national park. It will draw a lot of visitors and it will continue to consume significant budget resources.

Question. How are you going to keep this Monument from consuming ever-increasing amounts of the BLM budget?

Answer. The BLM will handle proposed allocations for the Monument through the agency's normal budget process. By following customary budget procedures, BLM will consider funding for the Monument in the context of other resource management priorities. The Monument is a high priority for BLM. However, the agency recognizes that it must seek a balance in meeting the needs of the Monument as part of the BLM's overall mission and responsibilities.

Question. What activities will have to be forgone in order to support the Monument, not only this year but in years to come?

Answer. The BLM has requested an increase of \$5 million in the 1998 President's Budget. Once the 1998 funding levels for the Monument are established, future funding allocations for the Monument will occur through the normal budget process. The budget process serves to evaluate BLM's priorities and needs, as well as to present workload units to be accomplished to support those funding priorities and needs. As work is accomplished, or as priorities change, the budget request is modified to reflect the changes.

When the Congress creates a national park, it does so with a recognition that it comes with long-term financial responsibilities.

Question. How will the Department and BLM find ways to support the Monument without sacrificing the agency's multiple use responsibilities?

Answer. The Monument encompasses public lands that were previously managed by BLM for multiple uses, and many of these same uses will continue within the Monument. Thus, the President's designation complements the BLM multiple-use mandate regarding activities such as livestock grazing and basic visitor services. Through the budget process, BLM has identified some Monument area activities for additional funding, including recreation and interpretation. These activities have been underfunded in the past, and BLM would have recommended increases regardless of the Monument's designation. Interior and BLM identify new funding needs through the normal budget process, which considers the long-term needs of the entire Department.

Question. How much of the \$5 million of new request will go to local communities?

Answer. In 1997, through a cooperative agreement BLM has agreed to provide up to \$200,000 to Kane County to facilitate its participation in the Monument planning process. Although Garfield County initially refused any planning assistance, they have just agreed to enter into their own cooperative agreement with BLM that would provide \$50,000 to facilitate participation in the planning for the final months of fiscal year 1997. In addition, BLM previously agreed to extend cooperative agreements to both counties during the 1997 field season for law enforcement, search and rescue, and trash removal costs associated with the Monument. Subject to Congressional appropriation, BLM is also exploring further cooperative funding options with Kane and Garfield Counties regarding law enforcement, search and rescue, trash removal and planning for fiscal year 1998. In addition, BLM plans to share various resources with Kane and Garfield counties, which will result in significant savings for the counties. These resources include communications facilities for law enforcement, road signs, and Geographic Information Systems (GIS) databases. The BLM estimates the value of these shared resources as follows: GIS (\$400,000); road signs (\$50,000); visitor information materials that address dangers associated with visiting the Monument (\$10,000); road maintenance (\$50,000); law enforcement (\$30,000); sanitation (\$60,000); and search and rescue access to communications towers and other equipment (\$100,000).

BLM LAW ENFORCEMENT

The BLM is requesting an additional \$2.054 million and 7 FTEs in its law enforcement program.

Question. How much of this additional funding did BLM intend to use in its effort to consolidate its various law enforcement regulations, as it had announced?

Answer. None of the additional funding is to be used to consolidate the various law enforcement regulations. The \$2.054 million in additional funding is intended to reinvigorate the BLM drug enforcement efforts within existing BLM law enforcement authority and is being done at the direction of the Office of National Drug Control Policy (ONDCP).

Question. How much was the consolidation going to cost?

Answer. The proposed consolidation of the BLM law enforcement regulations would have had no cost impact.

In response to criticism of the BLM plan to consolidate its law enforcement regulations, you announced on March 11 that BLM would shelve its plan to consolidate its various law enforcement regulations.

Question. Does BLM still need the entire additional \$2.054 million for law enforcement or can we use that money somewhere else?

Answer. Yes, BLM does need the additional \$2.054 million increase in the law enforcement budget to conduct an effective drug enforcement program to suppress marijuana cultivation and methamphetamine production activities that impact the public lands. The ONDCP has directed BLM to spend this additional funding in support of the national drug strategy to reduce all domestic drug production and availability on public land.

PAYMENTS IN LIEU OF TAXES

The BLM budget proposes a reduction of \$12 million in the Payment In Lieu of Taxes (PILT) program. The PILT program is the money the Federal Government pays to local governments to compensate those units of government for the loss of taxes that they would otherwise collect if the land were in private hands. The PILT payments were \$113.5 million in 1996, \$113.5 million in 1997, and are proposed at \$101.5 million in 1998.

Question. Why do you propose a reduction in payments to local units of government that cannot tax the Federal Government for its occupancy of lands within States at a time when the Administration seems to be re-doubling its efforts to acquire lands—the Headwaters Forest, Grand Staircase-Escalante National Monument, and Crown Butte mining land comes to mind?

Answer. The BLM budget request for PILT is the same as its proposal for 1997; Congress appropriated an additional \$12 million above the 1997 requested level.

Question. Do you think that local units of government are entitled to PILT payments?

Answer. The BLM supports and administers the PILT program that makes payments to units of local government that contain certain Federally owned lands within their boundaries (the Federal lands that qualify include not just BLM lands but lands in the National Park System, the National Forest System, National Wildlife Reserve Areas, plus a variety of other categories). The amount of payment is determined by several codified formulas and is designed to supplement other Federal land revenue sharing payments that county governments may be receiving.

Question. How do you explain to local governments that BLM needs the money to expand existing programs more than they need it for their local needs? What do you propose to use the money for rather than making PILT payments?

Answer. The BLM 1998 budget proposal for PILT is the same as its proposal for 1997. However, in 1997 Congress appropriated an additional \$12 million above the request level. The Administration's commitment to deficit reduction has made it impossible to seek budget increases for all programs.

Question. How does the Department intend to deal with the addition of land in the unorganized boroughs of Alaska, which accounts for 60 percent of Alaska?

Answer. For many years after enactment of the PILT program by Congress in 1976, BLM interpreted the law to mean that unorganized boroughs in Alaska, and organized cities within them, did not qualify for PILT payments. However, this interpretation did not take into account the organized cities with the borough which qualify separately under the PILT statute. In response to a request from the BLM Director in late 1993, the Solicitor's Office rendered an opinion in July 1994 that organized cities located within unorganized boroughs do qualify for PILT payments. Thereafter, BLM started including these organized cities in their PILT calculations.

In November 1996, Public Law 104-333 was enacted, which amended the PILT Act's definition of unit of general local government to include unorganized Alaska boroughs as eligible for PILT payments. In accordance with this recent amendment, BLM will add the census areas contained in the unorganized borough to the units of local government previously determined eligible for PILT payments.

Question. How much additional PILT money will Alaska be entitled to with this addition?

Answer. As we testified before the Senate Energy and Natural Resources Committee on June 11, 1996, we estimate that this will increase the total PILT payments to the State of Alaska by approximately \$1.5 to \$2.5 million, based upon current appropriated levels of \$113.5 million.

The unorganized borough of Alaska was added to the list of eligible local governments at the end of the last Congress—long before the Department put together its budget request for fiscal year 1998.

Question. Why doesn't the Department budget request reflect this additional need?

Answer. The Department's June 11, 1996, testimony clearly stated that we did not oppose adding the unorganized borough to the list of units of local governments eligible for PILT payments, but would not support expanding the scope of the PILT program in such a way as to lead to an increased need for annual appropriations at the expense of higher priorities.

The PILT payments are allocated according to a formula set by law, from a fixed pool of funds appropriated by Congress. This fixed pool means that, within the appropriated funds, an enlargement of eligible lands in one State will diminish the entitlements of other States and local governments.

Payments to each unit of general local government are based on the number of acres of Federal entitlement land within each unit of general local government. Federal entitlement land is defined to include, among others, lands within the National Forest and National Park systems, lands managed by BLM, and lands affected by Federal water resource development projects.

For payments under Section 6902 of the PILT Act (payments for Federal lands in the National Forest System and the National Park system, lands administered by BLM, lands in Federal water resource projects, dredge areas maintained by the Corps of Engineers, inactive and semi-active Army installations, and some lands donated to the Federal Government), the number of acres of Federal entitlement land is multiplied by one of two formulae, whichever one provides the largest amount of PILT payments for each unit of general local government. Payments under either alternative are subject to population payment ceilings for each unit of general government eligible to receive payments as the principal provider of government services under Section 6901(2)(A). The payment ceilings are based on a sliding scale, for last fiscal year they started at \$77.33 per capita for populations of 5,000 and under, and going to \$30.83 per capita for populations of 50,000. These figures were then adjusted upward for inflation.

