In the fiscal year 1996 budget request, the Administration proposed to close or transfer to States 11 fish hatcheries.

Question. To date, how many of these hatcheries have been transferred to States? What is the status of the remaining hatcheries, both with regard to fish production and any continuing discussions regarding transfer to the host States?

Answer. Five hatcheries have been transferred to the States: three in fiscal year 1996 (Walhalla NFH, SC, to SC; Carbon Hill NFH, AL, to AL.; and Bo Ginn NFH, GA, to GA) and two in fiscal year 1997 (McKinney Lake NFH, NC, to NC; and Meridian NFH, MS, to MS). Transfer talks have been completed with the State of West Virginia for the transfer of Bowden NFH, WV, under a MOA that will take effect on July 1, 1997.

Production at three of the hatcheries not transferred to the States (Chattahoochee Forest NFH, GA; Wolf Creek NFH, KY; Inks Dam, NFH, TX) will be redirected into high priority Federal Fisheries activities (i.e., providing fish to mitigate for the adverse effects of Federal water development projects, restoration of imperiled inter-jurisdictional fisheries, and recovery of T&E species). Because Mescalero NFH, NM, meets the needs of the Native American Pueblos in New Mexico, consistent with the FWS tribal trust responsibility, production at the hatchery will not be redirected.

Valley City NFH, ND was originally proposed for transfer/closure in the President's fiscal year 1996 Budget. However, after a subsequent review of the hatchery's role, the hatchery was withdrawn and is no longer considered for transfer/closure.

The FWS will continue to pursue State initiated transfer requests for Chattahoochee Forest, Wolf Creek, or Inks Dam, and offer the three year transition opportunity, through fiscal year 1997.

Question. What savings from hatchery transfers, production cuts or closures will be realized in fiscal year 1997 for use in other fisheries programs? In fiscal year 1998?

Answer. The total base funding of the 10 hatcheries of concern was approximately \$2.37 million annually. As hatchery transfers proceed over the three year period that began in fiscal year 1996, an increasing portion of this base funding has been freed-up and redirected to meet high priority Federal fishery responsibilities. This freed-up funding is \$655,000 for fiscal year 1996, \$1.2 million for fiscal year 1997, and \$1.5 million in fiscal year 1998.

The savings from hatchery transfers have been reinvested into the fisheries program in an effort to restore the FWS ability to meet high priority Federal responsibilities. Had FWS not done this, the Fisheries program would have continued to fall substantially short of fulfilling its core responsibilities. The \$1.46 million in savings is being redirected into: mitigation (\$232,000), restoration efforts (\$899,000), and threatened and endangered species recovery (\$44,000). Transfer/administrative costs (\$282,000) will also be covered out of realized savings.

Page 131 of the justification indicates that Hatchery O&M funds will be used to replace inadequate backup water supply systems at Dexter National Fish Hatchery.

Question. How old are the systems that are being replaced? Why were these systems inadequate?

Answer. The current backup systems are over 20 years old and rely on water from distant wells being redirected to rearing units where the water supply has failed. Because of the need to manually switch valves, water to some fish tanks has been disrupted for an hour before backup water arrives. This has led to the loss of endangered fish, most recently the loss of razorback suckers involved in a broodstock development program. A new backup system would provide an immediate water reserve through a 50,000 gallon water tower, with water supply redirection accomplished using automatic controls. The threatened and endangered fish species maintained at Dexter NFH and Tech Center are too valuable to be exposed to the risk of the current backup system.

Over the past several years, the Pacific Northwest has been grappling with the issue of salmon recovery. The FWS hatchery system plays an important role in this process.

Question. How have operations at salmon and steelhead hatcheries in the Pacific Northwest changed in response to ongoing salmon recovery efforts? Have funding requirements for individual hatcheries changed significantly? Have funding requirements for the FWS Northwest hatchery system changed significantly?

Answer. In recent years, conservation needs for hatchery and wild salmon and steelhead stocks in the Pacific Northwest have become increasingly acute. Marine and freshwater conditions have been extremely poor in most areas. Habitat, hydro-power, harvest, and hatchery issues also have received considerable attention. Resource managers have responded in a number of ways to ensure that healthy productive hatchery and wild salmonoid populations can be recovered, restored, and maintained to support sustainable fisheries and other important ecological and social values for future generations. The FWS, along with its other partners, are committed to a comprehensive conservation strategy for salmon and steelhead that has many complementary components (supplementation, mass marking, improved genetics, improved fish health, captive broodstock, comprehensive evaluation, etc.).

The primary responsibility of FWS hatcheries is to meet the restoration/mitigation production and trust resources goals for which they were established. Production from these facilities directly supports recovery plans/objectives, legislative and judicial mandates, and Executive Orders. In order to meet these responsibilities, mandates, and goals, FWS must continue to meet hatchery production requirements with quality fish in an environmentally sound manner. In addition, the FWS hatcheries, fish health centers, and fish and wildlife offices must continue to expand their evaluation and monitoring programs to maintain production efficiency and assure that the genetic integrity, diversity, and fitness of hatchery stocks are sustained.

In response to ongoing recovery efforts, and activities designed to preclude species listing, FWS hatcheries and supporting offices have initiated many of the following actions:

1. Develop captive broodstock (maximize effective population size and genotypes).
2. Initiate new broodstock development techniques (improve mating protocol, reduce effects of inbreeding, maximize biodiversity, increase effective population size, incorporate wild stocks, etc.).
3. Increase hatchery evaluation and assessment.
4. Mark additional hatchery fish to assess impacts between hatchery and wild populations.
5. Utilize hatchery stocks for supplementation activities where wild stocks have been extirpated.
6. Restrict locations of hatchery fish releases to reduce impacts on wild stock (do not release on top of emerging native fry).
7. Adjust operational practices to produce hatchery fish which are released at the size and time that reduces impacts to wild stocks and eliminates competition and displacement of wild populations.
8. Produce salmon and steelhead smolts that are ready to migrate immediately upon release.

9. Improve fish health and increase disease diagnosis and monitoring of hatchery populations (reduce disease impacts of hatchery outplants).

10. Increase fish health monitoring of wild stocks. 11. Mark additional hatchery stocks to address harvest management concerns.

The FWS National Fish Hatcheries and supporting Fish Health Centers, Fish and Wildlife Offices, and Fish Technology Center have to establish annual funding priorities to meet the growing demands for evaluation and monitoring programs that maintain production efficiency and assure that the health, genetic integrity, diversity, and fitness of hatchery stocks are sustained. Mass marking of hatchery releases is also becoming increasingly important.

COOPERATIVE ENDANGERED SPECIES

In fiscal year 1997, the Department for the first time received funds for a land acquisition grants to States program.

Question. How are funds allocated under this program? Has the Department established grant criteria for this program? Have such criteria been published?

Answer. The HCP Land Acquisition Grants to States program provides grants for land acquisition at the local level for approved HCPs. The Department considers the States' use of Federal acquisition dollars for habitat protection within, and adjacent to, HCP areas to be an important and effective mechanism to promote the recovery of threatened and endangered species. These acquisition and land exchanges complement, not supplant, private and/or local government responsibilities required for mitigation related to implementing HCPs. Of the \$6.0 million available for the program for fiscal year 1997, \$2.75 million has been allocated as follows:

—Balcones Canyonlands HCP, Texas (\$1.0 million): The BCCP is a regional HCP that protects 35 listed and candidate species, including the golden-cheeked warbler, black-capped vireo, and six invertebrates, among others.

—Orange County Coastal Central HCP, California (\$0.5 million): This HCP covers the California gnatcatcher, peregrine falcon, southwestern willow flycatcher, and 34 other rare species.

—Volusia County HCP, Florida (\$0.5 million): This plan protects three species of nesting sea turtles as well as piping plovers.

—Washington County HCP, Utah (\$0.75 million): This HCP covers 34 listed and candidate species, including the desert tortoise, peregrine falcon, and bald eagle.

The remainder of the funds will be allocated later this year as FWS continues to evaluate project proposals. The fiscal year 1998 President's Budget continues this program at the \$6.0 million level.

NATIONAL PARK SERVICE

SPECIAL USE FEES

In a 1995 audit report, the OIG concluded that the National Park Service "did not implement its authority to collect and retain fees for special park uses in a consistent manner. This occurred because the Park Service has not completed its efforts to revise the existing guidance (NPS-53, "Special Park Uses") to address the changes created by the Appropriations Acts of 1991, 1992, 1993, and 1994 * * *."

Question. Has NPS revised its guidelines for collection of special use fees subsequent to the OIG's report? If not, why not?

Answer. The NPS has a draft revision that is out for review.

Question. Does NPS intend to make such revisions? When, and through what process?

Answer. Yes, after the review is completed, the guidelines will be finalized and sent to the field. The NPS expects to complete this by late fall or early winter of 1997.

GRAND CANYON

Non-commercial boaters have expressed concern about the level of fees that have been levied on their activities in Grand Canyon National Park.

Question. What fees are currently charged for these activities?

Answer. Individuals participating in noncommercial river use within Grand Canyon National Park currently pay a \$100 Permit Application Fee, a \$25 Annual Renewal Fee (to maintain their position on the Permit Waiting List), a \$200 Launch Fee, and a \$4 per night/per person Backcountry Impact Fee. These fees are in addition to the \$10 per person Park Entrance Fee. This fee program has been specifically designed to spread the costs to the users over the life of the relationship between the permittee and NPS, which averages nine years. Payment is made as serv-

ices are rendered. Taking all of these fees together, split among the average number of participants in a noncommercial Grand Canyon river trip, the average cost is \$100 per person for all services rendered, preservation of the resource, and the opportunity to participate in this world class river experience.

Question. How do the fees compare to the estimated cost to the Park Service of managing such activities?

Answer. The cost recovery component of this fee program is designed to achieve 95 percent recovery of direct NPS costs associated with managing noncommercial river use in the park, in compliance with the law and OMB Circular A-25.

Question. If the fees are in excess of the costs of managing the activity, why?

Answer. The \$4 per night/per person Backcountry Impact Fee is being collected as part of the new Recreation Fee Demonstration Program. As such, this new fee does generate revenue above and beyond the amount necessary to cover current operational costs. In compliance with the legislation authorizing the Recreation Fee Demonstration Program, this revenue will be used to address a large backlog of resource related projects in the backcountry and the river corridor. These funds will only be used for projects directed at the prevention, monitoring, and rehabilitation of impacts caused by backcountry and river use.

Question. Are any of the fees assessed on this activity part of the recreation fee demonstration program?

Answer. As described above, the \$4 per night/per person Backcountry Impact Fee is being collected as part of the new Recreation Fee Demonstration program.

PRESIDIO AND PRESIDIO TRUST

I recently had the opportunity to visit the Presidio in San Francisco. While impressed by the beauty of the property, I am perhaps more convinced than ever that the Presidio would more appropriately be managed as a city or local park. Nevertheless, we have passed legislation establishing the Presidio as a national park to be managed by the Presidio Trust. My principal concern is now how to pay for the operation of this very expensive park.

The fiscal year 1998 budget request for the Presidio is \$24.6 million dollars. This same amount was approved for fiscal year 1997. On April 18, 1997, the Secretary announced selections for the Board of Directors of the Presidio Trust.

Question. What activities will occur during fiscal year 1997 by the Board of Directors to move forward with plans to designate sites within the Presidio which will be managed by the Board?

Answer. The NPS expects that through the summer and fall of 1997, NPS and the Presidio Trust's Board of Directors will organize the transition of responsibilities between NPS and the Trust. Orientation provided by NPS will help familiarize Board members with the Presidio, their responsibilities as Board members, and the first year's requirements as outlined in P. L. 104-333. Once this is accomplished the Board can then move forward in designating sites within the Presidio they will manage and develop the appropriate plans to guide future management decisions.

Question. Has the agency developed plans and alternatives for consideration by the Board?

Answer. The NPS is developing plans and alternatives to transition responsibilities from NPS to the Trust. However, actual decisions regarding administration of the Presidio areas managed by the Trust rest with the Board.

Question. Does the agency have estimates of what the long-term operations costs will be for those sites not selected by the Board to be operated by the Trust?

Answer. The NPS has not developed long-term operational costs for non-selected sites.

Question. Does the agency have estimates for the potential "seed" money necessary to restore specific sites which may be designated by the Board?

Answer. The Presidio Trust plans to hold its first meeting in early July, 1997. As part of the planning process, it is expected that the Trust will develop estimates of funds needed to redevelop the Presidio.

Question. In your mind, how long should it take for the Presidio to generate sufficient revenues to finance its own operation?

Answer. The authorizing legislation requires the Board to present a financial plan within a year of their first meeting, which is expected to occur in July, 1997. The financial plan will review Presidio leasable space, current market conditions, trust financing authorities, and related factors. That plan will also provide a timetable by which the lease revenues will finance the operation of the areas managed by the Trust.

Question. How many years do you envision Federal support for Presidio operations remaining at the level requested in the fiscal year 1998 budget?

Answer. The Department lacks the appropriate information to determine the exact time when Federal appropriations will diminish. However, the Department notes that significant work must occur before the buildings can be leased. To achieve this result, the Trust has several financial tools by which it can guarantee loans, provide direct loans, or issue Treasury obligations. All of these financial authorities are subject to Federal appropriations and the use of these tools will require the appropriation of funds in excess of the amounts requested in the fiscal year 1998 budget.

Question. How long before we reduce that amount by half?

Answer. As stated previously, the Department lacks sufficient information to determine when Federal appropriations will be reduced for the Presidio. The financial plan that the Trust is required to prepare should provide an indication of the time-frame.

GOVERNMENT PERFORMANCE AND RESULTS ACT (GPRA)

The agency budget justification states that by Spring 1997, a revised strategic plan will be produced.

Question. What is the status of the strategic plan development?

Answer. The strategic plan should be published in the late summer of 1997.

Question. Are copies available? If not, when will they be available?

Answer. Copies of the final draft strategic plan (published October 1996) are now available, as are the revised interim goals. The final strategic plan is expected to be available late this summer.

Implementation of GPRA requires the establishment of national accomplishment and accountability standards.

Question. How will such uniform standards be established for the agency which is highly decentralized, and in which decision making authority is delegated to individual park managers?

Answer. The GPRA requires common outcomes rather than uniform standards throughout the agency. Development of an Eight-Step process of GPRA implementation—which goes from the mission of NPS to daily activities to reporting on annual accomplishments, and by setting Servicewide outcome goals—will enable individual parks to use the Servicewide goals (which will be aggregated) as well as develop park-specific goals. The entire NPS GPRA implementation system is designed to work at both the national (Servicewide) and park-specific levels.

Question. Will GPRA reduce costs for the agency?

Answer. Once GPRA is fully implemented, NPS expects this will make the agency more efficient.

Question. Does the agency intend to discontinue the use of any other planning processes upon implementation of GPRA?

Answer. The NPS is considering eliminating the Statement for Management as redundant to the annual performance plan. The agency is also working to integrate GPRA with current NPS planning and management reporting processes.

Question. Does the agency intend to continue its consultation process with Congress?

Answer. The NPS has consulted with Congressional offices since August 1995, on GPRA and its implementation. Because GPRA implementation is an ongoing process, the NPS intends to continue consulting with Congress in the future.

PARK OPERATIONS

A \$65.7 million increase is planned for park operations. The agency budget justification states that parks will receive a one percent across-the-board increase. In addition to the one percent across-the-board increase, the agency proposes to increase operations at various park sites by \$16.3 million.

Question. How are operating costs and efficiencies assessed annually to determine if some parks need more or less in funding?

Answer. The NPS maintains a data base which identifies all unfunded park operating requirements. This data base is generally updated twice a year: 1) in the spring prior to the beginning of the budget formulation process; and 2) in the fall, after enactment of the current year budget request. The increases identified in the data base undergo review at all levels of the organization, beginning with the park and park cluster management, and continuing with the Regional and Headquarters Offices. After review, the requests are prioritized within the amount of funding allowance provided at each stage of the budget process.

The agency budget request states that 63 units will receive an increase of 214 FTEs and \$16.3 million.

Question. How will these FTEs be allocated among each of the units?

Answer. If the entire \$16.3 million is enacted as proposed, the FTEs associated with each request and identified by the requesting office, would be allocated as described in the NPS fiscal year 1998 Budget Justifications. Should the requested dollars not be provided, NPS would reexamine staffing requirements prior to any allocation so as to fit the needed FTE within available targets.

A \$7.1 million increase is requested to improve capabilities within the natural resources management program. Included in this amount is funding for establishment of Cooperative Ecosystem Studies Units to focus on science needs of NPS.

Question. What portion of the total scientific program will be funded from this effort?

Answer. The NPS defines its "scientific program" as inclusive of both its research and resource management activities. Natural resource management applies the scientific findings of inventory, monitoring, and research to the management of park natural resources. The NPS technical specialists in natural resource management generally are trained in one of the natural or social sciences and use their training as scientists to guide their application of scientific information in their routine work. The Service's natural resource budget request in fiscal year 1998 (Natural Resources Applied Research, Natural Resources Management, Everglades Restoration and Research) totals \$93.2 million. The requested increase of \$7.1 million represents 7.6 percent of this total request. The Cooperative Ecosystem Study Unit (CESU) portion of the increase represents 2.5 percent of the total natural resources request.

Question. What portion of total science needs are handled "in house?"

Answer. Very little research is conducted in-house. The NPS does have structured air-quality and social science research programs. However, NPS obtains most of its needed scientific research from its partners in the USGS Biological Resources Division (BRD), other governmental research organizations, the academic community, and other science partners. The Park Service relies on BRD to fund and conduct much of the biological research NPS needs, but in some cases also directly funds the applied, site-specific biological research that BRD either is unable, or does not want, to fund. The NPS receives research support from other divisions of the USGS and also directly funds some of its water and geology research needs.

The NPS usually defines "science needs" to include its resource management activities—that is, the application of science to management of resources. The Park Service handles inhouse almost all of its resource management science application needs within its resource inventory, monitoring, and management activities. The NPS seeks technical assistance to support this inhouse application from BRD and other government researchers and science-educated professionals, from university scientists, and from scientists in other partner organizations.

Question. How does work to be performed by these units differ from work performed by the Biological Research Division of the U.S. Geological Survey?

Answer. The BRD conducts biological research, but not research in other disciplines and not routine, management-oriented inventories, monitoring, and operational management activities that apply science. The NPS science-educated resource management professionals analyze and apply scientific information from a wide range of physical, biological, social, and cultural sciences in conducting their inventory, monitoring, and resource management responsibilities. The CESUs will provide technical assistance to NPS and other land managers in these activities, as well as in a wide range of research disciplines.

The CESU partnership is designed to provide NPS professionals daily consultation with BRD research biologists, as well as with university and other Federal researchers in non-biological disciplines. The work performed at these units will be directed and overseen by a CESU managers committee (from land management and other agencies).

A \$6.5 million increase is planned for cultural resource management program needs. Of this amount \$3.5 million is planned for the Vanishing Treasures program.

Question. How much of this program involves cooperative arrangements with other government or private interests?

Answer. To date, there are no cooperative agreements with other government or private interests in the Vanishing Treasures program. It is likely, however, that some parts of the program, for example the training, will involve cooperative agreements with educational institutions that possess demonstrated expertise in ruins preservation in arid lands. There could be room for other agreements as well.

Question. Is any funding for this effort received through leveraging?

Answer. The vast majority of the need for the Vanishing Treasures initiative involves straightforward operational activities of the National Park System, in which opportunity for leveraging is limited. It is anticipated that private philanthropists will want to participate—probably in some area of work that would not normally be done with appropriated dollars. The Vanishing Treasures Working Group would

endeavor to use both appropriated and donated funds in a manner that maximize the benefit to the resources and the taxpayers, and that might be described as leveraging. We also believe that, should the Congress fund the program, the private sector will be more likely to support the program, thus allowing appropriated funds to leverage donated funds.

Question. Are Native American Tribes active partners in this program?

Answer. The Vanishing Treasures Working Group has not yet enlisted Tribes as active partners, however several Tribes are aware of the initiative and could be involved if the program is fully funded. In addition, a plan has been developed for consultation with Tribes known to have affiliation with the places to be preserved, and preliminary consultations will begin within the next several weeks.

A report by the General Accounting Office, dated April 1997, states that "decisions about spending and operating priorities associated with park operating funds are delegated to individual park managers." The report also states: "According to park managers we (GAO) spoke with, regional or headquarters staff rarely, if ever, discussed with them operation priorities or results accomplished * * *. No expectations have been established for the goals that are to be achieved in the parks, and there is no process for measuring progress toward these goals." The GAO's conclusions are that national priority setting and accountability is lacking regarding expenditures and accomplishments at the parks.

Question. What action is the agency taking to address the issues identified in this GAO report?

Answer. The NPS acknowledges that most of the day-to-day operating and spending decisions at parks have been delegated to the park managers. The need to balance competing priorities as ever-changing circumstances warrant is best left to managers on the scene. The NPS disagrees with the report's conclusion that operational priorities are "rarely, if ever, discussed" with park managers by regional and headquarters management. Overall NPS operational policies and priorities are communicated to park managers in many forms, ranging from official memorandum, electronic mail, and formal meetings. For example, in fiscal year 1997, the Acting Deputy Director of NPS communicated to the field the expectation that the fiscal year 1997 enacted appropriations should prove sufficient to preclude significant closures as was the case in fiscal year 1996. Special emphasis program thrusts, such as messages on employee safety and enhanced fee collection, are frequently highlighted by central office personnel in various communications. In addition, park managers are evaluated by regional directors based upon performance in park operations, and specific priorities are frequently highlighted in these evaluations to stress the importance placed upon them. These practices will continue and further emphasis will be placed on effective communication of NPS priorities to the field.

Question. How will these findings be addressed in the development of GPRA goals for fiscal year 1998?

Answer. The NPS is implementing GPRA by requiring the development of goals and annual performance plans at the park level. These plans will be in conformance with the NPS Strategic Plan and will be approved by Regional Directors. This GPRA implementation plan, to begin for fiscal year 1998, will ensure that further emphasis is placed on what results are anticipated from a park manager's efforts.

The process of developing appropriate and meaningful goals is dynamic. When developed and stabilized, they should provide a linkage of budget resources to results achieved. This process may take several years, but should lead to performance measurement in a more systematic manner than at present.

A General Accounting Office report dated April 1997 states that the agency's flexibility is greatly diminished due to the large proportion of permanent employees. The GAO states that 93 percent of the Park Service staff is permanent which contradicts with the highly seasonal use of the parks.

Question. Why is the amount of permanent staffing at this percentage level?

Answer. The percentages cited are incorrect. The percentage of permanent employees in NPS ranges from 60 to 75 percent of the total work force, depending on the time of the year. The number of seasonal employees peaks during the summer season. For example, at the beginning of the summer season, only approximately 60 percent of NPS employees on-board would be classified as "permanent." This number grows as seasonals go off the payrolls throughout the summer and into the fall.

While the number of permanent employees is currently higher than it has been in the past, there are several reasons for this trend. So as to ensure that health and life insurance benefits are provided to eligible employees, NPS has taken steps to more appropriately classify long-term temporary employees who work longer than six months of the year and are employed without separation for a series of years. This has resulted in a reduction of "temporary" employees in NPS. Another factor

which has lessened the number of "seasonal" employees is a change in the pattern of park use by visitors. It is increasingly common to see rising visitation at parks in the "off-peak, shoulder seasons" of the fall and spring. This practice has resulted in seasonals being required for longer than a six-month period, and a reclassification of these employees to permanent.

Most importantly, at many parks, limited funding has decreased the number of seasonals able to be hired. The reduction in the seasonal program is a common management action taken to offset mandated cost absorptions in recent years, particularly the absorption of pay raises costs not provided. These actions have reduced the percentage of "seasonals" in the NPS work force.

Question. Does the agency foresee an increase in the percentage of the workforce comprised of temporary employees?

Answer. The NPS management has made it clear to park and regional managers that the growing percentage of permanent employees is a practice that is not generally conducive to good management. Accordingly, should the budget of NPS at parks continue to grow steadily as in fiscal year 1997, and as requested for fiscal year 1998, the percentage and number of temporary employees is likely to stabilize, at the least, and should potentially grow.

RESOURCE STEWARDSHIP

During the State of the Union message the President announced the establishment of 14 National Heritage Rivers.

Question. How will NPS be impacted by the establishment of these rivers?

Answer. Communities will submit nominations to designate rivers, and some that are identified that may include reaches that run through, or near, parks. In the event that one of these rivers gets designated, it is likely that park staff will be invited to participate in the partnership that is established to work on the community's plans.

In addition, several technical assistance and grants programs in NPS have been identified as useful components of the Federal "toolbox" that is available to assist communities with river conservation and historic and cultural resource preservation. These programs include Rivers, Trails, and Conservation Assistance, Historic Preservation Tax Incentives program, Comprehensive Historic Preservation Planning, the Historic Preservation Fund, and others. It is anticipated that NPS, operating these programs according to their customary criteria, may be able to assist some American Heritage River communities.

Question. What criteria will be used for designating a National Heritage River?

Answer. The American Heritage Rivers initiative was outlined in a Federal Register notice (published May 19, 1997) that invited public comment. The criteria listed in the Federal Register notice (which are still subject to change) are:

QUALIFYING CRITERIA

The qualifying criteria are intended to be broad, flexible, and credible. Designation is available both to community-led efforts that are well underway and to communities just beginning. In making a nomination, sponsoring communities or organizations must demonstrate broad community support; notable resource qualities; local and regional partnership agreements; strategies that lead to action; and an ability to achieve measurable results.

—(1) *Broad Community Support.*—A broad spectrum of private citizens, such as landowners, businesses, educational and arts organizations, community leaders, economic developers, nonprofit organizations, public and private institutions, local and State government agencies, Indian Tribes, elected officials, and/or other parties within and adjacent to the proposed area or areas support the designation and the goals of American Heritage Rivers.

—(2) *Notable Resource Qualities.*—There are within the proposed river area (as defined by the community or organization) a range of natural, economic, scenic, historic, cultural, and/or recreational features that demonstrate distinctive qualities of America's river heritage.

—(3) *Local and Regional Partnership Agreements.*—The principal party or parties nominating the river and local or regional governmental entities show their willingness and capability to enter into new, or to continue and expand existing, partnership agreements with each other as well as with Federal and State agencies, Indian Tribes, and/or other parties to implement a plan for the river area.

—(4) *Strategies That Lead to Actions.*—The principal local sponsoring party or parties has in hand, or is developing, a broad plan of action for the river area.

Any actions planned on the designated area should not impact downstream communities.

At a minimum, the strategy includes the following components: community vision; operating procedures and policies; description of how the proposal takes into account existing plans for the area; public participation and public education; projects and products (including any anticipated impacts beyond the designated river area); resources committed and anticipated (including means for generating additional and matching support from both public and private sources; schedule of actions; what the community expects the Federal role to be; obstacles to community action, including those the community believes can be resolved by joint Federal, State, and local support; and Measures of success.

—(5) *Measurable Results*.—Implementation of the community's vision must result in measurable benefits to the river community reflecting the community's goals, including, but not limited to, protection of water resources and/or public health, restoration of rivers, protection and highlighting historic and cultural resources, revitalization of local and regional economies, and/or implementing sustainable development within the river area.

SELECTION CRITERIA

A selection council, convened by the President and discussed below, will, for those nominations meeting the qualifying criteria, also seek to ensure that, individually or as a group, American Heritage Rivers will exemplify America's river heritage at its best, in all its natural, historic, cultural, social, economic, and ecological diversity. The selection council will judge whether the designated rivers will showcase a variety of stream sizes and situations, in urban, rural, and mixed contexts. They will also assess the potential for an American Heritage River to showcase one or more innovative programs in such areas as watershed planning, historic preservation, wildlife management, fisheries restoration, community revitalization, floodplain management, and recreation. Applicants should keep in mind the selection criteria in their responses to the qualifying criteria.

In addition, designated rivers will be able to benefit significantly from a broad range of refocused or retargeted Federal programs or other assistance and help generate broader public support for the goals and guiding principles of American Heritage Rivers as excellent examples and models for emulation throughout the Nation.

Question. How much will the President's initiative cost the Park Service?

Answer. Because the work done for this initiative falls entirely within the scope of existing programs (and their mandates and criteria), it is anticipated that the only cost to NPS for support of the American Heritage Rivers initiative will be the time associated with FTE dedicated to American Heritage Rivers.

A \$2.5 million increase is planned in the Applied Research program. Three projects are scheduled for completion in fiscal year 1997 which relate to air quality monitoring.

Question. Based on findings from these studies, how will alternatives be developed to determine the Administration's approach to air quality management around these three study areas?

Answer. The \$2.5 million increase for the Natural Resources Applied Research Program is primarily for establishing Cooperative Ecosystem Studies Units at universities; none of this increase will fund additional air quality monitoring and research activities. Coincidentally, \$2.5 million of the \$8.3 million fiscal year 1998 budget request for applied research is earmarked mostly to support all of the ongoing long-term visibility monitoring and research performed in national parks—especially those designated as "Class I" under the Clean Air Act.

However, a \$1.0 million increase is being requested within the Natural Resource Management portion of the fiscal year 1998 budget primarily for the much needed modernization of the NPS air quality monitoring network.

With respect to the three projects slated for completion in fiscal year 1997, the Administration will rely heavily on collaborative decision-making processes with all major stakeholders—i.e., appropriate Federal, State, local regulatory agencies and legislative bodies, business and industry groups, other Federal land managing agencies, foreign governments and environmental agencies (in the case of the United States-Mexico Aerosol Study) and the public—to develop alternatives in determining its approach to air quality management around the three study areas. The NPS is already an active participant in numerous multi-stakeholder, regional (and international) partnerships that have been formed to carry out these and other studies and to formulate appropriate solutions to air quality management problems facing national parks.

Question. What mitigation measures are being employed to stop or stall the spread of exotic plants and animals in the national parks?

Answer. While individual parks conduct many control activities, there is currently no Servicewide program in place to control exotic plants and animals. However, some examples include herbicide applications to control exotic plants, and beneficial (biological control) insects have been released at dozens of parks. Several western parks require horse and mule owners to use hay which is certified to be free of weed seeds. The NPS has played an active role in developing "Pulling Together A National Strategy for Invasive Plant Management" and has assisted with several Congressional briefings, developed park-specific educational materials and helped fund other educational materials. St. Croix National Scenic River in Wisconsin has an aggressive education campaign and boat inspection program to prevent the introduction of zebra mussels. Eastern parks use funds transferred from the Forest Service to spray gypsy moths and hemlock wooly adelgids. Wild pigs have been eliminated from Channel Islands National Park in California and are being managed at Great Smoky Mountains National Park in Tennessee and at the Hawaii Parks. Fencing is being constructed at White Sands National Monument in New Mexico to control gemsbok. \$100,000 is requested for the Northwest Ecosystem Office.

Question. Does this office have any association with the former Office of Forestry and Economic Assistance located in Portland?

Answer. This Administration established two offices in Portland, Oregon in support of the Northwest Forest Plan. One office, the U.S. Office of Forestry and Economic Development in Portland, dealt primarily with economic assistance to the States and local communities that were affected by the Northwest Forest Plan. After publishing its final report to the President and Congress, the Economic Development office closed, as scheduled, in December 1996. The second office, the Regional Ecosystem Office, is an operating, multi-agency office that works for various Federal land and regulatory agencies that have responsibility for implementing the Northwest Forest Plan. While both offices were part of the Northwest Forest Plan, they worked separately and on different aspects of the plan.

The estimated number of acres of park land which have been inventoried to current scientific standards for archeological resources is 1.5 million.

Question. What is the long term timetable to obtain an inventory of the total acres needed to be assessed?

Answer. Beginning in 1992, each NPS Region developed a plan establishing long-term strategies and priorities for conducting archeological inventories on park land within the Region. The plans currently are being reviewed and revised to reflect NPS's new cluster-level organization. The plans contain a ranked list and schedule of needed archeological inventory projects. The inventory program is a long term one that will take many decades to complete, depending upon the funds available each year to undertake projects.

The agency proposes \$750,000 for finalization of the Cultural Landscapes Inventory Procedural Guidance Manual.

Question. Once the manual is finalized, what are long term inventory plans? Be specific relative to timing and cost.

Answer. Development of the Cultural Landscapes Inventory Procedural Guidance Manual is only a small part of the \$750,000 allocated in fiscal year 1997 for the Cultural Landscape Inventory (CLI). Also included is finalizing the development of the associated database, Cultural Landscapes Automated Information Management System (CLAIMS); conducting CLAIMS training; and ongoing inventory field work Servicewide.

Long-term inventory plans include performing the CLI research and field work Servicewide in accordance with the goals of NPS Strategic Plan and the GPRA; entering collected data into CLAIMS; refinement of CLAIMS management queries and reports; and training to maintain high professional standards regarding the information collected. Each region has prepared implementation plans establishing long-term strategies and priorities for performing the CLI research, field work, and data entry.

The NPS anticipates this process will take in excess of a decade. The total costs associated with the long-term plans are unknown, due to the unknown quantity of resources that will be available. In order to be more specific regarding timing and costs, a goal has been established to complete reconnaissance surveys of all parks by the end of fiscal year 1999 to identify the potential scope of cultural landscapes in the National Park System.

The agency states that funding to provide enforcement protection of fossil resources has been minimal while documented violations have increased.

Question. How will the proposed increase of \$2.5 million affect these protection efforts?

Answer. The \$2.5 million increase refers to the estimated increase in budgetary resources proposed in fiscal year 1998 to address the "resource protection" program component of the budget subactivity "Resource Stewardship." Most of this funding (\$1.5 million) would cover the increased benefit costs for NPS rangers who have been appropriately shifted to a new retirement plan similar to that provided for other law enforcement officers.

The remaining \$1.0 million reflects an estimate of the "resource protection" share of the funding requested for park base operational activities in fiscal year 1998. The total amount requested within park management is \$24.4 million and would allow a one percent across-the-board increase for all park units to maintain current program capabilities and selectively address unfunded, high-priority needs at 63 individual units. Examples of parks proposed for increases which would involve resource protection activities include Cape Hatteras National Seashore, Kenai Fjords National Park, Florissant Fossil Beds National Monument, Whiskeytown National Recreation Area, and Manzanar National Historic Site.

The Park Service just completed its Servicewide strategy for management of exotic vegetation. The NPS has a prioritized list of park projects that for potential funding. It is estimated that current funding has met less than 10 percent of the documented need.

Mining operations are expected to increase in the California desert parks.

Question. What long term staffing and funding needs will be necessary to manage the Desert mining program?

Answer. At this time it is difficult to discern future long-term staffing and funding needs beyond the current baseline of active mining operations, number of proposed mining operations, abandoned mine sites, and associated resource impact issues. The fiscal year 1998 program increase request for salary and support costs for six FTE (\$580,000), combined with the increase for Mojave National Preserve (\$318,000 and 5 FTE) is the minimum necessary to meet currently anticipated specialized, technical assistance needs of the Desert park units. The six FTE in the Servicewide program will serve the parks in various technical capacities, including conduct of claim validity examinations, regulatory and policy guidance, mine land reclamation, and hazardous substance toxicology and remediation. However, events beyond Park Service control (e.g., significant price increase of mineral commodities, increased demand, and development of more cost-effective mining technologies) could result in more proposed operations beyond the current and projected level, thereby increasing the need for additional NPS staff and funding resources to handle management demands.

If an unanticipated increase in mining activity occurs, NPS will need additional FTE and support funds to conduct the requisite mining claim validity examinations to verify whether a claimant possesses a bona fide mineral right and to process proposed plans of operations. In addition, NPS may need funding to acquire mining claims if future mineral development of specific claims will be in derogation of park resources and values.

Mojave National Preserve's fiscal year 1998 program increase request for salary and support costs dedicated to mining claims management should meet the current and future park-based workload. However, fiscal year 1998 park-based program increases do not address long-term mining claims management staffing and funding needs at Death Valley and Joshua Tree National Parks.

Question. Is the proposed addition of six FTEs sufficient?

Answer. As addressed above, salary and support cost increases for six FTE in the Geologic Resources Division will meet current technical assistance needs in the California Desert park units. The fiscal year 1998 program increase proposed for Mojave National Preserve should meet current and future park-based mining claims management program needs. Death Valley and Joshua Tree National Parks may need additional mining claims management FTE depending upon the number and frequency of future mining operation proposals.

VISITOR SERVICES

Interpretive and education programs are provided at all 374 units in the system.

Question. How many units present this information only through displays (without personal contact with employees or volunteers)?

Answer. It is difficult to separate the units with only non-personal services (exhibits, wayside exhibits, publications) from those with personal (ranger-led programs) and non-personal services. There are approximately 324 staffed sites which offer both types of visitor experiences. Only the smallest of sites offer just displays. Parks such as Shenandoah National Park offer all types of display services and interpretive staff. Others such as Theodore Roosevelt Island have a few wayside exhibits

but no permanent staff and the Netherlands Carillon only has a single wayside exhibit. There are a small number of sites that offer only information displays and no permanent onsite staffing.

Question. Are there more such units today than in the past?

Answer. Small, unstaffed sites, in the past, were usually added to the System through boundary changes and other adjustments affecting larger NPS units. Areas added to the Park System in the past five years such as Washita Battlefield and Nicodemus National Historic Sites will be staffed by permanent NPS personnel. These areas will likely also feature wayside exhibits to assist in interpreting events that took place at various locations at these park areas.

Question. What is the past five year data on this question?

Answer. The NPS does not maintain historical information on the number of units that present interpretive information without staff resources. However, information is maintained on the demands for non-personal service displays, publications, and the workloads involved in production. A survey completed in June 1995 indicated the Service had 791 visitor center exhibits, 10,618 wayside exhibits, 1,233 media programs, 370 folders, and 163 park handbooks. This Harpers Ferry Center Interpretive Media Rehabilitation Survey defines the media rehabilitation needs for the Service in each category. The following statistics represent the work accomplished over the past five years in the area of non-personal services. A very small portion of this work was accomplished for non-staffed NPS units.

PUBLICATIONS

Fiscal year	Units print	Quantity printed	Total visitors	NPS folders/visitors
1992	221	20,142,000	274,694,549	1:14
1993	259	25,609,900	273,120,925	1:11
1994	247	31,117,000	268,636,169	1:9
1995	243	27,965,500	269,564,307	1:10

Question. Is the “Parks as Classrooms” program utilized away from park units?

Answer. Yes, the Parks as Classrooms program is an integrated, curriculum based activity that is designed to meet local school curriculum and classroom needs. The program is typically made up of three activities: (1) a pre-site visit by a Park Service interpreter to the classroom where students are prepared for an on-site learning activity, (2) an on-site learning experience at the park, and (3) a follow-up activity where the learning experience is evaluated. The park interpreter works closely with the classroom teacher to assure that the teaching/learning objectives are met. Many parks also produce theme-related teaching materials such as traveling trunks, teaching kits, interactive CD-ROM programs and teaching materials which are sent to schools. The Park Service is also using its Internet website, ParkNet, and has

recently entered into an agreement with NASA's Goddard Space Center to provide cooperative education materials and programs nationwide.

Question. Is this program presented in urban non-park areas?

Answer. Yes, all urban national park sites provide some degree of outreach programs to urban populations. For example, Santa Monica Mountains National Recreation Area in Los Angeles participates in the "Wonderful Outdoor World" program which provides outdoor learning and camping experiences for youth in their own inner-city neighborhood. At Independence National Historical Park in Philadelphia, park personnel offer an outreach program called the "Traveling Ambassador" which takes programs on jobs, history, and the National Park System to the inner-city. During the 1996-97 school year, the program was presented to over 7,000 students in 54 schools. Ecology Village at Gateway National Recreation Area in New York City offers off-site programs to over 3,000 children from January to March while the park's Outreach Office provides programs to thousands more throughout the year.

There are similar programs at Golden Gate National Recreation Area in San Francisco; Martin Luther King National Historic Site in Atlanta; Jefferson National Expansion Memorial in St. Louis; Lake Mead National Recreation Area near Las Vegas; Jean Lafitte National Historical Park and Preserve in New Orleans; and Boston National Historical Park in Boston. Some urban area parks such as those found in Washington, D.C., work with other organizations such as Project Learning Tree, Project Wet/Wild, and Urban Tree House to provide educational programs off park lands in urban settings. Many parks also offer drug prevention programs to urban school groups.

A Departmental OIG report found that NPS has failed to do an adequate job of recovering costs of emergency services from beneficiaries. The report states that "at least \$4.5 million were not recovered," and "fee collections totaling \$757,800 were inappropriately retained by park units".

Question. What action is the agency taking to rectify this problem?

Answer. The NPS disagreed with the Office of Inspector General Report (96-I-806) recommendation which we felt was in opposition to Congressional intent behind current law (28 U.S.C. 2671 et seq.), under which NPS has discretion to provide emergency medical services. Loss of such discretion would result from a practice of charging for emergency services, consequently extinguishing the immunity Congress intended for these activities. The Department has taken this matter on itself for resolution, and NPS is awaiting the Department's decision.

Question. What specific changes will be made in billing procedures to improve collections and make a more consistent process?

Answer. The NPS agreed to make the proper deposits into the miscellaneous receipt accounts of the U.S. Treasury, but disagreed that emergency search and rescue fees or emergency medical fees should be collected, absent willful and wanton negligence on the part of the lost, rescued, or injured visitor.

Question. How extensive is the problem of illicit drug manufacturing on park lands?

Answer. The NPS has had, and continues to have, a significant impact in the campaign to halt illegal drug production on National Park lands. As a result of numerous sustained law enforcement initiatives implemented by NPS there are indications that a number of marijuana growers have either stopped growing marijuana or have moved their operations from NPS lands onto private land or indoors.

In Hawaii, drug producers avoid national park lands for fear that they will be caught by park rangers, convicted in Federal Court, and sent to mainland prisons. Rangers have waged a relentless "Marijuana Campaign" since 1986 on marijuana growers who have historically used park lands as their garden sites. These joint eradication operations have been so successful that, today, most growers admit that NPS lands in Hawaii are off limits to the production of marijuana. The parks continue to produce large numbers of plant seizures and arrests.

The NPS Southeast Region is now the most prolific marijuana producing area in the System. Park rangers are producing a continuous stream of marijuana production cases. Efforts have increased significantly in 1997 to reduce this illicit crop and to arrest those responsible. In recent years the Big South Fork National Recreation Area has been used for the growing of marijuana plants. Joint eradication operations with the Forest Service on the Tennessee and Kentucky border have seriously affected the local drug economy and resulted in the destruction of large numbers of marijuana plants.

The NPS areas located on the United States/Mexico border are aggressively pursuing counter-drug operations with a sustained year-round effort. The U.S. Customs Service and the Border Patrol have provided cross training to the rangers with the Customs Service providing some cross delegation authority for the rangers. Smuggling activities continue and the violence appears to be escalating. Most smuggling

cases are considered far more dangerous than marijuana cultivation because most smugglers are Mexican nationals who are more accustomed to violent conflicts with police in Mexico.

The NPS anticipates continued violent contacts with growers and smugglers in the future. The park rangers assigned to the border parks are better trained and equipped than they were five years ago. Most of these border and marijuana growing park areas have one or two rangers who have experience and training in the areas of smuggling and surveillance of suspected growth locations.

Based on Park Service jurisdiction the agency is required to enforce all Federal laws and regulations within park units.

Question. Is there any significant cooperation occurring with local authorities on Park land?

Answer. Yes; NPS is working with a number of local task force operations which are being used to conduct coordinated counter-drug operations. The NPS is also assisted by the military in a support mode where the military provides transportation and other non-law enforcement support when requested. The NPS is transitioning to more electronic surveillance of the areas where drugs are grown or manufactured thus saving overtime costs and operating funds until they are actually needed. For the most part, all operations of this nature occur within park boundaries. The drug problem has increased in the last three years with the production of marijuana on the increase on park lands. Special emphasis is being undertaken to eliminate this activity, not only due to its illegality but because this farming method also causes harm to the park environment.

Question. To what extent can State and local statutes be enforced on park land?

Answer. In areas of proprietary jurisdiction, the State may enforce State law, but generally chooses to leave NPS to provide the level of enforcement activity that is called for on park land. In areas with concurrent or exclusive jurisdiction, NPS cooperates with the United States Attorneys Offices that handle court prosecution of violations. The decisions regarding jurisdiction are made by Department of Justice personnel. For the most part, States consider the parks responsible for enforcement actions within park boundaries. Cooperation is excellent between NPS and State and local law enforcement officials. Additionally, NPS does not volunteer to operate outside its boundaries or jurisdiction unless in a cooperative capacity with our State and local counterparts.

Question. Will the agency make increased use of visitor transportation systems at more park units in the future?

Answer. There will be increased use of these systems in park units in the future due to growth in park unit visitation and limited funds for improving park roads and providing additional parking. In many instances roadways cannot be widened or parking areas enlarged to accommodate private vehicles because of the need for resource protection and other environmental constraints.

A new visitor transportation system will become operational in Zion National Park and systems will be expanded in Grand Canyon and Yosemite National Parks in the near future. System planning has been undertaken in special studies or in NPS General Management Plans for: Acadia, Crater Lake, Sequoia, Mount Rainier, and Yellowstone National Parks; Indiana Dunes National Lakeshore; Presidio (Golden Gate National Recreation Area); and Bandelier National Monument.

While there has been major storm damage to facilities at Yosemite National Park, there is an opportunity to implement restoration efforts which will enhance the outstanding values. A significant aspect of this opportunity involves planning the visitor transportation system. The fiscal year 1997 Supplemental appropriations bill contains funds for repair and restoration of visitor transportation systems.

Question. What long term plans are being made to implement the best possible transportation system?

Answer. The NPS is working to identify options for a regional system through its involvement in the Yosemite Area Regional Transportation Strategy (YARTS). The YARTS is currently conducting public workshops to help in proposing a level of service for the forthcoming plan for a regional system. The local system that will move people around Yosemite Valley will be defined through the NPS Valley Implementation Plan, which is scheduled to be released for public comment in September 1997. This plan is considering an in-valley transfer and staging area. A transfer facility in Yosemite Valley is needed to provide the linkage between the local in-park system and the regional system. The staging (parking) area is being considered as a potential interim facility to be constructed and reduced in size with the maturation of a regional system. If a regional system develops concurrently, then NPS can elect not to construct parking or to proportion it based upon the capabilities of the regional system.

Question. What is the Park Service's ongoing relationship with local communities in the planning of the transportation system?

Answer. The NPS has a formal relationship with its gateway communities through its membership on the YARTS board, which consists of representatives of Madera, Mariposa, Merced, Mono, and Tuolumne counties, Cal Trans, the Federal Highway Administration, Forest Service, and NPS. Citizens, such as business and environmental interests, also are invited to participate.

Question. To what extent will the supplemental funds involve local communities in the planning of the system?

Answer. Local communities will be invited to help NPS define the criteria and decision points for whether to develop in-valley parking, the size of such parking capacity, and the conditions under which to downsize parking facilities based on the capabilities of the regional system. The NPS will also invite participation from businesses and environmental interests, representatives of State and Federal agencies, and staff from the offices of the California Congressional delegation.

Question. Will short term "fixes" to the storm damage affect long term transportation system options?

Answer. The repairs undertaken at the park will assure that NPS is prepared to link with the long-term regional transportation system if such a system is developed in the future. If a regional system were to move forward without additional in-valley shuttle buses, then our bus capacity would be less than half of that required to effectively move the number of visitors that come to Yosemite Valley. Our system is currently designed to handle the numbers of people that we can get out of their cars and into our bus system, not the number that would be utilizing the system under a planned transportation system, where automobiles would no longer be used to move about the valley. A transfer facility would provide a point of linkage with a regional system. A parking area, developed under the criteria mentioned above, would be reduced in size and possibly not constructed at all based on the capabilities of the regional system.

Question. Has NPS considered the use of advanced alternative fuel vehicles, such as Fuel Cell buses?

Answer. Currently, two electric buses are in operation in Yosemite Valley and two more have been ordered. The supplemental funds will be used to purchase electric buses and possibly compressed or liquid natural gas buses. Because of the demands that will be placed on that system, fuel cell technology is not economically feasible at this time. Should the cost be reduced in the future, the electric buses that NPS has acquired would be able to take advantage of that technology.

Question. Of all the agency's facilities used by the public, what percent are fully accessible to persons with disabilities?

Answer. In 1983, NPS established an official policy statement that asserted that, "it is the policy of NPS to provide the highest level of accessibility in all visitor and management buildings and facilities as is possible and feasible, consistent with the nature of the area and facility." Over the past several years, NPS has conducted an extensive program of education and technical assistance to help the parks understand what they should be doing and the methods and techniques for doing it appropriately and effectively. Over the past several years, most of the parks have conducted evaluations to identify barriers to access and have made some modifications and corrections, utilizing existing operating funds. Unfortunately, NPS has not conducted a comprehensive evaluation of all of its facilities to determine if all facilities are 100 percent accessible to persons with disabilities.

Question. Is there a timetable for achieving 100 percent accessibility? If so, what is that timetable?

Answer. Presently, there is no time table to achieve this level; however, all significant modifications and new construction must be in compliance with current code related to handicapped access.

Question. If so, what is that timetable? What are the costs?

Answer. In 1988-89 NPS asked each park to conduct a "self-evaluation" of their facilities and programs, utilizing the best information available at the time. Using the information generated by that evaluation, NPS made some estimates of the cost for correcting the access barriers that were identified and projected the cost for systemwide improvements. At that time, NPS estimated that it would need between \$60 and \$100 million to bring all of its facilities into compliance. However, that estimate was not comprehensive and actual costs could be more or less than that amount. Employee compensation costs are expected to increase by \$1.7 million.

Question. What is the agency's historic worker's compensation costs for the past five years?

Answer. The NPS actual Worker's Compensation Payments for the past five years were as follows:

NPS actual worker's compensation payments

	<i>Whole dollars</i>
1992	\$9,364,000
1993	10,249,000
1994	11,816,000
1995	12,332,000
1996	14,345,000

Question. What specific action is the agency taking to reduce these costs?

Answer. The NPS has adopted the following strategy to address the issue: (1) the National Leadership Council has committed itself to ensuring that all new workers' compensation cases are managed; (2) it is the Service's strategic plan goal under GPRA to reduce the cost of new workers' compensation cases by 50 percent by 2002; (3) a Workers Compensation Case Management Guideline has been drafted and will be issued servicewide along with a supportive training video; (4) training for case managers is being planned; and, (5) the Department is identifying cases on the long-term disability roles that are recommended for intervention. The NPS will focus on bringing personnel on this list back to work. The limiting factor is lack of funds to support FTE for personnel brought back to work, and the lack of personnel to manage these cases, but both some of the funding for these needs are requested in NPS fiscal year 1998 budget. The NPS is also recruiting for a Workers' Compensation Case Manager as a point of contact for case management and as a liaison between NPS and the U.S. Department of Labor, Office of Workers' Compensation.

Question. Does the agency have an aggressive program to return former employees to positions which will result in reducing compensation costs?

Answer. The NPS has proposed increased funding of \$320,000 in fiscal year 1998 for the Office of Workers' Compensation Program (OWCP). The proposal outlines a complementary program to the Department's current policy which provides FTE for two years to organizations wishing to reemploy injured workers who have obtained new skills. The NPS program would provide funding for those positions, also for a two-year period. At the end of the two-year period, the FTE would be returned and made available for use by other park units or offices. The request would fund nine positions servicewide.

Question. What are Departmentwide statistics relative to this issue?

Answer. The Department's actual Worker's Compensation Payments for the past five years were as follows:

Department's actual worker's compensation payments

	<i>Whole dollars</i>
1992	\$35,126,916
1993	36,452,000
1994	40,528,288
1995	42,282,473
1996	44,661,217

The agency manages 18 percent of the land on the border with Mexico.

Question. Have there been increased impacts to NPS lands as a result of illegal immigration and drug smuggling?

Answer. Yes, NPS has found that increased foot traffic has degraded park features as well as contributed to littering and resource degradation in park areas. Drug smuggling has also made nighttime activity in these parks extremely dangerous and campground thefts have also increased.

Question. Does the Border Patrol cooperate with the Park Service in the apprehension of illegal entrants?

Answer. Both the Border Patrol and NPS work together to investigate border crimes and to apprehend those individuals entering the United States illegally. The NPS has an interest in protecting park resources which prevents the use of some Border Patrol vehicles for routine patrol activity; these areas are patrolled by NPS on foot.

Question. Does the NPS utilize State, local, or other Federal agency law enforcement dispatch and radio systems for use by law enforcement rangers? If not, why not?

Answer. Yes, in locations where there are dispatch and radio system resources are available. However, for the most part, State and local agencies do not position their communication operations on border areas where parks are located. The NPS, in a number of areas, provides communication support, dispatch services, and similar assistance for other agencies in "dead areas" where State and local communication systems do not work. The Park Service works closely with the U.S. Customs Service

and in some cases shares communications systems. The NPS has also received grants to upgrade communication systems for cooperative counter-drug work.

Question. Has the agency investigated the prospect of shared law enforcement communication?

Answer. Yes, NPS has, when possible, joined with other agencies and local departments to share communications systems. The main problems are that State and Federal radio frequencies and radio equipment often are not compatible. For example, NPS has a presence in a consolidated Federal facility in Riverside, California, which is comprised mostly of Federal law enforcement, fire, and other law enforcement agencies. The NPS also shares a facility in Flagstaff, Arizona, which covers NPS, BLM, and Forest Service sites.

MAINTENANCE

A \$13.5 million increase is requested in the Operational Maintenance program in fiscal year 1998, which includes a net programmatic increase of \$7.3 million.

Question. What is the past five year history of funding in this area?

Answer. The total funding enacted for Operational Maintenance over the last five years was as follows.

Operational maintenance—enacted amount

<i>Fiscal year</i>	<i>In thousands</i>
1997	\$295,830
1996	275,788
1995	273,842
1994 ¹	301,086
1993	271,078

¹ In fiscal year 1994, NPS restructured its budget and budget monitoring system to more accurately reflect costs in various functional areas. In fiscal year 1995, after using the new structure and reporting mechanism for a year, functional amounts were revised to reflect the results of this use. In doing so, the amount estimated for operational maintenance was adjusted downward by about 10 percent. Subsequent monitoring activity in fiscal year 1996 confirmed the accuracy of this revision, in effect verifying the overestimates of the previous years.

Question. How will the increase be allocated to specific park facilities?

Answer. The \$7.3 million in programmatic increases requested for fiscal year 1998 will be distributed to a number of parks based on needs identified by specific parks. The parks receiving this and other park base funding are listed and their funding need identified and justified in NPS budget justifications. Examples of the parks that are proposed to receive this funding include areas such as Antietam National Battlefield, Canyonlands National Park, Chickasaw National Recreation, Mount Rushmore National Memorial, and Natchez Trace Parkway.

PARK SUPPORT

The use of volunteers is estimated to increase to 90,000 in fiscal year 1997.

Question. Has the agency had difficulty locating volunteers to perform work?

Answer. No; the NPS's Volunteers-In-Parks Program continues to experience growth in popularity. The NPS is attempting to increase the numbers of volunteers with specific skills relevant to NPS mission. To that end a "Volunteer Opportunities" homepage has been recently established on the Internet to allow individuals interested in the program to have direct access to existing volunteer vacancies. The following statistics represent the development of the VIP Program between 1992 and 1996.

DEVELOPMENT OF THE VIP PROGRAM BETWEEN 1992 AND 1996

Fiscal year	Number of volunteers—		Percent annual growth
	Total	Hours	
1992	73,350	3,057,660	4
1993	78,500	3,204,880	7
1994	80,743	3,471,418	3
1995	79,497	3,289,153	-2
1996	89,242	3,468,903	12

The total number of projects in the challenge cost-share program has remained constant for fiscal year 1995–1997.

Question. What is the future potential to increase the number of projects in future years?

Answer. The number of projects have remained relatively constant primarily because the amount of funds earmarked for the Challenge Cost-Share Program have remained the same at \$1.8 million. The NPS attempted to increase the number of projects funded starting in fiscal year 1996 and fiscal year 1997 by emphasizing in our implementation instructions to Regional Office selecting officials that all programs and projects of the Service, both inside and outside of parks, were now eligible for funding, and also by reducing the Federal share maximum contribution from \$40,000 to \$30,000.

However, despite the relatively constant numbers of projects funded with challenge cost-share money, parks and programs consistently receive more than twice the number of applications than can be funded by the \$1.8 million.

WILDLAND FIRE MANAGEMENT

The agency proposes a funding increase of \$2.5 million which will result in operations at 88 percent of the most efficient level (MEL).

Question. What level is the agency operating at in fiscal year 1997? Assuming this level is less than the 88 percent goal for fiscal year 1998, what consequences have occurred due to this lower level? How does the 88 percent goal compare to requests made by other land management agencies?

Answer. The Park Service Budget Justification provides a summary of likely funding allocations from BLM to the NPS Wildland Fire Preparedness and Wildland Fire Operations budget activities. The ultimate allocation is subject to the final 1998 appropriation made to the BLM Wildland Fire Management account. At the request level contained in the President's Budget, all four Interior bureaus would be allocated amounts at roughly equal levels of preparedness, based on historical use patterns for equipment, salaries, and the other costs that figure in the calculation of the most efficient level (MEL). At the request level, this would equal about 85 percent of MEL, up from 84 percent in 1997.

HISTORIC PRESERVATION

An increase of \$9.4 million is requested for the grants-in-aid program.

Question. When providing matching funds for historic preservation efforts, is the ratio of matching always 1:1, or does it vary?

Answer. The ratio it is not always 50 percent Federal and 50 percent non-Federal matching share. Section 101(e)(1) and 101(e)(2) of the National Historic Preservation Act authorize "matching grants" to State Historic Preservation Offices (SHPO's) and to the National Trust for Historic Preservation, respectively, and Section 102(a)(3) stipulates that grants to SHPO's may not exceed 60 percent Federal share.

However, Section 101(e)(3)(B) of the National Historic Preservation Act authorizes direct grants to "nonprofit organizations representing ethnic or minority groups for the preservation of their cultural heritage." While Section 101(e)(3) is silent about a matching share requirement for direct grants, it is within the Secretary's administrative authority to require a non-Federal matching share. The \$4.3 million cumulative total of grants awarded to historically black colleges and universities in fiscal years 1995 through 1997 were made to the United Negro College Fund (UNCF), which raised most of the \$4.3 million non-Federal matching share in accordance with the Memorandum of Agreement then in effect between NPS and the UNCF, and subgranted the funds to individual colleges.

However, Section 507 of Public Law 104-333, the Omnibus Parks and Public Lands Management Act of 1996, authorizes \$29 million in grants and identifies 12 HBCUs selected by Congress. Public Law 104-333 also provides authority for the Secretary to waive the non-Federal matching share requirement. Recent discussions between NPS, UNCF, and the 12 HBCU's indicate that neither the HBCU's nor the UNCF can promptly raise the 50 percent matching share that has been contributed for previous HBCU grants.

Question. If it does vary, please provide a project specific list for fiscal year 1998 showing the matching fund shares.

Answer. As indicated previously, NPS does not vary the matching share ratio except as prescribed by the National Historic Preservation Act. For fiscal year 1998, it is still too early to know how much funding the UNCF will raise for HBCU's.

Question. What process is used to award grants under this program?

Answer. The \$4.3 million in HBCU grants awarded during fiscal years 1995 through 1997 were selected based upon the following criteria: (1) the building was

listed in the National Register of Historic Places; (2) the building possessed greater architectural and historical significance than other HBCU structures; and (3) the building was in such a State of disrepair that, if structural deficiencies remained uncorrected, then the structure would be critically endangered. As a result, 11 of the most historically significant and threatened structures were evaluated by a joint Department of the Interior-private sector field assessment team and ranked in order. Seven of the 11 HBCUs selected have received grants during 1995–97. Section 507 of Public Law 104–333, the Omnibus Parks and Public Lands Management Act of 1996, has identified 12 HBCU's and has authorized specific amounts for these individual HBCU's (\$22.9 million was earmarked for the 12 schools from the \$29 million total authorization). The Administration has requested a \$9 million increase in HBCU grants for fiscal year 1998, and proposes to award grants to the 12 schools in the order they were listed by Congress in Section 507 of P. L. 104–333. This would be a multi-year effort; in order to complete enough work to make each building safe and usable, only three HBCU's could be assisted with the funds requested in fiscal year 1998.

CONSTRUCTION

The requested allocation for the construction program calls for a \$20.7 million decrease.

Question. What affect will this decrease have on the construction backlog?

Answer. The NPS has requested over the past number of years a Line Item Construction program level of \$80 to \$100 million worth of high Servicewide construction priority projects as well as other projects which can be linked to eliminating deteriorated conditions and achieving park development goals. This amount of funding is what NPS expects to accomplish each year given its planning and contracting abilities and workloads. The \$20.7 million reduction from the Line Item program appropriation does not represent a decrease in the Service's effort to reduce the backlog. It is, in fact, an increase of \$5.8 million over our fiscal year 1997 request.

Question. What are projections for income from the Recreation Fee Demonstration project that will be allocated to construction projects?

Answer. The President's Budget anticipated that the Recreation Fee Demonstration project would raise \$48 million in fiscal year 1998; however, since that estimate was made, Congress has amended the program in ways that provide for additional revenue. At this time, however, it is too early to know how much will be allocated to construction and how much will fund simple repair and rehabilitation projects.

Question. What are projections for allocation to maintenance projects?

Answer. As noted above, revenue from the demonstration fee program will be used to fund various high priority park projects, however, funding to be allocated to any particular program has not been determined.

The agency has been involved in a recent consolidation of design services with BLM and FWS.

Question. How is this consolidation working in terms of efficiency, project timing, and the ability to coordinate and prioritize between agencies?

Answer. The BLM and FWS are co-locating with NPS. In December 1996, FWS completed their move into NPS building. The BLM will complete their move into NPS building by July 1997. This physical co-location of bureaus affords all bureaus the opportunity to share and make efficient use of NPS technical support systems. These systems include telephones, computer LAN, micrographic reproductive services, technical information databases, and interagency contracts. Even though each bureau continues to maintain the lead on their construction program, overall project timing is expected to improve. The co-location affords greater opportunity for all project managers to confer about alternative ways to schedule and sequence their projects. This exchange of information and techniques across bureaus will allow work to be more uniformly produced through "best practices."

The prioritization and coordination of work between agencies will be enhanced through the availability of a more technically diverse and singularly located workforce. Should there be a project that exceeds the capability or capacity of any one bureau, the sister bureau will be able to immediately assist. This sharing of technical expertise is currently happening through the archeological services NPS is providing to FWS.

An increase of \$3.5 million is planned for equipment replacement. The agency justification states that a total of \$3.5 million is proposed for allocation to narrow band radio conversion and information management equipment modernization.

Question. Does this represent the total \$3.5 million increase?

Answer. The increase would be devoted to only these two areas; \$3.0 million of the additional \$3.5 million would be used to initiate a multi-year plan to modernize

NPS computer hardware and software by placing this equipment on a scheduled replacement cycle and allowing the technology used by NPS to remain current for maximum effectiveness. The remaining portion of the proposed increase, \$500,000, would be devoted to the implementation and testing of the narrow band technology for radio communications equipment in selected parks.

The agency reports a \$75 million vehicle/equipment replacement backlog.

Question. How have vehicle maintenance expenses (for vehicles retained past planned life) been affected by this backlog?

Answer. The current inventory of NPS equipment fleet identifies passenger cars, trucks, and heavy equipment that are operating well beyond their designed life expectancy. As equipment nears or reaches this stage, fleet operational costs increase. This is due in part to more frequent equipment breakdowns and more expensive drive train components wear out and have to be replaced, all resulting in more frequent and costly maintenance activities. This does not include the staff hours lost to efficiently perform work when equipment fails to perform.

EVERGLADES RESTORATION

The land acquisition program for the Everglades restoration project states that 58,000 acres will remain to be acquired after fiscal year 1997. A request of \$63.6 million is being made for fiscal year 1998 land acquisition. The Administration is also proposing to establish the Everglades Restoration Fund which is expected to result in the receipt of \$35 million for land acquisition.

Question. What are long-term projections for the Everglades Restoration Fund in terms of reducing land acquisition requests from regular appropriations?

Answer. The Everglades Restoration Fund consists of two components. First, is the request for direct appropriations of \$100 million every year for four years, for a total of \$400 million. The President's Budget had requested \$100 million for fiscal year 1998, with the remaining funding requested as an "advance appropriation." The second component consists of revenues of about \$35 million per year as a result of enacting a sugar marketing assessment on Florida sugar producers. If enacted this year, the Department estimates that about \$35 million would be available every year to acquire lands in the Everglades ecosystem. At some point, this income would reduce, but not eliminate, the requirement for direct appropriations to protect land in the Everglades region.

Restoration of the Florida Everglades and the South Florida Ecosystem is a high priority of the Administration. Much of the program emerged during a time of contentious litigation with Florida's sugar industry. This required the industry to contribute a total of \$312 million towards this acquisition through the Restoration Fund. Successful implementation of the program requires extensive coordination with other Federal agencies as well as State and local governments and industry. Plans are very ambitious and involve a major effort to mimic, not restore, nature's processes.

Question. What is the current overall status of the restoration effort?

Answer. The Department believes that significant achievements have been made since the Administration established the South Florida Ecosystem Restoration Task Force in 1993. Lands that have been identified for protection are being acquired; scientific research is on-going; construction of the modified water delivery project for Everglades National Park continues; the Task Force has been expanded to include State, tribal, and local representatives; the Army Corps of Engineers' restudy of the Central and South Florida project continues; and an unprecedented level of partnership among Federal, State, tribal, and local governments is occurring.

Question. How well is cooperation with other agencies and private parties working?

Answer. As stated above, an unprecedented level of partnership is occurring among all the parties to the restoration effort. At the field level, Federal, State, tribal, and local representatives have formed work teams to address numerous issues that affect the restoration effort. Similarly, at the Washington level, there is coordination among all the parties.

The NPS portion of the Everglades Restoration effort proposes \$12 million for science in fiscal year 1998. In fiscal year 1997, \$8 million will be spent on science.

Question. If the agency is actively engaged in a major scientific study effort, is it getting the "cart before the horse" in implementing this major program?

Answer. No, studies completed to date and the consensus of Federal, State, and local partners in the ecosystem restoration effort indicate that certain actions can and must proceed immediately while some scientific research remains on-going. Generally, completing Federal land acquisition, acquiring additional land outside Federal areas, and completing the modified water delivery project to restore a more

natural hydrologic flow for Everglades National Park are three components of the Everglades Restoration Fund that do not require additional scientific study. In addition, these areas also comprise the majority, or \$88 million, of the \$100 million requested for the Everglades Restoration Fund, with the \$12 million proposed for scientific research comprising the remainder.

Question. How much confidence does the Department have in the scientific and engineering studies made so far, to be sure the attempt to mimic Mother Nature will actually work?

Answer. The Department believes that the key to success of the restoration effort is in our ability to understand how the natural system functioned in the past and how man-made changes have affected that system. The knowledge gained from research efforts in these areas will guide future management decisions in an attempt to avoid similar mistakes in the future. The Department has a great deal of confidence that such research will allow it to design future systems that will replicate the natural system as much as possible.

RECREATION FEE DEMONSTRATION PROJECT

This program will allow the Director of the Park Service to disperse 20 percent of the funds collected from a specific site to be distributed at sites on a service-wide basis.

Question. What criteria will be used to determine the allocation process for this 20 percent?

Answer. The Director has requested all units of NPS to submit priority projects for funding from the 20 percent funds available from the total new revenue collected from the Recreation Fee Demonstration project. A panel will be established to review and recommend selected projects for the Director's approval. Once approved by NPS, the Department will review the proposals and approve the selected projects. The "20 percent" money will be largely targeted at parks that do not collect fees or are not part of the demonstration program.

Question. How will the recent the recent storm damage in Yosemite affect implementation of fee demonstration plans?

Answer. The recent storm damage in Yosemite affected the fee demonstration program only by causing a two month delay in implementing the program in Yosemite. Yosemite's visitation figures, however, are showing a decline that is greater than anticipated. The NPS is now doing a formal estimation of what this will mean to Yosemite's projected income, based on two full months of normal operation after the flood. The best current estimate is that the impacts of the flood will cost Yosemite nearly \$2 million in returned revenue this fiscal year.

Question. Please provide a project specific list for each of the Recreation Demonstration sites which will be accomplished under the program.

Answer. At this time, the specifics of what will be accomplished under the program is still under review. The Park Service will provide this information to the Committee once final decisions are made.

Up to 100 park sites will operate under this program.

Question. What is the projected income from the sites designated?

Answer. The fiscal year 1998 President's Budget estimated that NPS would collect about \$48 million in additional revenue from parks participating in the demonstration program. Since the President's Budget was submitted, the Congress has amended the demonstration program by changing the base year for which the new fee revenue is calculated from 1995 to 1994, which would result in \$12 million more in revenues. After the completion of the first year, NPS should be able to provide a more accurate estimate.

Question. What are the priority uses for income through the fee demonstration program?

Answer. The priorities of the program are the reduction of maintenance and resource backlogs as well as projects or activities that directly enhance the experience of the park visitor.

ADMINISTRATIVE COSTS

A Department of the Interior OIG Report 96-I-1259 dated September 1996, made five recommendations to address the issue of extended travel costs for Denver Service Center employees.

Question. What is the status of implementation of those five recommendations?

Answer. The OIG found that the policies and procedures of the Denver Service Center for extended travel of construction supervisors were in compliance with Federal and Department of the Interior requirements. However, the Inspector General found that the Denver Service Center did not adequately justify, or keep adequate

records to justify operational decisions. To rectify this situation, NPS is reissuing its policy regarding extended travel costs. Following is more detail The five recommendations and the status of their implementation follows.

Recommendation 1: Either ensure compliance with existing policy or revise the policy for extended travel to include consideration of other relevant and appropriate factors.

Recently, all Denver Service Center employees received a copy of the reissued policy in the form of DSC Guideline 97-01.

Recommendation 2: Develop procedures for estimating the cost of per diem versus the cost of employee relocation.

DSC Guideline 97-01 contains procedures for estimating the cost of per diem versus the cost of employee relocation.

Recommendation 3: Document the specific considerations that resulted in the determination to either pay per diem or relocate construction supervisors.

DSC Guideline 97-01 requires Construction Quality Leaders to prepare a "Record of Decision" form to document the decision-making process of whether to execute a permanent change of station move or to place an employee on extended duty when the duration of an assignment is expected to exceed two years. Factors to be considered include cost, human, and business/project factors. No one factor is more important than another.

Recommendation 4: Develop and implement procedures for authorizing per diem rates that consider actual expense levels at the specific locations of travel.

DSC Guideline 97-01 requires that per diem rates are computed under the lodgings-plus per diem system with the total not to exceed the applicable maximum per diem rate for the location. DSC Guideline 97-01 provides a flat rate for meals and incidental expenses that will be reviewed and reestablished every two years. Employees are responsible for obtaining lodging and for documenting their search, investigating a minimum of three equivalent lodging units. This procedure will determine the lodging flat rate for the location. Every six months the employee must certify that their costs have not been reduced. When an employee moves, their circumstances change, or an adjustment is requested, the same procedure will be followed to verify the applicable per diem rate.

Recommendation 5: Require travelers either to note annual leave taken on the travel voucher or to certify "no leave taken" on the voucher.

DSC Guideline 97-01 requires the recommended certification.

The agency recently went through a downsizing exercise and buyout program.

Question. For the hearing record will you provide the Committee with a detailed analysis of the cost savings which have occurred as a result of the NPS reorganization?

Answer. The NPS reorganization resulted in streamlined and reengineered administrative processes and downsized central offices. Since fiscal year 1993, NPS estimates that it has achieved annual operational savings of approximately \$31.5 million through these efforts. These annual savings have been shifted over the last four years, through both the President's Budget requests and Congressional appropriations, to help support the additional park and program increases that have been appropriated to NPS.

Question. How many central office positions were transferred to individual park units?

Answer. Since fiscal year 1994 central office FTE have been reduced by over 20 percent while available park-based FTE allocations have increased by about 1,100, allowing more staff at the operational level while keeping overall NPS FTE levels stable. This includes 264 employees transferring from central office positions to fill vacancies in park areas through Operation Opportunity—a program developed at the time of the implementation of our reorganization.

Question. How many positions were vacated as a result of the buyout and early retirement incentive programs?

Answer. In 1994 and 1995, 868 employees took advantage of the buyouts offered. The survival of pre-reorganization or pre-buyout positions cannot be tracked for two reasons. At NPS central offices, where 528 of the buyouts occurred, a job vacated by a buyout was allowed to be refilled as long as another central office position was not. Simultaneously, the reorganization caused changes to many position designations causing situations where certain positions were "vacated", but not because of downsizing.

Question. How much money will be expended in the buyout and early retirement incentive program for NPS?

Answer. The cost NPS will incur to cover the Voluntary Separation Incentive Payments and the nine percent early-out charge for those taking the buyout offer will be approximately \$22.1 million. This is a one-time only cost.

Question. Is the composition of the NPS headquarters and regional offices as lean as it should be?

Answer. The NPS continues to analyze reengineering possibilities and make additional reductions where possible.

In total, the agency proposes to add 440 FTE's to the workforce.

Question. Please stratify these positions for the record in terms of field, regional, and headquarters employees.

Answer. The 440 FTE's would be distributed as follows:

Adding 440 FTE's to the workforce

Field	376
Regional	36
Headquarters	28
 Total	 440

PARKWAY DIVESTITURE

A September 11, 1996, report from the agency acknowledges that Maryland and Virginia strongly oppose a "plan in its present form" to divest four parkways in the greater Washington area. Specific standards for continued management of the Parkways are contained in the present divestiture plan.

Question. What proposed standards could be relaxed to make the divestiture more appealing to Virginia and Maryland?

Answer. All of the standards contained in the proposed conditions of transfer are essential to ensure that management of these parkways meet the legislative intent that they serve as scenic gateways to the Nation's Capital. In our judgment, the States were not objecting to the standards as much as they were concerned about the maintenance costs, and the feeling that these roads should be a Federal responsibility as part of the park system of the Nation's Capital.

Question. What portion of United States Park Police staffing is directly attributable to traffic enforcement on the major parkways in the suburban parkways of Washington DC?

Answer. The U.S. Park Police assigned to the Glen Echo, Greenbelt, and the Anacostia Stations provide law enforcement services to the George Washington Memorial Parkway, Clara Barton Parkway, Baltimore-Washington Parkway, and Suitland Parkway 24 hours a day. Each police cruiser beat requires 5.3 FTE to maintain 24 hour-per-day coverage.

Three police cruiser beats are assigned to patrol the George Washington Memorial Parkway and the Clara Barton Parkway. In addition, five sergeants assigned to the Glen Echo Station, dedicated to supervising law enforcement activities on the parkways, assist in the patrols. Furthermore, in an effort to reduce excessive speeding that has led to serious traffic accidents along George Washington Memorial Parkway, the U.S. Park Police has redirected existing resources on an intermittent basis to provide increased coverage, especially during peak traffic hours. Two primary police cruiser beats are assigned to patrol the Baltimore-Washington Parkway. Due to extensive long-term highway construction, three additional officers are being used to supplement traffic enforcement efforts, eight hours per day. In addition, four sergeants assigned to the Greenbelt Station, dedicated to supervising law enforcement activities on the parkway, assist in the patrols.

One cruiser beat is assigned to patrol the Suitland Parkway. Five sergeants from the Anacostia Station, who provide necessary supervision of officers assigned to the parkway as well as other areas within the confines of the station, assist in the patrols.

Question. If divestiture occurs, what will happen to these positions?

Answer. If divestiture of the four parkways were to occur, the U.S. Park Police would reassign the previously mentioned parkway positions to other areas within the force. With the ever-increasing drug and criminal problems within our Nation's Capital and the increased responsibilities of new memorials and other areas within the District of Columbia, these positions would be effectively utilized.

U.S. GEOLOGICAL SURVEY

PROGRAM BASE

According to the budget proposal, the U.S. Geological Survey (USGS) will be required to absorb fiscal year 1998 uncontrollable administrative increases, which are estimated at a minimum of \$11,895,000, from within their current program base.

No other Interior Department agency funded through this bill has been required to meet additional costs of this same magnitude from within its current program base.

Question. How was the determination made to propose funding uncontrollable increases for some agencies, such as BLM, NPS and the Bureau of Indian Affairs, but not USGS?

Answer. In an optimum budget with unlimited resources, each of the bureaus would request increases for uncontrollable costs. The Department began the formulation process for fiscal year 1998 with that goal in mind, but the realities of balancing the budget forced difficult choices about priorities for program increases and overall funding levels for individual bureaus. As a result, some bureaus were able to cover uncontrollable costs with funding increases and others were not. The USGS presentation of uncontrollable costs is different from other bureaus because USGS elected to show their uncontrollable costs as non-adds rather than show the specific program reductions. It must be noted that regardless of the display methodology used, these are real costs that must be paid by all agencies of the Department in 1998.

In addition to absorbing uncontrollable increases, current program levels are proposed to be reduced further in fiscal year 1998 in order to offset funding for new program proposals, such as the Kalamazoo Project (+\$9 million). A significant increase for the Global Seismic Network (GSN), a relatively new program, is also offset from the current program base; the fiscal year 1997 appropriation for the GSN is \$800,000, with a proposed increase of \$3 million in fiscal year 1998.

Question. Why isn't there greater emphasis on enhancing traditional USGS programs? Are these programs now funded at sufficient levels to accomplish their purposes? Or is there a need to redefine the programs that comprise the Survey's core that is represented by the budget request?

Answer. Research conducted by USGS is not static; programs continually adapt and change to respond to emergency needs brought on by natural disasters, changing priorities of its clientele, and increased basic operating costs. Shrinking budget levels and the need to balance the Federal budget have created an environment in which managers and agency directors are forced to do more (and, in some cases, less) with fewer resources. They attempt to find programs and functions that can be eliminated or carried out in a new manner, thereby allowing for the redirection of funds to higher priority programs. In many instances, the proposed decreases in the fiscal year 1998 budget reflect estimated savings achieved under efforts to further Phase II of the National Performance Review goals of Reinventing Government (REGO II). As a result, USGS carries out program reviews and strategic planning to ensure an appropriate level of funding, so that its programs continue to provide credible and impartial information relevant to society's needs. There is no need to redefine the programs that comprise USGS' core represented by the budget request, because each budget submission of USGS portrays the changing nature of USGS science programs.

Buyouts and reductions-in-force have reduced the ranks of the USGS by over 1,000 people since 1994. In July of 1995, USGS indicated to the Subcommittee its concern that the division's ability to carry out its programmatic responsibility had been severely eroded by absorption of salary and other fixed costs.

Question. Inasmuch as the program base is proposed for further reductions through the continued absorption of fixed costs and new programs, please comment on the current ability of USGS to fulfill its mandate.

Answer. In the past five years USGS has absorbed over \$43 million in uncontrollable costs. The USGS has sought to deal with the effects of this absorption, as other bureaus have—by streamlining processes, by working more efficiently, and by setting priorities. In recent years, USGS has also had to conduct a Reduction-in-Force, pursue buyout relief, defer recruitment, defer replacement of equipment, and reduce travel and training in order to sustain operations at levels sufficient to carry out programmatic responsibilities. In fiscal year 1998 another \$12 million is proposed to be absorbed, with attendant impacts on program quality, timeliness, and output. The following are examples of the types of impacts to programs that can be expected from continued absorption of uncontrollables.

- Decline in timeliness and geographic extent of data collection and deferred modernization and upgrade of monitoring networks impacting availability of information for flood warning, water quality assessments, and geologic hazards assessments of earthquakes, volcanoes, and landslides.
- Reduction in the amount of geospatial data and satellite imagery that can be acquired, integrated, and made available to users each year to help resolve environmental and land and resource management issues facing the Nation.
- Reduction in the amount of effort to implement national digital data bases further delaying implementation of accessible, standardized frameworks of data.

- Decline in the number of research and development investigations, reducing the USGS ability to address emerging national problems and future needs of local, State, and other Federal Government agencies.
- Reduction in work with partner agencies and organizations in developing scientific information and management tools to enable wise use of resources.

NATIONAL MAPPING PROGRAM

An \$850,000 reduction in research for the National Mapping Program is proposed for the purpose of advancing REGO II goals. Funds will be redirected to higher priority programs in other divisions. The reduction modifies the mapping program's operational management strategy so that the original plan for relational data implementation will be postponed.

Question. How does the postponement of this work advance REGO II?

Answer. The proposed \$850,000 decrease represents an acceleration of anticipated REGO II savings which were originally scheduled for fiscal year 1999 and 2000. The decrease will delay implementation of a standard relational database management system for program operations. Savings from REGO II are expected to result from efficiencies gained through public access of cartographic data and products via the Internet. New Internet access capabilities have allowed the public to investigate USGS data holdings, determine the availability and characteristics of the data being sought, and arrange for delivery of the data, usually instantaneously, without the need for USGS personnel to assist in the process. This new mechanism saves the need to produce search materials and operate search mechanisms, saves salary and related costs for personnel no longer needed to operate the systems, and saves costly computer processing times, materials, and mailing expenses to retrieve, replicate, and transmit data to customers.

\$1.2 million of the National Mapping Program's budget is proposed to be refocused for the Urban Dynamics project, a three year program scheduled to begin in fiscal year 1998.

Question. What programs are being reduced or have been completed in order to begin this initiative?

Answer. The redirection of \$1.2 million to increase work on urban dynamics will result in curtailment of research projects that support the data programs of the National Mapping Division. These programs focus on improving existing production methods, supporting the development of new spatial data products, and improving the methods of spatial data acquisition and integration.

The other major area of research activity within the National Mapping Program, data applications development, has no flexibility for adjustment, and is a higher priority activity because of its direct support of customer requirements for methods to use geographic data in addressing issues of national importance related to the environment, resource management, and socio-economic topics. Production system maintenance and computer support activities also are not adjustable because the National Mapping Program hardware and software systems are dependent upon them and because of their direct linkage into the private sector, which provides most of the services in these areas.

Question. How was it determined which four metropolitan areas would be the focus of the program?

Answer. The four cities were selected from the American Farmland Trust (NFT) list of high priority cities where urbanization threatens agricultural land. Further refinement of the list was done by examining cities where there was concern for impacts on ecological diversity in very different ecological regions. Specific city selections had additional regional criteria as well. Philadelphia and New York were then identified as major urban areas that would continue the work started in the Washington/Baltimore area. Chicago was identified as a critical mid-western city that met the NFT and ecological criteria. Portland, Oregon was selected because the effect of different land use planning models being used in Washington and Oregon can be compared in subsequent research. All cities were chosen to meet multiple criteria important for geographic research.

The National Mapping Program has complied with the Congressional directive to increase its use of contractor services for data collection and integration.

Question. Please comment on the results of this action to date.

Answer. The USGS has increased the level of contracting for services in map and digital production by a third over the levels of fiscal year 1996. This represents nearly a doubling of the fiscal year 1995 level. Contracting has extended the capacity for several data categories of the National Mapping Program.

Developing successful contracting partnerships has required a significant investment of USGS resources. Some delivery schedules have slipped as new contractors

adapt to USGS product and quality requirements. The USGS has had to curtail spending on other efforts to redirect funds to production contracting, thus reducing programmatic flexibility. The National Mapping Program will continue to pursue a policy of contracting with the private sector throughout the program and in all areas where it is in the best interests of the Government to do so.

Last year, Congress included funds to assist USGS in preparing an Electronic Atlas of the United States.

Question. Please report on the progress of this project.

Answer. Significant progress has been made on the electronic National Atlas of the United States in fiscal year 1997. Accomplishments during fiscal year 1997 included initial development of a suite of National Atlas products, development of a prototype, conducting market research activities, developing atlas products for the World Wide Web (WWW), and seeking private sector partners.

The USGS has completed the revision of basic digital map layers such as boundaries, highways, and streams for the entire country. These data have been compiled according to exacting standards so that they will serve as an accurate and reliable framework for the integration of thematic data sets, such as geology, soils, major groundwater reservoirs, and demographic information. Work has begun on integrating thematic data from the U.S. Bureau of the Census and the National Center for Health Statistics.

The USGS has also completed an electronic prototype that demonstrates the vast potential of the National Atlas. Prototype development provided an opportunity to investigate the integration of multimedia software with geographic information systems capabilities as well as an opportunity to experiment with differing graphical user interfaces. The National Atlas prototype has been demonstrated to prospective partners in Government and the private sector. It will be used to assess consumer attitudes towards the National Atlas in focus groups scheduled for later this summer. The USGS has also initiated work on several map prototypes that will be available for customer assessment during the first quarter of fiscal year 1998.

The USGS has begun other market research activities that will help to determine the initial content and functional capabilities of the National Atlas and support the production of a comprehensive and cohesive marketing plan for all National Atlas products. These activities include a comparative assessment of atlas-like products currently marketed, point-of-sales tracking for these products, focus groups, and customer surveys to aid in focusing product development.

We are currently developing National Atlas products for the WWW. These include information products such as fact sheets, promotional materials, and project status reports. Also under development is a basic geographic information system capability that allows WWW users to select, symbolize, view, and query the data collected by this project. The WWW will be used to deliver National Atlas data and provide access to other sources for local, more detailed data and information. The WWW site for the National Atlas will be fully operational during the third quarter of fiscal year 1997.

The USGS has sought the participation of private sector partners to ensure the success of the National Atlas. The USGS has held discussions with companies involved in software development, market research, publishing, and product distribution. At present, USGS has formed a partnership with Environmental Systems Research Institute of Redlands, CA, to develop the National Atlas WWW prototype. This cooperative research and development agreement will expand to include development activities that exploit emerging technologies for managing large digital cartographic data sets and for serving map products via the WWW.

Question. How much is included in the fiscal year 1998 base to continue work on this project?

Answer. There is \$2.0 million included in the fiscal year 1998 base to continue work on this project.

GLOBAL SEISMIC NETWORK

The GSN is proposed to receive an increase of \$3 million to its current base of \$800,000 in order to begin the operation and maintenance phase of the program. The GSN is part of an international monitoring system being developed to verify compliance with the recently signed Comprehensive Test Ban Treaty.

Question. Specifically what will the proposed increase be applied to? What enhancements, if any, are anticipated to the GSN and how will long-term operation and maintenance costs be affected?

Answer. The proposed increase of \$3.0 million for fiscal year 1998 will be spent in the following manner: 1) \$1.7 million is for network deployment and support. This involves the preparation and testing of new equipment at the Albuquerque

Seismological Laboratory remote diagnosis of equipment problems, and repair of equipment malfunctions; 2) \$200 thousand is for routine maintenance visits to USGS-operated GSN sites within the U.S. and its territories; and 3) \$1.1 million is for data management and quality control. This involves shipment of data, extensive quality control, data archival, and reformatting of raw data for dissemination to users.

The GSN currently consists of 107 stations of which USGS maintains 77. When fully implemented, the GSN will have approximately 150 stations for which USGS will have operational responsibility for 106. Funds currently spent on testing and deployment of new equipment will be shifted to network maintenance and support as the network is completed.

Question. What agencies will be responsible for interpreting the data collected by USGS relating to implementation of the nuclear test ban treaty? Will USGS be reimbursed for their costs by these customers? Can the network eventually become self-sustaining?

Answer. The International Monitoring System (IMS) defined by the test ban treaty will consist of 50 primary seismic stations, 120 auxiliary seismic stations, and other technical sensors. The auxiliary stations are to be used to clarify the nature of events detected and located by the primary network. The GSN contains 69 of the auxiliary seismic stations. The Air Force Technical Applications Center (AFTAC) is responsible for the interpretation of all IMS data. Additionally, GSN data are used in treaty related research programs supported by the Department of Defense (DOD) and the Department of Energy (DOE). Because of initial capital investment in the GSN program by DOD and DOE, USGS does not expect to be reimbursed by these agencies for their use of GSN data.

The GSN is also supported in part by each of the host countries. They provide the local infrastructure required to keep the stations running. Nevertheless, because of the technical complexity of GSN stations, a central maintenance and support facility is also required for operation of the network. The USGS does not expect the network to become self-sustaining.

The Office of Science and Technology Policy (OSTP) reviewed the GSN funding issue in November 1995. As a result of this review, OSTP recommended that funding for the GSN should not be placed in DOD, but rather within the budgets of USGS and the National Science Foundation (NSF).

Question. How much and in what ways are other partners in the International Monitoring System contributing to the project? Why will USGS bear the responsibility for funding the operation of this network?

Answer. The NSF has provided substantial funding to USGS to install GSN stations. The NSF will continue to provide funds for the operation of those GSN stations not installed by USGS. It is appropriate for USGS and NSF to bear the responsibility for operating this network because its primary use is in the routine reporting and characterization of earthquakes and in research. The USGS' National Earthquake Information Center analyzes GSN data on a daily basis to determine the location, depth, magnitude, and "source mechanism" of large earthquakes worldwide. These results are usually obtained within an hour or less of the occurrence of the event. These results are used in emergency response and to determine if an earthquake is likely to have generated a tsunami which may affect coastal regions of the Pacific Northwest, Alaska, and Hawaii.

Data from GSN also are used in research for scientific exploration of the Earth's interior and for studies of the earthquake sources. For example, the recent discovery of the differential rotation rate between the Earth's inner and outer cores was based, in part, on data from GSN. This discovery is a major advance in understanding the source and nature of the Earth's magnetic field. Data on the source mechanisms of earthquakes worldwide, particularly those occurring in the middle of continents, can be applied to the understanding of earthquake hazards in the United States.

The GSN is a multiple-use activity. Data from GSN are used for disaster warning and response, research on earthquake and the interior of the Earth, and in arms control research and monitoring. The primary users of the data are USGS and the academic community and thus it is appropriate that USGS and NSF assume responsibility for the operation of GSN.

Question. To what extent have defense and intelligence-related functions traditionally been performed by USGS? Does USGS anticipate a greater program emphasis in these directions in the future?

Answer. Since World War II, USGS has been involved in varying degrees in defense and intelligence-related functions. Most of this involvement has been in the collection and interpretation of geological and geophysical data from foreign sites. Generally it has been on a reimbursable basis but in some cases cost sharing has

been applied where mutual program benefits are identified. Most of the work is done in-house, but USGS personnel have been assigned to other agencies for extended periods for specific purposes. During the past decade, USGS has made increasing use of data collected for defense and intelligence purposes in the revision of topographic maps, geologic mapping, and in assessments of natural hazards, mineral resources, and environmental changes.

Although USGS does not plan greater program emphasis on traditional defense and intelligence roles, it expects and welcomes an expansion of data sharing with these communities. In some cases, such as in the collection of satellite imagery data, the defense and intelligence communities carry the major costs of data acquisition. In other cases where USGS interests prevail, costs of data collection are borne by USGS.

NATIONAL COOPERATIVE GEOLOGIC MAPPING PROGRAM

In order to fund higher priority programs, a program reduction of \$1,726,000 to the National Cooperative Geologic Mapping program is proposed. It would be disbursed among the three program components as follows: -\$1,346,000 to the FEDMAP program; -\$345,000 to the STATEMAP program; and -\$35,000 to the EDMAP program.

The budget request could not provide information on the effects of decreases to the STATEMAP and EDMAP programs.

Question. Why was the decision made to reduce these programs when the impact of the reductions cannot be assessed?

Answer. The general impacts can be assessed; however because STATEMAP and EDMAP activities are based on annual proposals, the specifics cannot be determined until after the individual State mapping advisory panels meet this summer and the national awards panels meet during the late Fall of 1997. The STATEMAP awards committee consists of five representatives from State geological surveys, three USGS scientists, and the coordinator of the program's external funds. The EDMAP awards committee consists of three University professors, two State Geologists, and the coordinator of the program's external funds. The general impact of the decrease is the equivalent of funding four fewer cooperative projects with State surveys (STATEMAP) and four fewer cooperative projects with universities (EDMAP).

The FEDMAP program decrease would delay or terminate projects engaged in mapping earthquake faults, urban geology and risks associated with geologic hazards, along with a number of others. Dissemination of geologic map information would also be curtailed.

Question. What factors led to the decision to reduce this particular program? Why don't the activities accomplished with these funds merit a priority?

Answer. Difficult decisions were required in order to meet target allowances associated with formulating the fiscal year 1998 budget. In addition, within the geologic programs of USGS, decisions are made within the context of the recent Reduction-in-Force which was undertaken to correct a decade long problem of excessive personnel costs, the absence of operating funding, and the inability to carry out a financially balanced program. Based on these experiences, the decision was made to achieve the allowed funding level for fiscal year 1998 through cutbacks in a limited number of programs. This approach enables preservation of the financial viability of remaining programs as opposed to spreading these cutbacks across all programs and thereby eroding the financial balance that was achieved through the Reduction-in-Force.

This proposed reduction does not suggest that USGS considers geologic mapping to be a low-priority activity. In addition to construction of a digital National Geologic Map Data Base, the National Cooperative Geologic Mapping Program is conducting geologic mapping to address pressing issues related to natural hazards, water resources and quality, land-use planning, urban geology, and non-renewable resources. The program's activities are focused mainly on urban corridors in Washington-Oregon, California-Nevada, New Mexico, Colorado, Nebraska-Iowa, Kansas-Missouri, Georgia, South Carolina, Virginia-Maryland, Vermont, Florida, and Alaska. Priorities for FEDMAP projects are set in partnership with other Federal, State, and local agencies and industry. During the past year, the program has sponsored regional workshops to assess geologic mapping needs in the East, upper Mid-West, and West.

In addition, the program funds cooperative geologic mapping projects with State surveys and universities in more than 40 States on an annual basis. Significant funding would remain in the National Cooperative Geologic Mapping Program to support the continuation of a number of important projects, although the program be downsized to match the proposed reduced funding level.

CONTINENTAL SURVEYS

The continental surveys program is slotted for elimination and its funding of \$2,848,000 proposed to be used for higher priority programs. Results of the interdisciplinary research accomplished by this program are used by other USGS programs to help assess alterations of the earth's surface, earthquake hazards, volcano hazards, and petroleum energy resources. It is proposed in the budget request that, when feasible, some activities will be integrated into other USGS programs.

Question. Is there currently a determination of what activities will be continued in other programs? If so, please explain.

Answer. Program and financial plans for fiscal year 1998 are being prepared this summer. Through this planning process opportunities to absorb staff and functions of Continental Surveys in other geologic programs will be thoroughly explored.

The budget proposal does not specifically address the merits or lack of them that resulted in the proposed elimination of the continental surveys program.

Question. Please provide the Committee with the rationale for this action.

Answer. One aspect of the REGO II exercise conducted two years ago required the identification of program areas for termination. Because the Continental Surveys Program was conducting research and investigations supportive of other USGS programs it was selected for elimination on the grounds that these other programs might be able to absorb some of these activities.

KALAMAZOO PROJECT

The Kalamazoo project proposes to use \$9 million in new budget authority within the National Water Quality Assessment program to implement the President's announcement of an initiative last August to improve a community's knowledge about the quality of its water supplies and increase its ability to protect this resource. Offsetting reductions were taken in other USGS projects in order to absorb the proposed increase.

Funds for this project were not requested by USGS or the Department, but were included by OMB in the final budget proposal submitted to Congress.

Question. Please explain.

Answer. The Kalamazoo Initiative was introduced by the President in August 1996, too late to be included in the USGS budget submission to the Department or OMB. Although this initiative was a Presidential initiative which did not originate at USGS, the USGS strategic plan states that USGS will increase emphasis on "studies involving population centers, quality, and accessibility of resources". Further, the strategic plan identifies Environmental Effects on Human Health as an integral business activity of USGS. The President's Initiative is consistent with these provisions of the plan.

Question. How do you justify decreasing already reduced programs further in order to accommodate a new start?

Answer. The Administration places a high priority on the public's "right to know" what is in its drinking water, which is addressed directly by this initiative. But in order to fund this work within a shrinking Federal budget, it is necessary to provide partially offsetting decreases from other programs.

As presented on page 164 of the budget proposal, there are five distinct components of this initiative.

Question. Please explain how much of the \$9 million will be allocated for each component.

Answer. Allocation of funding among the five components of the Kalamazoo Initiative will change over the course of the planned four-year effort. Emphasis the first year will be on assembling existing information and identifying information gaps. Additionally, efforts in the first year will build the linkages necessary for easy public access to the data and information. In subsequent years with data gaps identified, much more of the funding will focus on collecting additional samples, expanding the available data on source water quality. For data collection activities to be effective and efficient in the out-years, a thorough analysis of existing information is planned the first year. Resulting funding allocations for fiscal year 1998 are:

	<i>Millions</i>
Analyze existing information, design data base, build public access	\$5.6
Develop fact sheets summarizing current knowledge	1.0
Augment some existing NAWQA sampling in urban areas	1.0
Identify and sample new streams and aquifers5

Funding allocations for fiscal year 1998

Funding allocations for fiscal year 1998—Continued

Enhance existing research capabilities for contaminants	Millions .9
Total	9.0

A major emphasis of the program is dissemination of information to the general public through published fact sheets, as well as a Web Site, in order to meet the American public's right to know.

Question. Is water quality assessment information currently reaching experts at the Federal, State, and local levels where productive work can be accomplished to effect change?

Answer. In addition to describing the status and trends in the quality of the Nation's waters, and understanding the natural and human factors affecting water-quality conditions; the third goal of the National Water Quality Assessment Program (NAWQA) is providing information to Federal, State, and local water-resource managers. There are liaison committees for each of the 36 study units begun in either 1991 or 1994. These liaison committees include more than 800 representatives of Federal, State, local agencies, and non-governmental organizations. At the national level there is also a Federal and non-Federal Advisory Council with more than 50 members. These committees meet annually. An example of recent impact can be found in Washington and New Jersey. Using USGS information on the vulnerability of shallow aquifers to pesticide contamination, the regulatory agencies in these two States instituted waivers (from Safe Drinking Water Act requirements) on source water sampling where the pesticide contamination risk was low. Each State saves about \$5 million annually. The Kalamazoo Initiative will provide for expanding communication with more managers in geographic locations beyond NAWQA study units.

This project is intended to be a collaborative effort with the EPA and National Oceanic and Atmospheric Administration (NOAA).

Question. How much is each of the other agencies proposed to contribute? What will their roles be? What are the anticipated costs for this program in future years for USGS and its Federal partners?

Answer. Each agency would have a different responsibility under the Initiative. The USGS (\$9.0 million) will provide information on the character of drinking water sources and how the quality varies temporally and geographically. The EPA (\$35.0 million) will work with cities serving information to the public on water conditions in the urban area, including toxic release information, types of water treatment for municipal supply, and impacts of the water delivery system infrastructure which partly determines the quality of water consumed. The NOAA (\$4.0 million) will evaluate the impact of cities on coastal water resources, and provide information to the public on beach and shell fish bed closures. In summary, USGS would work with the source water, EPA would focus on treated water consumed by the public, and NOAA would address the impacts of cities on coastal areas. Outyear estimates for each agency are:

OUTYEAR ESTIMATES FOR EACH AGENCY

[In millions of dollars]

	Fiscal year—			
	1998	1999	2000	2001
USGS	9	12	12	12
EPA	35	35	35	35
NOAA	4	3	2	2
Federal total	48	50	49	49

Question. What steps have been taken to assure that this proposal will not duplicate work already being done at the State and local levels, or by other Federal agencies? Is there a consistent set of data standards to which State and local agencies adhere currently?

Answer. At the Federal level, this proposal is coordinated with major water-quality activities of EPA. The USGS effort will build on and expand efforts underway at EPA. Through its network of communication with over 1,100 State and local co-

operators across the country, USGS will ensure that this initiative does not duplicate existing efforts. Further, across the country, consistent data standards have not been adopted at the State and local level. That was one of the reasons for initiating the NAWQA Program, and it remains the reason why the Program's results are of high interest to national organizations. Because this initiative will not duplicate existing efforts locally, work under the Initiative will have varying emphasis; however, no matter the emphasis, the approach and methods will be nationally consistent. In some locations the emphasis may be on disinfection by product precursors, and in other areas the emphasis could be on arsenic; consistent national methods will be used in either case.

ACID RAIN PROGRAM

The acid rain program is proposed to be discontinued as an isolated monitoring program in fiscal year 1998. Its current funding level is \$1,657,000. Some of the deposition monitoring activities of this program will be incorporated into the National Water Quality Assessment program.

Question. Which of the activities in the acid rain program will be discontinued altogether?

Answer. The USGS remains committed to its role as the lead Federal agency for the monitoring of atmospheric deposition. There are no immediate plans to change funding support for acid rain monitoring or to alter activities at any of the 71 USGS monitoring stations currently funded by the Acid Rain Program. Any changes in program composition based on this consolidation of programs will affect core NAWQA activities, rather than acid rain activities. The USGS will continue working closely with many other Federal, State, and local partners in the National Atmospheric Deposition Program (NADP) to ensure that the network continues to produce high-quality, relevant, and timely information needed for policy decisions on many critical environmental issues, and that any proposed modifications to USGS monitoring network arising from effects of inflation or future budget constraints will be fully coordinated with the multi-agency NADP.

Question. If NAWQA is capable of assuming a number of this program's activities without additional funding, why hasn't this consolidation been proposed before now?

Answer. There are three reasons why the change occurred in fiscal year 1998: 1) funding for the Acid Rain Program is slated for elimination in fiscal year 1998 as part of REGO II; 2) in fiscal year 1998, the Acid Rain Program would have been eliminated as a separate line item as part of a budget restructuring process; and 3) the importance of atmospheric contributions to the quality of ground water and surface water being studied in the NAWQA program has become increasingly important, so that only recently have the benefits of incorporating the two programs become obvious.

FEDERAL-STATE COOPERATIVE WATER PROGRAM

A decrease of \$1,214,000 is proposed for the Federal-State Cooperative Water Program. In terms of data collection, all activities at 120 streamflow gaging stations would cease. Additionally, the budget notes that important water supply and contamination issues would not begin as a result of this decrease.

Question. Are any of the stations proposed for closure among those that were damaged in recent floods? If so, were replacement funds included as part of the current supplemental request?

Answer. The stations which would be closed as a result of the proposed reduction in the Cooperative Program for fiscal year 1998 have not yet been identified. Since the stations supported by this program are funded by a combination of Federal appropriations and State matching funds, USGS will need to consult with its State and local cooperators to determine which stations should be closed. This consultation is necessary to ensure that the hydrologic information needs of State and local government agencies who participate in the Cooperative Program will continue to be met, to the fullest extent possible, despite the station closures.

Question. Why doesn't the work produced through this program merit sufficient priority to receive continued funding?

Answer. The funding proposal is not a judgment on the merits of this program. In these times when the Federal budget is under tight fiscal constraint, the reduction is proposed as one of several decreases to partially offset the increase for the Kalamazoo Initiative (to provide the public with information on the quality of their drinking water sources). Within the current fiscal climate, difficult decisions had to be made to accommodate new work, often at the expense of other programs.

WATER RESOURCES RESEARCH INSTITUTES

A proposed budget reduction of \$2,803,000 could result in the closure of institutes that cannot find a replacement for Federal funds. About one-third of the institutes now receive all or most of their funding from this appropriation and its matching funds. This reduction would also result in a loss of some data collections activities and interpretive studies dealing with water management issues.

Question. Please explain the reasons used to determine that this program lacks the priority of others.

Answer. The Institutes Program, though very important, supports USGS core mission less than other funded programs. By design, the programs of the Institutes are to be focused on priority needs of the States and are not required to contribute to national data bases or resolve multi-State water issues. Funding from the States and from Federal agencies such as the NSF, EPA, and Department of Agriculture, along with specific project-related funding from USGS, will continue to support water science in the States.

Since there are alternatives for funding water science which addresses issues of specific concern to the States, and since there is no alternative for funding the types of work that are done in-house at USGS, the Administration's priorities lie in ensuring continued support for long-term research and monitoring activities that take a national perspective. These activities cannot be undertaken by the States or by academia because there is no national infrastructure to support such work at the State or local level. In addition, there is no other single Federal agency which has the interdisciplinary scientific expertise to carry out an integrated national program of water resources research and monitoring.

BIOLOGICAL RESEARCH DIVISION

Question. Please comment on the consolidation of the Biological Resource Division's functions into the USGS. What problems, if any, have been encountered?

Answer. The consolidation of the functions of the former National Biological Service (NBS) into USGS as BRD is largely complete. This is the second fiscal year that USGS and the former NBS budget presentations are combined in budget to Congress. Administrative and personnel functions are being merged in line with the schedule presented in the USGS/NBS Steering Committee Merger report that was completed in late 1996. For instance, the Washington area BRD staff moved into the USGS National Center in Reston in September 1996. Science programs are being integrated through both day-to-day research and in planning for future interdivisional science initiatives. These efforts are applying the strengths of traditional USGS culture with those of NBS to develop improved, integrated, and efficient Bureauwide procedures.

Question. Are the Interior agencies that are served by the BRD satisfied with the support they receive under this consolidated division?

Answer. Given the diversity and magnitude of the resources for which the Department is responsible, the needs of its resource management bureaus related to scientific information will most likely always exceed the available resources of USGS. Department bureaus are generally satisfied with the support they have received from BRD and see the future stability of the organization as improving the ability of BRD to address their science needs effectively. In particular, BRD has worked hard to maintain and foster its working relations with the resource management bureaus. Improvements in identifying Bureau Information Needs (BIN) are being pursued to ensure that the critical needs of the bureaus are communicated to BRD and that the science conducted by BRD is responsive to these needs. While BRD is taking actions to improve this process, its initial success can be judged by the positive actions that have been stimulated in these bureaus.

The FWS has established and filled a senior management position to coordinate the identification of information needs within the Service. The BLM has formalized its strategic science planning process to systematically provide its science information needs directly into the BRD BIN process in a timely manner. Various avenues are used to report back to the bureaus on BRD responses to information needs. For example, BLM recently received a major report on the status of their information needs and on projects and activities underway to address these needs. The BRD Research Centers are holding workshops and meetings with counterparts at the regional and local level to discuss progress in addressing information needs. These actions have enhanced communication between BRD and bureaus at all levels.

Question. Has the integration of BRD into the Survey's activities enhanced the two divisions' abilities for interdisciplinary research, or is the nature of their work such that they perform as two distinct entities?

Answer. The BRD integration into USGS has enhanced the opportunity for inter-divisional collaborative research. The BRD is a full equal partner on bureauwide councils and task forces. Interdivisional planning and discussions are a key feature for identifying and developing budget initiatives for future years. Interdivisional meetings of program managers are regularly held to foster such discussions and collaborations of ongoing activities. Points of contact for specific topics (e.g., environmental contaminants) are identified at headquarters and regional levels to facilitate interactions between scientists at the working level. Collaborations are beginning where expertise and ongoing activities in each Division complement each other. For example, BRD was incorporated into the planning and implementation of the Abandoned Mine Lands Initiative.

A \$6,000,000 increase is requested for biological research and monitoring activities.

Question. Please provide the committee with a list of these programs with the currently appropriated levels of funding and prioritize the program increase request.

Answer. The biological research and monitoring activities constituting the requested \$6 million are listed below. The science addressed by the requested increases are the top information needs identified by bureaus submitted in 1995 and 1996.

Biological research and monitoring activities

	<i>In millions</i>
Science support for management of Federal Lands	+\$3.0
<hr/>	
Invasive species (base: \$3.3):	
Weeds in the West	+1.2
Exotics in the East	+0.7
Integrated monitoring (base: \$0)	+0.8
Air quality impacts on biological resources (base: \$0)	+0.3
<hr/>	
Endocrine disruptors (base: \$0.6)	+1.0
<hr/>	
Restoration of degraded lands and resources (base: \$0)	+1.0
Coastal habitats	+0.5
Pacific salmon	+0.5
<hr/>	
Restoration of Great Lakes fisheries and habitats (base: \$5.0)	+1.0

MINERALS MANAGEMENT SERVICE

DIRECTOR'S STATEMENT

The Minerals Management Service Director issued a statement to the House of Representatives regarding the fiscal year 1998 program. The Subcommittee has the following questions relative to this statement.

The agency states that it is accomplishing streamlining goals by reducing management layers.

Question. What are the specific statistics regarding this accomplishment? How many positions at mid-level grades have been reduced over the past three years? What savings have been derived from this effort? How have these savings been re-allocated to other MMS programs?

Answer. Under the recently implemented MMS 2000 reorganization all organizations reflect fewer reporting layers. The organization has flattened by eliminating layers of supervision and having Divisions and Regions reporting directly to the Associate Director. In that vein the following actions have been implemented:

—Five Deputy Associate Director (DAD) positions have been abolished. Pre-MMS 2000 there were seven DADs whereas post-MMS 2000 there are only two.

For both the Royalty Management and Offshore programs two DADs have been combined into one; General Administration (2) and PMI (1) have eliminated their DADs.

—A number of Divisions have been combined and or abolished as follows:

In General Administration, the Budget and Finance Divisions have been combined into one division; the EEO office has had training functions combined into it from Personnel, creating the Equal Employment and Development Opportunity Division; and the Management Services and Security Division has been eliminated.

In Offshore, the Engineering and Technology, and Inspection Compliance and Training Divisions have been combined and retitled to Engineering and Operations Division.

In Royalty, the Data Management Division, and Reports and Financial Division have been combined as the Accounting and Reports Division; and the Valuation and Standards Division and all solid minerals functions from the Data Management Division have been combined as the Royalty Valuation Division.

From October 1994 to the end of May 1997 MMS has been striving to reduce the number of GS 14s, GS 15s, and SES positions. As a result of that effort, to date MMS has 40 fewer GS 14s, 14 fewer GS 15s, and nine fewer SESs. A large majority of these vacancies were created by individuals accepting the voluntary separation incentive program (buyouts). The savings attributable to buyouts was partially offset by the buyout payment itself and the cost of an individual's lump sum annual leave. The funds not used to support the buyout program have been rolled back into their respective programs. Legislative and regulatory authorities have increased over the past three years, in most cases without a commensurate increase in funding availability.

The agency is attempting to reduce and streamline industry reporting requirements with a goal of 100 percent electronic reporting.

Question. What is the target date for achieving this goal? How has this goal been viewed by industry?

Answer. The Royalty Management Program's (RMP) target date for receiving 100 percent of its reports electronically is the end of fiscal year 1998. The industry is cooperative and recognizes the benefits of electronic reporting. The RMP currently receives 80 percent of its royalty reporting lines and 50 percent of its production reporting lines electronically which account for less than 10 percent of its total reporter universe. To assist reporters, the RMP provides free reporting software and many electronic reporting options that require minor conversion commitments. To ensure conversion, the RMP is drafting a proposed rule to require electronic reporting, but will include an exception for hardship cases.

Question. How does the Indian Royalty Internship intend to achieve its objectives of having Tribes manage their minerals affairs? What is the long term objective in terms of specific transfer of functions to Tribes for performing royalty management work? What is the cost of this program? How will personnel costs be affected by this program?

Answer. The program is intended for mineral producing Tribes considering self-governance or self-determination contracts and for Tribes who want to become more knowledgeable about royalty management. After consulting with the Tribes, we decided to offer a very flexible training program, built around on-the-job training and customized as much as possible to the needs of each participant. Interns can receive hands-on training in various aspects of RMP's mineral revenue management activities, including royalty accounting, report processing, exception resolution, audit, and valuation. The program will entail some classroom training, but will consist primarily of work assignments in one or more of our operating divisions.

The MMS is committed to providing opportunities for Tribes to manage or monitor their own affairs with regards to mineral revenues. The Royalty Internship Program is being designed for two purposes: (1) to provide tools and expertise for Tribes to monitor and oversee their mineral interests as well as the royalty management functions MMS performs in behalf of Indians; and (2) to help Tribes gain the experience and information they need to make decisions about potential assumption of royalty management functions.

Currently we have one intern from the Cherokee Tribe in the program. We have received interest from several other Tribes and expect to begin two additional intern training programs later in year. Costs for the program are difficult to predict until we have worked with the individual Tribes to design the best program for their needs. The cost for the initial trainee is expected to be less than \$20,000.

We do not anticipate any change in personnel costs due to this program. The objective of the internship is to provide Tribes with enough information so they can make an informed decision concerning the assumption of Federal duties regarding the management of their mineral resources. It is unknown at this time what, if any, functions may be assumed by the Tribes.

In June 1996, the agency announced plans to streamline its EIS process.

Question. Has this effort been fully implemented? In the Gulf of Mexico, the agency states that "EIS work for the period 1997-2002" will be reduced by 80 percent due to streamlining. What specific requirements have been eliminated to result in such a reduction of process? What cost savings have resulted from this streamlining effort? Has this increased the vulnerability to environmental appeals?

Answer. We are streamlining the EIS process in two ways. First, we are providing more focused, narrowly written lease sale EISs, making them less repetitive, less voluminous, less expensive to print and distribute, and easier to use. A recent lease sale EIS in the Gulf of Mexico (Sales 166 and 168) was reduced in size by 35 percent resulting in a \$9,800 savings in printing and distribution costs. This savings was accomplished through improved internal procedures for document preparation while continuing to fulfill NEPA requirements. Making these documents more readable will not increase our vulnerability to environmental appeals.

A second effort, limited to the Central and Western Gulf of Mexico planning areas, is also under way. We are eliminating the repetitive issuance of lease sale EISs for annual sales in the Central and Western Gulf. The results of such sales are similar in nature and level of environmental impact. The Council on Environmental Quality (CEQ), in their regulations at 40 CFR 1502.4(c)(2), recommends assessing similar actions in a single EIS. We cover all approved proposed sales in each planning area in one EIS. Producing, printing, and distributing two multisale EISs instead of five annual lease sale EISs is estimated to save approximately \$110,000 over a five year period. While this is a reduction of up to 80 percent in the cost of preparing and publishing lease sale EISs, it does not result in a concomitant reduction of NEPA work and manpower requirements. In order to meet CEQ requirements, we conduct an additional NEPA analysis for each lease sale to ascertain whether the coverage in the "multisale" EIS is still applicable. The Environmental Assessment (EA) or Supplemental EIS (SEIS) that results from this analysis cost somewhat less than the EIS's that were produced annually. The principal cost savings result from the fact that an EA does not entail publication and distribution costs, and an SEIS, if and when required, is a much smaller document than a full EIS.

By using a multisale EIS approach, coupled with additional sale specific NEPA coverage, MMS can continue to fulfill its environmental requirements, and there should be no increased vulnerability to environmental appeals.

Question. What are the receipt implications of allowing the Secretary more discretion to set royalty terms which adjust automatically to changing market conditions?

Answer. Our royalty receipts already adjust automatically to market conditions. Since the vast majority of Federal leases have ad valorem royalties, royalty receipts vary directly with the value of production. However, one could increase the Government's share of market risk by making the royalty rate vary with changes in prices or production value. In principle, given a set of expected market conditions, one could design royalty terms that, on average, would provide the same revenues as the current, fixed royalty rate terms. However, the receipts could increase or decrease, depending on; 1) the formula used to adjust the royalty rate; and 2) actual market conditions.

The agency claims to have made significant reductions in procedures, processes, and paperwork, through an aggressive reengineering effort. These reductions have been cited as offsetting the need for significantly more funds to meet rising agency demands.

Question. How does the agency account for the ability to make such significant reductions? Was it inherently inefficient prior to the reengineering effort? As the effort to further reduce the Federal budget deficit continues into future years, should it be expected that the agency will be less able to accomplish significant reductions?

Answer. Recent operational and procedural efficiencies in MMS have been motivated by a number of internal and external initiatives. These include:

- Implementation of Congressional legislation meant to reduce regulatory reporting requirements for industry.
- Implementation of Congressional and Administrative initiatives to streamline and downsize Federal agencies.
- Advances in electronic technology.
- Frequent reviews of MMS processes by internal staff and oversight organizations, to assure program objectives are accomplished and customer needs are met.

The MMS is committed to continuously looking for ways in which to improve the efficiency and effectiveness of its operations while delivering high quality service to its customers at the lowest possible cost. Through aggressive performance improvement initiatives and now reengineering, MMS has been able to identify ways to simplify its regulatory requirements; consolidate and flatten its organizational structure; and streamline or eliminate internal procedures, processes, and paperwork needed to accomplish its mission. In some cases, organizational structure, work processes, and regulatory requirements were found to be inefficient and in need of improvement, yet in other cases significant advances in technology and automation have permitted program performance gains.

In looking toward the future, the RMP Reengineering Initiative is now addressing core business processes and support systems in its accounting, financial, and compliance operations. The objective of the initiative is to design, develop, and implement new business processes and support systems for the 21st century. Continued Federal downsizing and growing expectations for better service at less cost led us to conclude that maintaining the status quo, with improvements on the margin, is not an acceptable strategy for the future. Furthermore, the Royalty Simplification and Fairness Act of 1996 (RSFA) has served to amplify the need for us to pursue a strategy of significant change. Clearly, capability for further reductions will depend on both the success of the reengineering effort and future legislative requirements.

ROYALTY SIMPLIFICATION ACT

This act was enacted in August 1996. The act provides for a seven year statute of limitations on royalty collections.

Question. What are the receipts implications of the act relative to this statute? Over the past three years what total sums have been "receivable" to the Treasury that are more than seven years in arrears?

Answer. The MMS does not believe the seven year statute of limitations will impact compliance collections because the major initiatives currently underway apply mostly to production that occurred prior to September 1996, the effective date of the seven year statute. Assuming these and other special initiatives are timely completed and progress is made on current reengineering initiatives, such as shortening the lease compliance periods to much less than seven years, the RSFA statute period should not impact collections.

By 2003, when the provision is fully effective, we believe we will be contemporaneous with respect to auditing as well as valuation and other issues. Our goal is to have leases verified in less than the seven year statute.

When MMS issues a bill for royalty underpayment, the payment is accounted for in the year in which it is received. An audit identifies the period and amount of underpayment and calculates interest due. While we have the basic data needed in our Auditing and Financial System, a separate report/query is not maintained that would track how much of the total underpayments are attributable to any prior year(s) period. To provide "receivables" to the Treasury that are more than seven years in arrears would be time consuming and extremely burdensome.

Question. How much interest has been paid by the agency since implementation of the act due to overpayment?

Answer. The RMP has processed three months of royalty data (February, March, and April) since implementing the interest programs. During each month, we process the reports and payments received during the previous month. In other words, reports and payments received during February were processed during March. Since RSFA has an effective date of February 13, 1997, for interest due to payors for overpayments, only overpayments made and corrected after that date would be included in the interest due to payors calculations. Very few payments qualified under this criteria when we ran the first cycle after implementing the software. In fact, from the first run we calculated only 18 cents in overpayment interest due payors.

The interest programs create prebills from which we verify the accuracy of the interest exceptions before the interest statements are sent to the payors. The prebill amounts have generally been reduced during prebill verification by up to 25 percent. For the March 1997 reporting month, we have verified about 50 percent and we are just issuing some of the statements which reflect interest MMS owes the payors. The third cycle, the April 1997 reporting month, is in the early verification stages. The data below summarizes the information contained on the prebills.

PREBILL INTEREST CALCULATIONS—(UNVERIFIED)

[In thousands of dollars]

	Reporting month—		March 1997 and April 1997 totals
	March 1997	April 1997	
Tentative interest owed to:			
Payors	\$440.1	\$703.1	\$1,143.2
MMS	2,553.1	1,366.5	3,919.6

The interest exception processing software reviews royalty lines only after the data has been verified through royalty edits. This process generally requires 30

days. At each month end, the interest module compares due and payment dates for accepted lines to generate prebills, which are manually reviewed and processed as final statements and mailed to the payors. Overall, 75 to 90 days pass between the time the royalty lines are received and the payors mailed interest statements. Overpayment and underpayment interest are netted together. The payor either pays the balance or can apply credits to their next royalty payment. If they are no longer a payor they will receive a cash refund.

STATE BENCHMARKING STUDY

Question. What specific "best practices" have been identified at State auditing organizations that are likely to be implemented in the MMS Royalty Management Program?

Answer. The "Final State Benchmarking Study" report prepared by the MMS Office of Policy and Management Improvement and issued February 14, 1997, identified a variety of "best practices" of State royalty programs for potential adoption by RMP. The report states that these best practices may or may not be practicable for RMP to adopt, depending on further analysis of the feasibility of implementation, a process to be conducted within RMP's Reengineering Initiative.

The RMP Reengineering Initiative is currently addressing core business processes in its accounting, financial, and compliance operations. As a part of the process, we are examining the feasibility of adopting/adapting "best practices" of a wide variety of financial, accounting, and compliance organizations. The principal audit-related "best practice" identified in the above-mentioned report was to conduct audits in two year increments. Currently MMS conducts audits in three to six year increments. Reducing the time increments addressed by audits is consistent with one of the "stretch goals" of the Reengineering Initiative; i.e., to assure compliance with applicable laws, lease terms, and regulations for all leases in the shortest possible time, but no later than three years from the due date. However, it is still too early in the Reengineering Initiative to confirm if or how this "best practice", as well as the other "best practices" identified in the above-mentioned report, will be included in RMP's future business processes. We anticipate completing the development of the preliminary design of our future business processes by the end of the calendar year.

NATIONAL PETROLEUM RESERVE SUPPORT

The agency has been chartered to support BLM in development of leases in the National Petroleum Reserve-Alaska (NPR-A). This follows a reduction in the size of MMS's Alaska Regional Office by 50 percent. This effort is planned for fiscal years 1997-99. The Subcommittee understands that tentative plans are for BLM to pay the cost of support items which are above normal salary for MMS employees involved in this project.

Question. Is the above assumption about costs correct?

Answer. Yes, the assumption is correct. The BLM will reimburse MMS for all above normal salary costs. These costs include any overtime compensation as well as all non-personnel costs, e.g., travel, printing, and data acquisition, incurred by MMS in support of the NPR-A effort.

Question. What planned work will not be accomplished as a result of assigning MMS employees to this effort?

Answer. To allow for this effort, MMS will defer action on the Cook Inlet Sale 173 which has been proposed in the approved Outer Continental Shelf (OCS) 5-Year Plan for 1997-2002. The prelease work for this sale was to begin this fiscal year and continue through 1999, which is the scheduled date for this sale. Following completion of NPR-A review, action on the Cook Inlet Sale 173 will resume and the sale may be conducted in the year 2001. This delay in Sale 173 is not considered to be a significant action and, thus, will not affect the 5-Year Plan for 1997-2002.

Question. Will the MMS need to hire additional employees to compensate for the temporary loss of these permanent employees?

Answer. The MMS staff will be diverted from planned activities in support of Cook Inlet Sale 173 in order to pursue the NPR-A review. As a result, it will not be necessary to hire any additional employees, either permanent or temporary, nor will it be necessary to shift funds between planned budget activity or sub-activity levels.

OUTER CONTINENTAL SHELF—REGULATORY PROGRAM

The agency expects a significant increase in demands for services from its regulatory program as a result of renewed interest in Gulf of Mexico production. The cost of conducting the regulatory function will increase.

An additional \$1.9 million is being requested. With leasing activity occurring further offshore and the number of operators increasing, the agency must enhance its attention to regulatory functions.

Question. With an increase of \$1.9 million and 15 FTEs in this function, will demands for services match this increase? What shortfalls, if any can be expected? How will individual productivity measures be affected by the factors of greater complexity in the regulatory function?

Answer. Demands on regulatory services in the Gulf of Mexico Region (GOMR) are expected to increase rapidly for the remainder of fiscal year 1997, through fiscal year 1998, and into fiscal year 1999. These expectations are based on an understanding of industry's commitment to exploring and developing the current lease inventory as well as on current statistical observations. Offshore operators have significantly increased their lease inventories through leases obtained in recent GOMR OCS lease sales. The increase in demand on services in the GOMR in the regulatory function can be attributed to (1) an increase in activity based on higher oil and gas prices and available lease inventories; and (2) more complex operations.

Increased demand has already been experienced in two areas of our regulatory function. The amount of rig activity rose 20 percent in fiscal year 1996 and another 20 percent during fiscal year 1997. Second, the number of plans of exploration and development have increased by more than 100 percent over the past two years. Further, the plan review workload has also increased because of the additional time required to review the more complex plans, such as Deepwater Operating Plans (DWOP). Several very complex deepwater structures (Mars, Ram Powell, and Neptune) have been installed in fiscal year 1997 and several more are planned for fiscal year 1998 and beyond. These facilities represent a significant level of capital expenditures for projects that will be in place and operating over a 10 to 20 year life. These development plans, along with the industry's plans to build at least five new deepwater drilling rigs by the end of fiscal year 1998, demonstrate the offshore operators' long-term commitment to developing their lease inventories in the Gulf. These more complex facilities require a substantially longer amount of time to review and to inspect. The review of these projects now entails a multi-disciplinary review through the DWOP. Many of the projects propose to use substantial amounts of new technology. Since most of these new approaches are not addressed in the current regulations, they must be analyzed on a case-by-case basis to determine if the intent of the regulations is met. (It is not uncommon for a DWOP to request waivers from 27 regulations.)

On the inspection side, these new, more complex facilities take longer to inspect than the typical production facility in the shallower shelf region. In many cases, two or more inspectors may have to be assigned to inspect these facilities where one is the norm. These facilities also are farther from shore and will require additional helicopter travel time. Longer flight times will directly affect inspector productivity; however, the proposed inspector FTEs should offset this loss in productivity.

In addition to the deepwater activities, an increase in the activities offshore Alabama and in the Eastern Gulf have and will continue to stretch resources. Travel times to these areas, from existing MMS offices, is comparable to the deepwater areas, with equally complex facilities. To better utilize helicopter flight time, the District offices are using overtime budgets to keep inspectors in the field. The additional FTEs proposed will allow more flexibility in scheduling and better utilization of helicopter seat space.

In short, we are certain that the full \$1.5 million/15 FTE increase requested in Regulatory Operations is necessary for MMS to keep up with the increased workload associated with heightened industry activity in the Gulf. Through careful management of budget and personnel resources, such as concentrating inspector resources on problem areas and performing pre-installation inspections, as described below, we do not anticipate any shortfalls.

In many cases, engineers and inspectors travel to onshore fabrication yards to inspect subsea systems that cannot be physically inspected once they have been installed on the seafloor. These trips to the fabrication yards also are used to conduct pre-production inspections for the most complex facilities. These trips often save the operator expensive changes in the field and save helicopter flight time for MMS. Due to the complexity of these facilities, consideration must also be given to the training that will be needed to support these approval and inspection activities.

Question. How will the costs of supporting employees involved in the regulatory function (travel, helicopter time, etc.) be affected by the greater complexity in this program?

Answer. The support costs will definitely increase, as mentioned in the answer to the previous question, because these new, more complex facilities take longer to inspect than the typical production facility in the shallower shelf region. In many

cases, two or more inspectors may have to be assigned to inspect these facilities where one is the norm. These facilities also are farther from shore and will require additional helicopter travel time.

In addition to the deepwater activities, an increase in the activities offshore Alabama and in the Eastern Gulf have and will continue to stretch resources. Travel times to these areas, from existing MMS offices, is comparable to the deepwater areas, with equally complex facilities.

The agency states that a transition is occurring in production operations from large companies to significantly smaller operators with less financial resources.

Question. How has this trend increased direct inspection costs? How has this transition affected compliance with regulation and policy? What are comparative enforcement activity figures for the past five years? How have FTEs assigned to the enforcement function changed over the past five years?

Answer. Many of the large multinational companies are making the move to the large fields anticipated in the deepwater areas of the GOMR. To make this transition to deepwater from the shallower shelf region, many of these companies are selling off their interest in shallower water fields to smaller companies that can make a profit based on their lower overhead. Some of these small operators, who are taking over these mature fields have never operated in the GOMR. These fields are generally characterized by aging infrastructure with declining production. Some of these facilities were installed in the late 1950s and are in need of constant attention by the operator. The MMS has concentrated some of its efforts at reviewing the condition of these facilities, prior to an operator transferring these facilities to an operator with significantly less financial resources, and in visiting the new operator to make sure regulatory compliance occurs. Our inspections have identified that some of these operators are unfamiliar with OCS regulations and compliance issues. The level of operating experience has also decreased at many of these field locations. For these reasons, our inspectors spend more time at these facilities for noncompliance and compliance education purposes. Our managers also spend time meeting with operators stressing the importance of safety.

FIVE YEAR COMPARATIVE ENFORCEMENT ACTIVITY FIGURES

	1992	1993	1994	1995	1996
Incident of noncompliance	4,139	4,044	3,662	3,866	4,826
Production INCs ¹	3,596	3,414	3,299	3,570	4,463
Drilling INCs ¹	543	630	362	296	363
Warning	1,754	1,587	1,286	1,482	1,976
Component shut-in	2,246	2,229	2,238	2,186	2,556
Facility shut-in	139	228	138	198	294
Civil penalties paid			15	19	32

¹ Incident of noncompliance [INC].

FTE's assigned to inspection/enforcement have been relatively stable as new efficiencies were implemented to keep up with the growing workload. While this has helped, we now need more FTEs to monitor and ensure compliance.

Enactment of the Deep Water Royalty Relief Act has spurred a significant increase in Gulf of Mexico leasing activity. The Budget Summary states that "by 1998, the enormous increase in the number of active leases in the Gulf of Mexico will require a redirection of resources" to ensure managing the program in a "safe and environmentally sound manner." This new activity will require additional resources in all areas of the regulatory program.

Question. Is MMS adequately prepared to keep pace? Is the \$6.3 million increase sufficient?

Answer. The GOMR believes the \$6.3 million increase will be sufficient to meet the demand on services through fiscal year 1998. The GOMR has made several changes to ensure that the OCS program is managed in a "safe and environmentally sound manner." These changes include promoting performance-based regulations and the Safety and Environmental Management Program (SEMP). These changes to the MMS regulatory program will lead to a different strategy in the inspection and enforcement program. In many cases, MMS will analyze trends and operator performance and will conduct risk-based inspections.

Enforcement actions will be based on these indicators rather than the current prescriptive requirements. The GOMR has also moved to the use of statistical sampling

and clustering of offshore structures to make more efficient use of current inspection resources.

Question. What are projections for how passage of this act will change receipts to the Treasury?

Answer. The Deep Water Royalty Relief Act (DWRRA) will impact Federal receipts in several ways. First, additional tracts will receive bids in near-term sales. Second, tracts that would have been bid on anyway will tend to receive higher bids. Third, there will be less royalties collected to the extent leases qualify for royalty relief.

Preliminary results on leasing activity tend to indicate significant positive impacts on bonus and rental receipts from DWRRA. However, it is difficult to statistically separate the impact of DWRRA from other possible effects arising from improved economic and resource factors which have also tended to spur leasing activity.

Concerning possible royalty impacts, there is not adequate data from exploration and production to reliably estimate this effect at this time. The MMS has only recently issued final regulations under DWRRA, and only one application for relief has been received (and granted). Thus, it is virtually impossible to derive accurate estimates of these various, and countervailing, factors at this time.

Question. Has passage of the act spurred any increased interest in OCS leases in Alaska? What additional incentives could improve Alaskan OCS production potential?

Answer. Most of the provisions of the Deep Water Royalty Relief Act apply only to the Gulf of Mexico, west of 87 degrees, 30 minutes west longitude. The one exception is DWRRA's discretionary authority to offer leases with royalties suspended for a period, volume, or value of production determined by the Secretary. The Secretary has not exercised this authority outside of the portions of the Gulf of Mexico where such royalty terms are mandatory. Therefore, DWRRA has not had any effect on the Alaska OCS program.

The MMS continues to monitor the health of the OCS industry in all regions. Should incentives be warranted, we have regulatory tools in place to provide appropriate financial incentives. On February 2, 1996, MMS published a final rule modifying the regulations governing the bidding systems used to offer OCS tracts for lease. The regulations now give the Department flexibility to offer leases with financial terms other than the traditional one-eighth royalty, including terms similar to those in place for the deep water areas of the Gulf of Mexico. The Department considers options for financial terms on a sale-by-sale basis as part of the individual lease sale planning process. As part of this process, MMS would consider any comments it receives on the financial terms in the Proposed Notice of Sale before making a final decision on those terms. In addition, on May 31, 1996, MMS published an interim rule modifying the regulations governing royalty relief on existing leases. With respect to the Alaska OCS, MMS may grant relief for producing leases if revenues are inadequate to sustain production or for projects to expand production that would be uneconomic without royalty relief.

ENVIRONMENTAL STUDIES

The administration proposes to increase funding in this program to \$14.4 million. This is an increase of \$1.5 million. The agency budget justification does not reflect any FTEs for this function.

Question. While the justification speaks to leveraging with other agencies, State and local governments, and industry, what function manages the overall studies program? What portion of this funding is associated with program administration? Assuming the Leasing and Environmental Assessment function oversees the Environmental Studies function, what amount of FTEs are attributable to the environmental studies program?

Answer. Management of the Environmental Studies Program (ESP) is carried out under the Leasing and Environmental Assessment Program. None of the ESP funding request is associated with program administration. All of the ESP budget, including the requested increase, will be directed to scientific research. The MMS has integrated management of the ESP throughout the Leasing and Environmental Assessment function so that many staff will participate in the management of studies as well as the preparation of NEPA documents. This approach facilitates utilization of studies results in NEPA documents and decisions. Approximately 43 FTE, including technical and clerical staff, are distributed in Headquarters and the Regions, and are involved in oversight of the Environmental Studies Program.

MORATORIA

The Administration now has in place a five year plan for development of oil and gas from the OCS. I believe this plan was developed pursuant to the requirements of the Outer Continental Shelf Lands Act and other relevant environmental statutes. Under the law, no oil and gas development can occur during the pendency of the five year plan in areas of the OCS not specifically identified in the plan.

In its fiscal year 1998 budget, the Administration has requested continuation of the various OCS development moratoria that have been included in the Interior Appropriations bill for a number of years. However, I don't believe any of the areas covered by the moratoria are included as possible development sites in the five year plan.

Question. In light of this fact, aren't the legislative moratoria redundant? Why do you put so little stock in your own five year plan? Doesn't this amount to an appropriations rider that supersedes existing environmental statutes?

Answer. The President's fiscal year 1998 Budget does not propose to continue the current moratoria in their present form. Rather, the proposed budget includes amendments that would conform the moratoria provisions to the newly-approved 5-year OCS oil and gas leasing program for 1997-2002, which proposes leasing in an area that previously has been subject to moratoria.

The current moratoria include restrictions pertaining to a specific lease sale—Eastern Gulf of Mexico Sale 151—that had been proposed in the 5-year program for 1992-1997 but was canceled in 1995. Proposed Eastern Gulf Sale 181 in the new 5-year program for 1997-2002 would offer a small portion of the area that had been proposed for leasing in Sale 151; this new proposed sale was developed in cooperation with the States of Florida and Alabama.

Removing the outdated reference to Sale 151 is intended to clarify that the current restrictions would not apply to the newly-proposed Sale 181. In addition to striking the reference to Sale 151, the proposed amendments would replace a similar outdated reference to a specific Atlantic lease sale with more appropriate wording and would remove North Aleutian Basin drilling restrictions, that are no longer necessary, due to the expiration of all leases in that planning area. Thus, the revisions would have the effect of continuing the existing preleasing and leasing restrictions as they apply to areas excluded from the new 5-year program for 1997-2002.

By proposing to remove moratoria restrictions that are ambiguous or inconsistent with the provisions of the new 5-year program, the Administration hopes to clarify and strengthen the role of the 5-year program in implementing our OCS leasing policies while also acknowledging that there is still considerable constituent support for continuing the current restrictions that apply to certain areas excluded from the program. We have made conflict resolution a high priority in managing the OCS program, and we believe that continuing the moratoria as they apply to the areas that are excluded from the new 5-year program will support our overall conflict resolution efforts. Although we have developed a leasing program based on science and consensus, which includes the small portion of the Eastern Gulf of Mexico Planning Area that previously was subject to moratoria, we realize that longer term efforts will be necessary to resolve conflicts related to the other areas under moratoria. We believe that continuing the moratoria as they apply to those areas will provide a useful foundation for those efforts, as the restrictions serve to assure stakeholders that the status quo will be maintained while discussions of relevant issues ensue. Thus, unlike previous moratoria that did not conform to existing 5-year programs and might be perceived as superseding existing statutes governing the formulation and implementation of those programs—the Administration views the provisions we are recommending for fiscal year 1998 as complementing the program for 1997-2002 and serving our longer term priorities.

In light of the Senate question's reference to development moratoria, we wish to clarify that the new 5-year program and the proposed fiscal year 1998 moratoria language pertain only to preleasing and leasing activities. Thus, neither the 5-year program nor the amended moratoria language will directly affect the development of existing leases, including those located in areas subject to moratoria on future preleasing and leasing activities.

Question. Recognizing that many areas of potential leasing are under moratoria, how have recommendations from this program affected planning for eventually proposing a complete or partial end to the moratoria?

Answer. As explained in the answer to the previous question, the 5-year program for 1997-2002 proposes a lease sale in a portion of the Eastern Gulf of Mexico Planning Area that currently is subject to the moratoria but would be available for leasing under the fiscal year 1998 amendments to the budget recommended by the Administration. Proposed Sale 181, which is acceptable to a consensus of stakeholders

including the Governors of Alabama and Florida, represents a small yet significant step on OCS moratoria.

The new program's exclusion of OCS areas subject to moratoria in which there are existing leases—Southern California, Florida Panhandle, and North Carolina—is enabling us to focus on resolving issues related to those existing leases without having to deal with additional conflicts and controversies that proposed new leasing in those areas would engender. We are addressing issues related to potential development of the Southern California leases through a multiyear study—the California Offshore Oil and Gas Energy Resources Study (COOGER)—which involves representatives of MMS, the State of California, the three affected local counties, and the lessees and operators. We have established an information office in Pensacola to conduct local education and outreach efforts relating to the Florida Panhandle leases, and we are consulting with the State of Florida and other stakeholders concerning exploration and development plans in that area. We have successfully settled buyback litigation relating to the North Carolina leases with all but two of the companies holding those leases. We also are planning to work with the State and other stakeholders to resolve issues concerning the North Carolina leases that will remain in effect as a result of the settlement that has been reached with all of the other companies. We believe that if new leasing were proposed in these areas in the program for 1997–2002, these efforts would be seriously impeded, thereby prolonging conflicts and preventing the consensus-building needed to set the stage for considering even very limited additional leasing in these areas in subsequent 5-year programs.

Question. How does the economic potential of areas under moratoria compare to other planning areas on the OCS?

Answer. In Alaska, the North Aleutian Basin's economically recoverable resources of 0.02 billion barrels of oil (BBO) and 0.88 trillion cubic feet (TCF) represent five percent on a barrel of oil equivalent (BOE) basis of the equivalent total Alaskan resource and less than one percent of the BOE OCS resource. The economically recoverable resources in the Pacific planning areas of 5.3 BBO and 8.3 TCF represent 25 percent of the BOE OCS resource, while the economically recoverable resources in the Atlantic planning areas of 0.4 BBO and 5.2 TCF represent five percent of the BOE OCS resource. The economically recoverable resources in the Eastern Gulf of Mexico of 1.1 BBO and 4.9 TCF represent seven percent of the BOE. Therefore, in aggregate, approximately 37 percent of the OCS economically recoverable resources are expected to be in areas under moratoria.

Question. Does the agency acknowledge an eventual need to enter areas currently under moratoria? If so, what steps are being taken to encourage the public's acceptance of leasing in areas presently covered by moratoria?

Answer. The Department does not rule out the possibility that changing international conditions or evolving domestic conditions and attitudes eventually could result in future consideration of leasing in areas currently under moratoria and believes that such consideration should be based firmly on science and consensus. As previously stated, we are attempting to resolve issues related to existing leases in certain moratoria areas to build public trust. The Department also is attempting to identify scientific information needs for areas currently subject to moratoria, and as part of this effort, requested that a joint subcommittee of the OCS Policy and Scientific Committees of the Minerals Management Advisory Board conduct a review and provide pertinent recommendations to the Secretary. In May 1997 the Subcommittee on Environmental Information for Select OCS Areas Under Moratoria submitted its report, which presented 10 specific recommendations in support of proceeding with environmental studies in moratoria areas. This report has been approved by both the OCS Policy Committee and the Scientific Committee. The report is under review at the Department, and the Secretary has not yet responded to the Advisory Board concerning the recommendations.

ROYALTY MANAGEMENT PROGRAM

The agency proposes to reduce this program by \$3.7 million and 36 FTEs.

Question. With increases in production expected, does the agency project an increased demand for services from the Royalty Management Program? How will valuation, operations, and compliance be affected? Has the agency identified program vulnerabilities in this area as a result of the personnel reductions?

Answer. Although we project significant increases in the production of both oil and gas by the year 2000, it will occur mainly in the Gulf of Mexico, and be the result of deepwater drilling. Such production from a few large leases will have a much smaller impact on RMP workload than would increased onshore production which is characterized by hundreds of small lessees. The workload increases that

will be realized, we believe can be absorbed through the efficiencies gained over the past two years involving the streamlining of reporting and internal processes, and organizational efficiencies resulting from the MMS 2000 Reorganization. We have not identified program vulnerabilities resulting from personnel reductions which would impact the current valuation, operations or compliance processes, even with the increased production levels discussed above.

Question. Will the \$3.7 million reduction in any way affect implementation of the Federal Oil and Gas Royalty Simplification and Fairness Act of 1996?

Answer. The overall reduction of \$3.7 million will be achieved through several streamlining efforts that have been in development and are now providing efficiencies, such as electronic commerce initiatives which are significantly reducing the error rates of the reporters, eliminating some processes no longer considered beneficial such as late and erroneous reporting assessments, and consolidating and flattening the organizational structure which reduced the need for some management positions. The impact of this reduction on the implementation of the Royalty Simplification and Fairness Act (RSFA) has not been completely assessed at this time. The RSFA was signed into law well after many of the streamlining initiatives referred to above were initiated. The requirements of RSFA provide for many changes in the way MMS conducts business, not the least of which is the need for several significant software changes. Some of those development efforts will take place this fiscal year through system reprioritization efforts.

Question. Will efficiencies offset the program reductions? If not, what functions will be reduced?

Answer. Yes, efficiency-derived savings should offset the program reductions. The MMS began a compliance reengineering effort in April 1996 which has now been expanded to a full program reengineering undertaking. As a result of the compliance study, we are beginning to implement process improvements that will result in more efficient use of auditors' time. Several recommendations in the reengineering report will be implemented which will both meet the General Accounting Office audit standards, while at the same time significantly reduce the amount of administrative paperwork currently required of the auditors. This workpaper and process streamlining will enable us to continue to provide effective compliance coverage with fewer staff. In other parts of the program, several streamlining initiatives including an aggressive electronic reporting policy have enabled the program to continue to provide effective levels of service with significantly fewer Federal and contractor resources.

An Office of the Inspector General audit report (96-I-1264) cited some weaknesses in negotiated royalty settlements. One specific finding included remarks about insufficient personnel in the Royal Management program to provide necessary documentation during negotiations.

Question. Will there be further difficulties in carrying out basic Royalty Management functions due to a lack of personnel?

Answer. The RMP has assigned two additional FTE for paralegal personnel to the Office of Enforcement specifically to assist in documenting negotiated settlements and civil penalty actions. Team members will assume greater responsibility for assuring settlement documentation is complete. We believe this will assure all the necessary internal controls will be in place.

Interior's Office of the Inspector General budget justification states that "MMS has not been successful in ensuring that all lessees and operators comply with its requirements to accurately and timely report the production and sale of oil and gas from Federal and Indian leases." The OIG states that this occurred because of "the lack of strong deterrent against noncompliance." The OIG cited a backlog of unresolved exceptions totaling \$21.2 million above the threshold for such exceptions.

Question. What is MMS doing to reduce this backlog? What will prevent this situation from worsening with reductions in the Royalty Management program?

Answer. To address the exception backlog the MMS added 10 employees for two-year terms to the Compliance Verification Division (CVD) and began implementation of a software development effort to streamline the follow-up process. As a result, the CVD has experienced a significant improvement in productivity and efficiency related to the Auditing and Financial System/Production Accounting and Auditing System (AFS/PAAS) comparison. During the January–April 1997 time frame, unresolved case closures increased 75 percent over the same 1996 period, from 3,200 to 5,700, while AFS/PAAS triggered royalty collections which previously averaged about \$1.5 million per month approached \$2.5 million in May 1997. The number of unresolved exceptions should continue to decline in the future.

The MMS has conducted a limited pilot project on royalty-in-kind.

Question. When additional efforts are undertaken with this program, will the agency test the OIG recommendation that royalty-in-kind involve government use

of natural gas as opposed to marketing the gas commercially? If not, what are the agency objections to this proposal?

Answer. With deregulation and easy access to an open gas market, there doesn't appear to be any additional benefits associated with designating specific production for a particular end user. In fact, such arrangements will likely result in additional transportation and administrative expenses for a given user versus acquiring the gas in the open market. Large Federal end users are currently taking advantage of the open access in the gas market and are currently negotiating better prices via the competitive market. This has been confirmed by MMS in recent discussions with the State of Texas who acknowledged this is what's happening with their own royalty-in-kind program.

OFFICE OF SURFACE MINING, RECLAMATION AND ENFORCEMENT (OSM)

APPALACHIAN CLEAN STREAMS INITIATIVE

A \$1 million increase is planned in this program for the purpose of restoring streams to pre-coal mining conditions and to combat acid mine drainage.

Critics state that an increase to the Clean Streams Initiative has the potential to reduce funds available for high priority reclamation projects, including those that protect health and safety.

Question. How has State funding of programs not related to the Clean Streams Initiative been affected? Please provide data since 1994 showing total State funding program expenditures for non-clean stream initiative projects.

Answer. Since the Appalachian Clean Streams Initiative (ACSI) was first conceived, it has been OSM's intention that the initiative not displace funding for regular State Reclamation Grants, but to instead fund it only through a net increase in State Reclamation Grant funding. However, as illustrated in the table below, OSM's goal of holding regular State Reclamation Grants harmless was not completely achieved in the fiscal year 1997 appropriations process, as Congress reduced regular grant funding by \$2 million to accommodate \$4 million in funding for ACSI. While the fiscal year 1998 President's Budget does include a small decrease (\$678,000) for regular grants, that decrease is proposed as a means to offset uncontrollable cost increases, not to accommodate the \$1 million increase proposed for ACSI. It must also be emphasized that all of the Appalachian Clean Streams projects funded in fiscal year 1997 were priority two projects listed on the State Abandoned Mine Land (AML) inventory and these projects have generated more than \$4 million in contributions from other sources.

The following table shows the funding history for regular State Reclamation Grants and Appalachian Clean Streams Initiative grants since fiscal year 1994. It should be noted that the history of the AML State Reclamation Grant program is characterized by fluctuating funding levels from one year to the next.

FUNDING HISTORY FOR REGULAR STATE RECLAMATION GRANTS AND APPALACHIAN CLEAN STREAMS INITIATIVE GRANTS—FISCAL YEARS

[In thousands of dollars]

	Enacted		1996 ¹	Enacted 1996	1997 ¹	Enacted 1997	1998 ¹
	1994	1995					
Regular State reclamation program grants	135,793	135,534	135,534	140,000	140,000	138,000	137,322
Appalachian clean streams initiative			11,009		4,300	4,000	5,000
Total ²	135,793	135,534	146,543	140,000	144,300	142,000	142,322

¹ President's budget.

² State reclamation program grants.

Question. How is the Clean Streams Initiative applicable to non-primacy States? How are project funding decisions made in these States relative to the initiative?

Answer. The Appalachian Clean Streams Initiative is broadly aimed at remediating the effects of acid mine drainage throughout the Appalachian region in both primacy and non-primacy States. In both cases, OSM financial assistance is provided to the State. The primacy versus non-primacy distinction is important in terms of the mechanism by which OSM provides the financial assistance and the source of the funds. In primacy States, OSM provides funding for Clean Streams projects through supplemental AML State Reclamation Grants. The fiscal year 1997 Interior Appropriations, as included in the Omnibus Consolidated Appropriations Act, ear-

marks up to \$4 million for such grants. By contrast, the mechanism for providing Clean Streams financial assistance to non-primacy States, such as Tennessee and Georgia, is a cooperative agreement funded through OSM's Federal Reclamation program, the roughly \$2.4 million budgeted each year for Federal high priority reclamation projects. The State of Tennessee will receive \$325,000 in such cooperative assistance in fiscal year 1997. At present, OSM is evaluating potential projects in primacy and non-primacy States for funding in fiscal year 1998. In non-primacy States, OSM selects Clean Streams projects in concert with appropriate State agencies and local watershed organizations.

The Department's Office of the Solicitor states that their office has provided extensive legal support to this initiative. The Office states that methods are being pursued to enlist industry's assistance in reclaiming abandoned mine lands.

Question. What interest has been expressed by industry in participating in the Clean Streams Initiative? Are specific projects being planned for accomplishment with industry participation? What methods of industry participation are planned (cash payment, in-kind participation, etc.)?

Answer. The Appalachian Clean Streams Initiative is an effort by OSM to establish partnerships with other government, non-government, and public groups that will work together to clean-up streams impacted by acid mine drainage (AMD). The focal point of these various partnerships is the "Statement of Mutual Intent," co-sponsored by OSM and EPA-Region III that was signed in February 1995. A strategic plan, developed as a part of the Statement of Mutual Intent, envisioned several industry-related objectives: site-specific clean-up projects with partners, including industry; industry financed projects; and encouraging more re-mining of AML lands in order to gain reclamation benefits such as cleaned-up or improved streams. The mining industry has been involved in the Clean Streams Initiative by contributing funds for specific reclamation projects, donating land for use in project construction, and providing in-kind services, such as equipment, design advice, or other project leadership/partnering contributions.

The OSM-sponsored Acid Drainage Technology Initiative is designed to complement the Clean Streams Initiative by focusing on coal mining operations in the planning phase, during operations, or prior to bond release. One objective of this initiative is to identify high-risk acid or toxic areas prior to permits being issued by the regulatory authority. A second objective is to use state-of-the-science design for operations so that AMD does not result in offsite damage or lead to a long-term problem that may require perpetual treatment. The success of this initiative largely revolves around the coal mining industry being willing to assist in developing workable strategies that will result in lowered risk of unanticipated AMD problems from active mines.

The OSM is also encouraging re-mining and its associated reclamation benefits under Title V of the Surface Mining Control and Reclamation Act (SMCRA) through various activities. Specific re-mining projects are being developed by industry, with participation of the regulatory authorities, which address serious water quality issues. The OSM, EPA, and States are participating on an interagency task force that, in part, is examining water issues associated with the Clean Water Act that appear to be impediments to re-mining.

Furthermore, OSM is working on a separate initiative to develop approaches under Title IV of SMCRA that will result in more reclamation of abandoned mine land. One specific Title IV approach could save AML Fund dollars through encouraging industry to restore abandoned mines by using proceeds from the sale of incidental coal recovered in the process to help finance the projects and to provide a reasonable profit to the operator. In fiscal year 1996 the agency obligated \$7.3 million for emergency projects.

Question. What has been the emergency obligations for the four years prior? Does the \$7.3 million include states with emergency reclamation programs?

Answer. Shown below are emergency project obligations for fiscal years 1992 through 1996 as reported in the OSM's annual reports.

Emergency project obligations for fiscal years 1992-96 in whole dollars

1996	\$7,240,542
1995	8,788,444
1994	10,742,901
1993	10,184,885
1992	9,532,398

These totals do not include emergency project obligations from States which have opted to assume the emergency reclamation program from OSM. It should be noted

that Ohio and Indiana assumed their emergency programs in fiscal year 1993 and fiscal year 1995 respectively.

Also, it should be noted that the above numbers do not reflect the \$7.2 million that was provided to conduct emergency reclamation in Kentucky, as part of the President's disaster relief fund in 1994.

Question. What is the historic backlog of reclamation projects which can be funded from Abandoned Mine Land funds? How has this backlog been affected by the change of minimum program level funding from \$2 million to \$1.5 million?

Answer. The Abandoned Mine Land Inventory System reports 4,580 high priority sites remaining to be reclaimed. An estimated \$2.5 billion is needed to reclaim these sites. The reduction in the minimum program funding has no discernible affect on the overall reclamation efforts of the program; it does transfer the reclamation achievement from some States to others. The minimum program States all have efficient, well run programs. Funds granted to those States are used primarily to abate health and safety hazards stemming from abandoned coal mines. This is also true of funds granted to the non-minimum program States. Thus, changing the distribution pattern due to a change in minimum program levels does not affect in a substantial way the overall amount, priority, or quality of reclamation. For the minimum program States, the reduction to \$1.5 million means that less health and safety problems will be corrected than would be addressed if \$2 million was the funded minimum level, as stated in the Surface Mining Act.

The Interstate Mining Compact Commission recommends higher allocations from the AML fund.

Question. Within existing staffing and support structure, could OSM manage an increased allocation to States from the AML fund?

Answer. If additional appropriations for grants were provided, OSM could distribute the additional funds to States without impacting the existing staffing and support structure of OSM.

The National Association of Abandoned Mine Land Programs and the Interstate Mining Compact Commission submitted to the Secretary and the Director of OSM, a proposed plan for distributing the accumulated balance in the AML Fund to the States in order to accomplish more on-the-ground reclamation projects. The Department has been petitioned to distribute the accumulated balance in the AML to the States.

Question. What is the agency reaction to this request? What interaction has the agency had with the States regarding this proposal?

Answer. Staff from OSM have discussed this proposal with the States and Indian Tribes on several occasions and have sent informal comments on the plan to the National Association of Abandoned Mine Land Programs. At this time, OSM is not in a position to support this proposal because it would involve amending SMCRA and would result in a substantial increase in appropriations from the AML Fund.

ACID MINE DRAINAGE POLICY

A March 31, 1997 policy statement, says that prevention, correction, and control of acid mine drainage is one of the agencies top priorities.

Concern has been expressed that emphasis on projects such as this will take funding from higher priority health and safety projects associated with the abandoned mine land reclamation fund. The agency responded that States can pursue abandoned mine funding through intergovernmental agreements with the Natural Resources Conservation Service (NRCS).

Question. How much funding has been utilized by States in cooperation with the NRCS for projects which could be funded from abandoned mine funds?

Answer. Acid mine drainage creates environmental and water pollution problems that frequently cause health, safety, and general welfare problems. These AMD-related problems represent as great a problem to the citizens in the coal fields as abandoned mine sites. A cooperative effort between OSM, NRCS, and the State and tribal programs is ongoing to identify areas that can be reclaimed through partnership efforts. We are encouraging State programs to maximize the reclamation they do by pursuing sources of funding other than their AML grants, including funds previously appropriated for the Rural Abandoned Mine Programs (RAMP) but not yet spent. Already two such sites have been identified, one in Oklahoma and one in Tennessee. The former has an estimated cost of approximately \$250,000; the latter has a cost estimated at over \$1 million. It should be pointed out that the funding coming from NRCS is AML funding from previous appropriations to RAMP that is not yet spent.

Question. What level of ongoing interaction occurs with NRCS relative to administration of the Rural Abandoned Mine Program? Are cooperative projects between

OSM and NRCS in operations? Is there coordination regarding expenditures from the RAMP trust fund?

Answer. In past years, RAMP and several State programs were carefully coordinating reclamation projects before the RAMP appropriation funding was curtailed. There were committees on which NRCS, OSM, and State officials sat and decided which projects would be funded and who would have the overall responsibility for a project. These committees still exist in those States and NRCS still provides input into the program. These committees also are facilitating the take-over of RAMP projects by the State programs. The OSM and NRCS are currently developing a new Memorandum of Understanding which will promote efficient use of the AML fund and the skills and talents of the NRCS personnel. In addition, OSM, NRCS, and the States are coordinating projects. Two such sites have been identified; other possibilities have been located. As each is undertaken, it will be done with a combined funding of NRCS and State, tribal, and OSM funding as applicable.

PRIMACY AND ABANDONED MINES

Currently three Tribes are administering approved abandoned mine reclamation programs but do not have primacy.

Question. What is the status of the effort to give Indian Tribes primacy?

Answer. Currently, SMCRA does not allow any Tribe to assume primacy. The Energy Policy Act of 1992 renewed interest in tribal regulatory program development by amending SMCRA to add a new Section (710(I)) which provides that the Secretary will make grants to the Crow, Hopi, Navajo, and Northern Cheyenne Tribes to develop tribal regulations and program policies with respect to surface mining; assist OSM in the permitting, inspection, and enforcement of surface mining activities on Indian lands; and sponsor employment training and education. Consistent with Energy Policy Act provisions, the Department of the Interior issued grants from BIA and OSM funding totaling \$480,000 in fiscal year 1996 and \$600,000 in fiscal year 1997 to the Tribes to assist in establishing a surface coal mining regulation unit for each Tribe.

The OSM staff met with Crow, Northern Cheyenne, Navajo, and Hopi tribal representatives in a series of meetings in 1996 to develop draft legislation that would allow tribal governments to assume SMCRA primacy. The last meeting occurred on November 13, 1996. Each meeting has resulted in bringing the Tribes closer to an agreement as to the language of the draft legislation.

On April 14, 1997 OSM sent a letter to the Tribes requesting that they review a final draft of the legislation and asked for further input. The Navajo Nation has advised OSM that they want to meet one more time to discuss the draft legislation. A meeting will be scheduled and, depending on the outstanding issues among the Tribes, OSM will then make recommendations to the Secretary on how best to proceed with the legislative initiative.

The State of Tennessee has relinquished regulatory authority.

Question. Are other States considering this action?

Answer. The OSM is unaware of any other State which is considering relinquishing primary regulatory responsibility.

COAL MINE COMPLEXITY

The agency budget justification speaks to increased production from a reduced number of mines. Permitted acreage has increased to 4.2 million. Technology has rapidly advanced.

Question. How has the skill level of OSM employees been affected by the technological changes? How have changes in technology affected the skill level of State and tribal regulators? How have agency training costs been affected?

Answer. Through OSM's Technical Training Program, the technical competence and professional knowledge of OSM, State, and tribal personnel has risen commensurate with technological advances and changes in coal mining and reclamation operations. Each year, the program trains approximately 700 State and tribal students and 300 OSM students. Regulatory and reclamation staff must make numerous and complex technical judgments while performing their duties. To update this technical expertise, the Technical Training Program continues to develop new courses in response to customer requests and advances in technology. The program has added numerous courses which specifically focus on the application of the most appropriate technology. For example, courses were recently developed to teach the latest technologies in predicting, controlling, and abating acid-mine drainage. Additional new offerings include five field intensive workshops on the most appropriate technologies and methods to abate the abandoned mine land problems of subsidence, landslides, mine fires, dangerous highwalls, and dangerous openings.

Courses are continually updated to include new practical applications resulting from technological changes including the latest materials and methods for erosion and sediment control, use of computer modeling in hydrology courses, use of global positioning units for field classes such as applied engineering, and the latest research on vegetation practices. Special emphasis is given to differences in the application of technology in different climatic and geographic areas.

By making these technological updates available through the training program, State, tribal, and OSM regulatory and reclamation staff have access to information that improves their knowledge of on-the-ground conditions and this enables staff to make better decisions about permitting, bonding, inspection, and optimal abatement of abandoned mine land problems.

The OSM has held its technical training budget relatively constant, so the training program has responded to the aforementioned trends by offering fewer sessions of several older and more fundamental classes and shifted some funding to meet advanced technical needs as newer courses are more costly. For example, more complex subject matter requires the use of additional instructors for each course, so that courses which are being offered on acid mine drainage require instructors who have specific expertise in geo-hydrology, soil science, plant and aquatic ecology, and water chemistry; the AML Design workshops require civil and mining engineers, AML project managers, and geologists; and the Wetlands Awareness and Erosion and Sediment Control courses require experts who are versed in the specific climatic conditions, soils, and vegetation of an area of the country.

This has had the effect of limiting the number of participants and increasing the travel costs because students may have to fly if only one session of a course is held nationwide. The reduction in basic course offerings means that not all State and Tribal new hires or staff requiring cross-training will have their needs met. Additionally, while the overall number of program offerings has increased, demand also exceeds available spaces for courses in advanced technology.

Question. How has the cost of mining coal changed? Is there comparative data available showing changes in the cost per unit for mining coal?

Answer. The OSM does not collect this type of data, and the agency is unaware of any readily available information source. However, over the last decade, coal mining productivity has risen at an average annual rate of 6.6 percent, including an eight percent increase from 1994 to 1995. Much of this productivity gain results from an increase in both the number and efficiency of underground mines using the longwall extraction technique.

The agency reduced its workforce by approximately one-third in fiscal year 1996.

Question. After implementation of this significant downsize has full organizational alignment been achieved? Are all employees located in the most efficient locations and properly matched with their respective specialties?

Answer. Immediately after OSM's reorganization and downsizing, the staff experienced difficulties maintaining the same level and quality of program delivery. Many employees affected by the reduction in force were placed in different programs or positions. The OSM has retrained many employees to improve their effectiveness in program delivery. Some staff were relocated to match technical expertise with workload demands. With training, redistribution of workloads, automation, and redesign of some of OSM's processes, OSM has employees located in the most efficient locations and has virtually completed its organizational realignment. The OSM will continually monitor its workload and adjust staffing locations as needed.

REMINING

The OSM has established a charter which involves the formation of partnerships with States and environmental groups to determine the status of remining in the Appalachian States.

Question. What levels of production can be expected through remining projects?

Answer. The OSM is unaware of any projections regarding total potential coal production from remining projects. However, in Pennsylvania, 60 percent of the active coal mining operations involve remining, as did 72 percent of the active operations in Virginia in 1994. Furthermore, in Virginia in 1994, 38 percent of the total permitted acreage consisted of previously mined lands.

Question. Will remining efforts affect sites that have been restored through reclamation projects? Have any sites over the past five years been reclaimed and then remined? Was the reclamation expense for any of these sites paid for with AML funds? If so, what has the cost been to the AML fund?

Answer. We do not anticipate that areas already reclaimed through the AML program will be disturbed through remining efforts. The OSM is not aware of any reclamation work funded from the AML program that has been disturbed by remining.

Our national program guidelines are quite specific regarding areas that have potential for remining. Such areas are not to be reclaimed through the AML program unless the reclamation authority can ascertain that there is little likelihood of a remining effort. Programs go to great lengths to ensure that remining does not occur on areas that have been reclaimed with AML funds. In some States, the landowner or mineral owner must complete a questionnaire which discusses any future plans to remine. If such plans are even remote, the AML program does not undertake a project. Also, the AML program discusses the site with the regulatory program and gets input as to the suitability for remining. Again, if the site is even slightly a candidate for remining, funds are not used for the portion of the site that might be remined.

STATE FUNDING, ENVIRONMENTAL PROTECTION

The agency is planning a \$500,000 decrease in the State Funding Program.

Question. Which States will be affected by this reduction?

Answer. The OSM anticipates this reduction, of less than one percent of the total grant funds, will have no discernible impact on States. It has been determined that States are not fully obligating grant funds, as evidenced by some States consistently turning back funds at the end of the grant performance period; over \$1 million was deobligated in fiscal year 1995, the latest year for which we have complete data.

Question. Are these reductions due to reduced matching funds by the States? If so, why have the matching funds been reduced? Is there less work to be accomplished?

Answer. This reduction is due to a reduced matching level by the States. The reasons for the reduction in State matching funds are numerous and can vary from State to State and from year to year. However, the most consistent reason is, like the Federal Government, many States are facing a financial challenge and are forced to make tough choices for dwindling or flat resources.

Question. What was the fiscal year 1998 grant request total on a State by State basis?

Answer. The following table shows the States' fiscal year 1998 grant estimates, which were submitted to OSM in August 1996.

FISCAL YEAR 1998 REGULATORY GRANT ESTIMATES STATES' REQUEST

[In whole dollars]

State	Non-Federal lands (Federal shares)	Federal lands	Total
Alabama	1,203,815	15,000	1,218,815
Alaska	173,580	173,580
Arkansas	196,836	196,836
Colorado	510,227	1,409,199	1,919,426
Illinois	2,239,046	87,486	2,326,532
Indiana	2,161,827	2,161,827
Iowa	180,570	180,570
Kansas	104,166	104,166
Kentucky	13,760,504	359,285	14,119,789
Louisiana	192,563	192,563
Maryland	663,173	663,173
Mississippi ¹
Missouri	573,166	573,166
Montana	266,444	840,965	1,107,409
New Mexico	278,586	398,526	677,112
North Dakota	296,628	230,711	527,339
Ohio	1,551,254	1,551,254
Oklahoma	899,374	24,030	923,404
Pennsylvania	12,023,329	12,023,329
Texas	1,446,563	1,446,563
Utah	280,028	1,398,181	1,678,209
Virginia	3,063,965	10,518	3,074,483
West Virginia	8,142,287	8,142,287

FISCAL YEAR 1998 REGULATORY GRANT ESTIMATES STATES' REQUEST—Continued

[In whole dollars]

State	Non-Federal lands (Federal shares)	Federal lands	Total
Wyoming	262,250	1,271,732	1,533,982
Totals	50,470,181	6,045,633	56,515,814

¹ Has not yet submitted estimates for fiscal year 1998.

The Interstate Mining Compact Commission recommends reducing the State “matching” share to 25 percent from 50 percent.

Question. How would such a change affect the operations of OSM in terms of program accomplishment, FTEs, and project backlog?

Answer. If the State matching share is reduced to 25 percent and the overall grant appropriation of \$50.7 million is increased proportionally within OSM’s budget, such a change would severely impact all of OSM. The OSM would have to reduce its direct operating budget from \$55 million to \$32 million. The OSM operating budget could not be lowered to this level without severely impacting the agency’s mission. Such a reduction would adversely affect not only coal field residents in Federal program States who are completely dependent on OSM for protection from coal-related hazards, but also primacy States who rely on OSM technical assistance and training, and who also benefit from OSM oversight and backup enforcement. At this time, the precise impact of such a decrease on OSM’s programs, FTEs, and project backlog cannot be quantified.

ENVIRONMENTAL PROTECTION: STATE FUNDING

[In millions of dollars]

Current funding		Hypothetical funding	
Non-Federal lands cost (50 percent)	\$45.324	Non-Federal lands cost (75 percent)	\$67.986
Federal lands cost	5.352	Federal lands cost	5.352
State match (50 percent)	45.324	State match (25 percent)	22.662
Total program cost	96.000	Total program cost	96.000
Grant appropriation	50.676	Grant appropriation	73.338

If the State matching share is reduced to 25 percent without increasing the overall grant appropriation, there would be an immediate, adverse impact on the States’ regulatory programs. Under this scenario, State Regulatory Authorities’ (SRA) budgets would be cut in half, as the OSM State Regulatory Grants would have to be reduced by one-half to comply with the SMCRA requirement that primacy States contribute 50 percent of the cost of the SRA’s budget. A reduction of this magnitude would severely undermine States’ ability to operate viable regulatory programs. Some States would not be able to maintain effective programs, in which case OSM would incur a major expense to take over the regulatory programs.

ENVIRONMENTAL PROTECTION: STATE FUNDING

[In millions of dollars]

Current funding		Hypothetical funding	
Non-Federal lands cost (50 percent)	\$45.324	Non-Federal lands cost (75 percent)	\$45.324
Federal lands cost	5.352	Federal lands cost	5.352
State match (50 percent)	45.324	State match (25 percent)	15.108
Total program cost	96.000	Total program cost	65.784
Grant appropriation	50.676	Grant appropriation	50.676

The agency appears to justify a reduction of \$500,000 from the State regulatory grant program because States are unable to meet the 50 percent match requirement. States appear to be having trouble meeting this 50 percent level.

Question. Are there mechanisms in SMCRA which would allow OSM to increase the Federal share of the program? If changes to SMCRA are required, would the Department support the changes necessary to increase the Federal share? Has the agency analyzed what the financial impact would be to the Federal Government if States begin to opt out of regulatory programs? What steps is OSM taking to make sure that the State/Federal partnership remains in place?

Answer. Section 705 of SMCRA provides that grants shall not exceed 80 percent of the total costs incurred during the first year, 60 percent the second year, and 50 percent each year thereafter. At this time, all States with active mining are at the 50 percent cost sharing level. However, if a State elects to regulate surface coal mining and reclamation operations on Federal lands, OSM may reimburse the State up to 100 percent of its costs of such regulation. For fiscal year 1998, we expect 11 States to have a cooperative agreement with OSM to regulate surface coal mining on Federal lands.

There is no other mechanism in SMCRA to increase the Federal share of program costs. However, a State must have primacy to qualify for State Reclamation grants. Because of the impact a higher matching percentage could have on budget constraints, it is unlikely that the Administration would support any change to SMCRA which would result in such increased costs. The OSM has not analyzed the financial impacts if States begin to opt out of regulatory programs. At this time, we are not aware of any State planning to do so. One of the key steps OSM has taken to make sure the State/Federal partnership remains strong is the reengineering of the oversight process. In cooperation with the States, OSM developed a new results-based oversight strategy to focus on end results and the on-the-ground success of States in meeting the SMCRA environmental protection standards. Also, OSM and the States now develop State-specific evaluation plans tailored to the unique conditions of each State program and governed by performance agreements worked out by each State and OSM Field Office.

The agency is planning a \$240,000 increase in the State Program Evaluation. However, no FTE changes are shown.

Question. For what purposes will this increase be used?

Answer. This increase in Environmental Protection/State Program Evaluation is for a pro rata share of "uncontrollable cost increases," which includes mandated pay increases.

APPLICANT VIOLATOR SYSTEM

A Federal appeals court in February 1997 ruled that the agency's Applicant Violator System (AVS) could not be used. On April 21, 1997, OSM announced new rules which would "block permits for applicants responsible for uncorrected violations" in the past.

*OSM Clarification and Response—*In issuing its decision on January 31, 1997 the U.S. Court of Appeals for the District of Columbia Circuit did not address or prohibit use of the AVS. Instead, it ruled that OSM's 1988 ownership and control rules exceeded the authority provided by Section 510(c) of SMCRA. Specifically, the court held that Section 510(c) prohibits the issuance of a permit if there are unabated violations at operations owned or controlled by the applicant. This section does not, according to the court, authorize the regulatory authority to withhold permit issuance on the basis of unabated violations at operations owned or controlled by persons who own or control the applicant, as provided in the challenged regulations. The decision recognizes that OSM and State regulatory authorities have an obligation to implement Section 510(c) as interpreted by the court. The OSM and States use the AVS, which is a national database, as a tool to fulfill this obligation.

Question. How do these new rules address the Federal judge's actions?

Answer. The new interim final rules provide for application of the permit block sanction in a manner consistent with Section 510(c) of SMCRA as interpreted by the court. Under the new rules, regulatory authorities may not issue a permit if any surface coal mining and reclamation operation owned or controlled by the applicant is currently in violation. This differs from the previous rules, which extended the prohibition on permit issuance to situations in which any surface coal mining and reclamation operation owned or controlled by a person who owns or controls the applicant is currently in violation.

Question. Can any existing information in the Applicant Violator System be used to make administrative permitting decisions in light of the judge's decision?

Answer. Yes. As required by regulations unaffected by the court's decision, State and Federal regulatory authorities continue to base permit issuance decisions on the compliance and ownership and control information in the AVS. While the court decision invalidated OSM's 1988 ownership and control rules, it did not invalidate or

otherwise negate the regulations requiring use of the AVS as part of the permitting process. The AVS and the information it contains are still essential to ensuring implementation of Section 510(c) of SMCRA.

Question. What specific aspects of the new rules makes the process less susceptible to a repeat decision by a Federal court that this process can not be used to “screen” applicants?

Answer. In rendering its decision, the court found that the language in Section 510(c) of SMCRA clearly authorized the use of the permit block sanction in those cases where the applicant owned or controlled violations. However, the court found that OSM had exceeded this authorization when it promulgated regulations that applied the permit block sanction to those who owned or controlled an applicant. On the basis of this single flaw in the rules, the court invalidated OSM’s 1988 ownership and control regulations. In developing the April 21, 1997 interim final rules, OSM carefully considered the court’s interpretation of Section 510(c) and sought to ensure that the new rules were fully consistent with that interpretation. Most significantly, the new rules do not include the provision that the court rejected. Hence, OSM believes that these rules will survive further judicial scrutiny.

The agency states that there is a continuous violation problem, referring to 4,682² violations.

Question. What are the past five year comparative data regarding violations notices? What is the disposition history for these violations?

Answer. The following chart shows State individual violations for evaluation years 1993–1996. The 1992 data was captured at the aggregate notice of violation level, and a notice of violation may include more than one individual violation. Of the violation figures displayed, approximately 10 to 15 percent resulted in issuance of failure to abate cessation orders. The remainder of all violations were corrected to the satisfaction of the State regulatory authority.

1992	19,178
1993	10,148
1994	10,493
1995	8,675
1996	² 5,852

¹Data for 1992 is the total number of notices of violations, all other years are individual violations cited. A notice of violation may include multiple individual violations.

²Preliminary numbers, the 4,682 figure above is for 9 months of data, the 5,852 is for 12 months of data.

TECHNICAL INFORMATION PROCESSING SYSTEM (TIPS)

This system has become an integral part of State programs. The agency proposes a decrease of \$300,000 in this program which is attributable to accomplishment of upgrades and equipment replacement. The Western Interstate Energy Board disputes the contention that equipment has been adequately upgraded.

Question. Has OSM consulted with the States prior to making this budget request?

Answer. The TIPS is a technical assistance program for States and Indian Tribes which is entirely Federally funded. States and Tribes do not match the costs. The OSM did not specifically consult with the States about any reductions in TIPS funding prior to making this budget request. Given other program priorities to be funded in fiscal year 1998, the TIPS workstation upgrades were not included in the OSM budget request. The OSM has consulted with States to work toward developing an outline of the course of action and costs associated with maintaining TIPS at its current level of operation. It is intended that TIPS hardware will be replaced incrementally on a continuous five year rotating basis. Equipment replacement was initially envisioned as beginning in fiscal year 1996. However, due to budget reductions in fiscal year 1996, the replacement of equipment did not occur as anticipated.

Question. Will this reduction make the agency increasingly prone to system obsolescence by lengthening overall equipment upgrade and replacement schedules?

Answer. Some of the current TIPS workstations will be five years old in fiscal year 1998. This is a concern because the manufacturer’s warranted maintenance and repair service agreement expires after five years from purchase. The OSM is replacing some of the older hardware this fiscal year and is striving toward a regularly scheduled cycle of replacement for all TIPS equipment. The OSM is not increasingly prone to system obsolescence due to replacement delays to date.

DEPARTMENTAL OFFICES

OFFICE OF INSULAR AFFAIRS

The Committee last year directed the Department to withhold from American Samoa \$2 million in construction grants until the Secretary certifies that the recommendation of the immediate term financial recovery plan have been substantially implemented.

Question. Have these funds been released?

Answer. No, these funds have not been released.

Question. What progress is the American Samoa Government making with regard to implementation of the working group recommendations?

Answer. We are awaiting a report from the American Samoa Government on the status of implementing the Financial Recovery Plan. We expected the report by May 31, but apparently it is not completed.

Question. Would the Administration support inclusion of similar language in the fiscal year 1998 appropriations bill or report?

Answer. Yes, we would support a similar withholding attached to the fiscal year 1998 appropriation.

Similarly, the Committee has objected to the release of further funds for health care facilities pending establishment of an independent hospital authority with rate setting power.

Question. What progress has been made in American Samoa with regard to establishment of an appropriate hospital authority?

Answer. This issue was discussed with Governor Sunia in March. The Governor is strongly opposed to an independent hospital authority. On the premise that the primary Federal concerns are good hospital management and the imposition of a reasonable fee schedule, we invited the Governor to submit an alternative proposal that will accomplish the same objectives. He indicated he would do that and we expect his proposal at the same time as the report on the Financial Recovery Plan.

Question. What funds have been released to American Samoa for health care facilities in fiscal year 1997?

Answer. No funds have been released for health care facilities in fiscal year 1997. We will continue to withhold this funding until the American Samoa Government develops and implements a proposal for resolving health care problems that is acceptable to the Department and the Appropriations Committees.

The American Samoa Government is to provide a capital improvement plan that shows what projects will be funded in the current budget year and four outyears.

Question. Has the Department received an update of the Master Plan? If so, does the plan include any significant changes in priorities or funding requirements? If not, when does the Department expect to receive a plan update?

Answer. The Office of Insular Affairs received revisions to the Master Plan from the American Samoa Government at the beginning of June 1997. It included some changes in priorities, primarily associated with the Governor's desire to institute a program to improve village roads in American Samoa. The justification is that the village roads have so deteriorated that they are unsafe and basic services such as school buses, trash pickup, police, fire, and rescue cannot use many of the roads. We did not think the revised plan adequately demonstrated how priorities are determined and the criteria used to select specific projects. Also, although the transmittal letter referenced additional outyear information, specific lists of projects to be funded in fiscal year 2001 and fiscal year 2002 were not included. We are awaiting an improved plan and expect to receive it by mid-July.

GUAM

The fiscal year 1997 appropriations bill provided \$4.6 million to Guam for capital infrastructure projects.

Question. Has Guam provided the Department with a plan for allocating these funds and future funds that may be appropriated for this purpose?

Answer. Yes, the Governor has given us a plan for the use of these funds. However, shortly after receiving the Governor's plan, we were informed that the Guam Legislature enacted legislation, over the Governor's veto, that directs all Interior funding be used for new school construction. We have asked the Governor to resolve any discrepancy and offered assistance in the development of a plan that focuses exclusively on new schools.

MAINTENANCE ASSISTANCE

The Administration is proposing a \$980,000 increase in the maintenance assistance program to allow for a reduction in cost sharing for certain grants to island governments.

Question. Given the level of Federal investment in capital projects in the insular areas and the importance of proper maintenance programs to maintain the value of that investment, does it make sense to reduce the local matching requirements for this purpose? Doesn't this send the wrong message?

Answer. We think we can avoid sending the wrong message. Our major concern is that island hospitals simply are not participating in the program. While we want to develop incentives for participation by the hospitals, including waiving, delaying, or redefining matching requirements, we do not want that done at the expense of other participants. Given the huge investment made by the Department in island hospitals, we think the maintenance improvements are worth the proposed additional expenditure. We do not foresee any adverse impact from the proposal in terms of discouraging insular governments from investing in maintenance. The proposed incentives will be temporary and strictly limited to health care facilities.

BROWN TREE SNAKE

The Administration is requesting a \$1 million increase for the Brown Tree Snake (BTS) program.

Question. For what specific purposes will these funds be used? For research? Control? Eradication? If funded at the request level, how would BTS funds be allocated between Guam, the State of Hawaii, the Biological Research Division and other program participants?

Answer. Our major need is more research and \$800,000 of the proposed increase will be used for that purpose. Research can involve both improved control techniques and eradication methods. The remaining \$200,000 will go to the Commonwealth of the Northern Mariana Islands (CNMI), where a snake population appears to have developed, for control and containment efforts. The total \$1.6 million budget will therefore be divided \$200,000 each to Guam, Hawaii, and the CNMI for control operations, and \$1 million to the Biological Research Division of USGS for enhanced research. All work funded and performed will be consistent with the Brown Tree Snake Control Plan, developed jointly by several Federal agencies and the aforementioned State and territorial governments.

ENEWETAK SUPPORT

The Department is conducting a review of the Enewetak Support program.

Question. Is this review complete? If so, what are the Department's findings? If not, when does the Department expect to complete its review?

Answer. The review has not been completed. We are working with the U.S. Department of Agriculture to identify an expert to perform the review. We will use technical assistance funding to pay for the work. It now appears the work will not be completed prior to the end of this fiscal year.

DEPARTMENTAL MANAGEMENT

The Department established the Franchise Fund Pilot Program which began in fiscal year 1997.

Question. How has establishment of this fund affected Department efficiency?

Answer. Establishment of the Franchise Fund Pilot Program has not, and was not expected to, initially affect the Department's efficiency either positively or negatively. However, over time through economies of scale and the ability to invest in new technology, the Department expects to realize benefits in efficiency of operations. No unnecessary layers of management, regulations, or other bureaucratic constraints have been imposed as a result of the pilot program. The current structure, building on pre-existing management structures including the Chief Financial Officer (CFO), the Deputy CFO, and the Administrative Services Advisory Board, oversees Interior service providers and establishes common policies and operating principles necessary to operate the Interior Franchise Fund.

Question. Have internal Department administrative functions been affected adversely?

Answer. Quite the contrary, the internal Department administrative functions have been impacted positively by the Franchise Fund Pilot Program. Revenues generated by the Interior Franchise Fund service providers result in funds for the acquisition of capital equipment for the improvement and implementation of Depart-

ment financial management, ADP, and other support systems. Additionally, direct costs of the service providers such as labor and benefits are shared with Franchise clients instead of being borne entirely by the Department. Also, fees charged to non-Interior agencies are helping to offset certain fixed costs associated with the general purpose computer centers maintained by the Department.

Question. What internal Department savings are attributable to establishment of this process?

Answer. It is too early to quantify the savings related to the Interior Franchise Fund with any precision. Nonetheless, the labor, software, and computer center charges which are now being used to support external clients, which would otherwise have been borne by Interior bureaus, are estimated at nearly \$2 million for fiscal year 1997.

The Department's budget justification discusses implementation of DOINET for 57,000 employees.

Question. Does each bureau bear the cost of accessing the system?

Answer. Yes, the bureaus pay for their costs of accessing the DOINET through the Departmental Working Capital Fund.

Question. How are individual bureau costs computed for system access?

Answer. The DOINET costs are allocated to bureaus based upon what they spend annually for non-DOINET data communications and on their actual DOINET measured usage. The costs of these two elements are weighted at 50 percent each and applied against projected DOINET expenses to determine a bureau's apportioned cost.

OFFICE OF THE SOLICITOR

The Office of Solicitor reports that it has provided significant assistance to "basin wide" watershed protection efforts. A specific example includes the Columbia River area.

Question. As a result of these major basin wide assessment projects, is the agency devoting an increased level of resources to litigation and appeals?

Answer. No, in the short term, the watershed protection efforts require additional legal support, but in the form of client counseling, reviewing documents for legal sufficiency, legal research, interagency coordination, and negotiations, rather than increased litigation or appeals.

Question. Is litigation declining as a result of emphasis on basin wide areas?

Answer. Certainly in the short term the answer is no. Existing litigation is not immediately resolved. Also, as watershed management efforts are initially undertaken, novel legal issues arise. Some of these are likely to be challenged. Over the next several years, we do anticipate a reduction in litigation, as issues related to the development of watershed management programs are resolved, and litigation over piecemeal management efforts declines.

The Office has identified the lack of up-to-date computer technology as a serious problem.

Question. What is the specific timetable for implementation of DOINET links to all Office employees?

Answer. At this time, we do not have sufficient resources to establish DOINET links to all Office employees, given the high cost of the necessary hardware and software. Instead, we are proceeding incrementally, with our first goal being to establish a DOINET link to one computer in each of our six headquarters divisions and seven regional offices. Currently, DOINET connections have been made in all six divisions and in four regional offices, and we are making good progress in two additional regions.

Where a regional office is in reasonable proximity to a client bureau, we have generally been able to extend their DOINET connections to our office. In other locations, it will be more difficult and costly for us to make the connections. We hope to complete these initial connections this calendar year. As resources permit thereafter, we will establish additional links with our 11 field offices and extend the existing links to additional workstations in each location. In order to do so, however, we will need to upgrade our workstations and purchase additional software to take advantage of the DOINET links.

Question. What is the estimated timetable for implementation of the Office home page on the World Wide Web?

Answer. We expect to have an Office of the Solicitor home page on the World Wide Web, with limited features, by the end of fiscal year 1997.

The Office reports a significant increase in litigation and counseling issues with a specific note regarding Equal Employment Opportunity (EEO) programs. The Department estimates that pending cases before the Equal Employment Opportunity

Commission (EEOC) will be reduced by approximately 60. The Department also estimates that the number of new cases will continue to decline in fiscal year 1998 from its fiscal year 1996 levels.

Question. What are the factors affecting this decline?

Answer. As noted in the Departmental Management budget justification, policy guidance, training, and technical assistance have been provided to the bureaus to increase their effectiveness in resolving EEO allegations and complaints. The counseling program has resulted in the resolution of 79 percent of all pre-complaint allegations, and additional cases have been resolved through the use of alternative dispute resolution and settlement negotiations.

A contributing factor in these successes may be the significant backlog of cases awaiting hearing at EEOC, which has resulted in fewer cases being scheduled for hearing in fiscal year 1997. This is likely to be only a temporary respite, as we are expecting EEOC to schedule a greater number of hearings in fiscal year 1998 to reduce its backlog. In the meantime, the EEOC backlog and attendant delays have influenced some complainants to opt for agency decisions without a hearing in order to obtain more expeditious consideration of their allegations.

Question. What level of Office of the Solicitor involvement has assisted in the decline?

Answer. The Solicitor's Office has been heavily involved in the efforts cited by the Department, including developing written guidance and providing training for managers and EEO officials. Some recent examples include our Office's active participation in development of the Department's zero tolerance policy on harassment and discrimination, and in EEO training for managers and EEO officials in Anchorage, Alaska; Rapid City, South Dakota; Albuquerque, New Mexico; and Denver, Colorado. We also have taken a proactive role in the development of effective diversity strategies and have provided extensive counseling in EEO matters. We believe these efforts have resulted in a better understanding of the EEO process and diversity issues by managers, and an increase in the effectiveness and professionalism of the bureau EEO staffs. This in turn has contributed to earlier resolution of complaints, as well as avoiding the filing of some complaints altogether.

In addition, the Office is settling more cases prior to an EEOC hearing. The backlog in EEOC cases awaiting hearings has decreased our litigation work in fiscal year 1997, but it has substantially increased our work in providing legal review of the Department's decisions on complaints. There has been almost a 300 percent increase in our review of agency decisions over the comparable period last year.

Question. What is the Solicitor's cost for processing these types of cases when settled informally, resolved formally, or heard by EEOC?

Answer. We estimate that it costs our Office, on average, \$170 to provide legal services in connection with a case settled at the informal stage (i.e., during EEO counseling); \$2,280 for a case resolved at the formal stage (i.e., subsequent to the filing of a formal complaint but prior to an EEOC hearing); and \$5,470 for a case heard by EEOC. Cases that proceed to an EEOC hearing are among the most labor-intensive and expensive in the Office, as our attorneys must provide a full range of litigation services without any assistance from the Department of Justice. The chart below shows the number of each type of case we expect to handle during fiscal year 1998, the average cost per case, and the total amount we expect to spend on these cases:

COST OF PROCESSING CASES

[Whole dollars]

	Number of EEO cases ¹	Estimated average cost	Estimated total cost
Informal stage	50	170	8,500
Formal stage	135	2,280	307,800
EEOC hearing	200	5,470	1,094,000
Total			1,410,300

¹Number expected in fiscal year 1998.

OFFICE OF THE INSPECTOR GENERAL

Question. The OIG's statistical results are displayed on pages 4 and 5 of the OIG's budget justification. Please provide the Subcommittee with comparative data for these items for fiscal year 1992–1996.

Answer. The information is provided in the following table.

OFFICE OF INSPECTOR GENERAL COMPARATIVE DATA

	Fiscal year—				
	1996	1995	1994	1993	1992
AUDIT ACTIVITIES					
Audit reports issued or processed	912	960	869	1,194	1,003
Internal audits	64	60	82	85	102
Contract audits	45	97	124	160	155
Single audits	803	803	663	949	746

¹ Fiscal year 1992 recoveries were substantially higher due to a \$6 million fine in one case.

The statistics reported in the Semiannual Reports to the Congress for fiscal year 1992 to 1996 revealed that the total number of audit reports issued or processed during that time declined 10 percent, from 1,003 in fiscal year 1992 to 912 in fiscal year 1996, including a 37 percent decline in internal reports—from 102 to 64, and a 71 percent decline in contract audit reports—from 155 to 45. The major factors contributing to the decrease in the number of internal and contract audits were: (1) the Chief Financial Officers (CFO) Act of 1990 requirement to audit the Department's financial statements—this resulted in an increase of 23 staff years devoted to CFO audits between 1993 and 1996; (2) reductions in audit staff—the number of auditors and analysts decreased 18 percent, from 225 to 184, in fiscal year 1992 to 1996 because of a lack of funds to replace auditors who retired or otherwise left OIG; and (3) OIG travel funds have been reduced because funds have been used, in part, to absorb increased costs of salaries, statutorily mandated availability pay for criminal investigators, and other uncontrollable costs which were not funded over the years.

A more detailed discussion of these factors and how they have impacted audit operations follows.

CFO Act Audits. To fulfill the requirements of the Chief Financial Officers Act of 1990, the OIG has devoted an increasing percentage of staff to CFO audits. For example, in fiscal year 1993, about 26 staff years (11 percent of available staff) were charged to the five CFO audits performed for that year. By fiscal year 1996, we had fully implemented the CFO Act and performed 15 CFO related audits, which increased the resources required for these audits to 49 staff years (about 27 percent of available staff). The combination of staff reductions and increased resources devoted to CFO audits has greatly reduced the staff available to accomplish audits of programs and operations that have historically resulted in a large monetary impact.

While we are taking steps to reduce the resources necessary to conduct CFO audits, increasing requirements related to CFO audits make that difficult. These requirements include: (1) additional steps required by the Federal Financial Management Improvement Act of 1996; (2) the General Accounting Office's request that the OIG use its Financial Audit Manual as the primary audit guidance for accomplishing CFO audits; and (3) additional reviews required by new Federal Accounting Standards Advisory Board Statements including: Statement No. 4, Managerial Cost Accounting Concepts and Standards, Statement No. 5, Accounting for Liabilities of the Federal Government, and Statement No. 8, Supplemental Stewardship Reporting.

The CFO audits have resulted in significant improvements in the financial management systems within the individual bureaus and thus in the Department as a whole. However, these positive results are not reflected in the statistics in the Semiannual Report.

Reductions in Audit Staff and Travel Funds. The combination of staff reductions as a result of budgetary restraints and increased resources devoted to CFO audits has greatly reduced the staff available to accomplish audits of programs and operations that have historically resulted in a large monetary impact. As noted earlier, between fiscal year 1992 and 1996, the audit staff was reduced from 225 to 184 employees. Included in this reduction is a decrease from 30 to 16 auditors in the Virgin Islands and Guam audit offices.

In addition, the travel funds available to perform audits declined about 71 percent from fiscal year 1992 to 1996, from \$1.1 million to \$326,135. Because Departmental offices are in about 2,000 locations (some very remote), the number of audits we can perform has been impacted by the reduction in travel funds. During our reviews in recent years, we frequently were unable to visit the number of locations required to enable us to project audit results. Instead, we reported the monetary impact only for the locations visited. The reduction in travel funds has also impacted our ability to perform Nationwide royalty-related audits involving major oil and gas leaseholders.

The reduction in the travel budget has especially impacted our ability to perform audits in the insular areas, which include the Virgin Islands, American Samoa, Guam, the Commonwealth of the Northern Mariana Islands, the Republic of Palau, the Federated States of Micronesia, and the Republic of the Marshall Islands. The total travel budget of our audit offices performing these audits (located in Guam and the Virgin Islands) has decreased from \$110,000 in fiscal year 1994 to \$62,500 in fiscal year 1996 despite increases in airfares, per diem rates, and other travel-related costs during that time. The travel costs in these areas are especially high because of their remote locations (where we do not have permanent staffs).

Reduction in Contract Audits. From fiscal year 1992 to 1996, the number of contract audit reports decreased from 155 to 45. However, the number of contract audits performed from one year to the next is not exclusively under the control of the

OIG. Contract audits are performed based on a request from either a contracting officer or a grant manager or upon notification that the Defense Contract Audit Agency is scheduling an audit of a Departmental contractor. The number of audits of cost proposals requested by contracting officers decreased from 53 in fiscal year 1993 to two in fiscal year 1996. Also, the number of audits of costs incurred by contractors performed by the Defense Contract Audit Agency decreased from 33 in fiscal year 1993 to 18 in fiscal year 1996. In addition, the number of special audit reports decreased from 40 in fiscal year 1993 to 13 in fiscal year 1996. The majority of these reports are prepared by the Defense Contract Audit Agency and are audits of the internal controls of major defense contractors. Other factors contributing to the decrease were: 1) the elimination of direct funding (\$350,000 in fiscal year 1993) for OIG requests for audits by the Defense Contract Audit Agency after fiscal year 1993; 2) the staffing requirements of the CFO audits that reduced the number of auditors available for the OIG to perform contract audits; and 3) the decrease in BOR major dam construction activity as a result of a change in its mission that resulted in fewer requests for audits and smaller contractor claims to review. The OIG reports had typically identified significant savings in the past for these kinds of audits.

Reduction in Monetary Impact Because of CFO Requirements, Reduced Staff, and Reduced Travel Funds. The CFO staffing requirements, reduced staff, and reductions in travel funding have impacted our ability to conduct audits (including follow-up audits) in the following areas where, historically, we have issued audit reports with significant monetary impacts and recommendations to improve Departmental operations.

Bureau of Reclamation Audits. In fiscal year 1993 and 1994, we issued two BOR audit reports which accounted for about \$400 million, or 18 percent, of the total monetary impact reported by the OIG during that time. Some of the recommendations in these reports are still in the implementation process. Factors discussed above have impacted our ability to conduct similar audits and follow-up audits of BOR to determine whether the recommendations are fully implemented as intended.

National Park Service Audits. During fiscal year 1992 and 1993, the OIG performed audits with major monetary impacts in concessions management, recreation fees, and special use fees. For example, in fiscal year 1993, the OIG issued one report on recreation fee charges and collections that had a monetary impact of \$229 million. As a result of these audits, significant changes were made to revenue collections in the national parks. These kinds of audits involve large staffs. However, factors discussed above have decreased the staff and travel funds available to perform similar audits.

Minerals Management Service Audits. During 1992 and 1993, the OIG conducted several Federal oil and gas royalty audits that had a high monetary impact. For example, our review of gas contract settlements in 1992 resulted in recommendations that had a potential monetary impact of \$754 million, and a review of offshore oil and gas leasing in 1993 resulted in increased revenues to the Government of about \$181 million. Factors discussed above have impacted our ability to conduct similar audits of MMS and follow-up audits to determine whether the recommendations were fully implemented as intended.

Conclusion. While the number of audit reports and the monetary impact of the OIG program have decreased, we continue to evaluate our operations and to initiate new and innovative approaches to optimize the use of our resources to provide value and assistance to the Congress, the Administration, Departmental managers, and the taxpayers in building a Government that "works better and costs less." The value of assisting in the identification and implementation of improvements in programs and operations cannot always be easily measured in dollars and cents. For example, over the past couple of years, we have attempted to be increasingly responsive to requests from the Congress and Departmental managers for our audit services. The audits and audit assistance we provided in this regard have resulted in substantial improvements in the programs and operations of the Department of the Interior.

OFFICE OF THE SPECIAL TRUSTEE FOR AMERICAN INDIANS

Secretary Babbitt, we have been dealing with the difficult issues of the United States trust responsibility since the establishment of the relationship with Natives. In relatively recent years, say within the last decade, Congress has tried to tackle the task of reconciling Native land title records, Native land and natural resource management, and trust fund management. The United States has a trust responsibility in regard to the management of 40 million acres of tribal land and 10 million acres of land owned by individual Indians, for which legal title is held by the United

States. As trustee, the Government is responsible for managing the assets, collecting the income from them, and investing and disbursing the money collected. Congress has assigned management to you, the Secretary of the Interior.

Congress created the Office of the Special Trustee (OST) in the Indian Trust Fund Management Reform Act of 1994. We did this in response to evidence that the Interior Department has failed to meet the basic obligations of a trustee.

In 1996, the Office of Trust Funds Management and other trust services functions of the Bureau of Indian Affairs (BIA) were transferred to OST. As a result, OST now has the responsibility for trust moneys of Indian Tribes and individual Indians. Other trust functions, principally natural resource asset management activities, are still carried out by BIA, MMS, and BLM.

The OST was directed by Congress to develop a Strategic Plan for trust management to ensure proper and efficient discharge of the Secretary's trust responsibilities.

The Special Trustee submitted the Strategic Plan to you and to Congress in April—after the President submitted the Department's request for funding for the OST. I'd like to talk to you about the Department's formal request and the Special Trustee's plan.

The President's Budget Request is for \$39.337 million. This amounts to a \$4.7 million increase related to program changes and \$499 thousand in uncontrollable costs compared to the fiscal year 1997 enacted level of \$34.1 million. The Budget Request includes \$16 million for implementation of the Plan.

Question. Will the Office move forward with the Special Trustee's Strategic Plan, which was submitted in response to Congressional mandate?

Answer. The OST cannot move forward with its proposal to create a single organization to manage the U.S. Government's trust responsibilities to American Indians and American Indian Tribes for trust resource management, trust funds management and land title and records management (collectively, trust management activities). Implementation would require substantive changes in law.

However, there are no legislative changes required for certain components of the plan, and some of these proposals are currently being implemented. For example, the Office of Trust Funds Management (OTFM) is continuing to make progress in an ongoing Individual Indian Money (IIM) data cleanup effort; elimination of land title and records backlogs will proceed in earnest if funding requested in the 1998 BIA budget for Land Records Improvements is approved by the Congress.

In addition, acquisition of new systems should be able to proceed after a number of fundamental issues are addressed by the Special Trustee, including providing sufficient alternatives and benefit/cost analyses and preparing an adequate implementation plan. The proposed acquisition of a Trust Asset and Accounting Management System (TAAMS) will be reviewed pursuant to the requirements of the Information Management Technology Reform Act, (ITMRA) under the direction of the Department's new Chief Information Officer to ensure that the system meets these and other legislative requirements and is consistent with Administration policies.

Question. What, specifically, will the OST accomplish in fiscal year 1998 with \$39 million?

Answer. The 1998 OST budget includes both ongoing operating funds, and funds for improvement efforts. About \$20.6 million of the request supports on-going operations, and the remaining \$18.7 million is for improvement initiatives.

Operations.—Approximately \$16.8 million of operations funding is allocated to OTFM and its area and field staff. These funds support the management of more than \$2.5 billion in balances currently held in trust. Activity in the trust funds total more than \$1.9 billion in receipts annually (including investment income) and \$1.7 billion in disbursements. The 1998 funding for operations includes a modest increase of \$0.2 million to fund the full cost of the annual lease trust system for tribal accounts; specifically, the funds will be used to support two sub-systems needed to comply with the Chief Financial Officers Act. Specific information on base operations is included in the Budget Justification as well as the fiscal year 1997 Semi-Annual Status Report submitted to the Subcommittee on June 19, 1997.

Operations funding is also allocated to support ongoing settlement and litigation support. Specific information on base operations is included in the Budget Justification as well as the fiscal year 1997 Semi-Annual Status Report submitted to the Subcommittee on June 19, 1997. The 1998 request includes an additional \$0.6 million required for the significant activities necessary to support the IIM litigation, as well as other litigation and settlement activities stemming from the tribal reconciliation project.

A total of \$1.7 million is requested under Executive Direction which supports the Immediate Office of Special Trustee, its advisory board, and the Intertribal Monitoring Association.

Improvement initiatives.—A total of \$16.8 million is requested under Strategic Plan-Systems; this amount is in addition to \$13.4 million appropriated in 1997 which largely remains available for obligation. Of the \$30.1 million available for 1997 and requested for 1998, the Special Trustee has proposed the following allocation to the various components of his Strategic Plan.

STRATEGIC PLAN COST
[In thousands of dollars]

	Fiscal year—			
	Strategic plan 1997-98 request	1997 budget	1998 budget	Total 1997- 98 budget
I. Standard trust asset and accounting management system and land title and records management system	15,933	6,050	4,687	10,737
A. Trust asset and accounting management system (TAAMS)	8,237	4,800	3,437	8,237
B. Land titles and records management system (LTRMS) ...	3,196			
C. General ledger system (GLS)	2,000			
D. Interface development	2,500	1,250	1,250	2,500
II. Information technology infrastructure	13,215	1,511		1,511
A. AITDA, BIA, MMS, BLM	10,458	1,158		1,158
B. Tribes including end-user training	2,757	353		353
Subtotal systems costs	29,148	7,561	4,687	12,248
III. Data conversion, reconciliation and backlog clean-up	27,535	2,000	4,000	6,000
A. Probate Related Backlog clean-ups	6,000		1,000	1,000
Agency	[600]			
Hearings and appeals/administration Law	[1,400]			
Land titles and records offices	[4,000]		[1,000]	[1,000]
B. File clean-up, data/document check	4,400	2,000	1,000	3,000
C. IIM/Lease/subsystem conversion/reconciliation	1,375		1,000	1,000
D. LRIS conversion/owner reconciliation/defective title clean-up	2,600		1,000	1,000
E. Imaging clean-up	3,160			
F. Appraisal clean-up and ongoing management	10,000			
IV. Implementation	31,573	3,789	8,070	11,859
A. Imaging	2,730	500		500
B. Training AITDA, BIA, MMS, BLM	6,417		4,859	4,859
C. Policy, procedure and legal manuals	4,000	2,000	1,000	3,000
D. Risk management	4,520			
E. Archives and records management	10,406			
F. External professional services	3,500	1,289	2,211	3,500
V. Management	3,687			
Total	91,943	13,350	16,757	30,107

The Special Trustee's Strategic Plan is ambitious—and, I understand that you, the Administration, and OMB oppose it.

Question. Why?

Answer. The Department believes that the Special Trustee's Strategic Plan goes beyond the objectives of the American Indian Trust Fund Management Reform Act. This Act specifically states that the office was established to oversee and coordinate reforms of Departmental practices relating to the management and discharge of Indian trust responsibilities to ensure that reform of such practices in the Department are carried out in a unified manner. The Department does not believe the Act envisioned fully removing trust accounting and management functions from the Department.

The plan recommends major investments to bring Indian trust asset management functions up to commercial trust standards, without providing sufficient alternatives and benefit/cost analyses to support the proposed level of investment. Such analyses are required by the Clinger-Cohen Act (ITMRA) and envisioned by the Trust Reform Act and its legislative history.

The plan's usefulness to the Administration and Congress is limited because it only offers one model, the creation of a Government Sponsored Enterprise (GSE). Inherent in this proposal is the assumption that the Congress will be able, in these tight budgetary times, to adequately fund a stand alone GSE which would provide enhanced financial and banking services to 300 Tribes and 300,000 individual Indians. Such an assumption is unrealistic, given the numerous competing demands the Government faces to fulfill its current responsibilities.

Additionally, given the Special Trustee's own assessment that BIA trust functions have been seriously underfunded and understaffed, the Administration questions the conclusion that BIA could not perform these functions if it was provided adequate resources—particularly if improvement efforts were overseen by a Special Trustee with budgetary control over improvement dollars, as proposed in the President's 1998 Budget request. Indeed, a number of such improvements to trust funds management were implemented prior to the transfer of financial trust services to OST. While some reorganization of trust functions within BIA or the Department may be warranted, the Administration simply cannot support the separation and dissipation of the government-to-government trust relationship that would result if this proposal were implemented.

The Special Trustee has asked us to appropriate \$80–\$100 million for fiscal year 1998, compared to the Department's \$39 million request. There is a gap of almost \$50 million between the President's request and the Special Trustee's request, just through 1998. In addition, the Special Trustee states that an additional \$76 million would be required in 1999; and between \$56 million and \$61 million would be required thereafter in on-going recurring costs for Phase I.

In the first phase, the Special Trustee proposes the creation of an "American Indian Trust and Development Association" (AITDA), a new independent government enterprise. Authority, responsibility, and funding of all Indian trust activities are proposed to be transferred to AITDA, including natural resource management and land records and title functions of BIA; inspection and enforcement of oil and gas leases on Indian lands by BLM; and royalty management of Indian leases of MMS.

Phase I of the Strategic Plan is designed to bring the trust management and management information systems up to commercial standards within two years. The Special Trustee says he needs \$80–\$100 million in each of the next two years to accomplish all of this.

In total, implementation of the Special Trustee's recommendation for Phase I would mean transferring about \$250 million from the budget of the Department of the Interior to the American Indian Trust Development Association.

I understand that OMB, the Administration, and you, personally, oppose the Strategic Plan.

Question. Do you support this part of the Special Trustee's plan?

Answer. The Administration does not support transferring funding and responsibility for Indian trust management activities from the Department to the American Indian Trust and Development Administration, a new independent government enterprise.

Question. Do you oppose it because it will cost too much to the Department, or do you disagree with the idea generally? What do you object to?

Answer. The Administration does not simply oppose the plan because it costs too much. The plan recommends major investments to bring Indian trust asset management functions up to commercial trust standards, without providing sufficient alternatives and benefit/cost analyses to support the proposed level of investment. Such analyses are required by the ITMRA and envisioned by the Trust Reform Act and its legislative history.

The Administration objects to the removal of Indian trust resource management functions from the Department and the broadening of the Department's investment responsibilities. Rather than expanding financial services to Tribes and individuals, we should be concentrating our efforts to improve the performance of our current responsibilities. Additionally, while there is general agreement about the need to replace or acquire new systems, the Administration has serious concerns about the level of analysis and implementation details supporting the systemic recommendations in the plan.

Question. How much of your objection to the idea of moving all trust functions into a single agency relates to a fear of what the loss of \$250 million of Interior Department funding would mean?

Answer. None. However, the Department would object to redistributing this level of funding from other programs in the Department, or elsewhere from the Federal Government, given the current level of analysis prepared in support of the Special Trustee's recommended funding levels.

I have heard that some Tribes have expressed concerns over this proposal, claiming that they do not think the Office of the Special Trustee will be able to manage these functions.

Question. Have you heard from the Tribes on the idea of consolidating all trust management functions into a single agency? Do they support consolidation? Why or why not?

Answer. The Special Trustee's Strategic Plan does not propose to move all trust functions to the Office of Special Trustee; rather the plan proposes a single organization, distinct from OST, to perform trust management activities, and would operate as follows, per the Strategic Plan:

This will involve consolidating trust resource, trust funds and land ownership and records management processes into a single, independent institutional unit with its own management structure to accommodate the restructuring and reorganization contemplated by Phase I of the Strategic Plan. The unit should be organized by function and dedicated exclusively to trust management. The unit should be managed by a full time Chairman and a Board of Directors appointed by the President and confirmed by the Senate. The unit's proposed organizational form is as an independent GSE subject to Congressional oversight.

A majority of the participants in the consultation hearings on the Special Trustee's draft Strategic Plan preferred that the management of natural resources remain with BIA and Self-Governance Tribes, rather than be transferred to AITDA as proposed in the draft Strategic Plan. The Special Trustee believes he has adopted this preference in the final Strategic Plan by proposing that resource management functions will continue to be performed by BIA, but will be subject to the oversight of AITDA. The AITDA will have authority and budget control (all funding is proposed to be appropriated under AITDA) over natural resource management and will out source such activities to BIA, which will act as a service bureau to the Trustee.

The Tribal Consultation Report on the Draft Strategic Plan has been previously provided to the Subcommittee. The following letters are additional written comments received subsequent to the issuance of the Strategic Plan on both the draft plan and the final plan, for the Subcommittee files.

[The letters follow:]

LETTER FROM THE COUNCIL ANNETTE ISLANDS RESERVE

METLAKATLA INDIAN COMMUNITY,
Metlakatla, AK, March 24, 1997.

House of Representatives,
Interior Appropriations Subcommittee,
Washington, DC.

MR. CHAIRMAN: Our tribe recently received a copy of the draft "Strategic Plan to Implement the Reforms Required by the American Indian Trust Fund Management Reform Act of 1994".

While certain aspects of the Plan have merit, we are concerned that a majority of the Plan needs more careful study. The Special Trustee has recommended that trust management duties, responsibilities and activities, including Trust Resources Management, Trust Funds Management, and Land Title and Records Management be transferred to a new government sponsored organization outside the Department of the Interior. The proposed plan would fundamentally change the way American Indian trust activities are managed by the Federal Government and needs considerable review and examination.

In its current form, the Plan does not provide sufficient information as to how the Plan is intended to address a range of key issues such as funding and accountability. In addition, it is not clear that the Plan would succeed in establishing a more effective trust management, nor is it clear that the Plan will protect the principles underlying federal trust responsibility.

In that regard, we strongly urge restraint in any appropriations which would implement any portion of the proposal as it relates to removal of further functions from the Bureau of Indian Affairs.

We expect to continue our review and actively participate with other tribes in evaluating the Plan. As you know, plans for Indian Country of the past have not worked well when they don't have the full participation of the tribes in their development. We will expect to communicate further with your committee as the process moves forward.

Sincerely,

JAMES E. SCUDERO,
Acting mayor.

LETTER FROM THE KLAMATH TRIBES

THE KLAMATH TRIBES,
Chiloquin, OR, April 10, 1997.

Re Response to the OST strategic plan proposal.

Mr. BRUCE BABBITT,
Secretary, Department of the Interior,
Washington, DC.

DEAR SECRETARY BABBITT: By this letter the Klamath Tribes will make known its position and opinions concerning the proposals being forwarded by the Office of Special Trustee (OST).

The Klamath Tribes resolutely and steadfastly reject the recommendations being presented by the OST. We base our rejection upon the following:

- 1. The OST has not consulted properly with Tribes. The four regional meetings conducted by OST do not and can never be considered as consultation with the 535 tribes.
- 2. The answers to questions raised at the four meetings have not been distributed to the tribes with sufficient time to review, analyze and understand the answers. The questions posed were to issues which cut to the heart of the federal/tribal relationship.
- 3. The Tribes were not involved in the formulation of the charge to the OST, nor involved in the development of the OST agenda.
- 4. The creation of a development bank may be a reasonable idea, but the bank should not be used as a means to gain control of Indian monies and land.
- 5. The recommendations of OST appear to define trust responsibility to mean only trust as it applies to monetary accounts and land issues, all other trust related responsibilities of the Federal Government are dismissed as governmental responsibilities. This redefinition of trust responsibility is tantamount to financial and political termination of the tribes.

Lest you believe the Klamath Tribes may not understand the issues or the implication of the recommendations of the OST, I would like to provide you with some information which will give you context for our Tribes' response.

The Klamath Tribes has been intently following those issues which led to the formation of the OST. Like most people, the Klamath Tribes suspected there might have been mismanagement with the monetary accounts of tribes and individual Indians. But unlike most, the Klamath Tribes has had first hand experience with the federal government's mismanagement of tribal and individual tribal members financial and land affairs through that great injustice of the mid-fifties called termination.

During the termination era Klamath's had their land and resources taken from their control and were forced to either accept a single cash payment or have your assets placed into a special trust administered by a bank.

Some members chose the single cash payment and others had their assets placed in control of a bank. The emotional and spiritual scars of this arrangement notwithstanding, the assignment of tribal members assets to a special trustee led to a whole catalogue of abuses which the tribe was powerless to stop. The special trustee sold lands and assets and resisted any and all attempts by tribal members for an accounting of the assets and land sales. In addition the special trustee charged the tribal members accounts to support their brutal mismanagement of Indian assets and monies. Meanwhile, tribal members were literally forced to beg the special trustee for access to their own funds. And the Special Trustee could and did determine how much money and when a tribal member could access their funds.

I can continue with a litany of other equally horrific tales of my people's experience with banks and Special Trustees, but suffice it to say the Klamath Tribes will not agree to the recommendations and will steadfastly resist any and all attempts by the Federal Government to implement the current OST recommendation.

The Klamath Tribes would however, support a position whereby the Tribes can become an active participant in the crafting and development of recommendations on how best to address the issues of the fractionated lands, development banks and trust responsibilities and services required of, and provided by, the U.S. Government. If I can provide you with any additional information on this topic, please feel free to call upon me.

Sincerely,

JEFF C. MITCHELL,
Tribal Chairman.

LETTER FROM THE TIGUA INDIAN RESERVATION

TIGUA INDIAN RESERVATION,
YSLETA DEL SUR PUEBLO,
El Paso, TX, March 27, 1997.

Hon. BRUCE BABBITT,
Secretary of the Interior,
Washington, DC.

DEAR MR. BABBITT: Enclosed are comments from the Ysleta del Sur Pueblo regarding the Draft Strategic Plan Proposed by the Office of the Special Trustee for American Indians.

Overall, the Pueblo is opposed to the plan since it appears to be in the best interest of big government. The Pueblo feels the plan focuses on creating another bureaucratic tier without any assurance of its success. Duplication of services is not the solution in our opinion.

Should you have any additional requests, feel free to call us at (915) 859-7913.
Sincerely,

VINCE MUNOZ, Governor.

Attachment:

 YSLETA DEL SUR PUEBLO'S

 COMMENTS ON THE DRAFT STRATEGY PLAN PROPOSED BY THE OFFICE OF THE SPECIAL
TRUSTEE FOR AMERICAN INDIANS

Revampment yes. More bureaucracy, no.

The Ysleta del Sur Pueblo agrees that there needs to be a revampment of the current trust funds management system, however, disagrees with the methods proposed by the Special Trustee. We support reform efforts that would strengthen regulatory standards and practices for the management and accounting of trust funds, as well as agree to the need for reconciliation and updating of land titles and records. We further support efforts to update and centralize record keeping systems, but creating an entirely separate bureaucratic tier in order to do this seems ludicrous. It seems to us that strong sanctions penalizing the mismanagement and misaccounting of trust funds would be a stronger message to send than just "Let's start all over." We should alleviate the problem, not make it worse which is what we think is going to result from this new system.

Strategic plan poses questions as to whether a separate organization is needed to handle trust mismanagement issues and carry out the Government's trust responsibility.

The plan suggests that the American Indian Trust and Development Administration (AITDA) will assume the legal trust responsibility while the BIA will continue to address areas of general trust responsibility and continue providing other services which have been scrutinized. If the plan is approved, the efforts of the Reorganization Task Force will prove to be futile. The entire goal of the Task Force is to diminish the BIA, however, this plan will only make it that much more difficult. What about funds to operate this new system? Where will they come from? Will the AITDA compete for the same limited financial resources? It seems hypocritical that the Special Trustee identified the competition for scarce financial resources as a reason for trust resource mismanagement, yet under this plan would be doing the exact same thing.

Talk about starting big. There are five management sections with 43 divisions for Phase I alone. This organizational set up is not justified. How much will it cost the tribes to fund the AITDA? This tribe would be interested to see a budget inclusive of start up costs and salaries being that they will most likely be commensurate to those in the private industry. The tribes will be affected by this proposal in one way or other, regardless of how much they say it will not.

Conclusion

We stress the need for change within the current trust funds management system, however, are not convinced that the creation of a separate organization is justified, nor necessary.

LETTER FROM THE INTER-TRIBAL COUNCIL, OF THE FIVE CIVILIZED TRIBES

FEBRUARY 28, 1997.

Hon. HILDA MANUEL,
Deputy Commissioner of Indian Affairs,
Bureau of Indian Affairs,
Washington, DC.

DEAR MS. MANUAL: The Choctaw Nation of Oklahoma is very concerned in regard to the proposed transfer of all trust management duties, responsibilities and activities carried out by the Bureau of Indian Affairs to newly created Government entity.

I am requesting that Muskogee Area Director of the Bureau of Indian Affairs, Jim Fields, and the appropriate support staff attend a meeting scheduled for March 12, 1997, in Albuquerque, New Mexico to provide technical assistance to Muskogee Area Tribes at this meeting.

A copy of the letter from special trustee Paul Homan is attached for your informal. Your consideration in this matter will be appreciated.

Sincerely,

CHIEF HOLLIS E. ROBERTS,
President, Inter-Tribal Council,
the Five Civilized Tribes.

LETTER FROM THE KAW NATION

KAW CITY, OK, *March 24, 1997.*

Re Comments to the Consultations for the "Draft Strategic Plan" proposed by the Special Trustee for American Indians.

Mr. PAUL M. HOMAN,
Special Trustee for American Indians, U.S. Department of the Interior, Office of Special Trustee for American Indians, Albuquerque, NM.

DEAR MR. HOMAN: The Kaw Nation recognizes and appreciates the hard work, commitment, and diligence you, your staff, and the Office of Trust Funds Management have demonstrated in the reconciliation and acknowledgement of the problems with the American Indian IIM and tribal trust funds. There are many more years (100's) of problems with the recording and management of Indian land, natural resources, and money. The very short period officially examined by the Office of the Special Trustee (OST) only exhibits a near term problem compounded by over 100 years of poor records. Treaties, legislation, Court Decisions, agreements, etc. with Indians have not been thoroughly abided to by the Federal Government according to its Trust Responsibilities and Fiduciary Duties.

The many problems in the management, documentation, accounting, and recording of Indian land transactions, management of Indian natural resources, continued due diligence in the reconciliation of past problems, and the management recording, and accounting of trust funds needs perpetual dedication, oversight, management, and reconciliation. The "new (relatively) BIA" is much different than the "old BIA" in that it is staffed with a majority of Indian people who are dedicated to tribal and Indian needs. However, the current employees of the Bureau are "stuck" with poor record-keeping, poor accounting, not enough funding/staff, and lack of separation of duties (Trust Functions vs. general trust responsibilities). They are building upon poor management/accounting and because of this poor base, they can only compound the situations and problems.

The Kaw Nation, at the March 12, 1996 OST Strategic Plan Consultations, was represented by Walter I. Hare, Jr., Kaw Nation Administrative Services Director. In addition, the Kaw Nation has been in possession of the written "draft" Strategic Plan and the Special Trustee's Assessment, although only for a short period of time prior to the Consultations in Albuquerque.

The Kaw Nation does not agree with the dismantling of the BIA and the removal of the Trust Functions from the Department of the Interior to any "independent government sponsored entity." However the Strategic Plan's recommendation for a "modern, up-to-date, and technology up-grading system" is an intelligent and workable concept. For many years, as evidenced by the immediate past and the Reorganization Task Force, the Honorable Senator John McCain's Senate Bill to re-organize the BIA, the OST reconciliation efforts, and even the 1978 BIA Reorganization task force, attempts to address the many problems have been studied recommended, and continue to collect dust. A re-organization/re-structuring of the BIA is entirely possible using your "technological modernizations, including constant up-grading"

and general organizational chart, only within the BIA and/or the DOI, if properly structured.

The TDbank as an independent government sponsored entity (e.g. Farm Credit Bank) including life-line/full service banking, depository accounts, investment services, retirement accounts for tribes/Indians, some trust department services, etc., is credible and needed. The funding for start-up and operations, including subsidies, will be a problem that can be addressed in the near future. The Kaw Nation currently owns and 100 percent manages a small, but highly successful, Bingo Hall, a full service travel plaza, Kansa Travel Plaza on Interstate-35, that includes gasoline/diesel fuel, a convenience store, a restaurant, and a motel; two smokeshops; over 54,000 sq. ft (Kanza Greenhouses—14 greenhouses, warehouses and office/maintenance building) Greenhouse enterprise; a retail greenhouse within Ponca City city limits; a pharmacy; and is examining future business operations in Oklahoma and Kansas. In addition, the Kaw Nation is currently constructing and/or planning a Gymnasium/Community Multi-purpose facility, a wellness center that includes an indoor swimming pool, cardiovascular and physical therapy services, weight room and aerobics rooms, etc; a new clinic for rural health services, and a museum/social services building. The life-line banking services could greatly assist the Kaw Nation in the management of current resources and future Economic and Business Development activities.

In addition, the Kaw Nation participates as a Self-Governance tribe in both the Department of the Interior's and the Indian Health Services Programs. The clinic, gymnasium/community multi-purpose center, and wellness center are located in Rural areas and will fulfill much needed rural health and recreational unmet needs. However, the maintenance and operations costs for the facilities will be expensive and the Kaw Nation is investigating assisted living for the elderly and additional services.

If you have any questions, you may contact me or Walter I. Hare, Jr., Administrative Services Director, at the address and phone numbers listed on Kaw Nation letterhead. The fax number is (405) 269-2301.

Respectfully,

WANDA STONE,
Chairperson and CEO.

Question. Why do you think the Tribes oppose the idea? The BIA has done an awful job.

Answer. The Tribes reasons for opposing consolidation of trust functions are varied and are outlined in the consultation report and the additional written comments provided to the Subcommittee.

Question. Would you agree with the idea of consolidating trust management functions assuming that professionals in the areas of records management, natural resources management, and oil and gas leasing were hired into the agency?

Answer. At this juncture, the Department does not support consolidation of trust management activities in the manner proposed by the Special Trustee. However, some consolidation may be desirable. Any proposal to consolidate trust management functions either within or outside the Department must be carefully evaluated against other organizational alternatives based upon a complete understanding of mission and underlying activities, core processes, and resources; be supported by a detailed implementation plan; and involve substantive tribal consultation.

Question. Could Tribes continue to contract for these functions, as they do now from the various agencies? I don't see why they couldn't.

Answer. Yes; the Strategic Plan proposed by the Special Trustee envisions that Tribes will continue to have the ability to contract or compact trust functions under the Self-Determination Act and Self-Governance Act. Specifically, the Strategic Plan states:

Like a private trustee, the proposed administration of the trust activities would rely on a common set of laws, policies, practices, regulations, and a common Trust Asset and Accounting Management System and a means through annual audits and reviews and administrative oversight and supervision to assure performance by the Self-Governance Tribes. The Self-Governance Tribes would act as service bureaus under delegated authority from AITDA to provide trust management services for which they had expertise. Thus, increasingly in the future, service bureau management of nearly all of the trust management activities could and should be provided by qualified Tribes or American Indians, themselves, under appropriate compacts and contracts, subject to the rules, oversight and supervision of the Federal trustee.

The Special Trustee proposes that during Phase 2, the AITDA would transform into the American Indian Trust and Development Bank—a full service banking, trust, and financial service for individual Indians and Tribes. It would include a national headquarters building, a national archives and records center, and nationwide

branch offices. The Federal Government would provide \$500 million in equity contributions and \$3 billion in direct long-term loans, and would be required to maintain permanent equity capital equal to five percent of assets.

Question. Do you support this part of the plan? It is a purely financial function.

Answer. The Administration does not support the establishment of a Federal American Indian Trust and Development Bank to fulfill the requirements of the American Indian Trust Fund Management Reform Act. However, full banking services are often not available in Indian Country, and the Administration has developed legislative proposals to address the absence of such services. In 1996, the Administration proposed the Native American Financial Services Organization Act to provide technical assistance to local lending institutions with the intention of overcoming barriers to housing and community development lending to help improve Native American housing and economic situations. Similar to the Administration's position on Phase 1 of the plan, the Administration would not support Phase 2 without a clear examination of alternatives and benefit/cost analyses.

Question. Are you opposed to specific parts of the plan or to the entire plan? If you are opposed to only parts, which parts? Which parts would you support, and why?

Answer. The Administration objects to the removal of Indian trust management functions from the Department and the broadening of the Department's investment responsibilities. Rather than expanding financial services to Tribes and individuals, we should be concentrating our efforts to improve the performance of our current responsibilities.

There is agreement on the components of the plan relating to the clean up of the accounts and elimination of trust asset processing backlogs; however, the cost estimates to eliminate these backlogs are not fully substantiated and may be overestimated or underestimated. There is also general agreement to improve or replace systems; however, the Administration has serious concerns about the level of analysis and implementation details supporting the systemic recommendations in the plan.

Question. If you, the President, and OMB oppose the Special Trustee's plan, what is happening over at OST right now? What do you propose for the Special Trustee? Is Congress spending money wastefully to continue to fund this office if the Administration will not support it?

Answer. The Special Trustee has been requested to address a number of fundamental concerns regarding his proposal, including ensuring that the requirements of the Clinger-Cohen Act and OMB guidance on systems acquisitions are met; developing a realistic implementation plan; and coordinating with impacted Bureaus. The Administration supports effective implementation of the Office of Special Trustee as envisioned in the American Indian Trust Fund Management Reform Act. That is, an office that would ensure Indian trust reform efforts were coordinated. The funding requested in the President's Budget for the immediate Office of Special Trustee is necessary to perform the activities envisioned in the Act.

In a press release commentary on the plan, Mr. Secretary, you were very critical of the plan's overall direction, saying it adds another layer of bureaucracy by creating a quasi-private, quasi-government agency to manage and administer trust funds. In the press release of your commentary you also express concerns that the plan seems to lack a fundamental understanding of the relationship between sovereign tribal governments and Federal trust responsibility.

Question. What do you think the Federal trust responsibility entails? Where does it begin? Where does it end? Does it end?

Answer. The United States unquestionably has a trust responsibility with respect to the administration of Indian trust funds and assets, and this responsibility carries with it the fiduciary duties attendant to a trust relationship. The Government's trust obligations arise whenever the United States exercises sufficient control over, or management of, trust property or trust money of Indian Tribes or individual Indians that the necessary elements of a common-law trust are present: a trustee (the United States), a beneficiary (the Tribe or individual Indian), and a trust corpus (timber, lands, funds, etc.). The trust responsibility does not extend to strictly commercial moneys that are the proceeds of Indian business enterprises, such as gaming revenues or revenues from tribally-owned firms.

In general terms, the Supreme Court has described the trust responsibility as a moral obligation of the highest responsibility and trust. The more specific contours of the fiduciary relationship are defined by statutes, regulations, treaties, and executive orders. Congress has enacted a variety of statutes vesting the Secretary with the authority and responsibility to maximize returns from the management of individual Indian and tribal assets and investment of individual Indian and tribal trust funds, consistent with the specific requirements of the statutory provisions. There

also are a number of other statutory provisions delimiting the Government's trust responsibility, including specific requirements for the disbursement, transfer, deposit, and investment of Indian tribal and individual trust funds, as well as related regulatory provisions.

Courts also have relied on common law trust principles to supplement the various statutes and regulations in defining the United States' fiduciary obligations. Accordingly, the Government, like a private trustee, has a general obligation to exercise such care, diligence, and skill in managing and dealing with the trust property as a person of ordinary prudence would exercise in dealing with his or her own property. The United States must administer trust resources in the interest of the beneficiary, so that any profits gained through administration of the trust accrue to the beneficiary. The Government must promptly place trust income into interest-bearing accounts, and maximize trust income through prudent investment. The United States also has an obligation to make a full and proper accounting and to keep clear and accurate accounts.

At the same time, courts also have recognized that the Government's trust obligation is unique and distinctive, in that Congress has required the Government to wear many hats and perform many functions, some of which may be in direct conflict. In this regard, the Government may not always be able to follow the fastidious standards of a private fiduciary, who would breach his duties to his single beneficiary solely by representing potentially conflicting interests without the beneficiary's consent. Consequently, all rules governing the relationship between private fiduciaries and their beneficiaries may not necessarily apply in every situation; rather, the precise scope of the fiduciary obligation of the United States must be determined in light of the relationship between the Government and the particular Tribe.

In sum, the United States' trust responsibility with respect to the management and administration of individual Indian or tribal trust funds or property is best understood as comprising various statutory, regulatory, and other directives, as supplemented by common law principles applicable to trusts and trustees. Its application in each situation may differ depending on the context and particular authorities at issue, but may be guided by the Government's affirmative duty to ensure that tribal and individual Indian trust property and trust funds are protected, preserved and managed in a diligent and prudent manner, so as to produce a maximum return to the Tribes and individual Indian owners, within applicable statutory or other regulatory requirements.

Specifically, the current investment authority for Indian trust funds is limited. Investments are limited to direct investments in U.S. Government securities (Treasury and other agency issues) and insured deposits or deposits collateralized by U.S. Government securities. The Special Trustee proposes a whole new range of trust management products, including savings deposits; voluntary tribal and IIM deposits from all sources, including gaming revenue; income from Federal taxation; and acceptance of retirement accounts.

Question. Does the Federal trust responsibility go as far as the Special Trustee's plan proposes?

Answer. No. The Federal trust responsibility does not require acceptance of voluntary deposits or provisions of the additional trust management products proposed by the Special Trustee.

Question. Do you believe that the Federal Government's trust responsibility extends into "private banking" for Natives?

Answer. No, however, the Administration is very supportive of efforts similar to the proposed Native American Financial Services Act to ensure that Native Americans are afforded banking services that most Americans take for granted.

On previous occasions, you've expressed the view that the management of trust funds should be handled by a financially-oriented organization like Treasury or the Federal Reserve.

Question. Why not support this plan, which proposes moving trust funds out of BIA? Wouldn't this be the solution you've been advocating?

Answer. The Department's expertise is in natural resources management. The Department has felt that the purely financial management components of trust funds could be better handled by financially oriented organizations who deal with these issues on a day-to-day basis as part of their core mission. The Department has never advocated movement of land management functions to a financial organization as the Special Trustee has recommended.

Question. If you do not support the plan, why should the Committee provide the \$16.7 million included in the President's Budget Request to implement the Strategic Plan?

Answer. The Department believes there is general agreement about the need to acquire adequate systems, cleanup accounts, and eliminate processing backlogs, for

which the \$16.7 million is necessary. In brief, the current status of BIA/OST systems can be characterized as follows:

- we have an inadequate IIM accounting system;
- we have no overall accounts receivable/tickler systems;
- we have no overall trust resource/asset management (including lease management) system; and
- improvements to land records systems are necessary to improve efficiencies.

The Department believes supporting systems (e.g., records management) also may require improvements. Additionally, current systems are not integrated, which creates inefficiencies. The lack of overall systems have necessitated that BIA Areas and Agencies develop their own local systems, which are sometimes manual. Such systems are difficult to audit on a comprehensive basis, and therefore we can not easily demonstrate proper management of our trust responsibilities. Current systems that meet BIA and OST needs appear to be available off-the shelf (IIM, accounts receivable, and trust resource).

Additionally, there is an urgent need to commence a thorough clean-up of the probate backlog, the IIM and Tribal account files, the land and title records backlog, and the appraisals backlog. Delaying this necessary process will make it impossible for the Government to comply with the requirements of Section 101 of the Act for the foreseeable future exposing the Government to increasing liability. Because Interior does not have the internal financial and managerial resources to conduct the clean-up effort, this initiative should be out-sourced to independent contractors. The Strategic Plan contains an action plan for each of the clean-up reforms. The information and cost estimates in the plan were developed by the Office of Special Trustee and have not been verified. For example, the Land Titles and Records Offices (LTRO) and Office of Hearings and Appeals probate related backlogs may be overestimated; the agency probate backlogs may be underestimated.

The President's Budget request was released before the Special Trustee published his Strategic Plan.

Question. In light of the Special Trustee's proposal, does the Administration wish to amend its budget request for fiscal year 1998?

Answer. No. At this juncture, the Department believes that the 1998 President's Budget will be sufficient to implement agreed upon reform efforts.

Question. Has the Special Trustee laid out alternatives for you to his plan? If you do not like his plan, what do you propose to address the problems, and can you do it within the President's request?

Answer. The Special Trustee did not adequately lay out alternatives in his Strategic Plan, or present an adequate implementation plan. The Department has requested the Special Trustee to do so, and a response has recently been received and is under review. At this juncture, the Department believes that the 1998 budget request should be sufficient to perform implementable activities in 1998.

In the press release I have seen of your comments, you also expressed the opinion that the plan requires large, new budget outlays.

Question. Would you please elaborate on your concerns about the budget impact? If Congress decides that an independent agency is just what the doctor ordered, what accounts and programs do you recommend that we reduce to raise the additional \$50 million or so for fiscal year 1998?

Answer. The plan recommends major investments to bring Indian trust asset management functions up to commercial trust standards, without providing sufficient alternatives and benefit/cost analyses to support the proposed level of investment. The Department therefore would not support reducing any accounts anywhere in the Government to raise the additional funds the Special Trustee has proposed in his Strategic Plan.

Mr. Secretary, we've only scratched the surface on this issue, today. Clearly, there is a great deal of concern over how or whether the Federal Government is meeting its trust function, in particular, the management of the trust funds. I don't think the budget justifications for the fiscal year 1998 budget for the Office of the Special Trustee sufficiently explains any strategy or plan.

Question. If you and this Administration do not support the Strategic Plan of the Special Trustee, which this Administration chose for this job, when can we expect to see an alternative plan, and at what cost?

Answer. The Department has requested the Special Trustee to lay out alternatives to his plan and prepare detailed implementation plans. A response has recently been received and is under review.

INDIAN GAMING PROPOSED RULEMAKING

Last year, the Department issued an advance notice of proposed rule making in response to the Seminole decision. As you know, this proposed rule making to establish procedures for Departmental authorization of Class III gaming raised strong objections by State governments and members in Congress.

Question. Can you tell the Subcommittee the status of the Department's review of the advance notice of proposed rule making? The closing date for comments was July 1, 1996.

Answer. Based in part on the comments received, the Solicitor has been carefully reviewing the question of whether the Department has the authority to issue regulations governing such gaming procedures. If the Solicitor concludes that the Department does have such authority, the Department will publish in the Federal Register a Notice of Proposed Rulemaking regarding Class III gaming procedures. We anticipate that the Solicitor will complete his review in the very near future.

Question. Has the Solicitor made a final recommendation on the proposed rule making? If yes, what was the decision? If no, when do you expect the Solicitor to render a decision?

Answer. No, as stated in preceding answer we anticipate that the Solicitor will complete his review in the very near future.

I have learned that the Department plans to run the Solicitor's recommendation through the Justice Department before making a final decision.

Question. Has this occurred? If not, can you give us an estimate on when you expect this report to be transmitted to Justice? If so, how long do you expect the Justice Department's review to take?

Answer. No, although it is correct that the Department will consult with the Department of Justice prior to finalizing our review.

Question. If the Solicitor and Justice determine you have the authority to permit Class III gaming to Tribes under the Indian Gaming Regulatory Act or some other Vehicle, do you expect to exercise this authority? Do you plan to consult Congress prior to doing so?

Answer. If the Department decides to promulgate regulations governing procedures, it would do so in accordance with the requirements of the Administrative Procedure Act; all interested parties, including Congress, will have the opportunity to comment.

Question. Has the Department or one of its subdivisions done any drafting of rules or procedures in the event the decision is in favor of Secretarial authority to permit Class III gaming? If so, the Subcommittee would like to receive a copy of any draft rules or procedures developed to date.

Answer. Staff in BIA have drafted proposed rules which might be suitable in the event the Solicitor's Office determines that we do have the authority to promulgate such rules.

NATIVE LAND IN TRUST

A number of Indian Tribes are devoting significant portions of their budgets, including funds allocated to them by the Federal Government, to acquire additional land, and that is their right under the current law. Yet, the use of scarce resources for land acquisition necessarily limits the amount of funds that the Federal and tribal governments can jointly devote to programs that address the fundamental needs of Native American people (e.g., health care, education, and law enforcement). It also limits the amount of funds that can be spent to properly care for the lands already within their ownership.

Question. Should we consider changes in policy or funding allocations in order to focus limited financial resources on the fundamental needs of Native American people?

Answer. The Department does not believe policy changes are necessary because Tribes are not using BIA funds for land acquisition. As a matter of fact, BIA has not requested any appropriations for general acquisition of lands for Indian Tribes in the past 18 years.

Furthermore, Indian Tribes are not devoting significant portions of their budgets to acquire additional land. As a matter of fact, for the period 1992 through 1995, the Secretary accepted title to only about 215 thousand acres in trust for Indian Tribes.

Question. Do you believe Tribes have a mutual obligation with the Federal Government to address the needs of their members?

Answer. The Department agrees that Tribes have a mutual obligation to meet the needs of their members. The Department believes that the Tribes are doing this as evidenced by the high priority Tribes place on Tribal Priority Allocation programs.

Tribal governments are actively involved in addressing the needs of their members. One of the most effective mechanisms available to tribal governments, in its effort to meet the fundamental needs of its members, is the acquisition of lands that are more suitable for economic development. Lands more suitable for development enables the tribal governments to establish economic enterprises that will generate the capital needed to more adequately address the fundamental needs of the tribal membership.

The primary purpose of taking land into trust is most often to reacquire land lost under the General Allotment Act (between 1887 and 1934, over 90 million acres passed out of Indian ownership under the allotment policies of the General Allotment Act); to provide tribal sovereignty; to provide land for Indian housing; and to allow Tribes a means of economic development.

A Tribe's acquisition of land, and the Government's taking of land in trust are two different things. A Tribe can acquire land to reclaim its aboriginal homeland, or it can acquire land for speculation or economic development.

Question. In deciding whether or not to take land in trust, does the Department consider the competitive advantages that accrue to tribal enterprises (i.e., with respect to tax and regulatory status)?

Answer. Yes. When an acquisition is for economic development, the Secretary is required by regulation to take all State and local concerns into consideration as well as the following additional criteria: the existence of statutory authority for the acquisition; the need of the individual Indian or the Tribe for additional land; the purposes for which the land will be used; the anticipated economic benefits to the Tribe; the impact on the State and its political subdivisions resulting from the removal of the land from the tax rolls; and jurisdictional problems and potential conflicts of land use.

Each acquisition application is evaluated on its own merits. The Secretary additionally considers: whether the State or local entities oppose removal from the tax rolls; whether there is factual conclusive documentation to support the opposition; whether the Tribe has made good faith attempts to mitigate any anticipated adverse impacts; whether the Tribe offered to offset the loss of the tax base by some other income source or benefit to the State or local government; and whether the offer was accepted, along with other factors.

Question. In the past five years, how much land has been taken into trust for Indian Tribes that is not contiguous or located within that Tribe's reservation boundaries?

Answer. The BIA does not maintain a breakdown of acres acquired and located on or off (not contiguous) to a Tribe's reservation boundaries. The BIA has made a special data collection effort for the time period 1992 through 1996. At this time, data are available for the period 1992 through 1995. For the period 1992 through 1995, the Secretary accepted title to approximately 215,000 acres in trust nationwide for Indian Tribes. The BIA is currently compiling the annual real property caseload and acreage report for 1996. This report will be completed by September 1997 and will be made available to the Committees at that time.

Between 1887 and 1934, over 90 million acres passed out of Indian ownership under the allotment policies of the General Allotment Act.

Last April, the Department changed its regulations to provide 30 days notice to State and local governments for written comments on an application by a Tribe to have land taken in trust.

Question. Since this regulation was implemented has the Department received more or less comments from State and local governments over the placement of lands in trust?

Answer. The regulatory change in April, 1996 was not for the purpose of providing 30 days notice to State and local governments for written comments on a Tribal land acquisition application. The 30 day notice regulation has been in place since 1980.

The regulation promulgated in April, 1996 provides additional procedures to ensure the opportunity for judicial review of decisions on trust acquisition. Since April, 1996, all interested parties have the right to file action in Federal court to prevent a trust acquisition if they disagree with the final administrative decision to take land into trust, giving all interested parties the opportunity to file lawsuits to overrule land acquisition decisions through the Federal courts.

Since implementation of the new rule in April 1996, there has been an increase in the number of administrative appeals filed on decisions to approve applications to take land into trust status.

According to the Code of Federal Regulations (25 CFR 151.11), the Secretary is required to consider, "the impact on the State and its political subdivisions resulting

from the removal of land from the tax rolls (and) jurisdictional problems and the potential conflicts of land use which may arise.”

Question. How much consideration is given to this? What is given greater priority a Tribe’s desire to have land placed in trust or the concerns of the State or local government in which the land is located?

Answer. The Department gives a great deal of consideration to this factor. Some of the items that the Secretary considers when weighing this factor are:

1. Does the tax bill include any special district assessments, and if so, does the special district actually provide services/benefits to the property/landowner; or does the Tribe have an infrastructure plan to provide similar services to benefit the property?

2. Will the Tribe be able to offset the loss of the tax base by some other income source or benefit the State or local government?

3. Have the State or local entities submitted justifications for opposition to removal from the tax rolls?

4. Will removing this property from the tax rolls impose severe economic distress on the non-Indian jurisdictions?

5. Has the applicant made good faith attempts to mitigate any anticipated adverse impacts, and does the record demonstrate so?

6. What are the anticipated economic benefits to the Tribe?

7. What are the anticipated economic benefits to the local community?

8. Does the use comply with local jurisdiction zoning laws? If not, is it compatible?

The Federal Government enjoys a special relationship with Indian Tribes that is rooted in the U.S. Constitution. This relationship gives rise to certain rights and privileges that no other group of citizens is afforded such as self-determination and self-governance. The Federal Government is committed to promoting tribal self-determination, self-sufficiency, and economic development. However, the Department does consider the interests of the State and local governments as well as local citizens in decision making about trust acquisitions.

Question. In what circumstances will the Department place lands in trust for a Tribe despite concerns and/or objections by a State or local government or local citizens?

Answer. Each trust acquisition application is unique and must be evaluated on its own merits. Decisions are based on an evaluation of the information submitted to support and justify the respective concerns by the applicant Tribe, State and local governments, and/or local citizens. It is not possible to state precise circumstances which would result in the Department placing lands in trust for a Tribe despite concerns by a state or local government or local citizens. It is fair to say that over the past three years, no lands have been taken into trust when there was strong opposition from state and/or local governments or citizens.

Question. Approximately how often does this occur?

Answer. Our experience shows that most local communities express little or no objection to tribal efforts to acquire lands located within the exterior boundaries of the Tribe’s reservation for the improvement of the health and welfare of tribal members. The BIA field staff indicate that about 75 percent of all trust acquisitions are routine and non-controversial, as most local governments recognize the positive effects that will result from Indian trust acquisitions.

The cases that appear to generate the most contentious positions and strong opposition are acquisitions proposed for gaming or similar large economic development projects.

We would like to note for the record that a number of Tribes and States have negotiated, or are in the process of negotiating, state-tribe tax compacts that accommodate the needs and rights of each party. The Department facilitates this type of negotiation as it is the most favorable way to resolve the issues. In the negotiation process, both sides can discuss revenue needs, economic development objectives, and economic concerns.

Where there is some controversy, many States and municipalities have been successful in negotiating agreements with Tribes such as the following examples reported by the National Conference of State Legislatures:

—The Cherokee Nation has signed agreements with the State of Oklahoma to make in lieu of tax payments to the state equal to 25 percent of all applicable excise tax on cigarettes.

—The Fort Peck Tribes concluded a cigarette tax agreement with the State of Montana.

—The State of Louisiana and the Chitimacha Tribe entered into a tax compact.

—Nevada and the Reno Sparks Tribe have an agreement on Tribal excise tax on tobacco products and a sales tax on retail sales on the reservation.

- The Warm Springs Confederated Tribes and the Oregon Department of Revenue hold an agreement to share revenues generated by tribal collection of state tax on cigarettes.
- Four Tribes have entered into tax agreements with the State of South Dakota on cigarette and tobacco tax.
- New Mexico and the Pueblos of Santa Clara and Pojoaque have been working on the development of a unified tax collection system that will allow shared revenues.

However, there have been a limited number of cases where some communities do not understand the unique status of Tribes and our government-to-government relationship. Local governments are concerned that continued expansion of tribal land bases will deprive the local governments of a significant tax base in the future and object to any proposed acquisition by a Tribe. The Federal Government's trust responsibility to Indian Tribes is to promote economic development, self-sufficiency, and self-determination pursuant to the 1975 Indian Self-Determination and Education Assistance Act, as amended. As previously stated, the United States has a special relationship with Indian Tribes that is rooted in the U.S. Constitution.

I understand that new procedures implemented last year would require the Department to specify in its decision letter the proposed use of the property that is taken in trust if this information is known.

Question. Does the Department include this information in its 30 day notice to the States and local communities? If not, why?

Answer. Yes. The Department's decision document requires an in-depth analysis and evaluation of the Tribe's application for trust status. The decision document includes a summary of findings of fact supporting all statements and references that support the decision to approve or disapprove an application. One of the primary factors considered is the purpose for which the land will be used. The decision document is furnished to all interested parties to the decision.

When land is taken in trust, it is removed from local tax rolls, depriving communities of badly needed revenues even though they will continue to be responsible for providing certain services to Native American communities.

Question. Do you believe that Tribes should be responsible for maintaining lands on the tax rolls, even if they are placed in trust?

Answer. No, the acceptance of title to land in trust status changes the character of title to the United States for the benefit of Indian Tribes. Requiring Tribes to continue to pay taxes on land held in trust status by the United States would be contradictory to the Federal Government's recognition of Indian Tribes as domestic dependent nations under the protection of the Federal Government. Federal lands generally are not subject to taxation. If this approach is taken, logic would imply that all lands where title is held by the United States should remain on the tax rolls. This would mean that all public (national forests, parks, wilderness areas, etc.) and reserved lands (military bases) should remain on the local tax rolls.

Question. Or, alternatively, should Tribes be required to make in-lieu-of-tax payments?

Answer. No. Tribes in the exercise of their governmental authority are entering into agreements with the local governments for some type of compensation for in-lieu-of-taxes. These agreements are beneficial to both the local government and the Tribes. Requiring Tribes to make in-lieu-of-taxes would impinge upon tribal sovereignty.

Question. Or, should the Federal Government be obligated to make local governments whole?

Answer. Discussion with BIA staff indicate that about 75 percent of all trust acquisitions are routine and non-controversial. Among the cases where there is controversy, many States and Tribes are resolving their problems through negotiation of tax agreements. In addition, while the Payment in Lieu of Taxes program (PILT) compensates local governments for losses to their real property tax base for Federal lands within their boundaries, most of the PILT land holdings have been set aside for preservation and other purposes which place inherent limitations on economic development. Conversely, Indian trust acquisition usually results in increased economic benefits to the community as well as the reservation.

Question. Do you know what affect the addition of that responsibility would have on the Federal Government's Payment in Lieu of Taxes program, which the Administration has proposed cutting by \$13 million for fiscal year 1998?

Answer. The effects to individual units of local government from the addition of new trust lands to the PILT land base would not be significant. In 1996, the PILT entitlement land base was comprised of over 484 million acres.

QUESTIONS SUBMITTED BY SENATOR ROBERT C. BYRD

BUDGET PRIORITIES

Mr. Secretary, many of the details of "the budget deal" will have to be hammered out through the appropriations process this summer. And while reports are that the overall domestic discretionary number will not be below the current level, and may actually increase, the specific 602(b) allocations to the Subcommittees have not yet been made. So while I hope Chairman Stevens will look favorably upon the needs of the Interior Subcommittee, I also know that he will be under extraordinary pressure from all of the Subcommittee Chairmen—each of whom will be making the case as to why they should receive better treatment than the other Subcommittees.

Regardless of the allocation this Subcommittee receives, it is unlikely that the budget as submitted will be approved without change by the Subcommittee. Thus, your task will be to work with us to address the most critical priorities. The President has proposed \$527 million in increases above the comparable fiscal year 1997 levels for the programs in this bill. Of that amount, \$389 million is for the agencies under your jurisdiction.

Question. If additional resources are made available above the fiscal year 1997 level, but not to the full amounts requested for fiscal year 1998, what would you characterize as most critical of the increases that have been proposed in the budget?

Answer. The Bipartisan Budget Agreement accepts the high priority that the President placed on his 1998 request for the Department. Discretionary spending in the Environment and Natural Resources Function (73 percent of the Department's budget) is specifically designated as a priority, as is spending for the Bureau of Indian Affairs' (BIA) Tribal Priority Allocations (10 percent of the budget). The Education Function, which includes the BIA education program (seven percent of the budget), is also designated a priority. The Department expects that these priorities will be reflected in the 602(b) allocation to the Subcommittee. However, the Department is prepared, as it has been in the past, to continue a dialogue with the Subcommittee concerning priorities once 602(b) allocations have been made.

Question. How much of the proposed increase for your Department that is within this Subcommittee's jurisdiction is linked strictly to maintaining current levels of service and is not associated with new or enhanced programs?

Answer. Almost all of the increases proposed for the Department cover increased costs of doing business or address backlogs of operational, maintenance or other needs. In the Fish and Wildlife Service (FWS) Resource Management account, for example, \$9.9 million is sought to cover increased pay and other costs. Program increases of \$9.7 million for the National Wildlife Refuge System address large backlogs of operational and maintenance needs identified in the new Refuge Management Information System. A program increase of \$10 million for the Endangered Species program reflects a growing workload.

Department-wide, fiscal year 1998 uncontrollable costs for Interior agencies under the Subcommittee's jurisdiction are estimated to total \$114.0 million, including \$21.5 million attributable to the 1.51 percent increase in agency contributions to the Civil Service Retirement System agreed on in the Bipartisan Budget Agreement.

Question. If the Subcommittee is held at a level that is roughly level with fiscal year 1997, what would you consider to be the highest priority issue that needs to be addressed of those proposed in the fiscal year 1998 budget request?

Answer. The Bipartisan Budget Agreement accepts the priority that the President has placed on many of the Department's programs. The Department expects that the Subcommittee's 602(b) allocation will reflect the agreement on these priorities.

Question. What will it mean to the Department of the Interior's presence in my State of West Virginia if the funding requested in fiscal year 1998 is not appropriated? Do you anticipate any changes in staffing, or office closures, or program terminations?

Answer. Denial of the requested increases would not result in program terminations, but it would mean curtailment of services to the public. For example, Harpers Ferry National Historic Park would not receive \$117,000 needed to maintain services and address increased requirements. Denial of increases requested for the National Conservation Training Center would prevent full operation of this important new facility in which the public has made a significant investment.

It appears that one aspect of the budget deal may be a significant increase for land acquisition. Two of the largest pieces may be for the New World Mine, and for the Headwaters Forest. This still leaves nearly \$400 million for additional land acquisition, if our understanding of the deal is accurate.

Question. What capacity does the Department have to expand significantly its land acquisition program in fiscal year 1998 with current levels of staffing?

Answer. The National Park Service (NPS) and FWS could not significantly expand their land acquisition programs in fiscal year 1998 without proportionate increases in funding for acquisition management, appraisals, and transaction costs. Significant expansion of the land acquisition program will add workload associated with identifying, appraising, negotiating, closing cases, and surveying of tracts to be acquired. Some of this work can be accomplished through contracts with outside sources, such as appraisals and surveying. Other work can be accomplished through agreements with nongovernmental organizations that have historically assisted the Government with land acquisition. The nature of Federal land acquisition and the unique regulations and laws to which it is subject require a cadre of experienced realty professionals on staff to manage and review appraisals, to negotiate purchase agreements, to conduct title curative activities, and to control budgets and obligations of funds.

The Bureau of Land Management (BLM), on the other hand, has some limited capacity to expand its land acquisition program in fiscal year 1998 with current levels of staffing, particularly in those States which have received consistent Land and Water Conservation Fund appropriations over the past few years. Acquisition partners greatly enhance its ability to acquire property. These third party partners often concentrate on purchasing numerous small tracts, often inholdings, to convey to the BLM in one subsequent transaction. Opportunities for matching Federal funds with private sector moneys are among the BLM's highest acquisition priorities. By working with partners, BLM is able to make maximum use of its staff and has the ability to expand its acquisition program with its current staffing level.

Question. What would be the operational requirements of adding new units to the Department's land base?

Answer. The operational requirements resulting from additional land acquisitions vary among BLM, FWS, and NPS as follows:

The BLM operational requirements would not significantly increase as a result of adding new units to the BLM land base. Most additions to the land base would be inholdings of private lands within areas BLM already manages. One of the objectives of the BLM land acquisition program is to increase public lands efficiency through the consolidation of public lands into manageable areas. In addition, BLM has focused on acquisitions that have minimal outyear costs associated with them. For those acquisitions that do require facilities or significant operations costs, BLM has used acquisition partners to leverage additional funding.

The operational requirements of adding new FWS units will depend on the individual units under consideration. The FWS land acquisition program currently focuses on acquisition of lands at existing units of the National Wildlife Refuge System. The President's fiscal year 1998 Budget does not request any funding for land acquisition that would establish new refuges. Moreover, of the 131 projects on the Land Acquisition Priority System list, only nine (or seven percent) are proposals for new units to the system. The FWS planning and budgeting for land acquisition emphasizes acquiring needed lands at existing units of the Refuge System.

Each time a new unit is added to the National Park System, the operational responsibilities of NPS are necessarily increased. These costs are identified during the process which looks at the feasibility of establishing a new unit and the alternative methods of protecting the resource, should that resource be judged nationally significant. Each new unit brings with it varying degrees of new operational requirements. Before testifying in favor of new units, NPS carefully weighs this consideration, and for this reason, the Department of the Interior and the Congress have, in recent years, looked into new kinds of partnership arrangements such as heritage area designations, where the costs of operation and development are spread among several partners at the State, local and Federal level.

Question. Aren't there already numerous units that are understaffed?

Answer. While all NPS and FWS units may not have an optimum number of staff, the bureaus provide at least minimum services for the programs offered to the public at the various sites. To help mitigate this problem, both bureaus perform "cluster management" of units that are geographically close together.

Question. Do you think the priority should be on adding new units before addressing adequately the needs at existing sites?

Answer. The Department develops its position on potential new units depending on the merits of the resources in question. For instance, new units have been added to the National Park System at roughly the same pace for the last three decades; new units will undoubtedly continue to be added. It would be wrong to lose a nationally significant resource due to a policy forbidding new units. On the other hand, the documented NPS operational shortfall and infrastructure backlog has led both the Administration and the Congress to explore, when feasible, other alternatives to Federal ownership. In general, a mix of establishing new units when clearly ap-

appropriate, while providing additional financial resources for existing units, has proven a successful strategy.

In the last two years, funding for the Interior bill is down about \$1 billion, or approximately seven percent, from where it was in fiscal year 1995. The Interior Department has taken its fair share of these reductions.

Question. How has the Department handled this reduction in its funding? How have personnel levels decreased, and what program changes have been implemented?

Answer. Since January 1994, 10 of Interior's Bureaus and Offices have experienced reductions in staff of more than 10 percent. These reductions were made through aggressive use of buyouts, hiring freezes, and the separation of close to 2,000 employees through Reductions-in Force (RIF) in 1995 and 1996. The largest RIF occurred as a result of the legislated closure of the U.S. Bureau of Mines. Concurrent with these reductions the Department has undertaken a major streamlining and reinvention effort consistent with the President's Reinventing Government initiative. The Department has made significant progress in changing business practices and finding more cost-effective and efficient management strategies with a focus on partnerships and cooperative funding. Despite our best efforts at reinvention, however, the Department has suffered some program degradation. Indian Tribes have borne much of the burden with a Congressionally imposed 11 percent reduction in fiscal year 1996 to Tribal Priority Allocations, the account which funds tribal governments, law enforcement, housing improvement, general assistance, and other reservation programs. While about a third of these funds were restored in fiscal year 1997, Tribes are still not able to maintain adequate services. For the land managing bureaus, the impact manifested itself in the curtailment of some services at parks and refuges and a growth in maintenance backlogs.

NATIONAL CONSERVATION TRAINING CENTER (NCTC)

The fiscal year 1998 budget proposes an increase of \$4 million for operations of the training center.

Question. How will the proposed funds be used? Are they necessary because fiscal year 1998 will be the center's first full year of operations?

Answer. The President's fiscal year 1998 Budget requests an additional \$4.1 million to operate the NCTC at the level for which it was designed during the first year of operation. The additional funds are needed to annualize the fixed costs related to the operation of an adult residential training campus, such as utilities, maintenance, and security; increase the number of course offerings to 250; begin to implement distance learning programs; and continue the technical assistance and development of partnerships in conservation education.

Question. If the full amount of funding requested in the budget is not appropriated, what consequence will this have on the Fish and Wildlife Service's ability to make use of this new facility?

Answer. Any reduction to the funding level requested would impact the FWS ability to operate the NCTC. Training and education course offerings would be reduced, course development would be curtailed, distance learning programs deferred, and facility operations would be reduced.

The fiscal year 1997 budget included funding of \$500,000 each in the budgets of the National Park Service and the Bureau of Land Management in support of NCTC operations since these bureaus will also be users of the facility. Through direct and reprogramming actions, these funds were approved.

Question. Is it your understanding that BLM and NPS funds provided in fiscal year 1997 are continued in the fiscal year 1998 budget? Are these funds considered to be a permanent part of the base?

Answer. The fiscal year 1997 budget included funding of \$500,000 each in the budgets of NPS, FWS, and BLM in support of NCTC operations since these bureaus will also be users of the facility. These funds are part of the permanent base for NCTC operations into the future.

CANAAN VALLEY NATIONAL WILDLIFE REFUGE

This refuge, the Nation's 500th, was established in 1994—nearly three years ago. Yet it has taken several years to establish a presence.

Question. How many refuges are staffed below the custodial level—a refuge manager, maintenance worker, and a biologist?

Answer. There are 509 "units" in the National Wildlife Refuge (NWR) system. Of this total, 274 units are staffed and 235 are not staffed. (The majority of the 235 unstaffed units are satellites of small acreage which do not warrant staffing. Also,

FWS has "clustered" management activities at logical sites to oversee some of the far flung units of the refuge system, such as in North Dakota).

According to a preliminary analysis, the system is staffed at the custodial level. For the job series in question, the following table displays refuge manning levels for the 274 staffed units:

REFUGE MANNING LEVELS

Job series	Staffed sites	Percent
Refuge managers/wildlife administrators	257	94
Biologists	154	56
Maintenance/equipment operators	228	83
Total staffed units	274	

Question. What funding level would be necessary to bring all refuges currently in the system to this minimal level?

Answer. The President's Budget request includes funding to address the highest priority operational needs of the NWR system. The budget includes a three-tiered effort to address the highest priority operational and maintenance needs of the Nation's 509 NWRs. First, operational increases total \$13.8 million, or eight percent (including \$4.1 million for pay and FERS retirement cost increases). Second, the budget continues the recreation fee demonstration program which will initially generate approximately \$1 million for on-the-ground project work at the refuges which collect the user fees. Third, construction funding totaling \$22.2 million will be used for the highest priority infrastructure backlog needs including the rehabilitation of roads, dams and bridges; as well as \$17.1 million in ongoing operations funding for routine maintenance. The \$17.1 million plus the \$22.2 million in the construction account will address the highest priority needs identified in the Maintenance Management System.

The first increment of the operations increase is \$9.8 million to protect wildlife, improve habitat, enhance recreation and education, and to accelerate comprehensive planning. The new Refuge Management Information System (RMIS) database was used to systematically rank priorities against nationwide goals to ensure project integrity and to compile a project list tied to the \$9.8 million increase.

The additional funding requested for habitat enhancement will be used to restore natural water flows and replant trees and prairie grasses. This funding will reverse the damaging effects of previous land uses which often include drainage, tree clearing, and elimination of native grasses. Restoring habitats now will ensure healthy and diverse ecosystems; ensure sustainable populations of fisheries and wildlife; and provide habitat for threatened and endangered (T&E) species. Implementation of wildlife dependent recreation and education projects will provide additional opportunities to the 29 million annual refuge visitors. Funding will also allow additional comprehensive management plans to be completed and guide future management of the refuge system.

The second increment of the operations increase is \$4.1 million to fully fund required pay and FERS retirement system costs for the approximately 2,800 employees of the refuge system. This ends the chronic hidden problem of eroded base funding which has been absorbed in recent years. For an average refuge, this could mean an additional \$20,000 that won't be siphoned away from operations.

RESEARCH/SCIENCE AT INTERIOR

Mr. Secretary, you have been a staunch advocate of the need for independent science within the Department so that land management decisions can be made with the most accurate information possible. Your efforts in this regard, however, have been scrutinized by many, often out of concern about possible impacts on current management practices and uses.

Question. Now that the Biological Resources Division (BRD) has been established within the U.S. Geological Survey (USGS), what is your assessment of the consolidation of biological science independent from the land managers?

Answer. The integration of BRD into USGS is progressing positively. The BRD's top priority is to address Interior bureaus' needs. Continuing efforts over the next few budget cycles will demonstrate the ability to match up differing scientific disciplines in efforts that result in better protection of the Nation's natural resources

and in providing reliable scientific information and management options supporting land management needs.

As you are probably aware, Mr. Secretary, there are some who still advocate disbanding the consolidated approach and allowing each land management agency to continue to have its own research element.

Question. What would be the consequences if the Congress were to consider breaking apart the BRD and reassigning the functions to the various bureaus of the Department?

Answer. In recent years, the need for broader and more timely biological information has been apparent in the numerous controversies and potential economic dislocations surrounding various issues, e.g., endangered species. Consequences of breaking apart BRD would reduce the ability and effectiveness of the Department to address issues that are of common concern to the resource management bureaus, particularly issues that involve several geographic regions of the Nation. Each bureau would have to create costly duplicate science structures with overlapping services, activities, and functions to address the same need.

For example, NPS, FWS, BLM, and other bureaus share a common concern about invasive species, noxious weeds, and exotic species. The BRD is in the best position to provide the scientific approach that can address those needs specific to each bureau and also simultaneously apply the broad perspective necessary to address the needs that extend across larger geographic areas. This broad perspective has been enhanced by the recent merger with the physical science divisions of USGS.

An important aspect of ensuring the success of the consolidated research approach is to be ever vigilant to the needs identified by the land managers of NPS, FWS, and BLM.

Question. How are you dealing with the concerns that continue to surface from within these agencies that they are not consulted adequately in determining how the BRD spends its money?

Answer. It is the responsibility of USGS to meet the priority biological needs of the Department of the Interior. The BRD has worked hard at maintaining and fostering its working relations with the resource management bureaus. Improvements and changes in identifying Bureau Information Needs (BIN) are being pursued to ensure that the critical needs of the bureaus are communicated to BRD and that the science conducted by BRD is responsive to these needs. Other bureaus are fostering positions and plans that strengthen their link to BRD scientists. The FWS has established and filled a senior management position to coordinate identification of information needs within FWS. The BLM has formalized its strategic science planning process to systematically provide its science information needs directly into the BIN process in a timely manner. These actions have enhanced communication between BRD and other bureaus at all levels.

One important aspect of the BIN process is reporting back to the bureaus on BRD responses to their information needs. The BLM recently received a report on the status of their information needs and on projects and activities underway in BRD to address them. The BRD Research Centers hold workshops and meetings with counterparts at the regional level to discuss progress in addressing the needs.

Programs developed specifically for other Interior bureaus continue with substantive input from those agencies. For example, BRD has the primary responsibility for science issues for developing standards and protocols for Long-Term Prototype Monitoring in National Parks, but all reviews and decisions (including funding) are made cooperatively with NPS. The FWS is beginning to implement a systematic process to assess contaminant threats to refuge lands with their resources while BRD provides technical support and continues the development of guidance and data management tools for this effort. Other examples of BRD focused activities designed to meet specific information needs of the bureaus include: the Natural Resources Preservation Program which addresses needs of national parks; the quick response program which provides short-term information needs for FWS land managers; and offshore environmental studies which provide information for the Minerals Management Service use in offshore leasing and development decisions.

The proposed increases for fiscal year 1998 reflect the priority needs of the bureaus identified through the formal BIN process, developed by a multi-bureau task force in fiscal year 1994 and initiated in fiscal year 1995. Based on the total resources available and the biological research capabilities of BRD scientists, the proposed fiscal year 1998 budget increases would address the highest priority biological information needs. The broad areas of research proposed for increases respond to bureau information needs (e.g., restoration ecology, invasive weeds). Because many resource problems are not confined to a single park, refuge, or BLM tract, USGS maximizes efficiency by focusing efforts on broad resource problems that transcend boundaries, and applying findings at the local level. Using this strategy and the BIN

process to identify highest priority issues of the bureaus, USGS serves the needs of its Interior constituency.

The fiscal year 1998 budget proposes an increase of \$7.5 million for the BRD. These funds are proposed to be used for biological research and to improve long-term monitoring of biological resources.

Mr. Secretary, a major focus of this Subcommittee has been to respond to the aspects of this appropriations bill which touch most directly the American people. Thus, the emphasis has tended to be on the resources necessary to provide for the visiting public—whether it be through the NPS, the Smithsonian, the Forest Service recreation program, or any of the other public aspects of the bill.

Question. Given the demands to continue funding these public use programs, what do you see as the correlation between dollars spent on science and the experience the average American has when visiting a national park or national wildlife refuge?

Answer. The mission of the Department to provide for the conservation and recreational use of the Nation's parks and wildlife refuges is enhanced when natural resource management decisions are based on objective scientific information. To this end, BRD conducts a full range of inventory, monitoring, and research from local needs affecting a single unit to large-scale issues affecting many resources. Results from these studies provide natural resource managers with the appropriate tools and information they need to deal with issues and problems associated with visitor use of the Nation's public lands. Thus, the experience of the average American visiting a national park or wildlife refuge is enhanced because potential conflicts over natural resource use are minimized and the continued health and sustainability of these areas is ensured for present and future generations. Examples of efforts by BRD include restoring the blackfooted ferret on the Charles M. Russell National Wildlife Refuge, evaluating the effects of mercury contamination in fish and wildlife on national parks and refuges in Maine and Florida, determining the distribution and the causes for decline of amphibians in North Cascades and Olympic National Parks, and modeling responses of the complex ecological processes of the Florida Everglades National Park to natural and human-induced changes to assist in the restoration of this park.