The two formulae are:

- (1) Multiply the number of acres of Federal entitlement land within each qualified unit of general local government by \$1.16 (in fiscal year 1996). Compare this amount to the population ceiling amount, and use whichever is lower. Subtract from that total the amount of funds received by the unit of general local government in the prior fiscal year under the following Federal programs: the Department of Agriculture Appropriations Act of May 23, 1908; the Enabling Act of Arizona and New Mexico of June 20, 1910; the Mineral Lands Leasing Act of 1920; Section 17 of the Federal Power Act; the Taylor Grazing Act; the Bankhead-Jones Farm Tenant Act; the Superior National Forest State of Minnesota Act of June 22, 1948, as amended by the Act of June 22, 1956; Section 6 of the Mineral Leasing Act for Acquired Lands; Section 3 of the Material Disposal Act; and the Refuge Revenue Sharing Act; as amended. Finally, prorate the amount down to the appropriated amount of funds in the PILT pool.
- (2) Multiply the number of acres of Federal entitlement land by 16 cents. Compare this amount to the population ceiling amount. Use whichever is lower. Unlike the first formula, do not deduct for prior year payments. Finally, prorate the amount down to the appropriated amount of funds in the PILT pool.

Under the 1996 amendment, BLM will add the census areas contained in the unorganized borough to the list of units of general local government.

Typically, there is only one recipient of PILT moneys in an area, because in most situations the PILT entitlement is to units of general local government that are the principal providers of governmental services within the area (e.g., police and fire protection). Thus, a county would not receive PILT moneys, if a city or township within that county were the principal provider of government services in that area.

Only the Federal lands within the boundaries of the service area for that unit of general local government that is the principal provider of government services is considered in determining the PILT entitlement. In most instances, this results in counting most Federal lands that may be counted as entitlement lands under the statute, and in all instances it results in no double-counting of populations or lands. The exception to this rule has been Alaska's unorganized borough, where cities and townships to Section 6901(2)(A)(i), qualify under that subsection as units of general local government, but the boundaries of those cities do not encompass most of the Federal lands within the unorganized borough, and the unorganized borough does not qualify as unit of general local government under the statute because it does not meet the criteria for a unit of general local government, e.g., it is not mentioned as a unit of general local government that may qualify for payments under the statute, and it does not in fact provide any government services as required under the statute.

Senator Stevens' amendment does direct payments to be made to the State of Alaska for the unorganized borough, but it does not qualify the borough as a unit of general local government, and it does not disqualify organized cities within the borough as units of general local government. Thus, the organized cities within the unorganized borough remain eligible recipients under a separate provision of the PILT statute for a separate PILT payment based on entitlement lands within the boundaries of the area for which they are the principal providers of government services. And that is how BLM is administering PILT under the 1996 amendment—it does not pay the unorganized borough and organized cities within the boroughs for the same Federal acres.

Question. I understand that since the unorganized borough of Alaska was made eligible for PILT in the last days of the last Congress, BLM's regional solicitor in Alaska has either produced or found a previously-produced document that cuts against some of the work that Senator Stevens accomplished with the amendment to the PILT Act.

Answer. The Alaska Regional Solicitor's office did not find any previously produced document that cuts against the Stevens Amendment to the PILT Act. The history of that office's addressing this issue is recounted in the answer above.

The first opinion was provided to BLM by the Regional Solicitor on July 14, 1994. It stated that under the PILT law in effect at that time, the unorganized borough was not eligible for PILT payments, but organized cities within the unorganized borough which serve as the principle providers of governmental services that have PILT entitlement land within their jurisdiction do qualify for PILT payments. This opinion in fact maximized the number of eligible populations that could receive PILT moneys within unorganized boroughs under the PILT law as it existed prior to the enactment of Senator Stevens' amendment.

In light of the 1996 amendment to the PILT Act, BLM asked the Regional Solicitor to assess its effect. In response, the Solicitor's Office pointed out that, even with the 1996 amendment, the statute still provided that payments are to be made to cities which are units of general local government within the unorganized borough. The Solicitor's Office also pointed out that the 1996 amendment for the first time made lands in the unorganized borough eligible for PILT payments. Finally, the Solicitor's Office concluded that separate payments must be made for the qualifying cities based on their populations and entitlement lands within such cities, and for the unorganized borough based on the population and entitlement lands outside of qualifying cities.

This conclusion is consistent with how BLM administers the PILT program outside of Alaska, and is also consistent with what we discern to be Senator Stevens' purpose in introducing the amendment. Specifically, in proposing the amendment, Senator Stevens stated:

It is a matter of fairness—60 percent of the Federal lands in Alaska are not included under current PILT calculations. Alaska is the only State not fully compensated for all of its Federal lands. Even the territories and the District of Columbia are fully compensated. (141 Cong. Rec. S9517-02, *S9534).

This statement reflects the Senator's concern to include Federal lands in unorganized boroughs—and outside of organized cities—in current PILT calculations. It does not suggest that double-counting of Federal land within the boundaries of unorganized boroughs and also within the boundaries of organized cities was the intent of the amendment.

Question. My staff has been told by BLM staff that BLM, subsequent to working with Senator Stevens' staff on the amendment language, "found" information that suggests that small population centers within the unorganized borough were eligible for PILT payments without the amendment and should have been receiving payments.

Answer. While BLM did testify at the committee hearing on this bill, and did not oppose it, BLM did not work on the actual amendment language. The Departmental witness who testified on this amendment specifically noted that "[u]nder current law, Federal entitlement land in the unorganized borough located outside the boundaries of an organized city does not qualify for PILT payments." (Testimony of Gwen Mason, Senate Energy and Natural Resources Committee, June 11, 1996, emphasis added.) This clearly reflects that BLM was aware, and had informed Congress that organized cities fell within the already existing PILT entitlement for units of general local government.

Immediately upon receipt of the July 1994 opinion, BLM began gathering the necessary data to include the organized cities in the units of general local government eligible for PILT payments. Since payments are based on data from the previous year, the first year BLM was able to make those payments was 1996, based on 1995 data, and those payments were made.

Question. My staff has also been told by BLM that it is possible that BLM's position will be that a mistake was made for many years but that it will not make back payments for moneys not paid. At the same time, BLM will not allow the populations of these "pocket" communities within the unorganized borough to be counted in the total population of the unorganized borough that is now eligible for PILT.

Answer. As indicated in the previous answer, as soon as the Regional Solicitor advised BLM that the organized cities were eligible for PILT payments, BLM added them to the list, the data was gathered, and they were paid. The BLM did not attempt to gather data from previous years to make back payments. The BLM in good faith administered the law in one way until advised by the Solicitor's Office the law was otherwise, and there is no provision for back-payments to correct errors without express authority from Congress.

The question of whether BLM should double-count Federal acreage in organized cities within unorganized boroughs for purposes of PILT payments is a separate question. We believe the plain text of the 1996 amendment, as well as the intent of its sponsor, was not to authorize such double-counting, but instead was only to allow Federal land outside of organized cities in unorganized boroughs to be counted for the first time.

As you know, the PILT formula considers both acreage and population. In a State like Alaska, and particularly in sparsely populated regions like the unorganized borough, every body counts.

Question. Are you aware of this memorandum? What is your opinion or that of Solicitor Leshy?

Answer. Solicitor Leshy has reviewed both the 1994 and 1996 Regional Solicitor's Opinions and agrees with their conclusions.

Question. If BLM failed to make payments as required or authorized under the law, will it make back payments to these communities in Alaska? Why or why not?

Answer. Since there is no separate appropriation for back payments, the BLM is not able to make back payments.

The BLM has refused to release the regional solicitor's memorandum to my staff or Senator Stevens' office.

Question. When will you provide this opinion to the Committee for us to use as we consider the fiscal year 1998 budget for PILT?

Answer. The opinion has been provided.

RANGE MANAGEMENT

For fiscal year 1998, the BLM budget proposes a reduction of \$1.6 million dollars in range improvement activities. The 1996 authorization was \$9.1 million, the 1997 authorization is \$9.1 million, and the request for 1998 is \$7.5 million. The explanation for this reduction is an expected reduction in grazing receipts. According to the Public Rangelands Improvement Act (PRIA) of 1978, BLM should request the larger of \$10 million or 50 percent of the grazing fees collected.

Question. Given the requirements of PRIA, how can this reduction be justified, particularly in light of increases in other land management areas?

Answer. The BLM 1998 request was based on a technical interpretation of what is available for this appropriation, which provided for 50 percent of the receipts projected for fiscal year 1997 (half of \$14.8 million) as opposed to the \$10 million called for in PRIA.

Quoting directly from the budget summary, "The anticipated decreases in [range improvement activities] will have profound impacts on the BLM's ability to improve resource conditions on a landscape basis."

Question. Given this Administration's emphasis on environmental stewardship, how can you justify under-funding rangeland improvements? What do you say to the professional range management specialists in light of the fact that so many other land resource programs are proposed for increases?