NATURAL DISASTERS

The emergency supplemental approved by the Senate Appropriations Committee recommends a total of some \$327 million in funding for your bureaus. A small portion of this is offset, but most is declared as emergency spending. While the single largest component is the funding to begin restoring Yosemite National Park, vast portions of the Department were affected by this winter's storms.

Question. Based on the most recent estimates from the field, will the funds recommended in the supplemental address the most critical recovery needs?

Answer. The funds recommended in the supplemental will address the most critical recovery needs of BLM, USGS, FWS, NPS, BIA, and the Bureau of Reclamation (BOR). In addition to the funding that it requested, BLM and NPS are also utilizing funding from the Federal Highway Administration, and therefore our ability to repair damage is also dependent on Federal Highway Administration's success in obtaining their requested funding.

Question. Are there any major elements that you feel the Committee has not addressed?

Answer. While we believe that all major elements were addressed by the Committees, USGS believes that additional elements warrant consideration. Non-emergency funds could be used by USGS to properly document the flood for purposes of improving risk estimates and improving forecasting capabilities for future floods. Large floods such as those that took place this year in the far western States, in the Ohio River Valley, and in the northern Great Plains provide information that is critical to the accurate assessment of risk, which is needed for design of future flood control works, for proper flood plain zoning and flood insurance rate mapping, and for improved calibration of the National Weather Service flood forecasting models. The physical evidence (e.g., high water marks) needed to make these improvements is highly perishable. If the field measurements are not made quickly, the evidence is destroyed by natural processes. If the USGS does not do these field investigations, the communities which have been devastated by recent floods will be no better prepared the next time significant flooding occurs.

Question. What would be the impact on the Department of the Interior if there are delays in the supplemental being enacted?

Answer. The 1997 Emergency Supplemental Appropriations and Rescissions Act (Public Law 105-18) has been enacted.

Question. How will the Department address additional recovery requirements that might not become known until after action on the supplemental is completed?

Answer. Our response cannot be determined in advance. If significant additional recovery requirements are made known to the Department, we will decide whether to request another supplemental, manage the requirements through the regular appropriations process, require the bureaus to absorb the cost of these additional actions within current funding levels, or forego the recovery actions.

Question. Would you anticipate requesting further funds, or will the affected agencies have to address these requirements out of their base program?

Answer. At this time, it does not appear that significant additional recovery requirements exist.

Question. And if they have to absorb it out of the base, what effect does that have on other responsibilities?

Answer. Should unknown significant recovery costs become known at this late period, the bureaus would have trouble absorbing new cost requirements in the last quarter of the fiscal year. Field offices in some bureaus would have to severely curtail significant mission-related field activities. However, we will keep the Committee informed of significant additional needs.

FULL YEAR CONTINUING RESOLUTION PROVISION IN THE SUPPLEMENTAL

Despite my efforts to have it stricken from the bill, the Supplemental contains a provision that serves as a full year continuing resolution for fiscal year 1998, but at the fiscal year 1997 funding level.

Question. What would be the impact on the Interior Department if funding were frozen at the fiscal year 1997 level? What would be the consequence on the Department's programs if the proposed funding to pay for fixed costs is not forthcoming?

Answer. The Department would have to absorb nearly \$100 million in uncontrollable costs and forego increases critical to providing adequate funding for parks, refuges, public lands, Indian Tribes, and high priority ecosystems restorations. The most significant impact would be felt in infrastructure maintenance and repair, where historically inadequate funding has resulted in backlogs well in excess of \$10 billion for the Department; and in the Bureau of Indian Affairs (BIA), where funding would be too low to address increasing school enrollment and deficiencies in funding for local reservation programs.

MONUMENTS IN THE WASHINGTON, DC AREA

FDR Memorial

Recently, the President dedicated the newest addition to the National Park Service's responsibilities in the monumental core with the official opening of the FDR Memorial.

There has been considerable attention lately to the monument's components and the manner in which President Roosevelt's fight with polio is addressed.

Question. What role would the Interior Department play in any decisions to modify the memorial? How would any modifications to the Monument be financed?

Answer. Senate Joint Resolution 29 provides that the Secretary conduct a study and develop recommendations for an appropriate addition to the memorial depicting FDR's disability and to report to Congress upon completion of that study. It also provides that any addition be privately financed. The Department plans to use appropriated funds for salaries and administrative expenses associated with the study and private funds for design and construction.

Question. What method will be used to select the designer for any addition to the memorial? Do you anticipate an open competition?

Answer. This has not been determined. While it may be appropriate to utilize one or more of the original sculptors who participated in the memorial, a fresh start with an open selection process may be the better approach.

Question. What timeline has the Department developed for planning, design, and construction of the addition to the FDR Memorial?

Answer. If the experience with the Vietnam Memorial is representative, the Department believes that this process may take several years.

Korean War Veterans Memorial

Recently, attention has been focused on the need for considerable repairs at the Korean War Veterans Memorial, even though this memorial is just a few years old.

Question. Can you describe for the Committee the actions the Department and NPS are taking to address these repair needs?

Answer. The work which has to be completed is related to the construction and design of the memorial. The NPS is meeting with the group which was authorized

to construct the memorial, the American Battle Monuments Commission, to ascertain how the commission will fund work to complete the memorial.

Question. What will happen if agreement cannot be reached with the contractor or other parties regarding funding for the repair?

Answer. The American Battle Monuments Commission will have to seek a special appropriation, or as alternatives, it could reestablish the fund-raising campaign, or each branch of the armed services could contribute funds to the construction work.

Question. What is the estimated cost to conduct the necessary repairs?

Answer. The U.S. Army Corps of Engineers, the original construction manager for the Korean War Veterans Memorial project, has reported to the American Battle Monuments Commission the amount of \$783,000 for the construction repair work.

Question. What steps is NPS taking to ensure that responsibility for repairs is specified before monuments or memorials are turned over to the Service?

Answer. The NPS is not always the contracting officer for the design or construction of a memorial. In these cases, the Park Service has no authority to effect changes in design, material, construction contract terms, or operational requirements. However, NPS has used Memoranda of Conveyance with the authorized group to address any continuing relationships and responsibilities between the Park Service and the group following completion of the memorial. The NPS has no authority to require the authorized group to retain funds to address latent design or construction issues.

The Park Service does request that construction contracts contain extended warranty periods for major or unique components of the memorial. The NPS also requests all authorized memorial groups to work with the architect, sculpture, and design contractors to develop a manual of information which comprehensively details the memorial and its features, its operation needs, materials, and finishes. This manual of information is used as a management tool. Examples of these are manuals for the Vietnam Veterans Memorial and the National Law Enforcement Officers Memorial. The information is formatted to indicate guarantee periods, contractors, sculptures narrative, and design maintenance.

Many groups, pleased to be at the end of the construction cycle, budget their remaining funds for dedication ceremonies and other public announcements of their achievement. They frequently do not retain the necessary funds to address latent design and construction issues nor to complete detailed operation and maintenance manuals to guide the NPS efforts.

Future Congressional authorizations to construct memorials on park land could include requirements for the authorized group to establish contingency or retention funds to address unforeseen design or construction issues, similar to the process used in construction projects undertaken with appropriated funds. This requirement could be in addition to an endowment for future maintenance and operating needs.

OFFICE OF SURFACE MINING (OSM)

A proposal has been developed for a cooperative research effort with the National Mine Land Reclamation Center to reduce formation of acid pollutants that can drain into streams and rivers where coal is mined. The objective is to pursue advances in technology to be used in the identification, evaluation, and development of methods that will be cost-effective and environmentally beneficial. The National Mine Land Reclamation Center can serve as a technical clearing house to identify and develop "best science" approaches to acid mine drainage related issues.

Question. Do you agree that there is benefit in seeking to address acid mine drainage issues in a non-confrontational manner, apart from the regulatory environment?

Answer. Yes. We believe that in order to make true progress in finding solutions for acid mine drainage problems, it is necessary to involve all parties—industry, States, academia, citizens, government agencies. This can be done best in a non-regulatory environment.

Question. Has OSM participated with the National Mine Land Reclamation Center in devising this program to address the need to be able to predict acid mine drainage occurrence and develop successful prevention efforts?

Answer. The OSM is participating extensively with the National Mine Land Reclamation Center (NMLRC). At OSM's request, with the agreement of the industry, the NMLRC serves as the Secretariat for the Acid Drainage Technology Initiative (ADTI). This initiative is a partnership-based joint venture, in which OSM has joined with industry, the States, academia, other governmental agencies, and other groups to identify science-based solutions to acid mine drainage problems. In addition, OSM, in conjunction with the Environmental Protection Agency (EPA), is providing funds to the NMLRC to: (1) organize a public meeting at the appropriate time to discuss the results of the ADTI prediction and prevention task groups ef-

forts; and (2) assist in the technical review and development of acid mine drainage stream restoration projects.

Question. Are other Federal agencies involved in acid mine drainage work? What activity have they had in working with OSM on this issue? How do you ensure that there is no duplication of effort?

Answer. Many other Federal agencies are joining in the partnership effort to address acid mine drainage problems. The EPA is a major partner both in the Appalachian Clean Streams Initiative and in the Acid Drainage Technology Initiative. Other Federal agencies that are actively partnering with us and the States include: Natural Resources Conservation Service (NRCS), U.S. Army Corps of Engineers (COE), Tennessee Valley Authority, USGS, Forest Service, Department of Energy, BLM, and FWS. Some of these agencies (e.g., EPA, NRCS, COE) are participating in the Appalachian Clean Streams projects that are being funded this fiscal year. Some (e.g., Department of Energy, USGS, EPA) participate on the Acid Drainage Technology Initiative work groups. Duplication of effort is avoided by the extensive coordination that takes place between the agencies involved in acid mine drainage issues. For example, the Eastern Mine Drainage Federal Consortium, comprised of 14 Federal agencies, meets regularly to discuss and coordinate issues relating to mine drainage. The work groups involved in the Acid Drainage Technology Initiative provide a coordinating mechanism for technical analysis. For the Appalachian Clean Streams Initiative, we conduct a conference call every two weeks to discuss progress and issues. Several Federal agencies (EPA, COE, NRCS) always participate in the conference calls.

Question. What need is there to move from small-scale research to large-scale demonstrations of acid mine drainage abatement under operational conditions?

Answer. There is a definite need to move in the direction of providing large-scale demonstrations of acid mine drainage abatement techniques under operational conditions. Our hope is that through a combination of Clean Streams projects funded through the Abandoned Mine Reclamation Fund grant appropriation and non-OSM contributions, and industry participation through the Acid Drainage Technology Initiative we will be able to field test techniques under actual operational conditions. That is one reason why we believe that continued funding for the Appalachian Clean Streams Initiative grants and OSM's technical assistance activities are important.

MAINTENANCE/INFRASTRUCTURE BACKLOGS

The maintenance backlog for the Interior Department is estimated to exceed \$10 billion. The largest segments of this backlog are for NPS responsibilities and BIA. To assist in efforts to address demands placed on the public land agencies, Congress established a recreation fee demonstration program that allows agencies to retain funds collected on-site to address high priority requirements.

Question. What has been the reaction of the public thus far to this program? Has there been any resistance to paying fees at sites participating in the program?

Answer. The national and local press have been almost unilaterally supportive of the Recreational Fee Demonstration Program. Public response has thus far been positive. The NPS has, to date, received few letters regarding the program. The Park Service will continue to monitor the reaction to these new fees and to provide information that illustrates that they directly enhance the visiting public's experience.

The NPS has already begun its evaluation of the Recreational Fee Demonstration Program by contracting with researchers from the University of Minnesota. A dozen case studies will be conducted to sample public opinion on the new fees.

The first evaluation project has already been concluded at Colonial National Historical Park. This park raised the entrance fee for its Jamestown unit from \$2 to \$5 per person and instituted a new fee at the Yorktown unit at \$4 per person. An admission fee for both units is \$7 per person and an annual family pass can be purchased for \$20. Preliminary findings culled from the focus group meetings held there from May 30 through June 2, 1997 show:

- Over three-fourths of those paying fees thought the fees were about right, or too low;
- Slightly less than one-fourth of the fee payers thought the fees were too high;
- Half of those gaining entrance using a Golden Age passport thought the free entry provided by this pass to senior citizens was right; and
- Slightly less than half of the Golden Age pass users thought that seniors should be charged at least something for entrance.

Question. What is your current estimate of revenue that can be generated by this effort?

Answer. Although the President's Budget had estimated that revenues generated by this effort in fiscal year 1998 would total \$48 million, that estimate is now being revised as a result of amendments to the program earlier this year.

Question. Can you provide examples of how the funds will be used?

Answer. Several projects that are under consideration for the use of the funds include the rehabilitation of the Beaver Meadows Visitor Center, replacement of vault toilets, rehabilitation of trails and relocation of trailheads, and historic structure preservation at Rocky Mountain National Park. Others include improved public restrooms; improvement or provision of handicap access; utility system repairs at Yellowstone National Park; new toilets and dump stations; stabilizing the Widows Ledge ruin site; rehabilitating Wahweap picnic area; and stabilizing and rehabilitating five historic structures in the Lonely Dell at Glen Canyon National Recreation Area.

FIRE

Question. Please describe Departmental policy and any other Federal-level policy on the use and amount of "prescribed burns" and mechanical thinning on Federal lands to better manage accumulated fuel load.

Answer. The Federal Wildland Fire Management Policy and Program Review Final Report dated December 18, 1995, establishes joint fire management policy for both the Department of the Interior and the Department of Agriculture. The role of wildland fire as an essential ecological process and natural change agent is prominently featured as one of the overall guiding principles for Federal fire management. Goals of the policy include the use of wildland fire to restore and maintain healthy ecosystems and to minimize undesirable fire effects, and to manage wildland fuels at levels consistent with wildland fire protection and resource management objectives identified in management plans. Federal agencies are directed by the policy to implement expanded use of prescribed fire to manage fire-dependent ecosystems, and reduce hazardous fuel loading. Actions specific to the Federal agencies' use of prescribed fire are as follows. Federal agencies will:

- Jointly develop programs to plan, fund, and implement an expanded program of prescribed fire in fire-dependent ecosystems;
- Facilitate the planning and implementation of landscape-scale prescribed burns across agency boundaries. Seek opportunities to enter into partnerships with tribal, State, and private land managers to achieve this objective;
- Require appropriate treatment of fuel hazards created by resource-management and land-use activities;
- Conduct all prescribed fire projects consistent with land and resource management plans, public health considerations, and approved prescribed burn plans;
- Implement the National Wildfire Coordinating Group (NWCG) interagency prescribed fire qualifications and certification standards;
- Train and maintain a qualified and adequate work force to plan and implement interagency prescribed fire projects safely and effectively, and make these personnel available when needed;
- Jointly develop simple, consistent hiring and contracting procedures for prescribed fire activities;
- Conduct research and development on fuel treatment alternatives and techniques;
- Seek authority to eliminate barriers to the transfer and use of funds for prescribed fire on non-Federal land and among Federal agencies;
- Seek authority or provide administrative direction to eliminate barriers to carrying over from one year to the next funds designated for prescribed fire; and
- Jointly develop tools to identify, assess, and mitigate risks from prescribed fires.

In addition, the 1998 Wildland Fire Management Appropriation Request includes language that would allow for funding to be available from the Wildland Fire Operations account to support an expanded prescribed burning and mechanical fuels treatment program. This would provide funding needed to accomplish the tasks identified in the "New Federal Fire Policy." Without this funding the opportunities to meet the identified action items will be extremely limited.

The amount of acreage to be treated over the next few years is planned to be two to three times greater than treatment levels in the recent past. The actual treatment amount will depend on fire management plan updates, available funding, environmental conditions in any given year, and available resources such as personnel and equipment.

Question. With current/renewed interest in scientific management of public lands, do you see more such activities in the near future?

Answer. The land management plans of Interior bureaus now incorporate concerns about the role of fire in restoring and maintaining healthy ecosystems. The bureaus are developing plans to utilize appropriate management tools, including mechanical thinning of forests and the use of fire, to reduce fuels to a more natural condition. As part of this program, the bureaus have projected an increase in acres treated from about 400,000 acres in 1997 to nearly 900,000 acres in 2001. This represents an approximate 25 percent annual increase for the next four years.

Question. Are all of the land managing agencies under your purview undertaking such activities?

Answer. Yes, all of the Interior bureaus are expanding fuels management programs on their lands and are developing integrated programs to manage hazardous fuels and prescribed burns across Federal administrative boundaries. This will increase the efficiency of treatments and will complement more comprehensive efforts to manage lands on an "ecosystem" basis rather than as isolated units.

Question. In what manner are such contemplated actions coordinated with interested parties including adjacent landowners and local residents?

Answer. Hazardous fuel treatment plans and prescribed burn projects are covered under environmental assessments that are submitted for public review and comment. In addition, many administrative units conduct town meetings and other public outreach programs to explain the purpose, timing, and possible impacts of these programs on local communities. The ongoing Mineral King Risk Reduction Project at Sequoia National Park is a good example of such an effort. That project involves extensive prescribed burning and mechanical fuels reduction both to restore fire to giant sequoia groves and to protect the property of private inholders in the National Park. All bureaus are expanding efforts to develop cooperative fuels management programs with adjacent State, tribal, and private landowners.

FIREFIGHTING PROGRAM INFRASTRUCTURE

In the past several months there have been reports of inoperable or inaccurate flood gauges. The result was inaccurate predictions of flood cresting. This basic infrastructure provides early warning of possible dangerous conditions.

Question. With the fire season approaching, and starting early in some regions of the country, is there any reason to be concerned about the reliability of such basic firefighting infrastructure as weather stations, lightning detection facilities, and lookouts?

Answer. Although the basic infrastructure is sound, there is a need to modernize many fire management facilities to meet health and safety codes and to support expanded fire management efforts. The Interior bureaus continue to modernize and improve their capabilities to identify critical fire weather conditions, and to detect and quickly respond to lightning and human caused wildland fires. Current automated lightning detection systems are adequate to provide coverage throughout most of the lightning-prone areas of the country.

There is also an ongoing program to expand the capability of remote automated weather stations to track weather and fuel moisture conditions and provide early warning of unusual or dangerous conditions. Further investments in these networks will help to support detailed assessments of appropriate management strategies on wildland fires, and prescribed weather and fuel moisture conditions on prescribed burns.

The fire weather forecasting section of the National Weather Service has always provided a critical service to the wildland fire program. We are concerned with efforts to reduce specialized fire weather forecasters and replace them with core forecasters. It is important to maintain specialized skills in these offices to support local and spot forecasting needs identified by the bureaus. In some cases, additional services may be required to support expanded prescribed burning programs.

Many fire lookout towers are old and in need of repair, but still provide a critical detection service. The bureaus support a continuing program within the funding provided to upgrade such facilities along with guard stations, fire engine storage areas, air tanker bases, and fire equipment caches.

SCIENCE

The Administration's budget for the Biological Resources Division of USGS includes \$10.93 million and 151 FTEs for Cooperative Research Units (CRU). These 40 units are located in land grant and historically black colleges and universities. Coordination and approval of research in these units is done within the unit and among the Federal, State agency, and university partners. Similarly, the NPS budget request includes \$2.4 million and 16 FTEs for Cooperative Ecosystem Study Units (CESU). These units, not funded in fiscal year 1997, would help focus science

research regionally. In its budget, NPS proposes to work collaboratively with the USGS BRD to establish the CESUs and reorganize former NPS university-based Cooperative Park Study Units (CPSU).

SCIENCE MISSION

Question. How does the mission of the BRD CRUs differ from that proposed by NPS for its CESUs? Why are the CESUs being established? What role will they play that is not being met by other existing Interior research labs?

Answer. As envisioned, the CESU network will enable close collaboration among researchers and resource managers to provide research, technical assistance, and education needed by land resource managers to solve complex interdisciplinary management issues that span the physical, biological, economic, social, and cultural sciences. The CESUs will not compete with the BRD CRUs or former Cooperative Park Study Units, but will identify resource information needs within parent agencies, and will offer improved access of managers to BRD and university expertise and capabilities.

SCIENCE COORDINATION

Question. The NPS describes working with the BRD in fiscal year 1998 to establish the CESUs, yet the BRD does not identify this coordination with the NPS as work in fiscal year 1998.

Answer. Within fiscal year 1997 budget allocations, BRD already has research scientists stationed at universities. There is no additional cost for BRD to participate in the CESUs, and BRD will benefit by having better levels and points of contact with its partner agencies.

PLANNING ISSUES

Habitat Conservation Plans (HCP)—Cooperative planning efforts among stewards for habitat on private, local, State, and Federal lands have been in the news lately. Several HCPs and Natural Communities Conservation Plans (NCCP) have been debated and approved in the larger public forum including the Southern California NCCP, the Balcones (Texas) Conservation Initiative, and the Brevard County (Florida) Scrubjay plan. These show the benefits of dialogue and coordination of interests and concerns at all levels.

Question. Please describe the future of such planning activities, and the lessons learned from the process thus far.

Answer. This program has been successful because the Department has forged strong partnerships with private, local, and State landowners to find innovative solutions that are biologically, economically, and politically feasible for all parties, and conserve listed species.

The growth in HCPs is due to several factors, primarily the greater incentives that have been offered to landowners. Previously, the fear of new listings, the potential for additional mitigation measures and the potential to have to redo a plan left landowners leery of entering into a long-term agreement. The Administration's new "no surprises" policy (a deal is a deal except under extraordinary circumstances) also provides certainty to landowners and encourages them to come to the table to develop long-term contracts to protect T&E species while allowing economic activities to proceed. The "no surprises" policy has been critical to the willingness of landowners to participate in the HCP process.

Additional factors which have increased the use of HCPs and also benefits both wildlife and landowners include: the development of multi-species HCPs covering larger geographic areas; substantial process improvements detailed in a new user-friendly HCP handbook; vastly improved coordination between FWS, the National Marine Fisheries Service, and other Federal parties; and a change in the FWS role from providing technical assistance only to full participation with landowners through all stages of the process.

These are the kinds of lessons learned which can help guide the national debate over reauthorization of the Endangered Species Act (ESA). The Department continues to explore additional ideas to forge strong partnerships with private, local, and State landowners to find endangered species habitat solutions. The Department has aggressively accelerated the use of additional existing authorities under the ESA to ease the regulatory burdens of the ESA on private, State, and other landowners. The Department would not be adverse to incorporating the "10 Principles" into the ESA. Many of those principles grew out of our early involvement with the HCP process.

The "safe harbor" program encourages landowners to provide habitat for listed species. Under this program, private landowners with assistance from FWS or with other qualified Federal or State agencies develop a management program to be carried out on their lands for the benefit of listed species. Based on such a program, a safe harbor agreement is entered into by FWS and landowner. The FWS, in turn, will issue the private landowner a permit for the future take of listed species above the existing baseline conditions at the time of the agreement.

The "no surprises" policy assures private landowners participating in HCPs that no additional requirements will be imposed on plan participants for species covered by the HCP except under "extraordinary circumstances."

These are partnership agreements where the landowner approaches the Department to develop a solution to allow economic development to proceed while protecting T&E species. The Department is confident that adequate safeguards are built into the permit process to avoid future potential problems. Within the framework of the HCP, it is the applicant's responsibility to carry out FWS-approved monitoring regimes to determine the effectiveness of the terms and conditions of the agreement to minimize and mitigate the effects of the action. The FWS is responsible for ensuring the compliance with the terms of the HCP and evaluating the effectiveness of the actions on the covered species.

In addition, FWS incorporates adaptive management clauses into HCPs that may cover a species for which FWS may not have all of the scientific information needed at the time of HCP development. Where these data gaps occur, not all of the questions regarding the long-term effects of implementing these HCPs can be answered. In these cases, FWS has begun to work with the applicants to incorporate adaptive management into the strategies designed to mitigate the effects of the HCP. These provisions are especially useful for species whose biology is not fully understood when the HCP is developed and the landowner wants to cover them. These provisions allow FWS to work with the landowner to change management strategies within the HCP area, if new information about the species indicates this is needed.

Cooperation to date has been impressive. Indeed, our field offices report a surge of additional non-required "monitoring" and "consultation" visits requested by eager HCP permittees.

GATEWAY COMMUNITIES

In fiscal year 1997, NPS is undertaking a pilot program to work collaboratively with four "gateway" communities on mutual planning and development related issues.

Question. What are the four communities?

Answer. The NPS identified several candidates for pilot projects addressing gateway communities in response to recommendations in the Vail Agenda. The initial pilot projects were Sitka in Alaska; Elbe, Ashford, and Greenwater near Mount Rainier in Washington; and Tusayan adjacent to Grand Canyon in Arizona. Larimer County Colorado, Springdale, Utah, and Gettysburg, Pennsylvania also have been recognized as models for cooperative relationships with adjacent national park units.

Question. What is the scope of these projects?

Answer. At Mount Rainier and several other units conservation assistance projects have helped local communities develop visions of the future and specific goals in the early stages of general management planning for the adjacent park. In some cases such as the Grand Canyon, the park's general management plan has addressed alternatives for the adjacent community to become a staging area for visitor information, transportation, and other services. Rocky Mountain National Park co-sponsored a conference with local officials in other surrounding jurisdictions to share ideas about cooperative planning. At Sitka, the park's general management planning project has been coordinated with local plans for visitor services and interpretation, transportation (including a shuttle bus system), design assistance for signs, and overall visual quality.

Question. What is the projected outcome of these joint efforts?

Answer. In general, the expected outcome is improved cooperation with the communities on transportation, public services, visual quality, future development patterns, and other matters. For example, the community assistance projects at Mount Rainier provided a basis for improved coordination with the communities throughout the general management planning process. At Sitka, a plan is currently helping to guide local decisions. The Grand Canyon general management plan's recommendations for improved visitor services in adjacent communities are being addressed as more detailed implementation plans and are being developed by the NPS and the towns around the park.

Question. How were the communities selected for the pilot?

Answer. The NPS Regional Offices were invited to submit nominations for the selection of the initial pilot projects in 1993. Twenty-five candidates were submitted, reviewed in the Headquarters Office, using criteria such as likelihood of success, and the best proposals were identified as pilot projects.

Question. Is this a model which will be incorporated into future NPS planning efforts?

Answer. Yes, NPS recently conducted two seminars on lessons learned in cooperative planning with gateway communities. Several suggestions are currently under consideration for how to assure that lessons learned with these pilot projects and other initiatives are incorporated into routine park management as well as future planning projects. However, one of the conclusions is that successful cooperation between parks and adjacent communities requires tools and relationships that are designed to fit local circumstances. Park managers, planners, and local communities will be encouraged to learn from past experiences, but to choose from various models one that is most likely to work for their specific purposes.

Question. Do you anticipate any new starts of such efforts in fiscal year 1998?

Answer. Lessons learned from these pilot projects will be incorporated in new general management planning projects wherever possible. The Rivers, Trails, and Conservation Assistance program also is expected to continue placing a high priority on support for some projects in communities adjacent to NPS units.

Question. Are there any plans to coordinate these efforts on an interagency basis in areas where other Federal land managing agencies have a presence?

Answer. Cooperative planning efforts with local communities routinely involves coordination with other Federal land managers. Interagency efforts with the U.S. Forest Service have been most evident in examples at Grand Canyon, Sitka, and Mount Rainier, but other Federal, State, and local agencies have been involved as well. Cooperation with other Federal agencies is expected to continue in future projects.

VOLUNTEERS

The Department and the land managing agencies have taken some creative approaches to supplement Federal funding of public lands management. In the past several years there has been an enhanced revenue stream through the recreation fee demonstration program, through the efforts of cooperating associations and friends groups, the use of volunteers, and partnering with private industry (i.e., recent American Airlines announcement).

Question. Please describe the use of volunteers in each applicable Interior agency and the impact that volunteer, community service, and internship programs has had on the ability of the agencies to accomplish their responsibilities.

Answer. The BLM, USGS, FWS, NPS, BIA, and BOR all have successfully used volunteers to supplement the work of bureau employees as follows:

Since 1981, volunteers have played an important role in helping BLM achieve its mission. Each year over 19,000 volunteers provide vital assistance to BLM in the management of public lands and associated resources. Volunteers not only contribute work time, which is estimated to be valued at over \$13 million each year, but they are taking on increasingly important roles in serving as team members, providing customer service, serving as important links to local communities, and providing innovative ideas and resources. Each of the 12 BLM State Offices has an active volunteer program where people of all ages pitch in without compensation to do such things as build trails, restore watersheds, patrol cultural sites, write informational brochures, staff visitor centers, train wild horses, clean-up recreational sites, provide engineering support, program computers, and conduct educational programs. Recently BLM honored eight outstanding volunteers for their dedication and contributions in the following areas: educational and public presentations about the BLM Adopt-a-Horse program, mechanical engineering skills, recording archaeological sites, conducting weekly maintenance of trailheads and campsites, conducting interpretive talks, staffing information desks, and greeting visitors.

The BLM is also actively involved in community service through such events as the National Public Lands Day, an annual volunteer program designed to bring thousands of citizens to public land sites for hands on restoration work and conservation education. The BLM also sponsors a number of environmental education programs for all age groups of school children in both classroom settings and field site exercises. Outdoor classrooms provide information and instruction in a variety of subjects, including geology, archeology, wildlife, and botany. The programs are designed to spark interest in children in both stable and at risk environments to learn about cultural and natural resource issues and gain a better understanding and appreciation for their world.

AmeriCorps participants are accomplishing essential on-the-ground work in environmental protection and restoration activities for the Department and to the mutual benefit to both the Federal Government and our partners.

At Fort Ord, AmeriCorps participants have worked to protect 7,250 acres by building fences and barriers which protect many acres of new habitat created for the reintroduction of endangered species as well as 300 habitat improvement and erosion control projects. Protection of sensitive wetlands and endangered species habitat through the planting of shrubs and grasses continues. Transformation of the former military base to public recreation lands and wildlife habitat has begun.

The USGS Volunteer for Science Program is an invaluable component of the USGS workforce. Every year nearly 10,000 volunteers from all segments of the American population—from school children to scientists emeritus—perform tasks ranging from entry-level clerical to highly technical scientific services. The Volunteer for Science Program is dynamic and flexible enough to satisfy high school students' community service requirements, provide internship opportunities for college students, give retired scientists and technical experts a place to continue to be productive and valuable to this Nation, and fulfill personal desires to contribute to the wise management of our natural resources.

The USGS gains significantly by receiving nearly one-half million hours of assistance annually in support of its mission. On a cost basis, volunteers replace nearly \$6.5 million in salary dollars. In some cases, volunteer time is key to project success and tips the balance from not getting the job done to accomplishing the job within the needed time frame. Even if USGS were provided the resources to hire employees to replace volunteers, it would be difficult to find the numbers of people with the expertise to do what our volunteers do free of charge. Many volunteers are expert in geology, digital mapping, engineering, computer science, ornithology, parasitology, mammalogy, ichthyology, ecology, and biology. Others are experienced in public education, technical writing, accounting, animal husbandry, and other specialties.

In 1982, FWS was aided by 4,521 volunteers who contributed 128,440 hours. Participation has steadily increased to 25,840 volunteers and 1.1 million hours in 1996. These volunteers work at a variety of tasks ranging from construction and repair projects to orienting and educating visitors to assisting with fish and wildlife surveys and habitat improvement projects. Volunteers include individuals, boy scouts, girl scouts, American Association of Retired Persons, Friends groups, local Audubon Chapters, and school groups to name a few. The FWS also uses volunteers from organizations such as the Student Conservation Association and AmeriCorps.

Volunteers supplement FWS resources, as described in the following examples: Edwin B. Forsythe NWR volunteers assisted in piping plover nest surveys and population monitoring when the refuge staff was unable to continue its weekly waterbird surveys. Ash Meadows NWR volunteers removed 240 inactive utility poles during April and May. They donated 504 hours and saved \$100,000 for FWS. At Bitter Lake NWR, the Roswell Job Corps constructed a handicapped-accessible Watchable Wildlife overlook.

At the Rio Grande project, AmeriCorps participants have restored 150 acres of riparian habitat, planted some 15,000 seedlings for erosion control, and conducted vegetation studies as well as photo documentation of oil spill contamination and cleanup efforts. Over 70 ecosystem, fish, wildlife, and water quality research projects have begun and been completed. In addition, endangered species "tool kits" for teachers have been created.

The NPS considers anyone to be a volunteer who contributes his/her time and expertise to the agency for no pay. Official NPS volunteers must sign a volunteer agreement to be covered under the provisions of P. L. 91-357, as amended. The NPS uses volunteers in nearly every sector of the agency and almost every unit of the National Park System. Volunteer activities in NPS are summarized in nine general categories. The following list summarizes NPS volunteer activities for fiscal year 1996: Administrative Support, five percent; Campground Hosting, eight percent; Curation, two percent; Archeology, one percent; Interpretation, 39 percent; Maintenance, 16 percent; Resource and Visitor Protection, five percent; Resource Management, 19 percent; and Other, five percent.

At the Everglades-South Florida ecosystem project, AmeriCorps participants have conducted 78 fish, wildlife, and water quality research projects at four National Parks and six Fish and Wildlife units. Automated water monitoring stations and Coral Reef nurseries for future marine habitat restoration have begun. Exotic plant removal has been accelerated.

Volunteers are nearly always beneficial in BIA response operations. However, much of the response to recent storm damage undertaken by BIA required use of equipment and trained personnel for major repair work. No volunteer equipment

and/or operators were available to assist during the disaster periods. On the community services side, Indian communities came together to work for the common good during the crises. Both the youth and elderly of Indian communities assisted by filling and stacking sandbags; evacuating homes; providing shelter for family, friends, and neighbors; helping unload trucks; and delivering food. The communities did what they could do within their limited resources and abilities to assist each other. Unfortunately internship programs are not available in all communities to assist in the necessary repairs and carry out the needed rebuilding and construction of damaged buildings, roads, irrigation structures, etc.

The BOR has many volunteers which have proven to be a successful tool in productivity and efficiency for the Bureau and local communities. Volunteers in BOR are used in a variety of ways. Some examples from the past year include: providing clerical and administrative support; providing visitors to Hoover Dam with information and assistance; assisting in cataloging and curating Hoover Dam's museum quality documents, photos, and other historical items; and serving as judges for the National Science Fair. In one region alone, specific programs include: Partners in Education, 47 volunteers/607 hours; Participation in Paint The Town 28 volunteers/156 hours; Participation in Rake-Up-Boise 31 volunteers/124 hours; Catch A Special Thrill (C.A.S.T.) Fishing 90 volunteers/720 hours; Idaho Adopt-a-Highway 10 volunteers/40 hours; Christmas Adopt-A-Family 23 volunteers/64 hours; Employee-Sponsored Scholarship Fund 20 volunteers/90 hours; and Area Pond Clean-Up six volunteers/48 hours.

EDUCATION

Question. Is the Department working with the Department of Education on science issues in education?

Answer. The Interior Education Committee, which includes representation from each of the bureaus, has worked with the Department of Education to keep abreast of the Federal role in science education. The Goals 2000 Subcommittee to the Interior Education Committee has convened meetings on matters relating to the Educate America Act—Goals 2000. The Department of the Interior's school partnership program is one of the focuses of the subcommittee. The subcommittee also keeps abreast of new initiatives sponsored by the Department of Education.

Question. Which agencies are involved in this effort?

Answer. The USGS has cooperative education projects with the National Aeronautic and Space Administration and the National Oceanic and Atmospheric (GLOBE Program) in addition to cooperative projects with other bureaus within Interior, including NPS and BIA. A subcommittee to the National Science and Technology Council with interagency representation meets to discuss grant programs in educational technology for school districts (K–12). The Subcommittee on Educational Technology is sponsored by the Department of Education and the Office of Science and Technology Policy. The USGS represents the Department on this committee for fostering technology in education.

Question. Describe how the Department shares with the children in America's schools the lessons learned through research on public lands and in the bureaus.

Answer. The USGS has 14 partnership schools nationwide in accordance with Executive Order 12821. The Interior Subcommittee works with the bureaus to provide guidelines for administering a formal School Partnership Program. The USGS also serves students with the Volunteer for Science Program, which dovetails with community service programs in most schools nationwide. The USGS administers the Excellence in Education Initiative, a project-based program, to develop materials for the K–12 education community and to teach teachers about the latest scientific developments in the earth and biological sciences. The USGS Visitors Center hosts about 10,000 visitors each year from schools throughout the DC metropolitan area via a tour program, activities-based learning, and science summer camp.

EMPLOYEE DEVELOPMENT

Question. How does the Department ensure that its employees are kept current on emerging technologies and competencies in professions relating to the sciences?

Answer. The Department encourages state-of-the-art technical competency by promoting and supporting continuous academic development including graduate course work, research, and independent study. Because of the job relatedness of technical academic studies, most course work is paid for by the employing bureaus. Technical professionals are also encouraged to attend conferences and symposia, to be active members in professional societies, and to subscribe to professional journals and publications. Costs associated with these activities, including travel and fees, are typi-

cally borne by the bureaus; employees are usually permitted to participate on Government time, as part of their regular duties.

Question. Do the bureaus have similar employee development goals and moneys available for training?

Answer. Employees of bureaus such as USGS, FWS, and the Bureau of Reclamation are regarded worldwide as experts and leaders in their fields. This level of recognition is gained only by state-of-the-art competency acquired through constant employee development. The financial commitment to this development is many times greater, in absolute terms and as a percentage of overall funding, than in non-scientific bureaus. Non-scientific employees in all bureaus are also supported in maintaining a high level of technical competency in their occupational areas.

GOVERNMENT PERFORMANCE AND RESULTS ACT

The Government Performance and Results Act (GPRA) requires that each agency submit by September 30, 1997 a strategic plan for program activities.

Question. What Congressional consultations have taken place to date, both on a departmental and bureau level?

Answer. The following table summarizes Interior's consultation process with the Congress since November of 1996. To date the Department and all eight of its bureaus have consulted with Congressional staff including the House GPRA team.

CONGRESSIONAL CONSULTATION SCHEDULE

Bureau	Date	Parties consulted
Department, NPS	Nov. 20, 1996	House/Senate Appropriations staff.
Department, NPS, OSM	Dec. 16, 1996	Do.
MMS	Feb. 4, 1997	Do.
Department/NPS	Feb. 7, 1997	Senate Energy staff/Senate Environment and Public Works staff.
FWS	Feb. 24, 1997	House/Senate Appropriations staff.
MMS	Feb. 26, 1997	Government Operations and Reform staff.
USGS	Feb. 28, 1997	House Appropriations staff.
MMS	Mar. 5, 1997	House Resource Committee staff.
NPS, BLM	Apr. 18, 1997	House GPRA team.
FWS, USGS	Apr. 25, 1997	Do.
BOR, WRD-USGS	May 2, 1997	Do.
MMS, OSM	May 9, 1997	Do.
BIAdo	Do.
Department	May 8, 1997	Do.
FWS	June 26, 1997	Do.
Department	July 11, 1997	Do.
Department—Insular Affairs	Aug. 21, 1997	House Appropriations staff.
FWS	Aug. 25, 1997	Do.

While the Senate is still organizing its GPRA review process, copies of draft strategic plans have been sent to Majority and Minority staff for the following Committees: Senate Appropriations; Senate Budget; Senate Governmental Affairs; Senate Energy; and Senate Environment and Public Works. The Department has offered and is available for further consultations.

Question. Please describe the efforts undertaken to date by the various land managing bureaus to coordinate development of meaningful goals and measurements for responsibilities common to the bureaus.

Answer. The Department of the Interior, as part of its strategic planning process, has established a Strategic Planning Steering Group to guide the development of the Interior bureau strategic plans. This group is composed of senior planning officials from each bureau, as well as representatives from the Departmental budget and financial management offices. This group is working closely to develop the bureau components of the Department's strategic plan and providing the mechanism for the bureaus to coordinate the development of strategic goals and measures.

The BLM has sponsored the Natural Resources Performance Measures Forum that has brought senior planners from BLM, FWS, BIA, NPS, USGS, the Environmental Protection Agency, Department of Agriculture, Department of Defense, Corps of Engineers, National Oceanic Atmospheric Administration, and other agen-

cies together over the last year to share plans and discuss goals and performance measures for common issues. This group has been successful in establishing the dialogue needed for agency plans to be more complementary.

Question. What mechanism is in place to review the multiple plans submitted to the Department by the bureaus?

Answer. The Office of Planning and Performance Management, which reports to the Assistant Secretary—Policy, Management and Budget, is responsible for coordinating the review of all the bureaus plans. Bureau plans are forwarded to key Departmental Offices for agreement with policy, legal, and budgetary issues.

Question. How will different measures of common goals be managed?

Answer. The Department of the Interior deals with many complicated issues in the management and preservation of the Nation's public lands. The Department has a diverse set of missions and program responsibilities that inherently are "in tension" with each other.

Each bureau is developing a plan with goals that support its legislated mission. While several bureaus have land management responsibilities, in most cases the legislation requires different land uses with different outcomes. For example BLM is required to manage lands for multiple use including consumptive as well as recreational uses while NPS legislation directs the agency to preserve the natural and historic resources of the land and provide for the public's enjoyment of those lands in perpetuity. Because of these fundamental differences, each bureau has developed goals and measures that allow the organization to measure performance and manage their organizations to fulfill their legislated mission.

Question. Do you anticipate common vocabulary among the land managing agencies in terms of defining goals and measuring progress?

Answer. The Natural Resources Performance Measures Forum sponsored by BLM has worked extensively on these issues and progress has been made but much remains to be done. The forum has worked to define "recreational opportunities" and the "health of the land" but there is no consensus for measurement across the Government. Resolving this and related cross agency issues are anticipated to be one of the challenges that will be addressed as future iterations of strategic plans are developed.

GRAND STAIRCASE-ESCALANTE NATIONAL MONUMENT

The President created the Grand Staircase-Escalante National Monument in September 1996, and BLM has been charged with planning and operating the Monument. The BLM has begun an estimated three-year planning process.

Question. Please describe efforts to coordinate facilities, tourism, and visitation issues with other recreational facilities in the vicinity of the Grand Staircase-Escalante National Monument area. These other recreational facilities include Utah State Parks, as well as Forest Service and NPS units.

Answer. The Monument planning team has taken a number of steps to ensure full coordination with other recreation facilities near the Grand Staircase-Escalante National Monument. The Monument planning team includes five members nominated by the Governor of Utah, who was invited to do so by the Secretary. These members have a thorough knowledge of local development issues, including tourism. They include a community planner from the Five County Associations of Governments, an employee of the State Parks Division, and an employee of the Wildlife Resources Division. The planning team has also been in frequent contact with representatives from Bryce Canyon National Park, Capitol Reef National Park, Glen Canyon National Recreation Area, Dixie National Forest, and Kodachrome Basin State Park. The BLM will continue to work closely with these representatives during the planning process. The planning team also includes two experienced BLM recreation planners who will be coordinating with local tourism and recreation interests.

Through the agreements with Kane and Garfield Counties, BLM has already taken steps to ensure that the planning team will be kept fully abreast of important local information, including:

- Socioeconomic information, including population trends and data;
- Opportunities to create and maintain sustainable community economies;
- Infrastructure;
- Public safety needs including law enforcement, search and rescue, and aid to visitors in the Monument; and
- In the case of Kane County, an updated county plan.

Question. Please describe efforts to involve the local communities in the planning efforts for the Monument.

Answer. The BLM has established a variety of formal and informal mechanisms to ensure that the planning team works closely with local communities and govern-

ments during the planning process. Monument manager Jerry Meredith, who served formerly as Cedar City District Manager, has brought to the planning team extensive experience in working with the local communities and governments. He has met with all the mayors of communities near the Monument, with the exception of Big Water. Monument staff participate in regular meetings with each county, as well as in meetings of the Southern Utah Planning Advisory Council. The planning team has a formal working relationship with the Community and Economic Strategic Planning Committee, which is appointed by the Governor. As noted earlier, the Secretary invited the Governor of Utah to provide five members for the planning team. Among the five full time members nominated by the Governor and agreed to by the Secretary is a community planner from the Five County Association of Governments who has considerable background and familiarity with local needs and concerns regarding the Monument.

The BLM has also acknowledged the important role of communities and local governments in the planning process by providing them with financial assistance. In the fall of 1996, BLM offered to extend cooperative agreements with both Kane and Garfield Counties to help them participate in the planning process. Although Garfield County initially declined the offer, both counties have since joined BLM in signing cooperative agreements which will be used to facilitate the counties' participation in the Monument planning process.

The BLM is also a participant, on an ex-officio basis, on the State of Utah's Community and Economic Development Strategy Team. The team, made up of representatives of local towns, counties, civic organizations, and business groups appointed by Governor Leavitt, has been charged with the development of a strategic plan for lands adjacent to the Monument as well as looking at other Monument-related issues that directly affect surrounding communities.

The NPS is currently working with four "gateway" communities near national park sites to develop planning documents and guidelines for development.

Question. Will the lessons learned from that experience be of value to BLM during its planning for the Grand Staircase-Escalante National Monument?

Answer. The BLM understands that in planning for the Monument, the planning team must build on its own experience, as well as that of other agencies, including NPS and the Forest Service. Shortly after the designation, BLM contacted Warren Brown, Program Manager for Park Planning and Special Studies of NPS, to determine what information could be learned from NPS park and Monument planning efforts. In addition, BLM has consulted with individuals from the Great Basin National Park, Golden Gate National Resource Area, Crater Lake National Park, Mojave National Preserve, Columbia River Gorge National Scenic Area, Mt. Saint Helens National Volcanic Park, and the El Malpais National Conservation Area. These areas were all designated relatively recently. The BLM will continue to consult with these individuals throughout the planning process to take advantage of their knowledge and experience, particularly with regard to gateway communities.

Question. Please describe opportunities for employment of local residents.

Answer. The BLM anticipates that the Monument will stimulate long-term, sustainable employment opportunities, particularly within the communities adjacent to the Monument. The area has already seen an increase in the demand for visitor services and information, as well as a need to address concerns over public safety. The BLM also anticipates that the Monument plan will provide for infrastructure improvements at campgrounds and day use areas, which in turn will be tied to job opportunities for local residents. Public interest and support for the Monument is already apparent. In May, 1997, the Escalante Visitor Center reported 4,000 visitors, twice the previous monthly high of 2,000. The number of visitors to the Monument itself is estimated to be much higher still. These visitors will provide economic benefits for restaurants, motels, gas stations, and other recreation-related businesses. Moreover, while it is difficult to assess long-term growth in employment opportunities outside the Monument's boundaries, BLM expects that the Kane and Garfield counties' success in attracting new and more diverse businesses will only be heightened by visitor interest in the Monument.

VANISHING TREASURES INITIATIVE

For fiscal year 1998, NPS has proposed a new 10-year, 41-park initiative in the arid west to bring historic and prehistoric structures maintenance from emergency repairs resulting from deteriorating conditions to a stabilized condition that will allow maintenance and preservation on a routine basis. The fiscal year 1998 request for the "Vanishing Treasures" initiative is \$3.5 million and involves physical restoration as well as 18 new FTEs and associated training. The FTE proposed essentially doubles the number of personnel now occupying positions of similar respon-

sibility, and begins the growth curve in personnel currently identified as necessary to carry out the 10-year initiative.

Question. Given the large investment in attracting and training skilled preservation maintenance workers and archeological and cultural resource preservation personnel, and given the fact that many other Federally-managed arid lands in the west have similar resources, do you anticipate that other land managing agencies will look to NPS to provide FTE and technological resources for stabilization of their resources?

Answer. The NPS acknowledges its responsibility under the National Historic Preservation Act and other authorities to provide training, technical information, and other assistance to other Federal agencies in preserving prehistoric and historic places under their jurisdiction or control. However, the Vanishing Treasures proposal described in the budget request has been calculated in terms of expertise and work needed in 41 parks in the arid west. The requested dollars and FTE were not calculated to enable NPS to provide money or FTE to do work on other Federal lands. It is possible, however, that other agencies and parties such as owners of certain types of National Historic Landmarks could participate in Vanishing Treasures-sponsored training and could benefit significantly thereby.

Question. Are there similar resources on BLM, FWS, and Bureau of Reclamation lands that might also need protection?

Answer. Most extensive tracts of Federal lands, including lands managed by other Federal agencies in the arid west contain prehistoric and historic ruins of varying degrees of significance, preservation, and preservability.

Question. What about on BIA lands?

Answer. The above answer applies to resources on BIA lands as well as to those on BLM, FWS, and BOR lands.

Question. Are there plans for technical assistance to the BIA?

Answer. Presently, there are no plans for such technical assistance, but should BIA request NPS assistance, NPS would do its best to help.

Question. Are there similar assemblages of sites or artifacts elsewhere in the U.S. that could be protected through similar initiatives?

Answer. One could group historic and prehistoric resources into categories and describe their needs in that way. The problems of preserving ruins in the arid west are so similar from one park to another, and the specific needs so acute, that the Vanishing Treasures parks make up an obvious grouping within which to solve their problems. The Vanishing Treasures initiative is only part of the larger \$6.5 million request for increased cultural resource management, and other elements of the request are proposed to assist other sites in the United States.

INFRASTRUCTURE

Roads maintenance

A 1997 joint reinvention study between BLM and the Forest Service identified savings of up to 20 percent in the efficiency and amount of road maintenance that could be accomplished through sharing equipment and improving coordination between among the agencies.

Question. Are the recommendations in this study being implemented?

Answer. Yes, many of the recommendations in the report are being implemented. All States are evaluating their heavy equipment needs and equipment for opportunities for cost saving through increased utilization and partnering with the Forest Service. The BLM Washington/Oregon State Office is currently piloting interagency crews. Several local agreements are being pursued in many western States. The BLM and Forest Service are in the final steps of establishing a national level Interagency Agreement which can be used by local offices to streamline coordination and resource sharing.

Question. Are there lessons learned that can be applied to cooperative work with other agencies?

Answer. Yes, BLM and the Forest Service are leading the way in working together to better service the general public and commodity users in transportation management. Because the missions of these two agencies are closely aligned, there are more opportunities for cost saving and improved efficiencies between BLM and the Forest Service. However, opportunities exist with FWS, NPS, BIA, and other Federal, State, and local land managing agencies. The national agreements will become models for other agencies to follow.

FEDERAL LANDS PROGRAM

Since the 1982 authorization of the Highway Trust Fund, almost \$1.1 billion has gone to NPS through the Federal Lands Highway Program and the Park Roads and Parkway Program. In order to bring the roads and related facilities to a condition in which the parks would be able to maintain that infrastructure through annual operations funding, FHWA and NPS analyzed data which indicate a \$2.2 billion backlog of necessary projects.

Question. How does NPS propose to address these necessary projects?

Answer. There are some 8,000 miles of public park roads and more than 1,250 bridges under the jurisdiction of NPS serving units of the National Park System. About 60 percent of these roads are paved. The current condition ratings of paved park roads are 38 percent "good"; 22 percent "fair"; and 40 percent "poor/failed". Of the more than 1,250 bridges in the National Park System, 35 percent are deficient. At the currently authorized Federal Lands Highway Program level of \$84 million, FHWA engineering analyses indicate that an additional one percent of park roads will continue to deteriorate to a "poor" or "failed" condition each year. Based on FHWA estimates, approximately \$120–125 million annually is needed to reverse this rate of deterioration. In line with that estimate, the Administration is requesting a total of \$161 million beginning in fiscal year 1998 under the Federal Lands Highway Program, subject to Congressional reauthorization of the program, which will be utilized to address National Park Service Road and Transportation needs as follows:

- \$120–125 million annually to prevent further deterioration of the paved park road and parkway infrastructure to "poor" or "failed" condition;
- \$25–35 million annually to complete construction of Congressionally authorized parkway projects; and
- \$5–15 million annually to implement alternative transportation systems in selected parks.

Question. Is there a priority list of projects?

Answer. Yes, NPS maintains and periodically updates a Servicewide priority listing of needed road and bridge projects.

Question. Do immediate safety concerns take precedence over planned projects?

Answer. Yes, and dependent upon the availability of funds, such problems are addressed as soon as possible.

Speed limits on roads which run through NPS sites has been the subject of much debate recently. There has been public concern over the number and severity of accidents which have occurred on the George Washington Memorial Parkway in Virginia. Excessive speed has been cited as the cause of most of the accidents. In Organ Pipe Cactus National Monument in Arizona the speed limit has recently been raised to 65 miles per hour—far above the 45 mph set in regulations for most of the NPS roads.

Question. How does NPS plan to deal with the issue of roads serving dual purposes, visitors and through travelers?

Answer. The problems associated with park road serving dual purposes presents an ongoing challenge to park managers. In response to several highly publicized accidents on the George Washington Memorial Parkway, park management there has added additional Park Police patrols to enforce posted limits, and is using two mobile, radar speed indicator display signs to slow down traffic. Also, NPS recently began installing additional median guardrails to lessen the potential for head-on collisions on the parkway north of Spout Run in Virginia.

The roadway through Organ Pipe Cactus in Arizona is a locally administered highway with the speed limit set by local authorities. Park management there has been engaged in negotiations with the State officials in an attempt to get the speed limit lowered, and NPS is on record in opposition to their recent decision to raise the speed limit.

With respect to the general issue of park roads, NPS, in cooperation with the Federal Highway Administration, is currently developing various management systems and investment strategies to influence future park road program focus. Factored into this strategy as a key component is the need to address the through travel issues, growing congestion, and associated resource concerns that have become increasingly serious problems in national parks.

Where appropriate, alternative transportation modes are being considered to help handle the rapidly growing traffic demands and to reduce the resource impacts associated with increasing numbers of visitors and motor vehicles. A study on alternative transportation in parklands was submitted to Congress in 1994. Also, a Presidential memorandum dated April 22, 1996, directed the Secretary of the Interior, in consultation with the Secretary of Transportation, to enhance access to, and mo-

bility within, our parks. In line with this, NPS has initiated a multi-year program of planning efforts for alternative transportation systems, which is now well underway in Yosemite, Yellowstone, Denali, Zion, and Grand Canyon National Parks. Additional transportation planning efforts have also been initiated at Acadia, Crater Lake, Sequoia, Mount Rainier, Indiana Dunes, the Presidio, and Bandelier.

Question. Is there likely to be an increase in construction and upgrading of the roads in response to more traffic and higher speeds?

Answer. In response to more traffic, NPS intends to look primarily at various alternate transportation modes. In line with this, and in response to many years of funding shortfalls, and to maximize use of limited fiscal resources, NPS, in cooperation with FHWA, is currently developing enhanced investment strategies using various management systems to influence future program focus. Factored into this strategy as a key component is the need to address the congestion and associated resource concerns that have become an increasingly serious problem in national parks.

In terms of increased speeds, NPS continues its law enforcement presence in order to ensure the safety of the roadway. Unfortunately, NPS law enforcement personnel can not be in all places at all times, so there are accidents that result from excessive high rates of speed.

Question. How would priorities be set for projects of this type?

Answer. A study on alternative transportation in parklands was submitted to Congress in 1994. A Presidential memorandum dated April 22, 1996, directed the Secretary of the Interior, in consultation with the Secretary of Transportation, to enhance access to, and mobility in, our Nation's parks. It is estimated that \$5-15 million annually is needed to initiate a multi-year program of planning efforts and projects for alternative transportation systems in selected parks.

MAPPING PROJECT

In fiscal year 1998 the USGS proposes to establish a mapping and modeling database over a three-year period using Landsat data and mapping technologies to track population growth and land development.

Question. Which cities have been selected for this program?

Answer. The four metropolitan areas proposed are Chicago, New York City, Philadelphia, and Portland, OR.

Question. Are these areas of ecological concern or where HCPs are under development?

Answer. The four cities were selected from the American Farmland Trust (NFT) list of high priority cities where urbanization threatens agricultural land. Further refinement of the list was done by examining cities where there was concern for impacts on ecological diversity in very different ecological regions. Specific city selections had additional regional criteria as well. Philadelphia and New York were then identified as major urban areas that would continue the work started in the Washington/Baltimore area, thus expanding into major portions of the Eastern Corridor and the Eastern Megalopolis. Chicago was identified as a critical mid-western city that met the NFT and ecological criteria. Portland, Oregon was selected because the effect of different land use planning models being used in Washington and Oregon can be compared in subsequent research. It met the other NFT and ecological criteria as well. All cities were chosen to meet multiple criteria important for geographic research.

QUESTIONS SUBMITTED BY SENATOR TED STEVENS

BROOKS RIVER, KATMAI NATIONAL PARK ACCESS ISSUE

The National Park Service (NPS) has prepared a final Environmental Impact Statement (EIS) and Record of Decision which would establish a management plan for the Brooks River area in Katmai National Park. The plan's intent is to regulate day users in order to lessen stress on bears. However, NPS picked the most expensive alternative, which requires moving Brooks Camp to the other side of the River, rather than building bear viewing boardwalks in the heavily used areas. I am advised that moving Brooks Camp may require a \$9 million appropriation. In addition to adopting a plan that would require high funding, the plan would also regulate day use through caps and include overnight guests and anglers in these caps. Very recently, it has been reported that NPS is enforcing these caps through requiring registration of people taking flights to the Brooks River area.

Management could occur through a system of boardwalks to contain heavier day uses to the bear using areas and vicinity, while allowing a greater number of people to enjoy their country's park system and reducing costs substantially.

Question. Under what authority has NPS adopted the policy of requiring registration of users going to the Brooks River area?

Answer. Under the fee demonstration program that was authorized by the Omnibus Consolidated Rescissions and Appropriations Act of 1996 (P. L. 104-134).

Question. What steps are involved in the registration process?

Answer. Advance reservations can be made by calling Destinet, who is handling reservations for Katmai under the NPS reservation contract. The visitor or commercial operator can also pay the user fee and check in upon arrival at Brooks Camp if they prefer. For 1997, there is no cap on the number of people using the area.

Question. Is registration provided through travel agencies for groups of tourists from outside Alaska?

Answer. Yes, travel agencies have been advised that Destinet will make group reservations through them if they want. For example, Alaska World Tours, one of the biggest travel agencies in Alaska, is up-to-date on the reservations system and is utilizing it. If a client of a travel agency does not use Destinet's service, they are still able to pay their fee upon arrival.

Question. Have the access needs and use patterns of Alaskans been considered in establishing registration procedures?

Answer. Yes; the development concept plan examined the following areas in establishing the reservation system: historic day use patterns at Brooks Camp, Limits of Acceptable Change (defining when visitor impacts have reached unacceptable limits for the visitor—the Limits of Acceptable Change study indicated that increasing visitor numbers were having a negative impact on the quality of the visitor experience), numbers of bear/human interactions per year, and local visitor use of the Brooks Camp area. Special allowances have been made for the local private visitors from the villages near Katmai.

Question. Is NPS intending to restrict visitor access to the Brooks River Area in any manner this summer?

Answer. No, NPS does not intend to restrict access to the Brooks River area this summer.

Question. If so, how have affected Alaskan interests, e.g., concessionaires, the State of Alaska, pilots, and anglers, been notified?

Answer. Even though no day use restrictions are in place for 1997, NPS has been working with affected Alaska interests to gather input and provide adequate advance notice of the 1998 day use regulations. The results of over eight years of meetings, drafts, and input were included in the development concept plan. In addition, four meetings for commercial operators were conducted in May and June of 1997: one in Homer, two in Anchorage, and one in King Salmon. The goal was to get input from the operators regarding implementation of the day use limit and reservation system for 1998.

Question. Why is NPS willing to spend \$9 million on tearing down one facility and moving it a relatively short distance away without first trying a more extensive boardwalk system to handle the bear viewing day users?

Answer. The issue and the development concept plan focuses on other issues than visitor use. Brooks Camp is on top of a major archaeological site which is a national historic landmark and listed on the National Register of Historic Places. This site contains human burials, subterranean dwellings, and significant ethnographic resources for Native Alaskans. The NPS wants to be sensitive to this important cultural resource. Operation and maintenance of NPS and concessionaire facilities continues to cause resource degradation of these cultural sites. In addition, the campground is located in a major bear travel zone, which impacts visitor safety. The new site does not include critical bear habitat or potentially significant archaeological sites. The current location would not have been selected had there been awareness of the cultural sensitivity of the area. Additionally, there is considerable cost associated with maintaining the aging infrastructure and protecting the archaeology in the current location.

Question. Why would visitor caps include persons not there for bear viewing?

Answer. The visitor cap was established based on day use patterns and statistics gathered over the last several years. These statistics represented all day users to the area and were not separated according to type of use such as fishing, bear viewing, or photography. The average daily high for day use at Brooks Camp is about 110. However, due to inclement weather, some days reached peaks of 170 users which negatively impacted the visitor experience. All visitors to the area impact the visitor experience and the resources as identified in the Limits of Acceptable Change study portion of the development concept plan. The Brooks River corridor is less

than 200 acres of land, and all park visitors, whether or not they are there for bear viewing, congregate in this small area.

KANTISHNA MINING CLAIMS

When the Kantishna mining district was added to Denali National Park in 1980, the local miners received assurances that mining could continue. Just a few years later, environmental groups sued and the court imposed an injunction on mining until an EIS could be completed. Because it took NPS four years to complete the study, many miners went bankrupt while they were prohibited from mining.

This Subcommittee met in Alaska with the Kantishna miners in 1989. Because NPS refused to approve a single plan of operation allowing mining to continue, in fairness to the miners, I agreed to a buy-out plan to acquire the mining claims so the miners could get on with their lives.

The U.S. Geological Survey (USGS) estimated that one family's claim, the Wieler brothers, was worth \$4 million. Yet NPS appraised it at \$200,000. Because \$400,000 of reclamation work needed to be done, NPS said the family would have to PAY the Government \$200,000 to sell its claim.

It has now been nine years since this Subcommittee met with the Kantishna miners in Denali, but many of the claims are still unresolved. Over the past several months, my staff has met with your budget director, the NPS regional director in Alaska, your personal representative in Alaska, others on your staff, and anyone else who would listen about this case.

On May 16 my staff was told that the case was just too complicated and no one knew what to do because the brothers were in bankruptcy. If your lawyers can't come up with a solution under existing law, I urge you to ask them to draft legislation that will resolve this matter.

Question. Would you be willing to submit a recommendation to the Committee by July 1 which includes a fair appraisal process, so we may consider it in the fiscal year 1998 Interior bill?

Answer. To the extent possible, the Department is interested in resolving the impasse that has been reached in our efforts to come to agreement with the owners of unpatented mining claims in Kantishna regarding the monetary value of their claims. Various ways of resolving this impasse include: (1) paying more than the appraised value of the claims, which is subject to Congressional review and approval; (2) having the courts decide what amounts constitute "just compensation" for these properties through a declaration of taking; and (3) enacting a legislative taking. Attempts to alter the appraisal process are not needed.

For the record, the Department would like to summarize the history of mining claims in Kantishna.

There are currently two bankruptcies in Kantishna. In the case of the Gold King claims, the bankruptcy was filed two years prior to the 1985 court injunction, at a time when plans of operation submitted by Kantishna miners received inadequate regulatory review and routine approval by NPS. This bankruptcy was filed after many years of mounting debts and unpaid creditors. The other bankruptcy was filed several years ago by an individual who had received title to substantial amounts of patented acreage and who showed no recent interest in mining.

Very few miners have submitted plans of operation to mine in Kantishna. Of the plans submitted, most have been so incomplete as to not allow NPS to evaluate them under the provisions of the Mining in the Parks Act. To date, two plans have been approved and one plan has been disapproved.

In 1983, an estimate of value of the Kantishna claims was prepared by DOWL Engineers/Plangraphics, Inc., under contract to the U.S. Bureau of Mines. This report has been reviewed and found to be highly flawed in its methodology and estimates. The purpose of the DOWL report was not an appraised fair market value, and therefore did not follow accepted mineral appraisal standards. The NPS has subsequently contracted with a mineral appraisal firm respected in the mining industry. Using actual market transactions as the basis of their determinations, we believe they have prepared realistic estimates of the fair market value of the claims appraised.

Industry respected environmental firms have surveyed the Kantishna claims for hazardous materials contamination. These firms have also prepared estimates of the costs to cleanup any contamination identified. These estimated cleanup costs are what it would cost for a professional firm to conduct the cleanups under contract. Most contamination on the claims in Kantishna consists of petroleum spills. It is recognized by NPS and the claimants that cleanups could be done by the claimants themselves or by other non-professionals for substantially less than the costs estimated by the environmental firms. Some claimants have now partially remediated

the contamination on their claims, and additional efforts are underway to complete the cleanups. The NPS has reduced the costs of cleanup by paying the owners to remove personal property, including old batteries, barrels of hazardous materials, and other potential contaminants. Additionally, NPS has removed substantial amounts of debris from the entire Kantishna Hills area, further reducing the contamination problems on the mining claims.

The Gold King claims are currently subject to bankruptcy proceedings and pending litigation. The Department does not believe it is possible to legislate a solution to this situation.

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

NATCHEZ NATIONAL HISTORIC PARK

It is my understanding that construction of the new visitor center at the Natchez National Historic Park will be completed during fiscal year 1998.

Question. What additional operating costs will be required to support the National Park Service's (NPS) presence in this new facility?

Answer. The amount that would be needed in fiscal year 1998 for a partial year is \$121,000. The full year amount is \$242,000.

Question. Is this included in the President's Budget?

Answer. The President's Budget contains numerous increases for park operations; however, at the time the budget was submitted to the Congress, this proposal was not included.

Question. What additional staff requirements will exist for this new facility?

Answer. The facility requires two FTEs.

Question. Does the Park have sufficient FTE's to meet this need?

Answer. The NPS has sufficient FTEs to meet this need; however, any FTE requirements are contingent on available funding.

Question. Does the President's Budget include the allocation of these additional staff years?

Answer. The President's Budget would provide two additional FTEs to the park, but for a different purpose.

Question. What funds would be necessary to ensure adequate access by the physically challenged at the Park?

Answer. Natchez National Historical Park has requested a study by National Center for Accessibility at the University of Indiana for a comprehensive Accessibility Plan. Until the study is complete, the amount of necessary funding is unknown.

Question. Does the President's Budget include funds to do so?

Answer. The President's Budget did not include such funding.

Mr. Secretary, I know substantial funds are being spent on some big, expensive, new projects in Florida and California, and I hope our 60 year effort to complete the Natchez Trace Parkway will not be forgotten or delayed in the excitement over these other initiatives.

Question. What are the plans of this Administration for the completion of our historic and scenic Parkway?

Answer. Good progress has been made in completing the Natchez Trace, and the Parkway is complete in the States of Tennessee and Alabama. At the present time, only 12 of 444 miles remain to be completed, about eight miles near Jackson, Mississippi, and about four miles near Natchez, Mississippi. The current construction estimate for completing these two sections is \$62.1 million dollars. The financial scope of Parkway construction has made it difficult to accommodate it as a priority within the normal line item construction program for NPS. We are encouraged by the inclusion of a provision to give priority to completing legislatively mandated roadways such as the Natchez Trace in the Administration's proposed Federal Lands Highway Program section for the ISTEA reauthorization.

There has been substantial interest over the last few years for the development of a trail to run alongside the Natchez Trace Parkway. The legislation which established the Parkway included this trail in its original plans.

Question. What steps has NPS taken to establish this trail, as authorized?

Answer. In 1994, Congress directed NPS to consider the need for a bicycle/mixed use trail within the Parkway's boundary in the Jackson, MS metropolitan area. However, the development of such a trail is conditional if such a trail could be included without significantly increasing the cost of Parkway construction.

In response, NPS prepared and issued a Multi-Use Trail Study in 1996, concluding that a 21 mile multi-use trail could be developed on Parkway lands from near Interstate-20 to a point along Ross Barnett Reservoir. This trail would be separate

from the Parkway motor road and would seek to include provisions for linkages with other bicycle and similar trails that may be developed by the State, surrounding counties, or cities. The NPS identified the time-frame for construction of the multi-use trail as contingent upon appropriations and opportunities for partnerships with local governments, organizations, sponsors, and individuals.

One such collaborative effort is nearing fruition. The NPS has been working since mid-1996 in a formal partnership with the City of Ridgeland, MS to design and construct, at no cost to NPS, the initial two mile segment of the multi-use trail with funding obtained by the City by virtue of an ISTEA grant. The enthusiasm the City of Ridgeland has shown in working with NPS to develop and maintain this segment of the multi-use trail demonstrates the level of involvement and commitment that are decisive in advancing this type of quality outdoor recreational opportunity for residents in the Jackson metropolitan area. The NPS plans to highlight the anticipated accomplishments from this partnership in an effort to stimulate similar local community-Parkway trail project collaboration, especially since this may afford additional ISTEA funding for trail construction pursuant to requests by local government.

The initial two mile segment of the multi-use trail, which is about to be developed, corresponds with a substantial portion of the priority trail segment identified in the NPS 1996 Study. This segment was assigned its priority in order to resolve existing conflicts between heavy motor vehicle traffic and bicyclists sharing the Parkway motor road between Interstate-55 and Old Canton Road.

Question. What studies have been conducted to ascertain whether a detached or attached trail would be most feasible, cost effective, and useful to potential users?

Answer. In 1996, NPS addressed the question of augmenting the standard 22 foot paved width of the Parkway motor road with paved shoulders to accommodate bicycle and other recreational trail uses. The evaluations concluded that paving the roadway shoulders would constitute an inappropriate departure from the Parkway's design integrity and historic landscaped character. However, NPS also evaluated separate options related to a continuous multi-use trail, as well as a segmented multi-use trail. While both of these options are feasible, there are high costs associated with such construction.

In the past, this Subcommittee has endorsed the construction of the trail as part of new parkway construction when feasible.

Question. What construction has taken place in compliance with this report language?

Answer. The NPS has been working to coordinate future construction funding requirements for the Parkway motor road with those for parallel portions of the proposed multi-use trail. The NPS has moved to incorporate the multi-use trail as part of the major unconstructed Parkway motor road bridges being planned for the Interstate-55 to Interstate-20 section of the Parkway by widening these structures to carry the trail adjacent to one side of the Parkway motor road. The portion of the proposed multi-use trail north of Interstate-55 cannot be included in corresponding Parkway motor road construction funding requests since this portion of the Parkway already exists. Separate funding plans would be necessary for this portion of the multi-use trail or the funding could be provided where local governments are willing to act as a sponsor, in collaboration with the NPS, in seeking alternative sources of funding.

FISH AND WILDLIFE SERVICE

Question. In relation to water resource development projects in the Lower Mississippi Valley, please summarize the specific role of the Fish and Wildlife Service (FWS) throughout the planning, coordination, draft proposal, and final proposal stages of the environmental, economic, and engineering documentation prior to project construction. Please list all official responsibilities, and specific authorization or mandates in the law to do so.

Answer. The Fish and Wildlife Coordination Act (FWCA) authorizes FWS to provide assistance to, and cooperate with, Federal, State, and public and private agencies and organizations in development, protection, rearing and stocking of wildlife resources and their habitats. Under the FWCA, Federal agencies that construct, permit or license water resources development projects must consult with FWS regarding impacts to fish and wildlife resources, and to ensure that these resources receive equal consideration.

The FWS is authorized to conduct surveys and investigations to determine possible impacts to fish and wildlife resources and to make recommendations to prevent the loss of, or damage to such wildlife resources. The FWS is currently involved in coordination on over 20 Federal water projects in the lower Mississippi River Valley.

These projects, planned and constructed by the Corps of Engineers, are in various phases of development, ranging from the reconnaissance stage to project construction.

To the extent allowed by Federal construction agencies, FWS participates in the formulation and evaluation of project alternatives. Under the National Environmental Policy Act (NEPA), the lead agency develops an environmental assessment or an environmental impact statement disclosing the project's impacts to environmental resources. The FWS is usually requested to be a cooperating agency in the preparation of the documents. As part of the interagency coordination procedures, the FWS also reviews and comments on all project and NEPA documents.

I am interested in the formal relationship between FWS and the Lower Mississippi River Conservation Committee (LMRCC).

Question. Please outline the formal agreement between the two entities, the mission statement of the LMRCC, and the membership composition. Please provide the Committee with the routine function which FWS performs as a result of the formal arrangement with LMRCC, including a breakdown of any funds utilized from FWS for the operation of the Commission.

Answer. The "History and Proceedings of the First, Second, and Third Annual Meetings of the Lower Mississippi River Conservation Committee" and the Cooperative Agreement between FWS and the LMRCC is provided separately. The FWS provides a full-time coordinator and part-time budget analyst to the LMRCC. The LMRCC is governed by an Executive Committee comprised of one representative from each of the following agencies: Arkansas Department of Pollution Control and Ecology, Arkansas Game and Fish Commission, Kentucky Department of Fish and Wildlife Resources, Louisiana Department of Environmental Quality, Louisiana Department of Wildlife and Fisheries, Missouri Department of Conservation, Missouri Department of Natural Resources, Tennessee Department of Environment and Conservation, and Tennessee Wildlife Resources Agency. The FWS provided \$97,000 to the LMRCC for its operation. An additional \$20,000 was also provided for the one time cost of the "1996 LMRCC/USFWS Fisheries Management Plan Cooperative Agreement".

[CLERK'S NOTE.—Due to its volume, the above mentioned material is being retained in subcommittee files.]

ARE ALL STATES THROUGHOUT THE LOWER MISSISSIPPI RIVER MEMBERS OF LMRCC

It is the Committee's understanding that not all States throughout the Lower Mississippi River are members of LMRCC.

Question. If this is so, could the agency please explain the background and reason on behalf of a lack of participation by any State. Please provide official documentation.

Answer. The States of Arkansas, Kentucky, Louisiana, Missouri, and Tennessee are members of the LMRCC. The Mississippi Department of Wildlife, Fisheries and Parks and the Mississippi Department of Environmental Quality withdrew from the Committee on September 16, 1996. Letters provided to Senator Cochran under separate cover outline the reasons for their withdrawal.

[The letters follow:]

LETTER FROM SAM POLLES

MISSISSIPPI DEPARTMENT OF WILDLIFE,
FISHERIES AND PARKS,
Jackson, MS, January 11, 1996.

Re MDWFP and LMRCC.

Mr. EDWIN CROWELL,
*Chairman, Lower Mississippi River Conservation Committee,
Vicksburg, MS.*

DEAR MR. CROWELL: The Mississippi Department of Wildlife, Fisheries and Parks (MDWFP) thanks you and Mr. Nassar for your visit with us on December 4, 1995, to discuss LMRCC policy and MDWFP's participation and contribution to LMRCC. We support your proposed amendment to LMRCC's constitution by the addition of item 5 requiring unanimous approval of the organization's positions on public works projects within member states. MDWFP appreciates the mutual acknowledgment of the importance and correctness of balancing economic and environmental issues, and we also value the opportunity to preview the newsletter prior to publication for controversial topics in order to allow us and other members a chance to offer views within the newsletter.

Effective upon receipt of this letter, Mr. Gary Lucas, Fisheries Biologist, will not represent MDWFP on the LMRCC executive committee, Fisheries Technical Section, or as Secretary/Treasurer. This is a mutual decision between Mr. Lucas and MDWFP. Mr. Lucas is a valued employee and his abilities are recognized and needed on other assignments. The MDWFP will be represented on the Executive Committee by Mr. Wayne Watts, P.E., Environmental Affairs Director. Mr. Ron Garavelli, Fisheries Director, will represent MDWFP on the Fisheries Technical Section.

We look forward to working with all members of the LMRCC to continue to improve the organization's role as a technical resource for identifying problems and solutions necessary to our environmental and economic well-being. If you have any questions or comments, please do not hesitate to contact us.

Sincerely,

SAM POLLES,
Executive director.

LETTER FROM JAMES I. PALMER, JR., AND SAM POLLES

STATE OF MISSISSIPPI,
DEPARTMENT OF ENVIRONMENTAL QUALITY,
Jackson, MS, January 26, 1996.

Mr. EDWIN F. CROWELL,
Chairman, Lower Mississippi River Conservation Committee,
Vicksburg, MS.

DEAR MR. CROWELL: Subsequent to our meetings with you and Mr. Nassar, we have evaluated the mission of the Lower Mississippi River Conservation Committee (LMRCC) and the State of Mississippi's role in this committee. We believe that the LMRCC can serve an important function as a mechanism for information exchange and cooperation among the states along the river. This would result in more efficient use of funds to protect and improve the fishery resource, conduct monitoring programs, and provide more effective protection of the water quality of the Mississippi River. However, we feel strongly that the LMRCC should not be a policy-forming organization. It would be difficult, if not impossible, for Executive Committee members to vote on policy resolutions regarding issues which their state may have to contend with in the regulatory arena.

Another area of concern we have is the Cooperative Agreement between the U.S. Fish and Wildlife Service and LMRCC which established a full-time coordinator for LMRCC. We suggest that the LMRCC would be better served if the Fish and Wildlife Service would enter into an IPA agreement with a LMRCC member state agency and place the LMRCC coordinator in that agency, thereby making it clearer that the LMRCC is independent of the U.S. Fish and Wildlife Service.

It is our belief that these changes would cause the organization to better serve the interests of all of the member states.

Sincerely,

J.I. PALMER, JR., *Director,*
Department of Environmental Quality.
SAM POLLES, PH.D., *Director,*
Department of Wildlife, Fisheries and Parks.

LETTER FROM JAMES I. PALMER, JR.

STATE OF MISSISSIPPI,
DEPARTMENT OF ENVIRONMENTAL QUALITY,
Jackson, MS, September 16, 1996.

Mr. BENNIE J. FONTENOT, Jr.,
Chairman, Lower Mississippi River Conservation Committee,
Vicksburg, MS.

DEAR MR. FONTENOT: We have delayed writing you in the hope that some additional discussions might be had among the leadership of the Lower Mississippi Conservation Committee to deal with concerns we raised at the beginning of the year regarding the focus and direction of the LMRCC. It appears that no further consideration of our concerns will be forthcoming, so we are writing to express to you our final sentiments in the matter.

First, as we expressed to Ron Nassar when he met with representatives of our two agencies many months ago, the fundamental concept of the LMRCC is sound.

While most of us are so strung out in our efforts to participate in a host of organizations and really do not need others to join, we recognize the reality that occasionally somebody does develop "a better mouse trap," and we should be openminded to such possibilities. As a consortium of specialists in various fisheries and related fields which can then bring these skills to bear in a very focused way in various projects and initiatives throughout the Lower Mississippi region, the LMRCC has promise. Moreover, Ron stated his specific goal of having the LMRCC emerge as a "consensus broker" when particular projects or research efforts hit a snag and contentions arise. This, too, is a worthy ambition. The reality of the matter, however, is that when any group adopts a "policy position" in a contentious matter, the group automatically becomes an advocate for one position or another. This, in turn, generally means that others who do not agree with this particular position are automatically made adversaries to it. Thus, we see little hope for the LMRCC to simultaneously be both an advocate and a consensus broker.

Additionally, the Department of Environmental Quality is responsible for handling Section 401 water quality certifications throughout Mississippi. Contested matters are elevated to our Commission on Environmental Quality for final disposition. Whenever a no-discharge or discharge NTPDES permit is associated with projects these matters must be handled by our Environmental Quality Permit Board, one statutory member of which is a representative of the Department of Wildlife, Fisheries and Parks. Neither the Department of Environmental Quality nor the Department of Wildlife, Fisheries and Parks can participate in an organization which adopts policy resolutions regarding particular projects (thus becoming, as we have said, an advocate) while simultaneously attempting to comply with federal and state "arbitrary and capricious" standards for final administrative decisions. Any policy position we would take would automatically, and probably conclusively, impeach our ultimate regulatory decision in such matters. We simply are not going to run such risks.

Another concern we discussed with Ron personally is the perception that the U.S. Fish and Wildlife Service is "officially" the administrative leader of this effort. We well understand that Ron has been given substantial latitude in committing his time to the LMRCC and that he works hard to develop his role accordingly. However, this will be extremely difficult for him to do as long as he goes to work every day at his traditional U.S. Fish and Wildlife Service duty station and "wears the uniform," as it were. We suggested that both the LMRCC and Ron would be much better served if the Fish and Wildlife Service would enter into an Intergovernmental Personnel Act (IPA) Agreement with the LMRCC so that Ron could be given appropriate "detachment." Unfortunately, we are advised that this particular concern of ours has received no attention.

After we wrote you, the LMRCC Executive Committee considered our first concern at their annual meeting in February, but stopped short of a by-laws revision to remove the policy-forming function earlier embraced by the group. As mentioned, Ron remains in the lurch he has been in from the beginning. We strongly feel that these aspects of LMRCC structure and function are major impediments to its ultimate success and we have determined that our further affiliation with the organization cannot be productive in light of these unresolved concerns.

With reluctance, we request that you remove the names of our respective agencies from your roster of members. If the LMRCC members decide to reshape their by-laws in the future to allow them to become what we believe the organization can truly be without shackling itself as it has, we will be happy to once again discuss with you possible membership.

Sincerely,

J.I. PALMER, JR., *Director,*
Department of Environmental Quality.

SAM POLLES, PH.D., *Director,*
Department of Wildlife, Fisheries and Parks.

Question. The Committee would like to know whether there have been any instances in the past, or if there are opportunities in the future for the agency, or agency personnel through formal arrangement such as the Lower Mississippi River Conservation Committee, to establish a position of advocacy or opposition to other Federal programs or projects which affect the human health, environmental, or general welfare of the people of the Lower Mississippi River Valley region. What safeguards or policies exist within the agency to ensure that third party relationships such as the LMRCC-FWS arrangement does not result in the agency becoming engaged in activities which are otherwise reserved for the National Environmental Policy Act process or the Fish and Wildlife Coordination Act process?

Answer. There have been no instances in the past where FWS has advanced policy through a formal arrangement with an organization such as the LMRCC. The FWS believes that there are no opportunities for such an action to occur in the future. As outlined in the "Resolution on Mississippi River Training Work" which is provided to Senator Cochran under separate cover, the LMRCC did not establish a position of advocacy or opposition to any Federal program or project which affected the human health, environmental, or general welfare of the people of the Lower Mississippi Valley Region. However, the LMRCC did request in its resolution that its members be allowed to provide "early and effective input," as provided by U. S. Army Corps of Engineers policy, into the project design in order that damages to the natural resources at risk could be minimized.

Although FWS is a cooperator in the LMRCC, our participation is not increased in NEPA and FWCA processes. The FWS is not a voting member in the organization's operation. No safeguards or policies are necessary because the FWS, as legislatively authorized, routinely participates in NEPA and FWCA activities.

[The information follows:]

RESOLUTION ON MISSISSIPPI RIVER TRAINING WORK

Whereas, the Mississippi River provides important habitat for a diverse assemblage of river-dependent species that provide important recreational and commercial opportunities; and

Whereas, habitat provided in the river ecosystem is essential for the existence of the federally listed interior least tern (*Sterna antillarum athalassos*) and pallid sturgeon (*Scaphirhynchus albus*); and

Whereas, The U.S. Army Corps of Engineers is charged with responsibilities for providing a navigation channel, flood control, and other river-focused societal benefits that can impact riverine habitat; and

Whereas, river training structures, such as dikes and revetments, that are important in channeling the river into a usable navigation channel can potentially alter flow patterns and impact riverine habitat; and

Whereas, the U.S. Army Corps of Engineers has provided for limited involvement of outside interests, including fish and wildlife interests, in planning for and implementation of their river training efforts; and

Whereas, state fish and wildlife agencies from the states of Arkansas, Kentucky, Louisiana, Mississippi, Missouri, and Tennessee, which are represented on the Lower Mississippi River Conservation Committee, and our federal counterpart, the U.S. Fish and Wildlife Service, need to be actively involved in the planning of river training structures;

Now, therefore, be it resolved that, the Lower Mississippi River Conservation Committee assembled at its annual meeting on January 25, 1995 in Paducah, Kentucky urges the U.S. Army Corps of Engineers Lower Mississippi Valley Division and its St. Louis, Memphis, Vicksburg, and New Orleans District Offices to initiate measures that will provide for early and effective input from the state fish and wildlife agency members of the Lower Mississippi River Conservation Committee and the U.S. Fish and Wildlife Service to assure that consideration of the long-term effects of river training structures on riverine habitat are included in the planning process, that river training structures be designed to retain and enhance riverine habitats, and that the dynamics of the Mississippi River be retained wherever possible.

LMRCC-FWS RELATIONSHIP

Question. In your review of the matter, have there been any instances when the LMRCC-FWS relationship contributed to the perception that the agency was advancing, or participating in the advancement of policy, rather than performing the functions outlined in the joint agreement between LMRCC and FWS?

Answer. The FWS periodically briefs the LMRCC in formal meetings when a request is made. The authority for the FWS to undertake this action is found in the Cooperative Agreement between FWS and the LMRCC. Our review of the guidelines of the Cooperative Agreement indicates that the relationship between FWS and the LMRCC has not fostered the perception that the agency was advancing or participating in the advancement of policy, rather than performing its mandated functions.

Question. The Committee would like to request copies of any official publications, newsletters, correspondence, or other informational pieces which have been developed or distributed by FWS personnel as a result of the FWS agreement with LMRCC. It would be helpful if FWS would provide the Committee with these publications or newsletters since the formation of the LMRCC.

Answer. The requested information is provided under separate cover to Senator Cochran.

[CLERK'S NOTE.—Due to its volume, the above mentioned material is being retained in subcommittee files.]

YAZOO BASIN, MISSISSIPPI

Question. The Committee is aware that FWS has demonstrated a keen interest in the Yazoo Basin, Mississippi projects, including but not limited to the Mississippi River Levee Enlargement Project, the Big Sunflower River Maintenance Project, and the Yazoo Backwater Project. Relative to these projects and the role of FWS in these activities, the Committee would like to submit the following questions.

Answer. Under provisions of FWCA and NEPA, FWS has an interest in all water resource development projects throughout the entire Nation, not just those projects within the Yazoo Basin of Mississippi, that may have damaging effects to fish and wildlife resources. Our Mitigation Policy provides guidance in methods and alternatives to avoid, reduce, minimize, and/or compensate for damages to fish and wildlife resources adversely impacted by Federal projects.

Question. Did a FWS staff person prepare, develop, and/or distribute the white paper relative to the Big Sunflower River Maintenance Project which was entitled, "A Biological Tragedy in the Making: The Big Sunflower River, Mississippi?" If so, what documents and data sources or scientific publications were used to develop this white paper? Was this white paper printed or distributed at the expense of the Federal Government? Further, is there any provision in the Fish and Wildlife Coordination Act or the NEPA process which encourages or discourages this type of information?

Answer. The sources of information for the white paper entitled "A Biological Tragedy in the Making: The Big Sunflower River, Mississippi" were two documents produced by the Corps of Engineers' Waterways Experiment Station. These citations are:

Hoover, J.J., and K.J. Killgore. 1993. Impacts of the Big Sunflower River maintenance project on fishes and fish habitat. Report prepared for U.S. Army Engineer District, Vicksburg. Waterways Experiment Station, Vicksburg, MS.

Miller, A.C. and B.S. Payne. 1993. An analysis of freshwater mussels (Unionidae) in the Big Sunflower River, Mississippi: 1993 studies. Report prepared for U.S. Army Engineer District, Vicksburg. Waterways Experiment Station, Vicksburg, MS.

These documents were provided to the Endangered Species Committee of the American Fisheries Society (AFS) by the FWS Jackson, MS Field Office in response to a general request for information on threats to freshwater mussels in the Southeast. This committee is composed of academia and research scientists, including Federal biologists, from across the Nation. The FWS staff did not prepare or develop the white paper. Other than forwarding copies of the white paper that was received by the Jackson Field Office to others in the FWS for their information, the white paper was not distributed at Government expense.

A primary role of FWS under both NEPA and FWCA is to provide biological review and information to Federal action agencies relative to specific Federal projects and their potential biological impacts. Because of its role in reviewing projects under FWCA and NEPA, FWS is often requested to provide the same or similar information to others, including research organizations, State agencies, nongovernmental organizations, and individuals. As a public agency, FWS feels obligated to respond to all legitimate requests for information by citizens of the United States, and neither NEPA or FWCA discourage this practice.

Question. Has the agency strictly adhered to the policies of interagency coordination relating to the three projects listed above?

Answer. The FWS has provided information about fish and wildlife resources as requested by the action agency, the local sponsor, and other interested parties.

Question. Has the agency initiated meetings, communications, or any actions which affect the three Congressionally-authorized water resources projects mentioned above, without coordinating these activities with the local sponsor and/or the U.S. Army Corps of Engineers? If the answer is yes, please explain the justification for these actions and outline the specific provisions in FWCA and NEPA which support these actions?

Answer. A primary role of FWS under both NEPA and FWCA is to provide biological review and recommendations to Federal action agencies relative to specific Federal projects and their potential biological impacts. Because of this role, FWS is often requested to provide its views to others, including research organizations, State agencies, nongovernmental organizations, and individuals. As a public agency, FWS feels obligated to respond to all public requests for information, and neither

NEPA or FWCA discourage this practice. After extensive coordination with the Corps, FWS provided information on the status and potential impacts of the Mississippi River Levee Enlargement Project to various organizations in Mississippi, Louisiana, and Arkansas, as requested. The FWS coordinated its economic study of the Big Sunflower River Maintenance Project with the local sponsor and the Corps by providing them with copies of the contract and inviting them to meetings with the FWS contractor.

Question. Has the agency coordinated its input and concerns relative to the three projects mentioned above with the local sponsor? When? In what way?

Answer. The FWS has provided the Corps and local sponsor written responses at all stages of the scoping, planning, and construction where our input was requested. Coordination with the Corps and/or the local sponsor has varied depending upon where the project is in regard to planning and/or construction. For example, some work items for the Mississippi River Levee Enlargement projects are currently under construction, while other items are still in the planning stage. The Big Sunflower River Maintenance Project is in the late stages of planning and the Yazoo Backwater Project is in the early stage of planning. Less coordination has occurred between FWS and the local sponsor on the Yazoo Backwater Project because it is in the early planning stage. The FWS and the local sponsor have coordinated on numerous occasions since 1995 concerning the Big Sunflower and the Mississippi River Levee projects. The local sponsor met with the Region 4 Regional Director, in October 1995, to discuss the Big Sunflower River maintenance project. The sponsor also reviewed our letter summarizing the FWS position on the project prior to the finalization of the FWS letter. Many meetings were held between FWS and the Corps where the local sponsors were present, to include the Corps' annual high water and low water trips on the Mississippi River.

Question. Has the agency assisted the local sponsor in identifying, avoiding, or minimizing adverse environmental impacts associated with these three projects mentioned above? Provide the Committee with correspondence, communications, or other records which represent assistance or dialogue between the local sponsor and the agency?

Answer. As directed by the FWCA, FWS has been primarily involved with the Corps in identifying potential avoidance and minimization of impacts to natural resources associated with these water resources projects. The local sponsors participated in many meetings between the Corps and the FWS.

[CLERK'S NOTE.—Due to its volume, the above mentioned material is being retained in subcommittee files.]

ALTERNATIVE TO CONGRESSIONALLY-AUTHORIZED PROJECTS

Question. Has the agency ever offered an alternative to the Congressionally-authorized projects which would require additional authorizations or in any way alter the existing Federal responsibility for the construction or maintenance of the three projects listed above?

Answer. The FWS has the responsibility to investigate all flood damage alternatives in cooperation with the Federal construction agency. The FWS offered a nonstructural alternative to dredging of the Big Sunflower River. It is unclear to FWS whether or not nonstructural features for the Big Sunflower River Maintenance project would require additional authorization. The FWS is developing an essentially nonstructural alternative for flood damage control in the Yazoo Backwater project. This alternative plan has not been completed, therefore, whether further Congressional authorization is needed is not known.

It is my understanding that FWS has commissioned an economic analysis of the U.S. Army Corps of Engineers project entitled the Big Sunflower River Maintenance Project.

Question. Under what authority was this study commissioned?

Answer. The FWS has the authority and responsibility under FWCA and the Fish and Wildlife Act of 1956 to address the impacts of Federal water development projects on fish and wildlife resources. The FWS staff has worked diligently with the Corps to avoid the impacts resulting from the proposed Big Sunflower River Maintenance Project. The viability of nonstructural alternatives that would reduce flood damages while protecting fish and wildlife resources is important to the FWS. For that reason, FWS decided to conduct a more in-depth investigation of economics of this nonstructural alternative. The results could be used in the review and analysis of future flood management projects to develop environmentally and economically sound projects.

Question. From what appropriated account will this project be funded?

Answer. Economic analyses are funded through appropriations made to the Resource Management account, under the General Administration activity.

Question. Why does FWS commission economic analyses? Is this not the charge of the Corps of Engineers? Why is the Corps of Engineers analysis inadequate?

Answer. The FWS commissioned this economic study for two reasons. First, we have a national interest in exploring the methods used to determine the value of property in less-than-fee acquisition situations. With increasing public interest in private property rights, we are investigating the feasibility of alternatives which could safeguard private property rights and meet conservation needs. Since there are numerous applications of less-than-fee acquisition methodology, FWS is interested in evaluating these methods to determine minimum, but equitable, costs for purchasing individual property rights. This information has application for protecting endangered species on private lands, migratory bird program enhancements, and refuge land acquisition. The Big Sunflower River Maintenance project is a good case study of this issue. Second, FWS supported a nonstructural method of flood damage reduction which would reduce damages while protecting fish and wildlife resources. Therefore, FWS decided to conduct a more in-depth investigation of its economics for use in evaluating future flood management projects.

Question. Was the economic analysis conducted by the Corps done in a manner which was different than the analysis performed on the Tallahatchie River Maintenance Project? If not, why did FWS not perform an economic analysis of that project?

Answer. In working toward conservation of fish and wildlife and other natural resources, FWS investigates any aspect of a water development project, including economics. The FWS concentrates its efforts on those projects where significant resources are at risk. This was not the case in the Tallahatchie River, and FWS did not object to the Tallahatchie River Maintenance project. Consequently, FWS did not closely examine the Corps' economic analysis of that project. The natural resources of the Big Sunflower River are more valuable, which warrants a closer examination of the viability of any alternative, such as the nonstructural alternative, which would provide a high degree of protection for those natural resources.

Question. Does FWS have sufficient information at its disposal to assess duck populations and study the impacts of changes in hunting season frameworks? What additional funds would be necessary, and for what purpose, to meet these unmet needs, if any exist?

Answer. The FWS predicts about a 25-percent increase in duck harvest in those States extending season dates seven to ten days longer than currently allowed. However, this prediction is based on experience in only two States—Iowa (1979–87, 1994–95) and Mississippi (1979–84). A more definitive assessment of harvest impact would require a large-scale regulatory experiment with adequate replication, experimental controls and randomization of treatments. Of more concern than adequate funding, is the question of whether a scientifically valid evaluation would be acceptable to the States, since about half of the States interested in framework extensions would have to agree to serve as experimental controls (i.e., no framework extensions) each year of the study. Moreover, there is a six to ten year timeframe for an adequate study and there could be no guarantee that the final results would support the use of framework extensions. Historically, it has been very hard to get broad-based agreement on an evaluation plan under these conditions.

The Migratory Bird Treaty Act states that the open season on migratory birds is from September 1 to March 10. The Treaty also states that the Secretary of the Interior shall give due regard to “temperate zones” and “times and lines of migratory flight” in setting seasons.

Question. Given this directive in the law, will a January 31 closure, as recommended by the Lower Region Regulations Committee of the Mississippi Flyway Council, be listed for comment in the Federal Register? If not, why not?

Answer. In the most recent *Federal Register*, FWS published the recommendations of the Mississippi and Central Flyways to extend framework dates beyond those currently used. The FWS also published a summary of all public comment received to date on the issue of framework dates. The FWS is not proposing to alter framework dates for the 1997–1998 season and is requesting further input from the Flyway Councils, States, and the public on a number of specific issues, such as potential for negative physiological impacts, possible changes in the size of the harvest, and reallocation of hunting opportunity within and among flyways. Comments will be accepted until June 27, 1997 and the final decision for the 1997–1998 hunting season will be published on or about July 15, 1997.

The Administration's Budget proposes an increase of \$1.8 million, or 12 percent, for the migratory bird management program to augment the FWS conservation and monitoring efforts for wild birds.

Question. For what purpose will these additional funds be used? Please be specific, using FTEs and object classifications as appropriate.

Answer. The President has proposed an increase of \$1.5 million for the FWS migratory bird management program, specifically to enhance conservation and monitoring efforts for migratory birds at a region, national, and international scale. Of critical importance is monitoring and assessing the status of migratory bird populations to provide opportunities for recreational pursuits, such as bird-watching or hunting, and to ensure that significant declines in species are identified and reversed before reaching the status of threatened or endangered. A breakdown of this proposed funding initiative into specific project categories is as follows:

Species of Management Concern (+\$600,000): This increase would be used by FWS to focus on the highest priority monitoring and conservation actions. The FWS has primary responsibility for migratory nongame birds, and successful conservation of these species depends on reliable information on population status and trends.

Goose Monitoring and Assessment (+\$500,000): This increase would be used, in conjunction with ongoing Flyway efforts, to shift additional emphasis for goose management activities to key arctic and subarctic breeding areas, where information on status, habitat trends, and annual productivity has become increasingly important.

Webless Species Monitoring and Assessment (+\$150,000): The additional funds will be used, in conjunction with other initiatives such as the recently-created Webless Migratory Game Bird Research Program, to develop more reliable monitoring programs for various webless game bird species, and provide a better understanding of population dynamics and the role of different factors that influence population demographics and distribution.

Sea Ducks, Mottled Ducks, and Whistling Ducks Monitoring and Assessment (+\$80,000): This increase would improve estimates of population status and production through aerial and ground surveys of sea duck distribution and abundance, particularly in key breeding areas in arctic and subarctic regions of Alaska and northern Canada, and in migration and wintering areas along the Atlantic and Pacific coasts. This would also enable increased monitoring capabilities for mottled and whistling ducks on important nesting areas along the Gulf Coast.

Harvest Information Program (+\$170,000): This increase will help FWS to share ongoing Harvest Information program costs with the States in documenting the names and addresses of all licensed migratory bird hunters that are collected by the States, thus assuring the development of a more reliable and effective sampling frame for this critical survey.

Waterfowl populations have made a significant recovery during the past several years, and this Administration has been quick to claim credit for this occurring. Favorable weather conditions and additional habitat in breeding, migration, and wintering areas have had a very positive impact on waterfowl populations. It is my understanding that because of these advances, seven of the 10 principal species of waterfowl surveyed are now above the goals specified in the North American Waterfowl Management Plan.

On May 17, 1991, I received a letter from Thomas Dwyer, then the Chief of the Office of Migratory Bird Management, in response to a letter I submitted on behalf of a constituent concerning framework dates. Mr. Dwyer said the closing dates were advanced “* * * in response to severe drought conditions on important duck breeding areas and low populations of most species.”

Question. Now that these adverse conditions have subsided, please explain what conditions exist which would prevent a January 31 closing date.

Answer. After a period of generally liberal hunting regulations during the 1970s and early 1980s, opening and closing framework dates (as well as season length and bag limit) were restricted during 1985–1993 due to declining duck populations. In 1992, framework dates were returned to roughly October 1 to January 20, which generally were those used prior to the restrictions. The FWS notes, however, that Mississippi had an experimental closing date of January 31 during 1979–84. The FWS believes that the question of appropriate framework dates now or in the future should not be predicated on current duck population status. Rather FWS has been working cooperatively with the Flyway Councils to develop an acceptable set of regulatory alternatives (i.e., specific combinations of season lengths, bag limits, and framework dates) and specific guidelines for their use (i.e., the process of adaptive harvest management). As with potential changes in season length and bag limit, changes to framework dates must be approached in a methodical and comprehensive manner, and with due consideration of both biological and sociological impacts. The FWS is not yet satisfied that all partners have had the opportunity to provide comments or are in agreement about the appropriate specification of framework dates.

It is my understanding, through a letter from Acting Director John Rogers on August 2, 1996, that FWS, Flyway Councils, and States, that a comprehensive review

of the regulatory alternatives has been conducted in preparation for the 1997 hunting season.

Question. Please provide for the Committee a copy of this study, including the names of those involved in this review.

Answer. Copies of the following are provided for the Committee: (1) a joint recommendation of all four Flyway Councils regarding development of regulatory alternative for ducks; (2) results of a mail survey of Flyway Council members regarding their opinions of duck hunting regulations; (3) a report from the adaptive-harvest-management technical working group, providing its recommendations for regulatory alternatives for ducks; and (4) a list of members of the technical working group.

[CLERK'S NOTE.—Due to its volume, the above mentioned material is being retained in subcommittee files.]

HARVEST RATES OF DUCKS

Question. Can the harvest rates of ducks accurately be measured? How?

Answer. The annual harvests of ducks can be measured reliably through the FWS mail questionnaire and parts collection surveys. A sample of about 35,000 questionnaires each year provide an estimate of total duck harvest and about 100,000 wings sent in by hunters permit the harvest to be apportioned among species. The harvest rate, or that proportion of the fall-flight taken by hunters, can be estimated accurately only for mallards. The estimate of harvest rate is based on: (1) the proportion of banded birds shot and reported by hunters; and (2) the likelihood that a band encounter will be reported (referred to as the band-reporting rate). The band-reporting rate traditionally has been low (about 30 percent) and a program is underway to increase the rate. Because the band-reporting rate currently is changing, estimation of mallard harvest rates has become less reliable. A new study of band-reporting rates is planned for 1999 or 2000, after which reliable estimates of harvest rate again will be available.

Question. Are there scientific articles which have been published which would corroborate not allowing a January 31 closure date, particularly at current population levels?

Answer. Yes, there are several scientific publications which imply that the late-winter period may be critical to subsequent reproduction and survival by ducks and that delays in pair formation or disruption of pair bonds during this period could affect future reproduction. However, it is not clear how disruptive hunting in late-January would be to ducks. Publications which demonstrate the importance of pairing to ducks include:

Heitmeyer, M. E. 1985. Wintering strategies of female mallards related to dynamics of lowland hardwood wetlands in the Upper Mississippi Delta. Ph.D. dissertation, University of Missouri, Columbia.

—Hepp, G. R., and J. D. Hair. 1984. Dominance in wintering waterfowl (Anatini): effects on distribution of sexes. *Condor* 86:251–257.

—Paulus, S. L. 1983. Dominance relations, resource use, and pairing chronology of gadwalls in winter. *Auk* 100:947–952.

—Paulus, S. L. 1984. Activity budgets of nonbreeding gadwalls in Louisiana. *Junior Wildlife Management* 48:371–380.

Question. Please provide a copy of the FWS Adaptive Harvest Management policy, including statistical formulas.

Answer. Copies of the following are provided for the Committee: (1) its adaptive harvest management policy for the most recent hunting season; (2) a peer-reviewed article from a scientific journal that provides the complete mathematical and statistical description of adaptive harvest management for mallards; and (3) a journal article that provides a more general description of adaptive harvest management.

[CLERK'S NOTE.—Due to its volume, the above mentioned material is being retained in subcommittee files.]

MAXIMIZE OPPORTUNITY BETWEEN AND WITHIN FLYWAYS

Question. If regulatory options can be adapted to maximize opportunity between flyways, why can't they be adapted to maximize opportunity within a flyway?

Answer. Adaptive harvest management maximizes total harvest, while maintaining duck populations at or above the goals of the North American Waterfowl Management Plan. The allowable harvest is allocated among Flyways based on tradition extending back more than 40 years. In fact, the Flyway Councils have recommended that the allocation of harvests among Flyways should be maintained, at least in the short term. Decisions about how harvest should be allocated within a Flyway ultimately rest with the States involved. In the case of the Mississippi Flyway, at least two States (Minnesota and Wisconsin) are on record opposing a framework exten-

sion in southern States because it would further shift the distribution of duck harvest to the south. Northern States are mindful that the five southernmost States of the Mississippi Flyway collectively enjoy the highest hunter success of any region in the country. The FWS believes that allocation of harvest both among and within Flyways is a sensitive political issue that must be addressed in full consultation with all affected parties.

The Land and Water Conservation Fund has provided \$38.4 million to Mississippi since 1965. It is my understanding that under the law, 60 percent of funds are to be allocated to States. Since 1988, States have received 10 percent or less. In the last two years, States have received no funds.

Question. Why has funding not been allocated to the States during the last two years?

Answer. During the past two fiscal years, no funds were appropriated by the Congress for the Land and Water Conservation Fund State grant program. Due to the lack of an appropriation, no funds were available to allocate to States.

Question. How much does the Administration's Budget propose to allocate to States in fiscal year 1998?

Answer. Because no funds have been appropriated for this program during the past two years, the Administration did not request funds for fiscal year 1998.

QUESTIONS SUBMITTED BY SENATOR PETE V. DOMENICI

LEVEL OF FUNDING FOR NEW MEXICO LAND ACQUISITION PRIORITIES

There are a number of projects within the purview of the Department of the Interior, primarily the National Park Service (NPS), which are nearing completion. For example, Congress has appropriated in excess of \$20 million over the past seven years to acquire land from willing, and in some cases anxious, property owners within Petroglyph National Monument. Unofficially, NPS estimates that to complete land acquisition at the monument will require between \$6 and \$8 million. Other monuments and parks in New Mexico face similar needs, perhaps to a lesser extent, in order to complete initiatives that were begun some time ago. These include Aztec Ruins National Monument, Pecos National Monument, and several small initiatives within the Bureau of Land Management (BLM) that will consolidate land holdings in specified areas of concern.

There are a number of Wilderness Study Areas on BLM land within New Mexico, where there are significant inholdings. Many in New Mexico would like to begin the process of developing a BLM wilderness bill to try to resolve this issue for some time into the future. I am concerned, however, that the record of the Department of the Interior in completing projects before moving on to a new "priority" will undoubtedly hinder this process.

Question. When does the Department of the Interior foresee completion of acquiring inholdings within the National Monuments and Parks within New Mexico?

Answer. Completion of acquisitions is contingent on the availability of funds. Though acquisitions in the New Mexico units are among the NPS priorities, the fiscal year 1998 budget request for the NPS land acquisition program includes no funds for acquisition in the New Mexico units. Identified future acquisitions in New Mexico units of the National Park System are as follows:

ACQUISITIONS IN NEW MEXICO

[Dollars in thousands]

Park unit	Tracts	Acres	Estimated value
Aztec Ruins NM	12	45	\$1,000
El Malpais NM	42	4,272	2,800
El Morro NM	2	239	234
Pecos NHP	37	442	2,501
Petroglyph NM	120	709	8,000
Salinas Pueblo Missions NM	5	9	50
Totals	218	5,716	14,585

Question. Will the Department of the Interior support additional land acquisition commitments within New Mexico before the completion of the current obligations for acquisition?

Answer. The Department does not support additional funds for any program or project which would result in the reduction of funding for priority programs included in the budget request. However, in general, completion of identified existing projects have priority over new projects. However, flexibility to respond to unique acquisition opportunities should be maintained, particularly for those projects that are time sensitive, and where the opportunity to acquire lands with significant resource/recreation values may be available and lands are under the threat of development.

DEPARTMENT OF THE INTERIOR—FUNDING FOR THE SOUTHWEST FISHERIES
TECHNOLOGY CENTER

The Southwest Fisheries Technology Center (SFTC) has received the support of this Subcommittee since 1993 as one of the highest priorities within Region 2 of the Fish and Wildlife Service (FWS), and to date Congress has appropriated \$20 million for construction of facilities at Dexter and Mora in New Mexico. When completed, the SFTC will be the only facility in the Nation dedicated exclusively to the breeding and stocking of native, threatened, and endangered fish. Approximately \$6 million is needed to complete construction and provide funding for the two units of the SFTC to become operational.

Question. Why has this Administration not requested funding to complete construction at the SFTC in any of the last five years?

Answer. In fact, the fiscal year 1997 President's Budget requested \$3.7 million for the Southwest Fisheries Tech Center.

Ongoing priorities have included health and safety construction projects and completion of the National Conservation and Training Center. For fiscal year 1998, the President's Budget has focused on backlog reductions, including for example a request for construction funding totaling \$22.2 million for the highest priority infrastructure backlog needs including the rehabilitation of roads, dams, and bridges in the National Wildlife Refuge system and \$5.3 million for rehabilitation projects in the National Fish Hatchery system.

Question. Does the Department support the completion of construction, and subsequent staffing and operation of the SFTC?

Answer. Each construction project has to be considered relative to program priorities, especially the health and safety of our employees and the public.

Question. Does the Department ever plan to request adequate funding for operation of the SFTC?

Answer. The Department will reevaluate the project in future budgets against all other priorities.

DEPARTMENT OF THE INTERIOR—PAYMENT IN LIEU OF TAXES

Under section 1033 of the Omnibus Parks and Public Lands Management Act of 1996, the Department of the Interior is authorized to recognize boroughs and other subdivisions as units of local government for the purposes of the Payment in Lieu of Taxes (PILT) program. This has added an additional obligation of \$6.5 million under this program, yet the Administration has requested a reduction of \$12 million in this program that is vitally important for local governments to provide services in those areas where local tax base is limited by the presence of Federal land. This level of funding is below that appropriated in fiscal year 1994, before Congress authorized an increase in the program.

Question. Does the Administration believe that the needs of local governments are less than they were in fiscal year 1994?

Answer. No, the Administration does not believe that the needs of local governments are less than they were in fiscal year 1994.

Question. How does the Department intend to make up for the shortfall in services, such as search and rescue, law enforcement, and road maintenance, currently provided by local governments in those areas dominated by Federal lands?

Answer. The BLM 1998 budget proposal for PILT is the same as the Administration's proposal for 1997. In 1997, Congress appropriated an additional \$12 million above the President's Budget.

Distribution of PILT payments is determined by several codified formulas and is designed to supplement other Federal land revenue sharing payments that county governments receive. Historic funding levels for PILT between 1977 and 1995 have been level, fluctuating only between \$100 and \$105 million. A 1994 amendment changed the methodology for calculating PILT payments but did not provide a new funding source.

Funding for all PILT payments is provided via BLM appropriations. The BLM makes PILT payments for lands managed by BLM, NPS, the U.S. Forest Service, Corps of Engineers, and U.S. Army. Current payment formulas (as a result of the 1994 amendment) authorize an appropriation of up to \$194 million for the 1998 payments. Congress has never appropriated this full amount.

WATER RESOURCES RESEARCH INSTITUTES

Dr. Eaton, one of the participants in the preliminary work to study the water resources of New Mexico's largest city—Albuquerque—was at the New Mexico Water Resources Research Institute headquartered at New Mexico State University. I have been familiar with the work of the Institute for years, and its scientists have made significant contributions to the State and to the Nation. The Administration proposes to phase out the State Water Resources Research Institutes, and essentially redirect its funding to the Federal program. In other words, the support the U.S. Geological Survey (USGS) has been providing through a long-standing partnership with the State Research Institutes is proposed to be terminated, and the work shifted in-house to USGS.

Question. How does this proposed shift of research in-house fit in with the Administration's initiatives to foster partnerships in research?

Answer. In a constrained budget climate, the Administration regrets the need to reduce funds to this program in favor of activities that more directly support the USGS mission. Nonetheless, the State Water Institutes, which receive grants under the Water Resources Research Act Program, will continue to receive Federal grant funds in fiscal year 1998 at a reduced level. Also, the USGS student internship program begun in fiscal year 1996 in concert with the Water Institutes will continue providing many opportunities for fostering partnerships in research and education.

New Mexico's Water Resources Research Institute will receive approximately \$80,000 in fiscal year 1995, but these funds will leverage contributions from the State Legislature by as much as five times this amount because of the critical work being performed.

Question. What is a realistic estimate of the lost resources to this important research that is likely to occur if the Administration's proposal is enacted?

Answer. Although the Water Resources Research Act Program has been highly successful in past years, the fiscal year 1998 Budget includes \$1.75 million for Water Resources Research Institutes, a reduction of \$2.8 million. At this level of funding, equal grants will be awarded to each of the 54 institutes, thereby reducing the administrative cost. Predicting the impact of the proposed funding reduction on matching funds for individual Institutes is difficult, but the average Federal grant to each Institute in fiscal year 1998 under the President's proposed budget would be about \$30,000. Currently, average leveraging of non-Federal to Federal dollars for the 54 Institutes exceeds 10 to 1, far in excess of their Federal direct appropriation and associated 2 to 1 matching funds. However, about one-third of the Institutes receive all or most of their funding from this Federal appropriation and associated matching funds, so that this action may result in the closure of some Institutes.

One of the benefits of the current partnership with the State Institutes is that these programs train new researchers in earth sciences.

Question. Does USGS have the capability to make up for this aspect of the proposed elimination of State Institutes?

Answer. The proposed decrease in Institutes Program funding would not directly affect funds available for the USGS Water Resources Research Institute Internship program, which was established in fiscal year 1996 in concert with the Water Institutes. This program is a means of providing undergraduate and graduate students with career-enhancing field, laboratory, and research experience through participation in USGS activities as interns. Funds to support the interns are derived from other USGS projects or programs that desire to support student interns as part of the mix of efforts required to carry out program or project activities. These funds are consolidated and awarded under grants to Institutes participating in the internship program. The Institutes use these grant funds to employ students competitively selected from among applicants at colleges and universities across the country. The students are assigned USGS mentors on projects and programs providing the funds to support the Internships. In fiscal year 1996 the USGS committed a total of \$345,000 to the Internship program in six States. The combination of classroom work, coupled with on-the-job training is excellent preparation for future water managers, water scientists, and technicians alike. It also assists USGS by providing a source of student help. Because of the success of this partnership, we expect it to grow significantly in the future.

Question. How would you assess the research productivity of the State Institutes with that of USGS overall? Has such an assessment been undertaken as the Administration has considered this budget proposal?

Answer. The State Water Institutes Program, with its non-Federal matching requirement, is an efficient means of stimulating and supporting water resources research, education, and information and technology transfer directed towards State and local water management problems. However, the Institutes Program cannot substitute for internal USGS functions that require a broad scale, long-term, nationally consistent approach. Functions such as collection and dissemination of streamflow data and the rapid response of USGS to flood emergencies could not be carried out by the Institutes. Similarly, a national assessment of water quality could not be conducted by the Institutes. The Administration recognizes that, although the Institutes Program provides excellent research and products, it does not contribute as directly to USGS mission activities.

The New Mexico Water Resources Research Institute has been a major contributor to resource issues in the State and nationally. Some of the most recent examples of the Institute's work in New Mexico include:

- Heading the Water Resources Task Force of the Governor's Technical Excellence Committee, which developed the concept and needs statement for the "Critical Basin Assessments" in New Mexico. This program recommended that the Albuquerque/Middle Rio Grande Basin be the first to be studied;
- Organizing the Water Conference in Albuquerque last fall in which you participated;
- Contributing to a regional planning process to focus on developing a more reliable municipal water supply for southern New Mexico and El Paso; and
- Working with WERC, Los Alamos, and Sandia to develop a proposal for a major water resources initiative for New Mexico.

QUESTIONS SUBMITTED BY SENATOR CONRAD BURNS

NATIONAL PARK SERVICE (NPS)

Question. Mr. Secretary, could you provide the Committee with additional information on what the current backlog of construction and/or repair projects is in our Nation's national parks? I would like to see this broken down by both region and per park level.

Answer. The information follows:

RECAPITALIZATION OF THE NATIONAL PARK SYSTEM

[Preliminary list of unfunded capital construction needs, alphabetically by park]

Park	Project title	Gross construction estimate	Package number	Reg.	Objective	Work type
Acadia National Park	Upgrade restrooms, water, sewer, power	5,750,000	232	MAR	1	U
Acadia NP	Rehabilitate historic structures	8,500,000	320	MAR	2	B
Acadia NP	Rehabilitate tour loop roads and bridges	24,000,000	287	MAR	2	R
Acadia NP	Replace visitor center and construct park entrance	16,560,000	233	MAR	4	B
Acadia NP	Improve McFarland Hill Headquarters	9,960,000	234	MAR	3	B
Acadia NP	Alternative transportation modes	1,320,000	206	MAR	5	R
Adams National Historic Site	Rehabilitate Beale Estate	2,020,000	108	MAR	2	B
Adams National Monument	Rehabilitate Beale Estate	1,950,000	198	MWR	5	H
Alaska parks (multiple)	Construct employee housing and recreation facilities	3,960,000	135	AKR	2	B
Alibates Flint Quarry NM	Rehabilitate historic/building New Backcountry cabins	4,320,000	105	SWR	4	B
Allegheny Portage National Historic Site	Construct visitor contact station	3,000,000	225	MAR	3	R
Allegheny Portage National Historic Site	Staple Bend Tunnel stabilization/development	11,760,000	226	MAR	5	L
Amistad National Recreation Area	ALPO/IOFL Development Program	3,000,000	117	SWR	5	B
Amistad NRA	Construct visitor contact stations and boat launch	2,640,000	180	SWR	3	R
Antietam National Battlefield	Reconstruct roads	2,400,000	315	NCR	2	B
Antietam NB	Stabilize/restore historic battle structures	2,886,000	271	NCR	2	R
Apostle Islands National Lakeshore	Construct new roads for scene restoration	4,642,400	839	MWR	2	L
Apostle Islands NL	Protect lightstation from shoreline erosion	1,440,000	248	MWR	3	H
Arkansas Post NM	Renovate employee quarters in historic lightstations	1,200,000	116	SWR	5	B
Assateague Island National Seashore	Construct maintenance/storage facility	9,000,000	263	MAR	2	L
Assateague NS	Rehabilitate historic structures/stabilize national resources	6,600,000	231	MAR	3	R
Assateague NS	Reconstruct roads and parking, MD and VA	3,432,000	233	MAR	3	R
Aztec Ruins NM	Redevelop parking—chiclg	4,680,000	133	SWR	5	B
Badlands NP	Construct administrative ctr./operations complex	24,156,000	120	RMR	3	R
Baltimore-Washington Memorial Parkway	Rehabilitate 30 miles of main road	31,680,000	106	NCR	5	R
Bandelier NM	System completion project	15,700,000	214	SWR	2	B
Bandelier NM	Relocate facilities from Frijoles Canyon	1,320,000	109	SWR	3	L
Bandelier NM	Rehabilitate Ponderosa Campground	3,600,000	210	SWR	2	L
Bandelier NM	Rehabilitate trails	840,000	246	SWR	3	U
Bering Land Bridge National Preserve	Construct water storage and distribution	5,564,000	100N0	AKR	4	B
Big Bend NP	Construct multiagency visitor center	3,200,000	274	SWR	3	L
Big Bend NP	Rehabilitate Chisos Basin Campground	19,008,000	223	SWR	3	R
Big Bend NP	Reconstruct major park roads	10,680,000	114	SWR	5	B
Big Bend NP	Construct addition to park visitor center	3,200,000	132	SWR	1	U
Big Bend NP	Modernize/expand Panther Junction water system					

Big Bend NP	Relocate overhead utility lines	4,200,000	169	SWR	3	U
Big Bend NP	Improve/expand Panther Junction maintenance area	2,400,000	160	SWR	3	B
Big Bend NP	Rehabilitate/expand campgrounds (RGV-CA)	2,400,000	166	SWR	3	L
Big Bend NP	Construct resource management facility	2,400,000	276	SWR	5	B
Big Bend NP	Rehabilitate and expand sewage treatment	3,200,000	278	SWR	1	U
Big Cypress Nat Preserve	Scenic corridor visitor safety hwy. improvements	4,800,000	1	SER	1	R
Big Cypress NPRes	Additional lands operation facility	1,720,000	2	SER	4	B
Big Thicket NPRes	Construct park visitor center/headquarters	8,280,000	107	SWR	4	B
Big Thicket NPRes	Construct trails, trailheads, water access	13,200,000	111	SWR	2	L
Big Thicket NPRes	Stabilize roads	2,112,000	113	SWR	3	R
Bighorn Canyon NRA	Provide safe recreation area at OK-A-BEH	254,400	222	RMR	3	L

Total		5,587,776,410				

Objectives:
1= Health and safety.
2= Resource preservation.
3= Repair/rehabilitation of existing facilities.
4= New facilities in a new/developing park.
5= Additional facilities in an older/established park.

Work type:
B= Buildings: Visitor, Park Support, et cetera.
H= Housing: Permanent, Seasonal.
L= Landscape Work, Site Restoration, et cetera.
R= Roads: FHP, Non-FHP, Bridges, et cetera.
U= Utilities: Water and Sewer Systems, et cetera.

Question. I would also like to know the status of repair work necessary for Yellowstone and Glacier National Parks.

Answer. Yellowstone National Park has a large backlog of repair needs due to its expansive and aging infrastructure. Repair work funded from park operations includes routine maintenance such as exterior painting of buildings, cleaning of drainage ditches, and the patching of potholes, that maximizes the life of an asset. Effective routine maintenance assumes each road, sewer system, bridge, or building is in a minimally acceptable condition. The repairs necessary to bring assets from poor condition to good condition are typically accomplished with project funding sources such as line item construction and repair and rehabilitation.

Yellowstone housing is characterized by having only 40 percent of the units in good or better condition, and over 140 of the units were originally intended to be temporary structures. Three sewage systems are in extremely poor shape. The Norris geyser basin system failed and was shut down in 1995. The sewage plant at Old Faithful is subject to spills and is degrading the groundwater. The sewage plant at Madison can fail at any time. Up to \$300 million is needed to bring the roads up to standards.

Yellowstone management identifies the operational funding currently needed to properly maintain assets whose condition warrants proper maintenance at \$4.5 million per year, and the non-recurring funding necessary to bring remaining assets to a reasonable standard at \$300 million for roads and \$300 million for buildings and utilities:

Glacier National Park's backlogged repair needs, estimated at \$7.1 million, are as follows:

- Maintain and Repair Historic Buildings
- Rehabilitate Lake McDonald and Headquarters Sewer System
- Walton rehabilitation of 60-year old two bedroom log cabin and replacement of two trailers with two duplexes
- Trail Brushing and Tread Repair for Visitor Safety
- Repair Roof, Administration Building No. 295
- Repair and Paint Headquarters Buildings
- Stripe Centerline on Park Roads
- Paint Interior/Exterior and Rehabilitate Drinking Water Tanks
- Chip Seal Damaged Roads throughout Park
- Rehabilitate St. Mary Visitor Contact Station
- Rehabilitate Many Glacier Campmaster's Cabin
- Rehabilitate Swiftcurrent Lookout
- Rehabilitate Scalplock Fire Lookout
- Repair Rising Sun Caretaker's Cabin
- Stabilize/Repair St. Mary Gas House
- Rehabilitate Sewer Lines in Headquarters
- Rehabilitate two Mission 66 Houses
- Repair Headquarters Maintenance Buildings
- Rehabilitate Coal Creek Patrol Cabin
- Rehabilitate St. Mary Campground Septic System
- Rehabilitate Avalanche Area in Conjunction with FIHP
- Rehabilitate St. Mary Visitor Center Exhibits
- Restore Historic Housing/Administrative District
- Parkwide trail repairs

In addition to the above, Glacier Park estimates that \$96 million is needed for Going-to-the-Sun road repairs.

Question. Would you provide this Committee with the scientific research that is presently occurring in our national parks? What is the system for peer review of this research and who conducts this peer review? Is this done on a national or local level?

Answer. Scientific research presently occurring in or on behalf of units of the National Park System ranges through all possible field science disciplines from anthropology to zoology. Most of this research is sponsored by non-NPS entities, and much of it is sponsored by organizations that are not part of the Department of the Interior. For 1995, about 1,702 individual research projects, excluding cultural resources, were conducted, 131 parks hosted one or more of these research projects, and the projects were distributed among the broad discipline groupings of biology (1,053 projects), physical sciences (417 projects), aquatic and marine systems (87 projects), social sciences (85 projects), and other (60 projects).

I know that you have recently asked the National Academy of Science (NAS) for a technical report on the science on the bison in Yellowstone National Park. It is my understanding that you requested this report be completed and in your hands by October of this year. I have to wonder how you can expect a clean, thorough,

and comprehensive report in this time frame, considering that NAS seeks to find consensus and goes through an intense peer review process before releasing the results of a study.

Question. To what extent has the team working on the Draft Environmental Impact Statement (DEIS) on Yellowstone Bison moved towards the release of the DEIS by July 31, of this year?

Answer. The EIS team is preparing the draft EIS with a team review of the draft to occur in late June 1997. Six alternatives have been identified and the team is completing the analysis of the effects of each alternative. The draft is expected to be completed by the end of June, is scheduled to go to the printer in early July, and scheduled to be distributed for public review by July 31.

Question. I am extremely interested in what the process, timing etc., will be for a comment period and then decision on a final EIS for this purpose?

Answer. At least a 60 day public comment period is scheduled. The agreement between the agencies calls for the Final EIS to be completed by January 31, 1998, with records of decision to be completed by March 31, 1998.

It has been suggested by your friends that the Natural Regulation Plan you have for Parks does not seem to be working.

Question. With this in mind can you explain to the Committee how and why you continue with a failed policy of natural regulation of wildlife in Yellowstone National Park?

Answer. The NPS does not agree that the wildlife management policies for Yellowstone have failed. There are currently populations of all native mammals in Yellowstone that were historically present and the adjacent States have active and successful hunting programs for many species. For example, the three States next to Yellowstone harvest an average of about 12,000 elk each year. These elk provide a tremendous outdoor recreational opportunity as well as a major economic benefit to the States surrounding the park. Yellowstone's northern herd of elk is the most economically important herd in Montana.

Question. Mr. Secretary, have you seen the letter from the White House, dated April 24, regarding their plans for the bison in Yellowstone Park? Can you explain to the Committee the differences in your position and that which the White House has detailed?

Answer. Yes, the Department has received a copy of the letter. There are no basic differences in positions. The alternatives being analyzed in the EIS all have aspects that ensure maintenance of a viable population of free-ranging bison, address bison population size and distribution, clearly define a boundary line beyond which bison will not be tolerated, address risk to safety and private property, protect livestock from risk of transmission of brucellosis, continue Montana's brucellosis class-free status, and address brucellosis in bison. The scope of this EIS is limited to bison management in Yellowstone National Park and adjacent areas of Montana. It does not address brucellosis in bison and elk throughout the greater Yellowstone area.

As you know the Greater Yellowstone Interagency Brucellosis Committee (GYIBC) has been formed based on the Memorandum of Understanding between the Departments of the Interior and Agriculture, and the States of Montana, Wyoming, and Idaho. The GYIBC has 10 objectives that have been agreed to including maintenance of free-ranging populations of bison and elk and to plan for the elimination of brucellosis in bison and elk.

Bison cannot be the sole focus. The situation must be addressed in elk as well, particularly the large elk herds in Wyoming that are maintained on State and Federal feeding grounds during the winter and have a high prevalence of brucellosis. Technology does not currently exist to eradicate brucellosis in bison and elk without capturing and slaughtering hundreds and hundreds of bison and tens of thousands of elk for many years. Such a capture and slaughter approach will not guarantee success.

As a result, management of risk is a key component of any management plan. Another key component is vaccination; however, there is currently no vaccine for bison or elk that is known to be both safe and effective. The vaccines developed for cattle do not seem to work well in bison or elk. Cooperating agencies are conducting extensive research to attempt to develop a safe and effective vaccine.

Question. What is the reasoning and the process behind the cost of construction of housing units in our National Parks?

Answer. The higher costs of housing construction in national parks as compared to private sector can be attributed to a number of factors, including remote locations, Davis-Bacon wage rates, the Buy American Act, requirements of the Small Business Administration Minority Business Enterprise Program, the Uniform Federal Accessibility Standards, the high first costs of energy efficient products mandated by the Energy Conservation Standards for New Federal Residences

(10CFR435), and policies related to fire suppression equipment in Federally owned buildings. While it is often assumed that building on Federal lands should be less expensive because there are no land acquisition costs, the costs associated with environmental assessments required to comply with the National Environmental Policy Act (NEPA) and the various sections of the National Historic Preservation Act add significant costs to projects. Additionally, the costs of infrastructure not typically borne by private sector developers, but rather, paid for by property taxes, are an integral part of NPS housing costs.

The goal of the Park Service is to provide adequate employee housing only in those park areas where it is absolutely needed. And where it is needed, this housing is to be comparable to market rate rental housing in the private sector, taking into consideration the high costs of service and maintenance in remote areas as well as the special needs of the employees who serve in these remote areas. The reasoning and the process behind the cost of construction of housing units in our national parks is embodied in two funding programs, 1) the Line Item Construction Program, and 2) the Housing Replacement Program. Each of these programs has a different manner of establishing priorities for project funding as discussed below, though the means for managing construction costs are similar in both programs.

With regard to the Line Item Construction Program, the Denver Service Center of NPS responded to a 1997 Inspector General report on housing implementing an action plan to meet housing needs in a more cost effective manner. Key action items to be taken: conduct a value analysis at two stages in the process; utilize standardized housing designs and specifications whenever possible; and revise NPS Housing Guidelines (NPS-76) per the Government Performance and Results Act (GPRA), which will update requirements and assure Servicewide consistency of park housing. The Housing Replacement Program also recently instituted criteria and priority setting systems.

The Omnibus Parks and Public Lands Management Act of 1996, section 814, requires changes in the manner and methods of providing employee housing. Among these are the revision of the criteria under which housing is to be provided, the conduct of physical assessments of existing housing in all parks, the development of agencywide priority listings by structure, a study to determine the feasibility of providing eligible employees with a housing allowance rather than housing, and a study to examine the potential benefits and risks associated with the sale of Government housing to a cooperative made up of field employees. Most of these activities are in progress. Complete implementation of the Act may significantly change the way NPS houses employees.

Question. As a follow up, I have to ask if you are aware that the cost of constructing a housing unit in Yellowstone National Park is double what it is to build a house in Bozeman, Montana, a mere 90 miles away in a high cost district within Montana?

Answer. Construction costs in Yellowstone National Park are higher than costs in Bozeman. There are several expenses that are included in construction of a home in Yellowstone National Park that are frequently overlooked when comparing to the cost of a home on the commercial market. Circumstances related to the following components impact the final cost:

Planning and Design: The planning for and design of houses in Yellowstone National Park is more complicated than that of houses in developed communities. The issues that must be addressed during this initial phase range from impacts on cultural and natural resources, to ensuring adequate accessibility, to minimizing the visual impact of homes on landscapes. This planning often requires time-consuming consultation with State Preservation Offices, particularly when historic areas will be impacted.

Frequently, the costs associated with county planning and designers in non-park houses are recovered by taxes and impact fees and thus not included in the "price" of a house. Yellowstone includes the costs of these components when identifying the price of a structure.

Basic Construction: Basic construction costs are more expensive in many national parks than in surrounding communities. The short construction season, transportation of material and employees, and the lack of adequate contractor housing all inflate these costs. By way of example, concrete delivered to the Old Faithful area in Yellowstone National Park costs \$105 per cubic yard. The same concrete delivered in nearby Bozeman, Montana, is \$65 per cubic yard.

Construction equipment entering the park is pressure washed to prevent the spread of noxious weeds. New housing must also withstand snow weighing as much as 150 pounds/square foot and is designed to withstand zone four earthquakes (the same seismic zone as San Francisco). These stringent requirements, which must be

applied to homes for Federal employees, are not necessarily applied to the “comparable” homes outside of the park.

Utility Systems: Housing that can use existing utility systems is considerably cheaper than housing for which utilities must be provided. In many cases utilities are already in place in non-park municipalities.

Landscaping/Revegetation: Unlike many non-park homes, the Yellowstone housing costs include the revegetation necessary to prevent erosion and minimize the visual impact on the surrounding landscape.

Yellowstone National Park and NPS are working hard to reduce construction costs where we can and provide more cost-effective housing for our employees. The Omnibus Parks Act provides NPS with new authorities to expand housing alternatives, to rely more on the private sector to finance or supply housing, and to reduce the need for Federal appropriations for housing.

As I have mentioned in my opening statement, the condition of roads is terrible in our Parks.

Question. With this in mind, what is the current road construction budget like for the National Parks, and what do you foresee for the use of ISTEA dollars in our parks?