Answer. Based on the technical interpretation that 50 percent of the receipts (grazing fees) from permittees and lessees that graze livestock on public lands is available for this appropriation it was not under-funded. Efforts will be made to maintain the 1997 level of noxious weed management which is of major concern to Federal, State, and local governments as well as private land owners. This will be accomplished by deferring other types of range improvement projects such as fences.

WILD HORSE AND BURRO PROGRAM

In recent months, Interior has been criticized for its Wild Horse and Burro program. There have been allegations of BLM negligence, even concealment, with respect to slaughter of wild horses from public rangelands in the West.

Question. What is your response to these allegations?

Answer. The BLM's policy is to maintain animals as a natural part of the range ecosystem. When necessary to protect both the health of the range and to maintain a thriving herd, BLM oversees gather operations to remove excess animals which are placed in our Adopt-a-Horse or -Burro Program. We treat all gathered equines humanely, assuring they receive veterinary care and are well fed and cared for prior to adoption. We also assign each animal a unique number—a freeze mark—which is useful in tracking that animal throughout its stay at a preparation center, its shipment to an adoption center, and its adoption to a private individual. This identifier is entered into a computer which can be queried by any BLM wild horse and burro office for tracking animals and answering questions posed by curious adopters.

The BLM is committed to doing all that it can to ensure that wild horses are placed in homes that will provide humane care. The BLM screens individuals to assure they understand the financial responsibility and need for proper facilities to care for an animal; such as corrals and shelters. Under recently enacted regulations, BLM will begin offering some adoptable horses on a competitive bidding basis. When not using competitive bidding, BLM will charge a uniform base fee of \$125 per animal. The competitive bidding process is expected to result in higher adoption fees for some animals, which will help defray expenses for the program. Higher adopter investment costs should also further diminish what minimal profiteering incentives may exist for adopting horses and sending them to slaughter after title.

Title may be received for no more than four animals in a year. The majority of adopters adopt only two animals. The adopted wild horse or burro remains the property of the Federal Government for one year. While the title to the animal is retained by the Federal Government, BLM regulations prohibit the sale of the animal, prohibit use as rodeo stock, and prohibit neglectful treatment of the animal. This one-year waiting period serves as a deterrent to people who want to immediately profit by selling their untitled animals. The cost of caring for an animal for a year runs an average of \$1,000 or higher, depending on the part of the country, making it economically impractical for people to profit after title is issued. Despite these safeguards, some wild horses that are titled and are no longer under Federal protection are sent to slaughterhouses. However, none of the animals cited in the articles were Federally protected.

The BLM often performs compliance checks prior to passage of title to an animal. Compliance checks are done on all complaints; random checks are performed on other adopters. Title is approved only after inspection by a veterinarian, humane officer, or other similarly qualified individual. About 150,000 wild horses and burros have been placed in private ownership since the program began. In 1996, BLM conducted almost 3,000 random checks and responded to over 200 horse neglect complaints which led to the repossession of 52 horses and the reassignment of 317 horses to other adopters.

Question. Is the Department investigating the allegations?

Answer. In 1993, the BLM began implementation of the Strategic Plan for the Management of Wild Horses and Burros on Public Lands. This plan established goals which address wild free-roaming horses and burros as important and perpetual components of the rangeland ecosystem. The plan also ensures humane care and protection for those animals removed from the range and placed into the adoption program. We continue to evaluate our performance. We have recently completed two such evaluations: The Wild Horse and Burro Program Emergency Evaluation Team, completed in January, 1997; and the Wild Horse and Burro Adoption Program Policy Analysis Team, completed in April, 1997. The recommendations from these two teams will result in improved herd management, healthier animals on the land, and increased protection for animals in the adoption program. In addition to these completed evaluations, we currently have several evaluations underway targeting improving our veterinary practices and monitoring of animal health on public lands. These evaluations are being conducted with the participation of representatives from the veterinary and scientific communities.

Because allegations that BLM employees may have been involved in deliberate profit-taking from the sale of wild horses for slaughter, Assistant Secretary for Land and Minerals Management, Bob Armstrong, ordered an immediate investigation by BLM's law enforcement special investigators. In the course of the investigation, teams of law enforcement agents and wild horse experts were sent to eight horse slaughterhouses in the United States and one in Canada. With the cooperation and assistance of meat processing plant owners and managers, the teams reviewed data from the last two years. They found that about 266,000 horses were slaughtered during 1995 and 1996 and that less than one quarter of one percent, about 350 per year, were at any time wild, Federally protected, or managed by the BLM. In con-

trast, the wild horse adoption program adopts approximately 8,000 horses each year to qualified adopters.

About a month ago, BLM announced that it is moving management of the Wild Horse and Burro Program from Reno, Nevada, to Washington, DC.

Question. How many personnel transfers will this move entail?

Answer. On February 10, 1997, the Acting Director of BLM reassigned responsibility for the wild horse and burro program from Nevada BLM to the BLM headquarters in Washington, DC. The existing wild horse and burro staff in Reno will not be moved but will remain in their present location and report directly to Washington rather than the State Director for Nevada. The purpose of this reorganization is to provide for personnel in the headquarters office with expertise in the wild horse and burro program. These personnel will be responsible for coordinating policy, communicating with the Congressional delegations, the media, and national level organizations interested in the welfare of wild horses and burros, and coordinating the national budget. The Wild Horse and Burro National Program office, located in Reno, Nevada, will remain in its current location and be responsible for coordinating all operational matters relative to the management of wild horses and burros. None of the Reno staff will be relocated to Washington.

The reorganization will require that several additional staff be added to the Washington Office. One new position is presently being recruited for the Washington staff and two additional staff persons will also be recruited sometime in the future.

Question. How much is this going to cost?

Answer. The reassigning of responsibility of the Wild Horse and Burro Program from Reno, Nevada to Washington, D. C., and the additional three personnel will cost approximately \$250,000 annually.

Question. Will there be cost savings for the Government?

Answer. Although it will cost BLM more to have this staff in Washington, they will be the contact point to provide increased coordination with Congress, other agencies, and National Wild Horse and Burro advocacy groups.

Question. Was this transfer in response to criticism of BLM mismanagement of the Wild Horse and Burro Program?

Answer. The reassigning of responsibility for the wild horse and burro program from Nevada to Washington, D. C., was the result of a recommendation made by The Wild Horse and Burro Program Emergency Evaluation Team. This team was established in August 1996 as a result of the drought conditions experienced in Nevada last summer. The Team's recommendation for reorganizing the program was based on the need to improve wild horse and burro program representation in Washington. The recommendation was not based on criticism presented in the recent Associated Press article and, in fact, the draft report presented the recommendation for reorganization prior to release of the news articles.

Question. How does moving management from the public land region of the West to Washington, D.C. solve the problem?

Answer. The reorganization will allow the wild horse and burro program to have a stronger presence in the headquarters office and a stronger voice in coordination with other programs. Improved communication with the BLM Directorate will aid in resolving many of the recurring issues facing the program.

Question. Is the transfer of management responsibilities temporary or permanent?

Answer. This reorganization of the program is expected to be permanent.

Question. What kind of assurances can you provide the members of this Committee that transfer of the management of the Wild Horse and Burro Program from Reno to inside the beltway, along with an increased budget, will solve the problems that exist within the Program?

Answer. The BLM is committed at the highest level to improving our management and protection of wild horses and burros. We are continually evaluating the performance of the Wild Horse and Burro Program. We have recently completed two such evaluations: The Wild Horse and Burro Program Emergency Evaluation Team (Pierson Report), completed in January 1997; and the Wild Horse and Burro Adoption Program Policy Analysis Team (Culp Report), completed in April 1997. The Acting Director has accepted the recommendations from these reports. The Pierson report found that while operational parts of the Wild Horse and Burro Program such as scheduling and coordination of animal gathers and adoptions had improved, coordination with other closely related BLM programs such as Rangeland Management, Wildlife Management, and Watershed Management was disconnected under the old organization. It also found that the public who have a high degree of interest in Wild Horse and Burro management (ranchers and wild horse advocates) thought they had lost the ability to make their views known to the highest levels of BLM management. We believe that the new organization will remedy those problems

while retaining the best aspects of the old organization. Other recommendations from these two teams will result in improved herd management, healthier animals on the land, and increased protection for animals in the adoption program. The increased funding is necessary to implement these recommendations. In addition to these completed evaluations, we currently have several evaluations underway targeting improving our veterinary practices and monitoring of animal health on public lands. These evaluations are being conducted with the participation of representatives from the veterinary and scientific communities.

The Wild Horse and Burro Program is about a \$16 million program annually. For fiscal year 1998, the Department's request includes a \$2, 443,000 increase.

Question. The request was put together before announcement of the move of the program management to D.C. How much of the increase will be used for this move?