Answer. The Federal Lands Highway Program (FHHP), which includes annual funding from the Highway Trust Fund for the Park Roads and Parkway Program, was created with enactment of the Surface Transportation Assistance Act of 1982. The primary purpose of FHHP is to provide a coordinated interagency program to address National responsibilities with regard to access to the Nation’s Federal lands, as well as protection of the multi-billion dollar Federal capital investment in assets constituted by this extensive road and bridge infrastructure. The FHHP established a multi-year funding mechanism from Highway Trust Fund user fees generated by the Federal gasoline tax, and has provided for development of long-range transportation planning and goals that serve the needs of Federal lands. This allows local and State governments to concentrate on their own transportation responsibilities, but still reap the benefits of the travel and tourism generated by national parks and other Federal lands.

There are some 8,000 miles of public park roads and more than 1,250 bridges under the jurisdiction of NPS serving units of the National Park System. About 60 percent of these roads are paved. The current condition ratings of paved park roads are 38 percent “good”; 22 percent “fair”; and 40 percent “poor/failed”. Of the more than 1,250 bridges in the National Park System, 35 percent are deficient. In 1995, some \$254 million in costs to visitors, employees, and the Government can be attributed to traffic accidents on the national park road system. The total current backlog of repair and rehabilitation needs for NPS roads and bridges exceeds \$2.0 billion, based on Federal Highway Administration estimates. At the currently authorized FHHP level of \$84 million, FHWA engineering analyses indicate that an additional one percent of park roads will continue to deteriorate to a “poor” or “failed” condition each year. Based on FHWA estimates, approximately \$120–125 million annually is needed to reverse this rate of deterioration.

Also, several major new construction projects, authorized by Congress, remain incomplete. These include the Foothills Parkway, Natchez Trace Parkway, Baltimore Washington Parkway, Chickamauga-Chattanooga Route 27 Bypass, and Cumberland Gap National Historic Park Tunnel. Currently there are no designated funds to complete these projects. It is estimated that \$350 million is needed to complete these unfinished projects.

In response to many years of funding shortfalls, and to maximize use of limited fiscal resources, NPS in cooperation with the FHWA are currently developing enhanced investment strategies using various management systems to influence future program focus. Factored into this strategy as a key component is the need to address the congestion and associated resource concerns that have become an increasingly serious problem in national parks. Alternative transportation modes need to be considered, where appropriate, to handle the rapidly growing traffic demands and to reduce the resource impacts associated with increasing numbers of visitors. A study on alternative transportation in parklands was submitted to Congress in 1994. A Presidential memorandum dated April 22, 1996, directed the Secretary of the Interior, in consultation with the Secretary of Transportation to enhance the access to and mobility in our Nation’s parks. It is estimated that \$5–15 million annually is needed to initiate a multi-year program of planning efforts and projects for alternative transportation systems in such parks as Yosemite, Yellowstone, Denali, Zion, and Grand Canyon National Parks.

In summary, the Administration is requesting a total of \$161 million beginning in fiscal year 1998 under the Federal Lands Highway Program, subject to Congress-

sional reauthorization of the program, which will be utilized to address National Park Service Road and Transportation needs as follows:

- \$120–125 million annually to prevent further deterioration of the paved park road and parkway infrastructure to “Poor” or “Failed” condition.
- \$25–35 million annually to complete construction of Congressionally authorized parkway projects.
- \$5–15 million annually to implement alternative transportation systems in selected parks.

As you know, Interior has a number of agencies working in the Greater Yellowstone Area. Some Federal non-Interior agencies are also there. I’m not certain how much duplication of effort, focus on good science for management decisions and sharing of information and data there is.

Question. I’ve been wondering if we could get a neutral party who could do some objective analysis involved with these agencies so that we can better discover, collect, process, and distribute information. I’d like to see some good scientific data which was available to all interested parties. I believe that Montana State University is a logical collaborator both because of its location and because of the expertise in resource disciplines which it has. Please comment.

Answer. Processing and distributing technical information is an ongoing challenge for all resource managers. In addition to using its own information dissemination programs, NPS often seeks the assistance of other agencies, such as the Biological Resources Division of the U. S. Geological Survey, and the Fish and Wildlife Service. With the new Cooperative Ecosystem Studies Units requested in fiscal year 1998, NPS would collaborate with colleges and universities, as well as with our Federal partners, to compile, process, and distribute technical information. The NPS also has several partnerships with non-government information organizations to assist us in the dissemination of published information and making data available. Often data are available through NPS supported programs such as the GIS spatial data on the NPS “homepage” on the Internet and the prototype inventory and monitoring program.

When the scientific issues become very complex or controversial, as is currently the case with bison, elk, cattle, and brucellosis in the Greater Yellowstone Area, NPS turns to the National Academy of Sciences to compile existing technical information and provide an independent assessment of the scientific implications of that information.

With respect to Montana State University and the Greater Yellowstone Area, the University already has been an active partner with NPS and other Federal agencies in conducting and reporting research about the area. If the increase requested for the Cooperative Ecosystem Study Units is funded, the existing expertise of the University will give it strong potential to become a partner in any Cooperative Ecosystem Studies Unit that might become established for the region that includes the Greater Yellowstone Area.

I have noticed the Parks for Tomorrow Plan, which your Department is planning, proposes regulations to place limits on National Parks over flights.

Question. What kind of rule making is being drafted that would affect over flights of Glacier and Yellowstone National Parks?

Answer. In response to the President’s April 22, 1996 Memorandum to the Departments of the Interior and Transportation on the national park over flight issue, NPS and the Federal Aviation Administration have jointly established a “National Parks Overflights Working Group,” an advisory group composed of conservation and aviation interests who have until September 1997, to craft recommendations on what such a rule ought to look like. Until this group finishes its deliberations, the shape of the rule and how it would affect commercial sightseeing air traffic over Glacier and Yellowstone National Parks is unclear.

Question. Is the Department scoping the public from those communities surrounding the parks on these proposals?

Answer. The recommendations of this advisory group will be put into the form of a Notice of Proposed Rulemaking which will be used to solicit public comments from all affected parties.

I would like also to commend NPS for the efforts they have made in preservation of the thousands of historic structures in the parks.

Question. Is each Park responsible for prioritizing the maintenance/preservation schedule, or is there a general outline for determining priority? I am concerned about the deferred maintenance on the historic lodges and supporting infrastructure in both Yellowstone and Glacier.

Answer. Each park is responsible for prioritizing the maintenance and preservation schedule for historic structures in the park based upon several factors including the level of significance of the structure, the condition of the structure, the location

of the structure, the types and severity of deleterious impacts on the structure, and the usability of the structure. The weight of these factors is determined by the park in concert with their overall mission and available resources.

Question. Would it be possible to allow the concessionaire a longer term so that they would be able to make the improvements and then capitalize that investment?

Answer. Concession contracts are limited by statute to a maximum term of 30 years. However, experience has shown that long-term contracts are not in the Government's best interest. Therefore, 10 to 15 year contracts are typical for larger operations with investment requirements.

To determine an appropriate term, a financial analysis is performed prior to the issuance of any contract. One of the purposes of this analysis is to determine what length of time would be required for a concessionaire to earn a reasonable profit in relation to the capital invested and the obligations assumed. In contracts with significant construction requirements, an analysis of the present value of the net cash flows is performed and compared to industry averages. The proposed term of the contract is then adjusted until the projected returns fall within the industry average.

Question. Could you please explain to the Committee what the Administrations Heritage Initiative will accomplish?

Answer. The funds requested in the fiscal year 1998 NPS budget are to implement a program of heritage areas pursuant to the authorization contained in the Omnibus Parks Act of 1996. The requested funds will provide a program of direct grants to eligible heritage areas, as well as technical assistance.

MINERALS MANAGEMENT SERVICE (MMS)

Mr. Secretary, I want to ask you about a proposal I understand MMS is making to do away with the current crude oil royalty valuation program.

If I understand the proposal correctly, producers—including independents in Montana—would be expected to pay royalties on some price related to futures contracts on the New York Mercantile exchange instead of the price they actually receive for their oil. I also understand that, to set that price, MMS would require new data gathering and then a complex calculation of so-called "differentials" to establish a price in Montana.

Question. Has the Interior Department conducted a study estimating what it would cost MMS to implement and administer its proposed oil valuation scheme and what it would cost the affected States and oil and gas lessees to comply with that scheme and subsequent changes to it if the Interior Department were to adopt it as an interim final rule and then change it based on the information and experience it develops while the interim rule is in effect?

Answer. In its Determination of Effect of Rule (DOER), MMS estimated the cumulative industry cost of submitting a proposed form to enable MMS to calculate location differentials at about \$800,000 annually. The MMS also estimated its total yearly cost to collect and analyze the data received, and publish resulting location differentials, at about \$20,000 annually. As the DOER noted, there would also be undetermined up-front computer programming and other administrative costs to MMS and industry to make their computer systems conform with the proposed reporting requirements.

The DOER estimated a yearly royalty increase of about \$54 million resulting from the proposed rule. Among other impacts noted were pricing certainty and reductions in audit efforts. The DOER also noted that the rule would have no obvious negative effects on State or local governments because the proposed rule is expected to provide additional royalties to them without added cost.

Finally, an interim final rule was only a possibility raised for comment in the preamble to the proposed rule. Even if an interim final rule were implemented, there would be no way to estimate costs of changing it until we knew what form the changes would take.

Question. If it has conducted a cost study, what information, if any, did it obtain from States and oil and gas lessees in the course of its study?

Answer. Members of the State and Tribal Royalty Audit Committee and the Western States Land Commissioners participated in the rulemaking effort on behalf of the States. States were thus kept informed of progress of the rule and expressed no concerns about implementation costs. In response to the December 1995 Advance Notice of Proposed Rulemaking (ANPR), many industry respondents said they could not participate in the rulemaking process because of various ongoing litigation regarding oil valuation. Thus, MMS received no direct input from industry on cost concerns while drafting the proposed rule.

Question. Has the Interior Department prepared any kind of a study which estimates the cost of administering a program in which the government would take its oil in kind as an alternative to implementing, administering and complying with its NYMEX oil valuation scheme?

Answer. The MMS has a study underway to evaluate both oil in kind as well as gas in kind. The MMS doesn't believe the entire oil royalty share would be taken in kind at any given time. There still would be an ongoing need for effective rules for valuing that portion of oil not taken in kind.

Before MMS moved forward with a royalty on natural gas, they tested a pilot project on a payment in kind basis.

Question. Would it not be just as sensible and prudent of the Department of the Interior to pilot test its NYMEX scheme before imposing such massive and radical change on our oil and gas producers?

Answer. The concept of pilot testing normally has merit. But the overriding factor in pushing forward with a revised rule is to assure that a fair royalty return is realized on public oil resources. The existing regulations need modification, and MMS believes an index-based procedure (NYMEX or, in California, Alaska North Slope spot prices) will better assure proper royalty receipts. The MMS believes that further delay would result in loss of revenues to which the States and public are entitled. In fact, in response to the ANPR, some States commented that MMS should immediately put in place an interim, index-based rule.

GENERAL INTERIOR QUESTIONS

As you know, Whirling Disease is a special concern in Montana, for economic, recreational and other reasons. The Fish and Wildlife Service (FWS) has undertaken some internal research and activities to combat it. We also have the very effective National Partnership on Management of Wild and Native Cold Water Fisheries in Bozeman.

Question. What are your plans for combating Whirling Disease in fiscal year 1998 and how can we effectively continue these important initiatives?

Answer. In fiscal year 1997, FWS was appropriated \$1.5 million for fish disease work with an emphasis on whirling disease. Of this amount, \$600,000 has been directed toward the development of a National Wild Fish Health Survey and Data Base; \$500,000 has been provided to the National Partnership for the Management of Wild and Native Cold Water Fisheries (Partnership) to support research aimed at combating and controlling whirling disease; \$300,000 has been directed toward specific cooperative research projects related to whirling disease; and \$100,000 has been allocated for on-the-ground whirling disease projects in Montana. The fiscal year 1998 President's Budget maintains funding levels of \$1.5 million to continue efforts to control the spread of whirling disease and other fish diseases.

The FWS will continue to take a variety of approaches to control the spread of whirling disease. The FWS is currently funding research to develop rapid, cost effective ways of detecting the parasite in both the fish and worm host. Other research is aimed at determining why the disease is problematic in some trout (and strains) and not others. Laboratory and field test are being conducted exposing different strains to the parasite to determine if there might be certain strains or species of fish that are less susceptible to the disease. If a resistant species can be found, fishery managers may have more options of managing around the disease in areas of special concern. The FWS also determines the health status of wild stocks nationwide, not only for the presence of whirling disease, but other dangerous pathogens as well. Therefore, FWS is developing a national database to share this information with all researchers and fishery managers so that they may have more options for controlling and protecting valuable stocks of fish. Mr. Secretary, you and I have opposite opinions of what the role of grazing on public lands is and should be. I feel that it is necessary for the future condition of our public lands, considering that we have greater numbers of wildlife than in years past, and that this land is in the best shape it has been in decades.

Question. With this in mind, why is it that each and every agency within the Department has different rules and regulations on the lands that they manage?

Answer. This Administration has placed emphasis on managing Federal land so as to improve the health of entire landscapes, with a coordinated management approach that often transcends jurisdictional boundaries. Nevertheless, the Department of the Interior agencies manage lands for different purposes, as required under land use laws and organizational missions established by Congress. For example, the BLM provides for multiple uses; these include resource consumption (e.g., grazing), and recreation, with no one use considered to be primary. The National Wildlife Refuge System is designed primarily to preserve land and water

habitat to conserve living resources. Separate legislation directs the Park Service to preserve natural and historic resources and to provide for the public's enjoyment of its lands in perpetuity.

Question. I would be interested in how many different proposed rules and regulations the Bureau of Land Management (BLM) and the other related agencies in the Department has put forth this year? How does this compare to previous years?

Answer. The BLM has published 21 proposed rulemakings this fiscal year while the rest of the agencies in the Department have published 82. These numbers are higher than for an average year because of the Administration's initiative to consolidate regulations.

Question. What is the purpose of the Secretary issuing policy statements directly opposed to language placed in the fiscal year 1997 appropriations bill regarding the rights-of-way issue or Revise Statute 2477?

Answer. By policy statements the Department understands the question to refer to a memorandum from Secretary Babbitt dated January 22, 1997, in which interim guidance is provided in the absence of a final R.S. 2477 rule. This memorandum does not contravene the language in the Department's fiscal year 1997 appropriation that restricted development of an R.S. 2477 rule.

One hundred and ten years after its enactment, the R.S. 2477 statute that governs rights of way across public lands was repealed by the Federal Lands Policy and Management Act of 1976. The repeal did not, however, terminate already existing highway rights-of-way created under R.S. 2477. Two decades after its repeal, the profusion of unresolved claims still presents a planning and management problem for Federal land managers and other landowners, and uncertainty for potential right-of-way holders and users of public lands.

On August 1, 1994, the Department published a proposed regulation to settle the controversy. The proposed regulation would clarify the meaning of important terms in R.S. 2477 and establish an administrative process for determining how many claims are valid and where they are. The comment period closed on August 1, 1995, after the Department received more than 3,200 comments. The Department did not finalize the regulations, since the fiscal year 1996 Interior Appropriations Act prohibited developing, promulgating, or thereafter implementing a rule concerning R.S. 2477. The fiscal year 1997 Interior Appropriations Act allowed the Department to work on R.S. 2477 regulations, but stated that no final rule or regulation pertaining to recognition, management or validity of rights-of-way pursuant to R.S. 2477 shall take effect unless expressly authorized by an Act of Congress.

In the absence of a final rule, the Department issued the January 22 statement to provide some broad guidance to BLM and the Department's other land managing agencies in handling right-of-way claims under R.S. 2477. Such guidance was necessary given the ongoing confusion over unresolved right-of-way claims.

The Administration has come out in the past few days and stated that they have reached an agreement with the members of the Congressional budget negotiations team on the issue of the Crown Butte Mine located in southern Montana.

Question. What are the exact impacts that this agreement will have on Land and Water Conservation Fund projects currently in the budget process on the list of priorities within the Department?

Answer. The agreement that was reached as part of the Bipartisan Budget Agreement calls for funding for the New World Mine project that will not have any impact on those projects identified as priorities in the President's fiscal year 1998 Budget. The funding requested for the New World Mine project is in addition to that requested in the President's Budget.

Question. What is your understanding of where the EIS process is, related to the Crown Butte Mine?

Answer. The New World Project EIS was halted as a condition of the New World Mine Agreement of August 12, 1996. Crown Butte Mines, Inc., the project proponent who was financing the preparation of the EIS, was a party to the Agreement. Specifically, Crown Butte Mines, Inc. placed its permit application into suspension and the Forest Service and the State of Montana, as joint leads on the project, accordingly ceased any further action.

Question. Is it done and what are the scientific results of the process?

Answer. The project was at the stage of a preliminary draft EIS when action was halted and therefore results of the scientific analysis were incomplete.

QUESTIONS SUBMITTED BY SENATOR KAY BAILEY HUTCHISON

ESA BUDGET OVERALL

You seek additional funding for the Endangered Species Act (ESA) program of \$11.4 million. The ESA has not been reauthorized, however, and is badly in need of reform. The ESA as presently implemented has failed to reach the goal of species recovery: no species has recovered primarily as a result of the ESA and most species claimed by the Fish and Wildlife Service (FWS) to have achieved 75 percent of their recovery objectives are not beneficiaries of successful ESA actions. Further, numerous species have been incorrectly listed as threatened or endangered and Government data is too poor to demonstrate a general trend that protected species have been assisted. Most importantly, the ESA as now implemented severely restricts the reasonable use and enjoyment of private property in violation of the Fifth Amendment of the United States Constitution.

Question. Given these failures of the ESA, how can you justify increased spending for programs under the ESA, prior to reauthorization by Congress and necessary changes to the administration of the Act?

Answer. To the contrary, the Administration believes that the current ESA is an effective and flexible tool for maintaining biodiversity for current and future generations while at the same time allowing responsible economic development to proceed. At the same time, the Administration is currently engaged in working cooperatively with the Senate Environment and Public Works Committee in aiding their efforts to reauthorize an even more effective Endangered Species Act.

Over the past several years, the Administration has implemented a series of policies to improve the effectiveness of the ESA while enhancing its flexibility for businesses and private landowners. Full funding at the fiscal year 1998 President's Budget level of \$78.8 million for the endangered species program will allow economic development to continue while maintaining biodiversity.

The Administration's March 6, 1995, announcement of Ten Principles For Federal Endangered Species Act Policy provides an overview of the Administration's approaches to minimize economic and social impacts on the economy, on private property, and the affected public. The Ten Principles are:

1. Base ESA decisions on sound and objective science.
2. Minimize social and economic impacts.
3. Provide quick, responsive answers and certainty to landowners.
4. Treat landowners fairly and with consideration.
5. Create incentives for landowners to conserve species.
6. Make effective use of limited public and private resources by focusing on groups of species dependent on the same habitat.
7. Prevent species from becoming endangered or threatened.
8. Promptly recover and de-list threatened and endangered species.
9. Promote efficiency and consistency.
10. Provide State, tribal, and local governments with opportunities to play a greater role in carrying out the ESA.

The following section discusses key implementation actions which have struck the proper balance between economic development and biological diversity. Following this overview, an in-depth discussion of one of these actions—Habitat Conservation Plans—will provide further information.

Candidate Conservation partnership efforts with Federal and State landowners and the private sector have been designed to avoid potential listings and litigation gridlock. Given the fiscal year 1998 President's Budget request of \$4.9 million for the candidate conservation program, FWS will be able to work on 292 actions.

More is also being done with the use of Habitat Conservation Plans (HCP) to ease the regulatory burdens of the ESA on private landowners. The FWS estimates that it will work with 400 partners on HCPs given the fiscal year 1998 President's Budget request of \$26.5 million for the consultation program thus demonstrating the flexibility of the ESA as it relates to the needs of private landowners. The Administration has produced concrete results with these HCPs. In the Pacific Northwest, the approved HCPs with State and private landowners cover over 4.2 million acres in the States of Washington, Oregon, and California.

Additional steps have been taken to provide landowners with certainty regarding potential future impacts of ESA actions. The "no surprises" policy assures private landowners participating in HCPs that no additional requirements will be imposed on plan participants for species covered by a properly functioning HCP.

An HCP seeks to maintain adequate protection measures for species, while allowing for development activities. These plans often call for land protection or acquisition costs at the local level. The fiscal year 1998 President's Budget continues the

Section 6 HCP land acquisition grants at \$6 million to provide grants-to-states to augment and complement land acquisition required at the local level as a result of the HCP planning effort.

The "safe harbor" program encourages landowners to voluntarily provide habitat for listed species. Under this program, private landowners with assistance from the FWS or with other qualified Federal or State agencies develop a management program to be carried out on their lands for the benefit of listed species. Based on such a program, a safe harbor agreement is entered into by FWS and the landowner. The FWS, in turn, will issue the private landowner a permit for the future take of listed species above the existing baseline conditions at the time of the agreement. Over 37 of these strictly voluntary agreements, mostly in the Southeast and the West, have been or are being developed. In the past year, for the Sandhill area of North Carolina alone, 18 non-Federal landowners have been given safe harbor agreements and it is anticipated that an additional 15 will be developed this year.

The Administration has also developed an innovative way to avoid placing a significant and unnecessary regulatory restraint on thousands of private landowners in the Pacific Northwest hoping for 4(d) rule relief. Implementation of the 4(d) rule for the northern spotted owl would relieve certain prohibitions on private lands within the range of the owl. The FWS expects landowners will participate more readily in conservation and recovery activities because of the relief provided by the 4(d) rule.

The Administration plans to propose species for delisting and downlisting in fiscal year 1998. Up to 25 species will be evaluated for possible delisting in fiscal year 1998, provided the funding requested in the President's Budget is appropriated. The Administration strongly believes that the public is best served by removing species from the list of threatened and endangered species once recovery has been achieved. This results in a decreased cost and regulatory burden on the public and State and Federal agencies. To this end, FWS is working hard to recover as many species as possible in an expeditious manner. The FWS is responsible for both planning and implementing recovery actions for listed species, and accomplishing this recovery mission is contingent upon the funding in the fiscal year 1998 President's Budget. The result of successful recovery planning and implementation is downlisting or delisting species.

The Administration has used the nonessential experimental population status to reintroduce both California Condors and grey wolves into the wild. This status permits greater management flexibility and helps to meet the concerns of private landowners. Both reintroductions are being carefully watched; but initial results have exceeded expectations.

The HCP strategy was designed to reduce conflicts between endangered species conservation and other land uses on specific parcels of land. The overall program has worked very well; by the end of fiscal year 1996, FWS had issued 197 permits and 15 permit amendments. By the end of fiscal year 1998, given the increased funding requested in the President's Budget for the consultations program, FWS projects there will be 400 complete HCPs or HCPs in development. To put this in perspective, in 1992, only 14 HCPs were approved.

The Administration has produced concrete results with these HCPs. For example, as of January 31, 1997, in the Pacific Northwest, the approved HCPs with State and private landowners cover over 4.2 million acres in the States of Washington, Oregon, and California. The FWS is currently working with the States of Washington and Oregon, the City of Seattle, Weyerhaeuser Company, Plum Creek Timber Company, Georgia Pacific, Louisiana Pacific, Murray Pacific, Arcata Redwoods, Simpson Timber Company, and many others in the development and implementation of HCPs.

This program has been successful because the Department has forged strong partnerships with private, local, and State landowners to find innovative solutions that are biologically, economically, and politically feasible for all parties, and conserve listed species.

The growth in HCPs is due to several factors, primarily the greater incentives that have been offered to landowners. Previously, the fear of new listings, the potential for additional mitigation measures, and the potential to have to redo a plan left landowners leery of entering into a long-term agreement. The Administration's new "no surprises" policy (a deal is a deal except under extraordinary circumstances) also provides certainty to landowners and encourages them to come to the table to develop long-term contracts to protect Threatened and Endangered (T&E) species while allowing economic activities to proceed. The "no surprises" policy has been critical to the willingness of landowners to participate in the HCP process.

Additional factors which have increased the use of HCPs and also benefits both wildlife and landowners include: the development of multi-species HCPs covering

larger geographic areas; substantial process improvements detailed in a new user-friendly HCP handbook; vastly improved coordination between FWS, the National Marine Fisheries Service (NMFS), and other Federal parties; and a change in the FWS role from providing technical assistance only to full participation with landowners through all stages of the process.

The HCP Land Acquisition Grants to States program provides grants for land acquisition at the local level for approved HCPs. The Department considers the states' use of Federal acquisition dollars for habitat protection within, and adjacent to, HCP areas to be an important and effective mechanism to promote the recovery of threatened and endangered species. These acquisition and land exchanges complement, not supplant, private and/or local government responsibilities required for mitigation related to implementing HCPs. Of the \$6.0 million available for the program for fiscal year 1997, \$2.75 million has been allocated as follows:

Balcones Canyonlands HCP, Texas (\$1.0 million): The BCCP is a regional HCP that protects 35 listed and candidate species, including the golden-cheeked warbler, black-capped vireo, and six invertebrates, among others.

Orange County Coastal Central HCP, California (\$0.5 million): This HCP covers the California gnatcatcher, peregrine falcon, southwestern willow flycatcher, and 34 other rare species.

Volusia County HCP, Florida (\$0.5 million): This plan protects three species of nesting sea turtles as well as piping plovers.

Washington County HCP, Utah (\$0.75 million): This HCP covers 34 listed and candidate species, including the desert tortoise, peregrine falcon, and bald eagle.

The remainder of the funds will be allocated later this year as FWS continues to evaluate project proposals. The fiscal year 1998 President's Budget continues this program at the \$6.0 million level.

CONSERVATION AGREEMENTS

In fiscal year 1998, you seek \$4.9 million for candidate conservation agreements under the ESA. This amount, in addition to resources of States, local government, and private parties, represent very substantial commitments toward the protection of species. These efforts should be considered under the ESA in determining whether species should be listed as threatened or endangered and in developing recovery plans.

Question. What steps does the Interior Department plan to take in order to ensure that candidate conservation and other similar agreements under which parties agree to manage resources to protect species, are considered when deciding whether to list a species?

Answer. Successful candidate conservation partnership efforts with Federal and State landowners and the private sector have been designed to avoid potential listings and litigation gridlock.

The FWS enters into voluntary candidate conservation agreements with one or more parties to remove the most significant threats thereby avoiding the need to list the species. States and private landowners support the program because it provides an opportunity to address the needs of declining species before they reach the point of listing. They can employ innovative approaches to species conservation without regulatory burdens that may be present for listed species and in ways that consider social and economic needs.

Proposed listing rules for the following species were withdrawn as a result of successful candidate conservation agreements: Arizona willow; the Virgin Spinedace in Utah; southern population of the copperbelly water snake in Kentucky, Tennessee, and two plants from the Peninsular Ranges of southern California.

Hundreds of conservation actions for candidates and species of concern have been conducted under candidate conservation MOUs with other Federal agencies as well as through the multi-agency Federal Native Plant Conservation Committee. Enforcement actions consist of FWS monitoring of the species and if candidate conservation agreements do not prevent a listing, they can form the basis of the Recovery Plan once the species is listed.

Given the fiscal year 1998 President's Budget request of \$4.9 million for the candidate conservation program, FWS will be able to work on 292 candidate conservation actions in 1998 to reduce or remove the need for these species to be listed.

Important research from the Biological Research Division of the U.S. Geological Survey (and other research from other reputable organizations) is also used to pinpoint potential ESA "flashpoints" and help to develop solutions to keep these species from being listed.

If the conservation efforts are not working, or if the species has declined to the point where listing may be necessary, the listing process would begin. In order to

list (as well as to reclassify or delist a species), FWS must follow a strict legal process known as a “rulemaking” (regulatory) procedure. The rule is first proposed in the Federal Register and after a public comment period, FWS decides if the rule should be approved, revised, or withdrawn. The process can take up to a year, or longer in unusual circumstances, and encourages the participation of all interested parties, including the general public. In some cases, the “trigger” to begin the listing process originates in the courts or with concerned organizations or individuals.

Once a species has been listed, every action is taken to improve protection and recovery of the species, while at the same time minimizing economic impacts, assuring fair treatment of landowners, and reducing delay and uncertainty through a variety of innovative initiatives, including multi-species HCPs and the “no surprises” policy to allow economic development; streamlined review and approval of Federal actions; multi-species recovery plans; and the development of “safe harbor” agreements with cooperating landowners.

Question. What steps does Interior plan to take to ensure that these agreements are considered when recovery plans are developed for species?

Answer. Species are listed under the ESA solely on the basis of the best scientific and commercial data available regarding the status of the species. As discussed above, the listing process would only begin if the conservation efforts are not working, or if the species has declined to the point where listing may be necessary. Also discussed above, the initial candidate conservation agreement can provide the basis for a recovery plan. The current ESA provides flexibility with regard to recovery, and various policies recently implemented by the Administration, as well as increasing the role of stakeholders in recovery and focusing of Federal lands, will decrease the burden on private lands and work towards minimizing the economic effects of the ESA on private landowners.

A new policy—part of the Administration’s Ten Point Plan for ESA reform—significantly expanded recovery participation beginning in July 1994. That policy directs that local jurisdictions, private organizations, and affected citizens be included in recovery plan development and implementation. Also, the public is invited to comment on draft recovery plans. These comments can supply important information about an affected community and can help to reduce or eliminate conflicts with listed species and their habitats. All comments are reviewed and addressed—if appropriate—in the final plan.

Question. What plans do you have to defend such agreements against judicial challenges, where necessary to insure Interior will continue to meet its obligations under the agreements?

Answer. The Department plans to defend candidate conservation agreements against judicial challenges to meet its obligations under the agreements.

QUESTIONS SUBMITTED BY SENATOR BYRON DORGAN

BUREAU OF INDIAN AFFAIRS (BIA)

EDUCATION CONSTRUCTION

The Ojibwa Indian School, located on the Turtle Mountain Reservation, is in desperate need of a new permanent facility. There are severe safety deficiencies, asbestos, and structural problems in the school’s three buildings. In fact, BIA decided in 1994 that these buildings, housing 150 students, had to be evacuated and the students relocated to temporary portable classroom units. Despite this emergency, Ojibwa School is not even on the BIA construction priority list. Even if it were, it could be years before a new school could be built and students could have the opportunity to learn in a safe environment. I find this situation abhorrent.

Question. When does BIA project that the Ojibwa School will be included in the construction priority list?

Answer. The Department is very concerned about the safety deficiencies in the Ojibwa School as well as in other BIA schools. Of the total backlog of BIA facility repair need (\$890 million), over \$680 million is needed to bring the BIA schools in compliance with health and safety and other required codes.

The Replacement School Facility list of 16 schools was approved by Congress in 1993. To date, only seven schools have been funded by Congress for construction. The list remains frozen until all the remaining schools are funded.

The BIA requests funding increases every year for repair and replacement of schools. In fiscal year 1996 and 1997, Congress reduced the education construction program by one third below the request.

The fiscal year 1998 request includes \$49.2 million for Education Construction, \$18 million over the 1997 enacted level. The request includes an additional \$10 million to replace Many Farms School in Arizona and an additional \$8 million to reduce the backlog of education facility repair need.

The BIA is not currently able to project when Ojibwa School would be included in a new school construction list. If Many Farms is funded as requested in fiscal year 1998, there will remain eight of the 16 schools on the present list to receive funding. If BIA receives annual funding for construction of two additional schools per year, it would take until fiscal year 2002 before the entire current list of 16 schools are funded for construction. Therefore, the earliest that a new list would probably be developed is fiscal year 2001. When it is determined that a new list should be established, applications will be requested from the Tribes/schools, and using approved ranking criteria, BIA will determine the ranking order of the individual schools. There is no way of knowing where Ojibwa would rank in a national competition among schools.

Question. What actions is BIA taking now or what actions does it intend to take in the immediate future to ensure that the severe education construction needs on Indian reservations will be met in a more timely fashion, either through creative financing mechanisms which would use existing construction and repair funding or other proposals?

Answer. The Administration has requested \$5 billion to address facility repair needs for public schools across the country. The proposal includes a two percent set-aside for the Department of the Interior. This is a step toward eliminating the backlog of repair.

The BIA has examined alternative financing methods in the past. Given that lease arrangements, loans, and revenue bonds require repayment which is subject to appropriation, opportunities are very limited. In addition, many Tribes do not have revenue generating opportunities available to public schools.

In the meantime, BIA continues to examine other options, including cost sharing with Tribes and debt servicing legislation that could circumvent budget scoring problems.

CORRECTIONAL FACILITIES

The need for additional correctional facilities in Indian Country far exceeds existing resources. For example, on the Fort Berthold Reservation, there are 3,000 arrests annually, but the jail facility that BIA leases only houses eight inmates. Due to this situation, there is essentially no deterrence to crime on the reservation. I am disappointed that, despite the substantial backlog in the construction projects, the fiscal year 1998 budget request contains only \$9.1 million to construct a single jail in Colorado for a Tribe that has been court-ordered to immediately address serious facility problems.

Question. Can you explain in detail what steps BIA will take immediately to ensure that there are sufficient and adequate correctional facilities in Indian country?

Answer. The BIA is quite concerned about the backlog of detention center facility repair and replacement need in Indian country. Unfortunately, as with schools, appropriations have been far short of need. Final funding from Congress for fiscal year 1996 and 1997 has been less than half of the President's Budget request for the Public Safety and Justice facility repair and replacement program.

In fiscal year 1998, BIA is requesting \$16.5 million for the Public Safety and Justice construction program, an increase of \$12.1 million. The increase will fund construction of the Ute Mountain Ute Detention Center in Colorado; design of the Salt River Center in Arizona; and an additional \$2.0 million for repair of existing facilities. The BIA would like to respond affirmatively that there is a plan which will be enacted to immediately ensure that we have sufficient and adequate Law and Order facilities in Indian country. However, as a result of a constrained budget, we have been unable to appreciably address the national list of 17 detention centers established years ago. Rather, our current plan is limited to addressing only those most imminent health and safety code and standards at the existing facilities on an annual basis. In this regard, the needs are established, prioritized, and addressed as funding becomes available.

Question. Can you tell me what action BIA intends to take with the Fort Berthold situation?

Answer. The Fort Berthold detention facility ranks 17th on the Detention Facility Replacement Priority List. In fiscal year 1996 and 1997, BIA requested funds for the Ute Mountain Ute Detention Center, fifth on the List, but Congress did not appropriate the construction funds. The fiscal year 1998 budget request also includes funds to complete construction of the Ute Detention Center.

As a result of the slow pace of funding, BIA presently predicts that it will take several years before construction begins at Fort Berthold. The BIA will provide repair funds to the extent that the funds are available, depending on the health and safety needs at Fort Berthold as compared to the needs at other facilities.

THERAPEUTIC MODEL

The North Dakota delegation wrote to you and OMB Director Raines to urge the Administration to provide additional resources for the therapeutic model program at the Circle of Nations School in Wahpeton, North Dakota. The fiscal year 1998 budget request contains no such additional dollars.

Question. What steps will BIA take to allocate existing or new resources to ensure that the special educational, health, and psychological needs of the students at the Circle of Nations School are met and to ensure the creation of a viable model for other Indian educational institutions?

Answer. The BIA provided additional funds to the school during fiscal year 1993 through 1995; the funds were used by the school for the therapeutic model program. Due to current fiscal constraints, BIA can no longer provide additional support to the school. The BIA allocates School Operations to all of the Bureau schools in accordance with a legislated distribution formula.

The BIA staff will continue to work with the school to explore additional funding opportunities, including working with the Indian Health Service in implementation of the therapeutic model.

FISH AND WILDLIFE SERVICE (FWS)

The FWS has for many years actively pursued the purchase of wetlands easements within the State of North Dakota. During this time, there has been a continuing frustration with the lack of flexibility that wetlands easements offer. Most recently, there have been law suits filed in the State by producers who had easements on their land. The law suits established that FWS had over-extended its interpretation of its easement authority.

Question. What is FWS currently doing to develop a more flexible policy on wetlands easement purchases?

Answer. The FWS policy regarding wetland easements in the prairie pothole region for Waterfowl Production Areas allows the FWS to acquire the minimum interest in private property that is necessary to perpetually protect the small pothole basins found throughout the upper Midwest. Landowners continue to own and exercise all other property rights.

The WPA wetland easements protect the potholes from four types of threats; draining, burning, filling, and leveling. Any of these activities would destroy or diminish natural characteristics of basins, thereby reducing their value to migratory waterfowl and other wildlife species.

Accordingly, the wetland easement program allows FWS to meet its Congressionally mandated requirement to protect prairie potholes from various threats, the greatest of which is drainage, while minimizing the affect of FWS acquisition on private enjoyment and use of property.

The FWS has been extremely helpful in North Dakota in developing water storage areas in the Devils Lake Basin through their wildlife refuge system. However, the need is continuing to grow with Devils Lake expected to rise another six feet or more this year.

Question. What further initiatives is FWS capable of undertaking in order to ensure not only the continued development of wildlife habitat in the basin, but also ensuring that the expansion of the lake does not completely eliminate water control structures and developed wildlife refuges.

Answer. Currently, FWS has \$3.1 million available from previous special appropriations to restore drained and expand existing wetlands on FWS lands in the Devils Lake Basin. With the continued rise of Devils Lake, 10 of the FWS facilities are threatened at Lake Alice National Wildlife Refuge and Sullys Hill National Game Preserve. The FWS is cooperating with local, State, and Federal efforts to develop a basin-wide water management plan and assist in other efforts to resolve flooding.

With the additional work FWS in has taken North Dakota with regard to water storage on its lands to alleviate flooding at Devils Lake, I am concerned that they do not have adequate funding to properly manage these new areas of responsibility.

Question. Do you plan to allocate additional operations and maintenance funding for the FWS in North Dakota for this purpose?

Answer. Due to operations and maintenance funding priorities for the Refuge System both nationally and regionally, there are no plans in the President's Budget to

increase operation and maintenance funding for FWS activities or refuge management in the Devils Lake Basin.

U.S. GEOLOGICAL SURVEY (USGS)

North Dakota has been hit with a series of disasters this winter and spring. The highest snowfall this century followed by millennial flooding have devastated large areas of the State. The USGS has been particularly hard hit with many of their gages as well as their facilities in Grand Forks damaged.

Question. Can you provide me an estimate of total damage assessments for USGS, what amount has been included in Public Law 104-208 (The Disaster Supplemental Appropriations and Rescission Act of 1997) for USGS, North Dakota, and what is the unmet need for full repair and restoration of USGS in North Dakota?

Answer. The funding included in Public Law 104-208 (The Disaster Supplemental Appropriations and Rescission Act of 1997) related to damages in North Dakota was \$840,000:

—\$640,000—repair/replace 20 damaged/destroyed gages, including replacement of equipment.

—\$200,000—replace damaged/lost water quality laboratory equipment and computer equipment. Replace one lost vehicle.

The USGS also received \$4,650,000 in funding in Public Law 105-18, the second Emergency Supplemental Act of 1997 for recovery from natural disasters. There are no unmet needs or additional funding required for full repair and restoration of damaged, USGS equipment in North Dakota.

NATIONAL PARK SERVICE (NPS)

The Lewis and Clark Expedition of 1804-06 traversed territory in what became 11 States, including North Dakota. Even before the Louisiana Purchase, President Thomas Jefferson was interested in exploring the territory west of the Mississippi to seek a water route to the Pacific and to learn more about the flora, fauna, and indigenous people who resided in the territory.

In 1803, Congress approved an appropriation for an expedition to explore the area west of the Mississippi which was purchased from the French in the Louisiana Purchase. President Jefferson chose Lewis and Clark to lead the expedition. Their 18-month, 8,000 mile journey added immensely to our scientific, geographic, and cultural knowledge of this largely unexplored area of the United States. As I am sure the Secretary knows, the expedition spent its first winter in Mandan, North Dakota. As we approach the bicentennial celebration of this most remarkable of events in the annals of American history, I would like to ask a few questions.

Question. What plans are currently underway within the NPS to support and promote the Bicentennial of the Lewis and Clark Expedition?

Answer. The Lewis and Clark National Historic Trail is administered from Madison, Wisconsin. The superintendent and trail manager have been cooperating with and assisting the Bicentennial Committee of the Lewis and Clark Trail Heritage Foundation, our primary private sector partner, and the more recently formed National Lewis and Clark Bicentennial Council. We believe it is desirable for private sector organizations such as these to be the focal point for coordinating the bicentennial nationally across all levels. The NPS provided \$45,000 through a cooperative agreement this year to enable the organizations to hire a shared executive director. We plan to continue our cooperation with them. We will also continue our support as funds are available to do so.

Through a limited amount of Challenge Cost-Share Program funds (\$42,000 in fiscal year 1997), NPS is assisting State and local agencies in their efforts to protect sites important to the history of the expedition and provide educational information to the public through wayside exhibit signs and information brochures. We have developed and published a technical assistance document that provides information to cooperating interests on how to design, produce, and install interpretive signs.

In regard to the Service's own participation in the bicentennial observance, we have formulated goals and objectives to guide the development of projects and programs at park units or that might be undertaken by the Lewis and Clark National Historic Trail administrative staff. A preliminary package of projects and programs is being built around those goals and objectives, along with funding and other resource requirements, for review by the NPS leadership.

Five park units—Jefferson National Expansion Memorial, Niobrara/Missouri National Scenic Riverways, Knife River Indian Villages National Historic Site, Nez Perce National Historical Park, and Fort Clatsop National Memorial—are directly related to the history of the expedition. These individual units, as well as others along the trail route that are not directly related to the expedition, are working indi-

vidually with local interests that want to plan for appropriate bicentennial events and projects.

Question. What are your future plans relating to this event?

Answer. The NPS plans to continue the cooperation with and assistance to the private partners, as resources allow, to enable them to continue the overall national coordinating role. The NPS will also continue to assist State and local interests in preparing for the bicentennial through on-the-ground development of interpretive facilities using Challenge Cost-Share Program funds.

Enhancements under consideration include new or rehabilitated visitor center and wayside exhibits that reflect the latest research and scholarship on the expedition and its cross-cultural contacts, and a brochure focusing on the expedition, its scientific and geopolitical accomplishments, and implications for United States history would be produced and distributed nationwide during the bicentennial period. To adequately serve visitors, NPS hopes to be able to augment the level of seasonal staffing at targeted sites that might experience the largest increases in visitation during the years around the bicentennial.

Question. How much funding has been allocated within the NPS budget for activities associated with the Expedition?

Answer. The base budget for the Lewis and Clark National Historic Trail for fiscal year 1997 is \$147,000. In addition, approximately \$42,000 was allocated from the Challenge Cost-Share Program to assist cooperating State and local interests in the protection and interpretation of sites important to the history of the expedition. The five park units that are directly related to the history of the expedition have their own individual operational budgets.

Although hundreds of events are being prepared all along expedition route and in nearby population centers, there are two major events associated with the bicentennial—a convention in St. Louis, Missouri at the beginning of the bicentennial festivities, and one in Mandan, North Dakota the following year.

Question. Do you intend to allocate any funding to the Lewis and Clark Bicentennial Foundation in North Dakota to help with the major event being planned in your State?

Answer. In fiscal years 1996 and 1997, NPS competitively awarded \$3,000 to \$4,000 to the National Lewis and Clark Bicentennial Council from the Challenge Cost-Share Program funds to assist the council in holding its annual planning conference. The NPS also assisted the sponsors of the annual Lewis and Clark Festival in Great Falls, Montana.

INTERIOR DEPARTMENT DISASTER ESTIMATES FOR NORTH DAKOTA

Many other Department of the Interior facilities in North Dakota were also damaged as a result of disasters in North Dakota this year.

Question. Can you provide me with a full accounting of all Interior Department facilities, equipment, etc., that were damaged by disasters in North Dakota this year?

Answer. While we do not have a detailed list of equipment that was damaged, FWS, NPS, BIA, and Bureau of Reclamation (BOR) facilities and USGS equipment that suffered disaster damage in North Dakota in 1997 are as follows:

NORTH DAKOTA STORM DAMAGE

[Whole dollars]

Department	Facilities and equipment	Amount
USGS	Repair/replace 20 damaged/destroyed gages, including replacement of equipment ...	\$640,000
	Replace damaged/lost water quality laboratory equipment and computer equipment.	
	Replace one lost vehicle	200,000
FWS	Flood damage at Long Lake, Tewaukon, J. Clark Salyer, Audubon, Arrowwood, Des Lacs, Devils Lake, Upper Souris National Wildlife Refuges; at Valley City National Fish Hatchery; and Valley City, Kulm, and Chase Lake wetland management districts	9,358,000
NPS	Repair campground infrastructure/entrance roads/trails/seven miles of bison-proof fence at Theodore Roosevelt NP, Knife River NHS, Fort Union Trading Post NHS ...	210,000
BIA	Dunseith Day School	15,000
	Mandaree School	58,000
	Ojibwa School	17,000

NORTH DAKOTA STORM DAMAGE—Continued

[Whole dollars]

Department	Facilities and equipment	Amount
	Trenton Indian School	10,000
	Turtle Mountain Elementary	36,000
	Twin Buttes School	16,000
	White Shield School	14,000
	Wahpeton Boarding School	742,560
BOR	Museum, University of North Dakota, Grand Forks	419,000
	Total	11,735,560

Question. How much of these amounts were covered in H.R. 1469?

Answer. All amounts were covered in H.R. 1469 except for \$604,560 at Wahpeton Boarding School that was unknown at the time of the request to Congress.

Question. What is the unmet need is for each?

Answer. The unmet need of \$604,560 at Wahpeton Boarding School is for roofing light buildings and the repair of campus streets and sidewalks.

GOVERNMENT PERFORMANCE AND RESULTS ACT OF 1993

The Government Performance and Results Act of 1993 (GPRA) directs Federal agencies to incorporate performance management by defining the agency's mission and establishing definitive goals and quantitative performance measures. The NPS planned to publish and distribute a revised strategic plan consistent with GPRA in the spring of 1997, and to issue an annual performance plan articulating the NPS goals and intended results in fiscal year 1998.

Question. What is the status of the revised strategic plan? Is it available yet? If not, when do you anticipate its being published?

Answer. The NPS anticipates publishing the strategic plan early this fall.

Question. What performance measures will be incorporated in the first annual performance plan?

Answer. The NPS strategic plan contains eight broad mission based goals, 31 long term goals, and numerous specific indicators that will be incorporated into its first annual performance plan. The mission based goals encompass, among other values, natural and cultural resource protection, visitor safety and enjoyment, educational, recreational and conservation partnerships, and improved management systems. Although too numerous and specific to list here, the long term goals and performance indicators will be fully incorporated into the agency's budget presentation that will be submitted to the Congress for the fiscal year 1999 budget cycle.

CONCLUSION OF HEARINGS

Senator GORTON. Thank you very much. Thanks for being here. The subcommittee will stand in recess awaiting the call of the Chair.

[Whereupon, at 11:45 a.m., Tuesday, May 20, the hearings were concluded and the subcommittee was recessed, to reconvene subject to the call of the Chair.]

DEPARTMENT OF THE INTERIOR AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

NONDEPARTMENTAL WITNESSES

[CLERK'S NOTE.—The subcommittee was unable to hold hearings on nondepartmental witnesses, the statements and letters of those submitting written testimony are as follows.]

[The statements and letters follow:]

PREPARED STATEMENT OF AUDREY GALLERY, HONORARY CHAIRMAN, U-505 RESTORATION COMMITTEE

Thank you, Chairman Gorton, for providing the U-505 Restoration Committee with the opportunity to submit testimony to your Subcommittee regarding fiscal year 1998 funding for the Department of Interior.

I serve as Honorary Chairman of the U-505 Restoration Committee. I am the cousin of Captain Daniel V. Gallery, Commander of the Navy Task Force 22.3 which captured the U-505 submarine off the coast of West Africa on June 4th, 1944, two days before D-day. As you may know, the U-505 is a type IX-C German submarine and is the only man-o'-war captured at sea by the U.S. Navy since the War of 1812. The capture of the U-505 enabled the Allies to break the German code. Within 60 days of its capture, all the German U-boats, nearly 900 of them, were disabled, thereby substantially hastening the end of the Battle of the Atlantic.

Acquired by Chicago's Museum of Science & Industry (MSI) in 1954 and viewed by 20 million people since then, the submarine serves as a memorial to the 55,000 Americans killed at sea during World Wars I and II. During a twenty-minute guided tour of the submarine and adjacent galleries, visitors get a taste of life on board, while also learning about the science of World War II submarine warfare. Unfortunately, the U-505's current resting place, outdoors in Jackson Park, has exposed it to dramatic changes in both temperature and humidity over the past 43 years. As a result, the interior, hull, and deck of the submarine are deteriorating at an alarmingly rapid pace.

Due to the national significance of this artifact, the U-505 Restoration Committee was formed in 1996. The Committee's purpose is to assist MSI with its plans to restore the U-505 and relocate it to a climate-controlled facility next to the East Pavilion, thereby protecting it for future generations. MSI also plans to connect the U-505 enclosure to a \$5 million exhibit opened in 1994 entitled Navy: Technology at Sea. This 10,000 square-foot gallery inside the East Pavilion helps visitors learn the scientific principles associated with navigation, communication, ship construction and operation, and underwater technologies.

The new U-505 exhibit would continue a process that began in 1993, when MSI began transforming its exhibits into uncommon classrooms where families and children could learn the fundamental principles of science, technology, mathematics, and history. As part of MSI 2000, the Museum's strategic plan to transform itself into a stimulating, state-of-the-art educational institution, MSI has developed and opened six new permanent exhibits totaling around 30,000 square feet. It is estimated that because of these new exhibits, MSI's annual attendance grew by more than 100,000 visitors in less than three years.

In 1989, the U-505 was designated a National Historic Landmark. It has been placed on the National Park Service's Priority 1 list of distressed objects. Since the submarine is threatened with impairment, funding for its restoration is authorized based on an amendment to the Historic Preservation Act of 1912 [16 USC 470a-e (1), (2) and (3)]. The amendment authorizes Congress to set aside funding within the National Park Service's Historic Preservation Fund for the restoration of facilities designated as National Historic Landmarks and threatened with impairment.

The U-505 Restoration Committee and the Museum are seeking a one-time appropriation of \$6 million, approximately half the cost of restoring, relocating, main-

taining, and operating the U-505. The rest of the funds will be raised by private and local sources. The Museum has been solely responsible for the vessel since 1954 and has never before requested federal funds to restore or maintain it.

Mr. Chairman, the U-505 Restoration Committee thanks you for the opportunity to submit testimony to your Subcommittee this year.

	1995	1996
National Science Foundation:		
Science Club Network (ESI-9154856)	\$236,530	\$262,161
Intergovernmental personnel assignment (ESI-9354157)	82,191	72,269
Illinois Department of Transportation:		
Underground garage (D-4-017-112)	3,258,689	6,819,823

PREPARED STATEMENT OF HUNTER R. RAWLINGS, III, PRESIDENT, CORNELL UNIVERSITY, ON BEHALF OF THE ASSOCIATION OF AMERICAN UNIVERSITIES, AMERICAN COUNCIL ON EDUCATION, NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND-GRANT COLLEGES

Mr. Chairman and members of the Subcommittee: I am Hunter Rawlings, president of Cornell University, a private land-grant university in Ithaca, NY. I am also a professor of classics, that is, Greek and Latin language and culture, and my particular interests are Greek history and Greek historians. It is my privilege to submit this testimony for the record on behalf of the Association of American Universities, the American Council on Education, and the National Association of State Universities and Land-Grant Colleges. Through their combined memberships, these associations represent all the public and private research universities in the country—institutions that educate large numbers of the nation's undergraduate and graduate students and conduct the bulk of the country's basic research and scholarship. I appreciate this opportunity to testify on their behalf in support of a fiscal year 1998 budget of \$136 million for the National Endowment for the Humanities (NEH).

NEH grants make possible a wide range of cultural endeavors that can only be achieved with help and encouragement from the federal government. As the philosopher Charles Frankel said, "Nothing has happened of greater importance in the history of American humanistic scholarship than the invitation of the government to scholars to think in a more public fashion, and to think and teach with the presence of their fellow citizens in mind." That role, since 1965, has been fulfilled admirably by NEH.

The NEH is not a monolithic ministry of culture or an arbiter of public taste such as exists in some other countries. Rather it is a remarkably successful and cost-effective mechanism for engaging the public more fully in American culture, advancing knowledge, and revitalizing education while preserving aspects of our heritage that might otherwise be lost.

Two characteristics of NEH support are particularly noteworthy:

First, NEH sustains long-term collaborative projects such as bibliographies, encyclopedias, dictionaries and critical translations that are of national significance but that are unlikely to be funded by any single state or institution. Cornell University, for example, in cooperation with eight other land-grant university libraries, has received NEH support for a two-year project to preserve the most significant published materials on the history of state and local agriculture and rural life. This rich literature traces agriculture as it evolved from a home and family way of life to the business enterprises of today. In this project, approximately 6,819 volumes published between 1820 and 1945 will be preserved from Alabama, California, Connecticut, Florida, Nebraska, New York, Pennsylvania, Texas and Wisconsin. Cornell and its collaborators hope to extend their work to all 50 states. Their ability to continue the work could be jeopardized, however, by budget reductions at NEH.

Similarly, in 1995, Cornell began the microfilming, cataloging, and conservation treatment of its 32,000-volume Fiske Icelandic Collection, also with the help of NEH. The Fiske collection contains virtually every publication issued in Iceland or written in Icelandic before 1930, including the first book printed in Icelandic, a New Testament published in 1540. One of the premier collections in the world, it is es-

sential to the study of the medieval period and attracts scholars from throughout the nation and abroad.

Additionally, an NEH planning grant is helping fund a traveling museum exhibit, "Up the Road on the Season," tracing how migrant farm labor emerged in the agricultural economy of the northeastern United States and how it has figured in the system that has supplied Americans with food. The project is enabling Cornell to connect the arts with the land and museum lovers with the people who work the land, to link some of the best aspects of our diversified American culture, and to bring them to citizens throughout the Northeast.

The second distinctive characteristic of NEH grants is their ability to leverage state, local, and private philanthropic investment and increase public engagement with the humanities. The imprimatur of NEH funding, awarded on the basis of merit as determined by rigorous peer review, has a multiplier effect, increasing public participation in humanistic endeavors and attracting additional funds. At Cornell, NEH's "Leadership Opportunities in Science and Engineering Education Program," administered jointly with the National Science Foundation, has enabled our Department of Science and Technology Studies to develop four undergraduate courses that are a key part of what we believe is the most innovative, wide-ranging and rigorous curriculum in humanistic and social studies of science and technology in the country. Similarly, one of Cornell's most successful archaeology projects, the Aegean Dendrochronology Project, has used NEH gifts-and-matching support to generate 4,721 contributions from 816 private individuals. This partnership of public and private funding ensures that limited resources support work of the greatest promise and make it available to the greatest number of Americans.

Mr. Chairman, we recognize the extraordinarily tight fiscal constraints under which the Interior Appropriations Subcommittee has operated in the past few years and will operate this year. In fiscal year 1997, the NEH budget was set at \$110 million, an amount approximately 36 percent below its fiscal year 1995 level and well beyond reductions sustained by most federal agencies. NEH already has implemented a major restructuring that has resulted in a reduction of NEH's divisions from six to three, a reduction in programs from thirty-one to nine, as well as the laying off of almost 40 percent of the NEH staff.

The fiscal year 1996 and 1997 budget cuts at NEH have greatly constrained the productivity of the NEH/university partnership, and they have disproportionately affected the national programs account, which has been reduced by 60 percent since fiscal year 1995. The programs and research projects within this division of NEH are unlikely to be funded by any individual state but will substantially benefit the entire nation. They include preservation of brittle books and newspapers and those that assist scholars in producing authoritative editions of the papers of America's great leaders so that they can be accessible to all Americans, from legal scholars, to political scientists, to school children. The impact of these cuts, and others, is illustrated by the examples below:

Brittle books and newspapers.—As a result of the fiscal year 1996 budget cut, NEH was unable to fund projects that would have preserved 20,000 brittle books. In addition, 230,000 disintegrating pages of newspapers will not be saved due to the funding reduction. Without NEH assistance, libraries will be forced to revert to a more parochial preservation role, caring only for those collections of direct interest to the immediate institutional community.

Papers of leading Americans.—The completion of scholarly editions of the writings of U.S. Presidents and other major historical figures has been put at risk by the funding levels of the past two years. Among the compilations that may not be completed are the papers of George Washington, Thomas Jefferson, Dwight Eisenhower, and Thomas Edison. In addition, NEH is now funding significantly fewer grants that support scholarship, which uncovers new information and expands our knowledge base.

Summer Seminars for Teachers.—Many colleges and universities, including my own, host summer seminars for high school and college teachers, who are given the opportunity to study with leading scholars in their fields. The workshops generate renewed enthusiasm and new knowledge among the participants which are then transferred to students around the country. In the summer of 1995, this program supported seminars and institutes attended by more than 2,600 high school and college teachers, who teach approximately 425,000 students a year. The fiscal year 1996 budget cuts have meant that 1,400 fewer high school and college teachers participated in these workshops.

Support for Young Scholars.—Among the programs that have been eliminated are several devoted to helping young scholars complete the Ph.D. and establish their careers. These include the dissertation grant program, which provided one year of dissertation support for the most promising Ph.D. students in the humanities, enabling

them to complete their degree during what is the most difficult time for humanities Ph.D. candidates to support themselves financially.

Because of the positive contribution that NEH makes to our society, we urge the Subcommittee to support the Administration's fiscal year 1998 budget request of \$136 million, which would allow the agency to recover some ground lost over the past two years. We note that this would still be a 21-percent reduction from the fiscal year 1995 funding level.

NEH has been the single most important source of support for humanistic endeavors in the United States for a generation. It has become an important national resource. It has allowed Americans, to borrow the words of Pericles, the ancient Athenian leader, to "value culture without extravagance and knowledge without self-indulgence." We believe it is in the national interest to continue funding NEH. We very much appreciate the Subcommittee's longstanding, bipartisan, support for NEH, and we urge the Subcommittee to support the \$136 million budget request.

PREPARED STATEMENT OF ROBERT H. KNIGHT, ON BEHALF OF THE FAMILY RESEARCH COUNCIL

In 1995, Congress voted to phase out funding for the National Endowment for the Arts. Many congressmen voted for funding in fiscal 1996 and 1997 with the express stipulation that the subsidies would end; no money was to be appropriated for 1998. From 1995 through 1997, the agency was supposed to be developing alternative funding sources.

Now, some in Congress are seeking to break the agreement by appropriating more funds for the agency. They appear to be bending to pressure from arts groups whose members receive federal subsidies. If Congress caves on the agreement, it would constitute a betrayal of those congressmen who agreed to the compromise. And worse, it would be a betrayal of American taxpayers.

Begun in 1965 as part of Lyndon Johnson's Great Society government expansion, the NEA was supposed to raise the level of artistic excellence and promote a wide variety of art. The agency's budget reached a high of \$176 million in 1992 and was slated for \$99 million in fiscal 1997. Although the NEA has funded many worthwhile programs around the nation, it has also managed to create an unbroken record of special favors and embarrassments. Year after year, the NEA has doled out money to "shock artists" who produce obscene, anti-family and anti-religious works.

At funding time, NEA defenders pledge to reform the agency, but this never happens. In 1989, Congress passed a law requiring the NEA to withhold funding from pornographic projects, but a federal court later struck it down. That opened the way for the NEA to continue disbursing questionable grants.

Some NEA defenders say that the unpalatable grants count for only a small share of NEA-funded projects. This may be true, as far as the most objectionable, but it is also misleading. Government subsidies, even with the best intentions, are dangerous because they skew the market toward whatever the government grant-makers prefer. NEA grants place the stamp of official U.S. Government approval on funded art. This gives the endowment enormous power to dictate what is regarded as art—and what is not. This power was never envisioned by the nation's founders when they limited the federal government to a few very specific duties in the Constitution.

As has been noted by NEA Chairman Jane Alexander, "When we give the grant, everybody has to fall in line with what our requirements are: That's a given." If a private donor is going to match NEA funds, "they are going to match what our panel has approved," she said. "We're the driving engine."¹ Alexander also has noted, "for every dollar we award we leverage 11 to 20 from other public and private sources in a community."² Private giving for art has reached more than \$9 billion annually.³ Given the tremendous availability of private funding, why should taxpayers be forced to contribute to a bureaucracy devoted to its own tastes?

How has the NEA used this enormous power? It has consistently: Paved the way for child pornographers' lawyers to claim in court that their works fall under the "artistic" merit defense, based on comparisons to NEA-funded works; rejected grants from artists working in traditional themes or mediums; discriminated against art with religious themes—unless the art demeans religion; cultivated a singular artistic style—avant-garde—in violation of the NEA charter which forbids the NEA to "impose a single aesthetic standard or attempt to direct artistic content;"⁴ continued to fund pornographic artworks, films and venues that stage obscene "performance art"; discriminated against some geographic areas in favor of others such as New

York, California and Minnesota; and promoted the splintering of America into identity groups.

Los Angeles Times arts critic Jan Breslauer charges the NEA with abusing the concept of multiculturalism by funding works based on the identity of the artist, not on the merit of the project. In *The Washington Post*, Breslauer writes: "The problem with the NEA isn't the funding of a few controversial artists. It is systemic. For while the NEA's right-wing foes have been railing against the chimera of obscenity, the endowment (along with, since the late 1980s, many private arts funders) has quietly pursued policies rooted in identity politics—a kind of separatism that emphasizes racial, sexual and cultural differences above all else. The art world's version of affirmative action, these policies * * * have had a profoundly corrosive effect on the American arts—pigeonholing artists and pressuring them to produce work that satisfies a politically correct agenda rather than their best creative instincts."⁵

In addition to aiding the pigeonholing of art, the NEA's stamp of approval has impeded the prosecution of people whose business is not art at all. In testimony before the House Interior Appropriations Subcommittee on March 5, Patrick Trueman, former Chief of the Child Exploitation and Obscenity Section of the U.S. Justice Department, said, "Much of what we prosecuted * * * involved material of the same nature as that funded through the years by the NEA * * * I submit that the NEA poses a direct threat to the prosecution, on both the federal and state levels, of obscenity and child pornography crimes."⁶

Trueman noted that the NEA's stamp of approval is often enough to provide a defense of pornography based on "artistic merit." He said, "It would be difficult if not impossible to keep from a jury a defense argument that the material charged is not child pornography at all but rather 'art' because the NEA has provided funding for its production or distribution. The threat that the NEA poses in the prosecution of obscenity and child porn cases is not merely hypothetical. The difficulties I have outlined in this regard were faced by the U.S. Department of Justice during my years in the criminal division with respect to the funding by the NEA of an exhibit by the late Robert Mapplethorpe."⁷

Over the years, the NEA has funded numerous forms of sexual debauchery in sculptures, paintings, films, theater, "performance art," and other media. The NEA also helped fund a 1994 film, *One Nation Under God*, that grossly misrepresents Exodus International and other ministries that help people overcome homosexuality. Other NEA-funded projects have directly attacked Roman Catholicism, evangelical Protestants, and depicted Jesus Christ as a drug addict and a sex object.⁸

Here are some recent works funded by the NEA:

Inside the visible.—A museum collection of feminist visual art and sculpture, it includes a video depiction of a naked woman on a mattress in various revealing poses and sculptures containing dozens of penises, some of them wrapped around a hat. The NEA awarded \$20,000 to the Institute of Contemporary Art in Boston to support the DocentTeens program starting in January 1996, which included giving more than 20 tours of "Inside the Visible."⁹

It's elementary.—This 78-minute film shows teachers and homosexual activists acquainting schoolchildren with homosexuality. It includes a scene in which a fifth-grader explains how the Nazis used pink triangles to distinguish homosexuals from other prisoners. A classmate then explains, "Some Christians believe that if you're gay, you'll go to hell, so they want to torture them and stuff like that." The remark, which implies that Christians are the same as Nazis, goes unchallenged. "It's Elementary" was supported partly by the Portland Art Museum's Northwest Film Center, which received a \$13,000 NEA grant in 1996.

Women Make Movies, Inc.—This group, which has received a total of \$112,700 in NEA grants from 1994 to 1997,⁹ has produced nearly 100 videos with graphic sexual content, such as *Watermelon Woman*, which includes an explicit lesbian sex scene, *Unbound*, in which "sixteen women * * * free themselves from societal definitions, stereotypes—and the prison of the bra * * * breaks through the constraints of traditional movie making and the censorship of women's bodies."¹¹ The group's catalog also features *Age 12: Love with a Little L*, by Jennifer Montgomery, which is described as a "vivid reconstruction of lesbian identity * * * a riveting amalgam of forbidden desire * * * . A *Village Voice* reviewer calls *Age 12* "playful, aggressive and unashamedly erotic."¹² The catalog also includes films dealing with incest, sado-masochistic sex, oral sex and highly political topics with titles such as *Keep Your Laws Off My Body* and *Daughters of Dykes*.¹³

By contrast, the Shakespeare Festival/LA has thrived without ever having received any NEA grants. Founded in 1985 by out-of-work actor Ben Donenberg, the theater festival staged *Twelfth Night* in a downtown square during its first year. The success of that production, which included an audience of homeless men and

women, spawned the festival's "Food for Thought" admission policy, in which canned food for the homeless is accepted for payment of tickets. In this way, some \$1 million in food has been donated to the Salvation Army. Donenberg also created a youth program to bring Shakespeare into the public schools, particularly in minority areas, and widened his following by staging productions in different locales. The festival attracts grants from major corporations and hundreds of individuals. "There's always a way to raise money," he told a reporter. "If the leadership is there, you can get it."¹⁴

CONCLUSION

In a time of high taxes and swollen government budgets, when many families are hard-pressed to live on one (or even two) incomes, it is indefensible to use tax dollars to fund government-dictated art. Why should a young family struggling to make ends meet be forced to find Watermelon Woman when, for them, going to a decent movie is a rare treat? Congress should abide by the agreement reached in 1994 to allow the NEA to pass into history and allow the marketplace to continue to support the arts, free from government intrusion.

Robert H. Knight is Director of Cultural Studies at the Family Research Council, a Washington-based research and education organization. Mr. Knight, a former Los Angeles Times news editor and writer, wrote and directed a video documentary on Alfred C. Kinsey titled *The Children of Table 34*.

PREPARED STATEMENT OF DR. THOMAS E. LINEHAN, PRESIDENT, RINGLING SCHOOL OF ART AND DESIGN, ON BEHALF OF THE ASSOCIATION OF INDEPENDENT COLLEGES OF ART AND DESIGN

Mr. Chairman and Members of the Subcommittee, I submit this testimony on behalf of the Association of Independent Colleges of Art and Design (AICAD) and recommend funding the National Endowment for the Arts (NEA) at \$136 million for fiscal year 1998. AICAD represents the free-standing, degree-granting, accredited colleges of art and design in this country. Our 32 member schools enroll 50,000 students from all 50 states, employ 8,000 artists and designers, and have combined operating budgets of more than \$475 million.

While most of our members have received grants from the NEA, all of our members believe in the importance of the NEA and its significant federal role. The endowment performs the important role of convener and creates the opportunity for national committees to reach a consensus relating to arts initiatives.

Many of these initiatives address the opportunities and threats of our times. For example, American science and technology has captured the world market advantage in computer graphics, animation and communications. Each of our member schools are providing instruction to artists, designers, and filmmakers in computer imaging. A small federal initiative through the National Endowment for the Arts can turn America's technology advantage into a design and communications advantage as well. The technology advantage was created through the support of the National Science Foundation.

The design advantage in the world marketplace can be secured through the support of the National Endowment for the Arts. The media arts and the design arts

have a severe shortage of design talent that can work with advanced imaging technology. We have given our engineers and scientists the computing power tools of the next century. Let's now develop a talented pool of performing artists, media artists and designers who can utilize these same tools.

Formal art teaching in America began out of a commercial need for artists to work in the textile mills of New England. The United States had a serious balance of payments problem in its trade with England and France. To make the local textiles more attractive to the American markets, we called upon American artists and designers to develop uniquely American designs—ones which would keep the textile dollars at home. It worked.

It is now time to call upon American artists and designers again. Through the NEA's various programs in the performing and visual arts, a national consensus can be reached that successfully turns the nation's technology advantage into an artistic advantage in the world market.

America's computer animators, worldwide Web designers, special effects artists, computer composers and performers can secure first place for the nation in the entertainment and communications marketplace of the next decade. The National Endowment can convene, critique and generate consensus regarding such urgent and pressing needs. This is a proper federal role.

For a second example of a proper federal role, let me suggest the following. As the demographics of the United States change and a larger percentage of our population ages, their needs will change. It is time to call upon America's architects, planners and designers to directly respond to this aging population. Both residential and public design must be changed to address these demographic changes. Instead of moving people from their homes to group residential centers, a new design agenda is needed. This national agenda, supported by the NEA, would promote a new design that assumed that we all will "age in place" (our homes). This new design accounts for the changes brought on by aging and allows for the residential environment to be either changed or reprogrammed.

The talent, the will, the agency support is here to create a revolutionary change in how residences are designed. This new design should minimize the impact on the citizens and maximize their independence. Such an NEA sponsored design initiative could be supported by insurance companies and health maintenance organizations, as well as by associations for senior citizens. This national initiative supported by a premiere National Endowment, can and would be an important federal role.

Finally, the National Endowment provides programs to help us understand the arts of our time. We look to the great nations in Europe, Asia and Africa that surround our own country. We know, understand and value their unique contribution to human culture. The National Endowment for the Arts is the vehicle Americans have, as a nation, to add our contribution to the global stage.

I urge you to provide an allocation of \$136 million to the Endowment for fiscal year 1998. In our colleges of art and design we teach our students that their work is important and that it will impact society. Through the endowment, the artists and designers of this country, like the textile designers of a younger America, stand eager and ready to make their contribution once again.

PREPARED STATEMENT OF DAVID O. WEBB, SENIOR VICE PRESIDENT, POLICY AND REGULATORY AFFAIRS, ON BEHALF OF THE GAS RESEARCH INSTITUTE [GRI]

Gas Research Institute (GRI) appreciates the opportunity to submit testimony to the Seante Interior & Related Agencies Subcommittee to present GRI's views and recommendations for fiscal year 1998 funding of gas-related research and development (R&D) programs within the Department of Energy's (DOE) Fossil and Conservation programs. GRI supports the overall budget request of \$192 million for gas-related R&D submitted by the President for these DOE programs since it continues critical funding for on-going programs in natural gas.

GRI is the RD&D management organization for the natural gas industry. GRI has over 320 member companies representing producer, pipeline, and local distribution companies. Our mission is to discover, develop, and deploy technologies and information that measurably benefit gas customers and enhance the value of gas energy service. GRI jointly plans and cofunds approximately \$20 million annually with DOE Fossil Energy and Conservation program offices. Therefore, any change in policy or reduced levels of federal funding for these DOE programs will have an impact on GRI and the gas industry's cooperative research program. Specifically in the fiscal year 1998 budget request for DOE, \$19.4 million is included for joint DOE/GRI projects. GRI and other industry participants are contributing \$29.5 million of cofunding for these projects.

Research managed and cofunded by GRI is in the public domain because we are a not-for-profit 501(c)(3) research organization and IRS regulations require public disclosure of the research results. The majority of benefits of such research most often accrue to the population in general and do not necessarily result in a marketable product by any one company.

Because many companies, manufacturers, government agencies, and marketers come together to contribute to the research under a GRI program, benefits are quickly dispersed to each contributor and society. Each contributor reduces its financial risk; research is not duplicated; the cost is reduced for each company; and the gas customers quickly receive the benefits if the research is successful. In this regard, GRI does not view federal cofunding of this type of research as corporate welfare since the benefits are broadly dispersed to the many companies and their customers. We view the private/public involvement as an added benefit through the prudent use of scarce research dollars by both parties. As research funding becomes more scarce, this type of joint R&D is even more critical.

FEDERAL ENERGY R&D POLICY

Federal Energy R&D Policy sets the future direction for development and efficient use of our nation's valuable energy resources. The role of the federal government in funding energy R&D is critical as a basis for decision-making by industry as it competes in an ever increasingly competitive world market. Our technical world is becoming increasingly complex and as the cost of R&D grows, no single company or group of companies can afford the cost and risk associated with the development of many of the new energy technologies. Therefore, in times of declining budgets, government funds should be used primarily for investments that are expected to yield broad public benefits and, therefore, not likely to be undertaken by the industry unless government provides all or part of the funds.

The government must continue to have the primary role and responsibility for funding and managing fundamental long-term basic research in energy because private companies are market driven and cannot capture the economic benefits of much of this research. Society receives large and continuing benefits from fundamental research, but industry alone cannot fund the level of basic research necessary to achieve national goals and objectives.

On the other hand, both government and industry have a joint responsibility to plan, conduct, and fund applied R&D to meet the nation's energy goals. Industry should be brought in early to assist in the planning, financing, and management of the applied research. The partnership of private industry in federally sponsored R&D accomplishes several goals:

If the federal research is aimed at top industry priorities, industry will provide cofunding. If industry is not willing to support applied energy research, government should question its own role in the research.

Industry will bring rigorous cost/benefit analysis to prioritize R&D.

Once industry buys into the research and participates financially and managerially, the commercialization path will be shorter because industry will be committed to bringing the product or process to the marketplace in order to benefit from the research.

When the project is ready for commercialization, industry is already on board and has a vested interest in ensuring the technology reaches the marketplace, thus ensuring success from the government/industry investment.

Finally, costly duplication of research is eliminated.

The DOE fiscal year 1998 gas-related R&D budget request was developed with input from the gas industry and with the goal of completing important on-going projects in a timely manner. Industry support of this budget is evidenced through significant cost-sharing from the private sector. The research proposal set out by DOE will result in completion and commercialization of technologies which will contribute significantly to the nation's goals as we pursue all of our energy options. In addition, many of these products which result from this R&D are excellent candidates for export to other countries, thereby increasing the U.S. position in global competitiveness.

Congress has recognized and needs to continue to recognize the role of government and industry in cofunding applied energy R&D and should give priority to those DOE research programs that are jointly funded with industry.

INCENTIVES FOR INDUSTRY-FUNDED R&D

In recognition that industry needs to fund more energy R&D as the direct federal funding of this research is reduced, last year Congress extended the Research and Experimentation (R&E) Tax Credit for eleven months. This tax credit will again be

a topic of consideration this year since the President's budget proposes to extend the credit for another year. However, this tax credit as now structured is a disincentive for collaborative research. GRI, along with other not-for-profit R&D organizations, has been active in seeking ways to eliminate the current disincentive and create incentives for collaborative research. Providing incentives for collaborative research is a sound policy at a time when shrinking research dollars both in government and private industry are a reality. Collaborative research is more efficient in terms of both dollars and time spent. The disincentives to the R&E tax credit can be corrected by extending and modifying the R&E tax credit to:

Recognize 100 percent of the funding contributions to 501(c)(3) collaborative research organizations as qualifying for the tax credit (versus the 75 percent in the current law);

Redefine "qualified research" for collaborative R&D to encompass the IRS definition of qualified research for a 501(c)(3) organization;

Provide a non-incremental 20 percent tax credit for companies' contributions to collaborative research conducted by 501(c)(3) organizations.

RECOMMENDATIONS

GRI encourages the Subcommittee to support the Administration's request for gas-related R&D of approximately \$192 million of which \$178.78 million is in this Subcommittee's jurisdiction. Critical goals can be reached by continuing funding in the proposed DOE budget for programs in natural gas supply, gas turbines, fuel cells, natural gas cooling, natural gas vehicles, and industrial efficiency. We at GRI are committed to continue to work with both Congress and the Department of Energy to accomplish the mutual goals of government and industry.

NATURAL GAS-RELATED RESEARCH WITHIN JURISDICTION OF INTERIOR AND RELATED AGENCIES SUBCOMMITTEE, FISCAL YEAR 1998

[Dollars in millions]

Program	Fiscal year—	
	1997 appropriation	1998 request
Fossil energy		
Natural gas supply:		
Exploration and production	\$14.12	\$14.90
Delivery and storage	1.00	0.99
Utilization	5.84	4.81
Environmental research/regulatory impact analysis	2.65	4.62
Advanced turbine systems	46.60	31.38
Fuel cells	50.12	46.29
Total fossil	120.33	102.98
Energy efficiency		
Natural gas cooling ¹	7.85	8.75
Lighting end appliance R&D ¹	0.46	1.45
Gas turbines	28.85	28.85
Industries of the future ¹	5.78	5.66
Transportation—natural gas vehicles ¹	20.34	23.48
Fuel cells (transportation and microgeneration) ¹	5.28	7.61
Total energy efficiency	68.56	75.80
Total gas related	188.89	178.78

¹Indicates gas-related portion taken from overall program.

PREPARED STATEMENT OF ELIAS H. CAMARA, PRESIDENT AND CEO, M-C POWER CORP.

Mr. Chairman, this hearing occurs at a very significant point in M-C Power's development of our molten carbonate fuel cell (MCFC) powerplant.

Fuel cells are energy conversion devices that transform the energy in a fuel directly into electricity by means of an electrochemical reaction. Because there is no combustion, fuel cells are clean, highly efficient, and can be sited close to the electricity demand point, significantly reducing the high costs of transmission and distribution. Molten carbonate fuel cells operate at 1,200° F., are 55 to 60 percent efficient, and produce high quality heat for cogeneration. With heat recovery, total plant efficiency can approach 85 percent.

On February 20, 1997, we had the pleasure of hosting the official dedication of our current 250 kilowatt (kW) cogeneration powerplant demonstration at Naval Air Station (NAS) Miramar in San Diego, California. The facility began to produce electricity and steam for NAS Miramar several weeks before the dedication and so far has operated for over 1,300 hours.

There are a number of aspects of this demonstration that we think are exciting.

First, a successful demonstration at NAS Miramar will show that we are applying the lessons we are learning throughout our development process in resolving the basic issues of fuel cell stack design, gas flow distribution, component manufacturing processes, and assembly techniques. Although most of the balance of plant components are commercial technologies that only need to be modified for adaptation to our fuel cell application, the fuel cell stack itself is cutting-edge, first-of-a-kind technology.

The 250kW stack at NAS Miramar is 6 feet high, containing 250 individual fuel cells, each approximately 60 inches long by 41 inches wide by 0.3 inches thick. They are layered one on top of the other, each with a total of six separate, full-area components. Every individual cell must fit, seal and stack within very close tolerances in order to maintain proper seals, gas flows and electrical current collection during operation. The engineering challenges of design, manufacturing techniques, materials handling and assembly procedures have been the drivers for M-C Power and the DOE fuel cell program, and success at Miramar will go a long way to show that we are meeting those challenges.

The second exciting aspect of our fuel cell development is the team we have put together. M-C Power was incorporated in 1987, with the sole purpose of developing molten carbonate fuel cells. That is the area of our technical expertise, backed by the continuing technical support of the Institute of Gas Technology, who performed the original stages of the development of our technology.

To turn fuel cell stacks into powerplants, however, a broader range of expertise is needed. In the fuel cell stack are the components that produce the electrochemical reaction that generates electricity. The powerplant must also include components, known as the balance-of-plant (BOP) equipment, that produce a clean stream of hydrogen-containing fuel from natural gas or other fuel, and components that convert the fuel cell's direct electrical current into high quality alternating current suitable for use in a conventional electricity distribution grid.

To supplement M-C Power's fuel cell expertise, we have teamed with the Bechtel Corporation for their world-wide reputation in engineering and powerplant design, and with Stewart & Stevenson Services for their world-wide reputation in powerplant fabrication and packaging, service, and market knowledge. That combination of skills and assets will continue to be of great benefit in moving our technology forward.

Members of this subcommittee should be proud of your role, as well. With increasing pressure to wisely spend fewer tax dollars, your consistent support of the DOE fuel cell program that provides our basic funding is deeply appreciated. We know there are competing interests for prioritization and funding under your jurisdiction.

We also owe much to the strong financial support to date from the Gas Research Institute, the Electric Power Research Institute, the Defense Advanced Research Planning Agency and individual utilities who have committed scarce R&D funds to supplement the DOE program funded through this subcommittee. San Diego Gas & Electric has shown strong leadership in their industry as the host utility for our HAS Miramar project.

We benefit, as well, from a number of other sources. During this same hearing you will receive testimony from the Alliance to Commercialize Carbonate Technology (ACCT), a rapidly growing consortium of electric and gas utilities and other private sector entities, including international members. ACCT provides us with a constant stream of guidance and feedback about technical issues and market directions to assure that we will better fit distributed generation needs. In turn, we hope

that ACCT members learn more about fuel cells and how ACCT members might soon use them in their own industries. We assume that the knowledge and insight they gain about our fuel cells will help give them sufficient confidence in our technology to be among our customers.

We are also pleased to see growing international interest in our progress. At the Feb. 20 dedication of our NAS Miramar demonstration, we had delegations from both Russia and Poland who recognize our leadership and are interested in working with us to develop future molten carbonate fuel cell markets and manufacturing in their home countries. We also have a series of development discussions underway with companies in South America who expect large markets there. The demonstration at Miramar is also serving as a good opportunity the Navy, Marines and other branches of the military an opportunity to begin to familiarize themselves with the attributes and cogeneration applications of molten carbonate fuel cells for dependable, efficient energy production on military bases.

Despite all that interest, we need to be clear that this demonstration of our first 250kW powerplant at NAS Miramar, while a great breakthrough, will still be several significant steps away from a powerplant adequately developed for deployment in the power generation industry. Our DOE program is directed toward a demonstration that will produce 1000kW or 1 megawatt (Mw) of power, effectively four times the output of the NAS Miramar unit.

Although we hope that the powerplant at NAS Miramar will show that we have solved the fundamental design, manufacturing and assembly techniques necessary for a successful fuel cell stack, we also fully expect that it will lead us to improvements that still need to be implemented in order to increase performance and reliability up to market-acceptable standards while also bringing down size and cost. Even when we can call the unit at NAS Miramar a success, it will still be only the first time that a fuel cell stack of this size has been successfully demonstrated. At the moment, it is a single stack that has performed well for several weeks. While we are extremely pleased with that, we also know that reproducibility, performance over time, scale-up, manufacturing cost and packaging to fit the market are the real criteria for success. Those are the challenges that lie ahead, in a program that will continue to need your strong support.

The balance-of-plant design and equipment used at Miramar were designed to provide a functioning plant that would allow the cogeneration of both electricity and heat for use within NAS Miramar. Our future 1 MW product will use multiple units of fuel cell stacks based on, but improved from, the one at Miramar, and a package design that will be optimized for cost, efficiency and size. That future product, producing approximately four times as much power as the Miramar unit, must do so in approximately half the ground space. Developing a multi-stack unit, with its own carefully designed balance-of-plant is the challenge that still confronts us beyond Miramar.

Mr. Chairman, M-C Power is here once again to ask for your continued support, and the support of this subcommittee. The Department of Energy's fiscal year 1998 request for molten carbonate fuel cells represents a 10 percent cut from the level the Congress appropriated for us this year, and the program funding has historically been divided approximately equally between M-C Power and the Energy Research Corporation, who is developing a different approach to molten carbonate fuel cells. Your strong and steady support in the past has been vital to bringing us this far.

The good news, however, is that we are now making significant steps forward. The past years of hard work and funding support are now showing more dramatic pay off, and the curve of our progress is accelerating. Although we know you will hear that same plea from many witnesses, we hope our Miramar project will provide the proof of that claim for us. If this subcommittee accepts the DOE request for fiscal year 1998 funding in this program, M-C Power's portion of that funding would likely be approximately \$15.5 million. In order to keep our fiscal year 1998 growth and progress on track according to our current DOE contract, approximately \$20 million for M-C Power would be necessary.

Unfortunately, we are not yet at the point where we can make up that difference by turning to the private sector. Although we look forward to that day even more than you do, because it will indicate our developmental success, we are not yet there.

As noted earlier, even if completely successful by any definition of success applied to it, the Miramar project is still only the first successful 250kW stack in a configuration that is not yet the final 1 MW unit.

We are also at a time when electric and gas utility markets are in a state of rapid change. You will hear more about this in the ACCT testimony submitted in this same hearing. While there is strong consensus that deregulation may lead to even greater markets for small, incremental distributed generation technologies such as

molten carbonate fuel cells, the current market uncertainties of deregulation cause caution among possible energy sector partners or purchasers. Current electric utilities, now both generating and distributing electricity, may, in future deregulated markets, become primarily distributors. Current gas utilities face similar uncertainties about their future competitive roles. New energy service companies and entrepreneurial ventures may arise to capture opportunity markets.

Until the impacts of those changes become more clear, however, sources of private funds for molten carbonate fuel cell development have the luxury of waiting both for more dependable proof of our success and more clarity about who will use or deploy technologies such as ours. Continued support by this subcommittee will stabilize assurance among our potential supporters that the Congress and the Department of Energy remain committed to our development until we reach that point.

Again, M-C Power thanks you and this subcommittee for your strong support in the past, and we ask for your equally strong support for fiscal year 1998.

PREPARED STATEMENT OF DR. FRANK DERBYSHIRE, DIRECTOR, UNIVERSITY OF KENTUCKY, CENTER FOR APPLIED ENERGY RESEARCH

My testimony is concerned with a request to the subcommittee to support an innovative concept that can lead to the commercialization of clean coal technologies for advanced power generation, and provide an opportunity for the entrance of commercial coal conversion technologies. I am asking for federal funds to cost share a one year study that will provide the basis for a decision point to proceed with the formation of an industrial consortium to design and construct a pioneer commercial powerplant in Kentucky. The plant will employ advanced technologies for the production of clean, low-cost electrical power, with the optional co-production of liquid fuels, chemicals, and materials.

USE OF COAL

Coal is our most abundant fossil fuel, the source of low cost electrical energy, and is vital to national prosperity and energy security. Low-cost power is an important locational factor for attracting new manufacturing industries, for economic development, and for job creation. Neither natural gas nor oil can compete in terms of abundance or low cost.

To address environmental concerns over the use of coal, the federal government, through the Department of Energy, has made an enormous investment to demonstrate clean coal technologies. The advanced technologies that are now available offer increases in efficiency, which translates to still lower cost electricity and greatly reduced CO₂ emissions. At the same time, sophisticated emission control systems minimize environmental impacts. The commercialization of advanced technologies would help to stabilize coal production, particularly in the eastern coal-producing states, and provide a spur to the growth of US industry.

ADVANCED POWER GENERATION

It is anticipated that any new plant for advanced power generation will employ one of several schemes tested by the DOE at the pilot plant or demonstration-scale and based upon integrated gasification combined-cycle (IGCC) technology. IGCC involves coal gasification to generate electricity efficiently with effective gas clean up. The system can be combined with one of a number of technologies to produce liquid fuels, chemicals, or materials. The advantages of IGCC include much greater flexibility in fuel selection, improved emissions control and greatly improved thermal efficiencies. Extremely low grade coals can be utilized with up to 99 percent SO₂ capture, and the thermal efficiency is up to 35 percent over conventional plants bringing a 25 percent reduction in CO₂ emissions. The ability to convert a slip stream of gasified coal to other products affords additional flexibility in the product slate and could improve overall process economics.

IMPEDIMENTS TO COMMERCIALIZATION

The deregulation of the electric utility industry has brought uncertainties, but also new opportunities for the free market implementation of new technologies. Numerous reported studies have demonstrated that while the utilities recognize the potential advantages of advanced power generation technologies, they are unwilling to incur costs that adversely affect their competitive position. Considerable investment is required to construct a new facility and, as with any new technology, there is some technical risk associated with a "first-of-a-kind" plant. IGCC represents a fun-

damentally new technology, and there is limited experience of economics and operation at the commercial scale.

As a consequence, decisions to build new baseload capacity, and the type of technology that will be employed, are being deferred as long as possible, and the life of existing plants is being extended. Even then, there will still be hesitance to adopt advanced technologies. An additional area of uncertainty concerns the price and availability of natural gas. Industry is unlikely to act alone to take the next steps, and government support is necessary to encourage commercialization and to protect the sizeable investments that government and industry have already made in the clean coal technology program—estimated to be nearly \$7.2 billion.

PIONEER COMMERCIAL PLANT

A proposed solution to this impasse has been developed by members of the Kentucky Coal Marketing and Export Council which provides oversight of the Commonwealth's coal interests and is a body advisory to the Governor of Kentucky, consisting of coal producers, utilities, transporters, and the academic and financial communities. The basic elements are to bring together an industrial consortium to construct and operate a 300–400 MW merchant or pioneer baseload plant for advanced power generation, based upon an appropriate gasification technology and, optionally, to co-produce liquid fuels, chemicals, and materials. The plant would represent the first essential step towards the eventual attainment of mature, low-risk commercial processes. Through collective investment by private industry, the risks are shared, and the proposed plant will deliver baseload power and products to the partners in proportion to their ownership interests and needs. The co-production of high added-value products could help to offset economic uncertainties, attract other industries to join the project, and provide a mechanism to commercialize coal conversion technologies. A particular example of these products is a recently developed minimum emission diesel fuel, or eco-diesel, that can be produced by synthesis gas conversion and could be used to meet federal fuel requirements for state fleets.

By siting the plant directly in the coal fields, transportation costs and environmental impacts will be reduced. Because advanced clean coal technologies can lower the constraints on coal quality, it will also allow the utilization of coals that have been “stranded” because of their sulfur and ash contents. It is also the intention to examine the use of coals that have been stranded by outdated mining practices (e.g. in waste ponds, abandoned highwalls) and because of limitations in mining technology (e.g. in thin seams). Other advantages and benefits of the project are that it will: assist economic development and the stabilization of coal industry; provide employment; realize revenue from taxes; enhance the utilization of indigenous resources and reduce dependence on imported energy; and improve US competitiveness in technology and engineering. The concept is consistent with the Department of Energy's strategy. It provides a model for similar ventures that can bring investments in research and development to timely industrial implementation, and could eventually lead to the widespread construction of new plants for advanced coal-fired power generation.

Private industry will bear the main burden of investment, and will look to the state and federal governments for support to help to initiate the venture, for use of their expertise and resources to help to carry it through, and to provide incentives in the form of guarantees or subsidies that will mitigate the risk and encourage investors. The period from inception to plant start-up will extend over five to eight and will involve several distinct stages, with a decision point at the end of each stage.

REQUIREMENTS

Stage I will be a one year feasibility study to establish a detailed definition of the concept, to determine the technological and economic uncertainties, and to ascertain whether the generation of co-products is worthwhile. This groundwork is essential to affirm a sound basis for the concept and to provide the information necessary to attract industrial partners. The study will produce: economic and technical analyses of prospective technologies; an evaluation of the technologies and benefits of the generation of co-products; cost estimates for subsequent phases; the projected cost of new power production; an analysis of markets for electric power and other products; and defined criteria for plant siting and potential locations. The end product will be a prospectus for potential industrial partners. Other critical issues should be addressed in related research and development programs.

If a decision is made to proceed, subsequent stages will involve: a detailed evaluation of the technology, and economics of the selected plant, environmental assessments, and a preliminary engineering design; a detailed engineering design and

costing; and construction and operation. The work will be directed by the Kentucky Coal Export & Marketing Council and will involve the efforts of the University of Kentucky Center for Applied Energy Research and an experienced DoE contractor such as MITRETEK Systems.

It is requested that the committee appropriate the sum of \$400,000 for the next fiscal year to support the first stage. In recognition of the significance of the overall concept to the Commonwealth of Kentucky, the state is prepared to commit a further \$200,000 towards the first stage costs, consisting of \$150,000 committed in kind by the University of Kentucky Center for Applied Energy Research and the balance through the office of the Governor.

Input to the feasibility study will be provided by information from current and on-going research and development programs. The continuation of these programs, and their focus on selected topics will be important to the success of later stages. We request the subcommittee to appropriate funding that will allow a continued funding and, where appropriate, expansion of the DOE's research and development programs in the following areas: the disposal and utilization of the solid by-products from advanced gasifiers; the production of liquid fuels and chemicals from coal synthesis gas; the production of added-value carbon materials from coal; and the development of technologies for stranded coal recovery.

LETTER FROM TOMMY CRAWFORD, CHAIR, SOUTHEASTERN MANUFACTURED HOUSING ALLIANCE

NEW YORK, NY, *March 13, 1997.*

Hon. Senator SLADE GORTON,
Chairman, Senate Interior Appropriations Committee,
U.S. Senate, Washington, DC.

DEAR SENATOR GORTON: I am writing today to urge your support for \$7.0 million in funding for Energy Star Partnerships, a program that works closely with industry to demonstrate energy efficient equipment and activities. The program is funded by the Department of Energy's Office of Building Equipment.

The Southeastern Manufactured Housing Alliance is working on a path parallel to the DOE Energy Star Partnerships. Our common goal is on reducing energy use and energy costs in manufactured housing. The Southeast is synonymous with manufactured homes. Over 47 percent of all new manufactured homes are in the Southeast and, in composite, this industry adds about \$14.1 billion to the regional economy (1996). About one out of every seven homes sold in the nation are produced by manufacturer members of the Alliance. Three of the top ten residential power suppliers are Alliance members and for many utility members over 70 percent of their new connections are manufactured homes.

However, manufactured housing is by no means only a regional concern. The industry is experiencing explosive growth nationwide. By sometime in the next decade, industry observers expect manufactured homes to account for about 50 percent of all new housing. The problems we address have relevance to all manufactured homes.

The Manufactured Housing Alliance is collaborating with the Department of Energy's Energy Star Partnerships program on a number of activities related to increasing the energy efficiency of our nation's manufactured housing. This is particularly important, since the manufactured housing industry provides the lion's share of shelter for low income families; households whose financial security often depends on the low energy costs associated with energy efficient construction. Some of the activities we are undertaking in partnership with DOE include the following: development of energy efficiency lending practices for manufactured housing, equipment sizing guidelines to improve overall performance, consumer home buying educational workshops, and improvements in air distribution systems. There are myriad other research areas that merit sponsorship. We will continue to identify and pursue these opportunities to improve housing efficiency and affordability. The Energy Star Partnerships program is an ideal vehicle for leveraging these initiatives and bringing the benefits to American home buyers and owners.

To that end, it is important that the Energy Star Partnerships program at DOE be funded at the fiscal year 1998 requested level of \$7.0 million. As Chairman of the Appropriations Subcommittee, we would very much appreciate your support for full program funding. The members of the Manufactured Housing Alliance feel very strongly that this program be fully funded—and activities relating to manufactured housing should increase—improving housing affordability, energy efficiency, and quality.

Thank you for your consideration of this request.
Sincerely,

TOMMY CRAWFORD, *Chair*.

PREPARED STATEMENT OF THE PETROLEUM TECHNOLOGY TRANSFER COUNCIL

The Petroleum Technology Transfer Council (PTTC) is pleased to comment in support of the Department of Energy fiscal year 1998 funding request for oil and natural gas programs in the Office of Fossil Energy. The Fossil Energy programs are responsible for many important projects that benefit US independent oil and gas producers.

This testimony is mainly about the PTTC, a unique organization formed by industry in 1994. In partnership with state governments, industry, and the US Department of Energy, PTTC has created a multi-disciplinary network for effectively communicating exploration and production (E&P) technologies. Our main mission has been to transfer practical, cost-efficient technology to producers in the field to improve production efficiency and help prevent the premature abandonment of the thousands of marginal wells in the 33 producing states. In a very short time, PTTC has proven to be a true success story for DOE. It has achieved its original goals—and the program is able to document its results.

The nation's small independent operating companies—which are responsible for the majority of the production in the lower 48 states—increasingly are using PTTC to gain access to the research and development programs from the Department of Energy, the national labs, universities, state geological surveys, petroleum service companies, and other sources. Independent producers are participating in PTTC's network of resource centers, workshops and Internet websites. As a result, accessing and applying E&P technologies is helping increase the recovery of US resources—and addressing the problem of the 17,000 marginal wells abandoned every year in this country.

PTTC has served as one of the main mechanisms for disseminating DOE-sponsored upstream technology and information to the industry. The Department of Energy has supported the effort and provided start-up funding under a five-year cost-share program. fiscal year 1998 represents the fourth year of the contract, and PTTC has more than exceeded its cost-share requirements.

The original agreement with DOE called for \$3.56 million in federal funding for the PTTC for fiscal year 1998. These funds currently come from both the oil and natural gas programs of DOE's Office of Fossil Energy. Our total cost estimates for the current year, fiscal year 1997, shown in Table I, have been scaled back by 27 percent from the contract amount, respecting the need to reduce federal spending. At the same time, PTTC has dramatically increased its non-federal cost-share.

Continued federal support of PTTC is needed to continue the program until it is completely established and can survive on funding from industry and state governments. Beyond fiscal year 1999, the PTTC expects that it will no longer need federal funds, as efforts are continued through self-generated revenues. We believe that this initial seed money investment by the DOE will be returned in multiples through incremental federal revenues from new projects and additional energy production that will be stimulated by effective technology transfer.

TABLE I.—PTTC FUNDING
[Dollars in thousands]

Source of funds/yr.	Fiscal years—					Total
	1995	1996	1997	1998 ¹	1999 ¹	
DOE FE Oi/Gas programs	\$2,200	\$2,200	\$2,400	\$3,560	\$3,460	\$15,720
Non-Federal cost-share	1,500	2,100	1,800	3,200	3,500	11,700
Total	3,700	4,300	4,200	6,760	6,960	25,500
DOE share (percent)	60	50	57	53	50	54
Non-DOE share (percent)	40	50	43	47	50	46

¹ Represents amount in 5-year contract.

INDUSTRY AND GOVERNMENT SHOULD SHARE IN R&D INVESTMENTS

Public and private research continue to achieve advances in petroleum E&P technology that could yield significant national benefits in the form of increased domestic production, reduced oil imports, and increased public sector revenues. Technology advances resulting from ongoing R&D projects promise to amplify these potential benefits. Both industry and the public sector stand to gain from the development and application of advanced E&P technologies; thus both should share in the investments.

Government also has an essential stewardship role—to ensure that our domestic resources are produced efficiently and with respect for the environment. To achieve these goals, industry and government must recognize the challenge and work together.

Industry investment in petroleum-related technology and R&D is significantly reduced. Thus, DOE needs to continue to invest wisely in “technology transfer” that is focused toward the industry’s most important needs. This means identifying where advances in geosciences and petroleum engineering can achieve the greatest return in deferring premature well abandonments and maximizing incremental oil and gas production.

EFFECTIVE TECHNOLOGY TRANSFER IS ESSENTIAL TO REALIZE R&D BENEFITS

The full economic potential of new and existing technologies will not be achieved if producers are not aware of the technology, do not understand its economic potential, or do not feel comfortable with applying it. Nor will it be achieved if known resources are abandoned in the reservoir before the technology can be applied. Effective technology transfer is essential to achieve the full benefits of this potential and to sustain a viable domestic petroleum industry.

The government has already invested billions of dollars through the years in federally-funded research at national labs, universities, and other R&D providers. To truly obtain value from this past investment, it is critical to continue technology transfer programs. It is important for PTTC to be funded for a few more years until it is fully established in all regions, and can become financially self-sufficient. By doing so, the government will have an effective mechanism for getting federally-funded R&D into the hands of industry.

PTTC EFFECTIVELY TRANSFERS PRODUCTS OF PUBLIC AND PRIVATE R&D

Current technology transfer approaches are not efficient—particularly as they serve independent producers. Rates of technology penetration in the independent producing community are far slower than among the majors. This is the primary reason why PTTC was formed by the Independent Petroleum Association of America, in conjunction with the state and regional producing associations, the Gas Research Institute (GRI), the Interstate Oil and Gas Compact Commission (IOGCC) and other groups.

Studies performed by the National Petroleum Council, IOGCC, and DOE have identified significant gaps and recommended improvements that must be made by government, industry, and the organizations that support the industry. PTTC’s role is to help bridge these gaps in technology transfer to petroleum producers, accelerate and improve the flow of technology information to domestic E&P companies, and provide essential industry input to the research community to help ensure that DOE and other research focuses on the highest priorities of the E&P industry.

PTTC IS ACHIEVING ITS TECHNOLOGY TRANSFER GOALS

The PTTC has helped DOE in targeting upstream R&D efforts on practical, short-term projects with immediate applications in the field. As a result, the public and private R&D process is accelerated by informing users of new and on-going research projects. PTTC technology workshops serve as catalysts for bringing new partners into R&D consortia and other industry groups. An important benefit is that small independent operating companies (those without the staff or budget for R&D) have new access to cost-efficient technologies to maximize the recovery of oil and natural gas reserves. The future of the domestic petroleum industry’s R&D efforts must be collaborative—a federal, state, industry partnership. PTTC epitomizes this new paradigm by serving as a technology clearinghouse.

Some of the PTTC’s most important accomplishments include:

PTTC has completed 32 problem identification workshops in all ten regions. The technical report from the workshops provide valuable input to DOE.

PTTC has conducted more than 30 technology workshops around the country, focusing on a variety of topics from 3-D seismic applications to produced water disposal.

PTTC conducted a series of traveling workshops for DOE to disseminate results of its Class 1 Reservoir Demonstration Project. These workshops were held in six cities, and more are planned.

PTTC is working jointly with many other organizations to co-sponsor relevant training sessions—including the Society of Petroleum Engineers, the American Association of Petroleum Geologists, IOGCC, GRI and others.

All 10 PTTC regional resource centers are open, and three satellite centers are expected to open in fiscal year 1998, depending on the availability of funds. These centers have been established at existing technical institutions in petroleum producing regions throughout the country. They provide technical assistance, computerized workstations with access to information and analytical tools, and other technical outreach services for local operators.

Commercial vendors of technology, software, and other information have been enthusiastic about donating their products and services to the PTTC resource centers, and helping to train producers in state-of-the-art technologies to solve their most important technical problems. PTTC has currently received approximately \$1.8 million worth of software donations.

PTTC has created an electronic information system on the Internet allowing petroleum producers and other users to share information. The system links the 10 regional home pages with the national Headquarters web site. The most popular feature is an interactive Technical Forum that is divided into topics for users to post questions, comments or notices. Hundreds of producers have attended PTTC workshops on accessing oil and gas information on Internet.

PTTC HELPS DOE'S OIL AND GAS PROGRAMS SERVE A DIVERSE CLIENTELE

PTTC is one key element of the oil and natural gas programs in the DOE Office of Fossil Energy that makes good sense. It delivers demonstrable and measurable benefits to the producing industry and to the nation. PTTC provides a new and effective means for disseminating the results and products of federally-funded oil and natural gas research and analyses. Last year, DOE designed its new outreach program based on the PTTC structure and the regional DOE-PTTC teams are working closely together to meet industry's technical needs. With other important DOE initiatives such as the Natural Gas and Oil Technology Partnership, the reservoir class programs, and other actions, the audience for the products of DOE programs has expanded.

DOE'S OIL AND GAS PROGRAMS PROVIDE VITAL SERVICES

We want to close on behalf of America's independent petroleum producers by asserting that Congress should continue to support an active DOE role in petroleum-related R&D and technology transfer. Oil and natural gas are strategically and economically critical national resources, and the value of DOE programs in these areas extend far beyond geoscience and engineering research.

Through technology transfer efforts such as the PTTC, the results of federally-funded research will reach operators in the field, where it can be used to preserve our national energy security. We encourage Congress to provide the funding that DOE has requested to continue its vital oil and natural gas programs. Thank you.

PREPARED STATEMENT OF THE COAL UTILIZATION RESEARCH COUNCIL [CURC]

This written testimony is submitted by the Coal Utilization Research Council (CURC or the Council), a recently-formed organization currently consisting of utilities, coal producers, major equipment suppliers, architect, engineering and construction firms and other service providers interested in the cost-effective and environmentally superior use of coal. Having only been launched within the past month, the membership of CURC is not yet able to comment, in detail, upon the proposed Department of Energy (DOE) budget for fiscal year 1998. During this Subcommittee's deliberations in the coming months, the Council hopes to provide Members with detailed comments about the scope and direction of the DOE's proposed fiscal year 1998 fossil energy budget, particularly those items related to the coal research and development program.

Many members of the CURC are also members of the Clean Coal Technology Coalition. The clean coal program is a model for successful government/industry partnering. Industry's successful involvement in clean coal has led many companies

interested in the continued use of coal to now join together in the creation of this new organization so that we might collectively focus on the longer term research and development needed to insure the continued use of coal.

THE MISSION OF THE COAL UTILIZATION RESEARCH COUNCIL

The members of CURC intend to examine in-depth those coal-related research and development programs being conducted at the federal and state government levels, as well as within industry. CURC will collaborate with government agencies and other industry organizations throughout this process. The Council intends to achieve a consensus among our members about the direction and level of effort required by government and industry to achieve coal-related technology development results that will then be applied commercially. The Council will be a vocal advocate and a provider of useful information that addresses the importance of, as well as the benefits to, our Nation with respect to coal-related R&D and technology development. To the extent possible, CURC will also encourage the establishment of international cooperation and information dissemination that addresses coal-based R&D and the promotion of international coal technology exchanges. Importantly, such exchanges must be reciprocal: information and "know how" cannot, and should not, flow in one direction only. We have information to provide and share; other nations do, as well. As a consequence of these efforts, we will seek, perhaps not in this budget cycle but in subsequent examinations of future budget requests, to provide this Subcommittee with an industry view of a coherent coal-related R&D agenda (a long-term coal R&D "roadmap") that will be designed to best insure the continued use of coal.

GENERAL COMMENTS ABOUT DOE'S COAL R&D BUDGET

Our membership is aware of the very difficult choices confronting this Congress as you must choose among programs and priorities. While we are in no position yet to recommend significant changes or reallocations or any overall increases to the coal R&D program, we do wish to take this opportunity to emphasize the importance of continuing an aggressive R&D program for coal utilization. And, importantly, the members of CURC urge the Subcommittee to resist any attempts to further reduce appropriations for coal R&D.

SPECIFIC COMMENTS

First, we would caution against reducing budgets or eliminating research and development programs related to fossil energy as some in Congress are advocating. Those Members have attacked federal energy research and development programs claiming that the programs represent corporate welfare and special interest Subsidies." That label needs to be challenged. Where industry is willing to cost-share with government in pursuing coal-based R&D, that partnership is not corporate welfare. That label also is not appropriate where the government, on behalf of taxpayers, is partnering with industry and has an interest, on behalf of the public, in ensuring that our natural resources are used efficiently and that the use of those resources results in the least negative impact to the environment while also insuring a great benefit to the general public through secure, reliable and low-cost energy and other coal-based products.

Second, many in industry, like government, have been required to downsize significantly. While industry recognizes the importance of research and development, it is nonetheless true that long-term R&D is among the first budget categories to feel the knife because limited dollars are increasingly directed at technology innovation designed to support shorter and shorter product life cycles. In other words, research and development dollars are only justified and approved if near-term results are shown. Yet, in the face of these budget cuts in R&D, we also know, as a nation, that federal support for longer-term R&D has been a critical element to our industrial competitiveness. The President's Committee of Advisors on Science and Technology recently reported to the President (see: letter from John A Young, Co-chair of the President's Committee of Advisors on Science and Technology, dated December 6, 1996): "The United States has allowed Federal spending on energy R&D to fall more than three-fold in real terms in the last 15 years, a period in which private funding for energy R&D also was falling. Government spending on energy R&D is more than twice as high in Japan as in the United States, and about four times as high as a fraction of GNP."

That same communication to the President recommended: "* * * an expanded effort on clean and more efficient fossil-fuel technologies."

For purposes of comparison, in fiscal year 1994, the DOE provided over \$167 million for coal R&D programs; however, in fiscal year 1997, this amount was reduced to \$103 million—nearly a 40-percent reduction in only 4 years.

While the reduction to the requested funding level for coal R&D is less dramatic this year, it is a continued reduction nonetheless. And, in light of the goals and objectives that the DOE has set forth as justification for the budget requested for fiscal year 1998, it does not appear that this decreased level of funding can achieve the goals sought. During the coming months, the CURC intends to examine the levels of funding for the various categories of programs included in the DOE's coal R&D program against the goals which those funding levels are supposed to support. In addition, the Council will seek an industry perspective regarding research and development and then will urge upon the Congress and the Administration our agreed-upon R&D "roadmaps" which we believe should be pursued in the support of an overall goal to insure the continued utilization of coal.

Third, in this time of constrained budgets, it may also be necessary to prioritize among programs. Our intent is to undertake such a task and to provide that information to the Congress, as well. As a result, while the CURC is not now suggesting that funding for coal-related R&D should be raised to the level of several years ago, we may call to the attention of the Congress a need to insure that a balance in federal expenditures is achieved among the various sources of energy and energy conservation/efficiency.¹

CONCLUSIONS

U.S. coal reserves represent 90 percent of our Nation's combined energy reserves; and, coal-fired generation provides 55 percent of U.S. electricity. Worldwide, coal accounts for 25 percent of total energy consumption and is projected to increase to more than 50 percent over the next 20 years. In addition, coal provides significant amounts of energy for industrial processes and is an emerging feedstock for transportation fuels and chemicals. Coal and coal-related technologies add billions of dollars each year to our economy. In addition, coal-based technologies that permit the use of coal are part of a growing U.S. export market. Those growing exports contribute to our country's international competitiveness.

To assure the continued utilization of our abundant reserves, coal must be used effectively, economically, and in a manner that is environmentally acceptable. Coal will remain a basic energy feedstock to power and fuel the U.S. economy and will be used increasingly throughout the world as an energy and industrial feedstock, particularly as developing countries gain economic strength. New technologies derived from research and development are key to the continued effective use of coal.

In an era of increasing competition to provide low cost electricity, it is important for coal to remain a significant fuel resource of the future. In addition, mounting pressure to produce economical energy from coal will be coupled with pressure to minimize the environmental impacts resulting from coal use. These demands can be met through advancements in existing technologies and the development of new technologies.

Continuing government support is required to ensure that a balance of short-and longer-term, high-risk research and development is pursued. Certain clean coal technologies for power production also are amenable to the production of clean fuels and chemicals. Research and development in these technologies should continue to be an important part of federal government's coal R&D program.

The members of the Council appreciate the opportunity to present these views and look forward to working with the members of the Subcommittee.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF ENERGY SERVICE COMPANIES

The National Association of Energy Service Companies (NAESCO) is a trade association of energy service companies (ESCOs) and their trade allies, including utility and manufacturing companies. NAESCO's current membership of over 100 organizations includes firms involved in the design, manufacture, financing and installation of energy efficiency equipment and services in the private and public sectors, including Federal buildings.

¹Despite an overall reduction in funding for DOE R&D programs, not all program budgets are being cut. In the fiscal year 1997 budget request, the budget for fossil energy programs was scaled back 10 percent, while the budget for renewable energy and energy efficiency was increased by 35 percent (from the fiscal year 1996 level of appropriations).

The thousands of energy efficiency retrofits installed by NAESCO member companies to date enable energy consumers to save an average of 25 percent off of their previous building energy costs. NAESCO's energy service company (ESCO) members offer capital constrained customers the opportunity to upgrade their facilities without any up-front capital expenditures. In addition, ESCOs assume the performance and technical risk so that repayment for project costs comes only from measured and verified energy savings generated by a successful, ongoing project. NAESCO appreciates the opportunity to present the following testimony.

In its fiscal year 1998 budget request, DOE states that "the major fiscal year 1998 emphasis" for the Federal Energy Management Program (FEMP) "will be on using private sector investments to retrofit federal facilities using energy savings performance contracting [ESPC], thus stretching federal leveraging to the maximum." For the reasons stated below, NAESCO fully supports DOE's budget requests for FEMP and other programs that are designed: (1) to support the objective of using ESPCs for the energy efficient retrofit of federal facilities, and (2) to provide equal access by all qualified energy service providers to the Federal market for energy efficiency services.

THE ENERGY SERVICES INDUSTRY

The U.S. electricity market is moving away from its traditional monopoly structure and cost of service regulation and into a market characterized by open retail competition. At the same time, energy efficiency retrofits, funded and carried out by private sector energy service companies (ESCOs) offer the opportunity to upgrade existing facilities and manufacturing processes to create a more energy efficient and productive U.S. economy.

ESCOs are entrepreneurial companies, who finance and install energy efficiency measures for energy users. The ESCOs' services often include the installation of energy efficient lighting, motors, HVAC and other energy conservation measures at no up-front cost to a customer such as the Federal Government. The owners or occupants of such buildings benefit from reduced energy costs, while enjoying an upgraded facility. As an added benefit, existing utility generation capacity is freed up so that it can be sold to new customers, thus avoiding investments in new generating capacity.

ESCOs produce numerous new jobs, not only within their companies, but through the use of contractors and through the countless other firms involved, directly and indirectly, in supporting energy conservation projects. For example, the ESCO industry has spawned a new group of firms that specialize in providing the hardware and software used in measuring energy savings.

Approximately one-third of the money invested in ESCO projects is applied to labor costs. Thus, out of the estimated \$2 billion of installed projects to date, ESCOs have generated approximately \$700 million in direct labor employment. In addition, the energy efficiency installed by ESCOs are primarily U.S.-produced, providing an added stimulus to the U.S. economy. Energy service companies thus support American manufacturing and stimulate job growth while enhancing the competitiveness of U.S. industry by reducing the operating costs of the nation's buildings, and manufacturing facilities and processes. In addition, the more efficient application of energy produces environmental benefits through reductions in air emissions from burning fossil fuels.

REDUCING THE COSTS OF OPERATING THE FEDERAL GOVERNMENT THROUGH ENERGY SAVINGS PERFORMANCE CONTRACTING

The Federal government is the single largest energy consumer in the world. In 1994, the Federal government spent about \$3.8 billion for the energy it used in the buildings that it owns and leases. These annual energy costs can be reduced by as much as \$1 billion through performance based energy efficiency improvements financed by the private sector, for example, through the use of energy savings performance contracts (ESPCs). Moreover, these savings and the related facility improvements can be achieved at no added cost to the Federal budget, or to American taxpayers. In addition to these energy savings, the U.S. economy benefits through the creation of new jobs and through the increased competitiveness in global markets that results from the reduced costs of maintaining public and private sector infrastructures.

Congress recognized and endorsed these potential budget and energy savings in the 1985 Omnibus Budget Reconciliation Act and in the bipartisan 1992 Energy Policy Act (EPAct). In recent years, initiatives undertaken by the Department of Energy's (DOE) Federal Energy Management Program (FEMP), including Energy Savings Performance Contracting (ESPC), are leading to the development of procure-

ment structures designed to enable Federal agencies to enter partnerships with the private sector for the installation of commercially available energy efficiency technologies.

Where these efficiency investments are undertaken by ESCOs through energy savings performance contracts (ESPCs), energy consumption and cost reductions are measured continuously and reported monthly, thus ensuring real and verifiable savings. Under an ESPC, all project costs can be financed by the private ESCO who is repaid out of verified energy cost savings over the life of a contract, up to 25 years. Also, ESPC contracts usually provide for the maintenance of the conservation measures by the ESCO at no additional cost to the customer.

Unfortunately, the Federal government is realizing only a small fraction of the energy cost savings available through such private energy conservation investments in Federal facilities. DOE initiatives like Energy Savings Performance Contracting, the Regional Energy Action Teams and the Energy Efficiency Partnership Initiatives offer an important first step on the road to capturing the energy cost savings readily achievable in a broad range of Federal facilities. DOE and its sister Federal agencies must be aggressive in their pursuit of a full realization of the dollar savings and energy consumption reduction available through the wide-spread use of ESPCs.

THE DEPARTMENT OF ENERGY BUDGET REQUEST FOR ENERGY CONSERVATION

As Secretary Peña observed during his Senate confirmation hearings, the DOE should be the leader in reducing energy consumption throughout the Federal sector. Over the past three years, the DOE Office of Energy Efficiency Conservation and Renewable Energy has demonstrated leadership and initiative in four critical areas: (1) in technical guidance and training of Federal energy managers; (2) in the formulation of standardized guidelines and procedures for quantifying the energy savings resulting from the installation of energy efficiency measures; (3) in the finalization of the energy savings performance contracting regulations necessary to undertake private investments in Federal facilities; and (4) in the development and dissemination of materials designed to educate both public and private concerns regarding the availability and benefit of energy efficiency measures.

There now is experience among some Federal energy managers with private-sector financing of energy efficiency upgrades of Federal facilities through the use of energy savings performance contracting (ESPC) procedures. At this time, additional Federal support is required in two principal areas: (1) Federal contracting officers must be better educated on the opportunities for greater energy productivity within available appropriations, through such alternative financing and contracting mechanisms as energy service performance contracting; and (2) Technical and contracting support is necessary to enable Federal agencies to implement energy savings performance contracts (ESPCs). Through these efforts, it is hoped that energy savings performance contracting (ESPC) will come to be viewed as a standard mechanism for the procurement of energy services.

Through DOE's Federal Energy Management Program (FEMP), training is being provided for the over 3,000 Federal energy managers and contracting officers. FEMP also is addressing the need for technical and contracting support through its regional energy action plan (REAP) teams and other related initiatives. In addition, FEMP makes a substantial contribution to education and information dissemination about the benefits of ESPCs through the creation of educational materials and TeleFEMP broadcasts.

Finally, both FEMP and the Energy Efficiency Partnership Initiative, within DOE's office of Building Technology, State and Community Programs, are supporting the development of educational materials for federal, state and local facility managers. These materials offer a highly effective means of: (1) creating awareness of the increased productivity available through energy efficiency; and (2) enhancing contract officers and facility managers' understanding of how public sector energy efficiency projects undertaken in partnership with private sector energy service companies (ESCOs) work.

NAESCO believes that these efforts facilitate DOE's stated goal of emphasizing the use of energy savings performance contracts (ESPCs) and thus supports the budgetary levels being sought by the DOE for these initiatives. Furthermore, these programs are more than self-funding since, according to the DOE, the energy costs savings are about \$3 for every \$1 invested. Since 1985, the U.S. Government has saved over \$11 billion as a result of energy efficiency investments in federal facilities to date. The DOE has set a target of \$15 billion in net cumulative energy savings by the year 2015 as a result of these investments. By comparison this year, DOE has requested \$31 million to support its ongoing efforts to facilitate the devel-

opment of a greater number of energy efficiency investments through its technical assistance and educational initiatives. NAESCO believes that the budget request for DOE's energy efficiency initiatives is relatively de minimus when compared to the dollars saved as a result of the widespread implementation of ESPCs. NAESCO looks to both DOE and Congress in its oversight capacity as helping stimulate Federal compliance with the existing laws and regulations mandating energy consumption reduction and utilizing third party entities like ESCOs to provide the financing and assume the performance risk.

THE NEED TO ENSURE ALL QUALIFIED ENERGY PROVIDERS EQUAL ACCESS TO THE
FEDERAL MARKET

During his Senate confirmation hearings, Secretary Designate Peña supported the development of a fully competitive marketplace for energy efficiency and other energy related services. In its fiscal year 1998 budget request for FEMP, the DOE has stated its intent to emphasize the use of energy savings performance contracts (ESPCs), which require an open competitive process, for the procurement of energy efficiency services in Federal facilities.

NAESCO believes that the current reliance on the use of utility sole source contracts by Federal agencies for energy efficiency services violates Federal requirements for full and open competition and is contrary to the national trend toward competition in the utility industry. Moreover, it denies the Federal government and U.S. taxpayers the benefits of competition in the market for energy services.

THROUGH THE COMPETITIVE PROCUREMENT OF ENERGY EFFICIENCY SERVICES, THE
FEDERAL GOVERNMENT CAN REDUCE THE ENERGY COSTS BORNE BY AMERICAN TAX-
PAYERS

Within the United States' economy, residential and commercial buildings, including those dedicated to the Federal sector, consume one-third of all primary energy and 65 percent of all the electricity we produce. By investing in energy efficiency, we can capture more than 25 percent of this energy for use elsewhere within our economy. If the same amount of capacity for energy production were to be provided from the construction of new electric powerplants, it would require 80 1,000 megawatt plants with their attendant environmental impacts and siting concerns. Through energy efficient improvements in existing buildings we can free up financial resources for other, more productive purposes while at the same time creating new jobs and reducing air emissions.

As NAESCO pointed out last year, a 1994 macroeconomic study demonstrates that by meeting a 2010 energy use reduction target of 30 percent, the U.S. will reduce annual electricity generation by 27 percent and decrease the need for the construction of new generating facilities by over 50 percent. U.S. electricity customers will enjoy an 18 percent overall reduction in their electricity bill (a savings of \$50 billion), while electric sector emissions of carbon dioxide and oxides of nitrogen will be reduced by 33 percent and 12 percent, respectively. These lower costs for energy, available through private energy efficiency investments, will enable U.S. consumers to increase their annual consumption of non-electricity goods and service by \$45 billion. ("DSM and the Broader Economy," Edward Moscovitch, *The Electricity Journal*, May 1994.)

CONCLUSION

The competitive procurement of energy efficiency investments in Federal facilities, which are financed with private sector funds, offers a win-win budget initiative for the Congress and the U.S. taxpayer. These initiatives will increase energy productivity by reducing the energy consumption and therefore the dollar cost of operating and maintaining Federal facilities.

Last year in the conference report on the fiscal year 1997 Interior Appropriations Act, the Congress recognized the potential Federal budget savings that are achievable through energy efficiency improvements in Federal buildings. In addition, it supported the greater use of partnerships with private sector energy service companies (ESCOs) to capture those savings through the use of energy savings performance contracts (ESPCs). NAESCO thanks you, and urges you to do so again.

PREPARED STATEMENTS OF JOSEPH N. DARGUZAS AND ILENE WILDER, SARGENT &
LUNDY, L.L.C.

Mr. Chairman and Honorable Committee Members: Thank you very much for this opportunity to provide testimony concerning an extremely critical issue facing the

United States and our energy independence. As a Registered Professional Engineer in many states and as a citizen of the United States, my professional opinion is that continued Federal and State participation in fossil energy development and demonstration projects is essential.

Our home State, Illinois, has committed to spend over \$2 million in support of the LEBS work this year. Our company, Sargent & Lundy, has invested millions of dollars in research, development and demonstration programs. However, we cannot afford to continue without the backing of our Federal government.

We support the continuation of the fiscal year 1997 line item for Advanced Pulverized Coal-Fired Power Plant development of the Low Emission Boiler Systems (LEBS) for fiscal year 1998. After due consideration last year, you and your colleagues in the House determined that this was an appropriate funding amount. Continuing at this level will allow the benefits of previous years' funding to be realized and allow us to begin the final phase of the LEBS project work.

This project, if your funding allows us to continue, will provide benefits to citizens across the United States. For example: Important research will continue at the University of Utah. States providing solid fuels will benefit by having a cleaner use for their product. In the East, people living in States such as New Hampshire, Rhode Island, Pennsylvania, West Virginia, etc. benefit from their employment on this project.

Please consider why we believe continued Federal participation in our Low Emission Boiler Systems (LEBS) Prairie Energy Project is so essential:

- We have been making steady progress since 1993 to take our LEBS design from concept through bench scale testing, through pilot scale testing. We are now at the point where we are ready to make the next order of magnitude size increase to an 80MW Proof of Concept facility.
- Consistent with the overall LEBS Combustion 2000 goals of having a nominal 400MW, pulverized coal design ready for commercial deployment in the year 2000, we believe the 80MW size is the next appropriate technological step. (We plan to build this Proof of Concept facility at a mine owned by Ziegler Coal Holding Companies.)
- Given the current status of the electric industry re-regulations, a project such as this must be economically viable without recourse to utility-rate-based support.
- While the 80MW size is technically appropriate, economies of scale dictate that this size is not economically viable. Even though our current and potential Prairie Energy Project team members including, DB Riley Research' Sargent & Lundy, AEP Resources, and Ziegler Coal are willing to commit to approximately one-half of the project cost, and the State of Illinois approximately one-fourth of the cost; we will simply not be economically viable without the 25 percent support needed from the Federal Government.
- Perhaps most importantly, Federal help will enable continued development of the technology that will provide economical electric energy in an environmentally acceptable manner. Given the current concerns with respect to global warming and other environmental issues facing the 105th Congress, we believe that having these technologies developed domestically is extremely important to our future economy. Funding significantly lower than the current levels will cause project delays that will result in this window of opportunity being lost to foreign competition. It would also leave U.S. companies at a disadvantage in competing in emerging foreign markets.

Going forward with this project will offer major benefits to the People of the United States, including:

Environmentally Sound: 70 percent lower NO_x emissions than conventional systems; over 98 percent SO_2 removal; reduces carbon emissions by 15 percent; and generates useful byproducts to several industries.

Technology Leadership: Continued use of U.S. technology and ingenuity; maintain world leadership role by developing "state-of-the-art" equipment and services; and create strategic competitive advantage for U.S. technology.

Improve Employment Picture: Create near term jobs; and promote industrial growth and long term employment.

Economical Power: Provides low cost electricity to consumers, approximately \$.03kWh; and economic benefit of spin-off jobs will be far reaching.

Your continued support for the LEBS/Prairie Energy Project and the entire fossil energy budget will be greatly appreciated.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION FOR STATE COMMUNITY SERVICES PROGRAMS [NASCSPP]

NASCSPP represents state administrators of the Department of Energy's Weatherization Assistance Program (DOE/WAP) and the Community Services Block Grant (CSBG).

This testimony is provided in support of the funding request contained in the President's budget, \$154 million, for the Weatherization Assistance Program. This is a program that from its infancy has conserved energy, created jobs, reduced dependency on oil imports and improved the health, safety and comfort of low-income citizens.

This committee has acknowledged that Weatherization is a worthwhile program that saves energy and improves the health and well-being of low-income citizens, and has demonstrated that support by increasing the funding levels provided by the House in fiscal years 1996 and 1997. We thank the committee for its constant support of this vital program.

We believe Weatherization has a national impact and senses the national interest by creating the technological and programmatic foundation for the individual state programs. Weatherization contributes to the achievement of national energy and social goals through: Cleaner air through reduced CO₂ emissions—Weatherization reduced CO₂ emissions by 63,215 metric tons in 1996 that would otherwise have been released into the atmosphere; reduced consumption of imported fuels through reducing consumption at the residential level; reduced demand on other social programs such as the Low Income Home Energy Assistance Program (fuel assistance), housing and health care; and implementation of innovative energy conservation technologies and transfer of this technology into the private market.

The Department of Energy invests significant amounts of money in energy conservation research through its laboratories. The Weatherization Program has been a testing ground and provided a fertile field for the real life demonstration of this research. The National Renewable Energy Laboratory (NREL) is developing an audit that will be used to determine the best way to conserve energy in mobile homes. Oak Ridge National Laboratory (ORNL) Building Technology Center is testing the use of storm windows as replacement windows for use in warm climate states. The Florida Solar Energy Center and the state of Hawaii are working on the development of cost effective solar hot water heaters. The front line in the deployment of these technologies will be the Weatherization Assistance Program, while the beneficiaries will be citizens across the nation. The technology developed as a result of field experience and demands from agencies using these retrofit measures have national benefits for the entire home-building industry, the prefabricated housing industry and the existing housing stock.

Numerous service providers in the Weatherization Program are private contractors. For many of them, the Weatherization Program provided their first experience with serious residential energy conservation. The advanced audits developed by ORNL, sophisticated diagnostics and the other technologies practiced by Weatherization providers are also now being used in the utility industry. The unique public-private partnership within the Weatherization Program means that the deployment of technological advances, proven within the Weatherization Program, are expeditiously adopted in the rest of the residential building industry.

Weatherization continues to be a wise investment of taxpayer dollars: The Weatherization Program provides a return on investment of \$2.40 for every dollar appropriated; the Weatherization Program produces an average of 33.5 percent energy savings for space heating per household; the Weatherization Program identifies and corrects for the presence of carbon monoxide and thereby increases health and safety in weatherized households; the Weatherization Program reduces CO₂ released into the atmosphere by 1.12 metric tons per household per year; the Weatherization Program leverages an additional \$3.39 from other federal, state, local and private sources for each dollar appropriated; and the Weatherization Program creates or sustains 75 jobs per million dollars appropriated; 11,550 at a funding level of \$154 million.

ORNL recently concluded a report: "State Level Evaluations of the Weatherization Program in 1990-96: A Metaevaluation That Estimates National Savings." The report finds that the Weatherization Program has improved its energy savings over the past seven years, by 83 percent. The program produced an average of 18.3 percent in savings in 1989-90, while by 1996 the program was achieving savings of 33.5 percent. With this greater increase in energy savings there is a concomitant reduction in carbon emissions. This report shows that the program reduced CO₂ emissions by 1.12 metric tons per household per year, or 63,215 metric tons in 1996

alone. The greater energy savings also increased the benefit/cost ratio of the program by 49 percent, from 1.61 in 1989–90 to 2.40 in 1996.

The greater savings are based in large part on the introduction and use of more advanced conservation diagnostic tools and audits. Over 26 States moved to more complex audits since the introduction of the National Energy Audit by DOE in the intervening years. The rigorous conservation standards developed by the Weatherization Program are also being adopted by the private sector.

The Government Performance and Results Act (GPRA) requires that all federal programs have measured outcomes. Weatherization has been performance based for years and uses feedback analysis of outcome measures to constantly evaluate effectiveness and as a basis for change. Weatherization is more successful in maximizing lessons learned from outcome measurement than other programs under the purview of this subcommittee or those operated by the few other Departments that have attempted such program measurements.

Largely because of skepticism from past administrations, the Weatherization Program was subjected to a more rigorous evaluation than most government energy or low-income programs. Its performance in 1989–90 passed all cost benefit tests with flying colors and funding was increased. Using the lessons from that evaluation, the Department of Energy insisted on common use of the most successful program elements, that is, advanced computerized energy audits and addressing air distribution systems. The program's performance nearly doubled.

What makes this program different from other DOE programs that are also working on improving measured outcomes is that many of the benefits go not only to business, but to private families who are low-income. More than a third of these households include an elderly person. It has been suggested that because of this, the program does not belong under the purview of this subcommittee. We think this is an erroneous assumption. The program has demonstrated its capacity for implementing sophisticated energy conservation technologies, and has continued to increase energy savings. Weatherization increases the health and safety of its clients; but, first and foremost it is the most successful residential energy conservation program in the country.

Weatherization is a proven federal, state, local and private partnership that develops and transfers technology, saves energy, creates jobs, puts dollars into local economies, and helps a needy segment of our society. For these reasons, NASCSP on behalf of the State Weatherization Programs urges you to support the continuation of the Weatherization Assistance Program for low-income people by approving the Administration's request for \$154 million in fiscal year 1998.

PREPARED STATEMENT OF U.S. SENATOR JEFF BINGAMAN, NEW MEXICO, ON BEHALF OF THE INTERSTATE OIL & GAS COMPACT COMMISSION

Mr. Chairman and other subcommittee members: The Interstate Oil & Gas Compact Commission (OGCC) submits the following comments in support of full funding of the Department of Energy (DOE) budget request for oil and gas research within the Office of Fossil Energy.

The IOGCC is a 36-state organization of governors founded on the principles of conservation of petroleum. The Compact was created by the governors of oil and gas producing states in 1935, at a time when the U.S. petroleum supplies were at a surplus level and production was out of control. The waste of this precious resource was rampant and the states decided to join together to address the desperately needed conservation issues. The Compact grew out of a recognition by a group of producing state governors that voluntary agreements among producers were not working, and the clear recognition that federal control of the industry was looming on the horizon. These governors believed states had an obligation to prevent avoidable waste of oil and gas, and believed this was a fundamental right of the states to preserve self-government. The states' initiative has certainly been successful regarding conservation. Now we face a different threat as most oil fields are abandoned after only 20 to 30 percent of the reservoir is recovered, America has turned to the easy access of oil and gas that imported sources offer. That has a compound effect in that domestic production could be enhanced with little or no environmental impact and our independence could be reaffirmed if we reduced our reliance on imports.

SUMMARY OF ISSUE

Research has pushed domestic production to vastly increased efficiency and recovery levels.

In 1995 oil imports accounted for \$52 billion dollars of the U.S. trade deficit.

Petroleum imports could increase to 65 percent of total consumption within the next five years.

Potential government revenue is being lost every day as production declines.

The U.S. may have to abandon 60–80 percent of discovered oil resources by 2015.

Federal support for applied energy research has fallen 81 percent since 1978.