Answer. The reassigning of responsibility of the Wild Horse and Burro Program from Reno, Nevada to Washington, D. C., and the additional three personnel will cost approximately \$250,000 annually.

The budget justifications indicate that it is BLM's goal to inspect a minimum of five percent of untitled wild horses and burros which have been adopted under the program.

Question. Is this a sufficient goal, given the criticism and allegations surrounding the long-term outcome for the animals?

Answer. One of the recommendations made in the Wild Horse and Burro Adoption Program Policy Analysis Team Report is to increase on-site compliance inspections to assure statistically that 95 percent of untitled animals within the last five years are being properly cared for. However, to accomplish this goal, an additional \$1.1 million dollars will be needed.

The BLM charges \$125 to adopt a wild horse and \$75 to adopt a burro. Your budget request indicates that the Department is considering increased adoption fees to offset the costs of the program.

Question. What is the status of these considerations?

Answer. In March 1997, the final rule was published in the Federal Register which established a minimum adoption fee for all wild horses and burros at \$125. This new rule also allows for the competitive bidding of animals. We are conducting five pilot competitive fee adoptions in different regions of the country to evaluate different bidding procedures and to gauge public perception of the process.

We have completed three of the pilots and are very pleased with the initial results. The public is very supportive of the competitive bidding fee structure, the adoptions take less time and thus cost less to conduct, and the average adoption fee has been above the minimum \$125. Based on pilot events using this competitive bidding process, the average adoption fee for a wild horse or burro has been approximately \$177 with some animals adopting for over \$400. After conducting the five pilot events, BLM issued its policy in July 1997, on procedures for conducting a competitive bid adoption nationwide.

Question. What other options are being considered?

Answer. The Wild Horse and Burro Adoption Program Policy Analysis Team Report recommended evaluation of a security deposit each adopter would provide to BLM. The deposit would be returned to the adopter upon successfully caring for the animal for a period of one year and receiving title. Failure to properly care for the animal or failure to receive title would forfeit the deposit. We are still evaluating whether holding these funds would be cost beneficial to the Government. Implementing this recommendation would require a change to the regulations.

Question. Would you need legislation?

Answer. The recommendations from the Wild Horse and Burro Program Emergency Evaluation Team and the Wild Horse and Burro Adoption Program Policy Analysis Team were made within the parameters of the existing law. No new legislation is being proposed at this time.

MINING

Taking out a \$50,000 request for use in funding the Grand Staircase-Escalante Monument, the request for coal management is flat (\$5.071 million and 78 FTEs). I note with some interest that BLM is not asking for any more money for its coal program.

Question. Given the President's request for funding increases in all the surface programs, do the reductions in oil and gas management and the flat funding for coal management suggest that the President is turning away from energy development on public lands?

Answer. Energy development on public lands is an important source of the Nation's energy supply. In preparing the budget, the Administration had to make dif-

difficult choices between increases and decreases for various programs. Other BLM programs received increases because the Administration believes that the needs are greater in those programs. We believe that adequate funds are provided to support exploration, development, and production of energy resources from public lands.

Question. Do you believe that the public lands are capable of making a contribution to the Nation's energy needs? If so, how does the BLM budget request reflect the agency's attitude toward energy development on public lands?

Answer. The BLM lands provide approximately five percent of domestic oil and gas production, virtually all the geothermal production, and about 35 percent of coal production. As stated previously, the budget contains adequate funds to support exploration, development, and production of energy resources from public lands.

The budget assumes that royalties will be available from hardrock mining operations to fund reclamation of abandoned mine sites. However, activities to remediate contamination from hazardous substances at mine sites is already governed to a substantial degree by the Superfund law. Under that statute, Interior has the same responsibilities to investigate and clean up releases of hazardous materials as a private party.

Question. Could you describe how you intend to have the royalties in the Abandoned Mine Land Fund used, and how those actions will relate to Superfund clean-ups?

Answer. The Administration has not proposed creation of a fund for reclamation of abandoned hardrock mine sites as part of the fiscal year 1998 budget process.

Legislation to date has limited Interior's ability to use royalties in the abandoned mine fund only if a hazardous substance release has been "listed" on the National Priorities List (NPL). But, as we know, Superfund liability attaches for a release irrespective of whether the site achieves NPL status. Other Federal agencies address many Superfund sites that are not on the NPL.

Question. If royalties in the AML Fund are used to respond to releases of hazardous substances governed by Superfund, would that make the royalty a new category of Superfund tax, similar to what is levied on the petrochemical industry?

Answer. The Administration has not proposed creation of a fund for reclamation of abandoned hardrock mine sites as part of the fiscal year 1998 budget process.

WARD VALLEY

The Federal land sale for the Ward Valley site was approved by your predecessor in 1993. Studies were completed, more studies were ordered, and today, we are no closer to completing the land transfer than we were four years ago.

In February 1996, Deputy Secretary Garamendi announced a second supplemental EIS and additional soil testing despite the California Department of Health Services' documentation that all the issues subject to the first supplemental EIS were addressed on the record. The State has announced it is ready to move ahead with some additional soil testing recommended by the National Academy of Sciences but has not had access to the site by your Department to conduct the tests. Instead, as I understand it, BLM is spending \$1.7 million in fiscal year 1997 funds to duplicate tests that the State has said it is responsible for.

The Department of the Interior has undertaken activities for a supplemental EIS, field work, testing, and analysis in relation to California's licensed low-level radioactive waste facility at Ward Valley. In responses to questions posed by a House Committee, the Department maintained that the funding for these activities were budgeted in BLM's fiscal year 1997 budget.

Question. Where, precisely, were these funds identified in the fiscal year 1997 budget for a supplemental EIS at Ward Valley?

Answer. Funding for Ward Valley and other land transfer or exchange proposals is contained in the Realty and Ownership Management Activity in the Management of Lands and Resources Appropriation and in the Acquisition Management Activity in the Land Acquisition Appropriation. However, Ward Valley is not specifically mentioned by name. Congress has provided BLM with the flexibility to work on the highest priority lands issues recognizing that they generally take several years to complete. Anywhere along the process issues can arise that could modify, delay, or terminate a realty action. If a specific lands action were delayed, BLM would proceed on to the next highest priority project.

Question. What amount was budgeted?

Answer. The Land and Realty Subactivity received \$28.6 million and the Acquisition Management Activity received \$2.5 million in the fiscal year 1997 Appropriations Act.

Question. Can you specify the precise funding requirements for the supplemental EIS, field work, testing, and analysis that you envisioned? How could these items

be budgeted and included in the fiscal year 1997 budget submission when the announcement of the supplemental EIS and additional testing was not made until February 15, 1997?

Answer. Costs for fiscal year 1997 as of May 1997 are listed below:

Funding requirements for supplemental EIS, field work, testing, and analysis

<i>Work</i>	<i>Estimated</i>
Prepare SEIS	\$427,000
Prepare protocol for field testing	63,000
Conduct field testing (drilling for tritium)	870,000
Laboratory analysis of testing materials	150,000
Prepare report on field testing and laboratory analysis	40,000
Independent review of laboratory analysis and report preparation	40,000
Total	1,590,000

The announcement of the supplemental EIS and additional testing was made by the Deputy Secretary on February 15, 1996. The budget estimates were developed beginning in June of 1996 in consultation with personnel from BLM, the U.S. Geological Survey, Bureau of Reclamation (BOR), National Academy of Science, and the Interior Solicitor. The supplemental EIS contract was awarded on May 15, 1997.

The scientific contracts for developing the testing protocol were awarded on April 21, 1997.

The amounts required for laboratory analysis and field work are uncertain. The Department of Energy has received a request from the State of California to fund this effort. Interior is currently discussing with the Department of Energy and the State of California on how a joint testing effort might work.

Question. Have any reprogrammings been sought for this purpose? How much is budgeted for these activities in fiscal year 1998 and where is it identified in the budget materials?

Answer. The BLM and Department must complete arrangements with the State of California and the Department of Energy on funding responsibilities for the tritium drilling before specific decisions can be made on BLM funding needs and funding sources. The BLM will keep the Committee apprised of progress on this issue.

The BLM has requested \$29.4 million in the Land and Realty Subactivity in the fiscal year 1998 budget justification. Until funding arrangements are determined for the tritium testing it is impossible to know what funding requirements BLM may need for 1998.

Question. Now that the State of California has agreed to perform the field testing, why is there a need for the Department of the Interior to seek funds for this purpose?

Answer. In response to Governor Wilson's proposal for the State of California to conduct the testing unilaterally, Secretary Babbitt and Energy Secretary Pena outlined a joint Federal-State program on May 21, 1997. The Departments of the Interior and Energy have held several meetings with the State of California. The Federal and State Governments are discussing how a joint tritium program would work. We continue to believe that a cooperative program will best serve the interests of both the State and Federal Governments, and will result in a credible test that is accurate, reliable, and objective.