Oil and gas are America's primary choice for fuel, accounting for about two-thirds of our total energy consumption. Unfortunately, to satisfy demand we rely on petroleum imports for about 50 percent of that two-thirds. It is projected by the DOE that in the next five years oil imports will increase to around 65 percent, while oil and gas use grows in supplying the United States' energy needs. The domestic petroleum industry is a key source of jobs and revenue for IOGCC member states

An even more striking number is that transportation fuel requires 97 percent of the oil produced. The IOGCC states believe we should not want to become more dependent upon foreign oil to ensure food is delivered, hospitals get their medicine, people get to work, and the military is able to move troops. Clearly the situation as it now stands is intolerable.

The United States cannot afford to increase its dependence on foreign supplies of oil and gas. The security of our Nation and the health of our economy depend upon a stable supply which can be met by increased domestic petroleum production. The federal government must begin to pursue a rational energy policy based upon three principles: increased domestic production, increased efficiency in the use of petroleum, and a common sense approach to regulation that encourages conservation without hamstringing production.

There are several steps the federal government can take to achieve these goals. One of the more important steps is a renewed emphasis on oil and gas research and development (R&D).

There are those who would argue that the United States is a mature producing region for oil and gas, but we are far from recovering all of our available resources. The IOGCC estimates that there are at least 351 billion barrels of oil left in known reservoirs, 106 billion of which are recoverable with current technology. With advances in research the U.S. could add another 25 to 50 billion barrels by the year 2015. Proved natural gas reserves are 164 trillion cubic feet (Tcf). According to the DOE, with current technology, economically recoverable natural gas in the lower 48 states is estimated at 1,040 Tcf. With advanced technology recoverable reserves rise to 1,696 Tcf by the year 2015.

Those numbers do not tell the entire story. In addition to proved reserves, there is the possibility that several undiscovered reservoirs still exist. The National Oil Program of the DOE estimates there are at least 25–60 billion barrels of undiscovered oil. Current technology allows recovery of only a limited amount of the oil in a reservoir. According to the DOE, unless new technologies are developed and made available by the year 2010, the United States would have to abandon 60–80 percent of known oil resources. The thought of having to abandon producible domestic oil is a chilling one. The federal government's role in oil and gas research is an important one. The DOE has provided the seed money for dozens of projects that bear economic and social benefits while strengthening our national security. This is not "corporate welfare", for two reasons: (1) the vast majority of DOE oil and gas research is funded through a cost sharing arrangement with independent and major producers, and (2) the benefits to the public greatly outweigh any benefits to the industry.

The vast majority of the oil and gas research done by DOE provides technology and knowledge that small independent producers would not be able to conduct for themselves. These independent producers, the equivalent of family farms, are the backbone of the oil and gas industry. These projects produce benefits for the economy by increasing jobs and wages, providing more efficient consumption of oil and gas, enhancing revenue for government, and increasing environmental protection.

RECENT SUCCESSES

DOE's oil and gas program helps increase production on existing wells by funding research into new recovery technologies. Only one-third of all oil can be produced through conventional vertical drilling. Secondary and enhanced recovery methods are absolutely necessary if oil production is to be increased. Past R&D by both the DOE and industry produced revolutionary technologies. The development of 3-D seismic imaging, horizontal drilling, waterflooding, in-situ combustion, inert gas flooding and other enhanced recovery operations have revolutionized oil production. These developments did not happen by accident; they required a tremendous commitment of capital, time and knowledge that the DOE helped industry find.

Advances made in secondary and enhanced recovery operations have not only been effective in increasing production but also in increasing revenue for producers, the economy, and government. Three-dimensional seismic imaging, in conjunction with other information technology and enhanced recovery operations, is being used to better characterize existing wells. This leads to identification of oil bearing formations that producers may have missed. After the formations are located, producers are better able to produce the existing well.

According to Alfred C. Decrane, Chairman and Chief Executive Officer of Texaco, horizontal drilling can double, triple, or even quadruple the amount of oil recoverable from a vertical well. Horizontal drilling allows operators to access reserves trapped in naturally fractured reservoirs. It also allows access to reserves in thin geographic formations where trapped hydrocarbons are not targetable with injection substances. Horizontal recovery has brought new life to fields in Utah and North Dakota. In the Pearsall field in Texas, horizontal recovery brought post primary recovery in excess of the vertically recovered reserves.

In Wyoming, Dakota Oil Producers, an independent producer, in partnership with the DOE's National Oil program, conducted tests with a new technology called Huff 'n' Puff. This enhanced recovery technique involves injecting surfactant and inert gas into a low pressure reservoir to produce a foam that helps prevent the premature channeling of injected gas. This technology helps increase the pressure of the reservoir which allows more oil to be recovered. Tests are still continuing in the area, but early results are encouraging. Wells that had ceased production are now producing again.

In the Unita Basin in Utah, DOE National Oil Program research into reactivating mature Class I fields is finding considerable success. In the fall 1996 newsletter of the DOE's Reservoir Class Program, Irene Chang (BDM-Oklahoma) writes "The result of the first two completed field tests? A win-win-win for taxpayers, producers, and DOE. The projected yield from federal taxes and royalties alone from just the first project to reach production, Inland Resources/Lomax Exploration Company's Waterflood in the Unita Basin, will pay for the entire 29-project, \$120 million Class program."

Another DOE program, the Rocky Mountain Oil Field Testing Center in Casper, Wyoming, uses a marginal oil well field to conduct tests of new technology. They provide a site for technology and environmental research, demonstrate new technology to cash strapped independent producers and offer a hands on classroom for a new generation of oil and gas students.

R&D for natural gas provides the similar benefits to the industry and the nation that oil research provides. A Gas Research Institute (GRI) program was initiated in the early 1980s to develop technology to leverage the innate capability of natural gas to approaching the problem of lowering nitrogen oxide emissions. The total investment in this area has been \$35 million; projected savings to customers and industry is projected to exceed \$40 million by 1999.

Another GRI R&D program, conducted and cost shared with the New York gas company Brooklyn Union, completed 13 separate R&D programs that allowed them to safely and economically produce methane from land fills. A \$500,000 investment yielded nearly \$15 million in benefits.

There are not many things, besides raising taxes, the federal government undertakes that might be said to increase revenue. On top of that, there are not many programs the federal government administers that pay for themselves. Oil and gas R&D is the exception to the perception that most government programs are wasteful and eventually failures.

These are only a few examples of the kinds of petroleum R&D projects that the federal government helps fund. Most of the projects are successful in that they help increase domestic oil and gas production. Every new barrel of oil or cubic foot of gas produced in the United States replaces foreign imports on a one-to-one ratio, thus reducing our trade deficit and enhancing our national security. Every new barrel also produces U.S. jobs and revenue for IOGCC member states.

In 1994 the DOE took steps to ensure that research breakthroughs are made available to those who need it most: independent producers. In a three-way partnership with the DOE, state governments and industry, the Petroleum Technology Transfer Council (PTTC) was established.

The purpose of this non-profit group is to provide independent producers access to information from federally funded R&D projects. PTTC acts as a clearinghouse of information for independent producers who cannot afford to do such an accelerated level of research themselves and may have been unaware of new knowledge and technology.

Time after time oil and gas R&D performed with the help of the federal government proves to be economically and socially successful. The contributions to the

health of the economy and the wealth of the nation are enormous. Petroleum R&D is licensed to other sectors of the economy who adapt it for their own uses. Petroleum R&D is a win-win-win situation for industry, the public, and federal, state and local governments.

FUTURE NEEDS FOR OIL AND GAS R&D

Two recent discoveries in the offshore oil and gas area provide an exciting picture of what the domestic oil and gas industry, in partnership with the DOE, could achieve through increased funding of R&D.

In the Eugene Island oil field off the coast of Louisiana, drillers made a startling discovery: the field seemed to be replenishing itself. Preliminary research suggests as oil is recovered more oil migrates up from a greater depth to replace it. Research undertaken to understand the "architecture" of this reservoir could help producers find the same type of formations in other places, thereby increasing production dramatically. Producers might also be able to create an artificial migratory formation in other reservoirs to determine if more oil lies under proven reserves. The knowledge and technology that might emerge from this research is unfathomable. The threat is that as research budgets are slashed, the type of research needed in this situation will wither.

In North Carolina, geologists discovered a new gas reservoir 200 miles off the coast in the Blake Ridge. This formation, according to the U.S. Geological Survey, is made up of enough natural gas to supply the world for the next 107 years. There is only one problem: nobody knows yet how to produce the gas. It is frozen in crystals along the Blake Ridge and presents, right now, severe structural, economic and environmental barriers. Long-term research could provide the tools necessary to overcome current barriers. As Dr. Charles Paull, a University of North Carolina geologist, said, "It's a pretty unanswered question [how to bring the gas out]. On the other hand, engineers are pretty good at figuring out ways to do things if you define the problem for them." The biggest unanswered question: Will the funds needed to support the engineers be available?

CURRENT PROBLEMS

Despite the recognized value of long-term petroleum R&D, according to a report by the DOE, there is an R&D "crisis." Long term R&D expenditures, by both the petroleum industry and the federal government, are declining.

The dollars, in private industry, are being shifted toward mid-term and short-term projects. While these projects keep industry competitive in today's marketplace, they do little to prepare for competition in the future. Stable oil and gas prices, restrictive regulation, and increased global competitiveness are several of the factors contributing to the decline of long term R&D expenditures in the private industry.

Funding by the federal government of applied energy research, which includes fossil energy research, has fallen a staggering 81 percent since 1978. In the private sector, energy R&D expenditures since 1982 have fallen nearly 30 percent from \$3.8 billion to \$2.9 billion.

As noted earlier, oil and gas R&D done by the DOE primarily benefits the independent producer. Independent producers provide up to 50 percent of our oil production. These producers are the petroleum industries' small businesses and are the backbone of the oil and gas industry. With the drop in research dollars allocated for DOE's oil and gas R&D program these independent producers face abandoning wells, a loss of income and jobs, forcing the nation to lose valuable petroleum resources.

CONCLUSION

A renewed emphasis on long term R&D is not a cure-all for all the problems faced by the domestic petroleum industry. There are other barriers that stand in the way including public indifference, economic, environmental, and political barriers. Long term R&D, while not the answer, could and would help the United States face these barriers armed with new knowledge and new technology.

C.H. Lyons, an independent operator, said in 1957, "So long as favorable political and economic conditions prevail, the minds of men will be directed toward improving methods and techniques for finding and producing ever-greater quantities of oil. We can be sure that our concept of finding and producing oil in the future will differ radically from those of today."

Federal government oil and gas R&D, when performed correctly and in partnership with industry, will foster the radical concepts needed to keep the domestic oil

and gas industry alive and producing valuable energy resources to fuel America well into the 21st century.

PREPARED STATEMENT OF DR. BERNARD S. LEE, PRESIDENT, INSTITUTE OF GAS TECHNOLOGY

This testimony supports fiscal year 1998 Department of Energy expenditures in: The overall natural gas related programs in Fossil Energy; the molten carbonate fuel cell program in Fossil Energy; the cross-cutting component development portion of the fuel cell programs in the Transportation and Buildings sections of the Conservation program; the Industries of the Future programs funded through the Office of Industrial Technologies in Conservation; and the natural gas related research on natural gas vehicles supported through the Transportation programs in Conservation.

Although it may not be the specific jurisdiction of this subcommittee, the current issue of utility deregulation should be interlaced throughout your consideration of fiscal year 1998 funding for Department of Energy programs. Because competitive market pressures may cause further near-term cuts in many areas of private sector, utility-based R&D, the need for continued—and strengthened—federal support is extremely important.

Utility efforts to lower costs to their customers must, by nature, focus on expenditures or savings with near-term impacts. They must also have predictable, almost guaranteed results. Those results must also deliver benefits directly and dependably to the investor. Those requirements are seldom predictable from many areas of R&D.

Deregulated utility markets, at least initially, will likely be driven solely by the price of the electricity or natural gas to be delivered, and, to remain competitive, that price will be stripped to its barest essentials. The natural gas utility industry is currently in the midst of a nation-wide debate over how—if at all—to create an on-going funding mechanism to support the work of the Gas Research Institute, and much of the controversy stems from business units that are willing to forego the GRI R&D surcharge in order to gain a competitive edge in current pricing. That short-term market focus is having similar effect throughout utility industry R&D.

In deregulated markets, new competitors, seeking to capture the most attractive segments of service territories, will do so solely on the basis of the cost of current services, without investing in R&D for the future. That may then force current utilities to similarly abandon long-term R&D.

We are particularly concerned about the impact of the potential near-term reduction of private sector support for the kind of long-term R&D programs that are typical of the Department of Energy programs funded through this subcommittee. While utilities may still have competitive incentives to conduct R&D in areas of maintenance, distribution, or automated metering and business systems in order to maintain a competitive advantage in the provision of service, they may have less near-term incentive to invest in end-use technologies where there will be no guarantee that, when successful, the energy used in those technologies will be acquired through that utility. Broader issues of R&D investment—energy efficiency, environmental performance, domestic industry competitiveness in world markets—risk being pushed aside by day-to-day competition. Equipment manufacturers may similarly be under increased pressure to keep costs—and, therefore, prices—as low as possible in order to stay competitive, marketing the best products already in hand rather than investing in long-term R&D.

While those competitive trends may bring attractive near-term savings to utility customers, and promises of significant near-term profits to the most agile and aggressive marketers, they also bring responsibility to this subcommittee and your jurisdiction over the important long-term R&D supported through the Department of Energy, which is in our national interest. In an ever-tightening budget, you obviously face difficult decisions. The constant pressure to be good stewards of taxpayers dollars must be balanced against continuing to develop energy and environmental technologies that will help our nation continue to address the valuable “public good” benefits of a stronger domestic economy, improved energy efficiency, lower emissions and lower reliance on imported fuels that will arise from DOE’s on-going research programs.

In recent years, despite steadily tighter budgets, this subcommittee has done an admirable job of not only preserving, but expanding natural gas related R&D in the DOE budget. IGT appreciates that support.

There are several specific areas to which we hope to draw the subcommittee’s attention as you consider the distribution of fiscal year 1998 DOE funds:

FUEL CELLS

The M-C Power Corporation is one of two contractors developing molten carbonate fuel cells through DOE funding and private sector cost-sharing. The approach to molten carbonate fuel cells currently being advanced by M-C Power was originally developed by IGT, and IGT still maintains a role in R&D support. During this hearing you will learn directly from M-C Power about the success of their current demonstration and the scope of both their technology and market development efforts. IGT strongly endorses M-C Power's request for funding to continue their work in fiscal year 1998.

As M-C Power moves toward success, IGT has the opportunity to turn our R&D capabilities toward other fuel cell R&D, as well. Through funding in both the Transportation and Buildings portions of the DOE Conservation budget, DOE will soon be receiving proposals for the development of cost-effective components for PEM fuel cells. This DOE program is designed eliminate redundant R&D and lower overall PEM development costs by establishing technology breakthroughs for specific PEM fuel cell components or systems that will then be available and of benefit to all developers of PEM powerplants. That is an effective method for simultaneously boosting the success and hastening the development of all competitive PEM developers, while taking advantage of the experience and unique skills that IGT and others may bring to this field.

IGT has recently developed a novel process for manufacturing the bipolar separator plates for PEM fuel cells that should significantly lower the future market cost of these fuel cells. Last year, DOE estimated the cost of mass-produced PEM fuel cell stacks to be \$234/kilowatt. The bipolar plate portion of that cost was \$149, with humidification and cooling costing \$45. IGT is developing a molded composite plate which incorporates the bipolar plate, cooling and humidification functions, and will cost less than \$10/kilowatt. That would be a 95 percent reduction in the total current cost of these stack components. IGT's bipolar plate technology is simple and economical, and can be adapted to any geometric configuration used by PEM developers.

IGT intends to apply for fiscal year 1997 support through this DOE competitive program, in the hope of securing \$575K for one year of funding, supported by private sector cost-sharing, to further develop and demonstrate our innovative approach.

DOE has asked for an increase to \$10 million in Transportation and \$1.7 million in Buildings for PEM component development for fiscal year 1998, and IGT supports that DOE request.

INDUSTRIES OF THE FUTURE PROGRAMS IN THE OFFICE OF INDUSTRIAL TECHNOLOGIES
(OIT)

The OIT programs in the Industry portion of DOE's Conservation budget offer a similar approach of funding technology development intended to benefit a broad industry rather than a specific company. OIT, in its Industries of the Future program, has chosen seven energy-intensive industries—steel, aluminum, metal casting, chemicals, refining, forest products and glass—for concentrated development. Collectively, these industries represent the bulk of our nation's industrial energy consumption, and the goal of the OIT program is to increase these industries' energy efficiency and productivity and lower their emissions, while increasing their competitiveness in world markets. While the individual industries may be large in size, scope and importance to our domestic economy, they are characterized by a broadly diversified base rather than a few industry-dominant companies. Benefits derived from the OIT projects will be applicable to a broad range of domestic market competitors. The problems to be addressed in the OIT programs are identified and prioritized by the affected industries, strengthening the probability that the innovations developed by the OIT projects will be broadly implemented. All projects are competitively chosen, and all come with significant private sector cost-sharing, making this program an effective mechanism for leveraging both federal and private sector funding.

IGT is already a participant in several of the OIT programs, particularly through technologies affecting our nation's glass industry.

Last year, IGT received a prestigious R&D 100 award for our work, co-funded through OIT's Glass Vision Area, on our oxygen-enriched air staging (OEAS) technology that uses natural gas for energy efficient NO_x control in endport and sideport glass melting furnaces. Our technology will achieve NO_x reductions of 50 percent from these furnaces while improving their energy efficiency.

In another Glass Vision Area project, IGT leads an industry team that is currently developing a high luminosity natural gas burner, a novel combustion system

in which soot is generated and then combusted in the burner flame zone, resulting in a highly luminous flame that greatly improves heat transfer and thermal efficiency, and lowers NO_x emissions.

With support through OIT's Steel Vision Area, we are working with industry partners to develop a natural gas fueled oscillating combustion technology that can be applied to a number of high-temperature material processing industries. Bench-through pilot-scale testing has already shown 50–90 percent NO_x reductions through this flame control, coupled with increases by as much as 10 percent in heat transfer, furnace efficiency and productivity. Further gains may occur by combining this technology with our OEAS and high luminosity burner breakthroughs.

We also have an on-going project with funding support from OIT's Refining Vision Area, through which we are working to develop an ultra-low-emission natural gas-fired Forced Internal Recirculation (FIR) burner that can be used in both new and retrofit applications in process fluid heaters used in the refinery industry and elsewhere, and watertubeboilers in a broad range of applications.

IGT hopes to continue to be involved in the competitive solicitations issued through OIT's Industries of the Future programs so that we can continue to work together with DOE and industry partners in improving our nation's industrial energy efficiency, environmental performance and competitiveness in world markets.

For fiscal year 1998, DOE has asked for an increase of approximately \$9.4 million for the industry-specific OIT programs, moving from an fiscal year 1997 appropriated level of \$46.3 million to \$55.7 million in the fiscal year 1998 request. IGT encourages this subcommittee's support for at least the full level of the DOE fiscal year 1998 request, and would encourage additional funds above the DOE request, particularly in the glass and steel industries and other technical areas where natural gas applications can produce significant benefits.

NATURAL GAS VEHICLES

Finally, IGT would call the subcommittee's attention to the DOE fiscal year 1998 request for R&D related to the more economic and expanded use of natural gas fueled vehicles.

Natural gas fueled engines are now being successfully demonstrated in fleets of cars, vans, trucks and buses throughout our nation, bringing significantly lowered emissions and a shift from imported crude oil to important transportation sectors. That visible success consequently may give the impression that we have now achieved maturity in our development of natural gas vehicle technology, and that future success now should rely strictly on competitive market forces. It should be noted, however, that most of the success achieved to date has been in limited fleet applications, where fueling station infrastructure support exists or when fuel cost savings are substantial enough to offset the cost of a customer-owned central refueling station. If we are to extend the energy and environmental benefits of natural gas vehicles to more fleets, as well as to the general public, significant R&D must still be done on compressed and liquefied natural gas engine development, on-board storage, fueling stations and fuel quality issues. Today's engines do not take full advantage of natural gas' beneficial fuel properties. Higher efficiency engines and lower-cost vehicles can be achieved by supporting DOE's programs in these areas. IGT also supports DOE's deployment efforts, which have encouraged vehicle and engine manufacturers to stay in the market.

Significant new benefits can be gained by expanding DOE's program to include large inland waterway and marine engines operating on liquefied natural gas (LNG). One engine on a tow boat moving barges on our inland waterways currently consumes as much diesel fuel annually as 100 heavy-duty trucks. Many tow boats have up to three engines. Conversion of these vessels to LNG could provide dramatic improvements in environmental benefits, lower shipping costs and reduced national reliance on imported oil.

IGT has begun to work with a consortium of equipment manufacturers, LNG suppliers and tow boat operators to develop the technology, adapting current DOE advances for rail applications, for converting tow boats and other marine vessels to LNG. IGT urges this subcommittee's support for expanded fiscal year 1998 funding in this area.

PREPARED STATEMENT OF THE ELECTRIC TRANSPORTATION COALITION

INTRODUCTION

This testimony is presented on behalf of the Electric Transportation Coalition ("the Coalition"), a national, non-profit organization of electric utilities, automobile

manufacturers, state and local governments and other entities that have joined together to advocate greater use of electricity as a transportation fuel. (A membership list is attached.) A principal activity of the Coalition is to encourage the adoption of incentive-based policies and programs to support the development of a widespread and sustainable market for electric modes of transportation.

The members of the Coalition recognize the significant budgetary constraints faced by the federal government. We also recognize that the Subcommittee must ensure limited dollars are prudently allocated. The Coalition believes that electric vehicle-related programs of the Department of Energy ("DOE" or "the Department") represent such wise expenditures in that such electric vehicle ("EV") programs provide valuable support for the introduction of this new transportation technology, thereby furthering the national policy objective of increasing the use of alternative fuels in the transportation sector.

The role of the federal government has been, first, to provide research and development support to address technological issues, through programs including the United States Advanced Battery Consortium and the hybrid propulsion systems program; and second, to assist industry in the testing and evaluation of the latest electric vehicle technologies through the Vehicle Field Test and Evaluation Program (previously called the Site Operators Program). A third major emphasis of the federal government should be to acquire electric vehicles for federal fleets.

The on-going DOE EV-related programs are providing critical support in a number of areas that are key to the success of this new, efficient and clean transportation technology. These DOE programs complement, and augment, other work that is being undertaken by industry separately or in partnership with other federal agencies. If fiscal year 1998 appropriations for these DOE programs are significantly reduced or eliminated, the requirements for funding would fall to other parties who may not be able to increase their investments even further in order to move this technology toward the marketplace.

THE UNITED STATES ADVANCED BATTERY CONSORTIUM (USABC)

The Coalition urges support for the funding level of \$15.8 million requested by the Administration for the USABC program. (In fiscal year 1997, the Administration requested \$15.32 million and the USABC was ultimately funded at that amount.)

The USABC is a battery research and development program, critical to the advancement of EVs. Full-size battery packs and their components, such as cells and modules, are being developed through research contracts and then tested by the developers, U.S. automobile companies, and national laboratories. The battery packs also have been installed in prototype EVs being operated at electric utilities and testing facilities of U.S. automobile companies. In April 1996, USABC participants (comprised of U.S. automobile manufacturers, battery developers, the U.S. Department of Energy and several national laboratories) completed Phase I of their efforts. The auto makers that participate in USABC include Chrysler, Ford and General Motors (GM). The national laboratories participating include Lawrence Berkeley, Argonne, Sandia, and Idaho National Engineering Laboratory. Phase I comprised four elements: begin research efforts (i.e., establish research goals and criteria as well as award contracts); establish a U.S. advanced battery industry; develop an advanced battery to meet mid-term criteria (potential to double the range and performance of EVs compared to battery technologies available today) with pilot plant production capability; and, demonstrate design feasibility of advanced batteries meeting long-term goals (i.e., make EV range and performance comparable to that of today's gasoline-powered vehicles).

These activities were not only successful, but cost effective. All the Phase I accomplishments were reached at less than projected cost. Phase I activities were budgeted to total \$262 million (from industry and government); only \$200 million was spent.

Phase II will build upon the successes of Phase I and move forward toward the next levels of battery development. Phase II consists of three elements which the industry participants expect to complete by the end of 1999: conduct more extensive safety, durability, and life testing of mid-term batteries to obtain automotive validation (i.e., ensure the batteries meet requirements determined by industry as necessary for normal automotive applications); continue research efforts to reduce costs associated with mid-term batteries; and, develop long-term battery technologies through the pilot-line production stages.

It is important to note that without the limited federal assistance already invested, the advancements in battery technology accomplished to date through the USABC probably would not have been achieved. Individually, companies cannot, or

are unwilling to, make the significant investment required to conduct advanced battery research.

The majority of fiscal year 1998 funding will be directed toward long-term, lithium-based battery research. In later years, the USABC anticipates reduced expenditures as the program and projects near completion in 1999.

FUNDING FOR THE HYBRID PROPULSION SYSTEMS DEVELOPMENT PROGRAM

The Coalition requests support for the Administration's funding request of \$67.7 million for the Hybrid Propulsion Systems Development Program. This program allows industry and government to work together to develop a consumer attractive, ultra-low emission vehicle with high fuel economy. As of February 1996, three major contracts had been awarded to teams of developers, featuring large and small businesses and domestic automobile manufacturers, for the development and demonstration of hybrid electric vehicles (HEVs). GM and Ford have been working under contract on HEVs since 1993. Chrysler's efforts began in 1996. The Phase I goal of this five-year program is a 50 miles per gallon (mpg) propulsion system. The Phase II goal, scheduled to be reached by 2004, is an 80 mpg system.

FUNDING FOR THE VEHICLE FIELD TEST AND EVALUATION PROGRAM AND FEDERAL FLEET CONVERSION ACTIVITIES

The Coalition urges the Subcommittee to fund the Vehicle Field Test/Evaluation program at the level recommended by the President, \$3.7 million. The program, which was initiated in fiscal year 1997 as a follow-on to the Department's Site Operator Users Task Force electric vehicle test and evaluation program, provides critical federal support to industry efforts to test, evaluate and undertake fleet case studies of electric vehicles manufactured by original equipment manufacturers. Two test teams, known as "Quality Vehicle Test Sites (QVTS)" have been selected under the program to establish a uniform set of procedures to be used in undertaking baseline performance, reliability and fleet testing of EVs and for the conduct of such testing on EVs as they become available.

This year, in addition to the important effort underway with industry, the Department plans to acquire, test and evaluate new electric vehicles within the U.S. federal fleet. DOE intends to focus federal acquisitions of electric vehicles on those equipped with advanced batteries that have been developed through the United States Advanced Battery Consortium. This important effort can help to assure that the federal government meets its obligations, under the Energy Policy Act of 1992 (Public Law 102-486), to transition to the use of alternative fuel vehicles.

Finally, the Energy Policy Act of 1992 ("EPAct") requires the federal government, beginning in fiscal year 1996, to convert the federal fleet to alternative fuel vehicles. Fifty percent of new vehicle acquisitions for the federal fleet (except for limited uses like military applications or emergency uses) must be AFVs in fiscal year 1998; next year (fiscal year 1999) that percentage rises to 75 percent. On December 13, 1996, President Clinton issued an Executive Order (E.O. 13031) directing federal agencies, in compliance with federal law, to convert agency fleets to AFVs and to provide reports to the Department of Energy, General Services Administration and the OMB certifying that such acquisitions have been made by purchase, lease or otherwise. Federal agencies are required to use their own funds to acquire such vehicles.

Importantly, the President's executive order also recognized the state of technology development of EVs and determined, and directed, that if funding is available, the Department of Energy shall provide financial assistance of a limited amount (no more than \$10,000 per vehicle) to agencies that choose to acquire EVs to fulfill some or all of their vehicle acquisition requirements. A portion of the funds requested would be used to assist federal agencies desiring to test and evaluate EVs in their fleets.

This requested funding for federal agency participation in converting portions of the federal fleet to EVs will complement the efforts of the Electric Transportation Coalition in its efforts to target major metropolitan areas for the early introduction of electric vehicles.

The President's executive order is directed toward metropolitan areas with populations of 250,000 or more. Last year, the Coalition, in cooperation with other national organizations and the Departments of Energy and Transportation, conducted a series of workshops in ten major metropolitan areas across the United States. The program, known as the "EV Market Launch Framework," was supported by the U.S. electric utility and automotive industries and is designed to "ready" the market for the introduction of EVs. Workshops were conducted in southern California; Sacramento; Phoenix/Tucson; Atlanta; Broward County, Florida; Detroit; Richmond; Washington, D.C./northern Virginia; New York City and Boston. These areas are be-

lieved to be the initial sites for EV introduction. Importantly, many federal agencies (and their fleets) are also located in these areas. The private sector, through the leadership of the electric utility industry, is making preparations to acquire EVs when they are made available; it is hoped that the federal government—in these same or similar areas—will do likewise. The funds requested by DOE will greatly assist federal agency decisions to include EVs in their plans to convert fleets.

The modest amount of funding that is being requested will enable DOE and industry participants to continue an important cost-share program through which electric vehicles and associated infrastructure and services to support such vehicles will be evaluated and tested. This focused test and evaluation of new technology is a foundation upon which a widespread, sustainable market for electric vehicles can be built in the United States

OTHER DEPARTMENT OF ENERGY PROGRAMS OF INTEREST TO THE ELECTRIC TRANSPORTATION COALITION

In addition to the programs outlined above, the Coalition also supports funding to a number of other alternative fuel-related programs administered by the Department of Energy.

The Coalition membership recognizes that electrically-propelled vehicles can be “fueled” through a variety of different sources. Continuing research and development efforts that will lead to a family of electric vehicles comprising those powered by batteries exclusively, those powered by batteries and an auxiliary power unit, and those powered by fuel cells, are critical to assuring that the U.S. leads the world in offering the highest-performing, cleanest and most consumer-attractive transportation options for the 21st century.

Further, to assure that the marketplace is prepared and receptive to new forms of transportation like EVs, the Coalition strongly encourages full funding, at the levels requested by the Administration, of DOE’s programs designed to create an infrastructure for alternative fuel vehicles, including electric vehicles, and to build public awareness and confidence in these new modes of transportation. These funds include \$3.8 million for the Clean Cities initiative; \$4.75 million for infrastructure, systems and safety activities and \$1.6 million for EPA’s replacement fuels programs. These outreach, education, organization and infrastructure deployment activities by DOE encourage investment by industry and help to build market acceptance for alternative fuel vehicles.

CONCLUSION

The Electric Transportation Coalition requests that the Appropriations Subcommittee on Interior and Related Agencies fully support the Department of Energy’s advanced automotive and alternative fuels programs to further the development of electric and other innovative modes of transportation. Successful development and introduction of EVs into the market will produce new, high-skill jobs in the United States; reduce our growing dependence upon foreign oil by substituting plentiful, domestically-controlled, supplies of electricity as an alternative transportation “fuel”; and, most importantly, assist in our continuing efforts to reduce the environmental impacts associated with the transportation sector.

PREPARED STATEMENT OF THE AMERICAN PUBLIC POWER ASSOCIATION

The American Public Power Association (APPA) is the service organization representing the interests of over 2,000 municipal and other state and locally owned utilities throughout the U.S. Collectively, public power utilities deliver electric energy to one of seven electric consumers (about 35 million people) serving some of our nation’s largest cities. The majority of APPA’s member systems are located in small and medium-sized communities in every state except Hawaii. We appreciate the opportunity to submit this statement concerning fiscal year 1998 appropriations. We welcome Senators Gregg, Campbell, Dorgan and Boxer to this Subcommittee and look forward to working with all of you during the 105th Congress. The focus of our testimony will be on U.S. Department of Energy (DOE) programs within this Subcommittee’s jurisdiction.

I. DOE ENERGY EFFICIENCY PROGRAMS

APPA supports the Administration’s emphasis on DOE energy efficiency programs in its funding request for fiscal year 1998. We ask that this Subcommittee ensure these important programs continue to be among the options available to our nation’s electric utilities as they strive to meet the increased competitive and environmental

demands placed on them by the marketplace and society. While we realize the budget constraints you face, we ask for favorable action on the Administration's request in this area. DOE's energy efficiency programs received funding of \$717 million in fiscal year 1995. Appropriations were cut 25 percent in fiscal year 1996 and were increased by 3 percent in fiscal year 1997. The Administration is proposing funding in fiscal year 1998 to approximately \$688 million, restoring most of the reduction from the fiscal year 1995 level. Energy efficiency is becoming even more important in the context of debate about electric utility restructuring. Due to the uncertain future this has wrought, many utilities already have downsized or terminated some energy efficiency programs in order to reduce costs. Yet these programs can be very helpful in maximizing the overall progress made toward achieving a competitive, high-growth economy for our nation while maintaining the kind of environmental quality we all desire for the future.

A. Electric Vehicles (EVs).—EVs provide multiple environmental benefits, with special emphasis on reduced tailpipe emissions and ozone formation in urban areas. Congress has recognized these potential advantages as well as the possibility for EVs to diversify the sources of energy used in the transportation sector, decreasing our nation's dependence on foreign oil imports and improving our trade balance. APPA urges the Subcommittee to maintain support for battery research and development through the U.S. Advanced Battery Consortium (USABC). This research has produced battery packs that have been installed into EVs at utilities and testing facilities of U.S. automobile companies. For fiscal year 1998, USABC will require approximately \$15.8 million in federal funds. In fiscal year 1997, the Site Operator Program (SOP) received only \$1.6 million. For fiscal year 1998, we encourage the Subcommittee to return funding to the fiscal year 1996 level of \$2.5 million. The SOP is a joint effort by government, utilities and educational institutions featuring cost-sharing by non-federal participants. It tests and evaluates near term electric vehicles and associated infrastructure in realistic operating environments and demonstrates market opportunities for EVs.

B. Fuel Cells for Transportation.—We urge the Subcommittee to fund DOE's transportation fuel cell program at the \$29.6 million requested by the President. It is important that these advanced technologies be available for application to both mobile and stationary sources. The availability of this technology for transportation is critical for cities and states that must achieve mandated federal air quality standards. The fuel cell vehicle is virtually pollution free and highly efficient. Even a 10 percent market penetration could reduce regulated air pollutants by more than one million tons a year and emissions of carbon dioxide by 60 million tons a year. (This would fulfill the U.S. commitment to bring its CO₂ emissions back to 1990 levels.) It also would save 800,000 barrels of oil a day. One of APPA's members, the Sacramento Municipal Utilities District (SMUD), has done extensive research in this field because of the outstanding environmental and energy efficiency attributes of the technology. We also support DOE's \$2 million program to develop fuel cells for buildings based on the technology developed in the vehicle program.

C. Community and Building Technologies.—APPAs supports the Administration's request of \$303.4 million to restore previous reductions to these energy partnership programs. Among them are Rebuild America, designed to accelerate energy efficiency improvements in existing commercial and multi-family buildings, and DOE's Energy Partnerships for Affordable Homes Program, a collaboration of public and non-public groups working to make public and private housing more energy efficient and affordable. DOE can play a facilitating role in helping bring new technologies and standards to market. Examples of valuable DOE efforts in this regard include the Technology Introduction Partnerships (TIPS) program and Motor Challenge. TIPS, in particular, has been an important one for APPA member systems. Motor Challenge is a voluntary partnership between DOE and industry designed to promote adoption of motors and motor-driven equipment that increase energy efficiency, enhance productivity and improve environmental quality. By the year 2000 it is estimated Motor Challenge will generate energy cost savings of \$1.2 billion and electricity savings of 25 billion kWh.

Building Codes and Standards.—EPA also requires each state to certify that it has reviewed its residential and commercial building codes to determine whether they meet energy efficiency targets. DOE is providing important technical assistance to encourage states to adopt such codes. We support the Administration's request that \$20.5 million be provided to continue this program. Of this amount, \$11.9 million would be used for the building standards and guidelines program and \$8.6 million for evaluating lighting and appliance standards.

Community Energy Systems.—District heating and cooling systems act as community energy systems by transporting waste energy (from local powerplants, industrial processes and natural resources) to buildings to provide heating and/or cooling.

In addition to reducing emissions of carbon dioxide and other pollutants, these systems enhance energy security and cost stability, stimulate community development and facilitate phase-out of ozone-destroying refrigerants. APPA member systems that receive information and technical assistance from this program include those located in Burlington, VT; Fairbanks, AK; San Antonio, TX; Holyoke, MA, and Lansing, MI. APPA recommends \$5 million to provide: (1) an integrated information campaign to local and state governments and the private sector on the benefits of district energy, and technical assistance and cost-shared funding for community energy resource assessments and feasibility studies, and (2) research, development and demonstration in partnership with ongoing cooperative international efforts to reduce costs and improve efficiencies of district energy technologies.

Municipal and Community Energy Management.—This program, within the Office of Building Technology, provides funding to municipalities for conducting a variety of projects that address energy-related areas of greatest concern to local governments. APPA recommends this program, operated by the Urban Consortium Energy Task Force (UCETF), receive \$1.6 million, funding level to that provided in fiscal year 1997. UCETF is a program of Public Technology, Inc. (PTI), the non-profit technology organization of the National League of Cities, the National Association of Counties and the International City/County Management Association. Currently 22 jurisdictions, including many public power communities, are represented on UCETF: Albuquerque, NM.; Austin, TX; Chicago, IL; Columbus, OH; Dade County, FL; Denver, CO; Greensboro, NC; Hennepin County, MN; Kansas City, MO; Long Beach, CA; Memphis, TN; Monroe County, NY; Montgomery County, MD; Orange County, FL; Philadelphia, PA; Phoenix, AZ; Portland, OR; San Diego, CA; San Francisco, CA; San Jose, CA; Seattle, WA, and Washington, D.C.

Weatherization Assistance Program.—APPA wholeheartedly supports the Administration's budget request of \$154.1 million for weatherization assistance, especially important to the working poor, elderly and disabled. The program helps more than 100,000 residents annually. Weatherization programs have the additional benefit of stimulating economic growth by increasing disposable income and creating jobs in the service sector. The DOE Weatherization Assistance Program has been especially effective at helping low income citizens afford their energy bills and at the same time reduce their energy usage. The funding increases requested for fiscal year 1998 should be provided to this valuable program to help alleviate the multi-year backlog of weatherization work requested locally.

State Energy Conservation Program.—State energy offices work on nearly every energy efficiency issue. They encourage technology development, renewable energy, alternative fuels, energy emergency preparedness, energy facility siting, recycling, transportation efficiency programs, energy conservation and economic development, among other activities. State energy offices have been extremely successful in identifying the needs of local communities, businesses and consumers, and funding appropriate efforts to effectively transfer technology to constituents. With increased devolution of responsibilities to the states, this program offers the ideal combination of state-level implementation on a flexible basis with federal support. We ask that this Subcommittee favorably consider the Administration's request of \$45.1 million for the State Energy Conservation Program. The program suffered a 50 percent cut in fiscal year 1996. The spending level requested for fiscal year 1998 would bring the program's funding level up to 85 percent of its fiscal year 1995 level.

II. DOE FOSSIL ENERGY RESEARCH AND DEVELOPMENT PROGRAMS

A. Fuel Cells.—Fuel cells have captured the interest of government and industry alike. Their modularity, high efficiency and negligible emissions of smog and acid rain precursors make fuel cells an important growth area deserving national priority. A consortium, including APPA member systems, along with the National Rural Electric Cooperative Association (NRECA), the Electric Power Research Institute (EPRI) and DOE, is co-sponsoring carbonate fuel cell research, testing and the first utility-scale demonstration of a carbonate fuel cell powerplant. The direct fuel cell program consists of two major efforts—the Santa Clara Demonstration Project and the ongoing Product Design Improvement (PDI) cost-shared initiative.

The first demonstration of a U.S.-developed fuel cell powerplant has now begun operation in Santa Clara, CA. This 2-MW fuel cell unit has been grid-connected for almost 4,000 hours. It has achieved a 44 percent efficiency level, a record for a fossil fueled powerplant of this size, has recorded emissions below conventional detection limits and is providing valuable information on fuel cell powerplant operations. APPA member systems participating in the consortium include the City of Santa Clara, Los Angeles Department of Water & Power, Sacramento Municipal Utility District, the City of Vernon, CA, the Salt River Project and Northern California

Power Agency. The final phase of the development effort, the design and fielding of a pre-commercial unit, has now begun. Performance and cost targets for this final phase are supported by the 21 members of the Fuel Cell Commercialization Group (FCCG). In addition to those named as supporters of the Santa Clara project, APPA member systems comprising FCCG include Alabama Municipal Electric Authority, City of Anaheim (CA) Public Utilities Department, Florida Municipal Power Agency, City of Manassas (VA) Electric Department, City of Tallahassee (FL) Electric Department and Wisconsin Public Service Corporation. In fiscal year 1998, the cost-shared contract calls for DOE support in the amount of \$20 million. We urge Congress to fully fund this project so that progress can continue toward full commercialization.

B. Advanced Gas Turbine Program.—APPA strongly supports DOE's Advanced Turbine Systems (ATS), Ceramic Stationary Gas Turbine and Catalytic Combustion programs. These are model public/non-public partnerships to develop more efficient, low-emission turbines for power generation in utility and industrial applications. They have been strongly endorsed by electric utilities, the natural gas industry, the oil industry, electric service industries and industrial users. To keep these programs on track toward their long-range goals, which include a reduction of liquid and gaseous fossil fuel consumption, \$22.2 million is needed for fiscal year 1998. Of this amount, \$17.1 million would be used by the ATS Program; \$4.1 million is needed by the Ceramic Stationary Gas Program, and \$1 million would go to the Catalytic Combustion Program. The benefits of this investment can be enhanced and made even more effective if DOE accelerates the programs with near-term funding increments, rather than decreasing dollars and stretching out the program years, as proposed in the Administration's budget.

III. ENERGY INFORMATION ADMINISTRATION (EIA)

APPA asks this Subcommittee to carefully review the Administration's request, which would result in a 5 percent reduction in spending at EIA during fiscal year 1998. We are concerned that this level of funding is inadequate to enable EIA to continue its important role in data collection and dissemination. With increasing competitiveness in the electric utility industry, it is critical that utilities, government, regulators and the public all have access to reliable data from EIA in order to monitor pricing and structural changes in the electric utility industry and their effects on competition.

PREPARED STATEMENT OF THE BUSINESS COUNCIL FOR SUSTAINABLE ENERGY

INTRODUCTION

The Council is pleased to offer testimony to the Energy and Water Subcommittee of the Senate Appropriations Committee on the proper role for government in promoting energy research and development, as it relates to renewable energy programs at the Department of Energy (DOE).

The Council is comprised of business leaders who share a commitment to pursue a new energy strategy designed to realize our nation's economic and national security goals through the rapid deployment of efficient, non- and low-polluting energy technologies. Council members include a diverse range of manufacturers, energy producers, suppliers of energy resources, and energy service companies.

The diversity of our membership is further reflected in the fact that our member companies range in size from Fortune 500 enterprises to small entrepreneurial businesses. A list of Council members is included.

FEDERAL PROGRAMS TO PROMOTE RENEWABLE ENERGY RESOURCES

The Council recognizes that it is the suppliers and users of energy—not the federal government—that ultimately will decide which energy sources will meet our future energy needs. However, the federal government does play an important role in helping the private sector share the risk of investing in deployment of clean technologies that, while at or near economical viability, face financial, informational, or institutional obstacles to their wide market availability.

Today, many efforts using the "cost-shared" approach advocated during the Bush Administration are mid-course in their program cycles. Industry agrees that the cost-shared approach offers the best way for the federal government to meet its policy goals in supporting renewable energy resources while at the same time ensuring that federal renewable energy research efforts are cost-effective. As Congress seeks new ways to further lower those costs, the Council strongly encourages Congress to preserve the integrity of existing multi-year contracts with the renewable energy in-

dustry. The Council also urges Congress, when making budget cuts, to resist the urge to make broad, indiscriminate cuts that may cripple cost-effective and productive renewable energy programs. Such cuts have the unintended consequence of freezing industry R&D efforts and make the financial community even more reluctant to invest in emerging technologies. Further, such cuts run the risk of ultimately undermining U.S. competitiveness as our technological superiority in renewable technologies is equaled and perhaps surpassed by the aggressive research and deployment programs currently being conducted by our trading partners in Europe and Japan.

Notwithstanding the significant progress renewable industries have made in reducing costs and increasing technology reliability, barriers still remain that slow their commercialization. DOE is engaged in a number of programs to help eliminate or mitigate the impacts of these barriers. I would like to briefly review a few of these programs that the Council believes are particularly effective.

WIND

World markets for wind energy are growing at an unprecedented rate. Figures for 1996 indicate that total worldwide installed wind capacity stands at 6,190 MW, up 24 percent from a year earlier. This figure includes approximately 1,200 MW installed in 1996. The Council expects 1997 additions to reach nearly 1300 MW. After 2000, The Energy Information Administration expects U.S. wind capacity to grow rapidly, reaching 12,000 MW by 2015, when wind is expected to generate enough power to serve more than three million homes.

The Council respectfully requests an appropriation of \$42.9 million for wind energy research and development in the fiscal year 1998 to fund projects in next generation wind turbine development (\$19.7 million recommended), cooperative research (\$9.1 million recommended), and applied research (\$14.1 million recommended). This level of funding is particularly important to continue development of next generation wind turbine technologies needed to keep the U.S. industry competitive in restructured domestic markets and in the fast growing, highly competitive international markets.

Wind programs have been a success story for DOE's overall R&D program. Although wind is making headway in the electric power generation market, present installed wind capacity represents only 0.1 percent of total U.S. generating capacity. Clearly there are opportunities for growth as wind power costs continue to fall. The goal of cost-shared DOE/Wind Industry efforts is to develop the next generation aimed at delivering electricity in the range of 2.5 cents/kWh.

A relatively small increase for Cooperative Research and Testing will provide additional support for industry testing at the National Wind Technology Center (NWTC) in Rocky Flats, CO. This will allow for a completion of efforts to develop U.S. certification and standardized criteria for wind energy technologies. Ultimately, streamlined certification criteria will make it easier for U.S. businesses to market and sell American-made wind turbine technologies in international markets.

The main focus of the applied research program is development of models to better understand aerodynamics (through wind tunnel tests), fatigue damage prediction and structural reliability capabilities. Modeling and code design work is underway at both the national Renewable Energy Laboratory (located in Golden, CO) and the Sandia National Laboratory (New Mexico).

More and more electric utilities are becoming interested in generating power from large-scale wind powerplants. The world markets for wind turbines were valued at \$1.3 billion in 1996 and turbines were Denmark's second leading export. This market is expected to further grow over the next few years. These new markets are driven by the fact that at least one-third of the world's population—over 2 billion people—do not have access to reliable energy. Maintaining a U.S. presence in this growing industry is a valuable investment of federal resources—one that will pay off many times in the next several decades.

SOLAR ENERGY

The United States currently leads the world in the diverse portfolio of solar technologies: photovoltaic, solar water heating, and solar thermal electric technologies (solar power tower, parabolic Troughs, and dish-engines). However, our international competitors are positioning themselves to take market share from the United States in vast, multibillion dollar world markets, as a result of strong support provided by their respective governments—especially in Japan and Germany—through a variety of aggressive development, commercialization, and deployment programs. Maintaining our lead will require strong and focused U.S. government ac-

tion, not only to support international activities but also to securing a secure position in growing and domestic markets.

Solar technologies available today include photovoltaics (PV), solar water and pool heating, solar process heat, and solar thermal power technologies. Faster integration of solar energy systems in both supply- and demand-side applications in our domestic economy—combined with support for increased exports of U.S. solar technologies to take advantage of emerging multi-billion dollar markets—will have the parallel benefits of creating thousands of new high-technology manufacturing jobs and improving our environment. The Council supports the trend toward market-driven, industry cost-shared programs designed to leverage federal dollars with private-sector participation to enhance private-sector understanding and use of these technologies.

Improving conversion efficiency of solar panels and reducing manufacturing costs will play a key role in sustaining U.S. dominance in the area of PV. We are recommending \$85 million for the Photovoltaic Systems Program, one of the best leveraged of any program in the Department of Energy. Our two most formidable competitors, Japan and Germany, are spending \$182 million and \$95 million, respectively, to jettison their in-country industries into increasingly lucrative world markets. One critical factor in the U.S. PV industry's future success will be its ability to leverage its financial and intellectual resources with those of its strategic partners in the Department of Energy to commercialize breakthroughs made in the areas of basic materials science, applied research, and systems engineering.

The Council supports DOE cost-shared initiatives in R&D (thin-films and other advanced materials, \$20 million recommended) and manufacturing (PV-MaT, \$18 million recommended) which address these issues. Equally important is the concept of building integrated PV programs (PV:BONUS, \$4 million recommended) where PV manufacturers, system integrators, and utilities are working together to reduce the cost of PV-generated electricity. Another good model for public-private efforts is the "PV-COMPACT" program (\$14 million recommended), a collaborative effort involving more than 80 electric utilities (representing over half the electricity production in the U.S.) and other interested organizations to garner the economic, commercial and environmental benefits of PV technologies.

PVs and other solar technologies offer the U.S. environmentally benign and cost-effective energy supply options in a variety of market applications. The market viability of these technologies is demonstrated in growing private sector interest in developing new manufacturing facilities related to solar industries. In the area of PV production alone, the last two years have witnessed six U.S. companies—including Council members United Solar Systems Corporation and Amoco/Enron Solar—announce plans to construct new photovoltaic plants. This activity is a unique example of DOE funding encouraging significant private-sector investment that creates new jobs. The Council strongly urges Congress to continue its support of public/private partnerships that help ensure that U.S. companies can compete effectively in rapidly emerging world renewable energy markets.

The Council recommends \$5.7 million in funding for the Solar Thermal Buildings program, a research and development program focusing on materials and components for solar water and space heating technologies for building applications. Based at the National Renewable Energy Laboratory and the Florida Solar Energy Center, the program also has a strong technology standard and certification component. Activities in fiscal year 1998 should include ongoing cost-shared technology validation projects, laboratory R&D, and customer-oriented applied R&D of solar building technologies with universities and industries.

The Council recommends a total of \$27 million for the Solar Thermal Electric and Process Heat programs, an R&D program on materials and components with a heavily cost-shared technology validation component. Over the past five years, the primary program focus has been collaboration with industry to develop advanced solar thermal electric technologies to the point of commercial readiness.

INTERNATIONAL ACTIVITIES

Finally, the Council would like to offer its support of federal programs designed to help open important international markets for renewable technologies, including DOE programs such as the Committee on Renewable Energy, Commerce and Trade (CORECT) and GT-World.

The developing world—Eastern and Central Europe, the former Soviet Union, Asia, Africa, and Latin America—presents tremendous opportunities for the deployment of renewable energy technologies. Renewables offer great flexibility to developing countries looking for economically viable, reliable, and clean energy supply options that can be used to serve growing metropolitan areas and remote rural regions

where power is otherwise unavailable. Renewables can also help support the development of commercial activities such as agriculture and telecommunications through remote power source applications. Competition in rapidly growing developing country markets is intense; U.S. renewables manufacturers face the dual obstacles of competition from conventional energy sources and foreign renewables manufacturers buoyed by government assistance.

In this regard, it is important to note that major U.S. competitors are now making aggressive moves into the renewables market. When measured against the relative size of their economies, Japan, Germany, and Sweden are each now making larger government R&D investments in renewables than the U.S. In fact, the U.S. taxpayer spends a lower portion of its R&D budget on energy than any other taxpayer in an industrialized, market-based economy.

U.S. Government assistance in identifying market opportunities, providing education and training for energy decisionmakers in the developing world, and supporting demonstrations of renewable technologies in overseas applications promises to help ensure that U.S. renewables manufacturers will be successful in capturing market-share throughout the expanding global market for clean energy technologies and services.

CONCLUSION

Promoting research, development and validation of emerging renewable energy technologies will result in the near-term creation of thousands of new jobs, a stronger economy, enhanced export opportunities for domestic manufacturers, and a cleaner environment. DOE's budget request continues federal emphasis on developing low-and non-polluting energy technologies and services as a means of achieving these goals. It utilizes cost-shared collaboratives with industry to leverage limited federal funds in recognition that cooperation with industry is vital for addressing market imperfections impeding the widespread use of renewables. The Council strongly supports this approach, and urges Congress to continue its support of federal research, development and validation programs for renewable energy technologies.

PREPARED STATEMENT OF FATHER WILLIAM L. GEORGE, S.J., ASSISTANT FOR FEDERAL RELATIONS, GEORGETOWN UNIVERSITY

Mr. Chairman and members of the Committee, I am Father William L. George, S.J., assistant to the President of Georgetown University, the Reverend Leo J. O'Donovan, S.J. Thank you for the opportunity to testify on the Fuel Cell Transit Bus Research and Development Program. In the past, this Committee has strongly supported the introduction of this key transportation technology. Your vision has successfully developed three, 30-foot Fuel Cell powered transit buses. These buses are the only Fuel Cell powered vehicles in the world capable of operation on liquid fuel, and currently undergo testing in various locations around the country.

In fiscal year 1998, we request this committee augment the National Park Service (NPS) Grand Canyon Project by \$1.2 million to develop the introduction of a Fuel Cell powered transit bus fleet amenable to the park operation. A specification should be included to properly identify Fuel Cell technology as most beneficial to the needs of the Grand Canyon. The suggested Fuel Cell technologies are those being developed under a ETA Grant to Georgetown. This activity will be the harbinger of the first pilot production Fuel Cell bus fleet in the country. This opportunity leverages all the R&D efforts of the past to solve a critical need of the NPS and provides a clear path for the introduction of the Fuel Cell technology into the transit industry.

Two years ago, I testified that the commercialization of Fuel Cell technology would pass to the Federal Transit Administration (ETA). Funds have been provided to develop a commercially viable 40-foot Fuel Cell bus using a domestic Fuel Cell manufacturer. Two such vehicles are being fabricated, each with a different type of Fuel Cell. The first, which we consider a commercial prototype based upon the initial program authorized by this subcommittee, should be delivered in the fall of 1997. The second is more developmental in nature and is due sometime later. Both are 40-foot transit buses that are designed to achieve commercial production.

The next step to commercialization is to build a small, pilot-production fleet of buses, and apply it to a real-world situation. To gain wide user acceptance, it is important to choose an operation which provides a showcase to a broad segment of potential bus riders and where the attributes of the Fuel Cell power system are absolutely essential. The problems of the Grand Canyon National Park provide an ideal opportunity.

Traffic congestion at the Grand Canyon National Park exceeds available road and parking capacity. The noise and pollution greatly detract from the serene beauty of one of our greatest National landmarks. The Park must convert to a pedestrian and transit-oriented facility. The conversion will initially require a fleet of at least 25 transit vehicles. The NPS has made a commitment to use a transit fleet that is environmentally sensitive to noise and exhaust emissions. The NPS is currently working through the preliminary concept phase of the transit planning for this system.

We strongly endorse the efforts of the Park Service to preserve the pristine natural setting of the Grand Canyon and believe that Fuel Cell powered transit buses offer the most promise. The Fuel Cell bus will introduce citizens from all over the country to the next generation of power systems. This highly visible program will serve as an exemplar of shared technology satisfying both Interior and commercial transit applications. The needs of the Grand Canyon and the commercialization of Fuel Cell technology for transportation will be advanced by this activity.

PREPARED STATEMENT OF THE CLEAN COAL TECHNOLOGY COALITION

I. INTRODUCTION

This testimony concerns fiscal year 1998 funding for the Department of Energy's (DOE) Clean Coal Technology Program. This written statement is submitted on behalf of the Clean Coal Technology Coalition (CCTC or Coalition), a public/private organization of electric utilities, coal companies, technology developers, state governments' universities and others organized to encourage the development and deployment of clean coal technologies.

The members of the Coalition understand the budgetary pressures resulting from fiscal constraints facing the federal government. However, we also understand the value of the federal government role in supporting prudent long-term investments in quality programs. The CCTC strongly urges the Congress not to sacrifice such important investments in our Nation's future for immediate and limited budgetary savings. We encourage the Members of the Subcommittee to maintain a course toward completion of the highly successful Clean Coal Technology Program (CCT Program).

The CCT Program is a jointly funded partnership between government and industry to demonstrate a new generation of innovative coal processes in a series of show-case, cost-shared demonstration projects. The CCT Program has been, and continues to be, an extremely successful public/private partnership in which government and industry have formed effective partnerships in making sustained progress toward long-term goals.

Last year, \$124 million was rescinded by Congress from the CCT Program. This was in addition to \$200 million that had previously been rescinded from the CCT Program by the Congress. These reductions have significantly affected the implementation and administration of the CCT Program and any additional reduction in funds could seriously impact the integrity of the program. The members of the Coalition urge Congress to defer any additional funding cuts and support the successful completion of this important, and successful program.

The members of the Coalition support full funding for the DOE cost share of the remaining CCT Program projects. We believe that government should fulfill its commitments accepted in good faith by the private sector. We encourage the Congress to ensure sufficient funds are available for all projects which the DOE and the industry partner have determined should be continued and completed.

For fiscal year 1998, the Administration proposes to rescind an additional \$153 million and defer the release (or payment) of \$133 million in unobligated CCT Program funds until fiscal year 1999. The Coalition understands that the Administration's request is predicated upon the cancellation of previously selected projects and the combining of other selected projects and the funds, therefore, are no longer needed.

In addition to its proposal to rescind an additional \$153 million, the Administration is seeking an advance appropriation of \$50 million to be made available in fiscal year 1999 to initiate the development of an international clean coal technology program. If approved, these funds are intended to "offset" part of the proposed \$153 million CCT Program funding cut. The Coalition has taken a position in support of international cooperation and demonstration of clean coal technologies. We strongly believe in the importance of successfully demonstrating clean coal technologies, either domestically or in the international arena. However, DOE participation in international clean coal technology projects has been evaluated by the Congress in the past and was rejected. Therefore, unless there is a change in the will of the Con-

gress, we are not able to view this proposed funding as an offset to the funding cut in the CCT Program. Indeed, the outcome of the Administration's request may simply be a rescission of the \$150 million and no addition of \$50 million for an international project in fiscal year 1999. Further, the outcome might simply be an additional \$50 million reduction in the program. This decision would be made in conjunction with the fiscal year 1998 budget to be effective in fiscal year 1999. We urge the Congress not to make such a conclusion.

Given the fact that the Clean Coal Technology Program is a technology development program, it is possible that projects might experience cost overruns or expected reductions in technology costs may not be realized as rapidly as expected. In such cases, more funding to achieve technology/program related goals would be required. To that end, sufficient funding must be available to provide the DOE adequate flexibility to ensure the goals of the Program can be achieved and the accomplishments to date are not lost. The Coalition recommends that if a rescission is to be made, the Congress rescind not \$153 million, but rather \$100 million, leaving the requested advance appropriations for an international program in the clean coal domestic budget as a "safety net" for ongoing projects or clean coal-related initiatives that will have the support of Congress and the Administration.

As the Subcommittee considers fiscal year 1998 appropriations allocations, we urge your continued support for this quality program that has assisted, and will continue to assist, efforts to obtain benefits derived from clean, efficient, and economic, coal-based power generation.

II. THE CLEAN COAL TECHNOLOGY PROGRAM—A SUCCESSFUL COOPERATIVE UNDERTAKING

In 1986, the DOE established the CCT Program as an industry/government partnership for sharing the costs of projects that demonstrate innovative technologies for using coal in a more environmentally sound, efficient and economical manner. The CCT Program was borne out of recommendations by the U.S./Canadian Special Envoys on Acid Rain and approved, and finally recommended, by former Canadian Prime Minister Brian Mulroney and President Ronald Reagan. The establishment of the CCT Program responded to the need to insure that the Nation's energy demands are met, in part, by our most abundant energy resource—coal—in an environmentally responsible manner that does not jeopardize the attainment of air quality standards. Clean coal technologies meet these needs.

Much of the CCT Program's success is based upon its unique structure. First, unlike many other federal programs, the CCT Program was designed to serve a specific mission: to demonstrate a variety of clean coal technologies. Once the selected projects are completed, the CCT Program will end. Second, industry is assigned a critical role in the project selection process. Rather than select technologies, the government assists in the development of technologies chosen as most promising by industry. Third, the CCT Program contains a repayment provision. Not only do U.S. taxpayers gain the environmental, energy efficiency, national security and job creation benefits associated with the development of clean coal technologies, but when the technologies are successfully marketed, project participants are required to repay the government for federal financial support received. Finally, and most important, the CCT Program is a cost-shared venture. Nearly two-thirds of all CCT Program funds have been supplied by the private sector (industry has invested approximately \$4 billion and the Federal government \$2 billion in the Program, even though the program only requires 50/50 cost-sharing.)

The CCT Program has been implemented by the DOE through five solicitations and currently consists of 40 showcase demonstrations that are either completed, or underway, in locations across the country. Success of this public/private partnership may be measured by several factors: first, the majority of the 40 projects are completed, in operation, or under construction; second, for every \$1 invested by the Federal government, private companies and states have contributed approximately \$2, making the CCT Program one of the most successfully leveraged technology-development ventures managed by the U.S. Government; third, millions of dollars worth of commercial sales of clean coal technologies have been realized, thousands of new U.S. jobs are being supported by clean coal technology projects and the U.S. balance of trade has benefited (and will continue to benefit) from export sales of clean coal technologies.

III. THE IMPORTANCE OF COMPLETION OF THE CCT PROGRAM

The federal government plays a critical role in the CCT Program by providing "seed" funding and support for these new technologies. Government support of clean coal technologies has mitigated the high risks and costs associated with technology

development and the lack of economies of scale that attends the initial demonstration of a technology. In turn, this support has increased the rate of development and deployment of clean coal technologies. Government participation has been, and continues to be, vital to the successful and timely introduction of clean coal technologies into the marketplace.

At the inception of the Program, Congressional appropriators had the foresight to provide advance appropriated funds for the clean coal program. This innovative funding process assured the private sector that the government was a committed and reliable partner and provided the security required by industry to invest large sums of capital into the CCT Program. To slash funding at this point would: (1) forfeit a relationship that the federal government and industry have worked hard to nurture and develop; (2) break government's commitment to partner with industry in the 40 clean coal technology demonstration projects; and, (3) destroy an important bond of trust. It is vitally important that sufficient funding be provided to the CCT Program, not only for the purpose of honoring government commitments, but also to provide the U.S. market with advanced technologies for future power generation needs. Adequate funding will allow the program to continue, projects to be completed, technologies to mature, and enable U.S. companies to access the potentially enormous clean coal technologies export market.

IV. CLEAN COAL TECHNOLOGIES YIELD MULTIPLE NATIONAL BENEFITS

Currently, coal is used to generate 56 percent of U.S. electricity and is emerging as a feedstock for the production of alternative transportation fuels and chemicals. According to the Energy Information Administration, coal is expected to fuel about 50 percent of U.S. electricity production through the year 2015 and coal will continue to be the primary source of electric power well into the next century, not only in this country, but for much of the world. Given these facts and projections, the United States is presented with an extraordinary opportunity to market its new, cleaner, coal-based power systems overseas which will create new U.S. jobs and help reduce the U.S. trade deficit.

Clean coal technologies allow the Nation not only to meet current and future power generation needs while utilizing our most abundant energy resource—coal—but also to provide that power in an environmentally sound manner. This is an important point. Without new technology, it may be difficult for generating companies to respond to increased electricity demand, comply with environmental regulations and, at the same time, refrain from increasing the cost of electricity production and electricity prices to consumers. Given that \$200 billion from our economy goes for the purchase of electricity yearly, any economic penalty could erode U.S. competitiveness and limit economic growth.

The clean coal technologies under development have proven successful in removing and preventing emissions. The various clean coal technologies can remove 30 to 90 percent of nitrogen oxides and 50 to 99 percent of sulfur dioxides from the combustion of coal. Also, because some of these technologies are more efficient converting coal to useful energy, significantly less CO₂ is emitted.

In addition to significant environmental benefits, CCTs already have benefitted our domestic economy through revenue from sales and jobs creation. Further, a significant potential exists to export clean coal technologies which, in turn, will create additional U.S. jobs. Global electricity demand, particularly in developing countries, is rapidly increasing. To meet that demand, many nations will rely upon indigenous coal resources and foreign capital to finance utility projects. In fact, the U.S. Department of Energy estimates that the total world market for CCTs is between \$250–750 billion through the year 2010. If the U.S. were to capture only 20 percent of that export market, DOE estimates as many as 29,000 to 43,000 U.S. jobs would be created.

V. CONCLUSION

The Clean Coal Technology Coalition understands the budgetary constraints faced by the federal government and respects congressional action to consider plans to reduce federal spending. We ask that the Clean Coal Technology Program, an effective program which promotes and achieves multiple national goals and benefits, not be sacrificed for immediate savings. In the long-term, such actions only would result in a net loss for U.S. taxpayers from lost jobs, exports, cleaner technologies and domestic fuel security.

PREPARED STATEMENT OF GARY A. STYLES, MANAGER, PLANNING AND ANALYSIS,
POWER SYSTEMS DEVELOPMENT FACILITY, SOUTHERN COMPANY SERVICES, INC.

INTRODUCTION

Mr. Chairman and members of the committee. This statement of Southern Company Services, Inc., ("SCS") is in support of \$20 million for the Wilsonville Power Systems Development Facility in the Advanced Clean and Efficient Power Systems Program requested in the U.S. Department of Energy ("DOE") Fossil Energy R&D budget for fiscal year 1998. Specifically, the budget request is for \$10 million in the high efficiency—integrated gasification combined cycle activities and \$10 million in the high efficiency—pressurized fluidized bed combustion activities. SCS would also like to request that the budget for the pressurized fluidized bed combustion activities be increased by an additional \$2 million (\$12 million total) to fund startup and commissioning of the advanced pressurized fluidized bed combustion ("APFBC") train and support projects. Construction of the APFBC is currently scheduled for accelerated completion in fiscal year 1998. Acceleration of APFBC construction will result in lower overall cost to project but will increase project cash flow for fiscal year 1998. Without this additional \$2 million, completion of startup and commissioning of the APFBC train at the PSDF may be delayed.

Southern Company is actively involved in many areas of research including technologies that can be used by the affiliated operating companies to produce power more efficiently. In particular, Southern Company, through SCS and its operating companies, supports and conducts research that will help the nation utilize its coal resources while minimizing the environmental effects of using one of our nation's most plentiful and valuable resources. As a result, SCS has participated in projects in both DOE Clean Coal Technology program and the DOE Fossil Energy Research and Development program.

The purpose of this testimony is to request this Subcommittee's continued support for the Power Systems Development Facility ("PSDF") for advanced coal gasification and pressurized combustion research. SCS would also like to express appreciation to this Subcommittee for previous support for advanced fossil energy research. SCS specifically requests a minimum of \$22 million for the PSDF project in fiscal year 1998. This request assumes that the full \$22 million for fiscal year 1998 and the full \$22 million that was approved by this committee for fiscal year 1997 are available to the project.

OBJECTIVES OF THE PSDF RESEARCH PROGRAM

The objectives of the PSDF research program, in conjunction with other DOE research projects and programs, are to reduce technical risk, improve environmental performance, and reduce the cost of producing electricity from coal, our nation's most abundant fossil fuel resource. For many reasons, natural gas fired combustion turbines and combined cycle power plants are currently the most cost-effective electric power generating technologies in many areas of the United States. Natural gas fired power plants are projected to capture over 50 percent of new electric generation capacity over the next 10 to 15 years. However, many may remember that less than 15 years ago, electric utilities were prohibited by federal law from burning natural gas to produce electricity due to shortages of natural gas and its importance to domestic heating. During this period of energy stability, we must not, as a nation, become complacent or we may face another energy crisis in the future. Our nation needs competitive, cost effective, clean, and efficient coal-based technologies to meet our future electric energy needs.

The fundamental purpose of the PSDF is to support the national program to assure competition between energy resources and, thereby, keep electricity prices low. Coal reserves currently accounts for over 90 percent of the U.S. combined energy reserves supplies over 56 percent of the energy for electric power generation. Coal is still our nation's lowest cost fossil fuel. However, for coal to continue to be a cornerstone of our national energy policy, we must reduce the capital cost of new coal fired power plants by at least 20 percent while simultaneously increasing efficiency and improving environmental performance. To accomplish these objectives, we must improve the reliability of individual plant components and optimize system integration and performance. This type of research can be accomplished most cost effectively at a dedicated pilot-scale development facility such as the PSDF. The PSDF is designed to be the U.S. test facility to support the Clean Coal Technology program and advanced coal-based power generation development for the next five to 15 years.

DESCRIPTION OF POWER SYSTEMS DEVELOPMENT FACILITY

The Wilsonville PSDF is a joint industry/DOE facility for engineering-scale testing and development of devices to remove particulates and other contaminants from hot gas in high-efficiency coal gasification and pressurized fluidized-bed combustion power plants. SCS and our industrial partners are supplying over \$40 million in cost sharing to the PSDF project. The industrial partners, which represent a major portion of the domestic electric power generation, power generation design and manufacturing, construction, and coal mining include: M.W. Kellogg, Inc., Peabody Coal, Foster Wheeler Corporation, Southern Research Institute, Westinghouse Electric Corporation, Combustion Power Corporation, Industrial Filter & Pump, Inc., and the Electric Power Research Institute. Three of the industrial partners, Foster Wheeler, M.W. Kellogg, and Westinghouse are also actively involved in Clean Coal Technology demonstration projects that will enhance commercialization opportunities for technologies being developed at the PSDF. Southern Company, and its industrial partners in the PSDF, have financial incentives to see that technologies successfully developed at Wilsonville and other sites are effectively implemented in the market place.

In addition to the Wilsonville, Alabama plant site, components for the facility are being developed at the following locations: Grand Forks, North Dakota (gasifier development), Houston, Texas (gasifier development); Livingston, New Jersey (combustor development); Menlo Park, California (filter fabrication); Cicero, Illinois (filter fabrication); Orlando, Florida (gas turbine burner), and Pittsburgh, Pennsylvania (filter fabrication).

High-temperature, high-pressure gas cleanup must be perfected in order to use new high-performance gas turbines in coal-based power plants. When fully developed, these technologies will: (1) improve the efficiency of power generation from coal by over 25 percent compared to pulverized coal power plants with a corresponding reduction in CO₂ emissions; (2) lower the cost of electricity by over 20 percent; (3) be more acceptable to coal-based utilities than today's coal-gasification combined-cycle designs; and (4) reduce pollutants by over 95 percent.

The PSDF will be the focal point for much of America's advanced electric power generation technology development in the 1990s and into the twenty-first century. Current plans call for the facility to contain five modules: (1) an advanced pressurized fluidized-bed combustor ("PFBC"), an extremely clean method for burning coal; (2) a transport reactor gas source, an advanced type of coal gasifier and pressurized combustor; (3) a hot gas cleanup module to test filters for removing fine particles and other contaminants from coal gases; (4) an advanced burner-gas turbine module; and (5) an advanced fuel cell. At the PSDF, private developers will be able to test innovative electric power system components—new combustors, improved cleanup systems, and advanced turbines and fuel cells—at a central location, saving the time and expense of building separate test facilities.

The Wilsonville PSDF offers a number of advantages to the utility industry and to the nation by being able to address issues for the near, middle, and long-term management of technology risk:

- The testing of hot gas cleanup systems addresses near-term developmental needs, and the schedule of the PSDF is geared towards providing support to Clean Coal Technology ("CCT") projects for advanced power generation as these projects enter the design and operational phases.
- The advanced pressurized combustion process offers the potential of a high efficiency system for the mid-term that may be widely used in repowering applications or in greenfield plants.
- The transport gasifier/combustor has significant commercial potential due to its compact size and resulting lower capital cost.
- The integrated gasification/fuel cell concept is a system that has the potential to become the most efficient and environmentally superior coal-based system available over the long-term.

Another important aspect of the technologies being developed at the PSDF is the interaction with technologies being developed in other DOE programs such as advanced turbine, filter development, and the fuel cell programs. The Wilsonville PSDF will be the only facility in the world where all the components of an advanced coal-fired power plant can be tested in an integrated system at a practical engineering scale prior to assuming the risk and cost of commercial applications. This facility and other DOE fossil energy programs will allow U.S. electric utilities to maintain reasonable domestic energy prices and for U.S. equipment suppliers to gain a technological advantage in electric power production that can help increase competitiveness in foreign electricity markets.

STATUS OF THE PSDF PROJECT

Construction of the M.W. Kellogg transport reactor train was completed in May 1996 and startup in the combustion mode began in August. By the end of 1996, over 800 hours of fluid mechanical testing were successfully completed including over 230 hours of operation on coal. In 1997, the transport reactor will be operated in both the combustion and gasification modes and tests on different particulate control devices will begin. Construction and startup of portions of the Foster Wheeler advanced PFBC (APFBC) system are scheduled to be completed in 1997. Tests of the fully integrated Foster Wheeler APFBC are scheduled to begin in early 1998.

CONCLUSION

The United States has always been a leader in energy research. Current DOE fossil energy research and development programs for coal will assure that a wide range of technology options continue to be available for future needs. We recognize the difficult choices that confront Congress when it examines the near-term effects of research programs on the Federal budget. We believe, however, that supporting advanced coal-based energy research today, in programs like the PSDF, will be a net plus for the economy, the federal government, and the American people over the long run. For the foregoing reasons, SCS requests your continued support for the Power Systems Development Facility by including \$22 million in funding in the Department of Energy's Fossil Energy Budget. We thank you for the opportunity to appear before you today.

PREPARED STATEMENT OF THE BUSINESS COUNCIL FOR SUSTAINABLE ENERGY

I. INTRODUCTION

The Business Council for Sustainable Energy (BCSE) is pleased to offer its views on the role of government in support of energy research and development—as it relates to energy efficiency programs at the Department of Energy (DOE).

The BCSE is comprised of a diverse group of companies. Our members represent manufacturers, investor- and municipally-owned electric and natural gas utilities, energy marketers, laboratories, associations, and energy service companies. Our diversity is also reflected in the size of our member companies. We have Fortune 500 enterprises and small entrepreneurial businesses as members. The BCSE supports energy-related policies and programs that enhance the nation's economic and national security goals through the rapid deployment of efficient, non- and low-polluting technologies.

The BCSE's membership adds value to government policies and programs by forming consortia and engaging in cost-shared partnerships, leveraging limited federal resources, and advancing U.S. industrial competitiveness. The international marketplace is more heavily subsidized by foreign governments than ever before. In fact, as a percentage of gross national product, U.S. government investment in non-defense research and development (R&D) remains well below that of our fiercest competitors, Japan and Germany.

We believe that energy efficiency can become an even greater force in our economy and offset reliance on foreign oil, while reducing our production of greenhouse gases, and providing new high-technology, high-paying American jobs. Increased federal emphasis on energy efficiency is arguably the least costly and intrusive means to accomplish the goal of an economically viable sustainable energy future. The BCSE will not attempt to address all of DOE's energy efficiency programs given their breadth and diversity. Rather, we will focus on a few programs that illustrate the value of federal support.

II. THE TRANSPORTATION SECTOR

Perhaps the best indicator of our Nation's need to advance alternative-fuel vehicle (including natural gas and electric vehicles) research, is the current record high level of U.S. oil imports, (52 percent) which is projected by the Energy Information Agency (EIA) to reach 63 percent by the year 2005. These imports contribute significantly to our trade deficit and threaten our economic security, as the Persian Gulf countries are expected to control over 70 percent of the global oil market by the year 2010.

Alternative fuel vehicles

As surface transportation in the U.S. is virtually 100 percent dependent on petroleum, alternative fuel vehicles (AFV), by definition, are the only solution to the

transportation sector's vulnerability. Although AFVs are available today, much more research must be done and technical advances realized before either natural gas (NGV) or electric vehicles (EV) will be universally accepted, reliable, and cost-competitive.

The BCSE is supportive of DOE's system optimization and tank storage research for NGVs, particularly in the industry's priority area of high fuel-use NGVs. By utilizing advanced composite materials, compressed natural gas (CNG) storage systems can be manufactured to require less weight for equal or greater amounts of fuel storage.

The BCSE is also supportive of DOE's Clean Cities Program, which in fiscal year 1998 will expand its partnerships to 65 cities across the nation, assisting state and local governments with AFV refueling infrastructure development, education, and technical assistance. The nation-wide infrastructure corridor will be extended and a long anticipated expansion of the Clean Cities electric vehicle deployment program will be undertaken. Our members are putting their money behind these endorsements. While we invest in infrastructure advancements, our members are simultaneously building their fleets. By the end of 1997 BCSE members, Brooklyn Union, headquartered in New York, will have 916 NGVs in its fleet (over 85 percent of its total fleet) and Pacific Enterprises, headquartered in California, will have 765 NGVs.

Battery technology

The battery provides an example of a promising technology for electric vehicles. BCSE member Energy Conversion Devices, headquartered in Michigan, which produces the Ovonic Nickel-Metal Hydride battery, is a member of the U.S. Advanced Battery Consortium. Fifty-five percent of funding for this important partnership is provided by the private sector. Advanced mid-term batteries will double the approximately 70-mile vehicle range compared with conventional lead-acid batteries, and the Ovonic Nickel-Metal Hydride battery has met or exceeded the mid-term performance goals set by the Consortium. The electric battery and other promising energy storage technologies could redefine transportation, ending the transportation sector's reliance on foreign oil.

III. UTILITY/POWER GENERATION SECTOR

EIA projects that cogeneration and non-utility applications in the U.S. will account for nearly 58 percent of all new electric generating capacity built over the next 20 years. Natural gas powered industrial turbines and fuel cells are the prime cogeneration candidates to meet the projected capacity demand.

Fuel cell technology

The BCSE is very supportive of DOE's fuel cell programs in the power generation, building, and transportation sectors. One of the BCSE's members, International Fuel Cell, headquartered in Connecticut, is engaged in cost-shared partnerships with the federal government. Fuel cell power systems are poised to enter the market for distributed power generation and, in the future, will be available in the future in a variety of sizes and types to fill the diverse power generating needs of the commercial, industrial and utility sectors. Fuel cells are very efficient energy converters. Compared to the average 35 percent efficiency of the present electrical grid, the projected fuel-to-electric conversion efficiency for fuel cell power plants range from 45 percent, for the units about to enter the market, to 70 percent for units that could become available by 2010. The ultra-low emissions and "good-neighbor" features of fuel cells enable them to be sited close to the end users, eliminating losses associated with long-distance transport over high-voltage lines. The ultra-low emissions include virtually zero NO_x and SO₂ levels, and the lowest CO₂ emissions of any fossil fuel power plant.

In the transportation sector, the DOE anticipates that light-duty fuel cells will begin to enter the market by 2008. By 2020, it is projected that 75,000 barrels per day of oil could be displaced, amounting to \$1.2 billion in energy cost savings and 2.9 million metric tons of carbon equivalent emission reductions. The worldwide market for fuel cells across the power generation, building, and transportation sectors is projected to be \$3 billion per year in the post-2000 era with an exponential growth in the market after 2010.

Gas turbines

The BCSE strongly supports DOE's Industrial Advanced Turbine Systems Program. EIA's 1996 Energy Outlook and the Gas Research Institute Baseline Projection of U.S. Energy Supply and Demand (1996 Edition), both project that total gas demand for electricity generation is projected to grow from 4.3 quads in 1994 to over

eight quads in 2015. The portion of this gas demand in industrial and commercial cogeneration is projected to more than double, from 1.1 quads in 1994 to 2.7 quads in 2015. Solar Turbines, a BCSE Member, is a solely-owned American corporation headquartered in California. Solar Turbines is the leading manufacturer of industrial-scale turbines. Solar Turbines is expected to be the first in the marketplace with the efficiency and environmental improvements emanating from the successful cost-shared partnership with DOE. fiscal year 1998 research will be geared toward reducing NO_x emissions at the higher temperatures (required to increase system efficiency) without increasing emissions of CO or unburned hydrocarbons.

Utility programs

DOE also has worked effectively with utilities and power authorities to promote energy efficiency. Through voluntary programs such as Climate Wise, DOE has obtained the commitment of industry to reduce its emission of greenhouse gases. Generally, activities that reduce emissions also reduce energy use. Climate program participants—such as BCSE member Sacramento Municipal Utility District (SMUD)—have premised their programs on sound economic principals. In fact, SMUD attributes its aggressive support for energy efficiency as a primary reason it has been able to stabilize its electricity rates.

IV. THE BUILDING SECTOR

The building sector (residential and commercial buildings) currently uses 32 quadrillion Btu (quads) of primary energy annually. This is about 36 percent of total U.S. energy consumption, and includes 66 percent of all electricity and 25 percent of all natural gas used in the nation. This energy costs consumers about \$220 billion annually. The average household spends about \$1,300 per year on domestic energy (excluding associated externalities). Energy consumption in buildings also has serious environmental implications. Carbon dioxide emissions attributable to primary energy use in U.S. buildings alone are roughly equivalent to the total emissions of Japan and the United Kingdom combined.

Natural gas cooling technology

Natural gas cooling is very energy efficient, especially when measured on a life-cycle basis (measuring energy from its source through transmission and distribution to the site), and its low-emission properties make it environmentally friendly. Additionally, natural gas cooling is used during the periods of the day and days of the year that correspond to the peak demand for electricity generating capacity, thereby benefiting gas customers and gas and electricity providers. BCSE member York International, headquartered in Pennsylvania, is engaged in a cost-shared partnership with DOE toward the development of a large natural gas commercial chiller. The cost-effective and efficient York chiller will allow end-users to provide for both the cooling needs and thermal requirements of their building. The planned market introduction is scheduled for 1998.

DOE and BCSE member American Standard Companies, headquartered in New Jersey, and its subsidiary Trane, headquartered in Wisconsin, are developing a highly efficient air pre-conditioner system to be incorporated into Trane's "Climate Changer" commercial product line. Desiccant dehumidification-based cooling systems are beginning to show real promise, and DOE technical and marketing studies are an essential component for assured broad commercialization. Similarly, with support from DOE, Engelhard/ICC is developing unique desiccant systems with heat exchange technology to independently reduce both humidity and temperature while drawing 100 percent fresh air from the outside. Indoor air quality is a serious public health issue today and the American Society of Heating, Refrigeration and Air-Conditioning Engineers has recently promulgated ventilation requirements for building systems (ASHRAE-62).

Standards and insulation

DOE has played a constructive role in providing educational and technical support of building codes and standards such as the Model Energy Code and ASHRAE 90.1. These codes and standards—promulgated by private-sector organizations—help ensure that our nation's housing stock reflects good building construction practices and is reasonably energy efficient. In addition, DOE has published industrial insulation guidelines that will significantly improve energy efficiency in this sector of the economy. DOE is currently providing educational and technical support to help industry implement the guidelines. DOE also has provided valuable technical assistance to the polyurethane foam insulation industry, helping the industry find a substitute for CFCs as a blowing agent used in insulation installation. The CFC-free polyiso insulation performs as efficiently as the prior product.

Federal energy management

The federal government spends over \$3.0 billion annually to light, heat, and cool the interior of buildings it owns and operates. These facilities, like those occupied by private industry, often can be economically upgraded and retrofitted to reduce the energy required to provide essential building energy services. The Federal Energy Management Program (FEMP) utilizes energy saver performance contracts for all federal agencies to maximize cost savings and federal purchasing power. These contracts enable facilities to take advantage of all life-cycle, cost effective energy efficiency and alternative fuel technologies. Consequently, DOE works cooperatively with several BCSE members, including: the American Gas Association (headquartered in Virginia), the Solar Energy Industries Association (headquartered in Washington, DC), the Alliance to Save Energy (headquartered in Washington, DC) and the Gas Research Institute (headquartered in Illinois).

V. CONCLUSION

DOE's energy efficiency activities reflect the broad diversity of the technologies and services that characterize the energy efficiency industry. The federal government has a long history of supporting energy efficiency programs based on the many societal benefits offered by these programs. DOE's programs are directed at mitigating market distortions and are consistent with sound market theory. For these reasons the BCSE urges Congress to continue its support for these efforts.

PREPARED STATEMENT OF THE AMERICAN ASSOCIATION OF RETIRED PERSONS

AARP appreciates this opportunity to comment on appropriations for the Weatherization Assistance Program. This program helps low income households reduce energy costs by funding such activities as installing weather-stripping, storm windows and insulation. Energy costs are a burden on low income families, often forcing such households to make difficult choices among basic necessities. This is especially true regarding the elderly, given their increased risk of fatality from freezing or heat stroke. Older persons also tend to live in older, less well-insulated homes. The bitter winter that swept across so much of the nation this year brought suffering to many elderly and working-poor families who had no choice but to remain in their drafty, dilapidated housing.

AARP supports the Administration's proposed increase (from \$120.8 million to \$154.1 million). These Department of Energy grants serve as the core program to leverage utility and housing resources for weatherization activities. Currently, the program is weatherizing approximately 61,000 homes; the budget request would increase this to 77,000 next year. More than 27 million homes remain eligible for such assistance. The Department of Energy reports that, to date, its weatherization program working in cooperation with Federal and State partners has increased the energy efficiency of over 4.6 million homes.

Data from the Department of Energy's 1993 Residential Energy Consumption Survey indicate that low income households spend approximately 14 percent of their income on home energy, about three-and-a-half times the percentage paid by the typical American household. The survey further indicates that energy expenditures as a percent of income for older households are about 50 percent higher than for the general population.

The Residential Energy Consumption Survey also indicates that 35 percent of the homes occupied by older households were built prior to 1950, compared to only 26 percent of those occupied by younger families. These homes are typically less well insulated, more expensive to heat and in need of repair. Research by AARP's Public Policy Institute using data from the 1993 American Housing Survey shows that older households, especially minority older households, are more likely to occupy substandard housing. For example, among owner-occupied units, homes of older African-American households were almost four times more likely to exhibit severe or moderate quality defects. The 1993 American Housing Survey indicates that 64 percent of low income older owners did not devote any funds to routine maintenance or improvements such as weatherization.

Weatherization Assistance has made a crucial difference for many of these older households. Just over one-third of the dwellings weatherized under the program are occupied by older persons. The most recent full-scale evaluation of the Weatherization Assistance Program, a study by the Oak Ridge National Laboratory released in January, 1997 indicates that Weatherization efforts through the Weatherization Assistance Program have reduced home energy heating expenditures by an average of 18 to 24 percent for households utilizing natural gas as their primary heating

source. When combined with Low Income Home Energy Assistance benefits, the home energy cost burden is reduced further.

Emphasis in the Weatherization Assistance Program with respect to methods used has evolved from emergency and temporary measures (such as caulking and weather-stripping) to inclusion of those conservation remedies that on average produce the highest savings (e.g., combined attic and sidewall insulation). Personnel in the field are now much more experienced in determining which conservation techniques, under what circumstances, are most cost effective and save the most energy.

A particularly promising area for improvement in energy efficiency is in manufactured housing. Manufactured homes, more commonly referred to as mobile homes, are a major source of housing for low-income and elderly households. Although the Department of Housing and Urban Development adopted improved energy efficiency standards for new manufactured homes in 1994, the large stock of existing manufactured homes is not energy efficient. Households living in manufactured homes spend on average twice as much for energy per square foot of living space as do households living in single-family homes. Homes manufactured before 1975, representing 44 percent of the existing stock, are even less energy efficient.

Currently, approximately 20 percent of all Weatherization work focuses on manufactured housing. Recent reports by the National Center for Appropriate Technology (NCAT) indicate that new Weatherization techniques for pre-1976 manufactured housing can reduce energy bills by 30 to 50 percent. These techniques are now being made available by NCAT to Weatherization agencies across the nation. The combination of improved weatherization techniques and tougher energy efficiency standards for new manufactured homes promises major improvements in energy efficiency for this form of housing and substantial benefits for low income residents.

DOE's supporting analysis for the 1990 National Energy Strategy indicated that long-term residential energy consumption could be reduced by 23 percent through a gradual introduction of the best available conservation technology. The analysis also noted that to make a major contribution in the short-term, conservation measures must focus on retrofitting existing buildings. In addition, the National Energy Policy Act of 1992 gives great emphasis to improving building efficiency. With a capability to weatherize approximately 250,000 dwellings a year, continuation of the Weatherization Assistance Program is essential to meeting national energy goals.

Thank you for this opportunity to comment on funding next year for this critical program.

LETTER FROM D. JAMES G. SPEIGHT, CHIEF EXECUTIVE OFFICER, THE WESTERN
RESEARCH INSTITUTE

LARAMIE, WY, April 8, 1997.

Hon. SLADE GORTON,
Chairman, Subcommittee on Interior, Committee on Appropriations,
U.S. Senate, Washington, DC.

DEAR MR. CHAIRMAN: On behalf of the Western Research Institute (WRI), I request that the following statement be submitted as part of the record of proceedings for the Subcommittee on Interior's consideration of the Department of Energy's Office of Fossil Energy research and development fiscal year 1998 budget request. Specifically, WRI requests the Subcommittee's support of the Cooperative Research Program and to provide at least \$6,000,000 of which we request \$3 million to support ongoing or planned cooperative research projects at WRI. These projects require at least fifty percent industrial cost-sharing. WRI has sought to implement a cooperative research program that is consistent with congressional intent to maximize industry involvement in research, development and demonstration projects. The following discussion reviews the accomplishments of the Cooperative Research Program at WRI and our expectations for fiscal year 1998.

WRI wishes to take the opportunity to support the Office of Fossil Energy's budget request in general. We do, however, have a concern over the new and unprecedented orientation in the budget request allocation of budget resources for the Cooperative Research Program. Specifically, WRI believes that in the past the even handed approach to funding allocations within this program has benefited the Department of Energy, provided necessary assurances to industry partners on the program's viability and met congressional intent to ensure that cost-shared research and technology development projects within this program can continue unencumbered by unrelated priorities. Therefore, WRI strongly encourages the Subcommittee to ensure consistency and equal treatment in funding allocation decisions and to ensure that WRI is able to participate at such levels consistent with Department of Energy and industry priorities.

SUCCESSFUL LEVERAGING OF FEDERAL FUNDING WITH PRIVATE COST-SHARING

The Jointly Sponsored Research (JSR) Program emphasizes technology commercialization and continues to be highly successful and supported strongly and enthusiastically by WRI's industrial clientele. All of the available Department of Energy (USDOE) funding for each of the first seven years has been committed to projects.

Since entering into a new JSRP cooperative agreement with the Department of Energy on March 26, 1993, WRI has put in place projects utilizing a total of \$10,986,264 in USDOE funds. These funds have been combined with \$14,586,209 in industrial funds to produce a \$25,572,473 program. The use of fiscal year 1997 funds will produce a program valued at or above \$30 million while using less than \$13 million in USDOE funds.

While it is always desirable to acquire an asset worth more than \$30 million for a price less than \$13 million, these numbers substantially understate the true value of the program. What price does one put on the value of new technology which improves regional economies and enhances our quality of life? As this report illustrates, the technology developed during the past four years not only results in billions of dollars of increased or enhanced energy reserves, but a cleaner, healthier and safer environment as well. This means a safer and more secure energy and environmental future for us, our families and for future generations.

TECHNOLOGY MEETING NATIONAL NEEDS

The Cooperative Agreement Program emphasizes technology commercialization consistent with the USDOE's mission to enhance the nation's energy security through increased efficiencies in exploration, production and utilization with minimal or no adverse environmental consequences. Technologies emerging from the program are consistent with this goal and include:

CLEAN FUELS FROM COAL

Thermo Ecotek announced in August 1995 the signing of an agreement to construct a 500,000 tons per year coal upgrading plant in the Powder River Basin of Wyoming. The plant cost \$42 million and uses the Koppelman Series C Process. This process was successfully demonstrated by WRI and KFx Inc. in early 1994 using a pilot plant funded by matching funds from the USDOE JSR Program. WRI is presently working with KFx Inc. on projects to increase the throughput and reduce the cost of second generation plants which will use the improved version of the Koppelman Series C Process and to test foreign coals as feedstocks for the process.

INCREASED PRODUCTION OF DOMESTIC OIL

Present above ground steaming technology is limited to depths of 1,800 to 2,500 feet due to large heat losses as depth is increased. Heat loss does not exist with the Meshekow electric downhole steam generator (EDSG) since steam is being produced directly at the formation zones. It is estimated that the U.S. has 42 billion barrels of heavy crude at depths between 3,000 and 5,000 feet. The high operating efficiencies of the EDSG will allow these formerly unexploitable reserves to be recovered.

The EDSG has significant applications for deep reservoirs under layers of permafrost as are found in regions like Alaska's West Sak and Kuparuk oil fields. Alaska's fields are estimated to contain 25 billion barrels of proven heavy oil reserves, the majority of which are deeper than 3,000 feet and lie under thick layers of permafrost. Because of the depth and permafrost conditions, conventional above ground steam generation is impractical if not impossible and the EDSG may represent the only technology capable of recovering this oil.

REDUCED ENVIRONMENTAL IMPACT ASSOCIATED WITH OIL PRODUCTION

Tank bottom wastes from petroleum production are estimated to exceed 27,000,000 barrels in the U.S. alone with an accumulation rate of 2,800,000 barrels per year. RCRA regulations currently allow storage in permitted pits or tanks but fewer and fewer permits are being approved. WRI developed and patented the Tank Bottom Recovery and Remediation (TaBoRR) process to address this problem. The method results in separation of water, a light hydrocarbon stream, a heavy hydrocarbon stream, and an inert, non-leaching, liquid-free solid. The process is currently undergoing testing in a 300 barrel per day process development unit and negotiations are underway with a number of domestic and international companies for extended testing and deployment within operating fields.

REMEDICATION OF HYDROCARBON-CONTAMINATED SITES

Thousands of sites in the US have subsurface hydrocarbon contamination and many are contaminated with heavy oils. WRI developed the CROW process to mitigate such sites. JSR funding has enabled field demonstrations of the technology at the Bell Lumber site in New Brighton, Minnesota and the Pennsylvania Power and Light site in Stroudsburg, Pennsylvania. Installation and shakedown of all field equipment at both sites are complete. The PPL system has been fully operational for more than six months and has produced more than 1500 gallons of DNAPL. The owner estimates that the CROW process has reduced the cost of remediation by more than \$1.3 million.

IMPROVED ENVIRONMENTAL MONITORS

The determination or screening of environmental contaminants in the field using portable analytical methodologies or down-hole real time in-situ measurements is an area of great interest in the environmental industry. The TROLL (SP4000) which became commercially available in fiscal year 1996 is a fully submersible intelligent probe designed for monitoring water level and temperature. Using Windows-based software, the TROLL can be easily programmed in the office, car or field and connected either to a PC, which is used for programming and receiving stored data, or to other units via separately-supplied wiring or telemetry.

INCREASED HEALTH AND SAFETY

PEAC is a hand-held computer system that provides first responders with fast, easy-to-use information for chemical spills and emergencies. The size of an emergency response area often dictates how limited resources are allocated. Evacuation distances vary greatly with spill and weather conditions. The ability to determine protective action distances using actual conditions is crucial to resource allocation. Commercial PEAC units are being produced and sales began in January 1997.

SOLVING ENERGY AND ENVIRONMENTAL PROBLEMS TO IMPROVE OUR ECONOMY AND ENHANCE OUR QUALITY OF LIFE

Each of the six technologies being brought to commercialization with the funds provided by the current Cooperative Agreement Program contributes to the overall goals of the U.S. Department of Energy and the Nation. Each has broad applicability both within the United States and abroad thereby helping to enhance the competitiveness of U.S. and western energy technologies in international markets and assisting in technology transfer. The downhole steam generator (EDSG) can potentially increase the Nation's heavy oil reserves by more than 40 billion and perhaps as much 100 billion barrels while the Koppelman Series C Process is expected to generate markets for as much as 20 millions tons annually of low sulfur coal. Both of these technologies contribute substantially to the goal of increased production of U.S. energy resources and reducing the Nation's dependence upon foreign energy supplies. The TaBoRR technology helps to minimize the impact of energy production and utilization on the environment while simultaneously recovering some additional ten million barrels of usable oil. This technology is augmented by the TROLL smart probe, CROW and PEAC technologies, all of which contribute measurably and substantially to a significantly cleaner, healthier and safer environment. The total funding to bring these technologies to this stage of development was more than \$30 million with the government's share of this being less than \$13 million. We certainly feel that these funds were well spent in "Solving energy and environmental problems to improve our economy and enhance our quality of life."

America has always been a nation recognized for scientific excellence. This excellence has served the nation well in the years since its founding and is largely responsible for our country's dominant industrial position in the world today. The Cooperative Agreement Programs are ideally suited to meet scientific and industrial needs in that they carry this concept—which has already been proven to be so fundamentally sound—one step further * * *.

SCIENTIFIC EXCELLENCE WITH A COMMERCIAL PURPOSE A STRATEGY FOR SUCCESSFULLY COMPETING IN A GLOBAL ECONOMY

In a high-technology global economy, technology development is crucial to the preservation and growth of the American economy and standard-of-living. Much of this technology and growth will come from companies which were small or nonexistent just a decade earlier. These emerging companies must rely upon creative and innovative Institutes such as the Western Research Institute to assist with their process and product development activities. It is a tribute to the wisdom and the

foresight of the United States Department of Energy and the Congress that activities such as the Cooperative Agreement Programs exist to meet these crucial national needs.

As we enter the fifth year of our present Cooperative Agreements, we have a sense of pride and accomplishment regarding what has been achieved during the first four years of the program. We hope that as you read the enclosed materials you shared the same pride and spirit of accomplishment that we do. Certainly much has been done and done well. Technologies developed at WRI during the past four years will add measurably to the Nation's energy reserves while providing a cleaner, healthier and safer environment. Yet much still remains to be done!

Increasingly, the demonstration and commercialization of technology require strong, coordinated and focused activities often spanning several years. Accordingly we find our industrial partners requiring multi-year segments of time and funding. In turn, if meaningful projects are to be undertaken and commercialized, there must be some assurance of long-term and dependable support. Ensuring that this necessary support is available and put to good use in fueling our domestic economy is the challenge facing us all. We at the Western Research Institute look forward to working with members of the 105th Congress to accomplish this extremely important and necessary task.

Sincerely yours,

D. JAMES G. SPEIGHT,
Chief Executive Officer,
Western Research Institute.

PREPARED STATEMENT OF JUDITH L. MONDRE, EXECUTIVE DIRECTOR, CITY OF PHILADELPHIA ENERGY OFFICE AND CHAIR, URBAN CONSORTIUM ENERGY TASK FORCE

This testimony is submitted for the information of the Subcommittee in connection with the Department of Energy's (DOE) budget requests for fiscal year 1998. The Urban Consortium Energy Task Force (UCETF) appreciates this opportunity to report to the Subcommittee regarding its participation in DOE's Municipal Energy Management Program.

The UCETF is made up of local government energy policymakers and administrators from major urban areas around the United States. Currently, 22 jurisdictions are represented on the UCETF: Albuquerque, NM; Austin, TX; Chicago, IL; Columbus, OH; Dade County, FL; Denver, CO; Greensboro, NC; Hennepin County, MN; Kansas City, MO; Long Beach, CA; Memphis, TN; Monroe County, NY; Montgomery County, MD; Orange County, FL; Philadelphia, PA; Phoenix, AZ; Portland, OR; San Diego, CA; San Francisco, CA; San Jose, CA; Seattle, WA; and Washington, D.C. The UCETF is a subgroup of the Urban Consortium, an organization of the nation's largest cities and counties joined together to identify, develop and deploy innovative approaches and technological solutions to shared urban concerns. The Urban Consortium is a program of Public Technology, Inc. (PTI), which is the non-profit technology organization of the National League of Cities, the National Association of Counties, and the International City/County Management Association.

With funding provided by the Department of Energy, Municipal Energy Management Program, the UCETF annually conducts a program of innovative energy technology development, application and replication projects. All projects are conducted by local government staff, in furtherance of the UCETF's objective of improving the energy management capabilities of local governments. Participation in the annual work program is open to larger urban jurisdictions around the United States. Projects are competitively selected based on merit for two categories of funding: energy project funding and technology transfer project funding. All programs must demonstrate strong partnerships, which in many cases include cost-sharing, from the private sector and other government agencies. In addition, the annual work program features a variety of technology transfer and solution deployment activities designed to widely disseminate the knowledge gained through the performance of local government energy projects to jurisdictions of all sizes throughout the United States.

THE UCETF RESPONDS TO LOCAL GOVERNMENT ENERGY NEEDS

Meeting local government responsibilities in times of ever shrinking resources demands creative and innovative solutions. Larger urban governments in particular have found means to utilize energy policy and programs as a tool to help reduce the cost of government and stimulate the local economy, thereby producing more revenues that can be used to deliver priority services to local populations.

The ability of local governments to respond to new challenges and make prudent policy choices in the energy area for the benefit of local citizens is directly enhanced through the UCETF program. The program responds to needs identified by local governments for specific support in addressing and resolving local energy issues. Through the program's emphasis on partnering, Federal funds through the Municipal Energy Management Program leverage more private sector dollars to help local governments achieve energy goals and respond to the mandates of national energy and environmental policies. DOE resources through the Municipal Energy Management Program leverage local and private sector in-kind and cost-sharing contributions, typically on as much as a 4:1 basis. The return on the Federal government's investment is measured in reduced energy consumption, cost savings and environmental improvement in local areas.

Some UCETF-funded projects have a technology focus, some address longer term and institutional issues, and some are policy oriented. The UCETF program is successful because it is able to address all of these areas.

Through its focus on annual work programs, the UCETF is in a position to respond to changing emphases and issues in the energy field. As an example, significant attention in the 1996–1997 program is being devoted to issues involved in the introduction of increased competition in the electricity industry. This issue has the potential to significantly influence—for better or for worse—all local governments. But because of the breadth and complexity of the issues involved, many local governments are ill-prepared to deal with the demands of the changing marketplace. Through research projects in jurisdictions around the nation, and technology transfer activities, the UCETF seeks to become a leading national resource for municipal governments on approaches to, and the implications for local governments of, coming changes in the structure of the electricity industry.

The UCETF maintains its traditional focus on application of technologies to increase the efficiency of energy use, and identify new sources of energy supply, in municipal governments. The UCETF has also been among the pioneers in advancing the concept of "sustainability," and the Task Force continues to focus on projects that make the linkage between energy, environmental and economic imperatives in local communities. An objective of the UCETF is to provide concrete examples to be followed by other local governments on how to integrate energy considerations into other policy disciplines in a way that supports local needs.

THE UCETF'S 1996–1997 APPLIED ENERGY PROGRAM

Through the current UCETF program, jurisdictions are conducting specific energy technology development/application or technology transfer projects addressing locally-identified priorities in the following areas:

Municipal Governments and Utility Policy.—Local governments are extremely interested in, and in need of reliable information on, the local impacts of the restructuring of the electricity industry. Local governments will be affected by the move toward greater competition in electricity in a number of ways. Competition offers the opportunity for cost savings through reduced energy bills for local government, businesses and residents. Open access to transmission systems, and wholesale and retail wheeling will affect those local jurisdictions that currently offer exclusive utility franchises. Franchise fees, or other revenues received by local jurisdictions from utilities, may be affected by changes in the industry. Opportunities for greater economic growth may be enhanced by lower electricity rates. But with lower rates come pressures on utilities to discontinue activities in a number of areas, including energy efficiency programs, low income efforts and research and development, that local governments have traditionally valued. The UCETF is conducting five projects focusing on local aspects of the restructuring issue. San Jose, CA is examining the impacts of utility restructuring on municipal revenues, utility costs and energy management. Chicago is investigating the potential role of local government (as consumer, regulator, generator, and possibly aggregator/marketer of electricity) in bringing competitive electricity service to industrial sites. Columbus, OH, which is interested in offering retail electricity wheeling on its municipal grid, is conducting a case study for developing local distribution rates. Portland, OR is developing a "GreenPower Partnership" to offer Portland businesses the opportunity to buy electricity generated by non-hydro renewable resources such as wind, geothermal or solar. Barnstable County, MA, a leader in addressing how competitive franchises may be used in a deregulated electricity industry, is working to transfer the results of its research among local governments around the nation.

Energy Usage and Supply.—Local governments face continuing requirements to cut energy usage and costs, and opportunities to apply new technologies expressly suited to local climatic conditions and utilizing local energy resources. Phoenix is in-

vestigating waste minimization and digester gas utilization at a large wastewater treatment plant. Yolo County, CA is monitoring an already constructed project to evaluate the technology and develop guidelines for application of technology to accelerate the rate of generation and capture of methane in landfills. Cabo Rojo/Mayaguez, Puerto Rico is addressing the use of solar assisted air conditioning and dehumidification systems to offset demand for electricity in subtropical climates. Chittenden County, VT is working to expand the opportunity for biomass district energy systems.

Energy Efficiency for Local Needs/Economic Development.—Energy efficiency activities can contribute to creation of a sustainable urban environment. Urban governments also have important roles to play in bringing energy efficiency technologies and techniques into the marketplace. Urban areas are well positioned to serve as testbeds for such technologies, as part of an overall effort to increase energy efficiency. The UCETF continues to focus on projects that make the linkage between energy, environmental and economic concerns in local communities. San Francisco is conducting a project to aggregate the small business marketplace for energy efficiency improvements, in order to provide a mechanism for energy service providers to penetrate this important market. Albuquerque is developing guidelines for reduction in both water and energy use, including integrating new technologies into computer controls for water distribution in parks. Honolulu is documenting the appropriate role for electric vehicles in municipal government fleets. Hennepin County, MN is undertaking an innovative effort to combine telework centers with job training and retraining centers. Memphis is working to centralize monitoring and control of HVAC equipment by electronically linking city buildings through a building automation network.

Technology Transfer.—The UCETF is conducting five projects specifically designed to document and transfer lessons learned through local government energy programs. Chula Vista, CA is documenting the results of its telecenter project to provide guidance on how to make telecenters work more effectively. San Francisco is developing a boiler maintenance manual including proven strategies for comprehensively maintaining and cost effectively improving the efficiency of existing municipal boilers. With UCETF support, Dade County, FL is conducting a conference to address sustainability and energy efficiency. Montgomery County, MD is developing a CD-ROM version of the Energy Design Guidelines, to provide an easily used and widely transferrable package for energy efficient building design. Tucson, AZ is documenting the barriers to straw bale construction for affordable, energy efficient housing.

In addition to these specific technology transfer projects, the UCETF program features peer to peer exchange and dialogue on a variety of issues, and is concentrating in particular on effectively documenting products available for transfer from prior year programs. Specific efforts are underway in several areas to conduct direct transfer activities to widely share the benefits of Federally-supported energy technology development and application programs. A special focus in the current program has been on electricity restructuring. The UCETF published and distributed widely a primer, "Keeping the Lights On" and supporting Resource Guide intended to introduce municipal governments around the nation to the issues in, and implications of, changes in the electricity industry.

CONCLUSION

Through the Municipal Energy Management Program, local governments can be a component of the national effort to maintain the United States as the world's leader in developing, applying and exporting sustainable, environmentally benign and economically competitive energy technologies. The UCETF program enhances the ability of local governments to identify, design and implement energy policies that support local economic objectives, including jobs growth and retention. The program offers the nation a proven successful method to identify ways that energy technologies can be applied to aid in addressing community issues; to share information among local governments, and to prepare local officials to respond to the energy and energy-related environmental issues in their own communities.

PREPARED STATEMENT OF THE NATURAL GAS INDUSTRY RESEARCH, DEVELOPMENT AND DEMONSTRATION INITIATIVE

I. INTRODUCTION

Mr. Chairman and Members of the Subcommittee:

The Natural Gas Industry's Research, Development & Demonstration (RD&D) Initiative is a group comprising the American Gas Association's 300 member companies, producers, pipelines, along with research and trade organizations, formed in 1989, specifically to promote accelerated natural gas technology development.

The Initiative has engaged in a year-long process to identify those areas and technologies of greatest importance to the natural gas industry and the U.S. economy and environment. The Initiative supports the Department of Energy's (DOE) overall fiscal year 1998 request, but specifically seeks \$7.7 million above the Administration's request in the following research areas: natural gas vehicle (NGV) on-board storage, NGV medium- and heavy-duty engine development, NGV fueling infrastructure, natural gas cooling/desiccants (dehumidification) systems, natural gas-fired engine driven systems (emission reduction research), and the industrial combustion program.

II. NATURAL GAS VEHICLES

Congress approved, in fiscal year 1997, the development of a five-year R&D plan for natural gas vehicles. This plan, which is being developed jointly by DOE, the natural gas industry, and the University of West Virginia, will help DOE identify future program needs. Results from a workshop attended by 48 technologists from all parts of the industry were not available to DOE in time for the fiscal year 1998 budget request, but will be used for future budgets. Although DOE has responded to the industry's emphasis on "high fuel-use" medium- and heavy-duty fleet vehicles, the Initiative has additional recommendations to Congress to match the priorities of the 5-year plan. The Initiative seeks \$4 million above DOE's request for fiscal year 1998. The priorities are: (1) on-board storage/smart fuel systems, (2) heavy-duty engine development and (3) fueling infrastructure R&D.

One of the major obstacles for natural gas vehicles (NGV) remains on-board storage systems for compressed natural gas (CNG) and liquefied natural gas (LNG) fuels. Improvements are needed in CNG and LNG fuel system inspection techniques, LNG fuel tank structural integrity, fuel storage integration, and lower cost materials such as high strength steels and composite materials for CNG storage. The Initiative proposes an increase of \$1.5 million above DOE's fiscal year 1998 request for these programs.

Heavy-duty engines are predominantly compression ignition (diesel) because they have higher potential energy efficiency than spark ignition (gasoline) engines. Natural gas does not lend itself readily to the compression ignition cycle; but, past research has shown potential in utilizing prechamber dual-fuel (natural gas/diesel pilot injection) and lean-burn natural gas prechamber (spark ignition) technology in accomplishing reduced exhaust emissions. To develop natural gas engine technologies which avoid knock and achieve power and torque levels comparable to the highest-rated diesels, further research and development of direct-injection natural gas engines should be pursued. The Initiative requests \$1 million above DOE's fiscal year 1998 request to be divided between spark and compression ignition cycles.

Lower-cost refueling technology remains critical to the healthy development of the NGV industry. Cryogenic fuel metering and fuel supply components are essential to ensure that current and future equipment will be the safest and most cost-effective available. Since this is a priority in the 5-year plan, the Initiative requests an additional \$1.5 million above DOE's fiscal year 1998 request to begin this research.

III. NATURAL GAS COOLING

Natural gas cooling is extremely energy efficient, especially when measured on a life-cycle basis (measuring energy from its source through transmission and distribution to the site), and its low-emission properties make it environmentally friendly. Additionally, natural gas cooling is used during the hours of the day and days of the year that correspond to the peak demand for electricity generating capacity, thereby benefiting gas customers and gas and electricity providers. DOE's funding for gas cooling programs continue to remain modest despite strong interest and cost-sharing from industry. The Initiative seeks an appropriation \$10.25 million in fiscal year 1998 for natural gas cooling, or \$1.7 million above DOE's request.

The Initiative advocates increased government participation on absorption and adsorption technologies. DOE should develop a program comparing and contrasting all available GAX technologies, including solid sorption technologies, with the objective of developing the best overall hardware that meets a direct materials and cost labor target of \$500 per cooling ton at production levels of 1000 units per year (comparable to an electric heat pump). In parallel, DOE should undertake a cost-reduction program with industry partners to improve the GAX absorber, solution pump and air coil designs.

Desiccant dehumidification systems for heating and cooling are poised to make a substantial impact on the marketplace and the environment. Although test procedures for the first desiccant products on the market have been developed in conjunction with public/private partnerships and support, further rating system work remains. Liquid desiccants can be configured in split systems to offer potential for significant sensible cooling in addition to latent cooling capabilities. Other potential areas of research include coupling engine and desiccant technology for the recovery of waste heat; advanced controls integration; and education, and training programs. The Initiative seeks \$700,000 above DOE's fiscal year 1998 request for these activities.

Finally, the Initiative again urges DOE to work with industry on reduction of emissions from gas-fired engine driven systems, particularly large commercial systems that are beginning to penetrate the HVAC market. These systems require pollutant emissions reduction in anticipation of future regulatory requirements. The Initiative seeks \$1 million for these activities.

IV. RESIDENTIAL APPLIANCES

With over 53 million customers and five quadrillion Btus (quads) of annual gas usage in 1995, the residential gas market is an important segment of the nation's population and energy use. Residential gas demand is about one-half of total residential energy consumption and almost a quarter of total U.S. natural gas use. The number of residential gas customers is expected to grow by 10–11 million by 2005. In 1995, 64 percent of newly constructed homes utilized natural gas. The Initiative will be working with DOE in fiscal year 1998 and fiscal year 1999 to expand research in the areas of space heating, (burners and heat exchangers), combination systems and appliance interface modules (metering systems).

V. INDUSTRIAL SYSTEMS

The natural gas industry supports DOE's mission to improve the global competitive position of U.S. industry. We encourage DOE to help develop new technologies needed in the next century by our key industrial sectors. These sectors include the seven "vision" areas identified by the Office of Industrial Technology. The Initiative's members are currently supporting the development of new and innovative technologies in cooperation with these industries, particularly in the areas of glass and steel. In the steel market, R&D is needed on rapid strip heating, billet preheating and steel reheating. In the flat glass market, R&D is needed to develop a glass heating furnace to reduce emissions and to improve productivity and oxygen-enriched air staging to provide lower operating costs and lower NO_x emissions.

The metal casting vision also offers significant opportunities for natural gas research. Innovative technologies and materials development can raise the temperature limits of gas-fired heat treating furnaces, reduce operating costs, improve productivity and parts quality, and reduce emissions and fuel consumption.

Finally, the Initiative recommends the restoration of funding (\$2 million) in fiscal year 1998 to continue important basic research in the areas of combustion systems and controls, with specific emphasis on the automation of industrial processes. In fiscal year 1997 DOE requested and received \$2 million for these important cross-cutting activities.

VI. GAS TURBINES

The Energy Information Agency's (EIA) 1996 Energy Outlook and the GRI Baseline Projection of U.S. Energy Supply and Demand (1996 Edition), both project that total gas demand for electricity generation is projected to grow from 4.3 quads in 1994 to over eight quads in 2015. The portion of this gas demand in industrial and commercial cogeneration is projected to more than double, from 1.1 quads in 1994 to 2.7 quads in 2015. Growth in gas-fired cogeneration capacity is strongly impacted by the move toward a more competitive electric market. Low operating and capital costs and increased-efficiency systems are the key to this market.

The Initiative strongly supports full funding for DOE's Advanced Turbine Systems Program, particularly the industrial-size gas turbine system. Research will be geared toward reducing NO_x emissions at the higher temperatures (required to increase system efficiency) without increasing emissions of CO or unburned hydrocarbons. The critical research issues include: system efficiency, emissions, and materials development and performance demonstrations.

VII. FUEL CELLS

The Initiative places a very high priority on DOE's Office of Fossil Energy's entire Stationary Fuel Cell program. Additionally, the Initiative supports DOE's Office of Energy Efficiency's Building Sector Micro-generation program. Fuel cell power systems are poised to enter the market for dispersed power generation and will be available in the future in a variety of sizes and types to fill the diverse power generating needs of the commercial, industrial and utility sectors. Fuel cells are very efficient energy converters. Compared to the average 35 percent efficiency of the present electrical grid, the projected fuel-to-electric conversion efficiency for fuel cell power plants range from 45 percent, for the units about to enter the market, to 70 percent for units that could become available by 2010. The ultra-low emissions and good-neighbor features of fuel cells enable them to be sited close to the end users, eliminating losses associated with long-distance transport over high-voltage lines. The ultra-low emissions include virtually zero NO_x and SO₂ levels, and the lowest CO₂ emissions of any fossil fuel power plant. The worldwide market for fuel cells is projected to be \$3 billion dollars per year in the post-2000 era with an exponential growth in the market after 2010.

The Initiative supports DOE's efforts to integrate fuel cells into commercial building applications. Applications in the building sector represent a large market for fuel cells and a significant opportunity for increased energy efficiency. The combination of electricity and heat generation give these market entry units an overall energy efficiency of 85 percent and make them an excellent candidate for commercial building sector applications.

VIII. NATURAL GAS SUPPLY

The GRI Baseline Projection of U.S. Energy Supply and Demand, 1977 Edition, of U.S. domestic natural gas production shows a potential increase from 19 quads in 1995 to 27.3 quads by 2015, an increase of over 40 percent. By the year 2015, about 40 percent of U.S. gas supply will depend on the availability of new technology. There have been significant environmental benefits to the nation from greater gas use in our energy mix. The Initiative supports DOE's natural gas supply request. For gas supply to continue to grow, at low and stable prices, new and improved technology advances will be needed to reduce exploration and production costs and increase recovery per unit of activity.

DOE should concentrate on working with industry to develop and demonstrate a set of tools that result in a minimum of formation damage during the drilling, reduce the cost and improve the efficiency of gas recovery from mature fields, and minimize overall environmental impacts.

Federal assistance is also needed to ensure that new regulations can be met adequately, consistently and at the lowest possible cost. A recent National Petroleum Council study noted that the combination of projected requirements of the Clean Air Act Amendments of 1990, the Safe Drinking Water Act and other pending federal legislation could, by the year 2010, raise overall gas-producing costs by as much as \$750 million per year.

IX. CONCLUSION

U.S. Industries compete in a global economy where our major competitors, such as Japan, Great Britain and Germany, provide substantial assistance in RD&D and commercialization activities. Natural gas technologies can provide substantial benefits to the nation through cleaner air, job creation, energy efficiency, energy security and increased competitiveness in the world marketplace.

Thank you for the opportunity to present our views.

PREPARED STATEMENT OF THE AMERICAN GAS ASSOCIATION

I. INTRODUCTION

Mr. Chairman and Members of the Subcommittee: The American Gas Association (A.G.A.) is a trade association representing over 200 local natural gas distribution companies (LDCs) in the United States, which together distribute more than 90 percent of the natural gas delivered in this country.

The A.G.A. has engaged in a year-long process to identify those areas and technologies of greatest importance to the natural gas industry and the U.S. economy and environment. The A.G.A. supports the Department of Energy's (DOE) overall fiscal year 1998 request, but specifically seeks \$7.7 million above the Administration's request in the following research areas: natural gas vehicle (NGV) on-board

storage, NGV medium-and heavy-duty engine development, NGV fueling infrastructure, natural gas cooling/desiccants (dehumidification) systems, natural gas-fired engine driven systems (emission reduction research), and the industrial combustion program.

A.G.A. continues to maintain concern that DOE's Home Energy Rating System (HERS) program does not measure energy efficiency on a life-cycle basis (measuring energy from its source through distribution to the site.) Nonetheless, A.G.A. supports the fiscal year 1998 request of \$1.5 million to be used only to continue existing state pilot programs. Also, A.G.A. is supportive of DOE's Weatherization Assistance Program and is working with the states toward making homes more energy efficient.

II. NATURAL GAS VEHICLES

Congress approved, in fiscal year 1997, the development of a five-year R&D plan for natural gas vehicles. This plan, which is being developed jointly by DOE, the natural gas industry and the University of West Virginia, will help DOE identify future program needs. Results from a workshop attended by 48 technologists from all parts of the industry were not available to DOE in time for the fiscal year 1998 budget request, but will be used for future budgets. Although DOE has responded to the industry's emphasis on "high fuel-use" medium-and heavy-duty fleet vehicles, A.G.A. has additional recommendations to Congress to match the priorities of the 5-year plan. A.G.A. seeks \$4 million above DOE's request for fiscal year 1998. The priorities are 1) on-board storage/smart fuel systems, 2) heavy-duty engine development, and 3) fueling infrastructure R&D.

One of the major obstacles for natural gas vehicles (NGV) remains on-board storage systems for compressed natural gas (CNG) and liquefied natural gas (LNG) fuels. Improvements are needed in CNG and LNG fuel system inspection techniques, LNG fuel tank structural integrity, fuel storage integration, and lower cost material such as high strength steels and composite materials for CNG storage. A.G.A. proposes an increase of \$1.5 million above DOE's fiscal year 1998 request for these programs.

Heavy duty engines are predominantly compression ignition (diesel) because they have higher potential energy efficiency than spark ignition (gasoline) engines. Natural gas does not lend itself readily to the compression ignition cycle; but, past research has shown potential in utilizing prechamber dual-fuel (natural gas/diesel pilot injection) and lean-burn natural gas prechamber (spark ignition) technology in accomplishing reduced exhaust emissions. To develop natural gas engine technologies which avoid knock and achieve power and torque levels comparable to the highest-rated diesels, further research and development of direct-injection natural gas engines should be pursued. A.G.A. requests \$1 million above DOE's fiscal year 1998 request to be divided between spark and compression ignition cycles.

Lower-cost refueling technology remains critical to the healthy development of the NGV industry. Cryogenic fuel metering and fuel supply components are essential to ensure that current and future equipment will be the safest and most cost-effective available. Since this is a priority in the 5-year plan, the Initiative requests an additional \$1.5 million above DOE's fiscal year 1998 request to begin this research.

III. NATURAL GAS COOLING

Natural gas cooling is extremely energy efficient, especially when measured on a life-cycle basis (measuring energy from its source through transmission and distribution to the site), and its low-emission properties make it environmentally friendly. Additionally, natural gas cooling is used during the hours of the day and days of the year that correspond to the peak demand for electricity generating capacity, thereby benefiting gas customers and gas and electricity providers. DOE's funding for gas cooling programs continue to remain modest despite strong interest and cost-sharing from industry. A.G.A. seeks an appropriation \$10.25 million in fiscal year 1998 for natural gas cooling, or \$1.7 million above DOE's request.

A.G.A. advocates increased government participation on absorption and adsorption technologies. DOE should develop a program comparing and contrasting all available GAX technologies, including solid sorption technologies, to develop the best overall hardware that meets a direct materials and cost labor target of \$500 per cooling ton at production levels of 1000 units per year (comparable to an electric heat pump). In parallel, DOE should undertake a cost-reduction program with industry partners to improve the GAX absorber, solution pump and air coil designs.

Desiccant dehumidification systems for heating and cooling are poised to make a substantial impact on the marketplace and the environment. Although test procedures for the first desiccant products on the market have been developed in conjunc-

tion with public/private partnerships and support, further rating system work remains. Liquid desiccants can be configured in split systems to offer potential for significant sensible cooling in addition to latent cooling capabilities. Other potential areas of research include coupling engine and desiccant technology for the recovery of waste heat; advanced controls integration; and education, and training programs. A.G.A. seeks \$700,000 above DOE's fiscal year 1998 request for these activities.

Finally, A.G.A. again urges DOE to work with industry on reduction of emissions from gas-fired engine driven systems, particularly large commercial systems that are beginning to penetrate the HVAC market. These systems require pollutant emissions reduction in anticipation of future regulatory requirements. A.G.A. seeks \$1 million for these activities.

IV. RESIDENTIAL APPLIANCES

With over 53 million customers and five quadrillion Btu's (quads) of annual gas usage in 1995, the residential gas market is an important segment of the nation's population and energy use. Residential gas demand is about one-half of total residential energy consumption and almost a quarter of total U.S. natural gas use. The number of residential gas customers is expected to grow by 10–11 million by 2005. In 1995, 64 percent of newly constructed homes utilized natural gas. A.G.A. will be working with DOE in fiscal year 1998 and fiscal year 1999 to expand research in the areas of space heating (burners and heat exchangers), combination systems and appliance interface modules.

V. INDUSTRIAL SYSTEMS

The natural gas industry supports DOE's mission to improve the global competitive position of U.S. industry. We encourage DOE to help develop new technologies needed in the next century by our key industrial sectors. These sectors include the seven "vision" areas identified by the Office of Industrial Technology. A.G.A.'s members and associated commercialization center are currently supporting the development of new and innovative technologies in cooperation with these industries, particularly in the areas of glass and steel. In the steel market, R&D is needed on rapid strip heating, billet preheating and steel reheating. In the flat glass market, R&D is needed to develop a glass heating furnace to reduce emissions and to improve productivity and oxygen-enriched air staging to provide lower operating costs and lower NO_x emissions.

The metal casting vision also offers significant opportunities for natural gas research. Innovative technologies and materials development can raise the temperature limits of gas-fired heat treating furnaces, reduce operating costs, improve productivity and parts quality, and reduce emissions and fuel consumption.

Finally, A.G.A. recommends the restoration of funding (\$2 million) in fiscal year 1998 to continue important basic research in the areas of combustion systems and controls, with specific emphasis on the automation of industrial processes. In fiscal year 1997 DOE requested and received almost \$2 million for these important cross-cutting activities.

VI. GAS TURBINES

The Energy Information Agency's (EIA) 1996 Energy Outlook and the GRI Baseline Projection of U.S. Energy Supply and Demand (1996 Edition), both project that total gas demand for electricity generation is projected to grow from 4.3 quads in 1994 to over eight quads in 2015. The portion of this gas demand in industrial and commercial cogeneration is projected to more than double, from 1.1 quads in 1994 to 2.7 quads in 2015. Growth in gas-fired cogeneration capacity is strongly impacted by the move toward a more competitive electric market. Low operating and capital costs and increased-efficiency systems are the key to this market.

A.G.A. strongly supports full funding for DOE's Advanced Turbine Systems Program, particularly the industrial-size gas turbine system. Research will be geared toward reducing NO_x emissions at the higher temperatures (required to increase system efficiency) without increasing emissions of CO or unburned hydrocarbons. The critical research issues include: system efficiency, emissions, and materials development and performance demonstrations.

VII. FUEL CELLS

A.G.A. places a very high priority on DOE's Office of Fossil Energy's entire Stationary Fuel Cell program. Additionally, A.G.A. supports DOE's Office of Energy Efficiency's Building Sector Micro-generation program. Fuel cell power systems are poised to enter the market for dispersed power generation and will be available in

the future in a variety of sizes and types to fill the diverse power generating needs of the commercial, industrial and utility sectors. Fuel cells are very efficient energy converters. Compared to the average 35 percent efficiency of the present electrical grid, the projected fuel-to-electric conversion efficiency for fuel cell power plants range from 45 percent, for the units about to enter the market, to 70 percent for units that could become available by 2010. The ultra-low emissions and good-neighbor features of fuel cells enable them to be sited close to the end users, eliminating losses associated with long-distance transport over high-voltage lines. The ultra-low emissions include virtually zero NO_x and SO₂ levels, and the lowest CO₂ emissions of any fossil fuel power plant. The worldwide market for fuel cells is projected to be \$3 billion per year in the post-2000 era with an exponential growth in the market after 2010.

A.G.A. supports DOE's efforts to integrate fuel cells into commercial building applications. Applications in the building sector represent a large market for fuel cells and a significant opportunity for increased energy efficiency. The combination of electricity and heat generation give these market entry units an overall energy efficiency of 85 percent and make them an excellent candidate for commercial building sector applications.

VIII. NATURAL GAS SUPPLY

The GRI Baseline Projection of U.S. Energy Supply and Demand, 1977 Edition, of U.S. domestic natural gas production shows a potential increase from 19 quads in 1995 to 27.3 quads by 2015, an increase of over 40 percent. By the year 2015, about 40 percent of U.S. gas supply will depend on the availability of new technology. There have been significant environmental benefits to the nation from greater gas use in our energy mix. A.G.A. supports DOE's natural gas supply request. For gas supply to continue to grow, at low and stable prices, new and improved technology advances will be needed to reduce exploration and production costs and increase recovery per unit of activity.

DOE should concentrate on working with industry to develop and demonstrate a set of tools that result in a minimum of formation damage during the drilling, reduce the cost and improve the efficiency of gas recovery from mature fields, and minimize overall environmental impacts.

Federal assistance is also needed to ensure that new regulations can be met adequately, consistently and at the lowest possible cost. A recent National Petroleum Council study noted that the combination of projected requirements of the Clean Air Act Amendments of 1990, the Safe Drinking Water Act and other pending federal legislation could, by the year 2010, raise overall gas-producing costs by as much as \$750 million per year.

IX. CONCLUSION

U.S. Industries compete in a global economy where our major competitors, such as Japan, Great Britain and Germany, provide substantial assistance in RD&D and commercialization activities. Natural gas technologies can provide substantial benefits to the nation through cleaner air, job creation, energy efficiency, energy security and increased competitiveness in the world marketplace.

Thank you for the opportunity to present our views.

PREPARED STATEMENT OF ARIS MELISSARATOS, VICE PRESIDENT OF SCIENCE,
TECHNOLOGY AND QUALITY, WESTINGHOUSE ELECTRIC CO.

INTRODUCTION

Advanced natural gas based power generation systems can save energy, reduce greenhouse gas emissions and lower electricity generation costs. Natural gas based systems are clean, efficient and economical. Westinghouse is participating with the Department of Energy in two key programs under the auspices of the sub-committee. Westinghouse urges Congress to maintain its commitment to the next generation of natural gas fueled power generation technologies by increasing funding beyond the Administration's fiscal year 1998 request for the Department of Energy's Advanced Turbine System (ATS) Program and for Advanced Concepts Fuel Cells, i.e. Tubular Solid Oxide Fuel Cells. We request that funding for the Fossil Energy ATS Program be increased from the Administration's \$31,379,000 recommended level to \$46,400,000, and to increase funding for Advanced Concepts Tubular Solid Oxide Fuel Cells from \$12,288,000 to \$16,000,000. Both technologies represent a step change in performance over existing alternatives, both can provide near term benefits and returns for our nation in the form of more high quality jobs and in-

creased exports; and both would enable a deregulated utility industry to reduce electricity prices to consumers while reducing the emission of greenhouse gases.

ADVANCED TURBINE SYSTEMS PROGRAM

The Advanced Turbine Systems (ATS) Program is a broad-based technology initiative, pooling the resources of the federal government, universities, and private industry to provide the nation with the world's most economical and cleanest approach to multi-hundred megawatt electricity generation. The ATS will enable a step change in performance over today's gas turbines. The ATS is being designed to be over 25 percentage points more efficient than conventional coal fired power plants, to emit a fraction of the greenhouse gases and to be installed quickly and economically to meet growing energy needs. The ATS will allow the nation's utilities and private power generator to save fuel and produce electricity at a lower cost, benefiting both consumers and the economy.

The ATS Program, since its initiation in fiscal year 1992, has been structured with a clear set of deliverables and aggressive completion date. The program goal is to develop technologies and innovative concepts applicable to natural gas fired combined cycle power generation systems, which will allow electrical efficiencies greater than 60 percent, while providing electricity at significantly lower cost than current combined cycle power plants; and operating with much reduced environmental impact.

Westinghouse is an industry participant in the utility portion of the ATS Program, bringing a significant share of private funding to the initiative. We are working with over 200 industrial, university and small business partners to integrate the new technologies needed to deliver ATS to the power generation industry. Benefits of a technology partnership approach include a more rapid introduction of new technology into the economy, a broader diffusion of technologies across a number of industries and, with ties to universities, providing hands-on experience for tomorrow's scientists and engineers.

The ATS Program was originally structured to include a full-scale power plant demonstration of the technology, with selection of a lead contractor in fiscal year 1998. We urge, instead, that the program be restructured to maintain two industrial participants through testing of the prototype engines. Out-year program savings from the elimination of the full-scale demonstration power plant are sufficient to continue funding for two contractors and still result in an overall savings to the program. By completing prototype engine tests, needed verification of the key technology component is accomplished; but the cost and lengthy permitting and approval process need for a full-scale plant is avoided. The Administration's low funding request and planned downselect will, in effect require DOE to pick a technology winner, creating an unfair market advantage for the selected contractor. The low funding request will also stretch the length of the program and delay market entry of the technology.

Added ATS funding in fiscal year 1998 will support completion of the technology development program started in prior fiscal years and the start of manufacture of a prototype engine. The restructured program we recommend would still accomplish the original program goals of allowing the introduction of this beneficial technology by 2000. It would maintain a strong U.S. market competition by continuing two suppliers and would provide U.S. industry with a competitive advantage over international competitors. And, it would encourage more rapid utility industry acceptance by demonstration the viability of the technology, without funding a full demonstration power plant.