Question. Why is the Department spending additional Federal dollars to conduct another supplemental EIS when State documentation shows this is unnecessary?

Answer. The Department is required under NEPA to prepare a supplemental EIS when "there is significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts; when the agency determines that the purposes of the Act will be furthered by doing so" (40 CFR 1502.10 (C)). In the May 17, 1996 Federal Register Notice of Intent, BLM identified nine new circumstances or information relating to the proposal or its impacts. During the subsequent scoping period, approximately 800 public comments provided further evidence of the need for the supplemental EIS. Such public concern is ongoing. The Department has also consulted with the Council for Environmental Quality confirming the need for a Supplemental EIS.

If the tests are so important, then I agree they should be conducted.

Question. Why aren't California's regulators being allowed to conduct them?

Answer. As stated in the answer above, the Department is currently discussing arrangements for a joint testing program with the State of California. Should the State desire to undertake unilateral testing, however, a land use permit must be obtained from BLM. The existing authorizations issued to the State since 1987 do not allow new surface disturbance. The State of California has informed BLM that

it would apply for such a permit but, as yet, no application has been submitted. Since the site where the tests would be conducted is within critical desert tortoise habitat, consultation with FWS would be required in accordance with Section 7 of the Endangered Species Act (ESA) before any work could be authorized.

FAIR VALUE IN LAND EXCHANGES

As you know, Mr. Secretary, the Office of Inspector General (OIG) of the Department of the Interior also files a budget request with this Subcommittee. The mission of the Office of the Inspector General is to detect and prevent fraud, waste and abuse, and to promote economy, efficiency and effectiveness in the operations and activities of government agencies.

In the fiscal year 1998 budget justifications, the Inspector General's Office described its 1996 audits and investigations. One of these operations was the audit of the BLM's Nevada Office land exchange activities. The OIG reported that the BLM Nevada State Office did not consistently follow land exchange regulations or procedures and did not ensure that fair and equal value was received in completing three of the four exchanges the OIG reviewed. As a result, the BLM exchanged public land for 2,461 acres of private land, valued at \$2.7 million, that "had no discernible mission-related purpose." In addition, "the Government may have lost revenues of \$4.4 million in completing three of the four exchanges reviewed.

Question. The OIG reported that BLM officials agreed with the OIG's findings. The description of the investigation ended there. I would like to know what is happening with respect to the lost revenues of \$4.4 million?

Answer. The BLM generally agrees with the OIG report recommendations but we disagree with several of the specific report findings. In the Audit report, the OIG recommendations outline opportunities for BLM to enhance our land exchange program and we are proceeding ahead in implementing these recommendations. However, we do not feel that the OIG was correct in their assessment of lost revenues. The majority of the claimed \$4.4 million in lost revenue resulted from one transaction involving a parcel encumbered by a right-of-way for a flood control structure. We feel the value established by BLM for this parcel was accurate, given the information available to the BLM regarding the City of Las Vegas' intended use and need for the right-of-way. Our response to the Draft Audit Report on Nevada Land Exchange Activities (pages 28 through 35 of the final Audit report, issued July, 1996) provides a more detailed discussion of the report findings.

Question. Can you tell us why BLM acquired 2,461 private acres that had no mission-related purpose?

Answer. The 2,461 acres referenced were acquired to provide habitat and watershed protection for the woundfin, the Virgin River chub, and desert tortoise (all threatened or endangered species). The 2,461 acres were evaluated by qualified wildlife biologists and it was determined that these acquisitions would benefit these species and were consistent with the mission of the Department and with applicable land use plans.

FISH AND WILDLIFE SERVICE

ARID LANDS ECOLOGY RESERVE

The Fish and Wildlife Service and the Department of Energy have been negotiating a Memorandum of Understanding (MOU) for management of the Arid Lands Ecology (ALE) Reserve at the Hanford site in Washington State.

Question. What is the status of the MOU? When will the MOU be completed? What role will the MOU likely establish for FWS in management of the Reserve?

Answer. The FWS and the Department of Energy have completed the Memorandum of Understanding. The FWS will have full management responsibility subject to continued access by the Department of Energy and its contractors to pursue ongoing research programs and operation of communication facilities. The FWS will operate the ALE in accordance with the present Department of Energy-approved Facility Management Plan and will develop its own management plan with public participation within 36 months. It is expected that FWS will manage the ALE as a Research Natural Area with emphasis on research, environmental education, and interpretation. Other operating functions may be conducted through partnerships.

Question. Is funding available in fiscal year 1997 to complete and execute the MOU? Are funds built into the fiscal year 1998 budget for this purpose? If so, how much and within what activity? If not, how much would be required in fiscal year 1998, for what purposes, and in what budget activity/subactivity?

Answer. Since 1971, FWS has funded its operation of Saddle Mountain National Wildlife Refuge and its related Hanford coordination activities, including initial ad-

ministration of the ALE, as part of the Columbia National Wildlife Refuge Complex. Under the ALE MOU, the Department of Energy is providing \$300,000 to cover the FWS management of the Hanford site.

OKEFENOKEE SWAMP

I understand you recently visited the Okefenokee Swamp to announce your opposition to a proposed titanium mine on the border of the refuge. I don't know enough about the project to know whether the mine itself is appropriate, but it does raise a concern.

Question. Is it possible the Administration will propose a Headwaters type exchange in this instance?

Answer. The Administration does not plan a Headwaters type land exchange in this instance.

SPACE COSTS

The budget request notes a slight increase in rental payments to GSA resulting from changes in rates.

Question. How have Service rental payments to GSA changed over the past three fiscal years? How has the amount of actual space rented changed over the past three years?

Answer. During fiscal year 1995, FWS rental payments to GSA totaled \$25.5 million. In fiscal year 1996, the FWS's rental payments to GSA totaled \$27.3 million. In fiscal year 1997, payments to GSA are projected to be \$27.5 million. In this three-year period, the FWS GSA rental costs have increased by almost \$2 million or seven percent.

In terms of the amount of space leased through GSA, the FWS fiscal year 1995 inventory totaled 2,099,341 square feet. Of this amount, 993,426 square feet was designated as office space while the remaining 1,105,915 was utilized for industrial, laboratory, and storage and parking purposes. In 1996, FWS leased a total of 2,177,033 square feet, of which 1,028,175 was office space and 1,148,858 was utilized for other purposes. In fiscal year 1997, FWS is leasing a total of 2,249,531 square feet through GSA. The utilization of this space is broken down as follows: 1,040,271 is office space while 1,209,260 is used for industrial, laboratory, storage, and parking purposes.

Over the past three years, the FWS inventory of total square footage has increased by 150,190 square feet. This is an overall increase of seven percent. The amount of office space has increased over this time period by 46,845 square feet or four percent, while non office space increased by 103,345 square feet or nine percent. These increases are primarily the result of increased appropriated funding for FWS field programs in the Pacific Northwest and Everglades. Both of these priority ecosystem-based initiatives have required additional biological staff to meet the Administration's goals.

ENDANGERED SPECIES ACT

The Administration has requested an \$11.4 million increase for FWS endangered species activities.

Question. Will the Administration submit a legislative proposal to reauthorize the Endangered Species Act?

Answer. The Administration is currently engaged in working cooperatively with the Senate Environment and Public Works Committee in aiding their efforts to reauthorize the Endangered Species Act. The Administration believes that the current ESA is an effective and flexible tool for maintaining biodiversity for current and future generations while at the same time allowing responsible economic development to proceed.

Over the past several years, the Administration has designed a series of policies to improve the effectiveness of the ESA while enhancing its flexibility for businesses and private landowners. Full funding at the fiscal year 1998 President's Budget level of \$78.8 million for the endangered species program will allow these policies to continue.

The Administration's March 6, 1995, announcement of "Ten Principles For Federal Endangered Species Act Policy" provides an overview of the Administration's approaches to minimize economic and social impacts on the economy, on private property and the affected public. The Ten Principles are:

1. Base ESA decisions on sound and objective science.
2. Minimize social and economic impacts.
3. Provide quick, responsive answers and certainty to landowners.

4. Treat landowners fairly and with consideration.
5. Create incentives for landowners to conserve species.
6. Make effective use of limited public and private resources by focusing on groups of species dependent on the same habitat.
7. Prevent species from becoming endangered or threatened.
8. Promptly recover and de-list threatened and endangered species.
9. Promote efficiency and consistency.
10. Provide State, tribal, and local governments with opportunities to play a greater role in carrying out the ESA.

Candidate Conservation partnership efforts with Federal and State landowners and the private sector have been designed to avoid potential listings and litigation gridlock. Given the fiscal year 1998 President's Budget request of \$4.9 million for the candidate conservation program, FWS will be able to work on 292 actions.

More is also being done with the use of Habitat Conservation Plans (HCP) to ease the regulatory burdens of the ESA on private landowners. The FWS estimates that it will work with 400 partners on HCPs given the fiscal year 1998 President's Budget request of \$26.5 million for the consultation program thus demonstrating the flexibility of the ESA as it relates to the needs of private landowners. The Administration has produced concrete results with these HCPs. In the Pacific Northwest, the approved HCPs with State and private landowners cover over 4.2 million acres in the States of Washington, Oregon, and California.

Additional steps have been taken to provide landowners with certainty regarding potential future impacts of ESA actions. The "no surprises" policy assures private landowners participating in HCPs that no additional requirements will be imposed on plan participants for species covered by a properly functioning HCP.

An HCP seeks to maintain adequate protection measures for species, while allowing for development activities. These plans often call for land protection or acquisition costs at the local level. The fiscal year 1998 President's Budget continues the Section 6 HCP land acquisition grants at \$6 million to provide grants-to-States for land acquisition required at the local level as a result of the HCP planning effort.

The "safe harbor" program encourages landowners to provide habitat for listed species. Under this program, private landowners with assistance from FWS or with other qualified Federal or State agencies develop a management program to be carried out on their lands for the benefit of listed species. Based on such a program, a safe harbor agreement is entered into by FWS and the landowner. The FWS, in turn, will issue the private landowner a permit for the future take of listed species above the existing baseline conditions at the time of the agreement. Over 37 agreements, mostly in the southeast and west, have been or are being developed. In the past year, for the Sandhill area of North Carolina alone, 18 non-Federal landowners have been given safe harbor agreements and it is anticipated that an additional 15 will be developed this year.

The Administration has also developed an innovative way to avoid placing a significant and unnecessary regulatory restraint on thousands of private landowners in the Pacific Northwest hoping for 4(d) rule relief. Implementation of the 4(d) rule for the northern spotted owl would relieve certain prohibitions on private lands within the range of the owl. The FWS expects landowners will participate more readily in conservation and recovery activities because of the relief provided by the 4(d) rule.

The budget justification indicates that funds for delistings and downlistings of species are within the Recovery activity rather than the Listing activity.

Question. Does the Administration plan on delisting or downlisting any species in fiscal year 1998? Is the conduct of any delistings dependent upon the \$3.8 million program increase for Recovery being funded? If held at the fiscal year 1997 level, would any delistings likely occur?

Answer. Yes, the Administration plans to propose species for delisting and downlisting in fiscal year 1998. Up to 25 species will be evaluated for possible delisting in fiscal year 1998, provided the funding requested in the President's Budget is appropriated. The Administration strongly believes that the public is best served by removing species from the list of threatened and endangered species once recovery has been achieved. This results in a decreased cost and regulatory burden on the public and State and Federal agencies. To this end, FWS is working hard to recover as many species as possible in an expeditious manner. The FWS is responsible for both planning and implementing recovery actions for listed species, and accomplishing this recovery mission is contingent upon the funding in the fiscal year 1998 President's Budget. The result of successful recovery planning and implementation is downlisting or delisting species. Therefore, given the increased recovery planning and implementation workload and the need to downlist and delist species, the \$3.8 million increase is of critical importance to the FWS delisting program

and to the extent to which FWS can engage in delisting and downlisting species in fiscal year 1998 is directly related to the increased funding.

Question. Why were no delistings or downlistings performed in fiscal year 1997?

Answer. Delisting and reclassification actions are currently funded under the "listing" line item in the FWS budget. Following the lifting of the listing moratorium in April 1996, significant program restart costs in terms of time and money were incurred by the listing program. The FWS developed listing program restart guidelines in fiscal year 1996 to help expedite the resulting backlog of proposed rules through the listing process. Due to the listing backlog FWS has at least twice the normal pending workload in the listing program in fiscal year 1997.

Under the FWS Final Listing Priority Guidance for fiscal year 1997, published in the Federal Register on December 5, 1996, delisting activities were assigned to Tier 4, the lowest priority category for listing activities. The FWS assigned delistings the lowest priority because completing listing activities that provide protection for currently unprotected imperiled species is a higher priority and will best satisfy the intent of the Act.

For fiscal year 1998, the delisting funding request is included with the recovery program budget. Because delisting is the ultimate goal and final step of the recovery process, the Department believes that it is more appropriate to include the delisting funding request with the recovery program.

In order to delist a species, FWS must determine that it is no longer endangered or threatened based on surveys of its population size, recruitment, and habitat quality and quantity. The FWS is responsible for evaluating status survey results and coordinating conservation efforts with landowners and other Federal, State, and local agencies. Delisting and reclassification actions demonstrate the recovery successes of the ESA and remove regulatory burdens once they are no longer needed.

Success stories, such as the reclassification of all bald eagles in the lower 48 States from an endangered to threatened status, demonstrate that there have been, and can continue to be, successes in endangered species recovery efforts. Several other species have improved in status to the point where they now near reclassification or delisting, such as the American peregrine falcon. The fiscal year 1998 President's Budget requests \$42.2 million for the recovery program, including an increase of \$3.8 million. Part of this increase will be of critical importance to the delisting program.

The budget justification states that no critical habitat designations will be made in fiscal year 1998 because this activity is a lower priority than responding to listing petitions.

Question. Absent the designation of critical habitat, at what stage of the Endangered Species Act process are economic considerations formally taken into account?

Answer. Species are listed under the ESA solely on the basis of the best scientific and commercial data available regarding the status of the species. However, economic effects can and should be taken into consideration in the planning and implementation of recovery activities. The current ESA provides flexibility with regard to recovery, and various policies recently implemented by the Administration, as well as increasing the role of stakeholders in recovery and focusing of Federal lands, will decrease the burden on private lands and work towards minimizing the economic effects of the ESA on private landowners.

A new policy—part of the Administration's Ten Point Plan for ESA reform—significantly expanded recovery participation beginning in July 1994. That policy directs that local jurisdictions, private organizations, and affected citizens be included in recovery plan development and implementation. Also, the public is invited to comment on draft recovery plans. These comments can supply important information about an affected community and can help to reduce or eliminate conflicts with listed species and their habitats. All comments are reviewed and addressed—if appropriate—in the final plan.

The justification indicates FWS will "significantly reduce its outstanding obligation" under the settlement agreement in *Fund For Animals v. Babbitt*.

Question. Given that FWS must cope with limited resources, does the Service feel its own listing petition management and priority system has been superseded or overwhelmed by lawsuits and settlement agreements such as the *Fund For Animals*? Does FWS manage its Listing workload according to national priorities that reflect threats to individual species, or is it forced to manage on the basis of the most recent court decision or lawsuit?

Answer. Following the lifting of the listing moratorium and the restoration of listing funding in April 1996, significant program restart costs in terms of time and money were incurred by the FWS listing program. The FWS developed listing program restart guidelines to help expedite the resulting backlog of proposed rules through the listing process. The FWS was not able to finish the backlog during fis-

cal year 1996 using this triage approach and had at least twice the normal pending workload in the listing program in fiscal year 1997. To continue to address the backlog, FWS issued the Final Listing Priority Guidance for fiscal year 1997, published in the Federal Register on December 5, 1996. The Department is rigorously following this guidance to fairly and adequately address the backlog.

Under the priority system, resources are apportioned among the following actions:

- Emergency Listing Actions; and
- Processing Final Decisions on Proposed Listings.

Resolving the conservation status of candidate species and processing administrative findings to add species or reclassify threatened species to endangered

Action on processing critical habitat determinations, is deferred because of the higher priority on resolving listing issues.

The FWS fiscal year 1998 budget request proposes \$78.8 million to support a workable Endangered Species program. This balanced request will address a variety of needs. The \$4.9 million requested for the candidate conservation program will support 292 partnership efforts to keep species off the list. The listing program is funded at \$5.2 million to respond to petitions and answer legal challenges. To support full participation in Section 7 and Section 10 consultations, \$26.5 million is requested. This will provide for 900 formal consultations, 1500 programmatic consultations, and 38,000 technical assistance consultations, as well as work on over 400 new and existing HCPs. With the \$42.2 million request for the recovery program, FWS will be able to meet the growing workload demands and to help address the backlog of 400 species without recovery plans. Delisting and reclassification actions previously funded in the listing activity would be funded at \$500,000 within the recovery program.

With the requested fiscal year 1998 listing program amount, the Department will continue to make progress in processing listings in accordance with the priority guidance. During fiscal year 1998, FWS anticipates that nearly 100 species will be proposed for listing and approximately 120 species will be added to the list. However, FWS does not anticipate designating critical habitat in fiscal year 1998, as this activity is a lower priority than responding to petitions and resolving the status of candidate species.