FUEL CELLS ADVANCED CONCEPTS PROGRAM

The Fuel Cells Advanced Concepts Program for fiscal year 1998 is a cost-shared program directed toward cost reduction and product improvement for tubular solid oxide fuel cells (SOFC's) prior to market entry by the private sector. Westinghouse is the recognized world leader in SOFC technology development and SOFC system demonstrations at increasingly larger scale and is committed to making the Tubular Solid Oxide Fuel Cell Program and success. Westinghouse has assembled a world-class team utilizing the resources of government, national laboratories, and private industry to provide the world with the highest efficiency and cleanest fossil fuel power generation technology known today. The SOFC, when combined with a gas turbine will be able to achieve electrical efficiencies approaching 75 percent. The SOFC/Gas Turbine power system has the potential to be the world-wide standard bearer for distributed power generation in the early 2000's and beyond, thus developing an industry of high quality U.S. jobs.

The SOFC/Gas Turbine power system is simple and synergistic, building on the best characteristics of both components. SOFC is the highest temperature fuel cell and its exhaust gases are exceptionally well suited to drive a gas turbine resulting in these ultra-high electrical efficiencies. Even in relatively small power systems generating only a few megawatts, electrical efficiencies of up to 75 percent can be obtained previously unheard of with fossil fuels.

The ecological benefits are huge. There is a 90 percent reduction in NO_x emissions and 20 percent reduction in CO emissions compared to today's best fossil fuel power generation technology. The system produces virtually no SO_x since the sulfur is removed prior to the natural gas entering the SOFC. In addition, the high temperature heat produced by the SOFC is very conducive to co-generation applications that will further increase the effective use of our fossil fuels.

The SOFC is a modular system that can range in size from several hundred kW to hundreds of megawatts. Its high efficiency in relatively small sizes is ideal for distributed power generation with the many advantages of that concept especially where small increases in power in local areas are needed.

SOFC power systems have excellent export potential in the over 500 billion dollar international electric energy market where fuel costs are high and electrical grids are weak thus creating many well paying jobs here in the U.S.

Matched by the DOE, Westinghouse and its partners have invested over \$90,000,000 in this technology. This year we will begin the final phase of this development program. The ultimate goal of our program is to operate a 1.3 MW SOFC/Gas Turbine power system in cooperation with the Environmental Protection Agency (EPA) and others at EPA's Fort Meade Laboratory in 1999, then expanding that to a 2.5 MW SOFC/Gas Turbine power system in 2000. Our program also includes the necessary cost reduction and product improvement activities to assure commercial success. Along these lines Westinghouse has recently completed a \$13,000,000 pilot manufacturing plant to test these on-going process improvements.

With the low funding request for Fuel Cells Advance Concept, coupled with the decrease in the Stationary Fuel Cell Program budget under the auspices of the Committee over the past few years, it is unclear that DOE will be able to continue funding for all the contractors and achieve commercialization of any advanced fuel cell technology with the foreseeable future. Congress is, therefore, urged to increase the overall Fuel Cell Program budget from \$46,000,000 to \$50,000,000 in fiscal year 1998.

PUBLIC BENEFITS

Increased funding for the ATS Program and the Tubular SOFC Program is a sound application of federal resources.

- Federal support is a good investment because it provides a high yield, relatively near term return to the economy in the form of lower energy costs, more jobs and more exports.
- Federal support benefits the nation's technology base and supports, not only the power generation industry, but possible use in a host of spin-off application. High temperature ceramics and other advanced materials, enhanced aerodynamic component designs and low emissions combustion systems can also have host of industrial applications.
- Federal support is needed because the aggressive goals of these programs, requiring improved emissions and better economics carry too great a technology risk for private industry to address alone because the long-term ecological and long-term energy saving benefits rarely accrue sufficiently to the original developer of the technology. The Programs continue the kind of public-private partnership that is needed to develop and commercialize high risk technologies.

CONCLUSIONS

Applying new technology to meet the demands of a changing market is always a challenging task. Together, we have made great progress in developing clean, advanced natural gas power generation turbine and fuel cell systems. Together, we have moved from basic concepts and bench scale experiments to full scale component tests. We have made a mutual commitment to move these advanced technologies into the market. Continuing Federal support is critical to that task. As we approach fiscal year 1998, we urge Congress to strengthen its commitment to technology development as a sound approach to meeting our nation's future energy needs.

The Advanced Turbine System and Advanced Concepts Solid Oxide Fuel Cells both hold the promise of being better economically and environmentally at meeting the electricity generation needs of our nation and the world. Westinghouse is con-

vinced that, with our university, small business and industrial partners, and, in cooperation with the Federal government we can develop and introduce these advanced power generation systems sooner and better than our international competitors. Westinghouse remains committed to that task and urges Congress to reaffirm its commitment.

PREPARED STATEMENT OF THE INTEGRATED PETROLEUM ENVIRONMENTAL
CONSORTIUM

It is proposed that the U.S. Department of Energy establish and support a focused, university-based program, the Integrated Petroleum Environmental Consortium (IPEC), with the goal of increasing the competitiveness of the domestic petroleum industry through a reduction in the cost of compliance with U.S. environmental regulations. Federal support is specifically requested as part of the fiscal year 1998 appropriation for the Department of Energy through the Fossil Energy account or other source the Subcommittee may determine to be appropriate.

THE CRISIS IN THE U.S. DOMESTIC PETROLEUM INDUSTRY

The availability of energy will be the single most important factor in determining quality of life in the United States over the next century. Jobs, manufacturing output, transportation, and personal comfort are all tied to a plentiful, affordable energy supply. The petroleum industry has played a major role in meeting energy needs in this century. Petroleum will continue to be a major factor in the energy needs of the world well into the next century. However, the declining price of crude oil and the increasing cost of compliance with environmental regulations have combined to produce a decrease in domestic oil production in the U.S. The major oil companies have scaled down their domestic operations and refocused their exploration and production activities on foreign resources. The 8000 independent producers are faced with two options—producing from the domestic resource base or going out of business. At the same time, the independents are increasingly the inheritors of mature fields and reservoirs left behind by the majors. Yet compared to the major producer the independent is the most vulnerable to the declining price of oil and gas, the costs of environmental compliance and unfavorable tax policies. The independent producer has only one source of revenue—the sale of oil and gas. There is no vertical depth to his business. These factors have combined to not only greatly reduce the number of new wells drilled but also to accelerate the plugging of marginal or stripper wells. In the U.S. a stripper well is plugged every 30 minutes. At the same time new well completions are at a 45-year low.

Clearly this trend is not in the best interest of the U.S. in terms of energy self-sufficiency or national security. We are turning over control of our cost of production in terms of energy costs to foreign interests. If domestic exploration and production and refining are to continue to play a strategic role in meeting US energy needs, the domestic petroleum producer will require access to low cost technology for waste minimization and environmental remediation in exploration and production (E&P), refining, transportation and end use of petroleum.

In many cases this technology does not now exist in a cost-effective form. Conventional waste treatment and pollution control technologies always add to E&P, refining and transportation costs. These costs are increasingly out of proportion with the economic output of the petroleum industry. In 1991, four industry sectors (chemicals, petroleum, pulp and paper, and primary metals) incurred three-fourths of the \$21 billion spent by U.S. manufacturers to comply with pollution control regulations. However, these sectors accounted for about one-fifth of U.S. manufacturers' value added (Office of Technology Assessment). In 1992, the domestic petroleum industry spent \$10.5 billion on the environment. This is more than the top 300 oil and gas companies earned in profits that year and more than the industry spent searching for oil and gas in the U.S. in 1992. With oil at \$16 per barrel at the well-head, the industry spent \$4 on environmental protection for every domestically produced barrel of oil—\$41 for every man, woman and child in America (Oil and Gas Journal and the American Petroleum Institute).

All U.S. industry is caught in the convict between national economic and environmental goals. Pollution control in the petroleum industry presents regulatory hurdles for U.S. domestic production and refining that producers and refiners in many other countries do not face. This places U.S. producers and refiners at a global competitive disadvantage. The U.S. petroleum industry needs cleaner, more cost-effective technologies and new approaches to lower the costs of complying with pollution and waste disposal regulations that U.S. society demands. A reduction in environmental compliance costs will have the greatest impact on the national economy

when applied at this level—the level of the extraction industries. Lower energy costs make all industry more competitive. The petroleum industry and the nation would benefit not only from lower compliance costs, but also from the jobs and commerce preserved in the domestic petroleum industry and the related trade in capital equipment and professional services in industries that service the petroleum industry. New technologies for pollution control and remediation will also be an exportable product.

THE INTEGRATED PETROLEUM ENVIRONMENTAL CONSORTIUM (IPEC)

For strategic and economic reasons the U.S. domestic petroleum industry must be able to compete with foreign producers and refiners. A major sector of our economy and our national interests are clearly at stake. Compliance with environmental regulations is a major factor in that competitiveness. The strategic and economic importance of this industry requires that industry, government and academia combine their resources and coordinate their efforts toward finding solutions for the environmental problems that represent the greatest challenge to the competitiveness of the domestic petroleum industry. The success of this effort will not only stimulate jobs in this industry sector, but also contribute in a large way to the environmental health of the nation. In response to this need, the four major research universities in the oil-producing states of Oklahoma and Arkansas have joined together to form the Integrated Petroleum Environmental Consortium (IPEC). The mission of IPEC is to increase the competitiveness of the domestic petroleum industry through a reduction in the costs of compliance to U.S. environmental regulations. Objectives specific to meeting the goals of the consortium include the following:

1. Development of cost-effective technologies and business practices to meet the challenges of environmental regulations to the competitiveness of the domestic petroleum industry

As already noted, new technologies are needed in the petroleum industry now to provide cost-effective solutions to environmental problems in exploration and production and refining. The U.S. petroleum industry is already undertaking this challenge; however, the industry needs help. The domestic petroleum industry is devoting ever more of its resources toward meeting a growing body of environmental regulations as the price of oil declines. The inevitable result has been severe reductions in work force and closings. The domestic petroleum industry has lost over 500,000 jobs in the last decade. It is time for the federal government to re-evaluate the regulatory burden on the domestic petroleum industry and to help the industry develop the cost-effective technologies it needs to meet meaningful environmental standards. With a dwindling technical work force caused both by redirecting E&P operations and layoffs, the domestically-oriented work force is increasingly focused on environmental compliance, not technology development. Industry laboratories which were once on the forefront of technology development are now empty and dormant. What is left of the once busy industry research centers are technical service centers. The former research leaders still employed are now “putting out fires” and the independent producers rarely have a technical staff for any kind of R&D. The U.S. petroleum industry is relying more and more on technical professionals in academia for research. However, budgets are tight and only the most immediate of problems are being addressed. Even a 3–5 year time frame is often farther out than the industry can afford to look.

The federal government should direct a larger segment of R&D resources to the development of new, cost-effective environmental technologies to support the domestic petroleum industry. A critical segment of this effort should be support of university research. A major part of this research funding should place emphasis on providing near-term solutions to these problems with direct input from the petroleum industry. In partnership with industry, IPEC can help provide these solutions.

The petroleum industry will measure the relevancy of research in terms of the tangible results produced. In the context of the vision of IPEC this means new, cost-effective technology made available to industry. The greatest impact on competitiveness on the domestic petroleum industry will be made by improved solutions to problems which have a significant economic impact on the industry. The research conducted within IPEC will, therefore, by necessity have a strong applied element.

IPEC will use an integrated team approach to technology development. The teams will not only be integrated with respect to scientific or engineering discipline but also integrated with respect to the technology development process itself. In other words the teams will also consist of members whose expertise is in scale-up and commercialization of new technology. If the work product of the team is to make a significant impact in the domestic petroleum industry the most important member of the team will be the end user of the technology. A teaming of investigators from

different disciplines and representing different levels of the technology development process will greatly facilitate communication among the investigators and keep the team focused on solving the problem. The team approach is certainly the shortest path to making a meaningful impact on the competitiveness of the domestic petroleum industry.

This team and systems approach to solving real problems in the domestic petroleum industry will be the hallmark of IPEC. Fundamental research will be coupled with bench-scale testing of concepts, pilot testing, field demonstrations and technology transfer. The end user of the technology will always be heavily involved in technology development as an advisor and hands-on participant. As an investment in future technology development, undergraduate and graduate students will be integrated into every aspect of the work of the consortium. Undergraduate students will gain valuable experience working on consortium projects while graduate students will use consortium research work for their theses and dissertations. The integrated approach to technology development will give these students much needed pilot and field experience and industrial contacts.

Competitive business practices are perhaps equal in importance to technology development, especially to the independent producer. The development of new business practices with respect to accounting, taxation, finance, forecasting, etc. are needed which can put the producer in a better position to determine the financial risks of potential environmental costs and manage those risks in order to maximize profitability. Reduced financial risk and growth create jobs.

2. Training of environmental professionals as an investment in technology, policy and business development

IPEC universities will continue to graduate scientists and engineers who have a strong foundation in a basic engineering discipline, physical science, or biological science with additional training in environmental technologies at the undergraduate or graduate level to produce environmental specialists. Environmental issues cut across many disciplines. Therefore, this additional training is cross disciplinary to give students a broad understanding of environmental problems. This includes environmental law and policy and the financial and economic impact of environmental regulation on the domestic petroleum industry.

Environmental policy curricula at IPEC universities will be enhanced to include a prerequisite foundation in a field of engineering or science. Those who shape environmental policy should fully understand the impact of those policies. IPEC universities also will develop new curricula to explore the boundary between environment and business in terms of accounting practices, economics, finance and taxation. A new kind of environmental specialist, invaluable to the petroleum industry, can arise out of the area where issues of environment and business converge.

In addition to training the environmental specialist, IPEC universities are committed to making all of their graduates environmentally aware. This is especially true of graduates in technical fields whose employment activities can have a direct environmental impact. These curricula will be enriched with an environmental component integrated into their course of study. The result of this enrichment will be a scientist or engineer who considers the environmental impact of a project up front and minimizes wastes.

3. Dissemination of information regarding technology development, legal and regulatory issues, and business practices which can impact the competitiveness of the domestic petroleum industry

Research results from all IPEC technology and business practice development projects will be documented through standard DOE reporting procedures. IPEC investigators also will deliver papers and contribute journal articles on noteworthy achievements. All resulting citations can then be picked up and disseminated through such standard online databases as DOE's "Energy Science and Technology," the American Petroleum Institute's RAPIDITY, and TU's "Petroleum Abstracts".

IPEC also will provide a central repository for all reports, papers, and articles resulting from its research projects. These documents will be available on demand from the repository for the fulfillment of external orders. Where appropriate, IPEC research results also will be compiled into databases for nationwide access via Internet. Information concerning the databases will be distributed to the domestic petroleum industry and other interested users through exhibits at selected conferences, the trade literature, target mailings and Internet Listserv messaging. Every effort will be made to guarantee equity of access throughout the petroleum industry. IPEC also will establish a feedback mechanism through which the major and independent oil and gas producers can inform the R&D community of their experiences with new technologies as well as their technology needs.

IPEC also will serve as a resource for Congress, federal and state regulatory agencies and the domestic petroleum industry to provide an objective assessment of existing or proposed environmental regulations on the basis of cost/benefit and risk analysis.

Lastly, there also is an acute need for readily accessible continuing education opportunities for scientists, engineering, legal professionals, accountants, economists, etc. in the petroleum industry to provide environmental retooling and continual updating. The environmental field is progressing rapidly. Activities such as focused environmental seminars, workshops, short courses, telecourses, etc. can sharpen the skills of participants and act as conduits for new ideas and technologies into the petroleum industry.

ORGANIZATION AND OPERATING PRACTICES OF IPEC

The Integrated Petroleum Environmental Consortium (IPEC) is a consortium of four universities in Oklahoma and Arkansas: The University of Tulsa (TU), The University of Oklahoma (OU), Oklahoma State University (OSU), and The University of Arkansas (UA) at Fayetteville. The fiscal center of IPEC will be the University of Tulsa which is the sole subcontractor to BDM-Oklahoma which is the M&O contractor for the Bartlesville, OK Department of Energy facility, the National Institute for Petroleum and Energy Research (NIPER). Through NIPER, BDM Oklahoma and TU are responsible for implementation of the National Oil Program for the DOE. IPEC will be an extension of this effort.

The operational activities of IPEC will be directed by an executive committee composed of two faculty members and one research administrator from each of the four universities (TU, OU, OSU, UA). The chair of the executive committee will rotate annually among TU, OU, OSU and UA. IPEC will be very much industry driven to ensure that the consortium is meeting the needs of the industry and fulfilling its mission. The executive committee will be advised by an industrial advisory board composed of technical, legal and business environmental professionals from major oil companies and independent producers. The industrial advisory board will have the last word on funding decisions for technology development projects. If, in the opinion of the advisory board, a proposed project does not help fulfill the mission of the consortium the project will not be funded. All four of the IPEC universities have signed a memorandum of understanding forming IPEC and agreeing to this organizational structure.

THE SOUTH-CENTRAL ENVIRONMENTAL RESOURCE ALLIANCE (SERA)

In order to bring additional resources into IPEC and further ensure the success of its programs, IPEC has entered into an alliance with the Waste-management Education and Research Consortium (WERC). WERC was established through DOE sponsorship to expand the nation's capability to address waste management issues through education, technology development and technology transfer. WERC's special niche is radioactive, hazardous and solid waste management. WERC's members are New Mexico State University, University of New Mexico, New Mexico Tech, and Navajo Community College in collaboration with Sandia National Laboratories and Los Alamos National Laboratory. The missions of IPEC and WERC will be enhanced by a synergistic collaboration between the two consortia as the South-central Environmental Resource Alliance.

FUNDING OF IPEC

IPEC is seeking an appropriation of \$4 million for fiscal year 1998 and the succeeding fiscal years 1999, 2000, 2001, and 2002 through the Department of Energy. The consortium will be responsible for private sector and state support of no less than 25 percent of federal appropriations in fiscal year 1998 and an average of 50 percent of federal appropriations over a five year period. The consortium will be subject to review as of September 30, 1999 and each 12-month period thereafter to ensure the effective production of data, regulatory assessments, and technology development meeting the stated goals of the consortium.

PREPARED STATEMENT OF JOHN T. NIMMONS, MANAGING DIRECTOR, ALLIANCE TO COMMERCIALIZE CARBONATE TECHNOLOGY

Mr. Chairman and Members of the Subcommittee, my name is John Nimmons. I am submitting this testimony as Managing Director of the Alliance to Commercialize Carbonate Technology ("ACCT"). ACCT's purpose here is to urge fiscal year 1998 funding of the Department of Energy's molten carbonate fuel cell ("MCFC")

program in the amount of \$20 million requested by M-C Power Corporation, and for continuation of a strong MCFC program.

As some of you know from prior years' testimony, ACCT is a working alliance of utilities and industry, created to help bring MCFC technology into commercial markets by the year 2000. ACCT's members include potential purchasers, installers and users of MCFC power plants, as well as potential investors in MCFC technology. During the past year, ACCT's membership has continued to grow. Members now include twenty-two leading electric and gas utilities, natural gas suppliers, and manufacturing industries from throughout the United States, Canada, Western Europe, and South America, as well as America's premier electric and natural gas research organizations. ACCT's principal focus is the MCFC power plant under development by the team of M-C Power Corporation, the Institute of Gas Technology, the Bechtel Corporation, and Stewart & Stevenson Services, Inc. (the "Development Team").

ACCT wishes to make the following points before this Subcommittee, each elaborated further in the testimony that follows:

1. *MCFC technology has made impressive progress in the last year.*—Early lessons have been well learned, and the new MCFC cogeneration facility at NAS Miramar is performing well.

2. *NAS Miramar's 250 kilowatt demonstration remains an early step toward a megawatt-scale commercial power plant.*—Major design improvements and cost reductions must still be achieved before MCFCs approach commercial readiness.

3. *Although Miramar is attracting strong private sector interest, uncertainty over electricity restructuring continues to postpone new technology investments.*

4. *Electricity restructuring will expand markets for clean, modular, generation from MCFCs,* even while it creates near-term uncertainties about what roles will be played by emerging industry entities.

5. *Staying the development course now is critical.*—Increased private sector confidence, and hence future investment, will depend on MCFC developers continuing to meet milestones based on previous Federal commitments.

1. MCFC TECHNOLOGY HAS MADE IMPRESSIVE PROGRESS IN THE LAST YEAR

M-C Power's development effort has made important strides during the past year. Building on earlier lessons, the Company developed a new fuel cell stack design which it has now incorporated in the new demonstration unit recently started up at NAS Miramar. The Company also introduced a first-of-its-kind fuel processing unit (or "reformer")—uniquely designed for MCFC use—which converts natural gas to the hydrogen-rich fuel used in the cell stack. Reports from the Miramar test site are very encouraging, indicating that both the new stack and the new reformer have performed extremely well since the plant's startup in early February.

The Miramar demonstration remains in its early stages. However, its performance to this point in a cogeneration application has already moved the technology beyond anything previously accomplished, and begun to fulfill the expectations of ACCT member companies for this phase of the development effort. If the plant continues to perform well as it goes through its paces over time, it will constitute a major milestone, and one which ACCT companies have considered an essential building block for future commercial interest in the technology.

2. MIRAMAR'S 250 KILOWATT DEMONSTRATION REMAINS AN EARLY STEP TOWARD A 1 MEGAWATT COMMERCIAL POWER PLANT

The Miramar facility is expected to demonstrate to ACCT companies and others that the major MCFC components—especially the new stack and reformer—can function together in an integrated power plant, using thermal energy from the fuel cell reaction to heat the reforming process, and providing useful electricity and heat to the facility site. These represent critical advances over the previous state of the art. However, they remain far short of what will be required for a power plant intended for commercial markets.

All who support MCFC development recognize that major design improvements and cost reductions must be achieved before MCFCs can approach commercial markets around the turn of the century. This is no different from many other energy technologies at similar stages in their development: the first imperative is to show that the concept can work—and only then to embark on simplifying and refining equipment design, finding cheaper materials, and developing more efficient production methods to reduce costs to near-commercial levels and set the stage for true manufacturing economies.

In addition, ACCT members and others who expect to invest in MCFC power plants will need to see convincing evidence of performance, reliability, and durability over time. This will require demonstration of the power plant configuration actu-

ally intended for commercial markets. Only after these requirements are met will private sector companies be in a position to commit to commercial investments, and thus to help the developer attract the private financing needed for its commercial manufacturing facility.

3. UNCERTAINTY OVER ELECTRIC INDUSTRY RESTRUCTURING CONTINUES TO POSTPONE NEW TECHNOLOGY INVESTMENTS

Electric industry restructuring has accelerated dramatically during the past year. In addition to this Congress, virtually every state utility commission is considering some form of restructuring of utilities subject to its jurisdiction: there is no electric utility in this country whose immediate future will not be affected by it. Every one of our utility members is fundamentally reassessing its business, including the key question of whether it will continue to provide generation at all—and if so, through what business entity and with what relation to its regulated transmission and distribution functions, whatever those turn out to be.

Last year we noted that the turmoil of restructuring and the headlong rush toward electricity competition had dramatically reduced, and in many cases eliminated, utility spending on research and development. This is especially true for generation-related RD&D, since utilities and state commissions increasingly recognize that generation will be spun out of the regulated utility as a competitive function, and monopoly ratepayers can no longer provide financial support for advanced generation research.

Proactive utilities are increasingly looking to supplant traditional ratepayer RD&D spending with shareholder-supported investments in technologies that promise advantages in emerging competitive markets. However, the enormous uncertainty attending restructuring has radically shortened the horizon for such investment. Many companies today will not invest in emerging technologies unless they can expect returns within two or three years, at the most. For MCFC technology, which still requires significant design and manufacturing innovations and cost reductions to approach commercial readiness, meaningful investment returns will not occur within that horizon. In the current utility climate of regulatory ferment and short-term competitive focus, this presents a short-term investment obstacle for most companies—even those which foresee a key role for fuel cells in the medium and long term.

We stress that reduced availability of advanced generation RD&D and investment dollars does not reflect on the value of these efforts, but on the vast uncertainty faced by companies confronting restructuring of one of the country's largest, most complicated, and most important industries, and on the prospect that utilities will need to divest their generation functions. For these reasons, ACCT's leaders believe it is vitally important to continue Federal RD&D support through the next several critical years, until the costs and risks of MCFC technology can be reduced to near-commercial levels, and the returns can more closely match the compressed investment horizons of newly competitive energy companies. For Congress to do otherwise would be to abandon substantial public and private investments already in place and now beginning to pay off, and to forego the economic, environmental, and competitive advantages that advanced fuel cell development can deliver.

4. ELECTRICITY RESTRUCTURING WILL EXPAND MARKETS FOR CLEAN, MODULAR, GENERATION FROM MCFCS

Although restructuring has created tremendous uncertainties about what roles will be played by existing industry entities and their successors, we believe that it can only enhance long-term market prospects for small, clean, modular generation sources such as MCFCs.

As this Subcommittee knows, MCFCs offer dramatic efficiency and environmental advantages over both conventional generating technologies and other types of fuel cells. These advantages will be increasingly important as electricity supply continues to evolve from large central station generation plants to smaller, cleaner, more flexible power plants located near the customers they serve, and avoiding the risks and costs of major infrastructure investments in uncertain times. The flexibility of modular plants with short lead times will become especially critical as competition supplants monopoly electricity supply, and customers demand products and services that can readily respond to changes in business conditions.

In emerging competitive markets, new generation capacity will be added in much smaller increments than traditional central station plants. However, the high fuel efficiencies characteristic of large central plants cannot be achieved with conventional technologies in small sizes. On the other hand, MCFCs as small as a few hun-

dred kilowatts can actually exceed central plant efficiencies—while offering emissions characteristics orders of magnitude cleaner than conventional equipment.

For many utility and industrial applications, MCFCs also offer distinct advantages over other types of fuel cells now under development. For example, MCFCs promise as much as 50 percent higher fuel conversion efficiencies than phosphoric acid fuel cells (“PAFC”) now entering the market, with even lower air pollutant emissions—amounting to less than 10 percent of current Federal air quality standards. For this reason, California’s South Coast Air Quality Management District has categorically exempted fuel cells from the nation’s most stringent air quality permitting requirements. In addition, MCFCs can produce much higher quality heat as a byproduct of electric generation than that produced by PAFCs, so they are especially suitable for utility and industrial cogeneration uses that PAFCs cannot serve. MCFCs are also far less sensitive to fuel contaminants than, for example, polymer fuel cells. For this reason, MCFCs are expected to operate well not only on natural gas, but on domestic renewable fuels such as landfill gas and methane from sewage digesters, which the M-C Power team expects to demonstrate within the next several years.

5. STAYING THE DEVELOPMENT COURSE NOW IS THE KEY TO BUILDING THE CONFIDENCE NEEDED TO ENCOURAGE PRIVATE SECTOR INVESTMENT

A vital part of ACCT’s mission is to help build industry confidence in MCFC technology, and to develop a framework for early purchase commitments to shepherd the technology into the marketplace. ACCT members have and will continue to work closely with the M-C Power Team to help it meet its development milestones, because they believe this is the key to creating private sector confidence and positioning the technology for success once its development is complete.

Increased private sector confidence, and hence future investment, will depend on MCFC developers continuing to meet these milestones, which in turn depends on the availability of Federal funds previously committed, and on the continued support of this Subcommittee. For ACCT’s members, the successful startup of NAS Miramar is an extremely important accomplishment, for which we wish to acknowledge not only the M-C Power Development Team, but the constancy of this Subcommittee, the Congress, and the Department of Energy. At the same time, we recognize that much remains to be done. The power plant must be scaled up fourfold to the one-megawatt size planned for commercial deployment, while substantially reducing its costs through design and materials innovations. The megawatt-scale plant must then be demonstrated to the satisfaction of the market under a range of climatic conditions, fuel types, and operating regimes critical to ACCT’s utility and industry members, and to other potential purchasers and users.

Each phase of this effort is planned to include substantial private-sector cost sharing. However, the magnitude of the undertaking and the risks it entails remain beyond the means of individual ACCT companies. MCFCs promise important societal benefits in the form of resource conservation and efficiency, environmental improvements, lower energy costs, and an enhanced competitive position for US industries. For these reasons, we continue to believe that substantial Federal funding remains both appropriate and essential to advance the technology and help US firms compete in world energy markets over time, and we urge this Subcommittee to stay the course and continue its support of the Department of Energy’s MCFC program at levels that will permit the sustained, orderly development our members need to see.

I am grateful to the Subcommittee for this chance to present our views, and I thank you on ACCT’s behalf.

PREPARED STATEMENT OF PETER J.A. TLJM, MANAGER, SYNGAS CONVERSION SYSTEMS, AIR PRODUCTS AND CHEMICALS, INC.

I strongly encourage the Subcommittee to provide an additional \$5.8 million fiscal year 1998 appropriation for the Indirect Liquefaction program. These monies would be in addition to the DOE Fossil Energy fiscal year 1998 Budget Request of \$4.2 million. This appropriation would enable continuation of proof-of-concept demonstrations at the DOE-owned LaPorte, Texas Alternative Fuels Development Unit (AFDU) and provide for supporting laboratory research and development.

The Federal Government has committed to a national objective of a cleaner environment through the use of cleaner burning transportation fuels that are environmentally superior to gasoline and diesel fuels based on crude oil. These innovative fuels will need to yield significantly lower emissions of particulate matter (PM₁₀), NO_x, SO_x and CO₂. One can calculate that replacement of crude-derived diesel by synthetic diesel, made through Indirect Liquefaction, would have resulted in a re-

duction of 100–160 million tons of carbon dioxide per year for the U.S. transportation sector alone in 1995, a reduction of 25–40 percent (“Automotive Engineering,” Feb. 1991, Vol. 99, No. 2, pp. 15–18, and 1995 IEA statistics). However, while the Government has established goals and objectives to reduce emissions, no commercially accepted technology currently exists that would enable such goals to be met. This lack of appropriate technology creates situations in which compliance deadlines are extended rather than met. Indirect Liquefaction is an emerging technology with the capacity to solve these problems.

The Indirect Liquefaction program is directly supportive of the Federal Government’s stated goals for cleaner air, higher energy efficiency/lower CO₂ emissions, and reduced dependence on foreign oil. The information resulting from this program will lead to: Industrial acceptance and early commercialization of indirect liquefaction technologies; production of highly efficient, environmentally superior transportation fuels and premium chemicals from our nation’s own vast reserves of fossil fuels, as well as renewables and environmentally disadvantaged energy sources; production of transportation fuels in quantities sufficient to enable vehicle road tests; and fulfillment of national environmental and energy security objectives.

The Indirect Liquefaction program—an industry/university/national laboratory partnership—has broad-based support, as evidenced by the recent industrial cost-sharing from Air Products and Chemicals, Inc., Eastman Chemical Company, Bechtel, and Shell Oil Company.

U.S. industries, universities and national laboratories are working at a laboratory scale to develop transportation fuels: That will meet the Government-desired emissions regulations; that can be handled in a manner that is compatible with the existing transportation fuel distribution infrastructure; and that are produced from a variety of indigenous feedstocks including coal, natural gas, biomass, as well as petroleum coke and a variety of other environmentally disadvantaged feedstocks.

However, laboratory-scale experiments alone provide insufficient information for industry to take the significant technical and economic risks involved in scaling up technology from the laboratory to commercial operation. LaPorte AFDU operation provides engineering and economic data, the intermediate step that will enable industry to assess scaleup and commercialization potential for the production of superior liquid transportation fuels from domestic carbonaceous feedstocks. Additionally, the AFDU produces these superior fuels in sufficient quantity to allow road testing in actual vehicles.

Since 1985, Congress and the Department of Energy have invested over \$25 million to build and maintain the LaPorte AFDU as a state-of-the-art facility for synthesis gas conversion. Results of AFDU operations have proven the efficiency and cost-effectiveness of producing methanol via the Liquid Phase technology. This technology provides a means to lower U.S. dependence on foreign sources of methanol. Significantly, the value of the AFDU is becoming internationally recognized; a growing number of energy and chemical companies are indicating a strong interest in sharing in the cost of operating the LaPorte AFDU to develop various transportation fuels and premium chemicals via Indirect Liquefaction technologies. These technologies first involve the well-established process of synthesis gas production from any carbonaceous feedstock, yielding a mixture comprising primarily hydrogen and carbon monoxide, with all polluting compounds removed. The new, emerging Liquid Phase technologies convert this clean synthesis gas to environmentally superior liquid transportation fuels and oxygenated fuel additives that can use the existing transportation fuel infrastructure—a major financial consideration.

From its inception in 1984 through 1990, the LaPorte AFDU was used to develop the Liquid Phase Methanol (LPMEOH™) technology. This program was aimed at converting carbon-rich synthesis gas, such as that derived from coal, biomass or waste materials like petroleum coke or bottom-of-the-barrel residual oil, to methanol. This application has appeal both for the power and the refinery processing industries for coproduction of electric power and methanol for power peak shaving or as a chemical feedstock. With support from Chem Systems Inc., the Electric Power Research Institute, and Air Products, DOE pioneered the LPMEOH™ process, introducing first-of-a-kind technology that successfully converted carbon-rich synthesis gas into methanol. Success at LaPorte led to a proposal and subsequent award under the Clean Coal Technology Program. The resulting LPMEOH™ process demonstration unit, located at Eastman Chemical’s Kingsport, Tennessee chemical complex, was started up in early April and is producing methanol at the design capacity of 260 tons per day.

With successful technical development of the Liquid Phase Methanol technology, the program objectives were broadened to develop other environmentally superior transportation fuels and chemicals from synthesis gas. In 1991, a unique government/university/national laboratory/industrial partnership was created to effectively

conduct this research and development work with periodic operations at the LaPorte AFDU. This program has successfully progressed with contributions from DOE/FETC, Sandia National Laboratory, renowned researchers at five universities, and seven cost-sharing industrial partners (currently Air Products, Eastman Chemical, Shell and Bechtel; in the past, support has also been received from Exxon, UOP and Statoil).

The expanding U.S. dependence on foreign oil is neither good for our country's balance of payments nor for national security. U.S. oil imports are currently more than 50 percent of consumption and are expected to reach 60 percent by 2010. Much of the imported oil comes from countries that are politically unstable and that may be opposed to U.S. interests. Reliance upon foreign petroleum can be reduced by the use of Indirect Liquefaction technology, which can utilize many different domestic carbon based feedstocks. Thus, Indirect Liquefaction can offer the nation a path to a cost-competitive, environmentally friendly alternative to foreign oil.

Environmental legislation and a drive toward energy efficiency has spurred the growth of the diesel fuel market. However, to meet environmental requirements, clean-burning, high-cetane-number, alternative diesel fuels must be developed. A diesel fuel with high cetane number features superior, smokeless combustion characteristics. The work at LaPorte has initiated the steps needed to reach this goal. In 1991, LaPorte was operated to generate dimethyl ether (DME) from synthesis gas through a one-step process. DME is viewed in the industry as a valuable chemical feedstock, and in 1995 it was proposed as a clean-burning, alternative diesel fuel with a high cetane number. Air Products is proposing to conduct additional DME operations at LaPorte using a more robust catalyst system than previously tested. In the laboratory, the combustion products from DME exhibited significant emissions reduction of hydrocarbons, carbon monoxide and particulate matter relative to low-sulfur petroleum diesel. Levels below the requirements for Ultra Low Emission Vehicles (ULEV) were obtained. DOE's Office of Transportation Technologies has expressed significant interest in conducting further fuel characterization tests, including fleet testing, on DME produced in this one-step process. In addition, Air Products' proprietary research has developed new diesel fuel additives/replacements. The cetane numbers obtained for these unique, super-clean diesel alternatives far surpass the cetane number of crude oil-based, commercial diesel fuels (i.e., 100 to 225 vs. 40 to 50). Continued operation of the LaPorte AFDU would make sufficient quantities of fuel available for these, as well as other tests.

Most importantly, the replacement of conventional diesel by synthetic fuels produced by Indirect Liquefaction can reduce tailpipe carbon dioxide emissions enormously. One can calculate that this replacement for the U.S. transportation sector alone would result in a tailpipe reduction of over 100 million tons of carbon dioxide per year, a decrease of over 25 percent ("Automotive Engineering," Feb. 1991, Vol. 99, No. 2, pp. 15-18, and 1995 IEA statistics). Depending on the feedstock used to manufacture the synthetic diesel, one could even claim an effective reduction of up to 20 percent in CO₂ generation "from well to wheel," an achievement in reducing factors that cause Global Warming. Should the exponential growth in the U.S. diesel market continue at its present rate, this reduction could be a multiple of the aforementioned. One can therefore not stress enough the importance of hastening industry's acceptance of the technology.

Continued LaPorte funding also enables the development of improved technologies for the production of clean hydrocarbon fuels using the Liquid Phase version of the Fischer-Tropsch process. Shell Oil, along with UOP, Statoil, and Exxon, participated, both financially and technically, in operations at LaPorte in 1992, and again in 1994. Shell Oil provided significant cost share in its participation in Liquid Phase Fischer-Tropsch operation in 1996, and is expected to return once more in the fall of 1997. These companies are particularly interested in the conversion of natural gas to liquid transportation fuels, and came to LaPorte because of its unique capabilities. The existence and resources of the LaPorte unit are the key reasons why private sector companies have committed to pooling their financial and technical capabilities to test such new routes to cleaner fuels. Private sector funding to date for LaPorte operations is more than \$6 million. This new, growing role for LaPorte is a strong endorsement for the continuation of Federal support for this facility.

In the future, LaPorte will lend itself conveniently to another important development in the production of low-cost liquid fuels via Indirect Liquefaction. Production of synthesis gas alone can represent well over 50 percent of final product cost, and recently, considerable research has been underway to reduce the cost of synthesis gas production via selective high-temperature membrane systems. The development-scale demonstrations of these technologies in the near future could be efficiently accommodated at the LaPorte site, where the infrastructure is already in place for such demonstrations. The synthesis gas generated could then be used in conjunction

with existing syngas conversion equipment, allowing the complete step-by-step demonstration of fuels production from raw material. Such technologies may be well suited to convert the vast quantities of Alaskan North Slope natural gas to liquid fuels via the Liquid Phase Fischer-Tropsch process. These liquid fuels will utilize the Trans-Alaskan Pipeline, thereby extending its functional life. Additionally, a synthesis gas generation/liquid fuels production facility could be a feasible source of power generation and transportation fuels in remote locations for U.S. military needs and for use in under-developed countries.

DOE's Alternative Fuels Development Unit at LaPorte is a unique national resource.—It can be cost-effectively used to test proof-of-concept approaches for producing clean fuels and high value additives via synthesis gas. This synthesis gas can be produced not only from coal, but also from natural gas, renewables, and environmentally disadvantaged feedstocks such as petroleum coke or bottom-of-the-barrel residual oil. Congress is to be commended for its foresight and its past support for the LaPorte Indirect Liquefaction program. The industry/university/national laboratory partnership for the development of Liquid Phase technology would not have been able to continue without DOE funding support. In fiscal year 1997, however, funding constraints for the Liquid Phase program led to a curtailment of operations at LaPorte, although some research activities have continued. In fiscal year 1998, if sufficient Government funding is provided, Air Products plans to test a Dimethyl Ether process developed under the DOE program.

The focus of the Indirect Liquefaction program is consistent with the national policy of meeting environmental goals through the development of clean-burning alternative transportation fuels and premium chemicals from a vast array of domestic carbonaceous feedstocks. We therefore request that the Subcommittee continue and build upon the important work being carried out at the LaPorte AFDU to make these goals a reality. Funding of \$5.8 million, an amount in line with the yearly average dollars needed for facility operations and supporting research, should be added to the DOE Fossil Energy Budget Request of \$4.2 million for the fiscal year 1998 appropriation.

PREPARED STATEMENT OF RICHARD L. LAWSON, PRESIDENT, NATIONAL MINING ASSOCIATION [NMA]

The National Mining Association's (NMA) member companies account for approximately three-fourths of the coal production in the United States, over one billion tons annually, and the vast majority of mined minerals including iron ore, copper, gold, silver, uranium, lead, zinc, and phosphate. The purpose of this statement is to present the NMA's views on fiscal year 1998 programs for the following agencies: Office of Fossil Energy (Department of Energy), Energy Information Administration (Department of Energy), U.S. Geological Survey (Department of the Interior), the Office of Surface Mining (Department of the Interior), the Bureau of Land Management (Department of the Interior) and the Forest Service (Department of Agriculture).

OFFICE OF FOSSIL ENERGY

NMA advocates that the Federal government's partnership with the private sector be continued as an integral part of the foundation for enhanced utilization of our domestic resources. The continuing development of innovative technologies will provide improvements in energy efficiency and environmental protection rather than reduced availability of energy through the imposition of drastic regulatory requirements. NMA supports the following Fossil Energy programs to enhance the clean and efficient utilization of coal by developing and facilitating commercialization of innovative technologies.

Clean coal technology program.—The Clean Coal Technology Program is a highly successful industry and government partnership designed to demonstrate a new generation of innovative coal processes. This partnership must be continued in order to obtain the multiple benefits derived from coal utilization and clean coal technologies both domestically and internationally. The NMA realizes that budgetary constraints have and will continue to make the Clean Coal Technology Program vulnerable to funding cuts. Additional budget reductions could adversely impact approved projects and significant private sector investments. NMA urges the Subcommittee to ensure that the Department of Energy continues its program management practice of allowing market forces to dictate project terminations if additional cost savings are necessary.

Coal research and development.—In the Advanced Clean Fuels Research Program, various advanced coal preparation technologies promise to enable the nation to con-

tinue the use of coal in traditional applications in large industrial and electric utility boilers, as well as opening new opportunities for high quality coal use in turbines for power generation and for liquid fuels. The cost per barrel of these liquid fuels, especially with techniques like coprocessing, has shown remarkable improvement. Maintaining an ongoing development effort for promising systems is both an insurance policy against the disruption of imported oil to the U.S. and a necessary investment in establishing an economically viable liquid fuels program.

In advanced Clean/Efficient Power Systems program, NMA supports continued funding for the Advanced Pulverized Coal-Fired Power Plant program (the low emission boiler system) which builds on the solid performance history of conventional pulverized-coal-fired boilers.

Within the Advanced Research & Technology Program, the NMA supports the goal to develop the advanced turbine system, fuel cells, and the critical development of cost-effective hot gas cleanup systems. The latter will allow gas from the combustion system to be cleaned without lowering temperature and energy level by quenching it prior to clean up.

The cooperative R&D program.—The Cooperative R&D programs with industry at the Western Research Institute in Wyoming and the Energy 8 Environmental Research Center in North Dakota have demonstrated value because of their potential for near-term payback through commercialization. These cost-shared, private-public partnership programs continue to deserve the emphasis placed on them in prior years.

National laboratories.—The Department of Energy should continue and expand its emphasis on making maximum use of its existing research facilities, including those national laboratories which traditionally have not been highly active in fossil energy. In 1990, the National Coal Association (now the National Mining Association) took the initiative to create a more effective partnership between the coal industry and researchers with the National Laboratories at Argonne, Los Alamos, Oak Ridge and Sandia, in addition to the Morgantown and Pittsburgh Energy Technology Centers. The partnerships' continuing mission is to stimulate, facilitate and coordinate the development and transfer of technology to the mining industry through technical information interaction and applications evaluations.

Extraction technologies.—Extraction technologies are an essential part of a research and development portfolio for coal and minerals. The NMA urges support for the establishment of such a program within DOE's Office of Fossil Energy in partnership with the mining industry.

Fossil energy environmental restoration.—The NMA is an active partner in the Acid Drainage Technology Initiative (ADTI) at the National Mine Land Reclamation Center (NMLRC) and supports funding in the amount of \$1.5 million. This action will provide necessary support for the NMLRC to implement this joint partnership effort to reduce the formation of acid pollutants that can drain into streams and rivers when coal is mined.

ENERGY INFORMATION ADMINISTRATION

In addition to its value to the nation, the functions performed by the Energy Information Administration (EIA) are of significant importance to the mining industry. EIA is an independent agency whose unbiased analysis and independent short and long term forecasts form the basis for reasoned and responsible policy decisions by the Congress, the Department of Energy and other government agencies on both the federal and the state levels. EIA's energy data collection and dissemination responsibilities are essential to our industry's ability to evaluate production and market trends, and to make investment decisions which benefit the nation. NMA urges the Subcommittee to reject the reductions proposed for the EIA.

U.S. GEOLOGICAL SURVEY

Federal investments in geoscience research and information have for decades paid enormous dividends, and the rationale for continued support of geosciences remains strong. For example, there is a demonstrated need for an integrated national effort to provide information about natural resources and geologic hazards. The Geologic and Groundwater Divisions of the USGS develop and provide high quality and scientifically reliable data that is important to maintaining our nation's economic and environmental health in addition to national security. The U.S. Geological Survey (USGS) addresses development of natural resources, prepares geologic maps utilized extensively in both the public and private sectors, in addition to maintaining healthy water standards.

Of particular importance is the maintenance of the data development functions transferred from the former Bureau of Mines (BOM). The USGS is the only source

for much of the statistical information on mining and minerals commodities and the NMA strongly advocates the continuation of these data collection and dissemination activities. While this activity is quite different from other USGS activities, the transfer has been effective to date. However, the NMA remains concerned that USGS may attempt to eliminate or reduce these important functions. The data is very important as it forms the basis for informed policy decisions by government and is also used extensively by industry, non-governmental organizations and academia.

OFFICE OF SURFACE MINING

The Office of Surface Mining's (OSM) Regulation and Technology appropriation should be evaluated in light of the maturation of approved state surface mining programs since the passage of the Surface Mining Control and Reclamation Act (SMCRA) in 1977 which has made federal duplication of state responsibilities under the Act unnecessary and wasteful. In spite of a reduction in appropriations in 1996, OSM still maintains 20 field and area offices in addition to the Washington, D.C. Headquarters, the Lexington, Kentucky AVS Office and three Regional Coordinating Centers that were created pursuant to the agency's 1994 Streamlining. That is a total of 25 federal offices for 26 coal mining states, 24 of which have federally approved state programs. In 1995, OSM consolidated the Springfield, Illinois and Indianapolis, Indiana field offices with no resulting gaps in environmental protection. The necessary functions of field and area offices not already assumed by the states can be consolidated with most of the functions accomplished by the three Regional Coordinating Centers.

State program grants, technical information processing systems, training of state personnel, review of state program amendments and electronic permitting activities should continue and can be effectively administered through a streamlined structure.

With respect to Title IV (Abandoned Mine Land) programs, over a \$1 billion balance exists in the Abandoned Mine Land (AML) Fund which is financed through the AML tax paid by the industry on each ton of coal produced. NMA supports an increase in the amount of money available for states and OSM to produce actual On the ground reclamation of lands mined prior to the passage of SMCRA.

BUREAU OF LAND MANAGEMENT AND FOREST SERVICE

National Mining Association (NMA) members are engaged in extensive exploration for and development of minerals on public lands. These lands are a cornerstone of the nation's mining industry. The NMA is concerned that the Bureau of Land Management (BLM) and Forest Service (FS) lack sufficient qualified personnel expertise and funding to conduct timely mine permitting. This is resulting in significant economic and social impacts.

NMA's members are committed to environmentally responsible mining activity on public lands and are committed to working closely with the BLM, Forest Service and the states in the planning stage to assure that mining projects meet environmental standards and objectives. To do otherwise would lead to increased costs both to industry and the Federal government.

Mining operations on public land generate taxes and employment and in many cases are the dominant source of employment in many rural communities. Delays in approval for mining plans have a negative effect on these communities. An adequate minerals budget will help assure timely, up front and cooperative efforts between the land management agencies, the states and the mining industry.

BLM and the Forest Service must have highly qualified and trained personnel with expertise in mineral exploration, development and production techniques to perform this "up front" work. The NMA urges the Subcommittee to provide adequate funding so that processing of mine operating plans, including National Environmental Policy Act (NEPA) compliance, can proceed in a timely manner. This would go far to alleviate an ongoing problem of major significance.

Late last year, the Secretary of the Interior reported to this Subcommittee that its directive on processing grandfathered patent applications will also mean that these [mineral] examiners will not be available to do other types of work [processing plans of operation] typically done by these geologists and mining engineers. Given this and other constraints, the industry was surprised by the Secretary's announcement early this year of a new major initiative to revise BLM's surface management regulations applicable to mining. The allocation of staff and financial resources to this major new initiative will further exacerbate ongoing delays in the timely processing of plans of operation and related NEPA requirements. NMA encourages the Subcommittee to scrutinize this new initiative which does not appear to be respon-

sive to any specific problems that would warrant wholesale revisions of the existing regulatory regime. The prioritization this initiative has apparently been assigned must be questioned.

PREPARED STATEMENT OF GENERAL ELECTRIC POWER SYSTEMS

This testimony is submitted on behalf of General Electric Power Systems (GE) for consideration by the Subcommittee during its examination of the funding requested for fiscal year 1998 for programs of the Department of Energy. GE supports funding through the Fossil Energy Research and Development program for the Advanced Turbine Systems (ATS) program in the amount of \$45.379 million in fiscal year 1998. This amount includes \$31.379 million as included in the Department's budget request, which is necessary to provide funding for the completion of the ongoing Phase 3 of the program, plus an additional \$14 million. This amount above the Department's original request is necessary to initiate a restructuring of the utility ATS program that was formally requested by the Department on March 3, 1997, and will maintain the program at near the level of funding provided in fiscal year 1997.

VALUE OF THE ATS PROGRAM TO THE NATION

Through the ATS program, the Federal government is sharing with industry the risks in the development of the next generation power system for utility and industrial applications using advanced gas turbines. To date, GE has invested \$60 million in the utility ATS program. The ATS program is essential to keep U.S. turbine manufacturers at the forefront of power system technology, enabling U.S. companies to increase exports to the rapidly growing world market and sustaining and creating new manufacturing jobs.

The Federal investment in the ATS program will produce market-ready technology that will provide the most energy efficient utility power generation option for the future. The benefits of this technology that will flow to the taxpayers include savings in energy resources; lower electricity costs; substantial emissions reductions; and stimulus for domestic jobs retention and expansion.

The ATS program overlaps with the period of growing international markets and transition in the domestic industry. Domestic market uncertainty resulting from electric industry restructuring makes potential investors in new technologies more risk averse, a trend likely to continue until the new ground rules for a more competitive electricity industry are set. These developments make properly tailored Federally supported R&D more critical. Continuing the ATS program will produce commercially available technology at the time when new increments of generation are needed, both domestically and internationally.

STATUS OF THE ATS PROGRAM

In 1993, GE was one of three companies competitively selected to participate in the Conceptual Design and Product Development phase of the utility portion of the ATS program. In August 1995, DOE selected GE as one of two companies to proceed to the Technology Readiness Testing and Pre-Commercial Demonstration phase (Phase 3) of the program, which GE is currently cost-sharing at 64 percent of allowable cost. In September 1995, GE executed a Cooperative Agreement with the Department of Energy. In view of budgetary limitations, last year GE agreed to defer certain Federal funding which, under the Cooperative Agreement, would otherwise have been required in fiscal year 1997. This change, coupled with the funding provided by Congress, has enabled the ATS program to maintain progress toward the program's ambitious technical goals, with two contractors, in fiscal year 1997.

Fiscal year 1997 funding is being used by GE to continue Phase 3 Enabling Technology design and demonstration for the critical new components of the ATS. The funding requested by the Administration for fiscal year 1998 will permit completion of the GE Phase 3 technology development component of the ATS program, which is currently scheduled for completion by the end of calendar year 1997.

On March 3, 1997, DOE issued a Request for Proposals to the ATS contractors for a restructured program. Instead of the original demonstration phase of the ATS program, which included the siting of the first commercial unit at a host site, the program would be restructured to achieve full speed no load testing of the ATS, including design, procurement and installation of unique tooling and test instrumentation. Replacement of the demonstration phase should eliminate the need for the Department to choose a single technology, thereby ensuring that DOE will not be put in the position of making technology choices that should be market-driven, while assuring that the program will still achieve the technical milestones necessary to

ready ATS technology for successful worldwide commercialization. GE's current assessment of the impact of this restructuring on the fiscal year 1998 funding requirements is reflected in the request for an additional \$14 million above the Department's original ATS funding request.

FEDERAL SUPPORT FOR THE ATS PROGRAM

In assessing any federal technology program, it is critical to (1) identify tangible benefits to the taxpayers; (2) assure that the technology to be supported is one that ultimately will be supported in the marketplace; (3) assure that the U.S. government does not stand in the position of picking technology winners or losers or otherwise distorting the marketplace, but facilitates the ability of the market to make such choices; and (4) assure that the program is consistent with and advances other national energy priorities. Where the public benefits will far exceed the cost to the government, Federal participation is appropriate. Judged against these standards, the ATS program is a cost-effective investment for the nation.

TANGIBLE BENEFITS TO TAXPAYERS

Energy efficiency.—The goal of the ATS program is to achieve fuel-to-electricity efficiencies of 60 percent or greater, resulting in significant reductions in fuel consumption.

Lower electricity costs.—These fuel savings will, in turn, lower electricity costs. The ATS program has as its goal a 10 percent reduction in the cost of electricity produced relative to current (F-level) combined cycle power plants. Energy cost reductions of this magnitude will have a positive impact on the competitiveness of U.S. industries in the world marketplace.

Emissions reductions.—Environmentally superior natural gas fired Advanced Turbine Systems will reduce emissions without the need for post-combustion controls. Natural gas fired gas turbines produce no particulates, ash, heavy metals, toxins, or sulfur oxides. Additionally, the ATS will achieve a significant reduction in emissions of oxides of nitrogen, and will further reduce carbon monoxide and hydrocarbon emissions relative to the current fossil fueled power generation base. The high efficiency of gas turbine systems makes this power generation concept the most effective method of reducing carbon dioxide emissions from fossil fueled electricity generation.

Stimulating jobs retention and growth.—Tens of thousands of Americans already work to manufacture gas turbines and to provide key components. These jobs depend on continued U.S. global leadership in turbine technology. The turbine manufacturing industry in the United States faces competition from foreign suppliers that are heavily supported by their own governments in both technology and market development. High value manufacturing jobs in this industry already have been lost, and the remaining jobs are at risk because of uncertain U.S. market conditions and stiff international competition.

A \$1 trillion international market in electricity generating systems is expected to develop over the next decade, and much of the market demand will be for advanced gas turbine systems. The ability of U.S. companies to capture a significant share of this market may well depend upon successful completion of the ATS program to assure that U.S. technologies will be developed in time to compete to fulfill the expected demand for advanced power generation systems after 2000. Taken together, the need to counter foreign R&D support for U.S. competitors and foreign export promotion activities, and the jobs and economic benefits of expanded U.S. exports of advanced power generation products, make a compelling case for the continuation of the ATS program.

MARKET OPPORTUNITIES FOR ATS TECHNOLOGY

ATS technology ultimately will be supported in the marketplace, both domestically and internationally. But because of the continuing technical risks, the market alone is not sufficient to bring this technology to the point of commercial acceptance. The likely users of this technology in the U.S., both utilities and independent power producers, are not in a position today to make multi-hundred million dollar investments in technologies and systems that are not yet proven by actual, full-scale operation.

The current discussion of deregulation and increasing competition in the electricity industry, including the potential for separation of generation and other functions of traditional utilities, makes it even more difficult to identify risk takers to go forward with new technology. While new technology is a driver for restructuring, and gas turbine technology advances are one way to secure the cost-saving benefits of competition in the domestic industry, the pressures of deregulation also may dis-

tort the market, and discourage investments in newer, cleaner technologies that have unanswered questions. The ATS program is vital to clean, efficient power choices in the U.S. because it will enable U.S. manufacturers to demonstrate favorable answers to these questions about advanced gas turbines.

FEDERAL ROLE IN ADDRESSING TECHNICAL CHALLENGES

Because they offer efficient fuel conversion, short installation times and lower installed cost, the current generation of gas turbine combined cycle systems has gained wide acceptance. In recent years, manufacturers have made upgrades in performance and incremental improvements that produce modest gains in turbine efficiency and emissions reductions. Moving beyond these incremental improvements, however, requires vision, commitment and a public-private partnership. The ATS program meets these requirements: it has an ambitious but attainable goal of a system that achieves 60 percent efficiency; it has the commitment, evidenced through cost-sharing, of the private sector, and it involves the government in sharing the technical risks that prevent private industry, acting alone, from meeting the ultra-high efficiency goal of the ATS program.

The key to the advancement of gas turbine systems in the future is a strong technology base focused in three critical areas: advanced gas turbine operating conditions, environmental compatibility, and fuel flexibility. From a technical standpoint, achieving the efficiency goals of ATS requires thermodynamic cycle modification and changes in gas turbine design through innovative cooling and materials developments. The multidisciplinary approach of the ATS Program fosters sharing of information, expertise, and research facilities, which enables American companies to address areas of technical risk more quickly and effectively.

CONSISTENCY WITH NATIONAL ENERGY PRIORITIES

The ATS program will permit greater utilization of domestic natural gas resources to meet power generation needs. The more efficiently natural gas can be burned to generate electricity, the more competitive it will be in the marketplace and the more likely it is that this fuel will continue to replace imported oil for electricity generation. This enhances U.S. energy security and reduces the outflow of dollars for foreign oil. The advanced turbine system will also be fuel flexible. It will be applied to coal fired systems (Integrated Gasification Combined Cycle) and will result in a significant performance increase and emissions reduction compared to conventional coal fired steam plants.

CONCLUSION

The benefits of the ATS for the United States will far exceed the Federal funds invested. The ATS program will contribute to continuing U.S. global leadership in advanced power generation technologies, thereby supporting high value manufacturing and engineering jobs here in the United States, both in the systems developers and in their network of suppliers from around the country.

Government and industry have made mutual commitments to the ATS program, and have made significant technical progress. GE appreciates the Committee's strong support for the ATS program in the past, and urges the Committee to provide the resources necessary to see this program through to completion in its restructured form.

PREPARED STATEMENT OF DR. MAXINE SAVITZ, GENERAL MANAGER, ALLIEDSIGNAL CERAMIC COMPONENTS

On behalf of AlliedSignal Inc., I am pleased to provide written testimony concerning recent ceramic gas turbine activities at AlliedSignal. Although AlliedSignal is a large, multi-national advanced technology and manufacturing company serving customers worldwide with aerospace and automotive products, chemicals, fibers, plastics and advanced materials, AlliedSignal Ceramic Components (ASCC), is a 50-person unit. AlliedSignal Ceramic Components has a goal to develop and manufacture viable high performance structural ceramics for automotive, advanced industrial and aerospace applications. Ceramic engine components are essential for the application of gas turbine engines as effective power sources for ground vehicles in order to meet performance, weight and life requirements. The ceramic gas turbine programs in the transportation and industrial Energy Efficiency programs at the Department of Energy (DOE), which this committee has supported, have made much progress in showing the performance and reality in a gas turbine environment.

We are requesting continued funding in fiscal year 1998 for the Transportation Propulsion Materials Program at the fiscal year 1997 appropriated level of \$6.5 million instead of the fiscal year 1998 request of \$4.25 million. It is also important to fund the other ceramic programs in the transportation and industrial programs at the fiscal year 1998 requested level. This includes Vehicle Systems R&D (Heat Engines R&D) High Temperature Materials Laboratory, Cogeneration (ATS) and Continuous Fiber Ceramic Composites programs.

The critical activity in the Partnership for a New Generation of Vehicles (PNGV) gas turbine effort in fiscal year 1998 is the development of ceramic manufacturing technology for gas turbine components. The recently released Review of the Research Program of the Partnership for a New Generation of Vehicles Third Report by the National Research Council (April 1997), states "The single most critical component yet to be demonstrated is a suitably sized, efficient, ceramic turbine, capable of being mass produced. The committee found that significant progress has been made by Kyocera-Vancouver and AlliedSignal Ceramics in making high-quality ceramic components with complex shapes and using processes with high potential for scale-up to automotive volumes and cost. Extruded regenerator rotors, integral turbine rotors, and scrolls have all shown new capabilities which, although beset by tooling and startup yield problems, have produced quality engine parts and have supported successful component durability demonstrations. Previously, precision silicon-nitride parts were made by hot isostatic pressing, which is impractical for large-volume production. Today, laboratory-scale parts can be produced in 10 minutes using a gelcast process, a much better time frame than the 8 hours required by the previous procedure. However, yield and consistency for this process have yet to be established. Some silicon-nitride components have been manufactured using this process and have been installed on an experimental basis in engines running at metal temperatures (approximately 2,000 °F), primarily to improve wear."

As a result of collaborative efforts between industry, government, and national laboratories—particularly Oak Ridge National Laboratory (ORNL)—significant advances in ceramic engine design and silicon nitride material and fabrication technologies have been achieved. A number of silicon nitride components are being evaluated and actually being implemented in gas turbine applications.

AlliedSignal Ceramic Components is currently in production with three silicon nitride aerospace parts: components for air turbine starters, auxiliary power unit oil pumps and, just this month, seal runners for turbofan main engines. The oil pump parts are used on U.S. and foreign commercial aircraft such as the new Boeing 777 and Airbus A330/340; the seal runners are being installed on engines which power business jets such as Citation, Learjet, Falcon. About 2,000 parts per month are now being manufactured. During the three years the gerotor rings have been in production, cost to manufacture these parts have been reduced 10-fold; yields have increased from 47 percent to 90 percent. Quality has been excellent. Every Airbus has been retrofitted and all Boeing 777s use the ceramic gerotor rings, as will the new 737s. These and the seals are examples of the achievements of ceramic engineers at AlliedSignal Engines who have participated in the DOE ceramic ATTAP and Ceramic Engine Demonstration project, and who are familiar with the design, test, and advantages of ceramics. As a result of knowledge in materials and fabrication experience from the Engine Programs and the ORNL Ceramic Technology Programs, AlliedSignal Ceramic Components was able to provide these parts in a short time, as an example, 20 days. The production decision was made within 4 months including rig and engine testing.

Within the next two years, model 85 APU ceramic turbine nozzles will be introduced into existing military ground carts followed by the commercial airlines. The nozzle program, funded as an DARPA insertion program and by AlliedSignal Engines has completed 46,530 accumulated hours and 54,230 starts. There are over 7,500 hours on the high time engine. Ten 85 APU's have been fielded on MD-80's and are flying in commercial service and have completed 23,690 hours and 38,635 starts and four military carts have been fielded. An internally funded program between AlliedSignal Engines and AlliedSignal Ceramic Components to reduce the costs of manufacturing the 85 APU nozzles, so that the military will more easily afford them, has reduced the costs 76 percent. Ceramic turbine nozzle technology will also see application in a new commercial air transport APU. The technology for design, testing and ceramic manufacturing for this application is sponsored by DOE. The 331-200 commercial field test will provide customer confidence and demonstrate improved reliability in 767/757 applications. These insertion efforts thus provide clear benefit—reliability, durability, and customer acceptance.

Introduction of a new material such as ceramic components in aerospace applications provides experience in manufacturing, customer confidence, acceptance. As mentioned, costs are being reduced but are still too high for most automotive and

industrial applications. Gas turbines, because of their temperature capability, have the potential to achieve fuel efficiency targets while preserving low emission characteristics. Ceramics have been identified as a major enabling technology and allow the gas turbine to meet the goals of a hybrid vehicle or advanced turbine systems for industrial applications. Cost of ceramic components is the major impediment to commercialization. At present, ceramic components range from ten to several hundred times the cost of their metallic counterparts. They currently are far too expensive for large scale, high volume use. Engine builders and vehicle manufacturers expect ceramic hardware to cost no more than conventional materials. This represents a significant challenge to the structural ceramic industry. To achieve parity, substantial cost reduction in every facet of ceramic component manufacturing is necessary.

In fiscal year 1994, a multi-year, cost shared program was initiated by AlliedSignal Engines as part of the DOE Ceramic Turbine Engine Demonstration Project with two ceramic suppliers. The objective is to improve manufacturing processes for ceramic turbine engine blades and nozzles and demonstrate the application of these processes to a production environment. Each supplier has implemented a focused strategy to meet annual yield, cost, and delivery goals for introduction of ceramic gas turbine components in commercial auxiliary power units (APU). Although the blades and nozzles being fabricated under this program are for AlliedSignal Engines' evaluation in a production environment, the technologies developed are applicable to structural ceramics as used in the Solar industrial gas turbine, Allison and Teledyne hybrid engine and other hybrid gas turbine power plants. The silicon nitride material (AS800) being used by AlliedSignal Ceramic Components is being used on all the gas turbine programs.

The funding AlliedSignal Engines received in fiscal year 1997 will enable them to successfully complete the program. Over 2000 cumulative hours of 331-200 ceramic nozzle engine testing has been completed with over 5335 starts. An additional 750 hours of engine testing is planned this year, with FAA certification/approval for field testing planned in June 1999. Ceramic blades have completed over 290 hours of successful engine tests and will accumulate an additional 700 hours in 1997. The complimentary ceramic manufacturing program will obtain process yield of 75 percent and show manufacturing capacity of 500 parts per month. The basic process and material is the same as for automotive components. Forming process is driven by quantity.

The AlliedSignal Engine program also provides input to the DOE, Office of Industrial Technologies Advanced Turbine Systems (ATS) ceramic engine program being conducted by the Solar Turbine Co. These two programs share non-proprietary technology data. As a result of the DOE sponsored manufacturing and scale-up tasks, AlliedSignal Ceramic Components is providing silicon nitrate blades for the Solar gas turbine. These parts have been successfully tested. AlliedSignal Ceramic Components is also providing prototype parts for Allison Engine Company for its Hybrid Vehicle Turbine Engine Program and its Advanced Turbine Systems Program. In addition, AlliedSignal Ceramic Components is participating in a cost-effective Continuous Fiber Ceramic Composites (CFCC) program with Caterpillar Inc. All of these programs have been planned to provide important steps to meeting the goal of engine quality parts. Manufacturing processes suitable for aerospace and stationary gas turbine quantities of components are being developed as an intermediate step toward processes suitable for automotive quantities of components.

To serve the needs of PNGV, there must be a transition from low volume to high volume products with a further reduction in costs. In March 1997, DOE announced its plan to issue a Program Research and Development Announcement (PRDA) for development of high efficient ceramic gas-turbine hybrid power units (GT-HPU) for hybrid-electric automotive applications. Phase I will develop and demonstrate high-volume, high-yield, cost effective ceramic manufacturing technology for automotive gas turbine components. The funding for the program would come from the Automotive Propulsion Systems Material and Heat Engine R&D portions of the Office of Transportation Program.

As mentioned, the proposed fiscal year 1998 budget reduces the Automotive Propulsion Systems Material budget from \$6.5 million (fiscal year 1997) to \$4.25 million (fiscal year 1998). The President's budget does not provide sufficient funding to develop the manufacturing technology for the three critical components: recuperator, combustor, and rotor. These three components are very different in design, materials, and manufacturing method. The President's budget will allow only one contractor and one component. The result will be insufficient data to make the go/no-go decision on the turbine option for PNGV.

If the \$2.25 million cut in the ceramic gas turbine program were restored, one or more additional contractors would be included in the program and all three critical

gas turbine components would be included. Core supporting technology development programs at Oak Ridge National Laboratory would be maintained with the increase in funding.

The Oak Ridge National Laboratory-led Ceramic Technology Project has been a unique partnership between government and industry to develop ceramic technology for advanced gas turbine engines. U.S. industry is developing manufacturing processes while national laboratories and universities are performing supporting technology efforts that are synergistic with the industry programs. In many cases, very effective teams have been established between ORNL principal investigators and industry participants. The ORNL inventor of gelcasting is spending a two year assignment at AlliedSignal Ceramic Components, helping to scale up and automate the process. The ORNL principal investigator for ceramic joining is working with Teledyne Ryan to develop a process to join Teledyne's ceramic turbine rotor to a metal shaft. ORNL and UDRI have led the nation in developing testing technology for high-temperature ceramics, and continues to develop the engineering data on commercial ceramics that are required by designers of ceramic gas turbine components. This information is critical not only for transportation applications but also for Advanced Turbine Systems Programs at Solar Turbines, Westinghouse, and Allison-Engine Company. ORNL and Boston University have worked with AlliedSignal Engines to develop a corrosion-resistant ceramic coating for ceramic gas turbine components, and are developing cost-effective methods of applying the coating. ORNL and UDRI are working with DuPont-Lanxide Composites and Teledyne Ryan on the development of critical ceramic recuperator material.

The \$2.25M reduction in the Automotive Propulsion Systems Material budget will not only reduce the needed industry effort in ceramic manufacturing, but will greatly reduce the supporting technology programs at national laboratories and universities as well. The funds reduction will result in the loss of six scientists at ORNL, the University of Michigan, and the University of Dayton and a 30-50 percent reduction in gas turbine materials efforts across the board including gelcasting, tensile testing, joining and DOE.

We realize, however, that these are times of reduced government spending, so your decisions have become more difficult. In that vein, one important point needs to be made—at least from AlliedSignal's point of view—that is that we're investigating in the development of ceramic components concurrent with the investment we've asked this Subcommittee, the Congress and the Department of Energy to make. Over the past several years, AlliedSignal has invested over \$35 million in the development of the technology and manufacturing processes necessary to keep pace with the international competition in this area. So, while we still ask for a modest level of government funding we, too, continue to spend our own resources on ceramics and ceramic production.

An advanced manufacturing facility was constructed for AlliedSignal Ceramic Components in 1992. The 30,000 sq. ft. facility located in Torrance, California has state-of-the-art equipment for fabrication and characterization of structural ceramics. Additional capital equipment is added annually, e.g. our machining capability has doubled in two years. Funds are provided, not only for "real cost shared" DOE contracts, but also for IR&D at AlliedSignal Ceramic Components, AlliedSignal Engines, and the ceramic technology skill base team at Morristown, New Jersey.

The continuing partnership between DOE and AlliedSignal ensures there will be a competitive ceramic manufacturer and leading edge turbine engine technology in the U.S., which will provide more energy efficient power sources, both in the United States and abroad.

PREPARED STATEMENT OF JEFF LUNDY, STATE OF MISSISSIPPI OIL & GAS BOARD AND
GROUND WATER PROTECTION COUNCIL

Mr. Chairman, thank you for the opportunity to testify today. My name is Jeff Lundy and I am with the State of Mississippi Oil and Gas Board. The Oil and Gas Board is responsible for all phases of oil and gas production as well as re-injection of produced salt water, which assures the safety of our ground water supplies. My testimony today is submitted on behalf of the Ground Water Protection Council (GWPC).

The Ground Water Protection Council (GWPC) is responsible for the development and operation of the RBDMS system. The GWPC is made up of state oil and gas agencies as well as those that regulate ground water and other underground injection control programs. Through the GWPC, the states are all working together to protect ground water resources while reducing the cost of compliance to industry.

We would like to thank the Committee for supporting \$.5 million for the Assistance to State Oil & Gas Agencies and the independent oil and gas industry with Risk Based Data Management Systems (RBDMS) last year and would urge the Committee to increase funding for RBDMS to \$1.5 million for fiscal year 1998 to expand the system to every oil and gas producing state. The system is currently operational in Alaska, Montana, Nebraska, Mississippi, North Dakota, and we are installing it in Ohio, Alabama and California. Additional funding would allow each remaining state to initiate the program as well. This amount would provide the smaller independent oil producers access to this environmental data management system. Smaller producers are often the most in need of such a system because high regulatory costs hit them the hardest. In addition to providing the system to smaller producers, additional funding will allow the GWPC to expand the system to include oil field surface facilities including tanks, pipelines, and storage units. Before I go into detail on the how RBDMS works, I want to make the point that states are dedicating their own resources to RBDMS. For example Ohio, is using almost \$600,000 in state dollars to implement RBDMS. I know all other states are planning on using state dollars as well as federal funds. But what the remaining states need is a relatively small amount of start-up assistance after which time they have shown they are willing to begin applying their own resources.

With past assistance from the US Department of Energy, the GWPC assembled a project team with extensive knowledge and experience in state oil and gas agency environmental data management to develop RBDMS, the only comprehensive, fully relational, PC-based oil & gas regulatory data management system in the country. By allowing the oil and gas industry to participate in the next phase of development of the system, we will assure that it will be useful and effective for them. Additional funding at \$1.5 million for fiscal year 1998 will be mutually beneficial to the private sector and the states by keeping environmental compliance costs down.

RBDMS is one of the best examples we have seen of how industry, working with government, can improve both industry production and environmental protection at the same time. Included with my testimony are endorsement letters of RBDMS as an alternative to costly command and control regulatory policies. It is supported by both the regulated community and the regulators themselves.

In summary, the increased funding we are requesting will provide a means for the successful expansion of the Risk Based Data Management System and will provide the following benefits: (1) improve environmental protection, (2) less regulatory and compliance costs for producers, (3) better state enforcement of environmental regulations, and (4) continued oil production. The remainder of my testimony provides a more detailed explanation of how we have used prior funds and how we would use the requested increase. Due to its length, I will submit it for the written record. Thank you for the opportunity to appear before you today.

RISK BASED DATA MANAGEMENT SYSTEM [RBDMS]

BENEFITS OF RBDMS TO THE OIL & GAS INDUSTRY

Enhance protection of the nation's ground water

The RBDMS will provide regulators with information that can be used to focus attention and resources, both governmental and industry, on those wells that pose the greatest environmental risks. The ability to target human and financial resources towards those areas with the greatest risk will result in a more effective and efficient use of those resources and a greater level of environmental protection. In addition to the tangible public benefits from enhanced protection of the Nation's ground water, the resulting decrease in incidents of pollution will also help protect industry's image.

Improve industry access to oil and gas commission data

Oil & Gas boards and commissions function as a clearinghouse for information on wells, geology and production. Exploration geologists, producers, and other players utilize this information on a daily basis to develop prospects and to more efficiently drill and operate their leases. In many oil and gas commissions, the vast majority of well data is only available via laborious searches through voluminous paper well files. In addition to estimating environmental risk the RBDMS is a comprehensive data management system that will answer most oil and gas information requests quickly and easily from a computer terminal. More readily available data on active, idle, and past P&A'd wells will decrease the cost of new discoveries and facilitate the development of enhanced recovery projects.

Reduced cost to industry of oil & gas commission operations

Many state oil & gas boards and commissions operate without the benefit of well designed computer systems. As a result, many operations that could be automated are performed manually at a much greater cost. The RBDMS is an efficient and comprehensive data management system designed specifically to meet the needs of state oil & gas commissions. It will make existing oil & gas commission personnel more efficient and reduce the cost of oil & gas commission operations. The oil and gas industry will directly benefit from any cost savings as most oil & gas commissions are cash funded with a production-based conservation tax paid by operators and producers. Furthermore, the fact that the RBDMS will be utilized by multiple oil & gas commissions will save each commission the expense of developing its own system.

Decrease time required to process applications

An on-line database of oil & gas commission data will decrease the amount of time commission staff require to research and process Applications for Permission to Drill and other applications involving re-entry and re-completion. Furthermore, the ability to evaluate environmental risk will result in construction and testing requirements commensurate with the level of risk.

Facilitate uniform reporting requirements among states

Operators that work in more than one state are often frustrated by the variety of applications and reporting forms used by different states. The RBDMS was designed for use in multiple states and during the design of the system all participants shared the goal of developing a common database, program screens, and reports that would work for all participating states. Implementation of the RBDMS in multiple state oil & gas commissions will further progress towards the goal of uniform application and reporting requirements among states. This will decrease costs to operators with wells in multiple states.

Preserve shut-in and idle wells

Many oil wells are inactive as they cannot economically produce at prices that prevail in today's market. Such wells may pose potential threats to USDW's, and pressure exists to plug inactive wells before they pollute and/or become orphans. While the future for increased oil prices is not bright, such wells may have value as possible candidates for enhanced oil recovery projects. The Department of Energy is currently sponsoring research into cost-effective enhanced oil recovery technology; but such technology will only be viable if wellbores exist where the new technology can be applied.

Some inactive wells do pose a threat to USDW's and should be plugged, and the RBDMS will assist in pointing out such wells; but the system will also assist in objectively evaluating inactive wells that pose a relatively low risk of endangering USDW's. Such analysis will minimize errors of omission and commission: not plugging wells that should be plugged, and plugging wells that should not.

The RBDMS will maintain an on-line list of all inactive wells together with historical Mechanical Integrity Tests, Static Fluid Level Tests, and Idle Well Reports. Computer programs will ensure that required tests are run and reports received. Inactive wells will not become lost and forgotten in a mass of paper files. Such a system will improve public confidence in the regulatory process and reduce pressure to plug inactive wells with future value.

PREPARED STATEMENT OF MICHAEL P. KENNY, EXECUTIVE OFFICER, CALIFORNIA AIR RESOURCES BOARD; ROBERT J. CABRAL, SUPERVISOR, SAN JOAQUIN COUNTY, CHAIRMAN OF THE BOARD, SAN JOAQUIN VALLEY UNIFIED AIR POLLUTION CONTROL DISTRICT; MANUEL CUNHA, JR., PRESIDENT, NISEI FARMERS LEAGUE; LES CLARK, VICE PRESIDENT, INDEPENDENT OIL PRODUCERS' ASSOCIATION; AND CATHERINE H. REHEIS, MANAGING COORDINATOR, WESTERN STATES PETROLEUM ASSOCIATION ON BEHALF OF THE CALIFORNIA INDUSTRY AND GOVERNMENT COALITION ON PM-10/PM-2.5

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry and Government Coalition on PM-10/PM-2.5, we are pleased to submit this statement for the record in support of our fiscal year 1998 funding request of \$900,000 for the California Regional PM-10/PM-2.5 Air Quality Study.

The San Joaquin Valley of California and surrounding regions exceed both state and federal clean air standards for small particulate matter, designated PM-10/PM-2.5. The 1990 federal Clean Air Act Amendments require these areas to attain federal PM-10/PM-2.5 standards by December 31, 2001. If the proposed PM-2.5 stand-

ards are adopted, they would have to be attained 2–3 years later. Attainment of these standards requires effective and equitable distribution of pollution controls that cannot be determined without a major study of this issue.

According to EPA and the California Air Resources Board, existing research data show that air quality caused by the PM-10/PM-2.5 problem has the potential to threaten the health of more than 3 million people living in the region, reduce visibility, and impact negatively on the quality of life. Unless the causes, effects and problems associated with PM-10/PM-2.5 are better addressed and understood, many industries will suffer due to production and transportation problems, diminishing natural resources, and increasing costs of fighting a problem that begs for a soundly researched solution.

PM-10/PM-2.5 problems stem from a variety of industry and other sources, and they are a significant problem in the areas that are characteristic of much of California. Typical PM-10/PM-2.5 sources are dust stirred up by vehicles on unpaved roads, and dirt loosened and carried by wind during cultivation of agricultural land. Soil erosion through wind and other agents also leads to aggravation of PM-10/PM-2.5 air pollution problems.

Several aspects of the research are important to federal agencies and programs within the purview of the subcommittee's jurisdiction, including the Forest Service, the Park Service, the Bureau of Land Management, and Department of Energy fossil fuel programs. Based on consultation with federal agency officials who work closely with the PM-10/PM-2.5 issue in the San Joaquin Valley Region, the Coalition requests funding for the following agencies and programs:

Forest Service (\$250,000).—PM-10/PM-2.5 is a highly important issue with the Forest Service's Region V, especially with respect to the Watershed, Soil and Air Department. Unpaved roads within the Forest Service's jurisdiction are a suspected, yet unproven, source of PM-10/PM-2.5 pollution. These roads include public, private and industry-use right-aways, such as those used for fire prevention and logging. Consequently, the Forest Service has a substantial stake in the PM-10/PM-2.5 issue and in research into its causes and remedies.

Park Service (\$100,000) and Bureau of Land Management (\$250,000) for a total of (\$350,000).—The U.S. Park Service and the Bureau of Land Management have a similarly substantial stake in the PM-10/PM-2.5 issue. Park Service officials in the California region are concerned about the sources and types of PM-10/PM-2.5 particulate matter, including secondary emissions, that are coming into park areas from the San Joaquin Valley. There is a need for an assessment of the effect of PM-10/PM-2.5 emissions on different elevations of terrain. The Park Service is concerned about the transport of Valley emissions into outside areas under Park Service jurisdiction, especially as these emissions have an effect on vegetation and visibility in park areas. Park Service and BLM officials are concerned about the possible contribution of prescribed and forest fires on the PM-10/PM-2.5 problem, as well as the effect of PM-10/PM-2.5 particulate matter on human and other animal life, vegetation, land management, and area lakes and streams.

Department of Energy (\$300,000).—The Department of Energy's stake in the PM-10/PM-2.5 issue falls into at least three categories. First, the oil and gas industry is vitally concerned about PM-10/PM-2.5, and is a key player in the coalition to address PM-10/PM-2.5 problems and the need for this research. Secondly, there are DOE laboratories with modeling capabilities that may be able to contribute to research and solutions concerning PM-10/PM-2.5. Finally, because of DOE's partnership in the Elk Hills gas production facility, DOE is in a critical position as a potential contributor to both the problem and the solution.

Improved information on the sources and composition of construction emissions is needed to develop accurate PM-10/PM-2.5 emission inventories. This study will provide information to better evaluate and understand the impacts of construction project emissions to total PM-10/PM-2.5 loadings in a region. Knowledge of the sources of construction emissions will also provide better information for evaluating the effectiveness of potential mitigation measures thereby minimizing the risk of implementing potentially costly control measures which might not be effective.

The importance of this study on PM-10/PM-2.5 is underscored by the need for more information on how the federal Clean Air Act Amendments standards can be met effectively by the business community, as well as by agencies of federal, state and local government whose activities contribute to the problem, and who are subject to the requirements of Title V of the Clean Air Act. There is a void in our current understanding of the amount and impact each source of PM-10/PM-2.5 actually contributes to the overall problem. Without a better understanding and more information—which this study would provide—industry and government will be unable to develop an effective attainment plan and control measures.

Our Coalition is working diligently to be a part of the effort to solve this major problem, but to do so, we need federal assistance to support research and efforts to deal effectively with what is essentially an unfunded federal mandate.

Numerous industries, in concert with the State of California and local governmental entities, are attempting to do our part, and we come to the appropriations process to request assistance in obtaining a fair federal share of financial support for this important research effort. In 1990, our Coalition joined forces to undertake a study essential to the development of an effective attainment plan and effective control measures for the San Joaquin Valley of California. This unique cooperative partnership involving federal, state and local government, as well as private industry, has raised more than \$12 million to date to fund research and planning for a comprehensive PM-10/PM-2.5 air quality study. Our cooperative effort on this issue continues, and our hope is that private industry, federal, state and local governments will be able to raise an additional \$12 million over the next three years to fund this important study.

To date, this study project has benefited from federal funding provided through USDA's, DOD's and EPA's budgets—a total of \$8.8 million in federal funding. State and industry funding has matched this amount virtually dollar for dollar. However, notoriously absent as funding sources are the key Department of Interior agencies and programs previously discussed. As a prime stakeholder in this issue, the Department of Interior should do its fair share, and bear part of the cost of this vital research.

The following is a list of PM-10/PM-2.5 research projects which are in progress:

Planning

Development of products for emissions, field monitoring, data analysis and modeling.

Technical support studies

Suitability of data base; Winter/Autumn intensive study; micrometeorological parameters; fog formation/dissipation; ammonia from soils.

Modeling

Demonstration of modeling system for application in SIP's.

Data analysis

Analysis of existing data to aid project planning.

Demonstration studies

Almond, fig, walnut, cotton, harvesting; unpaved agricultural roads; unpaved public roads; unpaved shoulders of paved roads; dairies, feedlots, poultry, dry cereal grain.

For fiscal year 1998, our Coalition is seeking \$900,000 in federal funding to support the continuation of this vital study by the Forest Service (\$250,000), the Park Service (\$100,000), the Bureau of Land Management (\$250,000), and the Department of Energy (\$300,000) in California. We respectfully request that the Appropriations Subcommittee on Interior and Related Agencies provide these funds in the appropriation bill for fiscal year 1998, and that report language be included directing the full amount for California.

The California Regional PM-10/PM-2.5 study will not only provide vital information for a region identified as having particularly acute PM-10/PM-2.5 problems, it will also serve as a model for other regions of the country that are experiencing similar problems. The results of this study will provide improved methods and tools for air quality monitoring, emission estimations, and effective control strategies nationwide. Consequently, the beneficial results of this study will contribute to national policy concerns as well.

The Coalition appreciates the Subcommittee's consideration of this request for a fiscal year 1998 appropriation of \$900,000 to support the California Regional PM-10/PM-2.5 Air Quality Study.

PREPARED STATEMENT OF HON. SHARPE JAMES, MAYOR, ON BEHALF OF THE CITY OF
NEWARK, NJ

Newark, New Jersey is a city of great contrasts and great promise. Our City is home to one of the fastest growing and convenient international airports in the nation, which is easily accessible to an unparalleled network of sea, rail and highway connections. Newark is also home to five institutions of higher learning, ranging from a fine community college to two law schools and a medical school. The park

system of the city is another important component of Newark's value as a commercial, educational, and cultural hub of northern New Jersey.

Weequahic Park is a 311-acre facility located in a densely populated mostly low/moderate income area of Newark, NJ, the Nation's third oldest city. The major areas of the park are: (1) several playing fields; (2) a 72-acre lake; (3) playgrounds; (4) tennis courts; (5) picnic area; (6) paddleball/handball courts; (7) trails; (8) a wide variety of open space; and (9) an 18-hole golf course, one of the few urban golf courses in the nation. Weequahic Park was designed by Frederick Law Olmstead in the 1850's and is the second largest park in the Essex County Park System, the oldest park system in the United States.

The park is within Newark's boundaries and borders on Frelinghuysen Avenue which takes its name from the long distinguished New Jersey family of Congressman Rodney P. Frelinghuysen. Further, the cities of Newark and Elizabeth boundary lines were established within Weequahic Park, then Waverly Fair Grounds, in 1668, two years after Newark became a city.

Over the past two decades or more, Essex County, the owner of the park, substantially reduced its maintenance support, and as a result, every aspect of this once-splendid park fell into substantial disrepair. The once beautiful system of trails became overgrown creating a haven for criminal activity, and the park's lake, which in the past provided recreational boating and fishing, became choked with algae.

In 1992, a group of park users came together to form Weequahic Park Association, Inc. (WPA), which is modeled after and received a generous amount of support from the highly successful Central Park Conservancy in New York City. The community-based people working effectively with the management team, has been the key to WPA's success to-date, i.e. grass roots people do grass roots work, and professionals do the professional work. In order to supplement the resources provided by Essex County for use in Weequahic Park, and to play a hands-on management role, WPA formally entered into a partnership agreement with the county in 1995.

Also, WPA participated in the city of Newark's last Empowerment Zone application submission, as one of eight (8) "area coordinators."

Following are some of the key accomplishments of WPA since 1992. It should be noted that these accomplishments were made without an administrative budget. Our estimate of the investment made in Weequahic Park associated with WPA's accomplishments (including "sweat-equity" and "in-kind contributions") is in excess of \$5 million and growing.

WPA's Accomplishments: Developed organizational structure; articulated key goals and objectives; recruited management team; incorporated and secured federal tax-exemption; negotiated partnership agreement with Essex County; planned and managed two Labor Day weekend festivals; functioned as Empowerment Zone "Area Coordinator"; conducted general park management planning; conducted park clean-up projects; collaborated with international, national, and local private entities to partner with WPA on specific park projects; developed Foundation Board; developed proposal to do a masterplan study; requested and received proposals from architects/engineers for participation in the masterplan study; new roadways throughout the park; two state-of-the-art playgrounds; restoration of fieldhouse/visitors' center; convened WPA meetings in various properties surrounding the park; caused lake to be treated and stocked with fish; submitted several projects (with budgets) to the county for funding; 30 new park "awareness signs" are being installed; eight WPA members scheduled for summer employment; and major foundation to undertake entranceway beautification project.

WPA strongly feels, and we concur, that they are at the point of reaching "critical mass" in their development. The president of WPA, Wilbur J. McNeil, has made such a positive impression on the county of Essex that they have appointed him to a county committee to make recreational policy.

The most immediate WPA projects are to: (1) continue showing physical improvement within and outside the park and thereby attract and involve more indigenous community participation; (2) continue to build the management team; (3) attract more local institutions (e. g. local school district, hospitals, churches, etc.) to have their constituents to use the park consistent with their goals and objectives; (4) raise funds and undertake the masterplan study; (5) raise funds to implement the masterplan study thereby upgrading the quality of open space with both passive and active recreational opportunities within Newark; (6) provide employment and economic opportunities within and around the park for members of the community; and (7) reduce crime.

An appropriation of \$3.5 million is hereby requested to accomplish a broad range of initiatives, including the completion of the masterplan, park maintenance above the level currently provided by Essex County, the upgrading of the lake in order to return it to a state usable for boating and fishing and the restoration of trails,

landscaping and horticultural features. The masterplan will include a fundraising component, to involve the private sector and foundations in the continued restoration of this historic and invaluable urban asset.

PREPARED STATEMENT OF THE CITY OF GAINESVILLE, FL, REGARDING THE
SWEETWATER BRANCH/PAYNES PRAIRIE STORMWATER PROJECT

Mr. Chairman: On behalf of the City of Gainesville, Florida I appreciate the opportunity to present this written testimony to you today. The City of Gainesville is seeking federal funds in the fiscal year 1998 Interior Appropriations bill, in order to assist our efforts to protect the Floridian aquifer from stormwater runoff. In particular, we are hopeful that the Subcommittee will provide the City with \$2 million to implement an engineering study.

In Gainesville, the Sweetwater Branch basin contains approximately 1,710 acres and is located in the southeast central portion of the City. The outfall from this basin discharges into Paynes Prairie, a state owned preserve and park system, which eventually flows into the Alachua Sink, a natural sink hole that drains directly into the Floridian Aquifer. This Aquifer provides the majority of drinking water to Florida's residents and has a direct impact on Florida Everglades.

The Sweetwater Branch drainage basin contains urban, commercial, industrial, and residential area stormwater runoff. Because the branch runs through some of the oldest portions of Gainesville, most stormwater runoff is directly discharged into the Branch with very little flooding attenuation or pollution loading reduction. The runoff has the potential to affect threatened and endangered wildlife such as the Bald Eagle, the Woodstork, the Florida Sandhill Crane, and the Southeastern American Kestrel. In addition, many domestic water wells are used to obtain water from surficial and intermediate aquifers in the area. In summary, the situation has created a concern amongst environmentalists, business leaders, and concerned citizens throughout the region that Paynes Prairie and the Florida aquifer are being compromised.

With this in mind, the City of Gainesville, Alachua County, St. Johns River Water Management District, Florida Department of Environmental Protection and local citizens are all seeking a comprehensive ecosystem management solution to the problem of stormwater runoff from downtown entering Sweetwater Branch, Paynes Prairie, and the Alachua Sink. The project devised by these groups would reduce or eliminate the sediment, debris, nutrients and general pollutants currently being discharged. Current projections are that the project would consist of the following three components: The purchase of undeveloped property in the vicinity of State Road 331 and Sweetwater Branch; the construction of maintainable sediment and debris removal systems; and the construction of maintainable nutrient removal systems.

An in-depth engineering analysis of the creek system, property topography, associated wetlands, and other pertinent factors is needed to determine the optimum and appropriate scope of property purchase and facilities construction. The City is prepared to pay some of the cost for this analysis, but we are simply unable to bear the entire burden. As a result, we request that the Subcommittee appropriate \$2 million to assist our efforts. Once the project construction is complete, Gainesville Stormwater Management Utility, a public utility, would provide the required annual maintenance for the facility and no federal maintenance funds would be needed.

This is a critical and much needed project for the City of Gainesville, as well as the entire State of Florida, and we respectfully ask the Subcommittee for its consideration of the Sweetwater Branch/Paynes Prairie Stormwater Project.

PREPARED STATEMENT OF KAREN WERBELOW, EXECUTIVE DIRECTOR, FOUNDATION
FOR NORTH AMERICAN WILD SHEEP

Mr. Chairman and members of the Subcommittee, please accept the following testimony for the Forest Service and Bureau of Land Management proposed fiscal year 1998 Budgets from The Foundation for North American Wild Sheep.

The Foundation for North American Wild Sheep, is a non-profit conservation organization with 7,000 members nationwide. We are deeply concerned by the current trend to reduce budgets for the Forest Service and the Bureau of Land Management, specifically for fish and wildlife management including cost share programs. Since fiscal year 1993, we have witnessed the steady decline of wildlife habitat management budgets. We respectfully ask for your attention to the details of these important matters of wildlife conservation.

THE CHALLENGE COST SHARE PROGRAM

The Challenge Cost Share Program provides opportunities for wildlife management and research in conjunction with the Forest Service, the Foundation for North American Wild Sheep and other conservation organizations. The success of these partnerships have allowed additional funding for Forest Service. Frequently, state wildlife agencies will also participate. Specific projects in which we are asked to cooperate, include and are not limited to, disease research and habitat management. The fragile balance between wildlife and multiple use challenges require constant monitoring by wildlife professionals. For the past three years, the Forest Service budget along with key personnel needed by the conservation community and vital to our partnership programs have slowly been reduced. The staff biologists, technical assistants and field personnel employed by the Forest Service are the driving force behind this program. Since fiscal year 1993, the fish and wildlife management programs have been jeopardized by funding cuts. Qualified field biologist and other staff have slowly been phased out. Without these personnel, many current and future projects are being eliminated. New partnership programs will eventually be non-existent. Consequently, wild sheep and other native wildlife in the United States are being severely affected.

We support an increase in budget funds for the Challenge Cost Share Program. This would allow projects such as "Movements and Habitat Use of Bighorn Sheep Along the upper Yellowstone River Valley" to continue. The three year study, funded by the Challenge Cost Share Program, provided invaluable information about bighorn sheep survival. This information will be used to design and implement successful management programs throughout Montana. The benefits to all wildlife would be realized by the simple increase of wildlife biologists and the seasonal personnel employed. This will allow for the continuation of baseline data collection, necessary for overall ecosystem health and management, and the implementation of programs such as prescribed burns and the monitoring of wildlife and its habitat. An increase in the Challenge Cost Share program would encourage problem solving by addressing the needs of wildlife and habitat before a species faces endangerment. Sound scientific management depends on a professional workforce suited to meet the needs of the wildlife and current public demands.

LAND RESOURCES

Proper rangeland management is vital to the health of all species, wild or domestic. The Foundation for North American Wild Sheep supports the \$2.8 million increase to the Bureau of Land Management, specifically for management of Wild Horses and Burros. Achieving a balanced management level of wild horses and burros is critical to the desert bighorn sheep. The previously inadequate budget for the Strategic Management of wild horses and burros has caused degeneration of rangeland habitat crucial for the survival of the desert bighorn sheep, and other native wildlife populations.

In conclusion, we ask you to strongly consider the benefits of increased fish and wildlife budgets to the American people. Wildlife biologist are just discovering the how's and why's of ecosystems. Research of established healthy populations of wildlife is as important as the research of the diseased populations. Maintaining the health and vitality of wildlife populations ensures future generations the opportunity to enjoy the heritage of America's great outdoors.

LETTER FROM R. DEAN TICE, EXECUTIVE DIRECTOR, NATIONAL RECREATION AND
PARK ASSOCIATION

ARLINGTON, VA, April 15, 1997.

Hon. SLADE GORTON,
Chairman, Subcommittee on Interior and Related Agencies, Committee on Appropriations, U.S. Senate, Washington DC.

DEAR SENATOR GORTON: This letter urges the Subcommittee to begin the restoration of public partnerships by appropriating funds for Land and Water Conservation Fund state assistance and the Urban Park and Recreation Recovery Program. Consistent with the early history of the program, LWCF state assistance should approach one-half of total LWCF appropriations for fiscal year 1998.

We also urge the Subcommittee to give fullest consideration to appropriations for the Federal Lands-to-Parks program. This program provides technical and planning assistance to state and local governments to obtain surplus federal lands for park and recreation purposes. Since fiscal year 1996, the program has emphasized assistance to those communities impacted by legislated military base closures. Nearly

15,000 acres of base closure land have been identified by local interests as key acquisition areas for recreation and conservation purposes. The continuing potential of this program to contribute to the public recreation estate without the need for continued federal investment or funds merits your support.

Previous appropriations for LWCF assistance grants and urban parks have resulted in a national legacy. The LWCF authority, for example, has provided over \$3.2 billion to the 50 states, the District of Columbia, Puerto Rico, Guam, the Virgin Islands, American Samoa, and the Northern Marianas for planning, acquisition and development of recreation opportunities in the United States. Through fiscal year 1996, a total of 37,300 projects were approved to support acquisition of park and recreation resources or development of recreation facilities. They are in every geographic region of the U. S., in every county and almost all localities. Federal obligations have been matched by state and local contributions for a total LWCF grant investment of \$6.5 billion. States have received about 8,300 grants and counties some 4,900, while cities, towns and other local agencies matched more than 24,000 grant awards.

Of the total number of grant projects, about 10,000 have helped states and localities conserve 2.3 million acres of land, including combination projects where donated land values matched the cost of development. Almost 27,000 projects have been for the development of recreation facilities. Seventy-five percent of the total funds obligated have gone to locally sponsored projects that provide close-to-home recreation opportunities readily accessible to America's youth, adults, senior citizens and the physically or mentally challenged. In addition to thousands of smaller recreation areas, grants have helped acquire and develop new areas of statewide or national significance such as the Allagash Wilderness Waterway (Maine), Liberty State Park (New Jersey), the Willamette Greenway (Oregon), Platte River Park (Denver), Herman Brown Park (Houston), and Illinois Beach State Park (Chicago).

Beyond the numbers of projects, acres and dollars, it is important to note the LWCF grant program's major effects on the country's overall attitudes and policies toward conservation and recreation. Most of these less tangible benefits have come about as the result of the partnership with states and localities. This type of influence continues to the present and the states and local governments have shown and continue to show great initiative LWCF has helped to catalyze many of these efforts and it can and should continue to do so.

A further legacy—and a major force for long-term protection of all recreation resources—is the provision of Section 6(f)(3) of the Act that requires all property acquired or developed with LWCF assistance to be maintained perpetually in public recreation use. Consistent enforcement has developed strong stewardship programs in each of the states to help ensure that LWCF's contributions to the national recreation estate remain real and accessible to our citizens.

The job must continue as population increases and land once available for recreation is committed to other uses. Our 1995 research indicated that local park and recreation agencies require a national total of \$27.7 billion in capital investment for rehabilitation, land acquisition and new construction. Localities expect to have less than half that sum available. While the total estimated need is down from \$30.4 billion projected from a previous five-year survey, the expected budget shortfalls increased by seven percent. Therefore, it is possible that the lower total for 1995–99 reflects reduced expectations as well as, or instead of, a real decline in needs.

Construction of new recreation infrastructure ranked highest, with a total need of \$13.6 billion (49.9 percent) nationwide. For those agencies expressing such new construction needs (87 percent), the average need per agency was over \$3 million, down from \$3.5 million for the previous five-year period.

Rehabilitation and restoration needs nationwide totaled \$8.8 billion (32.3 percent). It is important to note that these needs are not for "maintenance" but reflect major costs for capital renovation to correct deficiencies due to age or inadequate design and to increase user capacity of existing functional facilities. For those agencies expressing a need for rehabilitation investments (76 percent), the average need per agency was just under \$2.2 million, up from \$1.8 million in the previous survey.

Land acquisition needs, through both fee simple purchase and less than fee approaches, totaled almost \$5 billion (17.9 percent). For those agencies expressing the need for capital investment in land acquisition (52 percent), the average cost per agency was \$2.4 million, up from the \$1.8 million estimated previously. The average number of new acres needed rose from 167 to 214. Local governments anticipate (or hope) that six percent of their capital needs (almost \$1.8 billion) would come from federal sources, including but not limited to LWCF.

Ultimately, the Land and Water Conservation Fund is only in part about land and water. It is about what we are willing to invest in ourselves and our posterity. The United States contains the wealthiest society in the history of the world. Yet we are

a nation at risk. We have the greatest gap between rich and poor of any modern nation, and that gap is still increasing.

The U.S. currently spends proportionately more for health care—14 percent of GNP—than any other nation. We are a sedentary nation. According to a recent report by the Surgeon General, one fourth of all Americans perform almost no physical activity. Nearly half of our youth aged 12–21 years are inactive on a regular basis. And only 19 percent of our high school students are active for more than 20 minutes five days a week—down from 37 percent in 1990. Our population’s “limitation of activity” index—a measure of long-term disability—increased by 45 percent between 1957 and 1989.

The nation grows in population at an increasing pace. From 1964 to 1994, we increased from 191 million to 270 million people. As our population increases, so has competition for America’s natural resources, the most important of which is undeveloped land. We are losing more and more of our special places to urban and suburban uses or to resource extraction. We are depleting irreplaceable biological resources—some 3,900 plant and animal species are either threatened with extinction or endangered.

Some argue persuasively that we are witnessing a decline in the moral fabric of our society. Violence, crime and gang membership are on the rise, especially among the nation’s youth. Families, once highly influential in determining our direction and values, are often replaced by gangs, or if we are lucky, by social workers, teachers and other mentors. As communities continue to search for solutions to violence, the costs of dealing with crime are draining our public resources. We spend on average about \$30,000 a year to incarcerate a single juvenile offender. The monetary value of saving an at-risk youth has been estimated at \$1.5 to \$2.0 million over his or her lifetime, but note that these are reductions in negative costs and do not include the “saved” person’s positive contributions to the economy and society.

These pressing problems have a common link, documented in a wealth of research on the economy, human behavior, health and natural resources. Over 50 percent of the factors which determine our state of health have to do with our environment, our relationships with others, our status in the community and how we think about ourselves. Park and recreation resources and services help to supply these critical social benefits by offering opportunities for most citizens to engage in active recreation and to experience healthy relationships with others, ourselves and our natural surroundings.

How much are we willing to invest in essential public recreation systems? The Act promises revenues generated by Outer Continental Shelf (OCS) resources for the purposes of land and water conservation. A serious reevaluation of the continuing diversion of most of those revenues for other purposes is needed. We share the view of many in Congress that the heavy burdens of national public debt must be addressed, and that resource-based income can help diminish budgetary shortfalls. We believe, however, that the vision of 1964 is equally valid—that present and future generations will also be burdened by the failure of today’s leaders to invest prudently in capital park and recreation resources while we still have viable options to do so.

Projected fiscal year 1998 OCS revenues are \$2.254 billion, according to the Minerals Management Service. The LWCF act provides that a portion of such annual revenues—for 1998 perhaps \$850 million of the \$900 million authorized by the act—or about 39.9 percent of estimated receipts credited to the Fund be available, subject to appropriation. The President’s proposed budget requests only \$160 million—less than 19 percent of the authorized level and about 7.5 percent of total estimated receipts. If that budget is enacted, more than 92 percent of all OCS revenues for the year will have gone for purposes other than the Land and Water Conservation Fund.

Will this really save us money? In the longer view, equal or greater savings could accrue by encouraging regional, state and local recreation agencies to more aggressively pursue resource conservation and recreation access projects before capital costs escalate and before Congress is asked to respond to future “emergencies” by considering these assets for inclusion in federal land systems. When such emergencies occur, the federal government may bear the full fiscal burden, not only of higher capital costs for land protection, but for development and management in perpetuity.

While the costs of federal systems may be expected to increase consistent with the rate of inflation, they should not be increased through inclusion of projects lacking clear national significance. In the absence of a serious commitment to provide real incentives for systematic investment in partnership programs, piecemeal federal actions can be expected to touch randomly on first one site and then another, while the bulk of public recreation and resource conservation needs that could be ad-

dressed comprehensively are ignored. That partnership approach is part of the LWCF vision and promise.

Just as importantly, the results of this fragmented federal approach will ignore the clear evidence that most of us seek our recreation experiences close-to-home (and put the greatest user pressures on close-to-home public resources). This does not diminish the values of more remote recreation destinations or the environmental, historic and cultural values of places farther away. It does suggest, however, that our public policies and investments should recognize that both Americans and foreign visitors have always demanded and will continue to demand a continuum of destinations and experiences. This, too, is part of the LWCF act's vision and promise, and it is precisely the role envisioned by its authors for Land and Water Conservation Fund grants.

State and local investments in park and recreation resources (as well as all operation and management costs) have been largely borne by these governments and their publics. We expect this pattern to continue and strongly advocate it. The record also reveals that from 1965 to the mid-1980s the national government's reinvestment of a modest amount of its resource revenues in state and local projects leveraged immense public values and benefits for all taxpayers.

You are in a position to restore rational investment in an area of great national importance. Our organization stands ready and willing to work with you, and your staff to realize this goal.

Sincerely,

R. DEAN TICE,
Executive Director.

LETTER FROM ELAINE M. STOUT, PRESIDENT, THE BACK COUNTRY LAND TRUST
ALPINE, CA, *April 10, 1997.*

Re Land and Water Conservation Fund

Hon. SENATOR SLADE GORTON,
Chairman, Subcommittee on Interior Appropriations,
Washington, DC.

We strongly urge the Interior Appropriations Subcommittee to move swiftly to ensure the success of current conservation plans, which will protect both private property rights and endangered habitats, by fully appropriating the LWCF.

In numbers of endangered species and diversity of habitats, San Diego County is one of the nation's hot spots. It is also one of the nation's fastest growing areas. As the eyes of nation look to San Diego County as a model for conservation planning, what is done here will be critical for the success of conservation plans in other areas of the nation.

Lands that contain high quality, endangered habitats have been identified under the MSCP in San Diego County. It has been estimated that it will cost over \$300 million to acquire these properties. This amount is small compared to the enormous—in perpetuity—benefit that can be achieved here.

Our non-profit organization, the Back Country Land Trust, is working cooperatively and closely with local landowners, agencies, communities and organizations in our area of service which is affected by the MSCP process. The number one concern among all groups—environmentalists and private property owners alike—is adequate funding for properties containing high quality endangered habitats in the MSCP planning area.

We have identified three properties that have all of the following criteria and are in critical need for funding: A. High quality endangered habitats which contain significant numbers of rare, threatened and/or endangered species (red-zone areas in the MSCP planning area); B. Under imminent threat of development; C. Willing sellers at fair price; D. Significant community and local governmental support; E. Vehicle for acquisition/management/maintenance; and F. Support by local jurisdictions to accept LWCF funding.

A description of the properties, their total acquisition costs, their dominant habitats and Table 3-5 MSCP species that have been thus far observed in each are listed below. The potential for more rare and endangered species on each of the properties below is very high.

WRIGHT'S FIELD, 365 ACRES, \$2.9 MILLION

Habitats: High quality California native grassland, Engelmann Oak Woodland, Vernal Pools, Diegan Coastal Sage Scrub, Chamise Chaparral, Riparian.

Fauna: Burrowing Owl, nesting Grasshopper Sparrows, San Diego Horned Lizard, Golden Eagle, Northern Harrier, Cooper's Hawk, Southwestern Willow Flycatcher, Western Bluebird, Mountain Lion, Southern Mule Deer.

Flora: San Diego Thorn-mint.

Special Significance: Native Grassland is pristine and of statewide significance for its high quality, density and unusually occurring species on site. Extremely fine clay soils, pools to remain hydrated for 5–6 weeks. County's largest population of Chocolate Lily, Palmer's Grapplinghook, and possibly San Diego Thorn-Mint. Host plant for Quino Checkerspot Butterfly abundant on site.

FANITA RANCH, 2,567 ACRES, \$10.7 MILLION

Habitats: 1,070 acres Coastal Sage Scrub, Grassland, Oak Riparian, Oak Woodland.

Fauna: Large population of California gnatcatchers, estimated at 38–44 pair, Coastal Cactus Wren, San Diego Horned Lizard, Orange-Throated Whiptail, Least Bell's vireo, Grasshopper Sparrow, Northern Harrier, Cooper's Hawk, Golden Eagle, California Rufous-Crowned Sparrow, Mountain lion, Southern Mule Deer.

Flora: San Diego Barrel Cactus, Willow Monardella.

Special Significance: One of the largest populations of California gnatcatchers in the MSCP area. Extremely vital, strategic corridor.

CRESTRIDGE, 850 ACRES, \$4 MILLION

Habitats: Coastal Sage Scrub, Willow Riparian, Oak Woodland, Oak Woodland Riparian, Grassland.

Fauna: San Diego Horned Lizard, Golden Eagle.

Flora: Lakeside Ceanothus, San Diego Ambrosia, San Diego Nolina.

Special Significance: Largest known stand of Lakeside Ceanothus. Great Horned Owls nest on this site. Several species of oak. Very important riparian corridor. Currently within San Diego Wildlife Refuge. Development would seriously fragment and split off portion of refuge.

It is estimated that the current MSCP plan in San Diego County has over \$300 million in acquisition needs. We urge you to earmark a portion of LWCF funds for the above important projects in San Diego County.

The most important source of funding for acquisition are the Land and Water Conservation Funds. These funds have not always been used for conservation purposes. This Congress can do much to rectify past abuses, by directing every LWCF dollar to our enormous backlog of conservation needs and help to provide a permanent legacy for future generations.

Sincerely,

ELAINE M. STOUT,
President.

PREPARED STATEMENT OF THOMAS STEINBACH, DIRECTOR OF CONSERVATION,
APPALACHIAN MOUNTAIN CLUB

Thank you for this opportunity to provide testimony to Interior Appropriations Subcommittee. I am Tom Steinbach, Conservation Director of the Appalachian Mountain Club (AMC)—the nation's oldest recreation and conservation organization. I am speaking on behalf of AMC's 71,000 members to urge your support for fiscal year 1998 appropriations for several important, cost-effective Department of Agriculture and Department of Interior programs.

For over a century, the AMC has promoted the protection, wise use and enjoyment of the mountains, rivers, and trails of the Northeast. Today, a great need remains for federal land, trail, and river conservation funds for the northeastern United States. The greatest proportion of the nation's people live, work, and recreate in the northeast. The lives and livelihood of these citizens depend on the region's clean air and water, and wild areas and open spaces. Yet over the past several years, we have witnessed several attempts to severely cut back federal funding for land and river protection. As an organization of dedicated outdoor volunteers, AMC's 120-year history is testament to the power of partnerships between the private and public sectors. Funding rollbacks threaten to unravel such partnerships, sacrificing the human and financial power that they leverage. It is time to reverse this trend.

The AMC is sympathetic to the need to reduce the budget deficit, but the economic, social, and ecological benefits that accrue from our nation's land and river protection programs far outweigh their short-term costs. In the coming year, the

AMC urges this Committee to continue to invest in the nation's people and environment by supporting the following programs.

LAND AND WATER CONSERVATION FUND

As the federal government's premier land acquisition program, LWCF is critical to the future of many places that Americans treasure. Although LWCF has a dedicated revenue source, LWCF funding has fallen well below authorized levels. LWCF received its second lowest appropriation ever in 1997 at \$149 million with no funding going to stateside LWCF. Further, in recent years, especially as the state grant program has dwindled, the Northeastern United States has not received an adequate share of these funds. Given that the greatest proportion of our citizens reside in the Northeast, this pattern is especially disturbing. In addition, this population is increasing as is the demand for recreational services.

APPROPRIATE \$400-\$500 MILLION FOR LWCF

Today you will receive testimony from a representative of a new national coalition working to revitalize LWCF. This new coalition, Americans for Our Heritage and Recreation, has brought together recreation businesses, conservation organizations, urban interests, and state land managers to call for increased appropriations to LWCF for both the federal and state sides of the program. AMC strongly supports the full list of federal and state-side projects to be submitted and noted in the testimony of this new coalition, given by Rindy O'Brien of the Wilderness Society. While our ultimate goal is: full appropriation of \$900 million for LWCF, our short-term goal for both federal and state projects total approximately \$400 million and represent the priorities of a broad array of interests working to provide recreational opportunities and a healthy environment for future generations. A significant portion of these funds should be directed to restore depleted state-side LWCF. All of the projects we mention in the body of our testimony are included in the list submitted by the new coalition.

Of particular interest to AMC is the role that LWCF can play in protecting the Northern Forest of Maine, New Hampshire, Vermont and New York. The Northern Forest Lands Council (NFLC), which was established through bipartisan Congressional effort, recommended protection of key lands within this 26 million-acre region. The NFLC called on Congress to fully fund LWCF and reconfigure Me state grant program to ensure that sufficient federal funds can reach the Northern Forest. We support a total LWCF funding request of \$17.6 million for Northern Forest projects, with \$12.9 million targeted for high-priority projects.

As the Northeast's population grows, increasing pressure is building on our remaining forestland in the Northern Forest and throughout the Northeast. This trend threatens our forests' ability to provide jobs, outdoor recreation, wildlife habitat and timber projects. The need for LWCF funds in the Northern Forest—and throughout the Northeast—has never been greater.

FOREST LEGACY PROGRAM

The local economies and social fabric of the Northern Forest depend on the health and stability of their forests. The Forest Legacy Program, designed originally for the Northern Forest states, protects forests from inappropriate development while allowing forest management to continue. A voluntary partnership among eligible states, the US Forest Service, and forest land owners, the Forest Legacy Program is now working with eighteen states and one territory.

The Northern Forest Lands Council recommended that the Northern Forest states receive an annual Forest Legacy Appropriation of \$25 million. AMC believes that this figure reflects the true need within the Northern Forest. Efforts have been made streamline the Forest Legacy program and make it more effective and responsive to land owners. We feel this is a positive step and will result in Forest Legacy funds reaching more landowners in a timely fashion. We support an appropriation of \$27.4 million for projects in the Northern Forest region, of which \$11.8 million is targeted for critical, high-priority projects.

SPECIFIC LWCF & FOREST LEGACY PROGRAM APPROPRIATIONS

For fiscal year 1998, we request the following specific LWCF and Forest Legacy appropriations. Those projects labeled urgent require immediate funding from LWCF to protect them from imminent sale and development.

LWCF federal grants

Urgent.—Sterling Forest, New York, \$8.5 million, LWCF. Protection of Sterling Forest could be a reality this year given the continued commitment of federal, state,

and private partners that have worked hard to conserve this 17,500 acre gem just 45 miles outside Manhattan. Last year Congress passed authorization to purchase Sterling Forest and appropriated \$9 million of the \$17.5 million anticipated federal contribution to the acquisition. We urge Congress to ensure completion of the Sterling Forest purchase this year by appropriating \$8.5 million from the Land and Water Conservation Fund. This amount will complete the \$17.5 million federal component to the project and match funds contributed by New Jersey, New York, and private donors. New Jersey has committed \$10 million to the project already. New York has also committed \$10 million and is expected to nearly double its appropriation this year. \$5 million has been raised from the Lila Wallace Foundation and additional private funds continue to be raised.

Urgent.—White Mountain National Forest—Lake Tarelton, New Hampshire 2000 acres, \$2.7 million LWCF.

LWCF State Grants

Urgent.—Whitney Estate, Adirondacks, New York 15,000–25,000 acres, \$10 million LWCF State Grant Funds.

Urgent.—Long Trail, Vermont 1,060 acres, \$162,500 LWCF State Grant Funds.

Forest Legacy Program

Urgent.—Fish Creek Watershed, New York 30,000/40,000 acres, \$5.6 million Forest Legacy.

Urgent.—Green River Reservoir, Vermont 6,350 acres, \$1.5 million Forest Legacy.

Urgent.—Necatous Lake, Maine 22,000 acres, \$3 million Forest Legacy.

Urgent.—Upper Richardson Lake, Maine 5,122 acres, \$1.65 million Forest Legacy.

Pond of Safety, New Hampshire 9,880 acres, \$1.5 million Forest Legacy.

Champion Lands, New York 95,000 acres, \$6 million Forest Legacy and \$3 million LWCF State Grant Funds.

Lake George, New York 400 acres, \$1.75 million LWCF State Grant Funds.

Domtar Lands, New York 105,000 acres, \$6 million Forest Legacy.

Mattawamkeag Lake, Maine 4,195 acres, Mattawamkeag River, Maine 11,281 acres, Moose River, Maine 4,525 acres, \$2.1 million Forest Legacy.

APPALACHIAN NATIONAL SCENIC TRAIL—\$7.2 MILLION

Protection of the Appalachian Trail has made tremendous headway under the leadership of this committee. Thanks to your diligent effort, only 37 miles of the total 2,158-mile trail remain unprotected. The total fiscal year 1998 need for the Appalachian Trail is \$7.2 million with \$4.2 million for National Park Service acquisitions and \$3 million for US Forest Service acquisitions. We expect that with similar appropriations in each of the next three years, that the entire length of the trail will be protected by the year 2000.

RIVERS, TRAILS, AND CONSERVATION ASSISTANCE PROGRAM—\$12 MILLION

The Rivers, Trails, and Conservation Assistance Program (RTCA) provides technical assistance to communities and local organizations on river, trail, and conservation projects. For fiscal year 1997 citizens made over 400 project requests and NPS staff had funding for only half. Additionally, Congress has authorized 10 new heritage areas, most of which will fall under RTCA's jurisdiction. Therefore, for fiscal year 1998, we urge funding for this valuable program be increased by \$5 million as follows: \$300,000 increase for management of Wild and Scenic Rivers and \$200,000 increase for National Trails System (both under NPS operations); \$1.5 million for the 10 new National Heritage areas, \$1.25 million for technical assistance and heritage program administration, \$1 million for a new watershed initiative, and \$700,000 increase to RTCA base funding to enable staff to administer these new programs and to accept more project requests (under National Recreation and Preservation).

SILVIO O. CONTE NATIONAL FISH AND WILDLIFE REFUGE—\$2.1 MILLION

The Silvio O. Conte National Wildlife Refuge, which spans the length of the Connecticut River, is a model of a new federal approach to watershed conservation. Over the past two years, the Conte refuge has taken hold, with the formation of over 50 partnerships and the distribution of two rounds of grant funding to organizations in the refuge area. The AMC urges you to support \$2 million for land acquisition and \$100,000 for fish passage studies of the herring population, which has dropped to one-twentieth of original levels.

WHITE MOUNTAIN NATIONAL FOREST—\$10 MILLION

The White Mountain National Forest comprises about 770,000 acres of land in New Hampshire and Maine. Over 7 million people visit the area yearly. The AMC recognizes the impacts and the service needs of these visitors and we support the wide array of multiple uses in the WMNF. The current budget does not meet the needs for this magnificent area. The AMC urges the committee to support a fiscal year 1998 National Forest budget appropriation of \$10 million for the White Mountain National Forest.

ACADIA NATIONAL PARK—\$6.5 MILLION

Acadia National Park draws over 2.9 million visitors every year. To provide for the comfort and safety of these visitors, basic park infrastructure must meet strict standards. Utilities, restrooms, campgrounds and picnic areas are sorely in need of repair and upgrading to meet code, to conform to Safe Drinking Water standards, and above all, to provide an enjoyable outdoor experience. In addition, Acadia includes 44 miles of historic carriage roads whose maintenance since 1960 has fallen to the National Park Service. These roads represent a significant cultural and historic resource and require extensive rehabilitation of drainage systems, the road base and surface, and stone work. We urge you to support an appropriation of \$5.3 million to upgrade utilities and facilities, and \$1.2 million for rehabilitation of the historic carriage roads.

 PREPARED STATEMENT OF THOMAS M. FRANKLIN, WILDLIFE POLICY DIRECTOR, THE WILDLIFE SOCIETY

Mr. Chairman and members of the Subcommittee, The Wildlife Society is pleased to provide comments on the fiscal year 1998 Budget. The Wildlife Society is the association of professional wildlife biologists and managers. We were founded in 1936 and dedicated to excellence in wildlife stewardship through science and education. We are submitting for the record some detailed recommendations for each of the agencies listed above. In the past, the Society identified inherent funding difficulties in these agencies that have resulted from incremental budget cuts, downsizing, and seemingly constant reorganizations. Our concerns about these issues remain because more funding and staff resources, rather than less, are needed to address the increasingly complex biological conditions on public and private lands. However, I wish to focus my brief oral comments on a cross-cutting issue that affects each of the agencies and indeed all land management activities. This is the need for adequate funding to monitor biological resources that are affected by federal land management practices.

In recent years, the resource management community has recognized that business as usual concerning the management of commodities on federal lands will make it increasingly difficult to meet public demands for conservation, recreation and education benefits from these lands. Such understanding led the agencies to adopt an "ecosystem" approach to resource management. Ecosystem management has been widely discussed, debated and generally accepted among conservationists. However, the agencies have not yet gathered the political support and the necessary resources to implement ecosystem management effectively.

Ecosystem management requires a change in the way research and management are accomplished. Managers must adopt an "adaptive resource management" approach. The Wildlife Society recently published an important paper "ARM! For the future: adaptive resource management in the wildlife profession." I submit a copy of this report for your information. The authors explain that research and management must be integrated "to address uncertainty in wildlife and ecosystem management, and thereby ameliorate controversy in the future. Research and management can no longer afford to be 'two solitudes'; distinctions between basic and applied research have blurred. The central issue is the application of sound scientific principles to solve problems." Management experiments must be initiated that can provide the knowledge needed for more effective and acceptable natural resource policy decisions. Adaptive management involves: (1) hypothesizing how ecosystems work, (2) monitoring results, (3) comparing results to expectations, and (4) modifying management to better achieve objectives through improved understanding of ecological processes.

We recognize that there may be resistance among some who fear that monitoring will reveal information that will somehow constrain the ability of landowners to manage their property. To the contrary, appropriate monitoring can foster responsive management and help alleviate the need for regulation. We should not fear the

message or the messenger. Decision makers need the best available information on which to base short and long-term actions.

An absolutely key element of responsive natural resource management is support for monitoring. Without adequate monitoring, as is evident in each of the budgets of the federal agencies, truly responsive management will be impossible. There will be no way for managers to understand the actual biological consequences of their actions. Without monitoring, programs will be inefficient and likely ineffective in accomplishing resource management objectives. We understand that the White House Office of Science and Technology is developing a national monitoring proposal. We urge that this effort include input from the management agencies. We further suggest that the Administration prepare an analysis of monitoring needs for each agency to accomplish its management goals. We urge Congress to exert leadership to ensure adequate funding for monitoring in each of the budgets for the natural resource agencies.

The Wildlife Society is pleased to offer the following detailed comments on the fiscal year 1998 budget

BIOLOGICAL RESOURCES DIVISION, USGS

The Biological Resources Division (BRD) of the U.S. Geological Survey houses most of the science, research, and monitoring capabilities of Interior's land management agencies. It is critical that these activities continue. The integration of the BRD as a division within the USGS reduced emphasis on biological research by further separating research activities from the management agencies that are charged with conserving the nation's wildlife resources. Reliable biological information is necessary for the sound stewardship of natural resources by federal and state land management agencies.

Many issues under Interior Department's authority affect private, as well as public lands. Skilled managers and sound scientific information are critical to informed decision making regarding issues such as: (1) mitigating the effects of contaminants on wildlife populations such as that of DDT on bald eagles and peregrine falcons; (2) determining management prescriptions to improve forest and rangeland health; (3) setting appropriate fish and wildlife harvest levels; (4) protecting unique habitats and rare species; and (5) help in citizens achieve their land management goals consistent with conservation needs.

The Wildlife Society recognizes that to achieve excellence in management, we must achieve excellence in science, first. To maintain healthy wildlife populations while providing for a variety of other uses, management programs must be based on results of quality scientific investigations that produce objective, relevant information. Scientists are needed to identify and analyze alternative management options for consideration by policy makers. Good scientific information can help managers understand how to conserve natural resources while allowing multiple uses including timber harvesting and grazing. If the science budget of the Interior land management agencies is stripped, the ability of its managers to carry out their crucial duties will be jeopardized.

Research

The Wildlife Society supports fiscal year 1998 funding for NBS at \$149 million. Emphasis should be placed on adequate funding for Cooperative Fish and Wildlife Research Units, migratory birds, contaminants, wildlife health, Alaska wildlife, control of exotic species, habitat studies of agriculture and land management, and watershed level studies of wildlife affected by development. Special emphasis should be placed on the Cooperative Research Units. The Wildlife Society requests that this program be increased to at least \$15 million. The Cooperative Research Program provides the natural resources management community with a scientific basis for making decisions, and with highly trained professionals to help implement them.

FISH AND WILDLIFE SERVICE

Wildlife diversity programs

The Wildlife Society supports \$1 million for the Wildlife Conservation and Appreciation Fund (established by the Partnerships for Wildlife Act of 1993). The Act establishes a formal partnership between the FWS, state wildlife agencies, and private organizations to cooperatively initiate wildlife and appreciation projects. Better information about species and habitat throughout the United States is needed to promote wildlife diversity, productivity and environmental health. Of particular importance are habitats and species that are declining. Sufficient funding now may prevent future listings under the Endangered Species Act.

The Grants to States program, authorized for \$5 million under the Fish and Wildlife Conservation Act, was not slated for funding in the administration's proposal. The Wildlife Society recommends strongly that the program receive its full appropriation of \$5 million. The program should provide grants to states to assist them in the development and implementation of comprehensive wildlife conservation programs. Congress also should adopt a funding mechanism to support fish and wildlife diversity legislation by expanding the successful dedicated user fee approach of the Federal Aid to Wildlife Restoration Fund. This wise investment will help avoid future crises while providing needed conservation, recreation and education opportunities for all Americans.

Endangered species

The Wildlife Society supports the administration's request for an additional \$11.396 million in the Endangered Species Program. The President's request for an increase of \$7.5 million for the Cooperative Endangered Species Fund (Section 6) is needed. The Cooperative Endangered Species Fund establishes grants to states to assist the FWS in its work to recover endangered and threatened species, and to monitor the status of candidate and recovered species. The additional funding is needed to support state recovery actions and for habitat conservation plans. We also support the President's proposed funding for listing, consultation, and recovery.

Wetlands

The administration's proposed funding for the North American Wetlands Fund is \$14.4 million. The Wildlife Society recommends that the funding be increased to the full authorization level of \$20 million. This fund provides grant to support international Wetlands conservation. Criteria established under the North American Wetland Conservation Act encourage private-public cost-sharing projects for the purpose of protecting and managing wetland habitats for migratory birds and other wetland wildlife in Canada, Mexico and the U.S. The tremendous success of this program in generating in excess of a 2:1 match from non-federal sources plus the acreage secured warrant its full appropriation.

Migratory bird management

The Wildlife Society supports the administration's funding of Migratory Bird Management at \$17.107 million. The FWS is responsible for the management of migratory game birds, pursuant to the Migratory Bird Treaty of 1918.

The Wildlife Society supports the administration's request for migratory nongame birds, which includes the Partners in Flight program. The migratory nongame bird program focuses on the following: conserving species assemblages rather than individual species, protecting areas of high diversity and density, preserving or restoring critical, declining or vulnerable habitats, and cooperating with the public and private sector to protect sites that support species otherwise at risk.

The Wildlife Society support the administration's funding proposal for the North American Waterfowl Management Plan office at \$2.543 million. The North American Waterfowl Management Plan was established to conserve and restore North American wetland ecosystems for waterfowl and other wetland-dependent wildlife through forming partnerships. There are additional benefits associated with wetland restoration and these include: increased floodwater storage, reduction in flood damage, purification of groundwater, and retention of sediment.

Refuges

The Wildlife Society supports \$200 million for refuge operations and maintenance. This amount will begin to address the enormous maintenance backlog of nearly \$400 million that is allowing the Refuge System infrastructure to degrade. A significantly increased funding commitment is needed to restore the System to adequate conditions.

National Fish and Wildlife Foundation

The Wildlife Society supports the administration's request of \$5 million to fund the National Fish and Wildlife Foundation. The Foundation's funds leverage matching money from state and private sources to support many innovative wildlife conservation programs.

BUREAU OF LAND MANAGEMENT

Wildlife habitat and fisheries management

The administration's proposal of \$27.234 million for wildlife habitat and fisheries management is not adequate to address the significant needs on the 270 million acres of land that is administered by the BLM. The number of wildlife biologists

has been reduced to a level where each biologist is responsible for managing over 1 million acres of land. The Wildlife Society suggests a minimum of \$30 million for this program area.

The main objective of the wildlife and fisheries management program has been to implement the Fish and Wildlife 2000 strategic plan. The Wildlife Society recommends that this plan be clearly integrated into the BLM ecosystem management plans that are being developed.

Threatened and endangered species

The fiscal year 1998 proposed funding for threatened and endangered species is \$16.795 million. This program involves recovery actions for threatened and endangered species to assure that activities on BLM lands do not jeopardize the existence of species habitat. The Wildlife Society recommends at least \$20 million for this area.

Oregon and California grant lands

The Oregon and California Grant Lands appropriation provides funds for the management of revested railroad land, which is being managed for permanent forest production. The fiscal year 1998 funding request for O&C Lands is \$101.406 million. TWS supports the administration's proposal to increase funding for O and C Grant Lands with greater emphasis on wildlife and fisheries conservation, especially to help implement the Northwest Forest Plan.

Rangeland management

The Wildlife Society supports the administration's fiscal year 1998 request of \$54.342 million for rangeland management. We urge the BLM to develop measurable standards and guidelines, and increased monitoring efforts, which are necessary for rangeland reform. In addition, we support continued efforts to improve riparian habitat and the commencement of scientifically based efforts to restore upland habitats. We support the additional appropriation of \$250,000 for the Seeking Common Ground initiative. This program will attract matching grants that will bring ranchers and conservationists together to enhance livestock and wildlife habitat.

FOREST SERVICE

Wildlife management

The President's budget proposes \$30 million for the Get Wild program in fiscal year 1998. TWS recommends an increase of \$10 million, for a total of \$40 million. This funding level is still well below the \$54 million in wildlife management opportunities identified in forest plans. Increased investments in wildlife will yield tremendous economic benefits to local communities. There are 11 emphasis areas of wildlife management within the Get Wild program that focus on partnerships, habitat protection, public enjoyment, and habitat improvement for particular wildlife species, groups of species, or special habitats. Increased funds are especially needed for the following program areas; Neotropical Migratory Bird Conservation (Partners in Flight), and Wetland Wildlife Habitat Management (Taking Wing), and cavity dependent species.

Threatened, endangered and sensitive species

The Every Species Counts program (threatened, endangered and sensitive species management) is slated for \$27.2 million in the fiscal year 1998 budget proposal. The Forest Service manages habitat for over 265 threatened and endangered species, as well as 2,300 species which have been identified as sensitive by regional foresters. There are urgent needs for additional funding in the following areas: recovery of listed species, the prevention of future species listing, and rare plant protection and management. The Wildlife Society requests that emphasis be placed on the management of the following species of terrestrial wildlife: Mexican spotted owl, willow flycatcher, red cockaded woodpecker, grizzly bear, California spotted owl, northern and queen charlotte island goshawk, and marbled murrelet.

Range management

The administration is requesting \$45.388 million for range management for fiscal year 1998, an increase of over \$7 million over fiscal year 1997 enacted funds. The Wildlife Society supports this increase due to the importance of improving range conditions. Proper management of rangeland enhances ecosystems that are important for watershed protection, wildlife habitat, threatened and endangered species, recreation opportunities and livestock. Emphasis should be placed on restoration of

riparian areas and monitoring of range condition. An additional \$250,000 should be appropriated to support the Seeking Common Ground program.

Forest Environment Research

The Forest Environment Research program provides knowledge, techniques and strategies needed to manage and protect forest, rangeland and aquatic ecosystems. The administration's fiscal year 1997 budget request for Forest Environment Research is \$39.95 million. For fiscal year 1997, The Wildlife Society recommends that the Wildlife, Rare Plants and Communities research program be funded at \$15.1 million. The Wildlife Society also recommends that this money be allocated for the following specific research program focuses: threatened and endangered species, neotropical migratory birds, forest carnivores, forest raptors, old growth, and native prairie fauna. Research on threatened, endangered and sensitive species is especially important to help reduce future litigation under the Endangered Species Act.

State and private forestry

The cooperative state and private forestry program provides assistance to aid in the management and protection, of forest resources on state, urban, and private lands to meet domestic and international demands for goods and services. Fifty-nine percent of the Nation's commercial forest land is in nonindustrial private ownership. The proper management of these lands will ensure the future availability of natural resources. The Wildlife Society recommends an increased emphasis the Forest Legacy program, and the Urban and Community Forest Program. The Wildlife Society supports the President's request of \$4 million for the Forest Legacy Program. This amount would provide a continued base of support for this innovative program that protects private forest lands threatened by conversion to non-forest uses. The Wildlife Society supports the administration's budget request of \$10.23 million for the Stewardship Incentive Program. This program should encourage a landscape based perspective when planning for multiple benefits of forests on private lands. The Wildlife Society supports the President's request of \$25.5 million for urban and community forests. The Initiative assists the federal government in responding to the needs of people in urban areas and provides federal resources to protect, maintain, and manage trees, forests, and related natural resources in and around cities and communities.