The House Appropriations Committee has approved language to accompany the fiscal year 1998 appropriation for listing activities specifically restricting FWS from spending more than the allocated amount on the listing program. This language reads as follows: "And of which not to exceed \$5,190,000 shall be used for implementing subsections (a), (b), (c), and (e) of the Endangered Species Act of 1973, as amended."

Together with the listing priority guidance, the appropriations language will put FWS in a better position to make listing decisions based on the best available scientific information, and not necessarily in response simply to litigation.

Question. How much does FWS and the Department of Justice spend annually on ESA-related litigation?

Answer. Our estimate reflects FWS and the Department of the Interior's Solicitor's Office costs only. The FWS costs are approximately \$0.3 million and relate to document research and preparation, records assembly, and conferences with attorneys. The Solicitor's costs are approximately \$0.9 million and assume a net of 12 FTEs (at \$75,000 each). Figures from the Department of Justice will be provided under separate cover.

The budget justification indicates that FWS's Section 7 workload is steadily rising.

Question. To what does FWS attribute this continued increase? At what point does FWS expect workload to level off? To what extent is increased use of programmatic consultations and Habitat Conservation Plans reducing funding requirements for the Consultation activity?

Answer. The demand from Federal agencies for Section 7 consultations, especially wide-ranging programmatic consultations, has greatly increased the FWS workload. As more species are listed, and as Federal agencies increasingly recognize their responsibilities in endangered species protection, the number and complexity of informal and formal consultations requested under Section 7 has increased significantly. This increase has been most dramatic in the southwest, southeast, and northwest regions of the United States. To support full participation in Section 7 and Section 10 consultations, \$26.5 million is requested in the President's Budget which is critically important to ensure that FWS is able to issue accurate and timely biological opinions to other Federal agencies as required by Section 7, to maximize opportunities for the identification and informal resolution of potential conflicts in early project planning stages for both Federal (Section 7) and private (Section 10) actions, and to provide technical assistance to both Federal and non-Federal entities for the

preparation of necessary compliance measures under both Sections 7 and 10 as early in the planning process as possible.

In addition, FWS is responsible for monitoring both the implementation and effectiveness of any measures required by consultations to minimize the take of listed species. As the number of formal consultations increase, the need to monitor compliance also increases. The increased popularity of HCPs, (Section 10(a)(1)(B) of the ESA) as a tool to resolve conservation and development conflicts on private lands has also resulted in an increased Section 7 workload because FWS must conduct an intra-FWS Section 7 consultation on the issuance of each Section 10 permit. As more species are listed, and as economic growth continues, the need for HCPs to address non-Federal actions on private lands will increase resulting in an increase in intra-FWS Section 7 consultations.

The FWS expects the demand for consultations to continue to increase as Federal agencies continue to realize the need to consult, as the number of listed species continues to increase, and the continued increase in economic growth. However, FWS is taking every step to ensure that the consultation program is as effective and efficient as possible. To that end, FWS is finalizing a Section 7 handbook that emphasizes efficiency in the implementation of the program. Additionally, we have developed streamlined consultation procedures for the implementation of the Pacific Northwest Forest Plan. These procedures serve as a model to develop and implement similar procedures in other parts of the country to further enhance our implementation efficiency.

The FWS continues to be involved in many national, programmatic consultations on issues such as the EPA's registration of Department of Agriculture pesticides and pest control programs. The FWS anticipates that consultation on these and other national programs will continue in fiscal year 1998. Programmatic consultations tend to take longer to complete, but are often more effective and efficient in the long run because they allow FWS to address multiple actions affecting multiple species all at once, instead of several consultations on the same issue. The FWS believes that both Section 7 and Section 10 consultations are equally important, and will need the increased funding requested in the President's Budget to address the workload associated with both types of consultations.

A portion of the increase requested for Consultation is for Forest Plan activities.

Question. How much Forest Plan funding is being allocated in fiscal year 1997 to Eastside ecosystem management? How much would be allocated for this purpose at the fiscal year 1998 request level? Why is this work included in the Forest Plan activity?

Answer. The FWS has allocated \$250,000 in fiscal year 1997 for participation in developing EISs to launch the Interior Columbia Basin Ecosystem Management Project (ICBEMP). The draft EISs were released for public comment in May 1997. The purpose of the ICBEMP is to restore and maintain long-term ecosystem health and integrity and to support the economic and social needs of communities by providing sustainable and predictable levels of products from Federal lands managed by the Forest Service and BLM. It is also the objective of the ICBEMP that no species would need to be listed under the ESA because of management actions of the Forest Service or BLM within the Columbia River Basin. Therefore, the participation of FWS along with the National Marine Fisheries Service was crucial in the development of the ICBEMP.

Final EIS and Record of Decision (ROD) are planned for the third quarter of fiscal year 1998, with ICBEMP implementation to begin in the final quarter. The President's Budget requests an increase of \$1.3 million for Forest Plan consultations; approximately half of this funding increase would be allocated for the implementation of ICBEMP. Funding for the implementation of the Eastside EISs in the fiscal year 1998 budget reflects the fact that the FWS expertise in these activities in the Pacific Region is in the Forest Plan program. Additional funding is critically needed for: 1) the FWS participation in the Ecosystem Analyses that are to be undertaken on Federal lands as a basis for future ICBEMP decision making; 2) the development of an HCP/Conservation Agreement capability to enable our non-Federal partners to pursue voluntary conservation agreements; and 3) required ESA Section 7 consultations on sharply increasing Forest Service and BLM activities associated with ICBEMP implementation. In the future as the ICBEMP program grows in importance, these funds will be displayed separately.

PARTNERS FOR WILDLIFE

The justification seems to indicate that proposed fiscal year 1998 funding for the Partners for Wildlife program will continue the Klamath River Basin program, Ne-

vada biodiversity research, and the Washington State Ecosystems Conservation project at the fiscal year 1997 level.

Question. Is this accurate?

Answer. Yes, the FWS fiscal year 1998 budget requests \$1.7 million for the Klamath River Basin Restoration, \$1.0 million for the Reno Biodiversity Initiative project in Nevada, and \$1.5 million for the Washington State Ecosystem Conservation project, which is the same level as 1997.

The justification indicates that the Nevada program will be completed in fiscal year 1998.

Question. Are Partners for Wildlife funds for this program expected to be requested in fiscal year 1999? Will funding for follow-on activities be requested in other FWS activities?

Answer. This initiative is an intergovernmental effort to assemble, analyze, and interpret data on the biological resources of Nevada. The University of Nevada at Reno, Stanford University, Nevada Division of Wildlife and the Nevada Natural Heritage Program work cooperatively with FWS, USGS Biological Resources Division, and the Forest Service to collect data and provide it in a usable format to agencies vested with the statutory responsibility to manage Nevada Public Lands. The initiative provides land management agencies with a planning tool, and a forum where they may discuss how they may coordinate their agendas in a way that best serves Nevada biodiversity. In addition, cooperators are developing a GIS system that would link University of Nevada, BLM, FWS, Forest Service, and Gap Analysis Systems, processing sensitive species occurrence data, and enhancing quality control procedures at the Nevada Natural Heritage Program. The FWS will consider the need for continued Federal assistance as it develops future budget priorities.

The FWS is requesting an increase of \$750,000 in Project Planning to accommodate work related to the relicensing of hydroelectric projects. The justification indicates that FWS will use the increase to "design, test, and prescribe technically sound fishways * * *."

Question. Does FWS currently have the type of resident expertise required to design and test fishways? Does FWS intend to establish or expand its resident design capabilities in this area? Wouldn't it be more cost-effective for FWS to focus on analysis and testing of fishway designs proposed by license applicants?

Answer. When an applicant submits a fishway design, FWS must conduct a thorough biological, hydrological, and engineering analysis. It is imperative that the fishway fulfill the biological needs of fish, and function properly in a wide variety of river flow and environmental conditions when installed onsite. Often, trial field testing and modifications are in order to ensure fish will readily use and pass uninjured through the fishway.

The FWS does not have facilities to test fishways, and does not propose to duplicate test facilities available with the USGS Biological Resources Division. The most cost-effective method is to focus our resources on analyzing the applicants' fishway designs. The \$750,000 requested in the President's Budget would help FWS modestly upgrade resident engineering and biological expertise needed to complete technical reviews of proposed fishway designs and participate more fully in trial testing with license applicants. With the requested funds, FWS can also improve customer FWS to Federal Energy Regulatory Commission license applicants by providing timely prescriptions for fish passage facilities that are biologically and technically sound, cost-effective, and reliable.

Question. How much funding will be allocated to FERC-related work in fiscal year 1997?

Answer. In fiscal year 1997, FWS estimates spending about \$2.9 million on all hydropower licensing activities, and will participate fully in the review of about one-third of the 231 projects currently pending relicensing, as well as all of the other actions above.