Thank you for your support of scientifically based natural resource programs.

PREPARED STATEMENT OF DAVID N. STARTZELL, EXECUTIVE DIRECTOR, APPALACHIAN TRAIL CONFERENCE

Mr. Chairman: In behalf of the Appalachian Trail Conference, and for the reasons noted below, we are requesting an fiscal year 1998 Land and Water Conservation Fund appropriation of \$7.2 million for Appalachian National Scenic Trail land acquisition: \$4.2 million for the National Park Service Appalachian Trail program and \$3 million for the U.S. Forest Service Appalachian Trail program. Those levels are consistent with the Administration's budget request and will ensure continued progress toward our ultimate goal of a publicly owned corridor or greenway extending the entire 2,160-mile length of the Appalachian Trail—a goal that we now believe is achievable in the year 2000 (see tables 2 and 3).

Background.—The Appalachian Trail was initially established between 1923 and 1937 and has been maintained as a continuous footpath since that time. In 1968, with the passage of the National Trails System Act, the Appalachian Trail was designated as the nation's first national scenic trail. The act also authorized federal land acquisition to establish a permanent route and protective corridor for what then, as now, was America's most prominent long-distance hiking trail. Although the authorization was established 29 years ago, it was not until 1978 that significant appropriations from the Land and Water Conservation Fund were made available for federal land acquisition along the trail. Nevertheless; the Appalachian Trail project has become an outstanding example of what can be achieved through the collective efforts of the Congress, the affected federal agencies, and the private sector, represented by the Appalachian Trail Conference and our club and individual volunteer affiliates.

Resource characteristics.—The Appalachian Trail is a continuous, marked, 74-year-old footpath that traverses the Appalachian mountain chain from central Maine to northern Georgia for a distance of 2,160 miles. The footpath and its associated protective corridor form a greenway extending along much of the eastern seaboard and connecting more than 75 public land areas in 14 states, including six other units of the national park system and seven national forests, as well as many state park, forest, and game-management units. Virtually every mile of the trail is

within easy access of a major population center, and some portion of the trail is within a day's drive for two-thirds of the population of the United States.

As the longest unit of the national park system, the Appalachian Trail provides opportunities for millions of visitors each year to traverse and experience much of the richness and diversity of eastern America: its highest mountains, its great rivers, its pastoral valleys, its cultural legacies. The trail also affords opportunities for continuous long-distance hiking that are unparalleled anywhere else in the world. An estimated three to four million annual visitors enjoy some portion of the trail, ranging from leisurely strolls to weekend outings to extended backpacking excursions, ranking the trail among the most heavily visited units of the national park system.

In addition to its recreational qualities, the Appalachian Trail and its associated corridor represent an important reservoir of biological diversity. For example, the trail, due to its great latitudinal extent, passes through four of the seven primary forest habitats of North America. Moreover, recent natural-diversity inventories conducted by the Appalachian Trail Conference and a variety of state natural-heritage programs have identified 1,325 occurrences of rare, threatened, or endangered plants and animals at 370 sites along the approximately 70 percent of the trail route that has been surveyed to date. These findings have led a number of natural scientists to conclude that the trail and its greenway will play an increasingly important role in ensuring critical habitat for many species of flora and fauna in the eastern United States. These findings also rank the Appalachian National Scenic Trail as perhaps the most biologically diverse unit of the national park system.

A public/private partnership.—For more than 70 years, the Appalachian Trail project has been recognized as one of America's most successful examples of private-citizen action in the public interest. Since the initial construction of the trail in the 1920s and 1930s, volunteers affiliated with the Appalachian Trail Conference (ATC) have constructed, reconstructed, and maintained the footpath as well as a system of more than 250 shelters and associated facilities such as privies, bridges, signs, and parking areas. More recently, as a result of a unique 1984 agreement between the National Park Service and ATC, the conference has accepted management responsibility for more than 100,000 acres acquired by the National Park Service along the trail. ATC, through its network of 32 club affiliates and many thousands of volunteers, is now responsible for virtually all phases of "park" operations, including access control, structures management, public health and safety issues, and natural and cultural resources management. In 1996, more than 4,790 volunteers contributed more than 173,800 hours of labor along the trail: an annual contribution valued in excess of \$2 million. In addition, each year the conference and its club affiliates contribute more than \$2 million in operating revenues to support volunteer-based stewardship of the trail and educational and other forms of assistance to its visitors.

Program accomplishments.—The Appalachian National Scenic Trail land-acquisition programs of the National Park Service (NPS) and U.S. Forest Service (USES) surely rank among the most successful federal land-acquisition programs in the nation. With the strong support of this committee and the Congress as a whole, the two agencies have made truly remarkable progress in this long-term program: Since 1978, the NPS has acquired 2,348 parcels of land, encompassing more than 100,000 acres in 11 states, and protected a permanent right-of-way and associated resources along 599 miles of the trail. Similarly, the U.S. Forest Service has acquired more than 45,600 acres within the proclamation boundaries of the seven national forests crossed by the trail and protected more than 142 miles of right-of-way. As a result, while in 1978 more than 800 miles of the trail were located on private lands, often in areas with inferior natural or recreational qualities, including more than 200 miles along roads, today only 36 miles remain unprotected. In addition, in many instances, land acquisition has permitted relocations of the footpath to new areas possessing outstanding natural and scenic qualities.

Funding requirements.—While only approximately 36 miles of the Appalachian Trail remain to be protected, the total remaining program for both the National Park Service and the U.S. Forest Service will require the acquisition of approximately 400 parcels encompassing approximately 17,000 acres (see table 1). All of these remaining parcels possess significant natural, scenic, and recreational qualities worthy of federal protection, and many are threatened by incompatible development or land uses. For fiscal year 1998, given the requested appropriation level of \$7.2 million, we estimate the National Park Service will acquire an additional 1,880 acres, while the U.S. Forest Service will acquire an estimated 2,250 acres (see tables 2 and Table 3). Based on past experience, we also estimate that both agencies will achieve 100-percent obligation rates. In addition, we now believe, assuming similar appropriation levels in fiscal year 1998 and fiscal year 1999, the entire length of

the Appalachian Trail from Maine to Georgia—the world's longest publicly owned greenway—can be fully protected in the year 2000, providing the American people with a remarkable legacy for the 21st century and beyond.

Again, in behalf of the Appalachian Trail Conference, we wish to thank the chairman and members of the subcommittee for this opportunity to testify, for your consideration of our fiscal year 1998 appropriations request, and for the subcommittee's support over many years.

PREPARED STATEMENT OF MARY MARGARET SLOAN, CONSERVATION DIRECTOR,
AMERICAN HIKING SOCIETY

As the conservation director for American Hiking Society, a non-profit conservation organization, I am speaking on behalf of over 500,000 hikers nationwide. While economic, health and social benefits of trails are satisfied primarily at the local level, a strong but well-placed federal involvement is necessary for these benefits to be fully realized.

The numerous economic, health and social benefits of trails are compelling reasons for Congress to invest tax dollars in them. It makes sense for Congress to encourage and facilitate recreational land use, especially when examining the impact recreation has on the U.S. economy; for example, the Forest Service calculates that 74.8 percent of the \$130.7 billion generated toward the Gross National Product by activities in National Forests will come from recreation in the year 2000. American Hiking recommends Congress appropriate the following amounts for recreation:

- National Trails System: (a) National Park Service: \$3.5 million for the 15 national scenic and national historic trails it administers, (b) USDA Forest Service: \$1.35 million for the 10 national scenic and national historic trails it administers either solely or through agreements with the National Park Service, (c) Bureau of Land Management: \$400,000 to administer the Iditarod National Historic Trail and for the portions of nine other national scenic and national historic trails managed through agreements with the Park Service and Forest Service;
- National Park Service Rivers, Trails and Conservation Assistance program: \$11.5 million to support over 200 projects nationwide and provide base funding, technical assistance and administration to the 10 newly-designated National Heritage Areas;
- National Park Service Challenge Cost-share: \$600,000 for the 15 national scenic and national historic trails it administers;
- Forest Service Trails Construction/Reconstruction: \$36.5 million for the 125,000 miles of trail it administers;
- Bureau of Land Management Recreation Management: \$50.5 million;
- Land and Water Conservation Fund: \$7.2 million for the Appalachian National Scenic Trail.

Trails increase property values, contribute to local and national economies, and provide avenues to boost public health. A 1992 study by Greenways, Inc. found that Seattle's Burke-Gilman Trail has increased the value of homes near the trail by 6.5 percent. And the Outdoor Recreation Coalition of America, a trade association, estimates that total current sales of outdoor products and specialty items are \$10 billion. One of the reasons Americans invest so much in their local trails is the health benefits exercising on trails can provide: preventing heart disease, decreasing hypertension, improving and preventing osteoporosis and losing weight.

NATIONAL TRAILS SYSTEM

One of the most visited components of America's recreation lands are the 37,000 miles of congressionally-designated long-distance trails. The Appalachian Trail alone, stretching 2,100 miles from Maine to Georgia, receives 3–4 million visitors per year. The annual appropriations for these trails are very small, compared to their length—approximately \$95 per mile (excluding land acquisition through the Land and Water Conservation Fund). American Hiking supports a National Park Service appropriation of \$3.25 million, principally because of the demands the newly designated Selma-to-Montgomery National Historic Trail and the revitalized Potomac Heritage National Scenic Trail will put on an already under-funded program.

The American public has invested heavily in its national trails system. In 1996, local trail organizations brought over 473,000 hours of volunteer labor and over \$4 million in direct financial contributions to the trail-building efforts of public-private partnerships. The Potomac Heritage Trail was designated a National Scenic Trail in 1983, but public involvement and interest lagged at that time. 1996 saw a renewed interest in the trail and over 40 private groups are expected to participate in a trail community summit for the Potomac Heritage Trail this spring. To support the rebirth of this project, to conduct the legally required comprehensive plan for the Selma-to-Montgomery National Historic Trail and to meet the demands of the public, the National Park Service long-distance trails budget should be increased to \$3.25 million, for the 15 trails it administers. The USDA Forest Service should receive \$1.35 million for the four trails it administers, and the BLM should receive \$400,000 to administer the Iditarod National Historic Trail and for the portions of seven other trails managed by the BLM through agreements with the Park Service and the Forest Service.

NATIONAL PARK SERVICE RIVERS, TRAILS AND CONSERVATION ASSISTANCE PROGRAM

American Hiking strongly believes that the future of trails and outdoor recreation lies in the hands of the American public. However, the federal role in trails remains essential. Federal staff knowledge, facilitation skills, and technical expertise are needed so that local and state governments can do for themselves. The National Park Service Rivers, Trails and Conservation Assistance program (RTCA) has been one of the more effective federal programs in encouraging local initiative and providing technical assistance. One example of the program's success is the Arizona Trail. In partnership, the Arizona Trail Association, Arizona State Parks, four national forests, BLM, and four national parks are well on the way to establishing a 750-mile trail crossing Arizona from Mexico to Utah. Many parts of the trail are primitive, passing through wilderness areas, while other sections of the trail pass near or through urban areas, providing close-to-home connections to surrounding natural areas. RTCA assistance in completing the trail includes technical assistance in route planning, helping to establish a friends of the trail group to maintain the trail and coordinating involvement of the four national parks.

Unfortunately, the program is hampered by a funding shortage. Of the 400 project requests RTCA received from states, localities and the private sector last year, it was able to accept only one-half. With a \$700,000 increase to its base funding, RTCA will be able to accept 15-30 additional projects.

In addition this program is taking on several new types of projects this year. The 104th Congress designated ten heritage areas, for which RTCA will require \$100,000—a total of \$1 million, plus \$500,000 for competitive project-specific funding and \$1.25 million for technical assistance for these programs. An investment in these programs will yield benefits ten-fold in state, local and private investment and public health and enjoyment. As co-chair of the Rivers and Trails Coalition, representing 29 non-profit organizations and trade associations, American Hiking requests full funding for this program.

NATIONAL PARK SERVICE CHALLENGE COST-SHARE

National Park Service Challenge Cost Share program is a valuable tool, contributing to the completion of our national trails system. In fiscal year 1997, approximately \$600,000 was earmarked for national scenic and national historic trails within this program; the state and local government match was almost double. This match is the key to a successful federal program; it indicates that there is significant local support for the project, and it provides a basis for a true partnership. Local investment in trails, which this program demands, is a program worth receiving full federal backing.

FOREST SERVICE TRAILS CONSTRUCTION/RECONSTRUCTION

After floods and mudslides devastated the Pacific Northwest this winter, the Forest Service Trails Construction/Reconstruction needs are now \$36.5 million. Trails off of the Columbia River Gorge suffered tremendous damage; flow of granular snow scoured the whole gorge, wiping out the Eagle Creek Trail—among others—along with the trail's suspension bridge. The FS manages 125,000 miles of trail, including the Continental Divide, Pacific Crest and Florida National Scenic Trail, and the Nez Perce National Historic Trail. Many of these miles of trail need federal attention and assistance.

Forest Service Trails Construction/Reconstruction is not the only trail need in the Forest Service, but it represents the only trail line item in the FS budget. Trail maintenance was subsumed under Recreation Operations and Maintenance in fiscal year 1996. Since the line-item no longer exists, growing trail maintenance needs often go unmet, adding to a construction/reconstruction/maintenance backlog of \$267 million. Hikers do what they can to alleviate this enormous backlog; they volunteer their time and energy. In the White Mountain National Forest last year alone, volunteers from the Appalachian Mountain Club contributed over 16,100 hours. American Hiking requests that a line-item for FS Trail Maintenance for \$30 million be included in the fiscal year 1998 budget.

BUREAU OF LAND MANAGEMENT RECREATION MANAGEMENT

The Bureau of Land Management's current recreation management need is \$50.5 million, which is an increase of \$4.7 million over fiscal year 1997. This increase, which includes recreation, recreation operations and wilderness, is entirely justified by the devastation from floods and fires in the Pacific Northwest. In addition to trail damage from natural causes, there is wear and tear from increased recreational use. The BLM estimates that in 1998, recreation visitor days will increase by 2 percent,

to 75 million. The Outdoor Recreation Council of America estimates that, nationally, tent camping and backpacking will continue to increase at 11 percent annually; most of this use will occur on federal lands.

The demand for recreation on our public lands is staggering and American Hiking urges Congress to protect the investment American taxpayers have made in these lands. The private sector is contributing where it can. The BLM reports that in 1994 volunteers contributed nearly 532,000 work hours valued at over \$5.8 million. While these numbers are significant, volunteers can augment, but not replace, federal responsibility. The relationship needs to be a balanced public-private one, and the public responsibility is \$50.5 million.

BLM recreation opportunities include 502 miles of the Continental Divide and Pacific Crest National Scenic Trails, 3,600 miles of the Iditarod, Juan Bautista de Anza, California, Nez Perce, Lewis and Clark, Oregon, Santa Fe, Mormon Pioneer, and Pony Express National Historic Trails, 429 miles of 26 National Recreation Trails, and 7,370 miles of 68 multiple-use trails.

LAND AND WATER CONSERVATION FUND

Since its inception in 1964, the Land and Water Conservation Fund (LWCF) has proved to be a particularly valuable tool. This fund is authorized at \$900 million per year for land acquisition. Yet the average funding over the last 17 years has been approximately one-fourth of the authorized level. American Hiking supports full funding for both the state- and federal-side LWCF and particularly supports earmarking \$7.2 million for the Appalachian Trail (\$4.2 million for NPS land protection in eight states and \$3 million for FS land protection in Virginia, North Carolina and Tennessee). The Appalachian Trail Conference, which has management responsibility for the trail, estimates that funding at this level will permit the acquisition of 1,883 acres by the NPS and 2,250 by the USDA FS.

The Appalachian Trail Conference anticipates that at an appropriation rate of \$7 million per year, the trail will be completely protected by the end of the 20th century, making it the first national scenic trail to have that distinction.

American Hiking recognizes that there are only so many resources that Congress can direct toward trails. AHS supports the Forest Service Roads Construction budget cuts outlined in the Green Scissors Report. This is estimated to save \$50 million annually, more than enough to cover the increases proposed here. American Hiking hopes that Congress recognizes and appreciates the time and muscle power that volunteers around the country have contributed to our federal lands to make them accessible and enjoyable for all Americans. American Hiking believes that the balance between the investment of the federal government and the investment by private citizens is struck by the dollar figures we have outlined in this testimony.

Thank you for the opportunity to speak before you today. American Hiking Society's members and outdoorspeople nationwide appreciate the subcommittee's support in the past and look forward to continued strong support.

PREPARED STATEMENT OF GREGORY E. CONRAD, EXECUTIVE DIRECTOR, INTERSTATE MINING COMPACT COMMISSION

My name is Gregory E. Conrad and I am Executive Director of the Interstate Mining Compact Commission. I appreciate the opportunity to present this statement to the subcommittee regarding the views of the Compact's member states concerning the fiscal year 1998 Budget Request for the Office of Surface Mining (OSM). In its proposed budget, OSM is requesting \$50.1 million to fund Title V grants to states for the implementation of their regulatory programs and \$142.3 million for state Title IV abandoned mine land program grants. Our testimony will address both of these budgeted items.

The Compact is comprised of 18 eastern and mid-continent states that together produce some 70 percent of our Nation's coal as well as important non-coal minerals. Participation in the Compact is gained through the enactment of legislation by the member states authorizing their entry into the Compact and they are represented by their respective Governors who serve as Commissioners.

The Compact's purposes are to advance the protection and restoration of land, water and other resources affected by mining through the encouragement of programs in each of the party states that will achieve comparable results in protecting, conserving and improving the usefulness of natural resources and to assist in achieving and maintaining an efficient, productive and economically viable mining industry.

The Commission has testified before your subcommittee on several occasions over the years and has appreciated the subcommittee's consideration of our comments

and concerns. Given the attention that Congress is directing toward the federal budget in terms of deficit reduction goals, our primary purpose today is to emphasize the critical role played by the states under the structure of the Surface Mining Control and Reclamation Act of 1977 (SMCRA) and to urge that the OSM budget be aligned so as to support the continuing work of the states.

Before providing the states' views on specific budget items, I would like to address our concerns about the importance of the state/federal relationship called for under SMCRA. Congress incorporated the concept of cooperative federalism in SMCRA because of its belief that the states were in the best position to regulate mining operations within their borders. At the same time, Congress recognized the need for a limited federal oversight role to assure a degree of national uniformity among state programs and consistency in state performance. This scheme of allocated governmental authority between state and federal regulators can and does work in the day-to-day implementation of SMCRA when states and OSM are coordinating their efforts. Regardless of the level of funding, program expenditures will be more efficient and effective if OSM and the states are communicating and cooperating, rather than competing and duplicating responsibilities.

In recent years, OSM has made meaningful strides to incorporate the views of the states as part of several "Task Force initiatives" that directly impact the state/federal relationship and the effective implementation of SMCRA. These include federal oversight of state programs, use of Ten-Day notices in primacy states, prediction and treatment of acid mine drainage at active mining sites, and re-mining. These initiatives address many of the critical issues facing the states and OSM today. We have appreciated OSM's willingness to work with the states to explore potential solutions to these complex matters and, while the states and OSM may not see eye-to-eye on every issue, we trust that OSM will continue to operate in an environment of openness and congeniality with the states.

As Congress makes the difficult funding decisions required under the deficit reduction plan, we believe it is essential to keep in mind that the goal of SMCRA is to preserve the environment where active mining operations occur and to enhance the environment through the remediation of past problems associated with abandoned mines. We assert that funds should be appropriated by Congress in a manner that best accomplishes this goal—and that best serves the American people. We believe that an analysis of SMCRA confirms that the states are to take the lead in pursuing this goal and that state programs for active and abandoned mines need to be adequately funded to accomplish this objective. Furthermore, from a pragmatic budgetary perspective, experience demonstrates that it will cost the federal government significantly more to undertake this task than to partially fund the existing 23 state regulatory programs. The cost of the existing federal regulatory program remains high and in some cases is out of line with state expenditures and responsibilities under SMCRA.

Under the provisions of SMCRA, primary regulatory authority for the implementation of the Act was vested in the states. Congress provided for assistance to the states in developing and implementing regulatory programs to achieve the purposes and objectives of SMCRA through annual grants to the states under Title V of the Act. The states have come to rely on these Title V grants as a critical portion of the funding necessary to carry out their responsibilities as primary regulators under SMCRA. The necessity of this funding has taken on increased importance as state budgets struggle to keep pace with inflation and meet projected regulatory needs. Without these grants, it is unlikely that the states would be able to maintain the comprehensive, high quality regulatory programs expected under the provisions of SMCRA.

In OSM's fiscal year 1998 proposed budget, state Title V regulatory grants have been funded at \$50.1 million. OSM notes in its budget justification document that this is a reduction of \$500,000 from last year's budgeted amount and explains that, in part, this decrease "reflects smaller grant requests from States who are having difficulty meeting the matching share requirements of SMCRA." Although OSM fails in its budget justification document to identify specific instances of this phenomenon, as we noted in our statement before your subcommittee last year, some states are indeed facing decreasing state revenues for state program implementation. Most of these decreases are the direct result of decreasing coal production due to the impacts of the Clean Air Act Amendments of 1990. Since most of the states receive a significant portion (if not all) of their state revenues from fees assessed to coal operators, as these operators (particularly those mining high sulfur coal) reduce their production (or go out of business altogether due to implementation of the 1995 Phase I requirement contained in the Clean Air Act), those fees evaporate and are generally not replaced by revenues from other sources. States are simply not in the position to fund their state regulatory programs from general revenues given the fis-

cal belt tightening that is occurring at the states level. And yet full funding is necessary to support the affected state programs because regulatory efforts and needs do not decrease directly with decreased production or numbers of active permits. In some instances, just the opposite is true—the number of enforcement actions, civil penalties, permit revocations, bond forfeitures, and associated appeals increase as markets deteriorate, production and revenue decline and bankruptcies increase.¹

OSM also fails to note that the states had projected a need for \$57.7 million in Title V grant moneys when they submitted grant requests for fiscal year 1998 about 18 months ago. Consequently, the states are looking at an overall shortfall of \$7 million between what they had projected was needed to run their programs and what OSM believes is now necessary. This shortfall is \$2.5 million greater than last year's shortfall amount of \$4.6 million.

Meeting the states' funding needs is essential to offset the rising costs associated with the implementation of regulatory programs, which includes such activities as reviewing mine permit applications, designating lands as unsuitable for mining, inspecting surface mining operations, and maintaining effective enforcement programs. As we noted in our statement last year, we were concerned that OSM was initiating a trend, supposedly justified by deficit-reduction belt tightening, that would result in incremental decreases in the amounts being granted to the states. In light of this year's budget numbers, it appears our fears were justified and have become a reality. When factored together with the rising costs associated with implementing state programs, the compounded impact of these grants reductions will result in under-funded state regulatory programs and potential concomitant impacts on the ground.

For the states to continue the effective implementation of their programs, additional federal funding above and beyond that which we have traditionally received from OSM will be required. We are therefore requesting that OSM's overall appropriation for state Title V grants be increased by an additional \$35.75 million to \$86.25 million so as to accommodate the funding needed by states to run their programs. Under this scenario, the federal government would provide 75 percent of the necessary funding for state program implementation, while the states would provide a 25 percent match. We have also requested the Congressional committees with jurisdiction over OSM and the Surface Mining Act to adjust the specific statutory language in Section 705 of the Act to recognize this new funding reality. A resolution to this effect adopted by IMCC is enclosed.

In any event, should this Congress not increase OSM's appropriation to accommodate a 75 percent federal funding formula, we urge the Appropriations Committee to increase the amount for Title V grants from OSM's proposed amount of \$50.1 million to \$57.5 million in order to meet the states' projections of fiscal year 1998 implementation costs. While we can appreciate the necessity of containing the cost of federal regulatory programs, it is essential that funding for state programs be preserved at adequate levels since the states act as the front line regulatory authorities under SMCRA. It also is important to structure any realignment of OSM's budget in such a way that the valuable OSM activities which support and enhance state programs are not undermined. These include technical training, the Technical Information Processing System, the Applicant/Violator System (AVS), the COALEX Legal Research System, and a properly focussed evaluation of state programs.

The Compact states also urge the subcommittee to adequately fund the Title IV program for reclamation of abandoned mine lands (AML). As with Title V regulatory programs, it is important to examine all SMCRA program components with the objective of maximizing SMCRA services and benefits to our customers under Title IV. We assert that the states have been and continue to deliver these benefits and services in the most cost-effective and efficient manner through their state programs. However, with regard to Title IV funding in particular, we are seeing less and less on-the-ground reclamation per dollar spent as states struggle to maintain and implement their basic AML delivery system with decreasing amounts of money. This is especially true for smaller (minimum) state programs where a 25 percent reduction in funding translates to significantly less money being available for on-the-ground reclamation.

The benefits of the AML program are delivered almost entirely by the states. Each year they are responsible for the reclamation of hundreds of acres of abandoned coal mine areas along with the elimination of hazards to the public such as open edits and dangerous highwalls and the reduction or elimination of water pollution associated with acid mine drainage. It is incredibly difficult for a state to effectively manage a program under Title IV without the ability to rely on adequate, certain and consistent funding from year to year. Over the years we have seen the funding for state AML programs reduced while OSM's Title IV funding continues to increase. This is occurring at the same time that the states are assuming more

and more responsibility for actual implementation of the program, including the emergency AML projects. We therefore urge the subcommittee to increase the state AML grants from the budgeted amount of \$142.3 million to \$220 million (including a minimum of \$2 million per state), which will allow the states to effectively and efficiently manage their programs and to accomplish the valuable work under those programs. Increased funding will also serve as a significant economic stimulant, generating hundreds of jobs associated with increased AML work. Affording states the flexibility to decide local priorities for all expenditures would be more efficient and more responsive to the needs of coal field citizens, whom the AML program is designed to serve.²

You should know, Mr. Chairman, that in an effort to address the outstanding AML problem and adequate funding for state AML programs, the states have proposed a plan that would provide for the immediate allocation of the accumulated balance of over \$1 billion in the AML Trust Fund. Under our plan, states would submit to OSM a "Reclamation Management Plan" that would define the specific results to be achieved and a time frame for achieving them. The plan would delegate a management role to the states regarding the Trust Fund and would require Congress to modify traditional annual budget appropriations in favor of multi-year funding based on states' requests in their Reclamation Management Plans. I am attaching a copy of this plan and would welcome the opportunity to discuss it with subcommittee staff. We will also be providing a copy of the Plan to the Senate Energy and Natural Resources Committee.

OSM has proposed an amount of \$11.2 million for technology development and transfer, which includes improving and expanding the services and technical systems provided to states. We wholeheartedly endorse this commitment by OSM to strengthening and enhancing state programs. In this regard, one of the most successful programs of technical support for the states undertaken by OSM is the development of the Technical Information Processing System (TIPS). This national computer system is operated by OSM for use by the states in carrying out their technical regulatory responsibilities under SMCRA. TIPS assists in making technical decisions associated with permit reviews; performing cumulative hydrologic impact assessments; quantifying potential effects of coal mining; quantifying revegetation success; assisting in the design of AML projects; and preparing environmental assessments and environmental impact statements. We are encouraged to see funding continued for TIPS.

We also urge the subcommittee to continue its support of funding for state employees to attend OSM technical training sessions. As OSM has noted in the past, "the most important product of the training program has been the steady improvement in the regulation and reclamation of surface coal mining. These successes have been largely due to the increase in staff technical knowledge, the improvement of relationships among Federal and State personnel, and the improvements in staff ability to make sound evaluations and decisions." Given state budget constraints, travel to OSM training sessions is impossible without federal funding. If OSM reduces funds for state travel, it is unlikely that states will be able to benefit from this much needed service.

We are also hopeful that OSM, as part of its commitment to technical services, will support funding for the COALEX Legal Research System. Both the states and OSM have traditionally made use of this computerized legal research system on an almost daily basis. The system provides searches to yield complete and accurate data in minutes, thereby eliminating the need for staff to manually search through volumes of documents. As implementation of SMCRA becomes more and more complex, the need for COALEX has increased. The states, in particular, have become reliant on the system's ability to assist us with the implementation of our programs and to address the myriad compliance actions that attend enforcement of our programs.

Finally, we urge continued funding of the Small Operators Assistance Program (SOAP). This program is critical to the permitting of remining operations by small operators, especially the costs associated with background water quality assessments, overburden analysis and Probable Hydrologic Consequences (PHC) predictions. Without financial assistance to undertake these expensive analyses, small operators will be unable to submit quality permit packages for potential remining operations. This will, in turn, result in additional burdens on state and federal AML program funds as remining operations will be unavailable to correct problems that currently are on the AML inventory. In this regard, SOAP often serves as an incentive to encourage the remediation of AMLs through active remining operations, thereby reserving AML moneys for more critical problem areas.

Thank you for the opportunity to present these views on OSM's proposed fiscal year 1998 budget. I would be happy to answer any questions that you may have.

FOOTNOTES

¹As another rationale for the \$500,000 decrease in state Title V grant funding from fiscal year 1997 to fiscal year 1998, OSM states that the decrease reflects "anticipated cost savings as States adopt the state counterpart to OSM's November 1994 rule on inspection frequency." Again, OSM provides no specific data to support this justification for decreased state funding. Our experience, however, tells us that the number of inspections being conducted by the states is not expected to decrease significantly because of the inactive and abandoned sites rule. In general, reducing the number of required inspections does not directly reduce the number of inspectors or grant monies needed to support effective inspection and enforcement.

²We should note that the \$142.3 million requested by OSM for Title IV state grants includes \$5 million which has been allocated for the Appalachian Clean Streams Initiative (ACSI). This translates to a total request of only \$137.3 million for state AML grants funding. Although we recognize that at least some portion of the \$5 million ACSI funding will be allocated to the states, the overall trend in state AML grant funding is declining once again to unhealthy and unacceptable levels.

PREPARED STATEMENT OF BRUCE RUNNELS, CHIEF CONSERVATION OFFICER OF THE
NATURE CONSERVANCY

Mr. Chairman and members of the subcommittee, thank you for the opportunity to submit The Nature Conservancy's thoughts on fiscal year 1998 appropriations for the Land and Water Conservation Fund and other conservation programs under your jurisdiction.

The Nature Conservancy is an international, non-profit land conservation organization dedicated to the long-term preservation of biological diversity.¹ The premise that underlies our work is that in order to safeguard imperiled species, we must protect their habitats. This is the rationale behind our traditional conservation strategy of purchasing and managing lands that are home to rare plants and animals. Although this strategy has been largely undertaken through private action rather than through political means, the Federal Government has been an important partner in working to achieve conservation.

Successful conservation of biological diversity must be based on understanding ecosystems and conserving the critical occurrences of biological diversity supported by them as priorities for our attention. The Nature Conservancy is scientifically identifying and developing strategies to protect priority sites within ecoregions, or large area landscapes delineated by biotic factors rather than political boundaries. We are aware that most Federal land management agencies are also now committed to an ecosystem-based approach. This committee should encourage and strengthen this trend through investments in acquisition of exemplary high priority ecological sites and leveraging conservation dollars through partnerships with other levels of government, private landowners, industry and private organizations.

ACQUISITION AND MANAGEMENT

The Nature Conservancy believes that continued selective acquisition of land by the Federal Government is vital if we are to ensure that representative pieces of our nation's natural heritage are preserved for future generations. Often, the only thing standing in the way of species extinction is the purchase of critical habitat, and at times the Federal Government is the most appropriate purchaser. It is the quality of Federal lands, not the quantity, that is important.

Land Acquisition.—The Nature Conservancy appreciates this committee's past support for the Land and Water Conservation Fund. We recognize that in moving government toward a balanced budget, funding levels for the LWCF are under increasing pressure, making the identification of the "best" parcels even more important. Thus, we are highlighting several biologically significant projects about which have substantial knowledge. This year, these projects total \$51.1 million. We have provided detailed information and discussed most of these with committee staff.

U.S. Fish and Wildlife Service:

Amagansett NWR (Shadmoor), NY \$2,000,000

¹For more than 45 years we have implemented our mission by focusing on local, on-the-ground conservation, utilizing the best available science, market forces, and partnerships with people and groups across the political spectrum. We currently have conservation programs in all 50 States and 17 other nations. The Conservancy has more than 900,000 individual members and over 1,385 corporate sponsors. Our Board of Governors includes renowned scientists such as E. O. Wilson and Dan Simberloff; distinguished leaders such as General Norman Schwarzkopf and former Deputy Secretary of State John C. Whitehead; and corporate officers from major U.S. companies such as John G. Smale of Procter & Gamble and Samuel C. Johnson of S.C. Johnson & Son.

Stewardship of Public Lands.—A critical component of Federal land acquisition is funding for management of those lands. Without active management, many of the biological resources we are seeking to protect cannot thrive. Some habitats require prescribed burns to maintain vegetative diversity, and others require stringent programs for the management of exotic species. The Nature Conservancy supports the fiscal year 1998 budget requests of the public land management agencies for management and stewardship activities. For example, the Bureau of Land Management has included in its budget proposal \$1.0 million for prescribed fire operations and \$1.0 million for the prevention and control of invasive weed species. Although more funding is needed, this is a step in the right direction.

Land Exchanges.—While continuing to acquire biologically significant lands, The Nature Conservancy believes that the Federal Government should look for ways to divest itself, through transfers, exchanges or outright sales, of Federal lands having little or no important ecological function. The Conservancy has a good deal of experience with, and is supportive of, land exchanges as a mechanism for the acquisition of lands of high biological diversity. We are interested in finding ways to make the process less complicated and expensive.

Regional Conservation Initiatives.—The following initiatives are setting the standard for regional approaches as they are already operating under a regional framework to address their respective conservation challenges.

Natural Community Conservation Plan (NCCP), California.—NCCP is an unprecedented partnership among business, conservationists, local governments and State and Federal wildlife agencies. In 1991, Governor Pete Wilson urged the California legislature to pass the NCCP Act which called for the development of comprehensive conservation plans that identified key areas for endangered species protection while allowing economic growth in other areas. The regional plan covers 6,000 square miles and involves five counties, fifty-nine local government jurisdictions, and scores of private landowners. The private sector, local governments, and the State of California have contributed millions of dollars to date to this project—they must be matched by a continued strong Federal partnership to fulfill the promise of NCCP. The Conservancy supports the Administration's requests for a number of NCCP-related programs. For land acquisition, we support \$3.0 million for the San Diego Ref-

uge; \$1.0 million for Otay Mountain/Kuchamaa Area; \$1.0 million for Western Riverside County; and \$1.0 million for Santa Rosa Mountains. In the USFWS's Endangered Species program, we support \$2.0 million in the consultation subactivity for NCCP planning and \$6.0 million in the Cooperative Endangered Species Fund for grants to States for land acquisition in support of efforts like NCCP.

Florida Everglades.—The Florida Everglades are one of the world's unique natural systems, originally supporting a remarkable quantity and diversity of plant and animal life. The system has now been reduced to half its original size by the draining and diversion of water, and the remaining Everglades are suffering acute ecological problems. The Administration's fiscal year 1998 budget proposes a major investment in Everglades restoration, including the establishment within the Department of Interior of an Everglades Restoration Fund in the amount of \$400 million spread over four years to support the most critical elements of Everglades watershed restoration. Funding of \$100 million (\$76 million for land acquisition; \$12 million for modified water deliveries; \$12 million for scientific research) is requested by the Interior Department for fiscal year 1998 and strongly supported by The Nature Conservancy. This money is essential to acquire sufficient land for water storage and treatment to save the Everglades. Continuing research funds are needed to ensure that solutions are cost-effective.

California Bay-Delta.—The California Bay-Delta is the largest estuary on the west coast, providing habitat for 120 aquatic and terrestrial species and supplying water for much of California. In September 1996, the President signed the California Bay-Delta Environmental Enhancement Act, authorizing \$143.3 million per year in Federal funding for restoration activities in 1998, 1999, and 2000. The Administration's fiscal year 1998 budget includes this request and proposes to locate the \$143.3 million in an account within the Bureau of Reclamation, to be allocated later to participating agencies by CALFED, a consortium of ten Federal and State agencies. In addition, the request includes \$59.5 million for ongoing programs in the Fish and Wildlife Service, Bureau of Reclamation, and the USGS. The Nature Conservancy is an active participant in the Bay-Delta program and strongly supports the budget request.

KEY PARTNERSHIP INITIATIVES

One of the best conservation investments the Federal government can make is to be a partner to other entities, both private and public, that are working to achieve like-minded goals. In this way, scarce resources can be leveraged to increase the total amount of funds available for conservation activities. Within any given ecosystem, lands may be owned and managed by any combination of Federal, State, or local government, private landowners, industry and conservation groups. The Federal Government can be a leading partner in facilitating conservation in this context. We recommend that the committee continue to fund and promote the following programs and initiatives that are excellent examples of partnerships that leverage both private and public resources for conservation activities.

National Fish and Wildlife Foundation.—The National Fish and Wildlife Foundation [NFWF] is an excellent example of a Federal program that effectively leverages conservation benefits. The Foundation builds partnerships between the public and private sectors to support activities that are focused on solving environmental problems, and has an outstanding record of encouraging and rewarding innovation in natural resource management. NFWF consistently exceeds a 2:1 private match for every dollar received in appropriated Federal money, making scarce Federal dollars achieve results two to three times greater than otherwise possible. Over the last decade, it has leveraged approximately \$43 million of Federal funds into \$152 million through privately matched challenge grants. The Administration has proposed a level of \$5.0 million for this program in fiscal year 1998, the same level as was enacted last year. We believe NFWF merits at least this level of funding to continue to forge innovative partnerships and leverage limited Federal resources.

North American Wetlands Conservation Fund.—The North American Wetlands Conservation Fund supports an international grant program authorized under the North American Wetlands Conservation Act. A variety of partners in Canada, Mexico, and the United States have contributed millions of dollars to acquire, restore, and enhance wetlands to conserve intrinsic wetlands functions, including providing habitat for migratory birds, endangered species, and other wetlands-dependent wildlife. Private partners contribute more than two dollars for every Federal dollar, also leveraging scarce resources for conservation. As a member of the North American Wetlands Conservation Council since its inception in 1989, The Nature Conservancy has been part of the panel that recommends projects for final approval by the Migratory Bird Conservation Commission. The Administration has proposed to in-

crease the funding available for this program by \$5.25 million, to just over \$15 million. The Conservancy strongly supports this high-leverage increase.

Incentives for Private Landowners and Habitat Conservation Plans.—The Nature Conservancy also supports a number of Federal programs that have been successful in creating conservation opportunities for private landowners and conservation organizations. Private lands are critical in achieving the goals of resource protection, as many rare ecological systems and species exist only on private lands or are affected by activities on such lands. Often, private landowners are willing to take voluntary measures to protect habitat on their lands if some incentives are available, and Federal agency programs such as USFWS's Partners for Wildlife and the Forest Service's Forest Stewardship and Stewardship Incentive Programs can provide that incentive. The Administration's fiscal year 1998 request for the Endangered Species Act includes funding for improving species conservation on private lands. Of the \$78 million total requested, \$4.9 million is to support State and private partnership efforts that will keep candidate species off the endangered list. In addition, much of the \$8.6 million increase for consultation will be used to provide technical assistance to private landowners developing Habitat Conservation Plans. Last year, the Cooperative Endangered Species Fund included a pilot program of grants-to-States for land acquisition related to large-scale HCPs. These funds have been in high demand, and the Administration has again included \$6.0 million in its budget to continue this program. The Conservancy strongly supports this example of a Federal program that encourages partnership initiatives on the ground.

PREPARED STATEMENT OF HON. JIM GERINGER, GOVERNOR, STATE OF WYOMING

This testimony supports the President's Recommended fiscal year 1998 Budget relative to funding for the Bureau of Land Management [BLM] to accomplish Colorado River Basin Salinity Control activities

This testimony supports fiscal year 1998 funding for the Bureau of Land Management [BLM] to carry out Colorado River Basin salinity control activities. You will soon receive testimony from the Colorado River Basin Salinity Control Forum [Forum] on behalf of the seven Colorado River Basin States that is being submitted by the Forum's Executive Director, Jack Barnett. The State of Wyoming concurs in the fiscal year 1998 funding request and justification statements for BLM funding set forth in the Forum's testimony.

The State of Wyoming is one of the seven member states represented on the Forum and the Colorado River Basin Salinity Control Advisory Council. The Council was created by Section 204 of the 1974 Colorado River Basin Salinity Control Act, Public Law 93-320, and like the Forum, is composed of gubernatorial representatives of the seven Colorado River Basin states. Both the Council and Forum serve important liaison roles among the seven states, the Secretaries of the Interior and Agriculture and the Administrator of the Environmental Protection Agency (EPA). The Council is directed by statute to advise these federal officials on the progress of the federal/state cost-shared, basin-wide salinity control programs, and annually recommends to the Federal agencies what level of funding it believes is required to allow the Program to meet its objective of assuring continuing compliance with the basin-wide water quality standards.

The Council met most recently in October, 1996 and developed funding recommendations for fiscal years 1998 and 1999 based on the progress the Programs are making in managing and reducing the salt loading into the Colorado River System. Based on analyses made by the Bureau of Reclamation and the Forum and after conferring with BLM agency officials, the Council recommends that the BLM expend \$4,500,000 in fiscal year 1998 to accomplish activities that BLM either has underway or should initiate in order to further control the concentrations of salinity of the Colorado River.

It is particularly important that the BLM's line-item for Management of Lands and Renewable Resources be adequately funded. Section 203(b) of the Colorado River Basin Salinity Control Act as amended directs the Secretary of the Interior to develop a comprehensive program for minimizing salt contributions to the Colorado River from lands administered by the Bureau of Land Management. This is both important and appropriate because the BLM is the largest manager of land in the Colorado River Basin (53 million acres of public lands in the Colorado River Basin above Yuma, Arizona) and because salt loading reductions on BLM-managed rangelands can be done more economically than some of the methods available to and projects being implemented by the Bureau of Reclamation and the Department of Agriculture.

The Council and Forum recognize the major role that the Bureau of Land Management can have in the Colorado River Basin salinity control effort if more attention, effort and focus by the BLM is brought to bear on controlling salt discharges from the federal lands it manages. Great opportunity exists to decrease salt loading from BLM-managed lands to the river system. The Secretary of the Interior is directed by the Colorado River Basin Salinity Control Act to give preference to those salinity control efforts which reduce salinity at the least cost per unit of salinity reduction, e.g. in the most cost-effective manner. The Forum and Council have aggressively urged, and will continue to encourage, the BLM to identify, plan and develop additional projects that will remove, or prevent the loading of, a greater tonnage of salts from the River system.

The State of Wyoming wishes to emphasize the statement found in the Forum's testimony that while we are not opposed to BLM's budgetary process of focusing on ecosystem and watershed management, it remains essential that the expenditure of funds be directed to specific sub-activities and that the accounting for expenditures be done in such a manner that monitoring can take place on how the funds were used, what resources were benefitted and which natural resource concerns addressed. Wyoming and the other member states of the Forum have been frustrated by BLM's approach of identifying where funds are allocated as opposed to what purposes or how they are used to accomplish specific activities, objectives and benefits. The same difficulty exists with regard to accounting for how allocated funds have been expended. The BLM is simply unable at the present time to indicate how much money it is spending or where it is being spent to achieve salinity control benefits. For this reason, the Forum expressed in its testimony a strong desire to have the Congress direct the BLM to implement or modify its existing accounting practices to enable the Basin States to understand how much money this agency is allocating, and what results are being obtained, in carrying out its mandate for implementing a comprehensive program to minimize salt contributions from lands it administers.

Again, on behalf of the State of Wyoming, I wish to express our concurrence with the testimony that is being submitted by the Colorado River Basin Salinity Control Forum. Thank you for the opportunity to submit and for your consideration of this statement, and I would request that you make it a part of the formal hearing record on fiscal year 1998 appropriations for the Bureau of Land Management.

PREPARED STATEMENT OF ALICE KILHAM, CO-CHAIR, UPPER KLAMATH BASIN
WORKING GROUP

An innovative, results oriented approach to resolution of natural resource issues began in Oregon in 1995. The Upper Klamath Working Group, a community consensus group, is now seeking the support of Congress for the appropriation of funding for implementation of ecosystem restoration efforts in fiscal year 1998. By funding these projects, National pilots will be created that model not only cooperation among former competing interests, but demonstrate new ways to accomplish protection of National natural resource treasures while respecting economic and social needs.

March 5, 1997, the Upper Klamath Basin Working Group reached consensus and identified restoration projects for implementation under the \$1,000,000 authorized annually under the Oregon Resource Conservation Act of 1996 (H.R. 3610). These projects will be matched through partnerships which will double the benefits received beyond the federal funding. The following are the projects that have been identified and benefits expected:

1. Restoration of the springs in Sprague and Williamson river systems, proposed by the Klamath Indian Tribes, \$160,000. Restoration of the springs will provide improved water quality for endangered suckers and they are critical water sources during summer months for stream and river flows. This effort will benefit not only the immediate springs and tributaries but will benefit the entire watershed area including downstream salmon through improved water quality. Federal funds could be administered through the Fish and Wildlife Service's Partners Program or Endangered Species Recovery Program. The match will be provided by the Klamath Tribes.

2. Pilot field trials to identify alternate pest control methods to be implemented in the Integrated Pest Management Plan on Tule Lake and Lower Klamath National Wildlife Refuges, proposed by New Horizons Technology, contractor to the U.S. Fish and Wildlife Service, \$30,000. The results of these field trials will provide national leadership in implementation of lease land farming on National Wildlife Refuges. Federal funding could be distributed through the Bureau of Reclamation's Sump Rotation Account. The Klamath Basin Ecosystem Foundation would provide the match.

3. Development of a juniper management program, proposed by Oregon Department of Fish and Wildlife & Klamath County Soil and Water Conservation District, \$100,000. Implementation of a program to integrate Best Management Conservation Practices within the juniper woodland zone for juniper treatment, livestock grazing, road management, prescribed fire, and noxious weed control—all management actions that can improve watershed conditions. Furthermore, these practices will be applicable to Oregon's 2.2 million acres of juniper woodlands. Federal funds could be administered through Department of Agriculture's Natural Resources Conservation Service. The match will be provided by Klamath County Soil and Water Conservation District, landowners, and Oregon Department of Fish and Wildlife.

4. Riparian fencing and wetland restoration at various locations, proposed by Ducks Unlimited Western Regional Office, Rancho Cordova, CA, \$150,000. This partnership will contribute to the on-going restoration to benefit water quality and habitat while stabilizing the economy. Federal funds could be administered through the Fish and Wildlife Service's Partners program or Endangered Species Recovery Program. The match will be provided by Ducks Unlimited, landowners and California Department of Fish and Game.

5. Riparian protection and stream structures on three parcels of private lands, proposed by Klamath Soil and Water Conservation Districts, \$243,350. This partnership would open up a multitude of private lands for future restoration and ultimate resolution of ecosystem restoration needs. The direct immediate benefits are in water quality, fish habitat and recovery of endangered suckers. Federal funds could be administered through Department of Agriculture's Natural Resources Conservation Service. The match will be provided by landowners and the Klamath County Soil & Water Conservation District.

6. Wetland restoration on Sevenmile Creek, proposed by Water For Life, \$200,000. This pilot project will demonstrate the ability to improve the water quality of agriculture return waters. Presently nutrient rich agriculture waters are returned directly to the waters of the basin untreated. Federal funds could be administered through the Fish and Wildlife Service's Partners Program or Recovery Program. The match will be provided by private landowners.

7. Support for Geographic Information System center at Oregon Institute of Technology, \$123,000. OIT is willing to utilize its present space to meet a critical community need for GIS products, training and support. This funding would provide the match to OIT's contribution to allow for the acquisition of hardware and software to meet this need. This proposal is developed as a cooperative with Southern Oregon State University and Humboldt State College in California. Benefactors would be local resource agencies, businesses, agriculture community and individuals that are in need of accessing this information. The Department of Health Education and Welfare could be a vehicle to transmit funds. OIT will provide the match.

8. Implement bull trout restoration strategy and install fish barrier to protect bull trout in Sun Creek, proposed by Bull Trout Working Group, \$70,000. The status of bull trout in the basin is at a critical point. Listing as endangered or threatened is possible. A Basin strategy needs to be developed to provide direction for work on-going and for future restoration actions. The Bull Trout Working Group has provided the leadership to start this process and is a local consensus group. Immediate restoration needs to be implemented not only to avoid extinction, but also to help resolve the economic and social concerns that will result from the continued threat to the species. Specifically restoration would be centered on habitat issues that would protect existing population segments. Federal funds could be administered through the Fish and Wildlife Service's Partners Program or Pre-Listing. The match to be provided by Oregon Department of Fish and Wildlife, Trout Unlimited, U.S. Timber Lands, Klamath County Soil & Water Conservation District.

The following two projects were also endorsed for funding through the Interior Department budget:

1. \$500,000 for the continuing restoration of the Wood River Ranch by BLM. This is an ongoing restoration project of 3,200 acres. This project would create critical nursery habitat for endangered suckers. A partnership between BLM, Oregon Trout, Klamath Tribes, private land owners and others provides the kind of community support that sets a precedent. This is a continuation of efforts started in fiscal year 1996.

2. \$1,220,000 for the pilot project for Sump Rotation on the Tule Lake National Wildlife Refuge. This is the most innovative approach to provide for long-term co-existence between farming and wildlife interests on a National Wildlife Refuge system. The program as supported by the Working Group has agreement from the farming and conservation communities that solution has to be reached to allow these two activities to co-exist and prosper. The Refuge benefits to migratory waterfowl goes without question, but equally important is lease land farming that may

be dependent on sump rotation of crops and wetlands for its future. The leasing program is an important national program generating about \$2 million dollars to the national treasury each year in use fees. Funding could be through the Fish and Wildlife Service's Refuge Administrative Program.

The Upper Klamath Basin Working Group continues to be supported by a wide range of differing interest, Klamath Tribes, Oregon Department of Fish and Wildlife, Agriculture, Grazing, Industry, City of Klamath Falls, County of Klamath Falls, Conservation Groups, Oregon State Governor's Office and Federal Agencies. There is coordination with the other Basin restoration entities including the Klamath River Fisheries Task Force, The Klamath River Compact Commission and the Trinity River Task Force.

We respectfully request that you appropriate the \$1 million, as authorized under the Oregon Resources Conservation Act of 1996, for the eight restoration projects identified above for implementation in the Upper Klamath Basin for fiscal year 1998 and provide additional funding to accomplish the Wood River wetlands restoration and sump rotation on the Tule Lake National Wildlife Refuge. These restoration efforts will provide solutions that can lead to recovery of the endangered suckers, down stream salmonids and prevent potential future resource problems. They will also help the AG community, the City and County, the Klamath Tribes, and the Lower Klamath River commercial interests and tribes.

Background history: Senator Hatfield first established the Upper Klamath Basin Working Group as a volunteer group, the "Hatfield Klamath Basin Working Group", in early 1995 following a July 6, 1994, Senate Hearing in Klamath Falls. Testimony at the Senate Hearing demonstrated a strong desire and willingness by the local community to resolve its environment/economic issues at the Basin level. The Senator felt the local people were knowledgeable about the issues, that they were a lot closer to consensus than apart on the issues, and that they wanted an opportunity to resolve their own issues. He therefore appointed a group of 27 people representing public and private interests to serve on the Hatfield Klamath Basin Working Group.

The Senator's charge to the Upper Klamath Basin Working Group was to review issues in the basin and provide to him recommended solutions. The Senator specifically requested that the Working Group address: 1. Ecosystem Restoration; 2. Economic Stability; and 3. Reducing Drought Impacts. The Working Group was asked to identify short term recommendations for fiscal year 1996 and long term recommendations for out years. The Senator asked the group to work through consensus. Each member was chosen because they represent a segment of the community and through their consensus actions would provide community support and agreement. The Senator then pledged his support to help implement what the Working Group developed.

The Working Group first met April 6, 1995, developed ground rules for their consensus process, and on May 17, 1995 the Working Group developed six short term projects and sent them to the Senator for inclusion in the fiscal year 1996 Budget. From the recommendations the Senator obtained \$3,500,000 under the Wetland Reserve Program for Tulana Farms and \$725,000 was added to the Service's Klamath Falls Fish and wildlife Service Office for riparian restoration.

Tulana Farms wetland restoration is one of the nation's largest restoration effort to restore a river delta. When completed the restoration will put back 4,700 acres of riparian and wetland habitat that will benefit the endangered Lost River and shortnose suckers and improve water quality and quantity in Upper Klamath Lake. During the restoration phase New Earth and PacifiCorp will operate 1100 acres of agricultural in holdings to demonstrate the compatibility of farming and ecosystem restoration.

The Tulana restoration project and the riparian restoration effort have provided for the development of significant partnerships and consolidated efforts of many diverse groups. Included are: The Nature Conservancy, Oregon Trout, Water for Life, the Klamath Basin Water Users Association, The Klamath Tribes, PacifiCorp, New Earth, Oregon Department of Fish and Wildlife, The Natural Resources Conservation Service, The Bureau of Reclamation, The Bureau of Land Management, The Forest Service, The Fish and Wildlife Service, The National Fish and Wildlife Foundation, The County of Klamath, The City of Klamath Falls, The Friends of the Winema, The Klamath County Soil and Water Conservation District, Industry and interested citizens.

The Working Group developed a second set of recommendations for the fiscal year 1997 Budget that resulted in an additional \$5,500,000 million for restoration of Tulana Farms, \$500,000 for BLM wetland restoration of the Wood River Ranch and an additional \$500,000 for restoration by the Klamath Falls Fish and Wildlife Service Office. This funding has continued the above partnerships which not only

wouldn't have been possible two years ago, but which generated a synergy to take on projects which would have been beyond the abilities of any one group.

In order to insure the continued restoration of the Upper Klamath Basin on a consensus basis Senator Hatfield and Congress in 1996 created the Upper Klamath Basin Working Group as a pilot public advisory committee authorizing \$1 million per year for five years. The federal funds were to be matched by other funding. This authorization was supported by Federal Agencies, and the Oregon Congressional Group. The Act also provided for a coordination and communication group to be made up of two members each of the Trinity River Task Force, the Klamath River Compact Commission, The Klamath Fisheries Task Force and the Upper Basin Working Group. That group has met as the Klamath Watershed Coordinating Group three times in the last three months, and is optimistic about the opportunity to bring the entire Klamath River Watershed into a working whole.

PREPARED STATEMENT OF TRYGVE SLETTELAND, PACIFIC RIVERS COUNCIL

We urge the 105th Congress to take the following steps through appropriations legislation to increase the accountability of the Forest Service and the Bureau of Land Management for the protection and restoration of watersheds which provide clean water and fish habitat to the citizens of the west.

1. Prohibit new roadbuilding on the National Forests and Bureau of Land Management public lands by ending any appropriation for new roads and by prohibiting the use of purchaser road credits to build new roads.

2. Target fire-prevention funds to those areas where increased fire hazard threatens lives and property.

3. Target ecosystem restoration funds to those locations and activities which are likely to have the greatest ecological benefits. In many cases, this will mean funding for activities that remove existing threats to salmon and trout habitat and water quality.

4. Prohibit logging and road-building on unstable and potentially unstable national forest land. Recent landslides in the West have amply demonstrated the "hidden costs" to public safety and the environment of subsidized logging and road building on steep, unstable slopes.

5. Link accomplishment of ecological goals to managers' performance reviews.

A brief explanation of our rationale for these requests is provided below.

1. Eliminate roadbuilding subsidies and shift emphasis of roads program to obliteration

We urge the Committee to consider the fiscal and ecological benefits of using the appropriations process to prohibit new roadbuilding on the National Forests and Bureau of Land Management public lands by authorizing zero funding for new roads and by prohibiting the use of purchaser road credits to build new roads. We note that the President has taken the first step in this direction by eliminating purchaser road credits from his budget. At least one half of savings should go to targeted road decommissioning projects and improvement work designed to address the highest priority risks in the most ecologically sensitive watersheds.

The enduring ecological impacts of roads are many and well-known:

"Roads may have unavoidable effects on streams, no matter how well they are located, designed or maintained. Roads modify natural hillslope drainage networks and accelerate erosion processes. These changes can alter physical processes in streams, leading to changes in streamflow regimes, sediment transport and storage, channel bank and bed configurations, substrate composition, and stability of slopes adjacent to streams. These changes have significant biological consequences that affect virtually all components of stream ecosystems." (Federal Ecosystem Management Assessment Team 1993).

A prohibition on new roadbuilding would implicitly recognize the critical need to protect existing unroaded areas. There is an overwhelming consensus among natural resource agencies and within the scientific community that existing roadless areas are of extremely high ecological value. The literature points clearly to at least two conclusions which have management implications: (1) roadless areas are critical because they are the only undisturbed habitats on an almost universally disturbed landscape. As such, they are the de facto refuges for numerous aquatic, riparian-dependent and terrestrial species; (2) the reasons that these areas are roadless (high elevation, steepness and erodibility) are precisely the same reasons that they should be protected from roads and other management impacts: in these areas the risks to stream habitats from disturbance are extremely high.

Removing subsidies for roadbuilding also is fiscally responsible given that the land management agencies are far from meeting current road maintenance needs. Reducing road mileage will decrease road maintenance backlogs and, ultimately, permit reductions in agency work force.

As Congress has directed in past years, roads funding should be shifted to obliteration and re-engineering which addresses the risks to key watersheds and healthy salmon habitat regionwide. Projects should be selected which have the greatest impact on factors limiting salmonid spawning, rearing and holding habitat including sediment input, riparian cover etc. "Projects which will have the greatest long-term positive impact on watershed conditions should be favored over those with short-term benefits." (House Appropriations Report, June 24, 1993).

2. *Target fire-prevention funds to those areas where increased fire hazard threatens lives and property*

We urge the Committee to provide guidance that carefully targets current timber salvage and thinning and other "forest health" management efforts to focus our limited resources on the highest priority areas and while minimizing risks. These areas are those within the urban-wildland interface. Such targetting would be responsive to the desire to reduce the risks to life and property while simultaneously minimizing the risks forest health treatment could post to aquatic resources. This targetting is fully consistent with, and arguably required by, existing policies.

For example, Agriculture Secretary Glickman's guidelines for last year's emergency salvage program directed that salvage sales be targeted to areas where forests * * * "have high fuel loading or present a high fire risk and are near communities or occupied structures, such as homes * * *." Similarly, the interagency Federal Wildland Fire Management Final Report (USDA/USDI, December 16, 1995) reaffirmed protection of life and property as * * * "the first priority in wildland fire management." This report clearly recognized that the key role for federal managers' in preventing fires in the intermix zone is to reduce fuel hazards affecting populated areas on the land they administer.

The targetting we suggest is supported not only on the basis of human risks and values, but on purely ecological grounds as well. The conclusions of the blue-ribbon panel of scientists on the Aquatics Team of the Interior Columbia Basin Ecosystem Management Project support the need for extreme caution in subjecting ecologically sensitive watersheds to intensive fire-prevention treatments:

"Since past timber harvest activities have contributed to degradation in aquatic ecosystems, emphasis on timber harvest and thinning to restore more natural forests and fire regimes represents a risk of extending the problems of the past. * * * Attempts to minimize the risks of large fires by expanding timber harvest risk expanding well-established negative effects on aquatic systems. The perpetuation or expansion of existing road networks, and other activities might well erode the ability of [fish] populations to respond to the effects of fire as well as large storms and other disturbances that we cannot predict or control. (National Research Council, 1995)." (Lee et. al., 1996, "A Broad-scale Assessment of Aquatic Species and Habitats" pre-publication draft, Chapter VI).

The Team's findings support an assumption that the ecological risks from vegetative manipulation to aquatic systems outweigh the benefits in relatively undisturbed (e.g. sparsely roaded) watersheds unless and until we have dependable information to the contrary:

"In our haste, forest-health treatment projects have been justified from all perspectives including the risk of extirpation for sensitive aquatic species. There is undoubtedly a point where the risk of fire outweighs the risk created by our management. Management creates risk of somewhat known magnitude, timing, and extent, whereas wildfire potential is less known in each of these respects. Therefore, that point needs to be discovered through careful evaluation and scientific study. * * * Risks of fire are likely most important for aquatic ecosystems that have been seriously degraded and fragmented. *Watersheds that support healthy populations may be at greater risk through disruption of watershed processes and degradation of habitats caused by intensive management than through the effects of fire.*" (emphasis added).

3. *Target ecosystem restoration funds to those locations and activities that are likely to have the greatest ecological benefits.*

There is a need for clear guidance to focus watershed restoration efforts on those activities that have the greatest known positive impact on watershed function and riparian and aquatic habitats. Signals now are conflicting, and may lead the agencies to undertake experimental vegetative management activities that have little or no effect in addressing the most pressing ecological problems. We urge the Commit-

tee to provide guidance that effectively targets funding for ecosystem restoration to those activities with the greatest ecological benefits. In most cases, these activities will be those intended to protect and restore areas with relatively high water quality, relatively healthy salmon and trout habitat and high value for both aquatic and terrestrial species.

In much of the federally managed forested watersheds of the west, this kind of targeting will result in funding for road re-engineering, obliteration and culvert improvements. On federal rangelands, livestock enclosures and riparian revegetation may be the top priority.

The overwhelming weight of evidence suggests that the highest priority for federal lands restoration management in the Northwest is addressing road-related threats to streams and native fisheries and slope stability. The results of the recent storms have demonstrated clearly that logging and associated roads have reduced the ability of forested areas to withstand heavy rains. Far too many of our last best habitats for salmon, bull trout and other native fish were decimated by road-related landslides during the fall and winter of this year. Sadly, much of the damage to water quality and fisheries could have been prevented by more aggressive implementation of watershed restoration programs that already are established under existing federal plans and policies. We call on the Committee to meet funding needs, but also to provide clear direction to ensure these needs are met.

4. Permit natural recovery of watersheds by prohibiting logging and roadbuilding—particularly post-flood reconstruction—on unstable and potentially unstable national forest land. Recent landslides in the West have demonstrated the “hidden costs” to public safety and the environment of subsidized logging and road building on steep, unstable slopes.

The story is the same all over the Northwest: hillsides saturated with water are giving way, especially where they are weakened by roads and logging. In some watersheds, failures are occurring only because of roads. Pools and gravel bars, prime habitat for salmon and bull trout, are being filled with sediment. Stream channels are being scoured by debris torrents.

In an ideal world, natural disturbances like these wouldn't pose any real threat to the survival of species like salmon and bull trout, because the effects of high runoff would not be as severe and there would be plenty of other habitat to cushion the blow. But today's landslides all are too often in some of the last remaining habitat of sufficient to sustain our ailing fisheries. There are places like Isabella Creek and the North Fork of the Clearwater River, which the Forest Service has recognized as “priority watersheds” for bull trout that are suffering as a result of logging and/or road induced flood damage.

The message is clear: we have managed our lands to the point where even the last best places have been littered with time-bomb of our own making. In most cases, the bombs are clearcut hillsides and roads which have been poorly built and/or have been built in places where they nave should have been built at all.

This committee has an opportunity to demonstrate that we have learned from what is happening. Roads exist on steep, unstable slopes, where the are sure to fail in heavy rains no matter how fancy the engineering. These roads, now blown, should not be rebuilt. Other roads, now flooded because of debris dams in streambeds, were built along valley bottoms. Instead of listening to the floods and letting them heal our rivers, the tendency is for land managers to go in and pull out woody debris to keep the channel out of the roadbed and to ensure bridge safety. (This was done by managers on the North Fork of the Boise River, where wood was removed to facilitate access to timber sale units.) In most cases, roads we are attempting to save through these measures are suffocating the stream by restriction it to a single channel, which prevents the creation of pools and off-channel habitat for fish and restricts its ability to handle future flood events. Many of these roads too, should not be rebuilt. This will mean that some timber sales cannot be harvested using conventional, and perhaps any, method, because they will be too expensive to access without roads. But the payoffs generated by a healthier watershed will be greater in the long run.

The signals the earth is sending are unambiguous: we have used up our margin of safety. Given the high level of disturbance on the landscape, where even the most pristine of environments is threatened with road blowouts, the best option now is to stop kidding ourselves. Rather than trying to control natural disturbances, we should—wherever possible—let them play out. Just as forested ecosystems depend on fire to maintain their complexity and integrity, rivers depend on the irregular patterns of floods and droughts to maintain theirs.

5. *Make Managers Accountable for Meeting Ecological Objectives by Making them part of Performance Reviews of Line and Staff Officers.*

Performance measures needs to be adjusted to meaningfully reflect the accomplishment of ecological goals. If the line and staff officers have an incentive to meet goals that are related to the attainment of aquatic conservation and other objectives, the decision makers will be required to more carefully consider the recommendations of the resource experts within the agency.

Last year's Logging Rider clearly demonstrated the Forest Service's lack of accountability: healthy, green forests were logged as "salvage sales," water quality was endangered in the name of "forest health," and no record exists that any of the salvage sales sold under the rider generated funds for the U.S. Treasury or improved the ecological health of the watershed. As a result of the failure by the Forest Service to protect the full range of public lands values, both the ecological integrity of our forests and the interests of the taxpayers were sacrificed.

LETTER FROM J. KEVIN LACKEY, CONSERVATION PROGRAMS DIRECTOR, ROCKY MOUNTAIN ELK FOUNDATION

MISSOULA, MT, *March 18, 1997.*

Hon. SLADE GORTON,
Chair, Senate Interior Appropriations Subcommittee, Senate Dirksen Office Building, Washington, DC.

DEAR SENATOR GORTON: The non-profit Rocky Mountain Elk Foundation (RMEF), a wildlife habitat conservation organization, was established in 1984 to ensure the future of elk, other wildlife and their habitat through cooperative conservation activities utilizing hundreds of government and non-government partnerships.

The RMEF has efficiently operated with federal partners and would appreciate the Senate Interior Appropriations Subcommittee considering the following recommendations for the fiscal year 1998 budget:

U.S. FOREST SERVICE

The USFS "Elk Country" initiative is part of the agency's Wildlife Habitat Management Program commonly known as "Get Wild." The RMEF has cooperated with the USFS in this initiative to cumulatively accomplish over 685 USFS projects enhancing 806,811 acres of public lands. This project activity was completed with \$3.2 million of RMEF funds and matched by \$7.9 million of cooperator funds, including USFS and other contributions.

Wildlife habitat management budget

The President's fiscal year 1998 budget proposes \$29.9 million for the USFS Wildlife Habitat Management Program. RMEF recommends an additional \$10 million for a total of \$40 million to accomplish a larger portion of the \$54 million worth of habitat management opportunities identified in current forest plans for the Get Wild programs.

Challenge cost share budget

The USFS Challenge Cost Share Program (CCS) is a highly successful, popular and effective avenue to garner additional private funds for national forest fish and wildlife habitat improvement projects. As one of the earliest organizations to cooperate with the USFS in the CCS program, RMEF believes this program's effectiveness is becoming hampered by USFS budget reductions begun in fiscal year 1994. The budget decision to fund some operations and maintenance costs with wildlife habitat management dollars results in fewer CCS dollars available to match RMEF and other non-governmental organization dollars for actual "on the ground" projects. RMEF encourages the committee to appropriate \$8 million of the additional recommended \$10.1 million to the CCS program for the USFS's wildlife habitat management program in fiscal year 1998, thereby maintaining the momentum, efficiency and popularity this program currently enjoys. The RMEF also recommends the committee specify CCS funds be exclusively utilized for "on the ground" cooperative project activities and not for USFS administrative purposes.

Seeking common ground initiative

The Seeking Common Ground Initiative (SCG) is a successful national partnership effort addressing livestock/big game interaction on western rangelands. This endeavor is comprised of the RMEF, USFS, BLM, International Association of Fish and Wildlife Agencies, National Fish and Wildlife Foundation, American Farm Bureau Federation, National Cattleman's Association, Public Lands Council, National

Rifle Association and the Wildlife Management Institute. The SCG goals are as follows:

1. Improve public and private rangeland condition.
2. Promote individual stewardship that improves rangeland resources.
3. Improve communications among rangeland users.
4. Reduce real and perceived habitat conflict between wildlife and livestock.
5. Encourage problem-solving at the local level.

This program has more potential to advance positive action affecting public and private rangelands than any other activity today because of the program's emphasis on cooperative action to achieve mutually shared goals. RMEF supports the committee providing \$250,000 designated specifically to this program in fiscal year 1998. These additional funds would be leveraged to obtain matching funds from other private partners, thereby financing expanded activities including SCG national demonstration projects. The appropriated funding would best serve the SCG program if one-half (\$125,000) of the funds were allocated to the USFS fish and wildlife program and one-half (\$125,000) to the range program.

BUREAU OF LAND MANAGEMENT

The BLM has been a much more active partner with RMEF as a result of what we recognize as increased attention to fish and wildlife programs on public lands. An increased effort on behalf of the agency to fund additional wildlife habitat work on its 270 million acres would be in line with today's demands for increased wildlife and related recreation on public lands. To date, RMEF has contributed \$1.1 million to 206 projects on BLM lands, enhancing 170,912 acres of wildlife habitat under BLM jurisdiction.

National Fish and Wildlife Management budget

Fish and wildlife habitat management within the BLM is proposed to receive a fiscal year 1998 appropriation of \$27.7 million. Although this amount is an increase over fiscal year 1997 the RMEF would encourage the committee appropriate a fiscal year 1998 total of \$30 million for fisheries (\$1.15 million additional) and wildlife (\$1.15 million additional) programs to promote habitat work on BLM lands identified in the agency's Fish and Wildlife 2000 strategic planning document.

Seeking common ground initiative

The RMEF also encourages the committee to appropriate to the BLM over and above the \$30 million an additional \$250,000 for the Seeking Common Ground effort mentioned above. As a full SCG partner the BLM would utilize the funds to secure additional private matching funds for the restoration and enhancement of wildlife and livestock habitat on public lands. RMEF would suggest the funds be evenly divided between the BLM's range and wildlife programs, thereby emphasizing the cooperation necessary to continue the program's success.

U.S. FISH AND WILDLIFE SERVICE

RMEF strongly supports a \$200 million fiscal year 1998 budget for refuge operation and maintenance. RMEF's opportunity to form additional partnerships with the USFWS, particularly in those areas of high public interest such as the National Elk Refuge in Jackson, Wyoming; can be greatly enhanced by the USFWS investing in modern public information/education and refuge management facilities.

NATIONAL FISH AND WILDLIFE FOUNDATION

RMEF recommends the committee provide fiscal year 1998 National Fish and Wildlife Foundation (NFWF) funding at \$10 million as follows: USES: \$1.5 million; BLM: \$1.5 million; USFWS: \$7.0 million). NFWF has become RMEF's leading project cooperator by providing over \$530,000 in matching funds for wildlife habitat conservation. NFWF's aggressive matching funds requirements focuses private sector fundraising efforts for many organizations and has resulted in effective utilization of the appropriated federal dollars. NFWF's effectiveness is key to its partner's successes and this formula should be expanded through increased funding.

On behalf of its over 100,000 members, the Rocky Mountain Elk Foundation appreciates this opportunity to provide comment to the appropriations subcommittee. Thank you for your support.

Sincerely,

J. KEVIN LACKEY,
Conservation Programs Director.

LETTER FROM WARREN T. DOOLITTLE, PRESIDENT, INTERNATIONAL SOCIETY OF
TROPICAL FORESTERS, INC.BETHESDA, MD, *March 5, 1997.*

Hon. SLADE GORTON,
*Chair, Senate Appropriations Subcommittee on Interior and Related Agencies, U.S.
Senate, Washington, DC.*

DEAR SENATOR GORTON: As a former Associate Deputy Chief for Forest Service Research during the 1970's, I am deeply concerned with the Forest Service research budget for 1998. The reduction of line items in the budget from four to one line item makes it especially difficult to focus on and follow the diverse segments of the overall research program. And, the reduction of funding from \$193,509,000 for 1995 down to the President's budget of \$179,786,000 for 1998 is especially detrimental to the program. The trend of these reductions has resulted in the loss of many important projects and valuable scientists.

The reductions in funds and in scientists come at a very critical time in the need for providing the scientific information and technology essential to the protection, management, use, and sustainability of the nations 1.6 billion acres of forests and rangelands. With the new direction of the Forest Service and other land managers to manage natural resources according to the principles of ecosystem management, there is urgency to move ahead promptly with a blend of new basic research and a continuation of older long-term research to meet the needs of people at both the local and national levels in providing forest products, diversity, and recreation—with sustainably managed forests.

Forest Service Research describes its program under four broad areas:

1. Vegetation management and protection;
2. Wildlife, fish, water, and air sciences;
3. Resource valuation and use;
4. Forest resources inventory and monitoring.

The reduction in funding especially hurts the research efforts in the first three areas above. Research had 708 scientists in 1985, and since that time there has been a gradual attrition of budgets and scientists—down to 548 scientists with the proposed President's budget. These incremental reductions have resulted in drastic losses of key scientists and valuable, long-term research in the so called foundation areas—which often require many years for forests to respond to experimentation.

In summary, the research efforts of the Forest Service are going down exactly at a time when they should be going up. I implore you to reconsider the reductions being made in the research budgets, and restore the programs to a level of at least \$200 million.

Please let me know if I can be of any further assistance on Forest Service research.

Sincerely,

WARREN T. DOOLITTLE,
President.

LETTER FROM WARREN T. DOOLITTLE, PRESIDENT, INTERNATIONAL SOCIETY OF
TROPICAL FORESTERS, INC.BETHESDA, MD, *March 5, 1997.*

Hon. SLADE GORTON,
*Chair, Senate Appropriations Subcommittee on Interior and Related Agencies, U.S.
Senate, Washington, DC.*

DEAR SENATOR GORTON: I am writing this letter to you because of my deep concern for the international program in the USDA Forest Service. My name is Warren T. Doolittle—the elected President of the International Society of Tropical Foresters, Inc. [ISTF].

BACKGROUND ON ISTF

ISTF was first organized in 1950 and chartered as a—nonprofit scientific society of Washington, D.C., in 1979. ISTF is committed to the management, protection, and wise use of the world's tropical forests. This commitment is carried out through a network of about 2000 members in 115 countries—including the tropical, developing countries and most developed countries.

ISTF publishes a quarterly newsletter in English, Spanish, and French; publishes an annual Membership Directory; distributes publications on tropical forests; spon-

sors workshops and symposia; organizes chapters of ISTF; and generally serves as a source of information for ISTF members.

TROPICAL FOREST RESEARCH

Over the years, the Forest Service has carried out a modest program in tropical forest research with funding included as part of the regular research budget with programs for the International Institute of Tropical Forestry in Rio Piedras, Puerto Rico; the Institute of Pacific Island Forestry in Honolulu, Hawaii; and the Forest Products Laboratory in Madison, Wisconsin.

The research budget for the International Institute of Tropical Forestry in Puerto Rico was \$3,116,000 in 1995. However, the President's budget for 1998 is \$2,797,000. This level of funding means that research on the social and economic values of tropical forestry and on non-traditional forest products will not be continued. And, only the more critical issues of ecosystem management, reforestation of degraded lands, natural regeneration, and management of secondary forests will be pursued with a lesser capability.

The research budget for the Institute of Pacific Island Forestry in Hawaii was \$1,667,000 in 1995. And, the President's budget for 1998 is \$1,650,000. However, for 1997, the Washington office (Research) provided another \$629,000 (for one year only) to bring the total 1997 budget to \$2,100,000. This enabled the Institute to move ahead with research on the restoration and management of tropical forests in Hawaii and the Pacific region. It is important that the 1997 level be maintained in the budget for 1998.

The Forest Products Laboratory budget for research in the tropics was \$925,000 in 1995; it was reduced to \$635,000 in the President's budget for 1998. This downward spiral in budgeting means that critical progress being made on the utilization of lesser known tropical hardwoods and work on lumber grades for these species will be greatly slowed.

I recommend that Congress restore the regular international forestry budgets of the two institutes and the Forest Products Laboratory to the fiscal year 1995 level.

INTERNATIONAL FORESTRY (NONRESEARCH)

The International Forestry (nonresearch) line item budget for 1995 was \$7,000,000 and the President's budget for 1996 was \$10,000,000. However, Congressional rescissions made in 1995 reduced the \$7,000,000 figure down to \$5,000,000, and the line item for 1996 and 1997 was zeroed. In place of the line item budget an agreement was reached that the Forest Service could spend up to \$3,000,000 in 1997 and 1998 from the overall Forest Service budget.

This reduction in budget for international activities could not have come at a worse time for forestry. Globally, and especially in the tropics, forests are being depleted at an unprecedented rate, and there is a great need for solid leadership and demonstration in forestry.

There is currently a worldwide effort by members of the environment, industry, and governments to come up with guidelines and assistance to provide sustained management for the world's forests. The Forest Service had built up a competent staff and forward looking program to face the multiple facets of sustained management; product certification; and cooperative research and technical efforts in meeting the challenges in forestry. However, Forest Service participation has been crippled and reduced at this critical juncture of time. Meanwhile environmentalists and others are moving ahead with planning and assistance that the Forest Service cannot match with a \$3,000,000 budget.

The world's forests provide wood and non-wood products, soil and water protection, biodiversity, and sequestration of carbon dioxide as a deterrent to global warming. This is no time for the United States to allow other interests make critical decisions on forestry.

I strongly recommend that Congress restore the \$7,000,000 budget level of 1995—and if possible even raise it to the earlier proposed 1996 level of \$10,000,000.

Please let me know if I can provide any further information on international forestry.

Sincerely,

WARREN T. DOOLITTLE,
ISTF President.

PREPARED STATEMENT OF ANDREA L. COLNES, DIRECTOR, THE NORTHERN FOREST ALLIANCE

Mr. Chairman and members of the Subcommittee, I want to thank you for taking testimony on the fiscal year 1998 budget request for natural resource programs under your jurisdiction. I am Andrea Colnes, Director of the Northern Forest Alliance, a coalition of more than 30 State, regional and national organizations representing more than one million members who have come together to promote strategies for the protection and stewardship of more than 26 million acres of some of America's most significant forests across the northern tier of New York, Vermont, New Hampshire and Maine.

This is by far the largest remaining wild forest in the East, and is an incomparable natural resource for the people of the region and the nation. The vast, contiguous Northern Forest features the highest and most rugged mountain ranges in the Northeast; some of the very best free-flowing rivers in America; thousands of ponds and lakes that have to date escaped the irreversible impacts of development; and a forest that, if managed wisely, can provide a steady supply of timber while preserving important wildlife habitat and scenic beauty and serving as a destination for hunting, fishing, camping, hiking, snowmobiling, and other recreation uses.

We have a unique opportunity to work together to protect the region's most important Wildlands; to promote the sustainable production of wood products from these forests; and to improve and expand resource-dependent local economies and communities. With funding provided by this Subcommittee, the Northern Forest Lands Council worked over four years with thousands of citizens and organizations representing a wide range of interests to develop 37 specific recommendations for state and federal action to conserve the Northern Forest.

These recommendations are a reflection of the strong public support that exists across the region for protecting the resources, communities and way of life that is dependent on sustainable management of these forests. One of the key recommendations in the Council's report is support for public land acquisition as an essential part of a strategy for the future of the region. The Council called public land acquisition "an important tool in protecting components of the full range of values in the Northern Forest." In response each of the four states has either established a land acquisition planning process that covers its portion of the Northern Forest, or has engaged in deciding strategies to protect important areas in the region. The Council recognized, however, that the states will need to work in partnership with the federal government to achieve these goals.

Last Congress the Senate passed the Northern Forest Stewardship Act, a bill which would implement many of the recommendations of the Northern Forest Lands Council concerning land protection, sustainable forest management, and measures to strengthen local and regional forest-based economies. If this bill becomes law, it would provide explicit authority to the federal government—at the request of any of the four states—to use either the federal side or the state share of the Land and Water Conservation Fund to help finance acquisition of important Northern Forest conservation lands. This would provide long overdue access to a fair share of LWCF money to the people of New England. The Stewardship Act would authorize purchases from willing sellers only from the Fund.

As an important step towards achieving the goals embodied in the Northern Forest Stewardship Act and implementing a comprehensive strategy to conserve the Northern Forest, the Northern Forest Alliance has identified a region-wide system of 10 proposed Wildlands across the four states. These areas contain lands vital to the region's forest products and recreation economies. A detailed description and discussion of possible protection strategies for these areas is attached to my testimony.

Protecting the following parcels from possible development would be a critical first step towards achieving a longer-term vision for the Northern Forest. In particular, seven projects involving more than 80,000 acres of critical forest lands require immediate funding from the Land and Water Conservation Fund and the Forest Legacy Program if they are to be protected from imminent sale and development. By making this commitment, you would also indicate renewed support for the beleaguered Land and Water Conservation Fund which has served the people of our country so well for so long. fiscal year 1998 Northern Forest acquisition priorities

FISCAL YEAR NORTHERN FOREST ACQUISITION PRIORITIES

Urgent

Lake Tarlton, NH: 2,000 acres estimated.
Public acquisition cost: \$2.7 million.
Request for Federal LWCF funds: \$2.7 million.

An appropriation from LWCF in fiscal year 1998 will complete the federal portion of this important project, started last year. Federal funds will leverage an additional \$1.4 million investment from state and private sources to help protect the scenic and ecologically rich shore of Lake Tarleton and the surrounding forest including three lakes—Tarleton, Katherine, and Constance.

Urgent

Whitney Estate, NY: 15,000–20,000 acres.
Estimated public acquisition cost: \$25–50 million.
Request for State LWCF funds: \$10 million.

Fifteen thousand acres of the “Whitney Estate,” a 51,000-acre tract in the heart of the Oswegatchie Great Forest, has been subdivided and offered for sale. This sale would fragment a critical stretch of forestland including more than 40 lakes and ponds, some of which form the headwaters of the Beaver, Raquette, and Bog rivers and the largest private lake in the Adirondacks.

Urgent

Long Trail, VT: 1,060 acres.
Estimated public acquisition cost: \$325,000.
Request for State LWCF funds: \$162,500.

Seven key parcels on the northern section of Vermont’s Long Trail, the Nation’s oldest long-distance hiking trail, are for sale, jeopardizing the trail’s continuity. These seven parcels, totaling 1,060 acres, include 3.5 miles of the Long Trail itself, which runs the length of Vermont along the crest of the Green Mountains. More than 200,000 Vermont residents and visitors hike sections of the trail annually, contributing significantly to Vermont’s tourism economy.

Urgent

Fish Creek Watershed, NY: 30,000–40,000 acres.
Estimated public acquisition cost: \$7.5 million.
Request for forest legacy funds: \$5.625 million.

An opportunity exists to protect 30,000–40,000 acres of irreplaceable watershed in the core of New York’s Tug Hill Plateau with a combination of full fee purchase and conservation easement. The Fish Creek watershed lies within the Tug Hill area and provides drinking water to several cities and communities, including Rome and Oneida. Citing threats from land speculation and development, American Rivers has included Fish Creek in its list of the “Most Threatened Rivers” in the Nation for 2 years.

Urgent

Green River Reservoir, VT: 6,350 acres.
Estimated public acquisition cost: \$2 million.
Request for forest legacy funds: \$1.5 million.

Surrounding the 1,000-acre Green River Reservoir, this Forest Legacy project consists of more than 6,000 acres of forestland in northern Vermont. The property includes the state’s longest length of undeveloped shoreline, approximately 19 miles, and has been top on the state’s Forest Legacy list, stalled only by last year’s recession of Forest Legacy funds.

Urgent

Nicatous Lake, ME: 22,000 acres.
Estimated public acquisition cost: \$4 million.
Request for forest legacy funds: \$3 million.

Nicatous Lake is known for its high concentration of ecological, recreational, and economic values. This project would protect more than 27 miles of shoreline on Nicatous Lake which is listed in “Maine’s Finest Lakes” for its outstanding wildlife, scenic, and shore character resources, significant fisheries and cultural features.

Urgent

Upper Richardson Lake, ME: 5,122 acres.
Estimated public acquisition cost: \$2.2 million.
Request for forest legacy funds: \$1.65 million.

The Upper Richardson Lake project presents the Forest Legacy Program with an opportunity to ensure that more than 5,000 acres stays in timber production and to protect 13 miles of lake shore. Residents and recreationists seek out Upper Richardson Lake for its fishing, hunting, remote camping, snowmobiling, and outstanding visual beauty.

Pond of Safety: 9,880 acres
Estimated public acquisition cost: \$2 million.

Request for forest legacy funds: \$1.5 million.

The Pond of Safety property spans more than 12,000 acres along the boundary of the White Mountain National Forest. A Forest Legacy Program, easement on 9,880 acres would link two surrounding sections of the National Forest, buffer it from development, guarantee continued public access for recreation, and protect important timber lands.

Champion Lands, NY: 95,000 acres.

Estimated public acquisition cost: \$12–15 million.

Request for forest legacy funds: \$6 million.

Request for State LWCF funds: \$3 million.

Without a combination of funding from the LWCF State Grants program and the Forest Legacy Program, extensive, high-value lands owned by Champion International along remote, pristine rivers in the northwest area of the Adirondack Park may be lost to fragmentation and development. LWCF money would be used for outright purchase of river corridors. Forest Legacy funds would enable the State to purchase an easement on the adjoining forestland, ensuring that the bulk of this 95,000-acre holding remains in productive timber management.

Lake George, NY: 400 acres

Estimated public acquisition cost: \$3.5 million.

Request for State LWCF funds: \$1.75 million.

On the shores of Lake George, the “Queen of American Lakes,” an incredible 2.5 miles of pristine lake frontage is being offered for sale—and is in jeopardy of being developed and permanently closed to the public. This tract on the northeastern shore includes more than 400 acres of forested mountain slopes and is an integral part of the undeveloped scenic landscape that supports the region’s tourism economy which draws tens of thousands of visitors each year.

Domtar Lands, NY: 105,000 acres.

Estimated public acquisition cost: \$10–15 million.

Request for forest legacy funds: \$6 million.

In the heart of the Adirondack Park, Domtar Industries is offering a conservation easement on 105,000 acres of contiguous, high value forestland. While the property has been managed for a continuous flow of forest products, the 105,000-acre tract—and the jobs it supports—could be lost to fragmentation and development.

Mattavamkeag Lake: 4,195 acres.

Mattawameag River, ME: 11,218 acres.

Moose River, ME: 4,525 acres.

Estimated public acquisition cost: \$2.8 million.

Request for Forest Legacy Funds: \$2.1 million.

These three projects together contain a high concentration of public values including recreational assets, productive forest land and wildlife habitat. A total of 38 miles of shoreline would be protected from development through Forest Legacy easements which would help protect the region’s water quality and provide valuable recreational resources for anglers and boaters.

Total requested appropriations

14 projects: 331,813 acres.

Fiscal year 1998 priority request:

Forest legacy program: \$11.8 million.

State LWCF funds: \$10.16 million.

Federal LWCF funds: \$2.7 million.

Total estimated Public Acquisition cost: \$107 million.

I also want to mention that the Alliance is a founding member of the new Americans For Our Heritage and Recreation coalition, an alliance of national, regional, State, and local organizations dedicated to renewing and strengthening our Nation’s investment in places that conserve our natural and cultural heritage and provide recreational opportunities for all Americans. We are determined to see the Land and Water Fund receive the full \$900 million authorization annually, or to create an alternative that facilitates the protection of conservation lands, cultural and historic sites, urban parks, and expands outdoor recreation at the State and Federal levels. For fiscal year 1998, the coalition seeks an appropriation of \$400–500 million to fund the top tier of the tremendous national backlog of State and Federal LWCF projects. It is particularly important that the state side of LWCF be re-vitalized to serve critical land conservation needs of urban and rural Americans across the country.

Mr. Chairman, protection of these outstanding places represents a tremendous opportunity to conserve places of extraordinary natural and public value. It would also represent the continued commitment of Congress to work with the people of Maine, Vermont, New Hampshire, and New York to protect the irreplaceable resources of

the Northern Forest for future generations of Americans. Thank your for considering this request.

PREPARED STATEMENT OF DANIEL R. DESSECKER, FOREST WILDLIFE BIOLOGIST

The Wildlife Habitat Management Program of the United States Forest Service is that portion of the Wildlife and Fisheries Budget Line Item that funds habitat management initiatives on our National Forests for wildlife species that are not classified as Threatened or Endangered.

In 1994, the Wildlife Habitat Management Program was reduced by \$9.5 million (22 percent). These funds were transferred to the newly established Ecosystem Planning, Inventory and Monitoring Program [EPIM]. In 1997, the now separate EPIM budget line item totaled \$130 million.

The transfer of significant funds from well-supported, identifiable programs such as the Wildlife Habitat Management Program to EPIM, which is sufficiently broad to preclude and/or include virtually any expenditures renders it difficult to hold the Forest Service accountable for these expenditures. In addition, recent shortfalls in support for the Wildlife Habitat Management Program have hampered the timely implementation of resource management activities, including wildlife habitat management initiatives associated with timber sales, important to the conservation community.

The Ruffed Grouse Society and other conservation organizations have long supported the Wildlife Habitat Management Program and have provided both technical and financial assistance to the Forest Service to capitalize on potential cooperative opportunities. Such opportunities are becoming increasingly scarce as reduced funding for this Program has forced the agency into the unenviable position of refusing partnerships and associated contributions.

The Ruffed Grouse Society encourages the Interior Appropriations Subcommittee of the Senate to give serious consideration to returning funds to the Wildlife Habitat Management Program that have, since 1994, been diverted to EPIM. This return of approximately \$10 million would translate into increased agency accountability and increased on-the-ground habitat management accomplishments.

PREPARED STATEMENT OF STEVE HOLMER, CAMPAIGN COORDINATOR, WESTERN ANCIENT FOREST CAMPAIGN

Chairman Gorton, thank you for this opportunity to testify on Forest Service Appropriations. The Western Ancient Forest Campaign represents organizations and individuals nationwide who are dedicated to protecting forest ecosystems on the National Forests.

Working in conjunction with over forty other organizations, we have developed a Grassroots Forest Appropriations Initiative intended to outline a series of steps that we hope will help protect forest ecosystems and at the same time, help restore accountability to the U.S. Forest Service.

Increasing evidence demonstrates that over the past two decades, our National Forests have suffered too much logging and too much roadbuilding with little concern about the impact these activities have on our clean water supplies, fish and wildlife, recreational opportunities and the numerous other values our public lands provide.

Under the Salvage Logging Rider which suspended environmental laws and a citizen's right to have those laws enforced and participate in how their own lands were being managed, we witnessed the logging of old growth forests that had been protected by the courts. Under the rider, the guise of logging dead and dying trees was used to log large, green trees. Unroaded areas, which represent some our nation's last unprotected wilderness were entered and logged. The government's own Inter-agency Report on the Implementation of the Rider confirmed these abuses. And to their credit, the Administration's Glickman Directive halted some but not all of these abuses.

In the aftermath of the rider, several lessons are clear. Our environmental laws and public processes should never again be suspended. Ancient Forests, roadless areas and riparian zones need permanent protection. And the U.S. Forest Service needs to be reformed and made more accountable.

We offer The Grassroots Forest Appropriations Initiative to identify some specific ideas to help restore accountability to the agency and help stop the abuses that continue to threaten our forest heritage. Here are the four points in the initiative:

THE GRASSROOTS FOREST APPROPRIATIONS INITIATIVE (FISCAL YEAR 1998)

The Timber Logging Rider clearly demonstrated the Forest Service's lack of accountability: healthy, green forests were logged as "salvage sales," water quality was endangered in the name of "forest health," and no record exists that even a dime from any of the salvage sales sold under the Rider made its way to the U.S. Treasury. As a result of the failure of the Forest Service to protect the full range of forest values in the National Forests under their management, both the ecological integrity of our forests and the well being of federal taxpayers were sacrificed.

We urge the 105th Congress to take the following steps to restore the accountability of the Forest Service and protect the interests of both taxpayers and our natural environment:

1. *Prohibit new roadbuilding on the National Forests by ending any appropriation for new roads and by prohibiting the use of purchaser road credits to build new roads.*—The elimination of purchaser road credits in the President's budget is a good first step.

2. *Prohibit logging and road-building on unstable and potentially unstable national forest land.*—Recent landslides in the West have demonstrated the "hidden costs" to public safety and the environment of subsidized logging and road building on steep, unstable slopes.

3. *Restore accountability by reforming or abolishing off-budget funds.*— There is a growing consensus that the various off-budget funds—the Knutson-Vandenberg (KV), Brush Disposal and Salvage Funds—must be either reformed or abolished. The Green Scissors Coalition urges abolishing the Salvage Fund and the Clinton Administration proposes new limits on this fund in the 1998 budget. The Administration has also proposed the creation of a new fund for ecosystem restoration called the Forest Ecosystem Restoration and Maintenance Fund (FERM). While we support the intent of the new FERM fund, as currently envisioned it would only perpetuate the same perverse incentive to log that plague the other funds. Instead, we support the Administration's request for \$30 million of appropriated funds for restoration activities and urge Congress to appropriate necessary funds for restoration rather than creating another off-budget fund.

4. *End money-losing timber sales.*— The annual report of the White House Council of Economic Advisors shows that the Forest Service spent \$234 million more than it collected in timber receipts in 1995. "Generally, the Forest Service subsidizes timber extraction from public lands by collecting less timber sale revenues than it spends on timber program costs," the report says. According to the Government Accounting Office (GAO) the timber sale program lost nearly \$1 billion from 1992–1994. For the sake of both the environment and the taxpayer, it is time to end subsidized logging on the National Forests. This initiative has been signed by over one hundred groups including Sierra Club, The Wilderness Society, California Wilderness Coalition, Federal Forest Reform, Headwaters, Inland Empire Public Lands Council, Klamath Forest Alliance, Northcoast Environmental Center, Oregon Natural Resources Council, Northeast Ohio Sierra Club, Northwest Ecosystem Alliance, Oregon Natural Resources Council and the Western North Carolina Alliance.

To implement this initiative in the Interior appropriations bill we urge the Committee to:

1. *Eliminate funding for new timber roads and include language to direct the agency to prohibit timber sales in Ancient Forests, roadless and riparian zones.*—In testimony before the Senate Energy Committee on February 25, 1997, Chief of the Forest Service Michael Dombeck testified, "The unfortunate reality is that many people presently do not trust us to do the right thing. Until we rebuild that trust and strengthen those relationships, it is simply common sense that we avoid riparian, old growth and roadless areas." We urge the Committee to support Chief Dombeck's effort to reform the agency and restore the public's trust by adopting his common sense recommendation.

2. *Include language to prohibit logging and roadbuilding on unstable and potentially unstable National Forest land.*

3. *Support the Administration's \$30 million request for prescribed fire and restoration activities, provided that these activities be limited to non-commercial pilot projects to guide future restoration efforts.*—While we recognize that there is a substantial backlog of needed forest rehabilitation work, there is substantial evidence that the agency is not spending current restoration or prescribed fire dollars in an appropriate fashion. For example, some restoration money is being spent removing logging slash which should have been cleaned up by logging companies as part of the timber sale. There is also concern that prescribed fire has been inappropriately used to convert forest types in violation of restrictions placed on type conversion found in the National Forest Management Act.

We urge the committee to be very specific in how the restoration money is to be spent as occurred on the watershed restoration money appropriated under the Northwest Forest Plan. Further, we urge the committee to prohibit restoration activities that subsidize or in any way further logging operations by the agency.

4. *Oppose the creation of any new off-budget fund for the agency.*—The other off-budget funds have been consistently abused by the agency and have created strong incentives to log even when other activities may be more appropriate.

5. *Prohibit the agency from offering any timber sales that will cost more than the agency can expect to receive in receipts for the sale.*—The timber sale program lost \$445 million in 1995 according to an independent analysis. According to the White House Council of Economic Advisors and the Government Accounting Office the program loses money. It is time to end this subsidy to the timber industry.

Thank you again for this opportunity to testify, we look forward to working with the Subcommittee to realize these needed environmental and fiscal reforms.

PREPARED STATEMENT OF LAURI G. AUNAN, EXECUTIVE DIRECTOR, FRIENDS OF THE COLUMBIA GORGE

Mr. Chairman and Subcommittee Members, thank you for the opportunity to submit this testimony in support of appropriations for vitally needed U. S. Forest Service land acquisition and payments to local governments in the Columbia River Gorge National Scenic Area. This testimony is submitted on behalf of Friends of the Columbia Gorge ("Friends") and its approximately 1,700 members in the Northwest and throughout the country.

In 1986, the Congressional Delegations of Oregon and Washington State worked in tandem to pass legislation creating the Columbia River Gorge National Scenic Area. When President Reagan signed that legislation into law on November 17, 1986, he finalized the establishment of one of the most unique federal designations for one of the most spectacular places in the world.

Since the enactment of the Scenic Area Act 10 years ago, Congress has worked diligently in a bipartisan way to meet its commitments and fund the programs authorized under the Act. These programs include land acquisition, economic development, payments to local governments, development of recreational facilities, and protection of cultural resources. We applaud the courageous stand originally taken by Congress to create the Scenic Area and its diligent efforts to implement the law. Much more, however, remains to be accomplished.

To continue the legacy of commitment to both the natural and human resources of the Columbia Gorge National Scenic Area, we strongly recommend two funding priorities for the Scenic Area for fiscal year 1998. The first priority is adequately funding the Scenic Area land acquisition program by providing at least \$4.9 million through the Land and Water Conservation Fund. The U.S. Forest Service Scenic Area office has identified at least this amount of funding as necessary to meet land acquisition needs for fiscal year 1998, and Friends will be working with the Forest Service and landowners to provide a final list of priority lands and funding. The second priority is continuing the appropriations begun in fiscal year 1997 to provide payments to local governments.

Both of these programs will protect the significant federal investment already made in the Gorge and continue building on the progress that Congress, through this Subcommittee, has made over the years to fulfill all dimensions of the Scenic Area Act, from economic development to environmental protection.

BACKGROUND: UNIQUE RESOURCES, UNIQUE SOLUTIONS

As I believe the Subcommittee is aware, the Columbia Gorge is a national treasure that is like no other place in the country. Stretching 85 miles along the Columbia River, this deeply carved sea-level channel through the Cascade range is home to a remarkable diversity of public resources. From the dry eastern Gorge to the dense conifer forests and surging creeks of the west, dazzling wildflower displays, including species found nowhere else on earth, cover hillsides and plateaus along the river. The corridor is rich in history—figuring prominently in the journals of Lewis and Clark and the Oregon Trail settlers—and in Indian prehistory, with ancient petroglyphs and village sites bearing witness to thousands of years of Indian life and commerce.

Among the countless waterfalls that spill from high hanging valleys is Multnomah Falls, one of the tallest in the United States and the single most visited attraction in the entire National Forest system. Along with awe-inspiring geologic features that include towering monoliths, pillars, stone arches, these resources comprise a world-class experience for those who live in the Gorge and the many thousands of

visitors who come from across the country and around the world to enjoy the spectacular scenery, recreation, and natural and historical heritage.

After completion of the Columbia Gorge Scenic Highway in 1916, state and county parks in Oregon and Washington were established to meet recreational demand, provide scenic vista points, and protect important natural features. A portion of the Gorge lands also fell under the jurisdiction of the Mt. Hood National Forest. But by far the majority of Gorge lands, including many of the most resource-rich areas and most prominent view sheds, remained unprotected or at best partly protected. Much privately held land was completely unzoned, raising an increasing threat of scatter-shot, unplanned development that would have irreparably destroyed the rural way of life and natural and cultural heritage of the Columbia Gorge. This sort of development, in such key scenic areas as the Multnomah Falls view shed and the Mt. Pleasant highlands at the western "gates of the Gorge," was on the drawing boards in the late 1970's. In response, the Department of the Interior prepared a study, and Congress considered legislative proposals in the early 1980's to maintain the Gorge's special character while also supporting the capacity of towns in the Gorge to maintain economic development and appropriate growth.

In 1986, the legislation creating the Columbia River Gorge National Scenic Area was enacted, establishing a new partnership approach for a complex area that is a mixture of urban, rural and wild lands with various federal, state, county and private ownerships. Under the Scenic Act, cities within the Scenic Area are targeted for economic development and growth, and are administered by city governments. Many of the most critical resource lands are included in "Special Management Areas" in which public land consolidation and stewardship are primarily the responsibility of the Forest Service. For other areas, county governments are relied on, through zoning and planning, to ensure that private land uses are consistent with the Gorge's rural, agricultural character and heritage.

PROTECTING THE GORGE THROUGH LAND ACQUISITION—PROGRESS TO DATE

Friends greatly appreciates the Forest Service's demonstrated commitment, with the support of this Subcommittee, in securing the most critical recreational, natural and scenic lands on an as available basis through its land acquisition program. Land acquisition appropriations in previous years have allowed the Forest Service to make substantial progress in securing some of the Gorge's most special resources, from the rare plants and hiking trails of Burdoin Mountain and Rowena Dell to the pastoral Mt. Pleasant Highlands and the undisturbed Archer Mountain. These federal efforts have combined with private conservation work and state acquisitions (in such crucial areas as Beacon Rock State Park and the beautiful 6,000 acre Dalles Mountain Ranch in Washington) to move further toward comprehensive protection of the crown jewels of the Gorge.

But a number of private properties remain in these areas of consolidation, including lands that could be developed among otherwise protected landscapes. Public and private investment in the conservation of these areas, and the good work to date toward comprehensive public management, will be jeopardized unless these parcels can be secured from willing sellers.

Toward this end, Friends is developing a list of specific properties to be acquired, in conjunction with the landowners who have willingly offered these properties for sale, the U.S. Forest Service, and the Columbia River Gorge Commission. This coalition of landowners, land managers and land protection advocates all agree on the importance of this level of funding and of acquiring these parcels in a timely fashion. A preliminary list of properties has already been identified and outlined by the Forest Service which identifies \$4.9 million in needed land acquisition funding. As soon as a final list is agreed to by all parties, we will transmit it to the Subcommittee as soon as possible.

Some examples of key parcels which will almost certainly be on this list include the following:

Catherine/Major Creek, WA.—For the past ten years, the Forest Service has acquired numerous fee interests to protect the scenic quality and natural heritage of this one-of-a-kind landscape in the eastern Gorge in Klickitat County, Washington. Along an approximately 20-mile stretch of the Columbia River are rare oak grasslands and native wildflowers unique in the world. Several prominent properties here have been offered by landowners for public purchase.

Cape Horn/Mt. Pleasant, WA.—The Forest Service has also acquired numerous fee and conservation easement interests to protect these spectacular pastoral and forested cliffs and fields, signature landscapes of the western Gorge and only a short 20-minute drive from Vancouver, Washington. Due to these lands' proximity to Clark County, Washington—one of the fastest growing counties in the country—

these properties are at extremely high risk of sprawling development and timber harvest. Several prominent properties in this area have been offered by landowners for public purchase.

These are examples of key properties that need to be acquired to realize the vision and protect the national investment in this special area. Failure to take advantage of these offers from landowners will result in inconsistent development that would frustrate the years of effort and investment.

MEETING COMMITMENTS TO COUNTY GOVERNMENTS

The second funding priority is to continue the effort begun in fiscal year 1997 to provide Gorge county governments with payments to compensate for lost tax revenue due to federal land acquisition. In 1986, Congress recognized that private land would need to be purchased in order to protect the ecological and cultural resources of the Gorge. It also realized, through its experiences creating such legislation as the Payments in Lieu of Taxes Act of 1976, that putting private land into public ownership can put a strain on the operating budgets of county governments. When the Gorge Act was considered in 1986, however, the PILT program did not provide payments to counties for lands newly transferred into public ownership. Only lands in public ownership when PILT was originally passed actually received payments. Therefore, Congress included in the Gorge Act a provision for \$2 million to be authorized for five years of PILT-type payments to Gorge counties for lands newly acquired, and taken off the tax rolls, by the Forest Service.

Unfortunately, no money was appropriated for this program until fiscal year 1997—\$250,000. Friends believes this commitment to the counties has gone unmet long enough and supports an appropriation of \$215,000 in fiscal year 1998 for continuing this program, an amount identified by the Forest Service as necessary to meet its commitments under this authorization.

PROTECTING THE GORGE—THE NEXT STEPS

In the land acquisition category, the Catherine/Major Creek and Cape Horn/Mt. Pleasant properties are among a number of available lands in the Columbia Gorge for which we are told the Forest Service will be requesting at least \$4.9 million. This request is clearly a recognition of the national importance of this program. We believe that at least \$4.9 million is needed this year to help complete the vision that has come so far in the past 10 years. We hope the Subcommittee will be able to provide this amount.

In addition, we hope the Subcommittee will provide the small amount identified by the Forest Service for the payments to counties authorized under the Act. These payments will assist these governments with providing services to Gorge residents, as well as the area's rapidly growing number of visitors, most of whom come to experience the magnificent vistas, waterfalls, wildflowers and recreational opportunities of the National Scenic Area.

We appreciate all of the support you have given this program in the past. With the funding we are requesting, we believe the Forest Service can make significant progress toward realizing the goals of the National Scenic Area Act, and protecting the heritage of the Columbia Gorge.

Thank you very much for your consideration of this testimony.

PREPARED STATEMENT OF JAMES EARL KENNAMER, PH.D., VICE PRESIDENT FOR CONSERVATION PROGRAMS, NATIONAL WILD TURKEY FEDERATION

The National Wild Turkey Federation [NWTF] urges the United States Senate to increase funding of the U.S. Forest Service Challenge Cost Share Program, hire additional wildlife biologists for our National Forests and increase funding of wildlife management programs thus allowing the private sector to increase our commitment of resources on our National Forests.

The NWTF is an international nonprofit conservation organization centered in the United States. Our 132,000 members are dedicated to the conservation of the wild turkey and the preservation of the turkey hunting tradition. Our 800 volunteer chapters work closely with state and Federal conservation agencies to manage the wildlife resources on public and private lands. The NWTF cooperates with the U.S. Forest Service to cost share projects on National Forests through the "Making Tracks" program.

While the NWTF supports the Federal government's commitment to ecosystem management and wildlife conservation on the National Forests, we are particularly concerned with the continued reduction in the level of funding for wildlife manage-

ment programs and projects. This reduction in funding has seriously impeded the management of both game and nongame species on many National Forests. Similarly, the reduction in the number of trained and experienced wildlife biologists on many forests has reduced the level of expertise to the point that there are simply not enough qualified people to do the job. This reduction in force has occurred at a time when the wildlife related workload (legal appeals, threatened and endangered species concerns, wetland issues and ecosystem management planning) have increased dramatically. This increase in wildlife related work will continue in the foreseeable future.

At a recent meeting with the U.S. Forest Service in Washington, DC, the gravity of the situation became apparent.

The USFS Wildlife Habitat Management budget has decreased 7 percent since 1993 and is 23 percent below the 1993 agency request.

Currently 15 forests of 119 reporting do not have forest level wildlife biologists. All forest-level wildlife and fisheries staff officers have been eliminated from the Southwestern Region.

Technicians, rather than biologists, now do most of the wildlife work in the Southeast.

Less Challenge Cost Share funds are reaching the ground at a time when more money is available from the private sector.

Since 1986, The USFS, the NWTF and the state wildlife agencies have completed over 542 projects for a total expenditure of \$3.75 million on the National Forests. The NWTF has contributed \$1.24 million or approximately 33 percent of these funds. The down-sizing of the Federal Government was supposed to increase the number of partnerships. The opposite is true since less dollars and manpower are available to develop projects and cultivate partnerships.

The National Forests produce some of the pulp and much of the saw timber that this country needs. The forests also protect water quality and while these uses are important they are overshadowed by the value of the forests for wildlife habitat and as recreational areas. In a 1993 USFS study of the economic impact of the National Forests on Gross Domestic Product, approximately \$105 billion or 85 percent was attributable to recreation including hunting, fishing and wildlife viewing.

The National Forests can and should provide timber and wildlife benefits to the nation. These two uses are interdependent, not mutually exclusive. However, the reduction of the wildlife budget is so great that the USFS can no longer be expected to do "more with less". They can only do "less with less" and our National Forests and their valuable timber and wildlife resources are beginning to show the strain.

The NWTF applauds the effort this administration and the Congress have made to reduce the national debt. However, the wildlife resource and the recreational users are being adversely impacted disproportionate to their value to the nation. Partners such as the NWTF are willing and able to help fund projects through the Challenge Cost Share Program, but the USFS needs the matching funds and the trained professionals on the forest to help us spend our volunteer's funds wisely.

The NWTF urges Congress to increase funding of the Challenge Cost Share Program, hire additional wildlife biologists and increase funding of wildlife management programs thus allowing the private sector to increase our commitments on our National Forests.

Thank you for this opportunity to comment on this most important issue.

PREPARED STATEMENT OF LONNIE L. WILLIAMSON, VICE PRESIDENT, WILDLIFE
MANAGEMENT INSTITUTE

Mr. Chairman: I am Lonnie L. Williamson, vice-president of the Wildlife Management Institute. Established in 1911, the Institute is staffed by professional wildlife scientists and managers. Its purpose is to promote the restoration and improved management of wildlife in North America.

U.S. FOREST SERVICE

Wildlife habitat.—WMI recommends that the U.S. Forest Service wildlife account, referred to in the agency as the "Get Wild Program," be increased in fiscal year 1998 to \$40 million, which would be \$10 million more than requested by the administration. And, we recommend that \$8 million be earmarked for the Challenge Cost-Share Program.

The Service's Wildlife Habitat program was drawn in fiscal year 1994 and has been in the process of being quartered ever since. The President's request of \$28.3 million for fiscal year 1998 is 27 percent below the fiscal year 1993 appropriation of \$38.9 million. For an already seriously underfunded effort, this is a particularly

savage blow. Wildlife is suffering from inattention as the number of wildlife biologists eases down and those that remain are reassigned non-wildlife duties. On the Ouachita National Forest, for example, there is only \$128,000 in wildlife funds to cover 1.75 million acres. Ouachita's wildlife program is surviving only with the use of KV funds, which may or may not be available in any given year. If this inequity is not corrected, wildlife uses will have to be curtailed, causing significant social and economic distress. Under this scenario, we now can make the same mistakes in all Forest Service regions as were ineptly accomplished in the Pacific Northwest, which is now costing a fortune to correct.

Indicative of the Forest Service's lost ability to take proper care of the public's wildlife is the Challenge Cost-Share Program, which matches non-federal contributions to implement wildlife habitat improvement projects on national forests. Forest Service partners participating in the program consistently provide more than their share to this effort because the agency does not have funds to match those donated. In fiscal year 1993, the Service had but \$4.5 million to match \$6.6 million provided by partners. In fiscal year 1994, it was \$6.2 million for the Service and \$7.4 for the partners. In fiscal year 1995, it was \$5.6 million to \$7.4 million. Last year, the partners began diverting funds from the national forests because of the lack of matching by the Service. In the Pacific Northwest, more than \$200,000 were retrieved from the table by partners because the Service had no matching money.

Inland fisheries.—WMI supports the administration's request of \$17.157 million for inland fisheries on national forests. We further suggest that \$3.4 million be earmarked for Challenge Cost-Share projects.

Anadromous fisheries.—WMI supports the Administration's request of \$22.521 million for anadromous fisheries. And, we recommend that \$3.1 million be earmarked for Challenge Cost-Share projects.

Threatened and endangered species.—WMI supports the administration's request of \$27.218 million for T&E species. That is \$5 million more than fiscal year 1997. This is about one third of what the Forest Service says that it needs for T&E species. And that is no mystery, considering the scant attention given to the vast majority of national forest species which are not endangered. By not making the investments in the Wildlife Habitat account, we assure a continued march of species into the T&S category, where huge amounts of money are needed to protect and/or extricate them. WMI also recommends that \$5.1 million of T&F funds be earmarked for Challenge Cost-Share projects.

Rangeland management.—WMI supports the administration's request for an additional \$7.4 million to improve range conditions. Despite progress, 23.5 million acres of the 99 million acres of grazed national forest remain in unsatisfactory condition. This program has been sorely underfunded for years. Its budget could be doubled without taking care of all the needs.

Seeking common ground.—WMI recommends that \$300,000 of the Forest Service's budget be earmarked for Seeking Common Ground (\$150,000 from wildlife and fish and \$150,000 from range management). SCG is the most successful range restoration program to date. It is directed and funded by the Forest Service, Bureau of Land Management, National Fish and Wildlife Foundation, American Farm Bureau Federation, Rocky Mountain Elk Foundation, and Wildlife Management Institute. It features local groups solving local problems at the local level in the national interest. We encourage the committee to become familiar with this effort. A speech that I gave on the beginnings of SCG is attached for the committee's information.

Forest stewardship and stewardship incentive.—WMI supports the President's request of \$23.380 million and \$10.230 million respectively for the Forest Stewardship and Stewardship Incentive programs. Forest Stewardship fosters constructive interdisciplinary partnerships between state foresters and state wildlife agencies. For example, this program shares the costs with state wildlife agencies of hiring professional wildlife managers to work closely with foresters in writing multiple purpose forest management plans. This cooperative effort helps ensure that nonindustrial private forests are managed to meet resource objectives of landowners who want to integrate wildlife habitat with forest product production. Stewardship Incentive provides cost-share funds to help NIPF landowners implement forest plans produced under the Forest Stewardship program.

Forest and rangeland research.—WMI recommends that Forest and Rangeland Research be increased \$2 million to \$181.781 million, so that the Service may have about the same amount (in inflated dollars) as in fiscal year 1997.

Ecosystem planning, inventory, and monitoring.—WMI recommends that the increases recommended above may be offset by taking money from the EPIM account. Ground-level resource management activities, including fish, wildlife and range have suffered in great part because funds were taken from those efforts to finance this account, which is not justified in the budget. We have not been informed on

how the EPIM money is being spent, nor have we seen the benefits of that expenditure. We can but conclude that on-the-ground management activities are more important to the National Forest System and its customers.

BUREAU OF LAND MANAGEMENT

Wildlife, fisheries and T&E species.—WMI is most disappointed with the administration's request for \$44.573 million to fund fisheries, wildlife and T&E species on BLM's 270 million acres. The wildlife account is essentially the same as in fiscal year 1997 and remains about 10 percent below the fiscal year 1991 level. BLM reported recently that its lands and waters now harbor more than 300 species either listed as T&E or proposed for listing. T&E species on BLM land has been increasing about 20 species annually during the past several years. And that is no wonder, considering the meager wildlife management resources available.

By denying wildlife a seat at the table when land management decisions are made on livestock grazing, timbering, mining and the like, we are perpetuating a very efficient model that creates endangered species. WMI recommends that this budget item be increased by \$7 million above the administration's request, up to \$51.573 million. We recommend that the wildlife account be increased to \$24 million, which better reflects the funding called for in BLM's Fish and Wildlife 2000 document. We also support a \$1 million increase in the fisheries account to get it nearer the Fish and Wildlife 2000 level. And, we recommend that the T&E account be upped by \$2 million for the same reason. As with the Forest Service, we note that adequate investments must be made in the nonendangered species to keep them out of the T&E category and from disrupting multiple uses of the land.

Rangeland management.—WMI supports the administration's request for \$54.342 million to finance the rangeland management program. However, we recommend that \$150,000 be added for the purpose stated below.

Seeking common ground.—WMI recommends that \$150,000 of our proposed add-on to Wildlife, Fisheries and T&E Species, and the \$150,000 proposed add-on to Rangeland Management, be earmarked for Seeking Common Ground.

U.S. FISH AND WILDLIFE SERVICE

Endangered species.—WMI supports the administration's request of \$11.4 million. We further recommend that the Cooperative Endangered Species Conservation Fund be budgeted at the \$14.1 million dollar level enacted in fiscal year 1997. Endangered and threatened species conservation, management, and recovery activities were impaired by Congressional action in the last Congress, and the backlog of proposed listings and recovery actions must be erased. We are disappointed that the administration proposes to reduce the Section 6 funds available to the states for T&E conservation projects to \$14 million from the fiscal year 1997 level of \$14.1 million. The management action necessary to conserve T&E species, and to conserve candidate species prior to listing, is best taken by the various states.

Habitat conservation.—WMI supports the Administration's request of \$57 million for Habitat Conservation. The Partners for Wildlife Program is extremely popular with private landowners, and by providing cost-sharing, gives landowners the incentives and the capability to implement conservation practices on private lands, often reducing or eliminating important causes of wetland and other habitat degradation. Similarly, the Project Planning activity saves millions of dollars in habitat restoration needs by assuring that planned projects are designed from the outset to minimize adverse environmental consequences.

Refuge operation and maintenance.—WMI recommends an appropriation of \$220 million for Refuge Operation and Maintenance. The maintenance needs of National Wildlife Refuges have been consistently neglected to the point of jeopardizing the ability of some refuges to accomplish their mission. There is currently a maintenance backlog of \$428 million on National Wildlife Refuges. We recommend the administration's budget request of \$192 million be increased to \$220 million, with the additional \$28 million earmarked for reduction of maintenance backlogs.

Congress requested information regarding the use of animal traps on National Wildlife Refuges in the fiscal year 1997 Appropriations Conference Report. Some question the use of certain types of traps. However, there are no other suitable trapping devices to use as yet, even though USDA-APHIS-ADC and a coalition in Vegreville, Alberta, Canada continue research for alternatives. The U.S. Fish and Wildlife Service has not contributed to either of these research efforts. Given the significant role trapping plays in the management of National Wildlife Refuges, we recommend \$200,000 be added to the Fish and Wildlife Service budget and earmarked for methods development research at USDA's National Wildlife Research Center at Fort Collins.

Migratory bird management.—WMT supports the administration's request of \$17.1 million. Monitoring migratory bird populations, both nongame and game species, is necessary to detect population declines and address them before species become rare and may require listing as T&E species. Increased funding for the North American Waterfowl Management Plan not only benefits waterfowl, but leverages federal dollars through partnerships with states, organizations, and individuals, and also provides habitat conservation and restoration benefits to a whole suite of other wetland birds and amphibians.

Wildlife conservation and appreciation fund.—WMI supports a \$1 million appropriation for the Wildlife Conservation and Appreciation Fund. This fund leverages federal expenditures by serving as a match for external contributions, and provides the states badly-needed money to manage species which are neither harvested nor listed as threatened, endangered, or candidate species. In most states, there is little or no other funding source for managing such species.

North American wetlands conservation fund.—WMI recommends appropriation of the full amount authorized by Congress of \$30 million. This highly successful program returns \$2 of nonfederal funds for each \$1 of federal funds, and has attracted more than 600 paying partners. The program consistently receives more proposed partner cost-sharing each year than can be covered by the full \$30 million. Millions of dollars of nonfederal funds are being lost each year.

National Fish and Wildlife Foundation.—WMI supports a fiscal year 1998 budget of \$7.5 million for the Foundation. The National Fish and Wildlife Foundation has raised more than \$2 non-federal for every federal dollar expended. Over 11 years, more than 1,800 grants have advanced management of wildlife, fish and their habitats. Increased appropriation will assist the government in doing more for wildlife with less federal money.

U.S.G.S.—BIOLOGICAL RESOURCES DIVISION

The Wildlife Management Institute supports the administration's proposed budget of \$145 million for the Biological Resources Division of the U.S. Geological Survey. The Biological Resources Division (BRD) of the United States Geological Survey comprises nearly the entire biological research capacity of the Department of the Interior (DOI). Prior to the formation of the National Biological Survey, scientists and programs of BRD were located in the land management agencies of DOI (U.S. Fish and Wildlife Service, Bureau of Land Management, National Park Service). Removal of scientists and programs from the land managers critically impairs the communication of research needs from managers to scientists and the communication of research results from scientists to managers. The result is that the scientific information needs of land managers are less well met. The important work of BRD includes research in support of federal land management, research on endocrine disruptors in the environment, research on restoration of degraded lands, research on restoration of Great Lakes fisheries, development of scientific information management technology and making scientific data accessible to users, and the Cooperative Fish and Wildlife Research Units.

The Cooperative Research Units are particularly important. State fish and wildlife agencies depend on the Cooperative Research Units to deliver scientific information needed for effective fish and wildlife management. The Units also train the next generation of fish and wildlife scientists, and are an efficient use of federal dollars since those dollars are leveraged by contributions of the state fish and wildlife agencies and universities. There are currently 22.5 vacant positions of Unit Leader and Assistant Leader. A high priority of BRD should be to fill those vacant positions over the next few years. We support that priority emphasis, and support the administration's requested increase of \$1 million earmarked to reduce the number of vacant positions at the Cooperative Fish and Wildlife Research Units.

LETTER FROM JEAN HOCKER, PRESIDENT, LAND TRUST ALLIANCE

WASHINGTON, DC, April 14, 1997.

Hon. SLADE GORTON,
Chairman, Subcommittee on Interior and Related Agencies,
Committee on Appropriations, U.S. Senate, Washington, DC.

DEAR CHAIRMAN GORTON: On behalf of the Board of Directors and members of the Land Trust Alliance (LTA), I am sending this letter to be included in the record of testimony on the fiscal year 1998 appropriation to the Department of the Interior.

The Land Trust Alliance serves more than 1,200 land trusts across the country. These are independent grassroots organizations dedicated to protecting land and the

quality of life in their communities through private, voluntary action. Working with in a cooperative, incentive-based strategy, these groups have helped save more than 4 million acres of wetlands and wildlife habitat, productive farm and forest lands, and other significant resources.

Land trusts have worked with several programs under the committee's jurisdiction to conserve land valuable to communities across the country, usually leveraging the private funding that is the key to the success of these programs. They have formed partnerships with local landowners and the Partners for Wildlife program to protect valuable privately-owned habitat. They have helped preserve valuable working timberland by arranging easements under the Forest Legacy program. They have helped make possible land conservation plans that have used acquisition funding under the federal Land and Water Conservation Fund (LWCF) appropriation. They have worked with state and local governments to target state-side LWCF funding to the best purposes.

Though clearly effective, these programs are suffering from chronic underfunding. The LWCF appropriation has fallen to a level far too low to meet even the most urgent federal land acquisition priorities. State LWCF funding, so important to community conservation efforts, has been eliminated. Partners for Wildlife, an extremely responsible and cost-effective program of public-private partnerships was also recently threatened with elimination. Forest Legacy, an innovative program that has suffered from unnecessary administrative delays, is now funded at a level so low as to barely make it a viable national program.

FEDERAL LAND AND WATER CONSERVATION FUND

The lack of funding from the Land and Water Conservation Fund is bad public policy since the government collects these funds under a law that intends them to be used for conservation purposes. The diverting of the vast majority of these funds to other purposes, while perhaps understandable given fiscal constraints, is nevertheless at odds with the intent of the law establishing the fund, and it all but creates a situation in which the government is collecting fees under a false pretext. The appropriation committee can begin to return the use of LWCF to its original purpose by appropriating a larger percentage of LWCF funds for the purposes for which they are collected. An increase in this appropriation will encourage land trusts to carry out more important land conservation projects as they have in the past.

For example, a \$10.5 million LWCF appropriation made possible the acquisition of 1,227 acres of land bordering the Golden Gate National Recreation Area in San Mateo, California. Because of the appropriation, the Peninsula Open Space Trust was able to leverage \$10.5 million in private contributions to purchase the tract which was subsequently transferred to the National Park Service for the enjoyment of all Americans.

In addition, a \$1.4 million LWCF appropriation enabled the Wilderness Land Trust to purchase and protect a 1,320 acre inholding in the James Peak Roadless Area. Situated near Rocky Mountain National Park in Colorado, this U.S. Forest Service high-priority acquisition could not have occurred without the trust's involvement. Because of the appropriation and the trust's excellent and on going relationship with the landowner, the largest private inholding in the James Peak Roadless Area is now in public ownership and the area may finally achieve long-sought wilderness designation.

President Clinton's fiscal year 1998 request for \$167 million from the LWCF is inadequate. LTA recommends that the committee provide funding at a level more consistent with the demonstrated need. A more appropriate level would be almost triple the President's request, to \$450 million, which would be only slightly more than half of the level Congress appropriated twenty years ago: in fiscal year 1978, Congress appropriated \$805 million from the LWCF, \$314.1 million of which was directed to state matching grants.

STATE-SIDE LAND AND WATER CONSERVATION FUND

Congress also needs to fulfill its legal responsibilities under the LWCF to provide matching grants to states. State LWCF grants leverage at least an amount equal to federal conservation funding, and therefore have a positive impact far in excess of the amount appropriated. State-side LWCF funding has suffered a dramatic reduction over the past five years: at this point, the program is all but shut down. There is no fiscal year 1997 money for state grants, nor does the Administration propose any for fiscal year 1998. It is unfortunate that a program that has historically been very successful in promoting community and nonprofit involvement in conservation activities should suffer from such neglect.

Grants to states from LWCF spawned a fruitful partnership between the State of New Hampshire and the state's largest land trust, the Society for the Protection of New Hampshire Forests. The Society has been successful in acquiring several properties that the state has deemed as desirable for park land. The Society's non-governmental status has allowed it to move quickly and decisively to protect land for state parks—land that might have otherwise been developed. The Society then transfers the land to the state after the state has received its state LWCF funding. Without these grants, the people of New Hampshire's would not have as many state parks to enjoy, and their right to have adequate outdoor recreational opportunities would be compromised.

FOREST LEGACY PROGRAM

The Forest Legacy program is another example of a highly leveraged program that gets a tremendous value for each federal dollar appropriated to it. It provides partial funding of conservation easements on working timberland. This program has in the past been plagued by administrative delays, but the 1996 farm bill amended the program to allow for direct state grants in the hope that this would help to streamline the process and make Forest Legacy more efficient. Even before this new administrative provision, land trusts formed successful partnerships with the U.S. Forest Service through the Forest Legacy program to protect thousands of acres of forestland threatened with conversion.

For example, the Rangeley Lakes Heritage Trust worked with the Forest Legacy program to protect 1,272 acres of pristine Maine forestland. As a result of the Forest Service's decision to supply \$840,000 for the acquisition of a conservation easement on the property, the trust was able to raise over \$400,000 to cover the remaining amount needed to purchase and protect the tract. The result was the protection of 3.4 miles of lakefront that represented a critical link in 12 miles of continuous undeveloped lakeshore. It also contributed to more than 40 miles of protected shorefront in the Rangeley Lakes chain which encompasses over 33,000 acres of public access conservation lands.

In a wooded area on the outskirts of Boston, the purchase of a permanent 73-acre conservation easement by the Forest Service helped to facilitate the protection of nearly 1,200 acres in the historic Estabrook Woods of Concord and Carlisle. A favorite haunt of Henry David Thoreau, the Woods have come under increasing development pressure. The Forest Service's willingness to purchase the easement served as the catalyst that allowed several area land trusts to complete negotiations on the protection of the adjoining woodlands.

LTA recommends an increase of funding for the program because of the need to protect timberland and because of the growing number of states qualified to participate in it. An appropriation at least three times the President's request of \$4.006 million—and substantially increased over last year's level of \$2 million—is required to allow the program to function as an effective, national program to protect private working timberland.

PARTNERS FOR WILDLIFE

With some reluctance, LTA supports the President's fiscal year 1998 level funding requests for Partners for Wildlife of \$22.513 million, although it is inadequate to meet the need in these areas, as acceptable given current budgetary constraints.

Thank you for considering the views of the Land Trust Alliance on behalf of the 1,200 private citizen conservation organizations that make up the nation's burgeoning land trust movement as you make your funding decisions for the coming fiscal year.

Sincerely,

JEAN HOCKER,
President.

LETTER FROM DANIEL P. BEARD, SENIOR VICE PRESIDENT FOR POLICY, THE
NATIONAL AUDUBON SOCIETY

WASHINGTON, DC, *March 31, 1997.*

Senator SLADE GORTON,
*Chairman, Subcommittee on Interior Appropriations,
U.S. Senate, Washington, DC.*

DEAR SENATOR GORTON: On behalf of the National Audubon Society's more than half a million members and our 515 chapters in communities throughout the United States, I am writing to you regarding the Department of Interior and Related Agen-

cies appropriations bill for fiscal year 1998. National Audubon is dedicated to the protection of birds, wildlife, and their habitat for the benefit of all Americans and for future generations. Proper stewardship of our public lands and wildlife requires adequate levels of funding. To that end, we have identified below a number of priorities that support our goal of strong stewardship of our national lands and wildlife. We would appreciate it if your office would include this letter in the public record.

PRESERVATION OF MIGRATORY BIRDS

In the United States more than 60 million people identify themselves as bird-watchers, contributing more than \$20 billion annually to the U.S. economy. Yet year after year the U.S. government fails to sufficiently fund programs that protect nongame birds, despite the fact that it makes good economic sense. In conjunction with Partners in Flight, Audubon recently published the WatchList; it includes 90 bird species, primarily nongame, that are in decline. Funding for the conservation of these birds today will halt their decline and preclude the need for expensive emergency measures later to prevent their extinction. In recognition of the economic and environmental importance of this natural resource, we urge you to fully fund the following programs.

The Office of Migratory Bird Management (MBMO) provides scientific information and management advice on migratory birds to federal land managers. We believe that the President's budget request of \$17.11 million for this key program is inadequate to meet current needs. The budget request includes \$600,000 to monitor and implement conservation measures for the 120 Species of Management Concern identified last year. This initiative, which is designed to prevent future listings of migratory birds under the Endangered Species Act, needs an additional \$600,000 to fully implement the program. We also support increasing MBMO's budget by \$500,000 to allow the FWS's seven regional offices to hire one additional nongame bird coordinator. These offices currently lack sufficient staff to advise federal land managers and implement nongame programs. We also request additional funding to support the MBMO's ongoing effort to develop national guidelines for the issuance of permits to take migratory birds, and to create a database for tracking the cumulative regional and national take of individual species. These activities will improve FWS's customer service and response time to individual permit requests.

We also support the activities of the U.S. Fish & Wildlife Service International Programs (International Conservation line-item), and in particular the Western Hemisphere Program, which trains protected area managers in Latin America and makes small matching grants for education and grassroots conservation. This is one of the few U.S. programs that benefits North America. Audubon urges Congress to support an increase of \$1 million for funding this important program.

We also support game and nongame bird habitat acquisition programs such as the North American Wetlands Conservation Fund (\$15 million), the Land and Water Conservation Fund (see below), and the Partners for Wildlife Program (\$22.5 million).

Audubon urges Congress to recognize the economic importance of nongame bird species, and to fully fund programs that benefit these species.

LAND AND WATER CONSERVATION FUND

Recent reductions in appropriations for the Land and Water Conservation Fund will have a long-lasting negative impact on America's natural resources. LWCF funding protects wilderness, wetlands, beaches, and other open spaces for the protection of wildlife and the enjoyment of future generations. In many cases, direct fee acquisition from willing private sellers, facilitated by use of the LWCF, is the best way to accomplish long-term protection of priority lands. The Administration's \$166.6 million request will not meet current needs and should be significantly increased.

The LWCF state program provides funding for the conservation priorities of individual states. This matching grant program allows states to complete conservation projects at the local level and the matching requirement ensures that states and communities are fully committed to these projects. Eliminating the acquisition funding for state side projects in fiscal year 1996 interrupted ongoing state projects by removing a vital source of funds. We urge this Subcommittee to fund acquisition grants to states in fiscal year 1998, meeting at least fiscal year 1995 spending levels of \$30 million. We have submitted our acquisition priority list separately.

EVERGLADES

As Everglades National Park approaches its 50th birthday, it also nears a crossroads that will determine much of the fate of its next fifty years. The National Au-

dubon Society urges the Subcommittee to seize this opportunity and fully fund the Administration's Everglades Watershed Restoration budget request.

The President has requested \$139.5 million for the Department of the Interior's fiscal year 1998 Everglades Watershed Restoration programs. NAS strongly supports the proposed budget, particularly the \$100 million requested as an initial deposit into the Everglades Restoration Fund (ERF).