During fiscal year 1998, FWS estimates that 100 additional license renewals will be initiated by applicants. To meet this increased workload, the fiscal year 1998 budget includes a request for an additional \$0.75 million to allow FWS to develop non-regulatory partnership solutions by working upfront on 50 new FERC relicensing actions. Relicensing actions provide opportunities to mitigate for previous fish and wildlife impacts by improving instream flows, providing for fish passage, and creating or improving habitat.

The FWS role in the hydropower licensing process is authorized by statute and the FERC regulations. The FWS participates by advising and assisting developers in preparation of study plans, developing terms and conditions, coordinating with other agencies, preparing mitigation plans, and participating in fishway, instream flow, and other studies. Relicensing activities are increasing nationwide as licenses for many hydropower projects expire. Since 1993, the licenses for over 260 dams

across the country have expired. The licenses for over 550 more dams will expire in the next 15 years. Many of these dams were built without the benefit of fishways, instream flows, and other measures to conserve and protect fish and wildlife.

Current workload is significant. During fiscal year 1998, FWS will work on almost 1,100 hydropower projects nationwide, including:

HYDROPOWER PROJECTS

	Fiscal year—		
	1996	1997	1998
Prelicensing actions:			
Preliminary permits	150	140	130
Original licenses	150	130	130
Relicensing	160	200	230
Exemptions	30	40	40
Postlicensing actions:			
Licenses	350	450	500
Exemptions	50	50	50
Totals	890	1,010	1,080

¹ "Rolling number" includes 50 of the estimated new applications.

NATIONAL WETLANDS INVENTORY

The justification indicates that FWS is continuing to seek alternative data collection techniques that may lower the cost of data collection per unit.

Question. What progress has been made in this regard in recent fiscal years? What prospects are there for further improvement? Has the level of cooperation from other agencies been satisfactory?

Answer. The FWS has made considerable progress in recent years in working with its partners to determine alternative data collection techniques in order to lower costs in wetland mapping and collecting wetland status and trends data. These efforts are:

- (1) Collaboration with EPA and the Natural Resources Conservation Service on refining a cross-correlation technique. This technique uses satellite imagery to monitor wetland changes in the 30 percent of National Wetland Inventory maps that have been digitized and are components of the wetlands layer of the National Spatial Data Infrastructure.
- (2) Work with the Central Intelligence Agency (CIA) and BLM on use of recently declassified imagery to map wetlands and other natural resources in remote regions of Alaska lacking existing aerial photography.
- (3) Refinement of the techniques involved with Analytical Stereo Plotters and Global Positioning System satellites for applications in mapping wetlands on military facilities and for updating wetland status and trends plots.

Improved efficiency and lowered costs are probable with all three methods. The only drawback is the scale limitation imposed by most conventional satellite imagery. However, the declassified CIA imagery may solve that problem. The level of cooperation among agencies continues to be congenial and productive.

MAINTENANCE

The budget request includes a \$9.75 million programmatic increase for Refuge Operations and Maintenance, which follows an \$8 million increase in fiscal year 1997.

Question. If funded at the request level, would the maintenance backlog in the refuge systems be reduced? If so, by how much? If not, why not?

Answer. The budget includes a three-tiered effort to address the highest priority operational and maintenance needs of the Nation's 509 National Wildlife Refuges. First, operational increases total \$13.8 million, or eight percent (including \$4.1 million for pay and FERS retirement cost increases). Second, the budget continues the recreation fee demonstration program which will initially generate approximately \$1.0 million for on-the-ground project work at the refuges which collect the user fees. Third, construction funding totaling \$22.2 million will be used for the highest priority infrastructure backlog needs including the rehabilitation of roads, dams and bridges; as well as \$17.1 million in ongoing operations funding for routine mainte-

nance. The \$17.1 million plus the \$22.2 million in the construction account will address the highest priority needs identified in the Maintenance Management System.

The first increment of the operations increase is \$9.8 million to protect wildlife, improve habitat, enhance recreation and education, and to accelerate comprehensive planning. The new Refuge Management Information System (RMIS) database was used to systematically rank priorities against nationwide goals to ensure project integrity and to compile a project list tied to the \$9.8 million increase.

The additional funding requested for habitat enhancement will be used to restore natural water flows and replant trees and prairie grasses. This funding will reverse the damaging effects of previous land uses which often include drainage, tree clearing, and elimination of native grasses. Restoring habitats now will ensure healthy and diverse ecosystems; ensure sustainable populations of fisheries and wildlife; and provide habitat for Threatened and Endangered (T&E) species. Implementation of wildlife dependent recreation and education projects will provide additional opportunities to the 29 million annual refuge visitors. Funding will also allow additional comprehensive management plans to be completed and guide future management of the refuge system.

The second increment of the operations increase is \$4.1 million to fully fund required pay and FERS retirement system costs for the approximately 2,800 employees of the refuge system.

LAW ENFORCEMENT

Question. The table on page 105 of the justification indicates that the number of shipments inspected in fiscal year 1996 fell dramatically from the number inspected in fiscal year 1995. Why?

Answer. At the time the fiscal year 1998 budget was prepared, FWS had only preliminary information on shipments through July 24, 1996. The total shipments for fiscal year 1996 are 87,848. The shipments increased by 2,190 over the previous year.

MIGRATORY BIRD MANAGEMENT

A \$1.5 million increase is requested for migratory bird management.

Question. To what extent are activities that would be funded with this increase, particularly the increase for "Species of Management Concern," activities that might otherwise be conducted with Endangered Species Candidate Conservation or Listing funds? How does FWS determine which accounts to draw upon for bird population monitoring activities? Are activities that will be conducted with funds identified for "Implement[ing] Conservation Actions" similar to or the same as activities that will be funded with Candidate Conservation funds?

Answer. Of the \$1.5 million increase requested for migratory bird management, \$600,000 is targeted for "Species of Management Concern" to implement those provisions of the Fish and Wildlife Conservation Act of 1980, as amended, that direct the FWS to "identify species, subspecies, and populations of all migratory nongame birds that—are likely to become candidates for listing under the Endangered Species Act of 1973" and to undertake appropriate conservation actions. We anticipate that fewer than one percent of the "species of management concern" will also be candidate species in fiscal year 1999.

Migratory bird populations may also be monitored in conjunction with activities in the Candidate Conservation and Listing programs. These surveys are focused on specific threatened and endangered species, primarily to gather data needed for decisions on regulatory actions.

The planned surveys on "species of management concern" concentrate on species that are not on the threatened and endangered species list. The monitoring information helps FWS and its partners to take actions to avoid future imperilment and listing of species of concern.

No increase is requested for the North American Waterfowl Management Plan (NAWMP).

Question. How many wetlands joint ventures currently exist? At what level are each of these joint ventures funded in fiscal year 1997? In the fiscal year 1998 request? How much of an increase would be required to provide currently unfunded joint ventures with a level of support comparable to funded joint ventures? Would such an increase enable currently unfunded joint ventures to coordinate a significant amount of additional wetlands restoration projects?

Answer. Currently, 10 wetlands habitat joint ventures exist in the U.S. as part of the North American Waterfowl Management Plan. Of these, the six original joint ventures are funded through the FWS Regions. The table below presents the fiscal year 1997 allocation to each FWS Region in support of coordination activities for the

original joint ventures (Atlantic Coast, Central Valley Habitat, Gulf Coast, Lower Mississippi Valley, Playa Lakes, and Prairie Pothole Joint Ventures). The table identifies funded and unfunded joint ventures in each Region and indicates the Region with lead coordination responsibility for each joint venture.

FISCAL YEAR 1997 REGIONAL ALLOCATION TO SUPPORT ORIGINAL NAWMP HABITAT
JOINT VENTURES

[In thousands of dollars]

FWS region	Joint ventures—		Allocations
	Funded	Unfunded	
1	Central Valley habitat ¹	Pacific Coast ¹ , Intermountain West	275
2	Gulf Coast ¹ , Playa Lakes ¹ , Lower Mississippi Valley.	Intermountain West	314
3	Prairie Pothole, Lower Mississippi Valley ...	Upper Mississippi River/Great Lakes Region ¹ .	357
4	Lower Mississippi Valley ¹ , Atlantic Coast, Gulf Coast.	366
5	Atlantic Coast ¹	266
6	Prairie Pothole ¹ , Playa Lakes	Rainwater Basin ¹ , Intermountain West ¹ ..	713

¹ Joint ventures indicate regional lead coordination responsibility.

The fiscal year 1998 President's Budget does not include an increase in funding for the North American Waterfowl Management Plan. Allocations to the Regions to support coordination of the six original joint ventures would remain essentially the same under the fiscal year 1998 budget request. If appropriated, an additional \$800,000 would fund the remaining joint ventures with a level of support comparable to that provided to the original six joint ventures in fiscal year 1997.

HATCHERY OPERATIONS AND MAINTENANCE