The ERF would provide \$76 million for land acquisition, \$12 million for research, and \$12 million for modified water deliveries. It would be funded by royalties from oil and gas leasing on the Outer Continental Shelf. The use revenues generated from non-renewable resources to fund the protection of natural resources is long-standing policy, and we urge the Subcommittee to use this funding source to fully appropriate the ERF.

We reiterate our appreciation to the 104th Congress for the discretionary funding included in the Freedom to Farm Act. While we are concerned with the slow expenditure of these funds, we are very optimistic that most, if not all, of the remaining balance will be allocated by October 1, 1997. Therefore, we caution the Subcommittee to separate the funds included in the Farm Bill from its decisions with respect to the fiscal year 1998 Interior appropriations bill.

BIOLOGICAL RESOURCES DIVISION/USGS

National Audubon urges Congress to pass a sustainable level of funding for the Biological Resources Division of the United States Geological Service (BRD). BRD provides sound, unbiased scientific information to federal agencies, state and local governments, private industry, and the public, which in turn use this information to make informed natural resource and land management decisions. To ensure the future of these vital programs, the President's request of \$145 million should be increased to fiscal year 1994 levels (\$166 million). We urge Congress to include an earmark of \$300,000 for research on the impacts of commercial fishing on seabirds in the Pacific.

BRD programs include 60 science centers, such as the National Wildlife Health Center in Madison, Wisconsin, which responds to outbreaks of wildlife diseases including rabies and avian cholera, and the Patuxent Research Center in Maryland, which monitors the health of the Chesapeake Bay ecosystem and the wildlife that depend upon it. BRD monitors waterfowl population and fisheries research programs which collect vital data that is used by states and the USFWS to set fishing catch limits and hunting bag limits, and to determine the length of hunting seasons. BRD is the only federal bureau that is dedicated both to collecting biological scientific data and to sharing that information with FWS regional and field offices and the States. BRD scientists conduct nearly one hundred percent of federal research on nongame birds and a significant amount of research on game birds. We urge you to fund BRD at \$166 million so that vital, unbiased, scientific information continues to guide the decisions of federal and state natural resource managers.

BUREAU OF LAND MANAGEMENT

We support full funding of Secretary Babbitt's proposal to reintroduce wildland fire to our forest ecosystems. Wildland fire is a natural and necessary component of forest ecosystems. Occasional fires burn excessive undergrowth, and are also necessary for many fire-dependent species.

FOREST SERVICE

We oppose funding for construction of more logging roads, whether by direct appropriation or through the device of "purchaser credits." Road building is one of the most environmentally destructive of all Forest Service activities. The Administration's proposal to discontinue timber purchaser credits and to alter the cost of road-building to a direct cost is a step in the right direction, but does not fully address the issue: taxpayers would still be forced to subsidize additional and unnecessary road-building. Audubon supports funding for road obliteration and for maintenance of existing roads to reduce stream sedimentation and prevent mud slides.

Audubon supports a funding level of \$121 million for the Forest Service Wildlife and Fisheries Habitat Management Program. This program supports restoration and improvement of important habitats, including old-growth, riparian, and watershed habitats.

We oppose the Administration's proposed Forest Ecosystem Restoration and Maintenance Fund (FERM) as it is currently written. Although we support the intention to supply more funding for restoration, we feel the activities and funding mechanisms permitted under FERM are open to abuse.

NATIONAL WILDLIFE REFUGE SYSTEM

Although the National Wildlife Refuge System represents a vitally important investment by the American public in our nation's precious wildlife resources, the operating budget for the Refuge System represents a tiny fraction of federal spending. Approaching its 100th anniversary in 2003, the refuge system includes more than 92 million acres and over 500 refuges, offering habitat for a quarter of the country's threatened and endangered species, and providing vital rest stops, breeding grounds, and staging areas for migratory birds. In addition, the Refuge System offers tremendous opportunities for public outdoor education, wildlife viewing, hiking, hunting, and fishing and other compatible recreational activities. Inadequate operations and maintenance funds have degraded refuge habitat; consequently, refuges are less productive for wildlife and associated recreational opportunities.

As part of its Wildlife Refuge Campaign, Audubon has recently launched the Audubon Refuge Keepers program (ARK) that establishes volunteer support groups for individual refuges. These groups provide support for wildlife refuges through volunteerism and educational outreach. Although Audubon volunteers and others can help refuges meet a variety of unfulfilled needs, we cannot expect volunteers on refuges to supplant federal O&M funding.

In 1993, Interior's Inspector General issued a report that documented a \$323 million backlog in maintenance projects. This figure has grown to \$428 million, jeopardizing the integrity of the entire Refuge System. The President's budget proposes \$192 million for refuge operations and maintenance, including new activities such as public awareness campaigns and the development of comprehensive management plans. As a member of the Cooperative Alliance for Refuge Enhancement (CARE), National Audubon supports the objective of incrementally increasing O&M funds for the Refuge System over the next six years (as outlined in Dr. Rollin Sparrowe's CARE testimony). While the CARE proposal will not meet desired funding levels, it will go a long way toward meeting the bird and wildlife conservation objectives that we support for the System. For fiscal year 1998, we support a funding level of \$220 million for Refuge Operations and Maintenance.

ENDANGERED SPECIES ACT

The Endangered Species Act was intended to prevent the decline of our nation's biological resources and to recover those species threatened with extinction. We urge you to pass adequate funding levels for these programs to ensure the uninterrupted operation of vital species recovery programs.

The Fish and Wildlife Service is under a court order to list a number of candidate species by the end of this year. The \$5.16 million requested for listing activities is barely adequate to address this backlog, which will cost an estimated \$5 million, leaving little for dealing with new petitions or other listing needs. We urge you to increase funding for listing of species. We also support increased funding for the Cooperative Endangered Species Conservation Fund to assist states with their species conservation priorities.

The President's request includes increased funding for the rapidly-expanding Habitat Conservation Plan program (HCP). In 1992, the federal government had approved fewer than one dozen HCPs; as of November 1996, they had approved 197, with another 200 in development. The federal government has obligations to monitor and enforce these plans, and to respond in the event that unforeseen circumstances require modification of plans. The nominal increase requested by the President is inadequate to fulfill these obligations.

NATIONAL FISH AND WILDLIFE FOUNDATION

The National Audubon Society supports the Administration's request of \$7.5 million for the National Fish and Wildlife Foundation. This increase of \$2.5 million will allow the Foundation to address the growing need for partnerships to solve difficult conservation issues. The Foundation leverages its federal appropriations through the use of challenge grants. An increase in appropriations will fund the implementation of the Partners in Flight North American Bird conservation strategy.

Thank you for your consideration of our priorities for funding for the Department of the Interior. With your strong leadership of this Subcommittee we believe that our nation's resources will be fully protected.

Sincerely,

DANIEL P. BEARD,
Senior Vice President for Policy.

Attachment.

PREPARED STATEMENT OF R. MAX PETERSON, EXECUTIVE VICE PRESIDENT,
INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

The International Association of Fish and Wildlife Agencies was founded in 1902 as a quasi-governmental organization of public agencies charged with the protection and management of North America's fish and wildlife resources. The Association's governmental members include the fish and wildlife agencies of the states, provinces, and federal governments of the U.S., Canada, and Mexico. All 50 states are members. The Association has been a key organization in promoting sound resource management and strengthening federal, state, and private cooperation in protecting and managing fish and wildlife and their habitats in the public interest.

U.S. FISH AND WILDLIFE SERVICE

The Association generally supports the Administration's fiscal year 1998 budget request for the U.S. Fish and Wildlife Service. The funds requested demonstrate a strong commitment to the nation's fish and wildlife resources. Presented below are the specific Association recommendations for the fiscal year 1997 USFWS budget.

General Comments.—We recognize that because of the need for defect reduction, Congress will take steps to reduce appropriations for some agencies. Programs will be controlled, reduced or eliminated. A serious test for any program will be whether or not it fits the basic mission of the Service and provides substantial public benefits. The Association believes the programs that offer the following characteristics are consistent with the basic mission of the Service and afford the highest benefit to fish and wildlife resources and the cooperating state agencies: (1) establish true state/federal partnerships; (2) offer significant leverage of non-federal funds through cooperative programs; (3) support efforts to prevent species and their habitats from becoming threatened or endangered; (4) provide fish and wildlife associated outdoor recreation opportunities including hunting and fishing which serve a large number of people each year; (5) provide important economic and environmental benefits to large segments of the American people; (6) reinvest and enhance existing public land holdings/refuges; (7) empower states to best determine priority management action at the state level; and (8) provide adequate flexibility for local program adjustment.

We encourage Congress to measure programs against these criteria and to ensure that programs which measure up are funded.

Wallop-Breaux and Pittman-Robertson.—The Association urges Congress to continue to protect the integrity of the Wallop-Breaux and Pittman-Robertson user pay/user benefit programs from diversion from their intended purpose. Public support of user fee programs will continue if the funds provided are used only for the purposes for which they were established. The Association strongly supports the reauthorization of the authority (which expires at the end of fiscal year 1997) to dedicate the motorboat fuel taxes from the ARTF to the Boat Safety Account, which funds Boating Safety Grants to the States. The Association also strongly supports reauthorization of the authority (which expires at the end of fiscal year 1997) to transfer receipts collected on small engine fuels from the Highway Trust Fund to the Aquatic Resources Trust Fund. Finally, the Association strongly supports reauthorization of the Clean Vessel Act (which expires at the end of fiscal year 1997) to continue to dedicate up to \$10 million from the SFRA to boat pumpout programs and \$10 million to boating safety. The Association is disappointed that the Administration is not supporting reauthorization of this program, which is contributing significantly to address the problems of overboard sewage contamination of inland waters.

Based on the success of these model user-benefit/user-pay programs, the Association has been shepherding an effort similar to Pittman-Robertson and Wallop-Breaux to expand user fees on other outdoor recreation products. Under the Teaming With Wildlife proposal funds would thus be provided for a broader fish and wildlife conservation, recreation, and outdoor education programs in the States. This is a user-benefit/user-pay, incentive based program that is now supported by more than 1,700 organizations including both traditional fish and wildlife organizations and a wide array of bird watchers, photographers, hikers, etc.

Through the cooperative partnerships between the state fish and wildlife agencies and the private sector created by these programs, we can begin to develop preventive, comprehensive, and broad scale management to ensure the vitality of fish, wildlife and plant species and their habitats. Taking prudent actions to prevent endangerment simply makes good ecological and economic sense.

These efforts will also provide expanded outdoor recreation and educational opportunities for Americans to enjoy wildlife in natural settings and to increase their knowledge of fish and wildlife and their life needs and habited requirements. Public demands for these activities continue to increase and are unmet under existing programs.

North American Wetlands Conservation Act Activities.—The Association recommends that the North American Wetlands Conservation Act be funded at the full authorization level of \$20 million. This cooperative program that requires at least a 1:1 non-federal match is a highly successful, non-regulatory, incentive based program that has shown substantial results in restoring waterfowl and other migratory bird populations. While the \$15 million requested in the budget is very encouraging it remains well below the authorized level of \$20 million. The tremendous success of this program in generating in excess of a 2:1 match from non-federal sources plus the acreage secured or enhanced warrants its full appropriation.

The Association is pleased to recognize the Administration's continuing commitment to the implementation of the North American Waterfowl Management Plan, including support for the 11 United States, 3 Canadian, and 1 International Joint Ventures. The Association continues to recognize the need for additional funds to enable the Fish and Wildlife Service to provide adequate assistance for the Joint Ventures. Joint Ventures are the "engine" of plan implementation, and these partnerships need to be supported.

The Association continues to recommend that Congress appropriate an additional \$5 million to collect data and monitor 16 priority goose and brant populations across North America as part of the Arctic Goose Joint Venture. Currently there are no operational breeding population surveys or pre-harvest banding programs on populations of Arctic geese. This information is needed for management of these migratory, international resources.

The Association believes that evaluation of on-the-ground wetland habitat enhancement activities under the North American Plan, Farm Bill and other programs is extremely important to be sure which activities are most effective and to guide long-term efforts. We recommend that a minimum of \$80,000 per year be allocated for a 10-year period to conduct essential evaluation work.

Endangered Species.—The Association was disappointed that the Administration's request for Cooperative Endangered Species grants to the States was not higher than \$7.5 million, resulting in a reduction of \$85,000 from the fiscal year 1997 enacted. The Association requests a \$3 million increase in the budget dealing with the state grants under the Cooperative Endangered Species Conservation Fund. While the Association recognizes the merits of and supports the additional requested \$6 million in the fund for land acquisition under HCPs, the Association recommends

that the increase for assistance in this fund be made available to the states through the cooperative agreement process with the individual states deciding the best mix of inflammation, incentives and acquisitions to achieve habitat conservation and recovery objectives, and not dust for fee title acquisition.

The Association supports the \$6.1 million increase in consultation and this increase should be available to the states for direct support of state nongame/wildlife diversity program data services which are used in designing conservation plans.

Wildlife Nongame Grants to States.—The Association strongly advocates Congressional support through appropriation of the full authorized funding level for both the 1980 Fish and Wildlife Conservation (Nongame) Act (authored at \$5 million) and the 1992 Partnerships for Wildlife Act (titled the Wildlife Conservation and Appreciation Fund authorized at \$6.25 million). This remains a high funding priority for state fish and wildlife agencies in fiscal year 1998; the Association has supported federal-state nongame funding for many years. Without a prevention strategy for these species, we will continue to see species move into the threatened or endangered species category with all the expenses and disruption that entails.

The Association is disappointed that the Administration's request of \$800,000 for the Partnership for Wildlife Act is only level with the fiscal year 1997 enacted. Because increases in federal funds are matched equally by both state and private monies, this is a very effective program. We expect these cooperative proposals to increase dramatically in the years ahead. The Association recommends an additional \$1.2 million be appropriated for this program.

Migratory Bird Management.—Association commends the Service for the \$1.5 million increase but remains concerned that the base budget for the management of migratory birds is still below an adequate level. Inflation and increased operating costs have escalated and any enhanced funding in recent years has been earmarked. Additional funding is needed to facilitate meeting program objectives for migratory bird conservation. The Association recommends an additional increase of \$1 million to address this need.

In addition, the Association supports the Service's commitment to Adaptive Resources Management but stresses that strengthening data bases is necessary. Adaptive Resource Management offers excellent potential for strengthening federal/state relations.

The Association is supportive of efforts to amend the U.S./Canada Migratory Bird Convention. We are pleased that an agreement has been reached and amendments successfully completed. Since part of the agreement focuses on the need for proper monitoring, the Association feels strongly that funds must be available to properly monitor subsistence harvest in Alaska.

Nongame migratory bird populations need additional monitoring to assure that management of declining species precludes having to rely on the Endangered Species Act. Monitoring would target marshbirds and other bird groups in order to develop the same quality data available for waterfowl. The Association supports the request for an additional \$1.5 million for this effort. Many of these efforts are conducted in partnership with state fish and wildlife agencies, particularly through the Partners in Flight program for the conservation of songbirds and raptors that migrate between our temperate forests and grasslands to the tropical regions in Latin America. This is a class example of acting now to conserve many of these declining species thereby preventing them from becoming endangered. This is a cost efficient way to conduct our conservation efforts.

Since the early 1980's, there has been little effort devoted to correcting data deficiencies related to the management of webless migratory game birds. There is a demonstrated need for better population and harvest survey information for species such as woodcock, mourning doves, sandhill cranes and rails. The Association wishes to stress the importance of webless migratory game bird management as an integral part of the Services' programs and responsibilities, and as this program evolves, necessary budgets must increase as well.

Management for migratory game birds needs additional funding to fully implement the Harvest Information Program, which will add 28 states in 1998; and Adaptive Harvest Management, which was initiated in 1996 to enhance monitoring capabilities in support of waterfowl and migratory webless gamebirds. These funds would enhance management capabilities to balance competing objectives of population growth and responsible recreational uses. The Association requests \$1.5 million for these programs.

Refuges and Wildlife.—The Association recognizes and supports high priority land acquisition for Wildlife Refuges for the purpose of protecting nationally important wetlands, and fish and wildlife habitat (including threatened and endangered species) for public use and enjoyment. However, in years of continued budget shortfall and underfunding of the operation and maintenance activities of existing Refuges,

we question the wisdom of continued land acquisition of new Refuges without providing adequate funding for existing refuge operation and maintenance. The Association strongly supports the \$13.8 million increase requested for the operation and maintenance of the National Wildlife Refuge System.

The Association continues its long history of support for an increase in the funding requested for operation and maintenance of the National Wildlife Refuge System. Upkeep activities addressing the critical needs of the refuge system are vitally important. High priority should be given to maintaining refuge maintenance and operations at a level that adequately protects wildlife resources and provides for wildlife dependent recreational uses. The Association also encourages Congress to consider the appropriate changes in legislation to permit funding of operation and maintenance requirements from the Land and Water Conservation Fund. The Association supports the pilot changes in the collection and disbursement of recreation/entrance fees charged on refuges. All of the fees collected would be available for refuge operations and maintenance on the Refuges where they are collected.

The Association recommends full funding for the Refuse Revenue Sharing Fund; the fiscal year 1998 budget request is only an estimated 62 percent of the full funding level. These funds are used to offset the loss of tax revenues to state and local governments. Full funding will ease financial burdens to counties containing refuges, thus fulfilling the governments obligations pursuant to the Refuse Revenue Sharing Act.

In the fiscal year 1997 Appropriations Conference Report, Congress requested information regarding the use of annual traps on National Wildlife Refuges. While some question the use of certain types of traps, no widely applicable alternative trapping devices are available, in spite of pioneering research being conducted by USDA-APHIS-ADC at their Fort Collins Research Center, and by a coalition of interests in Vegreville, Alberta, Canada. The U.S. Fish and Wildlife Service has not contributed to either of these research efforts. Given the significant role trapping plays in the management of the National Wildlife Refuge system, the Association recommends that \$100,000 be added to the Services' budget for a portion of the methods developments research at USDA's National Wildlife Research Center at Fort Collins.

Private Lands Program.—The Association recognizes that partnerships with private landowners are essential in advancing fish and wildlife conservation and supports the \$266,000 increase in the Partners for Wildlife targeted to specific areas of primary federal concern such as migratory birds, wetlands, and threatened and endangered species. The Association also urges these funds to be an additional increase, and not to redirect funds from an already established source within the base budget. The Association urges the Fish and Wildlife Service to cooperate with and be responsive to the needs identified by state fish and wildlife agencies in implementing these programs. In the past the Association has voiced concerns about adequate coordination of the Partners for Wildlife Program with ongoing efforts of the states to provide assistance to private landowners. The Association believes that planned expenditures in the Partners for Wildlife program involving private land should be targeted for enhancement of habitat such as wetlands that primarily benefits migratory birds. There are many opportunities for wetland enhancement projects that would benefit waterfowl and other migratory birds.

Fisheries.—The Association is pleased to see the Administration's budget reflect an increasing dedication to the Fish and Wildlife Service's fisheries programs, particularly, an increase in the fish and wildlife management line item within the fisheries division budget. Additionally, the Association applauds the recognition by the Service of the need for financial support for whirling disease research under the Biological Resources Division of the USGS and work in partnership with the Great Lake states and the Canadian government to conduct genetic and other research on lake trout and sturgeon stocks and to mitigate the impact of nonindigenous species. In the Service's fiscal year 1997 budget request, these proposals were included within a broader initiative which also addressed the needs of coastal fisheries on the Atlantic and Gulf of Mexico coasts. The IAFWA recognizes that, though not in the President's fiscal year 1998 request, the needs of Atlantic and Gulf anadromous and riverine fisheries management will continue to exist through the next fiscal year, as well as the Service's authority and responsibility to meet those needs. Working in partnership with the states and interstate fish commissions, the IAFWA recommends an additional \$2 million for research, management and enforcement of anadromous coastal fisheries programs by the Fish and Wildlife Service.

Other Fish and Wildlife Service Budget Items.—Recognizing the essential and important research and field work that the Service has conducted concerning contaminants through the Natural Resource Damage Assessment Program, the Association supports the increase of \$628,000 for fiscal year 1998. Because of the reliance by

States and tribes on information from this program, this increase will improve the Service program and those of its partner States and tribes. Given that the program is the backbone for all federal damage assessment programs within USDI, however, the Association strongly supports an additional \$1.4 million in funding for this program.

The Washington State Ecosystem Project, which is entering its seventh year, is designed to evaluate innovative approaches to reverse the decline in farmland wildlife, wetlands and riparian areas in the state of Washington. It shows promise of substantial benefits to a wide variety of fish and wildlife by providing habitat diversity on private lands. The Association supports the continuation of this project at \$1.483 million for fiscal year 1998 and recommends that \$500,000 be appropriated to continue the South Carolina Coastal Ecosystem Initiative. The Association also strongly supports a \$1.7 million increase to the Fish and Wildlife Service to implement the South Florida Ecosystem Restoration Initiative.

The Northwest Forest Plan is a comprehensive approach to managing forests in the Pacific Northwest. The U.S. Fish and Wildlife Service participates with other federal and state agencies in carrying out this program. The Service's responsibilities under this plan focus on endangered species and habitat restoration concerns. It is essential that the Service continue to be funded to be able to participate as a full partner in this integrated program. The Association supports the request for an increase of \$1.6 million to meet its responsibilities under the Northwest Forest Plan.

The Association supports the Administration's request of \$5 million to support the National Fish and Wildlife Foundation. In the last 11 years the Foundation has funded nearly 1,800 fish, wildlife and plant conservation projects many of which have been done in cooperation with state natural resources agencies. These projects have leveraged over 2 non-federal dollars for every federal dollar appropriated. Further, the Foundation utilizes no federal money to fund its administration.

The Association supports FWS' continued production of the "Wildlife Review" and "Fishers Review" publications vital to research and management of natural resources.

The Association appreciates the increased request of \$750,000 for hydropower licensing and mitigation studies. This reflects the huge burden placed on the Service by the many FERC relicensing studies required as a large number of licenses expire and must be relicensed. The Association strongly urges Congress to provide this additional funding to allow the Service to adequately review and propose hydropower licensing/relicensing requirements. Adequate information is essential before long-term licenses are granted.

The Association recommends that the Bears Bluff Field Station be rehabilitated as Bears Bluff Fisheries Coordination Office to serve as a National focus point for Service operations in the restoration and recovery of the endangered shortnose sturgeon and the protected Atlantic sturgeon. The unique culture expertise and ability to produce sturgeon can be used to complement state and management group interest in restoration and protection of depleted sturgeon resources. The Association recommends the addition of \$1 million for site rehabilitation and construction and \$1 million for collaborative culture and fisheries studies with state partners of North Carolina, South Carolina, Georgia, and Florida.

Border 21.—At the February 1997 Mexico, Canada, and United States Trilateral Commission meeting, 15 high priority Border XXI projects were targeted for implementation. Geographically, these projects are widely distributed along the entire United States/Mexico Border and all 13 projects have been identified by individual United States-Mexico states as being border-wide issues. At this time, there is no funding identified in the U.S. budget for projects. The Association recommends that \$1 million be appropriated to initiate high priority international projects in 1998. This increase should be made in the General Activity Portion of the Service budget under "Border 21."

NAFTA Projects (Borderlands).—Over the past three years, collaboration between the U.S. Fish and Wildlife Service (FWS) and Mexico's Director General for Wildlife (DGW) has achieved important objectives in the conservation and management of Mexico and United States wildlife and protected areas. The NAFTA initiative continues to support habitat for many species shared by the United States and Mexico. These are species whose habitats would continue to decline in number and habitat quality without this support. NAFTA funds have in the past been leveraged at a 1:4 ratio with an apportionment of \$702,260 resulting in the development of over \$3 million in non-U.S. match.

The Association recommends that NAFTA initiative funding levels be increased to \$850,000 which, combined with existing funds, covers only 50 percent of the

amount requested by project proposals. This increase should be made in the General Activity portion of the Service budget under "International Conservation."

BUREAU OF LAND MANAGEMENT [BLM]

The BLM budget with minor exception is a continuation of last years efforts. Reductions in staff have resulted in increased demands and fewer reports on accomplishments. Consolidation of accountable budget categories from 48 to 19 has made it increasingly difficult for state fish and wildlife partners to obtain adequate information on specific programs. The Association is concerned about these changes, and particularly concerned that funding for such programs as BLMs riparian initiative and Challenge Cost Share moneys may suffer in the competition for funds if such moneys are not dedicated at the activity level. The Association continues to believe that it is important that BLM track and report annual performance objectives and accomplishments on these critically important sub-activities in their budget.

The BLM has made special efforts to communicate its management objectives through such documents as Fish and Wildlife 2000 and national habitat management plans. These plans establish measurable objectives for fish and wildlife programs on public lands managed by BLM. While progress has been made in the 1998 budget to improve habitat and aquatic performance indicators and to list natural resource opportunity projects by state, the current budget structure is still so broad it fails to tie these objectives directly to the budget process. The Association continues to believe that it is essential that BLM clearly relate its management goals to a specific, usable budget structure and site specific measurable performance objectives.

Land Resources.—The emphasis on Rangeland Restoration efforts throughout the west is essential to bring these lands back to their full productive capacity, and the Association is pleased to note the emphasis on this program. Similarly, the Association strongly supports BLM's commitment to increase cooperative efforts between the United States and Mexico under the North American Free Trade Act of 1994. Additionally, the management of Wild Horses and Burros has been an ongoing concern of the Association, and prior budgets have, in our opinion, been inadequate to allow BLM to successfully implement its Strategic Plan for Management of Wild Horses and Burros, which calls for achieving proper management levels of these species by 1998. The Association is therefore pleased with and commends BLM for its fiscal year 1998 budget request, and fully supports the recommended increase of \$2.8 million in this budget to control the growth of the wild horse and burro populations that compete with native wildlife population and can cause serious range deterioration.

Wildlife and Fisheries.—The Association commends BLM on continuing to identify the Wildlife and Fisheries Program as a budget activity separate from Threatened and Endangered Species. The Association recommends an increase of \$500,000 to implement fisheries management and BLM's share of the Recreational Fisheries Initiative because we feel the proposed 1998 budget request of \$500,000 is inadequate to address current demand. Public demand is strong for continuing fisheries habitat improvement on the public lands through such high priority partnership agreements as the Lake Havasu project, in conjunction with the Bureau of Reclamation, the states of California and Arizona, and private groups including Anglers United. This type of effort benefits a large segment of the public, and provides maximum return on federal expenditures. Additionally, the BLM is working closely with state fish and wildlife agencies on both Partners in Flight (terrestrial nongame birds) and watchable wildlife efforts. We urge continuation of these important conservation programs that address species and habitat needs before significant declines require further efforts. We continue to be very concerned with riparian habitats and support the intensive riparian inventory progress of 76 percent made to this point. However the progress made to directly improve identified degraded riparian habitats is woefully inadequate. The Association recommends an increase of \$1 million to begin to adequately address the significant backlog of riparian habitat recovery opportunities.

Threatened and Endangered Species.—Management of a number of candidate and federally listed fish populations in the Columbia and Snake River Basins of Oregon, Washington, and Idaho continues to be critical to avoid further declines and potential listing of some species, and to reduce or mitigate impacts to others. These efforts fall largely under the agreements resulting from the Pacific Northwest Salmon Summit of 1992. BLM efforts to improve resource conditions in this region and to implement interagency agreements is strongly supported. The Association supports the fiscal year 1998 identified species priorities including Desert Tortoise in Arizona, bull trout in Idaho and Montana and swift fox and mountain plover in Mon-

tana and the fiscal year 1997 effort made towards California Condor reintroductions but does recommend an additional \$400,000 to fully implement the BLM portion of the Desert Tortoise Recovery Plan in cooperation with Clark County, Nevada and the Nevada Habitat Conservation Plan.

Recreation Management.—The Association commends BLM proposals to coordinate Interior agency management of public lands protected under the California Desert Protection Act.

Finally the Association strongly supports the BLM's participation in such interagency efforts as the Eastside Ecosystem Management Project in the Columbia River Basin. Interagency efforts to identify resource concerns and management options at that level should provide significant benefits to decisionmakers as they strive for balance between competing land uses. The Association strongly endorses BLM participation in these interagency efforts, and firmly believes that efforts such as these will result in improved understanding of alternatives facing decisionmakers concerning the wise stewardship of public lands. More specifically, the Association supports funding for the Seeking Common Ground (SCG) effort of the BLM at a level of \$250,000. This nationally sponsored partnership includes the Association, the BLM, USFS, NFWF, the American Farm Bureau, the National Rifle Association, Rocky Mountain Elk Foundation and the Wildlife Management Institute. SCG partners goals include the support for demonstration projects that: Improve rangeland conditions; promote individual stewardship that improves resources; improve communications between rangeland users; reduce conflict between livestock and wildlife; and encourage problem solving at the local level.

U.S. FOREST SERVICE [USFS]

The Association urges Congress provide a balanced budget for the Forest Service, reflecting the full range of needs as identified in the forest plans. The public benefits economically and environmentally as a result of equal consideration for all National Forest resources. In 1995, wildlife and fish related recreation on national forests resulted in \$3.68 billion of net public benefit. That equals a \$37.27 return on each dollar invested in fish and wildlife.

National Forest System.—Funding for fish and wildlife habitats on National Forests has languished for more than three years. Considering the increasing amount of private matching funds made available to this program since 1986, the President's budget for fiscal year 1998 is very disappointing. The Association supports additional investments in wildlife and range programs that will result in significant economic and social benefits.

Get Wild Program.—This program focuses on terrestrial and semi-aquatic wildlife and serves as an umbrella for 10 national wildlife emphasis areas. In the President's fiscal year 1998 budget, funding for this program is increased only \$1.637 million from fiscal year 1997 enacted. Thus, the program would remain more than \$9 million below the fiscal year 1995 level. It is estimated by the Forest Service that full implementation of these opportunities would cost \$54.447 million in fiscal year 1998. This is a true habitat protection and restoration program that maintains wildlife populations and improves rangelands by providing the proper mix of several multiple uses on federal lands. The Forest Service's effort is to ensure the sustainability of terrestrial species and the habitats on which they depend. The Association supports this program and recommends that Congress provide a funding level consistent with fiscal year 1995 at \$38 million.

Challenge Cost-Share Program.—The Fish and Wildlife Challenge Cost-Share Program, a cooperative partnership effort, is funded at \$17.2 million for fiscal year 1998, which is nearly \$4 million less than the Service's cooperators contributed in fiscal year 1997. This is a very successful program, with non-federal fish and wildlife organizations providing considerably more than the Service for habitat improvement projects on national forests. The Association strongly supports increasing the Service's share of this program to the fiscal year 1997 cooperators' level of \$21 million.

Threatened and Endangered Species Programs.—The Association urges Congress to continue supporting this program by approving the President's request of \$27.218 million for fiscal year 1998. Assuring compliance with the Endangered Species Act creates significant impact on the states. Consequently, funding should be provided to help support state Endangered Species Act consultation with the Forest Service. The Association urges that current funding be used to help support state fish and wildlife agency efforts so that more of the national priority needs can be met.

Inland Fisheries.—The Association supports funding this program at least at the fiscal year 1998 level recommended by the President of \$17.157 million. These funds

would provide for habitat initiatives that protect and restore inland fish habitat that will enhance the productivity of National Forest System aquatic resources.

The Association recommends that the anadromous fisheries program be funded in fiscal year 1998 at the requested level of \$22.521 million.

Rangeland Management.—This continues to be one of the most underfunded of Forest Service programs. Therefore, we strongly support the proposed increase of \$7.376 million and urge that the increase be used to complete NEPA analyses, where they are needed, compliance monitoring, and the completion of improvements that alleviate riparian and other rangeland Grazing problems.

Forest Research.—Scientific studies provide information and technology needed to protect, manage, use, and sustain the natural resources of this nation. The Association urges Congress to fund forest research at the proposed fiscal year 1998 level of \$179.7 million. Funding at this level will continue to provide natural resource decision makers with a wide variety of information to make natural resource use and management decisions.

The Association agrees that there is a need to provide an appropriate level of funding for the Forest Service Ecosystem Management Program. However, during past fiscal years, millions of dollars have been transferred from the Wildlife and Fisheries and Range programs into Ecosystem Management. It is not at all clear how these funds will be used for the planning, monitoring and survey work required for viable fish, wildlife and range programs. In the past, these activities were funded directly from the individual budgets which were readily identifiable. In Ecosystem Management, the goals and objectives are not identified. The Association cannot support such a vague approach to planning and monitoring. We recommend that the Ecosystem Management division be directed to: (1) identify its goals and objectives; (2) determine its needs and institute an evaluation system; and (3) inform cooperators on how the funds will be spent and on what programs. Unless this is done, support will continue to erode.

State and Private Forestry.—The Association continues to be strongly supportive of programs that assist private landowners and states to improve and enhance fisheries and wildlife habitat, protect watershed values and contribute to the economic and environmental well being of urban and rural America. Therefore, we support proposed funding levels for Forest Stewardship, Stewardship Incentives, Urban Forestry, Forest Legacy, and Cooperative Lands Fire Management. We also remain supportive of Forest Health programs, but suggest that Forest Health programs should include a wider array of components, such as forest health from a fish and wildlife perspective and ensure forest health protection for state and private lands.

Seeking Common Ground.—The Association supports funding the Seeking Common Ground effort in the Forest Service at \$250,000. This nationally sponsored partnership includes the Association, the Forest Service, Bureau of Land Management, National Fish and Wildlife Foundation, American Farm Bureau Federation, National Rifle Association, Rocky Mountain Elk Foundation, and Wildlife Management Institute. SCG goals include support for demonstration projects that: improve rangeland condition; promote individual stewardship that improves public and private resources; improve communications among rangeland users; reduce conflict between livestock and wildlife; encourage problem-solving at the local level.

BUREAU OF INDIAN AFFAIRS [BIA]

The Association continues to be concerned by the wholly inadequate wildlife and parks budget of the Bureau of Indian Affairs. We are, however, pleased that the wildlife and parks base request of \$28.105 million for fiscal year 1998 demonstrates a positive move away from the traditional process of requiring that the tribes request individual Congressional add-one to meet on-going year-to-year wildlife and parks base budget needs. The Association strongly supports the base request in fiscal year 1998 of \$26.105 million.

The fiscal year 1998 budget includes \$372,000 for fish hatchery maintenance, an amount which barely recognizes the \$14 to 15 million backlog in required hatchery maintenance. The Association strongly recommends an increased funding level for fiscal year 1998 and out years with the objective of eliminating the fish hatchery maintenance backlog by fiscal year 1999.

The Association has in the past strongly supported the Administration's request for fish hatchery rehabilitation to rehabilitate tribal fish hatcheries and replace capitalized equipment for the highest priority projects. While the Administration has not requested any money in fiscal year 1998, the Association strongly recommends that Congress appropriate continued level (to fiscal year 1995) funding (approx. \$1.5 million) for this effort in fiscal year 1998 to replace failing systems and modernize

tribal fish hatcheries to enable them to optimize fish production. This funding would help satisfy vital tribal fishery needs.

The Association believes that tribal lands are integral to the maintenance and recovery of threatened and endangered species. Presently, the majority of tribes are unable to be parties to candidate species studies and conservation agreements due principally to lack of funding. The Association strongly supports an increase of \$400,000 to the central operations line item for the tribes to participate in all phases of the endangered species recovery process. This would enable tribes to begin to address listed species needs and recovery of species that all Americans benefit from.

While the Association is opposed to diversion of federal aid funds, it is committed to adequate federal funding to provide for professional management of tribal fish and wildlife resources. The Association believes that Native American tribes have identified legitimate funding needs for fish and wildlife on millions of acres of tribal lands and that adequate funding will preserve and enhance the cultural heritage of Native American Tribes while providing positive economic benefits, and ensuring the conservation of significant fish and wildlife resources.

BIOLOGICAL RESOURCES DIVISION, USGS

The Association supports the stated goals for the BRD, but we are concerned that inadequate progress has been made to refine the mission to provide the applied research necessary to complement existing state programs and emphasize partnerships. The Association wishes to reemphasize the importance of developing a partnership between BRD and state fish and wildlife agencies. A meaningful, co-equal partnership with the state fish and wildlife agencies is essential if the BRD is to achieve its goal of facilitating natural resources conservation based on sound applied science. The proposed fiscal year 1998 budget principally reflects an emphasis on meeting the needs identified by Department of Interior land management bureaus, units of the federal government that manage only 20 percent of the land area of the United States. Biological research needs for the 80 percent of the land area of the United States managed by states are largely ignored.

The proposed budget includes \$6.5 million for new initiatives while proposing reductions in areas of critical concern to states, in particular research on warm water fisheries, wetlands, and waterfowl. In addition, no increases are proposed within the following BRD program categories: Migratory Game Birds, Wildlife Disease, Chemical and Drug Registration, Partnership for Public Aquaculture, and Research on Endangered Species. While we support the increase to exotic invasive species, noxious weed management, salmon habitat research, and Great Lakes fisheries, the Association recommends that the BRD be directed to consult with state fish and wildlife agencies to insure adequate attention is directed to these other research needs and that no reductions in funding or the quality of service be permitted.

Cooperative Research Units.—The Association strongly supports the Coop Units. The Coop Units continue to be one of the best examples of cooperative research for wildlife and fisheries in our nation. This is at the heart of goals of providing scientific data that is essential for land management decisions. The proposed budget includes a \$1 million increase for the Cooperative Fish and Wildlife Research Unit program. While we applaud this increase, it represents restoration of only half of the reductions from the previous 2 fiscal years. The Association recommends that sufficient funding intended for new initiatives be reprogrammed to the Coop Unit program to fill all 21 currently vacant positions and provide adequate support for these positions. The Association supports the creation of new Cooperative Research Units with the understanding that existing units will be fully staffed and funded. We recommend that these Units be part of the fisheries and wildlife programs and that they work with State fish and wildlife agencies to carry out applied research on fisheries and wildlife issues.

The BRD bird banding laboratory and migratory bird research office at Patuxent is critical to the multi-government and non-government Partners in Flight effort. The Association recommends continuing support.

One area where state-BRD cooperation is critical is in the registration of fishery therapeutants. The BRD has received \$500,000 for this work and needs to make every effort to use these funds in cooperation with state contributions. This effort will take at least five years and will require the support of state and private interests to support BRD research.

The Association is disappointed that cooperation with the State fish and wildlife agencies in identifying critical research needs to solve on the ground resource problems continues to be minimal. We have reminded BRD that over 80 percent of the Programs now within BRD were originally in the U.S. Fish and Wildlife Service.

The Association recommends that BRD be directed to work with state fish and wildlife agendas to identify and address issues impacting fish and wildlife. The Association further recommends that state fish and wildlife agency personnel be included in developing the research program of BRD, including serving as members of the Science Board of BRD. Otherwise, the BRD research program will almost surely not serve the applied research needs of fish and wildlife agencies.

NATIONAL PARK SERVICE [NPS]

The Association is encouraged by the proposed \$65.714 million increase in Operations of the National Park System but is disappointed that no funds are requested for state grants for the Land and Water Conservation Fund in fiscal year 1998. We strongly encourage Congress to restore at least fiscal year 1995 level funding at \$30 million for this important partnership effort. The federal-state cooperative effort to provide outdoor recreation opportunities through the Land and Water Conservation Fund is seriously undermined when only the federal portion is funded.

The Association supports full implementation of and the progress being made in concessions reform providing those funds Reduced remain available to the National Park Service. Likewise, we support continued revision of fee policies to allow establishment of service fees on the basis of facility usage and operational requirements. As with concessions reform, monies generated by fee restructuring should continue to be available to the National Park Service for specific on-the-around activities.

The Association recognizes the importance of the South Florida ecosystem and supports funding for restoration efforts in the Everglades National Park, the Big Cypress National Preserve, and the South Florida Restoration program. We support the proposal to fund the NPS share of the Everglades Watershed Restoration project (\$100 million) as supportive of fish and wildlife and other resource interests. We recognize it may not be feasible to fully fund this initiative.

The Association generally supports the proposed National Park Service Land Acquisition budget (\$69.9 million), but recognize that budget reduction may prevent this level of funding.

The Association supports proposed funding of natural resource initiatives (approximately \$9 million) including air, water quality, habitat, and plant and wildlife distribution assessments provided the National Park Service closely coordinate these programs with state resource management agencies.

PREPARED STATEMENT OF KEN POYNTER, EXECUTIVE DIRECTOR, NATIVE AMERICAN FISH & WILDLIFE SOCIETY

Mr. Chairman and Distinguished Committee Members: My name is Ken Poynter, current Executive Director of the Native American Fish & Wildlife Society (Society) and an enrolled member of the Passamaquoddy Tribe of Maine. I would like to thank you, on behalf of the Society, for the opportunity to provide testimony to the Appropriations Subcommittee on the Interior. I will be requesting appropriations from the Department of the Interior, Bureau of Indian Affairs (BIA), Wildlife & Parks budget (under Other Recurring Programs) for continued funding at the organization's fiscal year 1997 level of \$488,000.

The Society is a national non-profit organization dedicated to the sound management and prudent use of tribal fish and wildlife resources. The organization serves as a network among tribes throughout the country, including Alaska and provides training and technical assistance to tribes in natural resource planning and enhancement.

The Society includes a membership of 136 tribes, which includes 32 Alaskan Native villages and non-profit corporations, 1,200 individuals, numerous regional Commissions and Native organizations who are supportive of tribal fish and wildlife development and of the Native American Fish & Wildlife Society. All Society members share the common goal of protecting tribal sovereignty in the management and use of fish and wildlife resources.

Due to our effective method of providing technical assistance, periodic trainings and general support to our members, the Society had an increase of 22 new member tribes to the organization in 1996. This represents a 17 percent increase in tribal memberships in fiscal year 1996 and a 110 percent increase since 1995 and attests to the strong tribal support and the positive impact the organization has made in Indian Country. It is noteworthy to mention that because of our large tribal membership base, the funding received through the federal appropriations process serves, at a minimum, 136 separate tribal governments.

To date (in fiscal year 1996), the Society has provided technical services and assistance to over 133 tribes, 22 non-profits, 14 states and 11 different federal agen-

cies in the areas of fish and wildlife management, education and environmental protection. Seven regional conferences, including Alaska, were held with associated technical work group meetings including: one national conference; four summer youth practicums; workshops on natural resource program development; development of fish and game codes, integrated resource management; fisheries; wildlife; wildlife management modeling, mutual gains negotiations, grant writing, ecosystem management, and environmental and conservation law enforcement. In conjunction with these activities, four quarterly newsletters (with a circulation of over 1,200 each), an annual report, promotion publications, informational management brochures and resource funding brochures were distributed nationwide.

The Native American Fish & Wildlife Society represents a wealth of experience and information regarding management of fish and wildlife resources on Indian lands. Society members embody a diverse group of lay people, fishery biologists, wildlife biologists, foresters,

conservation law enforcement officers, and land use managers and planners who currently manage tribal land bases throughout the country including Alaska.

The concept of the Society is based on the necessity for an organization to assume a leadership role to maintain the technical proficiency of tribal fish, wildlife and natural resource programs. Because of its organizational structure, the Society is able to efficiently respond to specific requests from tribes for technical assistance regarding the development, enhancement and wise use of their natural resources.

Members of the Society are involved in technical initiatives sponsored by the Society, as well as development of tribal technical fisheries, wildlife and recreation management initiatives critical to the preservation and protection of tribal resources. In addition, the Society continues to respond to the needs of its members in the area of technical assistance and program support.

The Society has developed an organized structure to assist in documentation of tribal fish and wildlife management efforts from the tribal perspective, and the techniques currently being used successfully by tribal governments. Our members have immediate access to technical assistance gleaned from an extensive in-house natural resource library, a computerized data base entitled "Tribal Watershed Forum" (containing information on the number and variety of water related programs that have been initiated nationally on Native lands) and the Technical Services Office which is dedicated to assisting tribal governments and individual members with their technical needs.

Collectively, American Indian tribes have a land base of approximately 94,000,000 acres, that includes thousands of miles of streams and rivers, and 730,000 lakes and impoundments. The wise use and management of these vast resources will only ensure that they remain intact for many generations to come. And because our work is so important, it is essential that we continue to receive funding so that we can carry on our goal to improve the general welfare of Indian people through charitable, educational, and other fish and wildlife related activities.

The Society is currently the only national Native American organization that provides technical assistance to American Indian tribes, federal, state and local governments as well as private industry to develop and implement sound policies, ordinances, regulations, and laws to protect, preserve, conserve and prudently use and manage fish, wildlife and other natural resources. In addition, it supports and conducts natural resource and conservation law enforcement trainings as well as annual educational opportunities for Native American youth.

fiscal year 1996 marked the fourth year that the Society has initiated the most pro-active budget in the organization's 16-year history. Funding has been set aside for each region to identify and conduct trainings and workshops in various aspects of natural resource management. Each region identifies its training needs and the logistics of the workshop is coordinated and funded by the Society's national office.

Regional conferences feature forums and seminars that share information between tribal entities and programs as well as focusing on current trends in resource management. Such efforts have had a recognizable as well as a positive affect on the tribal resource base.

Regional and National Youth Practicums are conducted by the Society for Native students who are interested in natural resource management careers. Such youth programs are an effective and unique method of providing hands on experience and instruction to these promising young people. The intent of these programs is to encourage their pursuit of further education and careers in natural resource management. To attest to the program's value and effectiveness, nine past Practicum students are currently in universities and colleges throughout the country pursuing degrees in natural resource management.

As mentioned in both our oral and written testimony of 1995 and 1996, the Society, in recognition of potential future funding cuts and an over-all lack of federal

funding for tribal natural resource management, has aggressively moved forward and established the Native American Fish & Wildlife Foundation. It is important to note that our assertion to form this new entity was not mere rhetoric, but a sincere desire to actively work to become a self sufficient organization.

The Society has shown its commitment to this endeavor by conducting grass roots fund raising activities and investing those funds exclusively to the project. To date, approximately \$191,000 has been raised and utilized to hire a full-time Foundation Coordinator with the remainder being used to establish a permanent endowment.

The Foundation has since been incorporated in the state of Colorado and has received IRS tax exempt status from the Internal Revenue Service. The new entity's Board of Trustees are currently being recruited and selected. Major fund raising activities continue on an on-going basis with an emphasis on securing large donations from the private sector (major corporations, foundations and the public at large).

With the establishment of the Foundation, and once the 10 million dollars for the permanent endowment has been raised, the Society will no longer require federal funding and will, at the same time, be in the position to provide funding to tribes, via a small grants program, for their natural resource management efforts. It is important to note that once this is accomplished, the Society will be the first national Indian organization in the history of this country to become totally self supporting.

At this time, and until we reach our goal of self sufficiency, Congress should view the federal funds appropriated to the Society as an investment which will be offering a return in the future via grants to tribal governments for natural resource management from the Foundation. It is critical that the Society continue to receive our current level of funding so that our important work with tribes, states, federal agencies and the private sector is not diminished while we work towards self sufficiency.

Due to the current level of funding, the organization is in a position to better meet the needs and address the issues facing fish and wildlife management in Indian Country. The Society has been able to increase its outreach efforts (which is evident in the 110 percent increase of tribal memberships realized since fiscal year 1995), double the size of the annual Native American Environmental Awareness Summer Youth Practicum, more than double the number of trainings conducted in each Region, and provide adequate support for the seven regional conferences including the annual national conference. To reiterate, the Society is requesting a Total of \$488,000 for fiscal year 1997.

The Society is appreciative of the support and funding that we received for fiscal year 1997. Reinstatement of the organizations funding, back to the fiscal year 1995 level of \$488,000, by both the House and Senate attests to the strong support and indispensable need for an organization, like the Society, to be working with Indian Country.

The fact that the current level of funding (\$488,000) allows the organization to deliver those services and technical assistance to the many individual members and member tribes as requested, the Society is not asking for additional dollars for fiscal year 1998. Instead, we request that our current level of funding be sustained for fiscal year 1998 so that we may continue to support tribes in the area of natural resource management while we diligently work towards becoming self-sufficient.

In addition, the Society encourages legislation that allows tribes to participate in Federal Aid Funding and including tribes in any proposed future legislation addressing the Federal Aid program.

The Society supports the White Mountain Apache Tribal Wildlife and Outdoor Recreation Program funding request for the following programs: Conservation Law Enforcement in the amount of \$511,000; and Endangered Species Management in the amount of \$180,000.

LETTER FROM ROBERT D. BROWN, PRESIDENT, THE NATIONAL ASSOCIATION OF
UNIVERSITY FISHERIES AND WILDLIFE PROGRAMS

COLLEGE STATION, TX, *March 17, 1997.*

Senator SLADE GORTON,
Chairman Senate Appropriations Subcommittee on Interior,
U.S. Senate, Washington, DC.

DEAR SENATOR GORTON: The National Association of University Fisheries and Wildlife Programs (NAUFWP) submits this statement in support of more adequate appropriations for important research and other essential activities to be carried out through the Biological Resources Division (BRD) of the U.S. Geological Survey.

Members of the NAUFWP include 55 Universities. We seek to enhance public understanding of the needs for improving natural resource management and to ad-

vance the science and practice of sustainable uses and management of the resource base. Our efforts focus on cooperative work with partners and customers to advance research, education, extension and management to benefit people and communities throughout the country.

Results from the Roper Starch fifth annual survey of adult Americans, prepared for the National Environmental Education and Training Foundation and released in December 1996, illustrate pressing needs for BRD's research, education and outreach programs. Key findings of adult views on natural resources provide an overall context in which to consider the specific figures in the President's proposed fiscal year 1998 budget. Adult Americans believe: Environmental resources should be conserved in ways that balance economic growth while protecting the environment and human health; natural resources can be managed in ways that protect wildlife and ecosystems while humans benefit from their planned use; Federal government spending should be shifted to environmental programs from other areas; and concerns for the environment and management of natural resources can be responded to by expanding education programs designed to raise current low levels of knowledge about the environment, such as to maintain and improve water quality.

Within this context of public views and needs for research, education, extension and management, the NAUFWP supports continuing and strengthening BRD programs. Stronger programs are required to be more responsive to needs of the public and resource managers. Four specific recommendations are offered for the fiscal year 1998 appropriations for the BRD.

1. Continue to support levels of funding that allow the BRD to respond to pressing needs to generate information on natural resources and their uses to (1) prevent adverse impacts on the resource base, (2) strengthen resource management, (3) educate and train students and adults, especially resource managers, (4) perpetuate sustained ecological, economic and social benefits, and (5) enhance the quality of life. Positive responses to citizens needs would be timely.

2. Provide at least \$145 million and 1,699 FTEs for the BRD in fiscal year 1998, as proposed in the President's budget. Regrettably, even this amount will not permit filling all vacancies in existing Cooperative Research Units. As you know, the states have public trust responsibilities for wild living resources within their boundaries. Both timely information and graduates from the Units are essential to help the states respond effectively to their responsibilities. Similarly, improved responses are required to support science that enhances the management of federal lands, restores Great Lakes fisheries and their habitats, and improves management of natural resources in other geographic locations.

3. Provide firm support for the Cooperative Research Units, with their enviable track record of invaluable products and services generated for more than 60 years, as well as the essential Bird Banding Laboratory and Breeding Bird Survey. This unique Laboratory and Survey provide helpful scientific information available from no other source.

4. Support research on the toxicity of various endocrine-disrupting compounds. Improved understanding of these compounds is required to prevent further adverse impacts on living creatures, including people.

Please make this statement a part of the official hearing record of the Subcommittee on Appropriations for Interior.

Sincerely,

ROBERT D. BROWN,
President.

PREPARED STATEMENT OF WAYNE PACELLE, VICE PRESIDENT, GOVERNMENT AFFAIRS,
THE HUMANE SOCIETY OF THE UNITED STATES [HSUS]

The HSUS requests funding recommendations for the Fish and Wildlife Service [FWS] as follows: The Administration's \$78.8 million request for implementing the Endangered Species Act [ESA] is inadequate; \$1 million and \$400,000 are recommended for the African Elephant Conservation Act and the Rhino and Tiger Conservation Act, respectively; \$830,000 for Land Acquisition; \$100,000 for the Wild Bird Conservation Act; \$500,000 for the Exotic Bird Conservation Fund; and \$13.85 million for law enforcement. The Bureau of Land Management [BLM] requires \$18.7 million for the Wild Horse and Burro Program and \$300,000 specifically for wild horse immunocontraception.

FISH AND WILDLIFE SERVICE/ENDANGERED SPECIES

The HSUS emphatically supports a strong and generous reauthorization of the ESA. We believe that many of the ESA's supposed deficiencies can be blamed on

inadequate funding. Consequently, generously funding the ESA will significantly improve its success at saving species and preventing or solving potential conflicts. We believe that the Administration's request for \$78.8 million for implementation of the ESA by the Fish and Wildlife Service is inadequate, especially with respect to funds for listing new species. There is a backlog of literally hundreds of species for whom consideration of listing has been dangerously delayed, threatening the species themselves and leaving land owners in a state of perpetual uncertainty. The FWS now is also carrying growing responsibilities for monitoring endangered and threatened species on federal lands and for designing and implementing Habitat Conservation Plans.

The HSUS supports funding for the African Elephant Conservation Act at the Administration's requested level of \$1 million. However, we would strongly recommend that the Fish and Wildlife Service use this money strictly for elephant conservation and not to support programs, such as Zimbabwe's CAMPFIRE program, that promote elephant hunting and reinstatement of the international commercial trade in ivory, both which harm elephant populations.

The HSUS also supports funding for the Rhino and Tiger Conservation Act at the Administration's requested level of \$400,000.

FISH AND WILDLIFE SERVICE/LAND ACQUISITION

The HSUS recommends the earmarking of \$830,000 for direct acquisition and conservation easements for Red Rock Lakes National Wildlife Refuge. This magnificent refuge is the heart of Montana's Centennial Valley, a paradise for waterfowl and large mammals, as well as a critical corridor between populations of threatened grizzly bears and, potentially, endangered gray wolves. Red Rock Lakes is under immediate threat of development on its boundaries, development that will degrade its wetlands and sharply reduce its value to wildlife.

FISH AND WILDLIFE SERVICE/OFFICE OF MANAGEMENT AUTHORITY

The HSUS believes that additional funding in the amount of \$100,000 is needed for the Service's Office of Management Authority for permitting activities related to the Wild Bird Conservation Act [WBCA]. Implemented in 1992 after a unanimous vote by the Congress, the WBCA promotes the conservation of exotic birds in trade by ensuring that imports into the United States do not jeopardize wild populations. Prior to its enactment, the U.S. was the world's largest importer of birds and a contributor to the decline of many species in the wild. The implementation of the WBCA in fiscal year 1998 requires, among other things, the monitoring of trade levels and the biological status of species in the wild, the approval of sustainable use management plans submitted by foreign countries, and the processing and granting of import permits and petitions for actions pursuant to the WBCA.

We also request \$500,000 for the Exotic Bird Conservation Fund established by the WBCA. These funds would be used to assist other countries in the conservation of their indigenous wild birds. Funding this initiative will provide the FWS with an additional tool to encourage conservation of exotic birds in their countries of origin.

FISH AND WILDLIFE SERVICE/LAW ENFORCEMENT

Additional funding in the amount of \$13.85 million is required to improve the FWS's ability to effectively monitor wildlife trade, intercept illegal trade, and improve the effectiveness of the Clark R. Bavin National Fish and Wildlife Forensics Laboratory.

Millions of animals, and their parts and products, travel through U.S. ports each year. The United States is the world's largest wildlife trading country, importing \$773 million and exporting \$256 million each year. The illegal trade into and out of the U.S. is estimated to be worth between \$100 million and \$250 million annually. The FWS is supposed to monitor this trade, and intercept illegal trade, by physically inspecting wildlife shipments. About 77,000 shipments are processed annually.

A December 1994 U.S. General Accounting Office (GAO) report gave the Service poor marks for monitoring wildlife trade and intercepting illegal wildlife trade. The report found that only about 25 percent of wildlife shipments are physically inspected, and, as a result, only about 10 percent of illegal shipments are detected. Under staffing and limited resources were cited as causing the Service's poor performance. Consequently, we believe that an additional 60 Special Agents, 12 Wildlife Inspectors, and appropriate support staff are needed to adequately administer the law enforcement program.

In addition, the Bavin Laboratory, which provides wildlife forensics for the Service, has experienced an over-whelming increase in caseload since its inception and

will need to double its current staff, an increase of 30 persons, and will need \$6 million for construction of additional facilities.

We request an increased allocation to the FWS's Washington Office Division of Law Enforcement for the purpose of funding special investigations by the Branch of Special

Operations. Investigations of complex international and domestic wildlife crimes, which are multi-regional, as well as multi-national, particularly cases relating to violations of the Endangered Species Act, Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), Marine Mammal Protection Act and other relevant laws, can only be conducted by the Branch of Special Operations. As the most productive unit within the Division of Law Enforcement, the Branch of Special Operations experienced numerous successes in 1996, which resulted in the sentencing of wildlife smugglers.

BUREAU OF LAND MANAGEMENT/WILD HORSE AND BURRO PROGRAM/FERTILITY CONTROL RESEARCH

Recent public and press attention has focused on the serious deficiencies of the Bureau of Land Management's Wild Horse and Burro program. We believe that, in principal, this is a highly valuable program: America's wild horses are a public trust greatly beloved by the American people, and any indication that these animals are being treated inhumanely generates immediate public outrage. Consequently, The HSUS recommends that the Administration's budget request of \$18.7 million for the Wild Horse and Burro program be fully funded. Within the program, however, funds should be shifted from the adoption program to on-the-ground management of horses and their range, especially wild horse monitoring, range monitoring, and habitat restoration.

The BLM currently spends more than \$1,000 for each wild horse that is removed from public lands and processed through the Adopt-a-Horse program. Even at that level of spending, the Bureau cannot guarantee humane treatment and adequate care to the 4,000 or more wild horses adopted each year.

The HSUS believes that fertility control, if used as part of a scientifically-based and equitable range management plan, can reduce human-caused stress on wild horses and burros, improve care for animals entering the adoption program, and reduce the costs of wild horse and burro management. The National Park Service is already using immunocontraception to control feral horse herds at Assateague Island National Seashore, and has proposed its use at two other sites.

Funds appropriated by Congress in fiscal year 1993-97 have made significant contributions to the development of a one-shot immunocontraceptive vaccine to prevent pregnancy in western wild horses for at least one full year, and provided principal support for two successful field trials on Nevada wild horses. In the first (1992) field trial, 131 mares were contracepted; in the 1996 field trial, 267 mares were treated with either one- or two-shot vaccine preparations, with an apparent success rate of about 95 percent for both preparations.

We remind Congress that every foal not born potentially saves the Bureau over \$1,000 in adoption costs, and thus, that, even in the research phase, the vaccine is highly economical. Consequently, we request \$300,000 from Congress in fiscal year 1998 to support further research in wild horse immunocontraception. These funds would support the refinement of a one-shot vaccine that is effective for at least two years, long-term studies needed before the immunocontraceptive vaccine can be used on a broad scale, and at least two additional field projects that should reduce wild horse population growth, reduce the number of horses that enter the Adopt-a-Horse program, and thereby recover the cost of the research.

The HSUS offers the following recommendations for modifications to the Wild Horse and Burro Program that will alleviate the troubling problems that exist in its current implementation:

- (1) Allocate a 50-percent increase in funding for contraception.
- (2) Raise the adoption fee to a minimum of \$250 for a horse or burro and allow competitive bidding.
- (3) Reverse the current trend toward reducing the number of wild horses on the range. Reductions in wild horse numbers in recent years are threatening the viability of many herds.
- (4) Restore the voice of the public in influencing decisions. The BLM has been using the "full force and effect" regulation, which was primarily intended for emergency situations, to effectively remove the public's opportunity to influence decisions to remove horses from the range.

(5) Include in title transfers a contractual, binding agreement stating that the horse or burro will not be sold for slaughter and prohibit slaughter plants from accepting BLM freeze branded horses.

(6) Implement a post-adoption, voluntary monitoring system using the national network of humane societies.

These reforms will benefit the program in general, the animals themselves, and the public. The HSUS stands ready to work with the BLM on this issue.

PREPARED STATEMENT OF CHRISTINE STEVENS, SECRETARY, SOCIETY FOR ANIMAL
PROTECTIVE LEGISLATION

WILDLIFE

The urgency of an increase of at least \$7 million for the Law Enforcement Division of the U. S. Fish and Wildlife Service has become more serious this year than ever before. The enormous increase in organized crime directed towards wildlife makes it absolutely essential that the Congress provide effective deterrents. This means the Special Agents, with the necessary backup, must be increased so that criminals do not have a free run.

Please don't forget that importation of drugs is intimately tied with importation of live wildlife, much of it endangered, and products from animals illegally killed for the trade. The United States is facing unprecedented attack by professional smugglers tied in with such groups as the Chinese Triads, the Russian Mafia and the Japanese Yakuza, as well as our home-grown organized criminals, and we must fight back.

I respectfully urge this Subcommittee, which has funded Interior over the years, to recognize the crisis and give Fish and Wildlife Service Law Enforcement the tools it so desperately needs to stem the flow of criminally acquired and smuggled wildlife.

ELEPHANTS

This Subcommittee provides funds for the African Elephant Conservation Act under which grants are made to American and foreign groups. Unfortunately a foreign group known as CAMPFIRE (Communal Areas Management Programme For Indigenous Resources) in Zimbabwe is trying to overturn U. S. policy with respect to the African elephant.

In 1989, the U.S. played a leading role in obtaining Appendix I (endangered) status for the African elephant whose populations had been decimated by poachers and smugglers for the ivory trade. The large majority of African nations demanded Appendix I status because they were being robbed of the elephants who lived within their borders.

The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) first tried to curb this criminal activity through the use of quotas, but after several years of utter failure, the nations belonging to CITES voted to end the international trade in ivory by placing the elephant on Appendix I. But Zimbabwe's CAMPFIRE, egged on by Africa Resources Trust (ART), a trophy hunting organization based in London, has lobbied in this country to overturn the ban on international trade in elephant parts and products. Rhodesia, a formidable colonial power named for the British explorer Cecil Rhodes, became Zimbabwe in 1980, but Rhodesia lives on in the ART Board.

We urge this distinguished Subcommittee to omit any funding for CAMPFIRE or organizations such as Safari Club International which donate to CAMPFIRE under the African Elephant Conservation Act. Not only is CAMPFIRE funded under this Act, but by USAID in separate government funding which is now under serious investigation.

With the scheduled tenth meeting of the CITES Parties in Zimbabwe June 9-20, 1997, it is essential that the United States uphold its established policy with respect to the African elephant and other Appendix I species currently being eyed by the commercial ivory trade and commercial trophy hunters.

Projects funded under the African Elephant Conservation Act, which falls into your jurisdiction, must not be geared to overturning American policy.

STEEL JAW LEGHOLD TRAPS

I wish to commend the Subcommittee on its wise 1996 Report language relating to steel jaw leghold traps. It is most regrettable that the proposal envisaged was preempted by the Fish and Wildlife Service.

The Service compounded this egregious behavior by advising and encouraging USDA's Animal Damage Control operatives to use an enormous, sensationally cruel steel jaw leghold trap with teeth on a pathetic six-month-old wolf pup who is part of the scheme to reintroduce wolves to Yellowstone National Park. The reintroduction scheme was paid for by U.S. taxpayers, as was the trap and the ill-advised, ill-conceived and basically cruel actions of Fish and Wildlife Service employees. The American public does not want its taxes to be used for such a purpose. In a November 1996 public opinion poll conducted by Caravan Opinion Research Corporation of Princeton, New Jersey, 74 percent of the American public said they want steel jaw leghold traps banned. Certainly they should not be compelled to contribute to their use.

Here are notes on the cruel suffering of the wolf pup, documented by a veterinarian and a government employee:

July 11.—“* * * foot severely swollen from carpus down, puncture wound with pus flowing out at distal carpus, severe bruising and soft tissue trauma.”

July 14.—“* * * still not eating.”

July 15.—“* * * swelling still pronounced * * * more necrotic tissue present.”

July 16.—“Still not eating.”

July 17.—“Much tissue loss and self mutilation of toes (gone). Foot dead. Foot should be removed or wolf put down.”

July 18.—“* * * food not eaten.”

July 19.—“Removed left front leg * * *”

We urge you to adopt Report language denying funds for any use of steel jaw leghold traps under the wolf reintroduction scheme so that further inhumane treatment of introduced wolves is not repeated by Fish and Wildlife Service personnel. This young wolf was subjected to intense torture for at least 30 hours during which there was no inspection of the trap. Most states require at least 24-hour inspection, but the inept judgment of these wolf transplanters and their tolerance for the pain of animals led to this typical result of the use of steel jaw leghold traps. It is rare for a trapped animal to be kept under veterinary surveillance for a week after having been trapped, so this record gives us an idea of what this most cruel of all traps inflicts on its victims. I trust you will take the action which lies within your jurisdiction. You can be sure the vast majority of your constituents will welcome a humane decision.

PREPARED STATEMENT OF SUSAN H. GUNN, DIRECTOR OF BUDGET AND
APPROPRIATIONS, THE WILDERNESS SOCIETY

The Wilderness Society appreciates this opportunity to present our views on the fiscal year 1998 funding needs of natural resource programs within the Committee's jurisdiction. The Wilderness Society has made increased funding of the four land management agencies and the Land and Water Conservation Fund one of its highest priority issues for the upcoming years. The following document outlines an initiative to increasing the 602(b) allocation to the Interior Appropriation Subcommittee by \$570 million in fiscal year 1998 to meet critical environmental needs within these programs.

PUBLIC LANDS FUNDING INITIATIVE

Introduction

The public lands of the United States—our National Parks, Forests, Grasslands, and Wildlife Refuges—are held in trust for current and future generations of Americans. Since the election a number of organizations from the environmental, recreation, and conservation community have been meeting to coordinate an initiative to address the funding needs of America's public lands. The public lands community plans to make this a long-term campaign that will help frame the budget debate while focusing on the message that we can balance the federal budget without abandoning America's public lands.

We plan to convince a majority in Congress that this is an area where additional cuts are not justified, and further, that incremental increases in the public lands budget are necessary to protect the nation's forests, parks, refuges, and wildlife. A successful effort will mean that we can maintain accessibility to these lands and improve their ecological health.

This proposal establishes annualized budget goals for several Department of Interior agencies and the U.S. Forest Service. The environmental, conservation, and recreation community will also be working toward eliminating ecologically damaging federal programs and subsidies.

Budgetary growth: an incremental approach

The following table depicts needed increases above the fiscal year 1997 spending levels for the 602(b) Interior and Related Agencies Budget Allocation. The table identifies the budgetary increases necessary to accommodate public land management over a 6-year period. Under this scenario, much needed funding for currently unmet public land conservation needs can be achieved by fiscal year 2003 through annual increases in the 602(b) budget allocation.

The fiscal year 1997 Interior Appropriation, less emergency funds, is \$12.4 billion in budget authority. The first line in the table (Resulting Allocation) presents, in real dollars, the recommended annual funding increases relative to fiscal year 1997 and not the total allocation for Interior and Related Agencies Subcommittee. The second line represents the funding additions to fiscal year 1997 levels for the agencies and programs specified in this document.

INCREASED 602(b) ALLOCATIONS: AN INCREMENTAL APPROACH TO BUDGET GROWTH INCREASES
OVER FISCAL YEAR 1997 FUNDING LEVELS

[Billions of dollars]

	Fiscal years—						
	1997	1998	1999	2000	2001	2002	2003
Resulting allocation	\$12.40	\$12.97	\$13.33	\$13.68	\$14.04	\$14.39	\$14.68
Yearly 602(b) increase		\$0.57	\$0.36	\$0.35	\$0.36	\$0.35	\$0.29
Increase from prior fiscal year (percent)		4.60	2.78	2.63	2.63	2.49	2.02
Total 602(b) increase		\$0.57	\$0.93	\$1.28	\$1.64	\$1.99	\$2.28

The proposal speaks to the funding needs and program areas of the agencies and programs identified herein only. It does not account for or anticipate changes in funding levels for other agencies or programs that also receive funding through the Interior and Related Agencies Appropriations bill. Nor does it anticipate specific cost savings or budget offsets that may be achieved through reductions in other programs areas within the Interior and Related Agencies Appropriations bill. It further does not address funding needs for natural resource and environment programs and agencies which receive funding through appropriation bills other than Interior and Related Agencies.

Increased funding needs

In developing our recommendations, we examined budget priorities for the four federal land management agencies: Fish and Wildlife Service, National Park Service, U.S. Forest Service, and the Bureau of Land Management. In addition, we considered Land and Water Conservation Fund needs. Increases outlined for each allocation are to be achieved over a six-year period.

Fish and Wildlife Service: proposed increase of \$495 million.

Increases are needed for the Fish and Wildlife Service in National Wildlife Refuge System (NWRS) Operations and Maintenance (O&M) and Endangered Species activities.

The National Wildlife Refuge System is the only federal public land system dedicated primarily to the conservation of fish and wildlife. Chronic underfunding of Refuge Operations and Maintenance has led to the degradation of refuge habitat and wildlife populations and put at risk popular wildlife oriented recreation programs. The Fish and Wildlife Service has identified a \$440 million maintenance backlog and an annual operations deficit of \$150 million.

More than 200 refuges have no staff and 97 percent of refuges operate at minimum funding levels with substantial maintenance backlogs. Exotic species, inadequate water supplies, and other problems plague many refuges, undermining the ability to meet wildlife objectives. Programs to help recover endangered, threatened, and candidate species, restore habitats, and address resource threats are left unaccomplished on an increasing number of stations. Continued failure to address this severe funding shortfall will jeopardize the integrity of the NWRS.

Funding for the Endangered Species Act has been chronically inadequate and the Agency has experienced an increase in tasks related to endangered and threatened species. For example, the Fish and Wildlife Service has become increasingly responsible for scientific monitoring for the conservation of endangered and threatened species on federal lands in addition to the increased costs related to designing and implementing Habitat Conservation Plans. The Fish and Wildlife Service has been sharply criticized for failing to complete its duties, yet it has never been given ade-

quate funds to accomplish its goals. The result is implementation that is sometimes scientifically weak or frustratingly slow for permit applicants.

Adequate funding will promote speedier, less costly recovery, and smooth implementation, ultimately minimizing conflict surrounding ESA. In addition, it is important to note that the anticipated reauthorization of the Endangered Species Act could result in new obligations under the law. The funding recommendations herein cover only current obligations and may require adjustment pending the outcome of reauthorization.

Bureau of Land Management: proposed increase of \$150 million.

The BLM needs increased funding for Management of Lands and Resources. Because of the scope and diversity of its land base, the BLM faces the opportunities and challenges of managing for over 3,000 species of vertebrates and 25,000 plant species in habitats ranging from the Pacific sea coast to the arctic tundra to the Sonoran Desert. BLM lands offer a variety of recreational opportunities and cultural resources and generate significant associated revenues. Yet, many species in each of these habitats are experiencing degraded habitats and declining populations. Likewise, many public land recreational opportunities are either hampered by degraded resource conditions or are themselves the cause of public land resource damage.

Ecological and cultural resource monitoring, restoration, and protection must be elevated to a top priority for the BLM. To that end, funding for riparian restoration and protection, fish and wildlife management, and wilderness management must be increased, as well as funding for the management of cultural resources and recreational activities including staff support on public lands.

Forest Service: proposed increase of \$225 million.

Estimates of Forest Service funding needs include Recreation, Ecosystem Research, Fish and Wildlife, and Trails. Funding in these and other critical areas fell short in fiscal year 1997, and estimates indicate a need for incremental increases in funding for trails, recreation, and ecosystem research. Fish and Wildlife activities are also underfunded including migratory bird management, and Partners in Flight. The condition of the trails, campgrounds, restrooms, and other recreation facilities at our nation's forests is key to the public's experience outdoors. Maintenance and reconstruction funds have not kept up with increased use. For example, the Forest Service estimates that the value of the backlog of trail reconstruction work has climbed to over \$267 million.

The Forest Service's trail system is larger than all the other trail systems in the nation with over 124,000 miles of trail. Because of inadequate funds, the Forest Service has been deferring 20 to 30 thousand miles of trail reconstruction every year since the 1980s.

National Park Service: proposed increase of \$600 million.

The National Park system today faces tremendous threats and challenges, including degradation of cultural, scenic, and natural resources, air and water pollution, internal and external development, and overcrowding. These threats have a direct impact on the quality of the National Park experience and the National Park Service's ability to protect and manage America's Park resources.

The Park Service's ability to adequately address these threats is limited by insufficient funding for monitoring, scientific assessment, research, resource protection and interpretation, and staff support. In constant dollars, the total National Park Service congressional appropriation declined by more than \$200 million between 1983 and 1997. At the same time, Congress assigned the Park Service more than 400 additional construction projects than it requested—costing more than \$867 million. In addition, Congress designated nine new heritage areas at the end of the 104th Congress without appropriating money to fund them. Finally, the Agency needs sufficient funds to enable it to address ongoing operations and maintenance needs and certain backlogged maintenance needs as well.

Land and Water Conservation Fund: proposed increase of \$750 million.

Congress has provided for an annual revenue stream of \$900 million, funded primarily from OCS receipts, for federal and state land acquisition and recreation projects. Yet the average funding for these purposes over the last seventeen years has been approximately one-fourth of the authorized level.

Full appropriation of the Land and Water Conservation Fund is critical to provide for investment in natural and cultural resources conservation, watershed protection, wildlife habitat, and recreational resources. Unrestrained development and dramatic population increases threaten the quality of existing public lands. The need to purchase and conserve additional available land and water resources is increasingly ur-

gent. This is true at the federal and state level, and the Congress should recommit to statewide assistance by funding the State Grant Program.

USGS Biological Resources Division: proposed increase of \$60 million.

Increases are needed to supply the science support necessary to understand the biological resources located on federal lands, to assess the environmental changes impacting on these biological resources, and to develop recommendations for management actions necessary to conserve the lands for the future. No integrated monitoring strategy for Federal Lands exists which can inventory critical biological species and communities at the local level and suggest solutions to land managers for conservation of these resources. Additionally, Federal trust resources such as migratory birds and endangered species, common to all Federal lands are coming under additional pressure through degradation of wildlife habitats; more emphasis on science support for adaptive management recommendations for system management in aquatic resources, and integrate biological information with geologic, hydrologic, and demographic databases.

General

Particularly where the BLM and Forest Service are concerned, there are any number of environmentally beneficial cost savings and budget offsets that could be achieved by increasing revenues for extractive uses (mining, grazing) and by eliminating costly subsidies. In addition, commercial user fees and concession fees are also potential sources of revenue and cost offsets.

While it is clear that substantial savings and budgetary offsets can be achieved through these types of reforms, the purpose here is not to develop a comprehensive package of recommended budget cuts and offsets, but to identify the unfunded and underfunded spending priorities that are being targeted by the public lands community.

LETTER FROM ANDY SAWYER, CHAPTER CHAIR, SIERRA CLUB
MOTHER LODE CHAPTER

SACRAMENTO, CA, April 11, 1997.

Re Fiscal year 1998 land and water conservation fund appropriations/Stone Lakes National Wildlife Refuge.

Hon. SLADE GORTON,
Chairman, Interior Appropriations Subcommittee,
U.S. Senate, Washington, DC.

DEAR CHAIRMAN GORTON AND SUBCOMMITTEE MEMBERS: The Mother Lode Chapter of the Sierra Club, on behalf of its 14,000 members and 10 affiliated local groups, respectfully requests that the Subcommittee appropriate \$5.5 million dollars for land acquisition at the Stone Lakes National Wildlife Refuge in fiscal year 1998 (fiscal year 1998). In addition, we urge the Subcommittee to increase overall appropriations from the Land and Water Conservation Fund (LWCF) in the fiscal year 1998 Interior and Related Agencies Appropriations Bill.

The Mother Lode Chapter (MLC) of the Sierra Club encompasses much of central and eastern Northern California, including the northern portions of California's Central Valley and Sierra Nevada. MLC and its members have long been active in preserving open space and critical habitats throughout this area. We therefore appreciate the efforts of your subcommittee to secure funding important land acquisition projects through the LWCF. Your efforts have helped ensure the conservation of thousands of acres of open space, recreation lands, and wildlife habitat highly valued by our members. These resources will provide invaluable recreational and educational benefits to future generations of Northern Californians.

We know that your work demands difficult choices and that you have always given conservation needs the highest consideration. MLC is concerned, however, that if funds available from the LWCF are limited to levels most recently appropriated available funds will be insufficient to meet the growing public recreational and wildlife habitat requirements associated with increasing human population pressures. We fear that without adequate funding, conservation opportunities may be lost. We therefore recommend that appropriations from LWCF be increased substantially over last year (fiscal year 1998) and eventually reach the Fund's mandated level of \$900 million per fiscal year. Only in this way can important public acquisitions keep pace with increasing public needs.

In our region we are dealing with these issues through local efforts to preserve open space and habitat at the Stone Lakes National Wildlife Refuge (NWR). Stone Lakes NWR is located in southern Sacramento County, only a few miles from urban

Sacramento. Since its inception in 1994, Stone Lakes has been able to offer limited hiking, canoeing, wildlife viewing and conservation education opportunities to the two million residents of the Sacramento metropolitan region.

The Refuge, which is adjacent to the Sacramento River, contains remnants of the Central Valley's once vast complex of permanent and seasonally flooded wetlands flanked by riparian forests, oak woodlands, and annual grasslands. The Central Valley region is projected to experience 40 percent of the growth in the state's expected tripling of population by the year 2040; the already intense development pressures on remaining natural areas will only increase, rendering future land acquisitions prohibitively expensive. If appropriations are postponed the opportunity to purchase property at an acceptable cost will be lost. The MLC urges the Subcommittee to appropriate \$5.5 million dollars from LWCF in fiscal year 1998 for U.S. Fish and Wildlife Service property acquisitions from willing sellers within the Stone Lakes NWR authorized area. The appropriations will protect essential wildlife habitat that would otherwise be lost to land speculation and development. We also believe these acquisitions eventually will enable the USFWS to expand the wildlife-compatible recreational and educational opportunities available to the public at Stone Lakes NWR.

Thank you for your consideration of these comments. We are grateful for this opportunity to include our written testimony in the official hearing record.

Sincerely,

ANDY SAWYER,
Chapter Chair.

LETTER FROM GARY O. FREGIEN, PRESIDENT, CALIFORNIA PARKS AND
CONSERVATION ASSOCIATION

SACRAMENTO, CA, *April 10, 1997.*

Re Fiscal year 1998 funding for Stone Lakes National Wildlife Refuge.

Hon. SLADE GORTON,
Chairman, Senate Interior Appropriations Subcommittee,
U.S. Senate, Washington DC.

DEAR SENATOR GORTON: By this letter, the California Parks and Conservation Association (CalParks) is asking for your support for the proposal to provide the Stone Lakes National Wildlife Refuge with \$12.8 million in funding for fiscal year 1998. This is the amount sought by the refuge's principal citizen support group, the Stone Lakes Refuge Alliance.

As you may know, Sacramentans have been working for the protection of this valuable land for more than twenty-five years. Once the site of a proposed Corps of Engineers flood control project, then the target of a private developer's 50,000-resident "new town" proposal, this relatively small but immensely valuable property is now one of the newest national wildlife refuges.

CalParks seeks substantial funding for fiscal year 1998 because the refuge is in need of significant support in its early years. Located just south of the City of Sacramento, it lies in the path of new urbanization that can only increase land values and thus inflate the cost of expanding the refuge to the boundaries called for in the approved 1992 plan.

The \$5.5 million which we seek for land acquisition in fiscal year 1998 will go only for land purchased from willing sellers, people who the Fish and Wildlife Service needs to deal with quickly before they (the owners) get discouraged at government delays and are courted by developers offering more for their land than they are asking today. You should know that this refuge ranked third in the nation on the Fish and Wildlife Service's land acquisition priority list for 1998. Nationwide, this acquisition is very important, very high in priority.

The \$0.3 million requested for operations and management will be used not only for the day-to-day activities which keep the refuge going, it will also be used to fund programs to enhance the productivity and carrying capacity of the refuge lands so as to increase their value for native and migratory wildlife. Even today, the refuge's modest operations budget has allowed limited public use of the facility, with an emphasis on educational programs for local school (K-12) groups.

The \$7 million sought for the construction of a conservation education facility will allow the refuge to provide educational and recreational opportunities for an estimated 200,000 visitors annually. This facility will educate the public in conservation and environmental matters and, to some degree, bolster the local economy through the expenditures of non-local people who visit the refuge and the facility.

You may be assured that this refuge has widespread support in the Sacramento region, from public officials, organizations and individuals. We urge the support of you and your subcommittee to continue the development of this important wildlife refuge.

Sincerely,

GARY O. FREGIEN,
President.

LETTER FROM PATRICE COX, PRESIDENT, SACRAMENTO OPEN SPACE

SACRAMENTO, CA, *April 10, 1997.*

Re Fiscal year 1998 funding for Stone Lakes NWF.

Hon. SLADE GORTON,
Chairman, Senate Interior Appropriations Subcommittee,
U.S. Senate, Washington, DC.

DEAR SENATOR GORTON: By this letter, Sacramento Open Space is asking for your support for the proposal to provide the Stone Lakes National Wildlife Refuge with \$12.8 million in funding for fiscal year 1998. This is the amount sought by the refuge's principal citizen support group, the Stone Lakes Refuge Alliance.

Sacramentans have been working hard for the protection of this valuable land for more than twenty-five years. Once the site of a proposed Corps of Engineers flood control project, then the target of a private developer's 50,000-resident "new town" proposal, this relatively small but immensely valuable property is now one of the newest national wildlife refuges.

Sacramento Open Space seeks substantial funding for fiscal year 1998 because the refuge is in need of significant support in its early years. Located just south of the City of Sacramento, it lies in the path of new urbanization that can only increase land values and thus inflate the cost of expanding the refuge to the boundaries called for in the approved 1992 plan.

The \$5.5 million which we seek for land acquisition in fiscal year 1998 will go only for land purchased from willing sellers, people who the Fish and Wildlife Service needs to deal with quickly before they (the owners) get discouraged at government delays and are courted by developers offering more for their land than they are asking today. You should know that this refuge ranked third in the nation on the Fish and Wildlife Service's land acquisition priority list for 1998. Nationwide, this acquisition is very important, very high in priority.

The \$0.3 million requested for operations and management will be used not only for the day-to-day activities which keep the refuge going, it will also be used to fund programs to enhance the productivity and carrying capacity of the refuge lands so as to increase their value for native and migratory wildlife. Even today, the refuge's modest operations budget has allowed limited public use of the facility, with an emphasis on educational programs for local school (K-12) groups.

The \$7 million sought for the construction of a conservation education facility will allow the refuge to provide educational and recreational opportunities for an estimated 200,000 visitors annually. This facility will educate the public in conservation and environmental matters and, to some degree, bolster the local economy through the expenditures of non-local people who visit the refuge and the facility.

You may be assured that this refuge has widespread support in the Sacramento region, from public officials, organizations and individuals. We urge the support of you and your subcommittee to continue the development of this important wildlife refuge.

Sincerely,

PATRICE COX,
President.

PREPARED STATEMENT OF TED JAMES, PLANNING DIRECTOR, KERN COUNTY PLANNING DEPARTMENT; STEVEN J. ARITA, ENVIRONMENTAL COORDINATOR, WESTERN STATES PETROLEUM ASSOCIATION; MANUAL CUNHA, JR., PRESIDENT, NISEI FARMERS LEAGUE; LES CLARK, VICE PRESIDENT, INDEPENDENT OIL PRODUCERS ASSOCIATION, ON BEHALF OF KERN COUNTY VALLEY FLOOR HABITAT CONSERVATION PLAN INDUSTRY AND GOVERNMENT COALITION

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry and Government Coalition for the Kern County Valley Floor Habitat Conservation Plan (KCVFHCP), we are pleased to submit this statement for the record

in support of our funding request for the Interior Appropriations Bill for fiscal year 1998.

First, the Coalition supports the Department of Interior's budget request of \$14 million for the Cooperative Endangered Species Conservation Fund—especially the \$6 million funding for HCP land acquisition.

Secondly, the Coalition urges the Subcommittee to appropriate additional funding for land acquisition above the \$6 million requested.

The Coalition's request is supported by the timely need to implement the KCVFHCP, which is in the final stages of development and expected to be completed by the end of calendar 1997. We are hopeful that our pending application for \$500,000, from previously appropriated funds, for the current (1997) fiscal year will be successful. However, to secure the \$6 million total necessary for full implementation of the plan, we will require \$2.75 million for fiscal year 1998 and \$2.75 million for fiscal year 1999.

The Coalition requests that the Subcommittee appropriate the maximum possible amount for this program, so that the funding pool can accommodate our request and need. We are confident that the plan's merits and urgency support this request.

Kern County's program is unique from other regions in the nation in that it contains some of the highest concentrations of plant and animal species protected by the Endangered Species Act (ESA) within the continental United States. The region is occupied by 13 wildlife species and 14 plant species listed as threatened or endangered under federal law. The potential for conflict with the federal ESA is great in Kern County because of the extensive agricultural and oil and gas production activities which occur. Since Kern County is the top oil producing county in the nation and one of the leading agricultural counties, potential conflicts with the ESA and their resolution through a proactive conservation program has significant national importance.

In recognition of the conflicts posed to economic growth by federal and state endangered species laws, a joint agency Memorandum of Understanding was entered into by the U.S. Fish & Wildlife Service, Bureau of Land Management, California Energy Commission, California Department of Oil & Gas and Geothermal Resources, California Department of Fish & Game and Kern County. The participating agencies agreed to develop a unified conservation strategy with the goal of providing a streamlined and consistent process of complying with State and Federal endangered species laws, yet at the same time allow important industry activities such as oil and gas, agricultural, ranching, and other industry activities to continue. Preparation of the KCVFHCP began in 1989 and involved a number of federal, state and local government agencies, as well as the oil and gas industry, agricultural, utilities and environmental groups.

Kern County's Valley Floor Habitat Conservation Plan (KCVFHCP) is one of the largest and most diverse endangered species conservation programs under development in the nation. The program embraces many of the conservation approaches that have been advocated by the Department of Interior, in that it represents a significant departure from traditional endangered species conservation programs which utilize prohibitory controls to assure conservation of species habitat. Instead, it is based on a system of trading habitat credits in an open market. In that regard, the KCVFHCP is considered to be a state-of-art conservation plan that will address compliance with the ESA for multiple threatened and endangered species. This innovative and state of the art system, for the first time, provides landowners with real incentives and more importantly, the ability to choose how best to manage their own private property. The KCVFHCP is in the final stages of development and is scheduled to be completed in 1997. The second draft of the HCP document will soon be released, and we are currently in the process of developing work on the Implementing Agreement.

Numerous agencies, in concert with the State of California and local government entities, as well as the private oil and gas and agricultural industries have contributed funding, time and other resources toward developing the KCVFHCP. Currently, the KCVFHCP program will be completed in the fall, 1997, provided there is the necessary federal funding for the acquisition of habitat to mitigate for agricultural and oil AND gas operations and development. As mentioned previously, we are currently in the process of securing funding in the amount of \$500,000 for this fiscal year; however, additional funding is critical to completing the HCP. This is one of the final steps necessary to implement the conservation strategy. Because of the extensive private, local and state government financial support that went into the development of this program, federal participation in program implementation will demonstrate that the burden of ESA compliance is not being placed exclusively on private property owners. Program funding will also contribute to eventual species recovery.

PROGRAM FUNDING NEEDS

In order for the KCVFHCP to be implemented, the program requires funding in the amount of \$5.5 million (provided we are successful in securing \$500,000 this fiscal year) that could be funded in increments over the first several years of the program. A breakdown of the purpose and amount of this funding is as follows:

Fallow lands issue

Agricultural practices and the lack of available water often result in situations where substantial amounts of previously farmed land (20,000 acres plus or minus) are placed in a fallow state. This situation invites the reintroduction of species into these areas which create potential ESA compliance problems when the farmer decides to reuse the land for agricultural purposes. Many farmers are forced to unnecessarily discard fallow lands to prevent endangered species recolonization.

The KCVFHCP has devised a strategy that includes the purchase and set aside of approximately 3,000 acres of endangered species habitat to mitigate for species loss resulting from reuse of fallow agricultural lands. The program strategy allocates \$3 million for acquisition and perpetual maintenance of species reserve areas. With this type of protection, farmers would no longer have to be concerned about endangered species act violations when fallow land is reused.

Oil development issue

A mitigation strategy has been devised that is intended to acknowledge existing oil field activities within Kern County. The strategy proposes to acquire 3,000 acres of endangered species habitat to mitigate for species loss resulting from oil field development outside of established oil field production areas, but within proximity of those areas. This is to allow for reasonable expansion of oil field activities over the life of the HCP program. The program strategy allocates \$3 million for acquisition and perpetual maintenance of species reserve areas. With this type of strategy, oil field expansion activities would be provided for in the program. This strategy would be of great benefit to the small independent oil and gas companies within the program area.

Together the \$6 million required for the agriculture and oil field strategies would provide a method to satisfy the program's conservation goals, while also providing for continued economic growth of Kern County's oil and agricultural industries.

Numerous industries, in concert with the State of California and local government entities, are attempting to do their part, and we come to the appropriations process to request assistance in obtaining a fair federal share of financial support for this important effort. This unique cooperative partnership involving state and local government, as well as private industry, has contributed substantial funds to date to assist in the development of this program.

The California Industry and Government Coalition appreciates the Subcommittee's consideration of this request for a fiscal year 1998 appropriation to support implementation of this significant program.

PREPARED STATEMENT OF MARY BETH BEETHAM, LEGISLATIVE ASSOCIATE,
DEFENDERS OF WILDLIFE

Mr. Chairman and Members of the Subcommittee: I am Mary Beth Beetham, Legislative Associate for Defenders of Wildlife. On behalf of Defenders and our nearly 200,000 members and supporters, I thank you for the opportunity to provide testimony concerning our fiscal year 1998 appropriations priorities. America's greatness and wealth flow in large measure from the abundance and diversity of our magnificent natural resources. As unprotected natural areas continue to disappear, our public lands and public trust resources are increasingly important in maintaining our nation's natural resource base and numerous attendant benefits to society. Yet ironically, at the same time that these irreplaceable publicly-held natural assets increase in value to our nation, their continued vitality is threatened by the prospect of funding cuts as Congress and the President move to balance the budget. Increasingly, people across America are realizing the looming peril to these vital assets and are uniting to support funding for our federal conservation programs. Defenders is a member of many of these coalitions which will be referenced throughout our testimony.

The largest and most encompassing coalition is the Public Lands Funding Initiative (PLFI) which advocates modest increments to the Interior Appropriations Subcommittee's 602(b) allocation over the next six years to support key public lands and wildlife accounts. Recommendations of the PLFI will be presented into the record later today by The Wilderness Society. This coalition consists of 150 environmental,

recreation and conservation groups and is endorsed by Theodore Roosevelt IV, great-grandson of the President.

As an investment banker, Mr. Roosevelt understands the wisdom of essential investments, as illustrated in his letter endorsing the initiative: "Given the overwhelming importance of these resources to present and future generations of Americans, the only fiscally responsible course is to invest adequately in their stewardship and management, even as we take needed steps to balance the federal budget. Indeed, denying critically needed funding is fiscally irresponsible and shortsighted—the neglect caused by deficient funding will result in destruction and degradation of these valuable assets that is far more costly in the long run than providing funds to properly care for them today."

SPECIES CONSERVATION

Endangered species.—Defenders is working with the Endangered Species Coalition, a broad base of national and local organizations committed to the conservation of threatened and endangered species, to increase funding for Endangered Species Act implementation. For Fish and Wildlife Service's (FWS) four main Endangered Species accounts (Candidate Conservation, Listing, Recovery, and Consultation), we urge at the very least the amounts requested in the President's fiscal year 1998 budget (\$78.781 million), but believe that increases over the request are both necessary and appropriate. Adequate funding benefits interests on all sides of the ESA debate because it allows for smooth implementation and speedy less-costly recovery, reducing the potential for conflict.

Under the President's budget, Candidate Conservation and Listing would be virtually level-funded even though the FWS anticipates increases of 23 percent in Candidate Conservation activities and 30 percent in Listing actions in fiscal year 1998. According to FWS, the Listing program, which would be funded at only half of the Bush Administration's fiscal year 1992 request level, is still suffering a backlog due to the fiscal year 1995–96 listing moratorium. The Service has already missed a statutory deadline for actions on 146 species currently proposed for listing and many of the 184 candidates needing listing proposals. One such candidate is the disappearing Florida black bear, waiting along with 84 other species since a 1992 court settlement for a finding under the Act. FWS has also indicated that it will not designate any critical habitat (funded by the Listing account) during fiscal year 1998.

The marginal increase requested for Recovery will not adequately address the backlogged 299 listed species lacking recovery plans and planning for the additional 120 species projected for listing in fiscal year 1998, while still allowing for recovery implementation. Based on a 1990 Audit Report on the ESA program by the Department of Interior's (DOI) Inspector General (Report 90–98), the lower-end estimate for average yearly recovery cost per species was \$100,000. This would result in a total fiscal year 1998 need of \$96 million to fund recovery for the more than 960 listed U.S. species under FWS jurisdiction. As can be seen from the projected fiscal year 1998 costs of recovery for keystone species listed below, \$100,000 per species is indeed a conservative estimate.

Although a 34 percent increase was requested for Consultation, the FWS expects to be involved in approximately 43 percent more Section 7 Consultations and Section 10 Habitat Conservation Plans. Moreover, the Service has also just begun to identify the need for monitoring and follow-up on these activities, but until now has had no funds to do so. Consequently, Defenders supports increases in this item and opposes the \$85,000 reduction in the Section 6 Cooperative Endangered Species Fund, the only ESA related program that directly supports State activities.

Defenders' highest priorities for recovery programs focus on keystone species whose restoration fosters recovery of supporting ecosystems and associated species. The Mexican wolf, extinct in the wild and unrepresented in any extant populations of gray wolves, is the rarest subspecies of gray wolf in the world. For captive propagation, public education, and initiation of reintroduction efforts to re-establish and maintain viable wild populations, \$546,600 (FWS) is needed for fiscal year 1998. For the successful red wolf program in North Carolina and Tennessee, \$1,025,000 (FWS) will support continued captive propagation, monitoring, and releases. The landmark Northern Rockies wolf recovery program, continues to enjoy tremendous success, and no further reintroductions are anticipated at this time. For monitoring, public education, and cooperative agreements with the Nez Perce tribe and states (which will receive most of the FWS allocation) \$975,000 (FWS) is needed, while \$300,000 (NPS) is needed for management of the program in Yellowstone National Park. In addition, we urge the Subcommittee to allocate \$50,000 (FWS/NPS) to study the suitability of Washington's Olympic National Park for Gray wolf restoration. At least \$480,000 (FWS) is necessary for recovery efforts in Wyoming, Montana, S. Da-

kota, and Arizona for the endangered black-footed ferret, thought to be extinct in the wild except for reintroduced populations. Of this amount, \$230,000 will continue the crucial FWS role as coordinator in this multi-partner program that leverages three to four non-federal dollars for every federal dollar. The additional \$250,000 is essential to fund management of the former Sybille breeding facility (now the National Black-footed Ferret Conservation Center), home to 60 percent of the captive breeding population and formerly run by the State of Wyoming. Finally, the grizzly bear recovery program is a successful cooperative effort between federal, state, and local governments and private landowners that is being eroded by budgetary reductions. Moreover, the grizzly program is cost effective, resulting in multi-species benefits to black bears, wolverines, lynx and mountain lions; \$800,000 is needed in fiscal year 1997 for the grizzly recovery program which covers 30,000 square miles in four states. Successful reintroduction of threatened grizzly bears into the Bitterroot ecosystem of central Idaho and W. Montana could increase grizzly bear numbers and range in the lower 48 states by nearly one third; \$250,000 of the grizzly recovery budget will be used for initiation of reintroductions.

Other FWS accounts: Defenders also wishes to underscore its support for no less than the President's budget request for other FWS accounts critical to species conservation: Law Enforcement; Migratory Bird Management, especially for conservation of non-game birds; International Affairs, which helps support U.S. international leadership in the conservation of wildlife and biodiversity, particularly through implementation of the Convention on International Trade in Endangered Species; and the modestly funded African Elephant and Rhino and Tiger Conservation Funds.

PUBLIC LANDS

Land and Water Conservation Fund (LWCF).—The LWCF represents a promise made by Congress to the American people to reinvest revenue from the development of non-renewable resources into acquisition and permanent protection of key land, water, and open space resources for future generations. Although authorized at \$900 million per year and the primary source of revenues, offshore oil and gas leases, average more than \$2 billion yearly, fiscal year 1996 and fiscal year 1997 allocations are the lowest in 25 years (about 15 percent of the authorized level). Moreover, according to DOI budget information, Outer Continental Shelf receipts totalled about \$4 billion in fiscal year 1997 and are expected to be about the same for fiscal year 1998.

Defenders is proud to be a leader in Americans for Our Heritage and Recreation (AHR), a new coalition dedicated to revitalizing and potentially expanding the LWCF. AHR represents thousands of LWCF stakeholders nationwide including urban, state, recreation, industry, and environmental groups. Defenders urges this subcommittee to renew the broken promise of the LWCF Act by fully funding the AHR's modest fiscal year 1998 federal project list.

Defenders' priority for such funding is the acquisition of lands to protect threatened and endangered species, conserve biodiversity, and consolidate protection of key ecosystems, such as the Pinhook Swamp, a corridor linkage between Northwest Florida's Osceola National Forest and Georgia's Okefenokee National Wildlife Refuge. Slated to be acquired and managed by the Forest Service, the linkage would complete a large, regionally significant conservation area providing a stronghold for wide-ranging species such as the Florida black bear and habitat for the federally endangered Florida panther, woodstork, and red-cockaded woodpecker.

National Wildlife Refuge System (NWRS) Operations and Maintenance.—The 92 million acre NWRS is the only federal lands network dedicated primarily to fish and wildlife conservation, serving as an anchor for protection of our nation's magnificent biodiversity. While the primary purpose of the Refuge System is conservation, it also serves more than 28 million recreationists yearly, engaging in compatible activities such as wildlife observation, hiking, and fishing, generating hundreds of millions in economic benefits to local communities.

Unfortunately, the NWRS continues to be a jewel in the rough, crippled for years by severe funding shortfalls resulting in a current Maintenance backlog of approximately \$428 million and Operations needs of approximately \$300 million. The National Fish and Wildlife Foundation's fiscal year 1997 Fisheries and Wildlife Assessment highlighted the Refuge O&M funding shortfall as a key policy issue for DOI, pointing out that the Refuge System receives the lowest per-acre funding of all federal land management agencies.

As a proactive member of the Cooperative Alliance for Refuge Enhancement (CARE), a diverse coalition of more than 15 environmental, hunting, fishing and recreation groups formed in 1995 to address the severe Refuge funding problems, Defenders fully endorses testimony presented on behalf of CARE by Dr. Rollin

Sparrowe. CARE is currently finalizing a proposal which would recommend increases of approximately \$50 million per year for the next six years, to bring the Refuge System to two-thirds of its capacity by the year 2003. For fiscal year 1998, we are requesting \$220 million, \$28 million more than the President's request and have worked with the FWS to identify a list of specific projects totalling \$35 million that will not be funded even if the President's budget is allocated, such as: National Key Deer Refuge (FL), population survey of backcountry islands for the endangered key deer and completion of GIS mapping to assist in key deer management; Lower Suwannee NWR (FL), aerial surveys for the endangered manatee; Alligator River NWR (NC), hiring of a full-time law enforcement officer. We appreciate the Subcommittee's fiscal year 1997 funding increase and urge allocation of CARE's recommended \$220 million for fiscal year 1998.

USDA Forest Service (FS)—The 192 million acre National Forest System (NFS) supports the greatest diversity of plant and animal species on any public lands systems nationwide—more than 3000 species of wildlife and 10,000 species of plants, of which 33 percent are federally listed species and 2,500 identified as sensitive. Viewing of wildlife is the fastest growing use on the NFS, generating 33 million activity days and supporting 55,000 jobs valued at \$1.6 billion (Resources Planning Act 1995 Draft Program). To support these important uses, the PLFI recommends funding increases for NFS Fish and Wildlife, Ecosystem Research, Recreation, and Trails.

Defenders is particularly concerned about funding for NFS Fish and Wildlife Habitat Management and recommends at minimum the President's request of an \$11 million increase (still lower than fiscal year 1991–95 levels), including a \$5.45 million increase for Threatened, Endangered, and Sensitive Species (TES). Moreover, the FS has identified \$68 million in opportunities for TES, more than twice the requested funding level, including projects such as improved protection for the endangered Hualapai Mexican vole on the Prescott National Forest and for grizzly bear, wolverine, and North American lynx on Washington's Okanogan National Forest. While Defenders is working aggressively to support an increase in the Subcommittee's 602(b) allocations to fund needs for programs of concern, we also support efforts by the Green Scissors Coalition and the Western Ancient Forest Campaign to examine and restore Forest Service accountability—called into question by the GAO and the White House Council of Economic Advisors—as a way of generating at least some offsets for necessary increases. To this end, we recommend reform or abolishment of permanent funds such as Salvage and K–V and elimination of below-cost timber sales. As a first step in addressing below-cost sales, we are pleased with the Administration's proposal to end the Purchaser Credit Program (PCP) but are concerned that 84 percent of the funds used to support the PCP and Purchaser Elect Program are still included in the President's budget. In addition, Defenders believes that any funding for road-building in roadless areas should be eliminated. The Administration has also proposed creation of a new Forest Ecosystem Restoration and Maintenance Fund. While we support the goals of this fund, we are awaiting details and are concerned about the creation of any new off-budget FS fund as well as some of the activities currently proposed for the fund that could create new incentives for FS managers to log to raise revenue.

Bureau of Land Management (BLM)—While the NFS supports the largest diversity of species, according to BLM the 264 million acres of public domain lands support the most ecologically varied land base. Based on agency information, fish and wildlife are the most important economic resources on these lands, generating 66 million visitor days and \$2.5 billion in economic benefits. The PLFI supports increased funding for BLM Wildlife and Fisheries, Wilderness, Cultural Resources, Recreation, and Riparian Restoration and Protection. A priority for Defenders is Wildlife and Fisheries, especially Threatened and Endangered (T/E) species and we recommend increases over the virtual level funding recommended in the President's budget for both of these accounts. The number of threatened and endangered species on BLM lands has increased in recent years at the rate of about 20 per year. Even though BLM lands will provide habitat in fiscal year 1998 for more than 300 listed or proposed plants and animals, fiscal year 1998 requested funding would support actions for just a little more than half of these species. Based on this figure the T/E level should be almost doubled to about \$30 million.

National Park System (NPS)—As a member of the Everglades Coalition, Defenders supports the President's budget request of \$100 million for the Everglades Restoration Fund. This fund is critically needed for land acquisition, modified water delivery and research to reverse damages inflicted over the past 100 years to the South Florida Ecosystem. This magnificent area is home to 6 million people and 68 listed species and provides wintering habitat for more than 129 bird species and breeding habitat for an additional 132 bird species.

SCIENTIFIC RESEARCH

USGS Biological Resources Division (BRD).—The continued existence and well-being of our nation's vast array of biological resources is dependent on informed and considered conservation and management. Rigorous scientific research of a long-term nature is absolutely critical to developing effective conservation strategies, determining the best available management plans, and reducing conflict over dwindling resources. The relocation of DOI's biological science capabilities to USGS offers significant potential for a truly interdisciplinary science agency capable of providing this type of integrated research. While we understand that the land management agencies have voiced concerns that their research needs are not being adequately addressed by BRD, we suggest that to the extent this is the case, a significant factor may be the funding cuts inflicted on these activities over the last two years—more than 15 percent below fiscal year 1995 levels for both fiscal year 1996 and fiscal year 1997. We urge, at the very least, full funding of the President's request (\$145 million), but note this amount would still leave the Division with almost a 14 percent funding reduction below fiscal year 1995 levels. Defenders is a member of a new group of organizations (BRD Watchers) which supports enhancement of DOI's biological research programs.

Defenders maintains its support for the Gap Analysis Program (GAP), a collaborative effort involving 40 states and more than 400 business, non-profit, local, and Federal agency organizations to map our nation's biological diversity and areas currently managed for its protection. We also continue to believe that insufficient resources have been made available for efficient transfer of GAP data to users and integration into on-the-ground conservation planning. We recommend that specific funding be earmarked for GAP product development and pilot projects using GAP for statewide and bioregional conservation planning. Thank you, Mr. Chairman.

PREPARED STATEMENT OF JOHN E. EBEL, DIRECTOR, THE WESTON OBSERVATORY OF
BOSTON COLLEGE

Mr. Chairman and members of the Subcommittee, I appreciate this opportunity to submit testimony regarding the importance of the National Earthquake Hazard Reduction Program (NEHRP) in the United States. As the Director of the Weston Observatory of Boston College, I want to bring to your attention how NEHRP funding has positively impacted Weston Observatory's efforts to stimulate earthquake hazard reduction activity in the northeastern United States and how future funding is vital if such efforts are to be successfully continued.

Let me say up front that increased NEHRP funding is essential if efforts to mitigate the effects of future earthquakes in the northeastern U.S., as well as in the earthquake prone areas in the rest of the country, are to be successful. NEHRP funding for the U.S. Geological Survey (USGS) needs to be increased to \$52 million for fiscal year 1998. Of this almost \$4 million increase over the USGS fiscal year 1997 appropriation, I urge that \$2 million of the increase be dedicated to improving the earthquake monitoring capabilities across the U.S. As I will explain below, prolonged level funding and recent budget cuts are severely hampering the current ability of scientists to collect data on earthquake occurrences and their effects. NEHRP cuts also are adversely impacting the ability of USGS and university scientists to analyze these data and to translate their research results into public mitigation efforts. In my remarks, I will focus on efforts and results of earthquake research in New England and vicinity. However, I know from discussions that my colleagues from throughout the U.S. are facing the same problems that I face here in the northeast.

From the days of the Pilgrims right to the present, earthquakes have been a part of life in New England. While many strong earthquakes in the past have caused damage in the region, in modern times New England so far has been lucky that none of its major cities has taken a direct hit from a strong earthquake. However, just in the northeastern U.S. itself earthquakes in the past few years near Boston, Providence, Hartford, New York City and Philadelphia are evidence that at some time in the future any of these cities could experience a catastrophe similar to that in Northridge, California in 1994. Earthquake awareness in this region is slowly increasing, as have mitigation efforts. During the past few years, for instance, New York City adopted a seismic provision in its building code, and Massachusetts began requiring older buildings be refurbished to earthquake resistant standards. Other New England states have begun adopting the recommended seismic provisions for new buildings from the national building code organizations. However, too many members of the general public view these requirements as legal impediments to be avoided rather than safety issues that must be undertaken. This is especially true

for those who own the older buildings that are most prone to damage in earthquake shaking. I hope someday to see those who design, construct and refurbish buildings take earthquake design as seriously as they take fire safety design. Unfortunately we still have a long way to go to get there.

It is my firm belief that earthquake monitoring and research is a key aspect necessary to motivate the public to take the earthquake threat seriously. Scientists of all disciplines know that publicity surrounding new research discoveries and observations can be a prime force motivating people to take action. This has certainly been true in such areas as cancer studies, global climate change research and environmental impacts on the earth's ozone layer. It is also quite true in earthquake studies. For example, during the spring of 1996 several small earthquakes were felt in eastern Massachusetts. Not only did people want to know from the Weston Observatory staff the magnitudes and locations of these events, but also they wanted to know if these shocks meant that a stronger earthquake could occur. We at Weston Observatory responded that we could not predict the occurrences of future earthquakes but that small earthquakes do indicate places where stronger events could be centered in the future. I have had many people thank me for studying these earthquakes and express the hope that the studies would lead to new discoveries in the future.

Other work by Weston Observatory researchers have added to the understanding of the earthquake threat in the northeast. For example, some of my research indicated that in 1638 an earthquake of Richter magnitude 6.5 to 7.0 (probably comparable to those recently at Loma Prieta, California in 1989, Northridge, California in 1994, and Kobe, Japan in 1995) took place in New England, with the most likely place for the epicenter being central New Hampshire. Today, central New Hampshire is the most seismically active zone in New England. In 1996, I and two other Weston Observatory researchers released the first seismic hazard study of the state of Vermont. Research by Prof. Alan Kafka of Boston College has shown that the persistent earthquake activity in the New York City area is similar to that in other areas where strong earthquakes can occur. We are still looking to identify which are the active faults throughout the region, but recent earthquake monitoring has allowed us to guess which geologic faults bear further study.

Unfortunately, if current funding trends continue, it will be difficult to maintain this level of research activity in the future. NEHRP funding to the USGS has decreased in the past two years after several years of level funding. This has translated into cuts in the funding that Weston Observatory receives for earthquake monitoring in New England. We have responded to these cuts by paring down the staff operating the seismic network and by delaying installation and maintenance of our 15 seismic stations spread strategically across the six New England states. Under the current-year funding for Weston Observatory, later this year I will no longer be able to afford my part-time seismologist who is the one who carries out the routine analysis on the earthquake data we record. By the end of 1997 Weston Observatory could be in a situation where it is recording earthquake data but has no one to analyze it on a routine basis. Not only does this represent a loss of vital scientific data, but it also severely hampers our efforts to increase the speed and improve the quality of the earthquake information that we deliver to the public.

I know that other seismic networks across our country are faced with this same kind of staffing problem due to budget cuts. It is for this reason that I call for \$2 million additional funding for earthquake monitoring throughout the U.S. That amount of money, spread across the 15 or so earthquake networks across the country, would go a long way alleviating the current crisis in the operation of our national earthquake monitoring infrastructure. Over the longer term, Congress should consider special appropriations of a few million dollars to improve earthquake monitoring all throughout the country. Such an investment is necessary if regional seismic networks are to deliver earthquake epicenters, magnitudes, ground motions, and estimates of damage within seconds or minutes of the occurrence of an earthquake. It is also necessary if such proposals as earthquake early warning systems are to be developed.

I believe that increased NEHRP funding to the USGS for basic earthquake research can have a number of benefits for earthquake hazard reduction efforts, both within New England and nationally. I list some of the most important research benefits here:

- (1) Improve our understanding of the causes, effects and probabilities of strong earthquakes. Earthquakes are a natural hazard that arise from deep inside the earth, a place that can only be studied by instrumentation placed at the earth's surface. While research over the past two decades has revealed why many strong earthquakes have occurred, many other earthquakes have been surprises to scientists. All across the country, we still have much to learn about which faults are active, how

often damaging earthquakes may take place on those faults, and under what geologic conditions strong earthquakes can occur. For example, in New England all of the faults are geologically old (hundreds of millions of years old). Most are probably seismically dead, but some must be active because we have earthquake activity. Unfortunately, we do not have enough seismological and geological evidence to determine which of the local faults are seismically active. I feel certain that the identification of one or more active faults would catch the public's attention and spur earthquake mitigation measures.

(2) Improve the speed and quality of earthquake information to the public and to government officials. The tremendous increase in the availability and speed of communications during the past few years has raised the expectations of the public with regard to how fast they expect to receive information immediately following the occurrence of an earthquake. The delivery of emergency services and decisions about repairing or restoring vital lifelines rely heavily upon the speed and accuracy of the earthquake information available. The development of systems to rapidly deliver earthquake information, ideally during or even before the earthquake shaking is experienced, is a goal that demands new resources over those currently allocated for NEHRP research.

(3) Improve the understanding of those parts of our urban areas that are most prone to damaging earthquake shaking. Earthquakes such as those that affected Mexico City in 1985, San Francisco and Oakland in 1989, and Kobe in 1995 have driven home the point that landfill and other thick soil areas within cities are prone to amplify earthquake shaking and hence are most prone to earthquake damage. There should be a major research effort to identify such dangerous zones within all cities in our country that lie in areas with moderate or high seismic hazard. In New England, Boston, Providence, Hartford and Portland, Maine all qualify as cities that have local zones where earthquake ground shaking will probably be amplified.

(4) Develop programs to encourage industry to undertake earthquake mitigation efforts. In my opinion, industry needs to be encouraged to invest in earthquake hazard research and mitigation. With the recent trends to allow regional or national banks, utilities and communications, an earthquake catastrophe in one part of the country could inadvertently impact other parts of the country as well. Such widespread impacts often are not appreciated when mergers or takeovers take place. Studies to learn the national effects of damaging earthquakes in different parts of the country should be something in which both industry and government regulators take interest.

There is a tendency among some in public and private circles to dismiss basic research, especially long-term research, as not meeting the needs of the nation. In fact, I believe that just the opposite is true. The current success of earthquake hazard mitigation efforts stems in large part from the past basic research that has been funded by the federal government. This is especially true of seismic monitoring of small earthquakes. To the public, such monitoring indicates that the earthquake threat is real and should be taken seriously. To the scientist, such monitoring provides the basic information upon which new theories and discoveries must be based. We are still at the point where each earthquake provides a new piece of information to help us decipher the puzzle of where and when future strong earthquakes may occur. There is no doubt that future efforts by the public to take action to mitigate the effects of earthquakes will be directly related to the amount of basic research that takes place now and in the near future. This is true in New England and throughout the rest of the country as well.

PREPARED STATEMENT OF THE INTERSTATE COUNCIL ON WATER POLICY

The Interstate Council on Water Policy (ICWP) represents state, regional and local water resource management agencies throughout the country. Since 1959, the Council has voiced the concerns of local and state managers regarding federal programs and activities. It is in this role that the Council wishes to express comments on the Administration's proposed budget for Federal fiscal year 1998 for the U.S. Geological Survey (USGS).

The Council is pleased to see the fiscal year 1998 budget for USGS remains at funding levels seen in fiscal year 1996 and 1997. The Water Resources Division comprises 26 percent of that budget and also sees an increase in funding over 1997. That increase stems from adaptation of the National Water Quality Assessment Program (NAWQA) to support President Clinton's "Water Quality Information (Kalamazoo) Initiative", providing water quality information on the major streams and aquifers in the Nation's 75 largest metropolitan areas, including the largest city in each of the 50 States.

This \$9 million increase in NAWQA funding appears to require \$1.9 million in new appropriation, with the balance coming from redirected funds of eliminated or reduced programs, such as the Acid Rain and the Water Resources Assessment Programs. The Council is concerned this new Initiative deviates from the original premise of Hydrologic Unit-based sampling which underlies the NAWQA approach and supports the ongoing implementation of the NAWQA Program. Directing investigations toward water resources in metropolitan areas appears to step away from the reigning philosophy of watershed oriented management and assessment which USGS has championed.

The Council believes much of the monitoring information sought by this new Initiative is already available from State and local water agencies and questions whether resources directed into the President's Water Quality Information Initiative comes at the expense of other endeavors which provide the States with useful and needed information, such as stream gaging stations and new NAWQA study units. An examination of the new directions of the NAWQA Program would seem warranted in order to ensure the most pertinent and valuable water quality data are collected.

The Council is extremely concerned by the disturbing effect that funding reductions and inflation are having on federal data collection efforts, under the heading of Water Data Collection and Management. We note that the portion of the stream gaging network supported by the federal funds was decreased by \$1.1 million in fiscal year 1997 and that there is no restoration of these funds or compensation for inflation in the fiscal year 1998 budget. This combination of factors will result in a loss of more than 100 gaging stations, further accelerating the losing trend which began in 1990.

A similar situation arises in the Federal-State Cooperative Program, which stands to lose \$1.2 million from 1997 funding levels. This decrease follows a \$2.4 million increase in funding between 1996 and 1997, which offset inflationary costs of the existing program. The "roller-coaster" approach to funding directly influences non-federal agency decisions to provide matching funds to begin investigative studies and monitor additional streams.

This budgetary method provides no stability to maintaining a program which is the foundation of partnership between the federal government and state and local agencies. Under the requested level, an additional 120 gaging stations funded through the Federal-State Cooperative Water program will be discontinued, further diminishing our ability to monitor and assess the dynamic trends of our Nation's stream systems. Reductions in this program also negate opportunities for the federal government to leverage its investment with contributions from state and local users.

The ICWP and USGS have been engaged in a dialogue of trying to provide guidance on modification of the Nation's stream gaging network given limitations in future funding. The nationwide network comprises both the federal program and the Federal-State Cooperative Program. There are selection criteria to be considered when deciding the fate of a given station. These criteria include monitoring of unique hydrologic areas, monitoring compliance for interstate compacts and Supreme Court decrees and adequate coverage for National Weather Service flood forecasting. The ICWP and USGS are working toward consensus on those criteria, but the Council fears that adoption of the fiscal year 1998 budget will pre-empt any further discussion on the configuration of the Nation's streamflow monitoring network, as the Survey hastens to discontinue stations to meet its funding constraints.

The Council appreciates and supports the Administration's and Congress' need to reduce the Federal Budget. We are concerned that in the process of downsizing federal commitments for water resource data collection, the States shoulder the burden of compensating for the smaller network. Adjustments can be made by all levels of government, but it must be allowed to occur in an orderly process so that any necessary transitions in responsibility minimize disruption to the access of important information.

The Council reiterates that the collection of water resource data remains the highest priority and retains the highest value of our relationship with the USGS. Changes in emphasis from data collection to hydrologic analysis provide marginal value to the states in situations when resources are redirected from data programs to new initiatives. The cornerstone of a local-state-federal partnership in water remains the availability of reliable water resource data on which to base decisions and coordinate activities.

In that spirit, the Council requests Congress to minimize any reductions in the fiscal year 1998 appropriations to the federal Hydrologic Networks and Analysis and the Federal-State Cooperative Programs to maintain the delivery of useful hydrologic information and to allow ICWP and USGS to prepare a plan for a necessary yet smooth transition in data collection support efforts in fiscal year 1999.

PREPARED STATEMENT OF DR. THOMAS G. BAHR, PRESIDENT, THE NATIONAL
INSTITUTES FOR WATER RESOURCES

Mr. Chairman: My name is Thomas G. Bahr. I am President of the National Institutes for Water Resources and Director of the New Mexico Water Resources Research Institute at New Mexico State University, Las Cruces, NM. I wish to thank you for the opportunity to provide testimony and express my appreciation for the strong support you have given the Water Resources Institute program. I have been directly associated with this program for over 20 years as a director of two different state institutes and also as the director of the federal agency which once administered this program during the first Reagan administration. This is a valuable program for America which recognizes the premise that states, not the federal government, are the managers of their water resources and that solutions to water problems are best solved at the state and local level. Water Resources Research Institutes are state entities, which through applied research, are ideally situated to tailor appropriate solutions to state water problems. States, in fact, put two dollars into the Institute program for every one federal dollar.

I am pleased to report that the Water Resources Research Act was reauthorized by the Congress and signed into law on May 24, 1996. This Act (42 USC 10301 et seq.) continues the important state-based program originally authorized in 1964. As my colleague, Dr. Leland Mink, points out in his testimony, the Act has been broadened to include emphasis on long-range water resources planning and the study of effective management of agricultural and natural resources systems. This adds important new dimensions to the program making it an even more comprehensive and robust authorization. Its implementation, however, depends on adequate funding.

We have reviewed the USGS budget proposed by the Administration and we strongly support the research program of the Water Resources Division. Their work is widely recognized as first class among the scientific community. For the first time in several years, the Administration has now recommended at least some funding for the Water Resources Research Institute program and we greatly appreciate this as a step in the right direction. Over the many years of the Institute program, however, there has been a steady erosion in the ability of Institutes to maintain viable programs. Last year's funding level of \$4.553 million is roughly the same amount as the first year appropriation for the program when it started over 30 years ago. Inflation over the past 30 years, however, has reduced the purchasing power of the research dollar by nearly 4-fold.

On behalf of the National Institutes for Water Resources we ask for your support for the following:

\$7,000,000 to support activities authorized by Section 104(b) of the Water Resources Research Act, that section which authorizes the base institutional grants for the 54 state Water Resources Research Institutes.

\$2,000,000 to support activities authorized by section 104(g) of the Water Resources Research Act, that section which authorizes regional, multi-state and inter-jurisdictional research.

\$250,000 to support U.S. Geological Survey for administration of this program.

We recognize the serious federal budget constraints at this time and fully understand the need for the federal government to be more productive with limited resources. It is for this reason we feel the documented productivity of the Water Resources Research Institutes program, the importance of the program to the individual states and the modest federal appropriation, essential in maintaining the high degree of productivity, amply justifies our request.

SECTION 104(b)—INSTITUTIONAL GRANTS TO THE 54 INSTITUTES. WHAT ARE THE
BENEFITS?

The Institute program assures that all states maintain the capability and expertise needed to solve their own water resources problems

The Water Resources Research Institutes use state scientists to conduct high priority state, regional and national research on water resources which can effectively reduce the size and cost of the federal role. The Institutes provide an existing research infrastructure by connecting and integrating the university-based water research capabilities. State agencies which are charged with direct management responsibilities need—but often do not have—such research capabilities. The Institute oversight and advisory committees, consisting of state and local officials and members of the public, provide direction to each institute and serve at no cost to the federal government.

Federal support for the Institute program creates a national network among the states and between their land grant colleges and universities and other research institutions. The network links water investigators throughout the nation, thereby

eliminating research duplication and ensuring high priority topics are addressed. The federal support and interest in this program is an essential component in the Institute's ability to secure non-federal funds to support additional water research and technology transfer and educational activities. During the last fiscal year, Institutes leveraged 11 non-federal dollars for every 1 federal dollar appropriated to this program!

Separation of governmental regulatory functions from the research process is essential

Most federal water management agencies have regulatory responsibilities. "In-house" research among these agencies is more susceptible to political pressure to generate conclusions in support of an agency's position, than is independent scientific research and technology development conducted at our nation's universities.

The federal water problem-solving role could be significantly reduced and transferred to the states

Federal regulations and programs designed to solve water problems have their primary impact at the state and local level. State and local governments are in a far better position to tailor solutions to local water problems. Significant reductions of many "in-house" federal water research programs could be achieved, while at the same time preserving the capacity to conduct research, transfer information, and solve water problems through the Water Resources Research Institute program.

The nation's future depends on a continuing stream of qualified engineers, scientists and policy makers, and requires that these people be trained to address more complex water issues

Training of water resource professionals has been a hallmark of the programs conducted by the Institutes. Not only does this program provide an opportunity to expand the number of students trained, it will more importantly offer training that provides the kinds of skills needed by many future water resource professionals. Funding this program would help ensure that this country develops enough personnel to deal effectively with the more complex problems of water management and water quality in the future. Unlike federal research agencies, virtually every research dollar spent on this program has the important added benefit of supporting the training of new scientists and engineers.

SECTION 104(g) REGIONAL AND INTERJURISDICTIONAL RESEARCH—WHAT ARE THE BENEFITS?

By authorizing the Section 104(g) program, Congress recognizes that water resources management is undergoing changes in the United States and many serious water problems are regional and interjurisdictional in scope. The information necessary to solve these problems must be generated by knowledgeable organizations with a familiarity and understanding of these interjurisdictional dimensions. The nation's universities have the interdisciplinary expertise needed to help solve such complex problems without the addition of more federal employees.

Federal funds are necessary to create a base of support for research on regional interjurisdictional problems

Without federal support, there are virtually no sources of funds available to support the scale of interdisciplinary research and analysis necessary for assessing regional and interstate water resources problems. It is wholly appropriate for the federal government to provide the support base and serve as a catalyst for the type of solution-oriented, problem-solving research toward which this program would be directed through our nation's universities.

The research and networking capabilities of the Water Resources Research Institutes are well-suited to lead multi-and interdisciplinary programs aimed at providing solutions to complex water issues

The record of the Institute program in carrying out its mission under the Water Resources Research Act has been well documented and is further described in the 1997 Executive Summary of our program provided to your committee. The Institutes can provide not only the technical expertise needed to offer solutions, but can serve as the point of contact to recognize and bring together concerns of all the participating parties across the relevant jurisdictions.

REGIONAL COMPETITIVE PROGRAM AS CURRENTLY MANDATED

Guided by language in the fiscal year 1996 conference committee report (House Report 104-259, pp. 33-34) the USGS and Institutes implemented a different mech-

anism to allocate Section 104(b) institutional grant funds. Last year, a base grant of \$20,000 was provided to each of the 54 Institutes and the balance of the funding was equally divided into four regional pools. Research priorities focusing on regional problems of each of the four regions were established and circulated among potential research investigators within each of the respective regions. Institutes within each of the regions then applied for research project funding on a competitive basis.

Having now gone through this new process one time, it is clear to us that it is not a very cost effective mechanism for allocating funding and it is extremely cumbersome to administer. Projects selected for funding were of very high quality, but no better than projects which had been selected under the former system of making competitive awards in each of the states. Of greater concern to us is that the regional competition process bypasses important state priorities established by state advisory boards who have, for many years, guided each of the state programs. States put far more money into the Institute program than the base funding provided by the USGS and state water managers now feel left "out of the loop" when it comes to providing input to funding decisions. Providing state dollars used to match projects which may not be of direct interest or benefit to the state does not make much sense to them. Use of Section 104(b) funds for the regional competition program is a significant departure from the state/federal partnership envisioned in the authorizing legislation. We feel the structure of conducting regional and national research would be best handled under the authorized 104(g) program, rather than under the state-based 104(b) program, as this language directs.

In conclusion, we believe that the productivity of the Institute Program and the evidence of increasing demand for the program speak convincingly to the need for continued funding for the Water Resources Research Program. The National Institutes for Water Resources are grateful for your continuing support of this important state-based program. Thank you very much.

PREPARED STATEMENT OF THE COACHELLA VALLEY MOUNTAINS CONSERVANCY

The Coachella Valley Mountains Conservancy appreciates this opportunity to seek the Subcommittee's support for a \$1 million appropriation to BLM for acquisitions in the Santa Rosa Mountains National Scenic Area and for an appropriation to assist NCCP planning efforts in southern California.

The Santa Rosa Mountains National Scenic Area is the large mountain range that forms the backdrop of Palm Springs and Palm Desert, and is often featured in the Skins golf tournament. The mountains rise quite steeply from the desert floor to San Jacinto Peak at 10,800 feet, going through five life zones from Sonoran desert to alpine. They are home to the peninsular bighorn sheep and several other endangered species. There are dozens of palm oases dotting the canyons and mountain-sides, including Palm Canyon where thousands of palms stretch for miles in the largest fan palm oasis in the United States. Cultural resources also abound, including Cahuilla Indian village sites along various creeks and oases, ancient trails leading from village to village and to food gathering locations, rock art, ceremonial sites, and cremation sites. Of great importance to the Coachella Valley's economy, hundreds of thousands of people who come to the desert each year for vacation enjoy our mountains, whether just the view from the fairway or their hotel room, or on a visit to the Indian Canyons Heritage Park, a paid jeep ride in Palm Canyon, a tram ride to the pine forests, a guided hiking tour, or the fastest growing set of uses: on foot, horseback, or mountain bike to enjoy the solitude and magnificence of the back country.

The mountains don't just define the valley geographically; they are truly the soul of the Coachella Valley. They define it visually and emotionally for the residents and visitors on whom our local economy depends. The mountains have brought together the cities and the people of the valley in a unique partnership with state and federal agencies. One expression of that partnership is the Conservancy's Governing Board, made up of representatives of seven city councils, the County Board of Supervisors, three citizens appointed by the Governor, the state Senate, and the state Assembly, the Bureau of Land Management, the U.S. Forest Service, the Agua Caliente Band of Cahuilla Indians, the California Resources Agency, the University of California, the Department of Fish and Game, the Wildlife Conservation Board, and the Department of Parks and Recreation. The Conservancy's primary mission is to protect the mountains surrounding the Coachella Valley, and our acquisitions to protect key areas are all done through partnerships. This past year our partnership completed an acquisition in which the state's Wildlife Conservation Board and the Bureau of Land Management both purchased portions of a 3,000 acre property which the Conservancy had been able to option from the owner.

This coming year we have two more partnership acquisitions lined up. The City of Palm Desert wants to cooperate with BLM to purchase a property which is proposed for development in the mountains overlooking our city. The property sits above Deep Canyon, a major University of California Biological Research Center, and is adjacent to the BLM's Santa Rosa Mountains National Scenic Area Visitors Center. The City has committed \$1 million towards the acquisition if BLM will contribute some LWCF funds to work with it. The City's goal is to purchase this property in phases over the next several years.

At the other end of the valley is the Snow Creek area which is the scenic gateway to the Coachella Valley, and in particular the City of Palm Springs. The City has committed matching funds along with the Conservancy for a state grant which will enable us to initiate acquisitions here. The Conservancy has been working with local landowners and we already have more than 1,100 acres of land available to us to purchase. Between the city's and the conservancy's matching funds and the state grant we expect to receive, we have \$500,000 to expend. We're looking for a BLM contribution from LWCF, and another state contribution from the Wildlife Conservation Board over the next two to three years to help acquire the balance of the land.

The Snow Creek land, like the Palm Desert land, is not important just for its scenic qualities, though these are unmatched anywhere. Both these areas also figure prominently in a Multiple Species Habitat Conservation Plan which covers the entire Coachella Valley and the surrounding mountains. The cities, the county, and all the state and federal agencies are actively involved in preparing this plan. BLM, for example, has committed a GIS person to the effort to work with Conservancy staff, and BLM biologists have helped with biological surveys. This is perhaps the most cooperative MSHCP effort anywhere. The Advisory Group for the effort includes groups as diverse as the Sierra Club and the Building Industry Association, and they are committed to working together in harmony. For a variety of reasons, not the least of which is our past history of success in these kinds of efforts going back to the mid 1980's when we developed the second habitat conservation plan in the nation for an endangered species, our valley has learned that all interest groups accomplish a great deal more by working together pragmatically and honestly rather than fighting and bickering.

Land and Water Conservation fund money has been well spent in the Santa Rosa Mountains Scenic Area because of these partnerships. The money is an investment in more than land. It's an investment in a model of local, state, and federal agencies working successfully together, and working cooperatively with diverse private sector groups.

Regarding the Multiple Species Habitat Conservation Plan effort, we recently became the first non-coastal sage scrub Natural Communities Conservation Plan effort in California. This means that we now qualify for some of the NCCP—or Natural Communities Conservation Plan—funding which Congress has appropriated in recent years. And just as we have with acquisition efforts, we bring a very real partnership to the MSHCP/NCCP funding effort. Since we began the planning effort two years ago, the funding for it has been almost exclusively local, from local grants, local mitigation fees, and local cash contributions from conservation groups and the Building Industry Association. BLM has contributed a small but very valuable amount of cash and several state and federal agencies have made in-kind contributions of staff time. Our eligibility for NCCP planning funds will help us complete the plan in the next two years. So in addition to seeking your support for LWCF acquisition funds to the BLM, the Conservancy also seeks your support for continued appropriations for NCCP planning funds. And with the number of successful NCCP efforts underway in five southern California counties (San Diego, Orange, Riverside, San Bernardino, and Los Angeles), it would help tremendously if the amount were increased from \$2 million to \$3 million.

The Conservancy appreciates your help in previous years, and very much hopes to have that same assistance this year to further the extremely successful partnerships in the Coachella Valley.

LETTER FROM TODD KELLSTROM, MAYOR, CITY OF KLAMATH FALLS, OR

KLAMATH FALLS, OR, *April 10, 1997.*

Hon. SLADE GORTON,
Chairman, Senate Interior Appropriations Subcommittee,
Washington, DC.

DEAR MR. CHAIRMAN AND MEMBERS OF THE SENATE INTERIOR APPROPRIATIONS SUBCOMMITTEE: The City of Klamath Falls is supporting the fiscal year 1998 appro-

priations request of the Upper Klamath Basin Working Group which was established by Senator Hatfield in the Oregon Resources Conservation Act of 1996. The City of Klamath Falls has been an active member of the organization since it was first established as the "Hatfield Klamath Basin Working Group" in early 1995.

The Senator's charge to the new Upper Klamath Basin Working Group was to review conservation and wetland issues in the basin and then recommend appropriate solutions and projects which would be supported by all group members and benefit the Upper Klamath basin. Original funding in fiscal year 1996-97 helped establish such programs as Tulana Farms Wetlands Restorations, BLM Wood River Wetlands Restoration and projects of the Ecosystem Restoration Office (ERG).

In March 1997, the Upper Klamath Basin Working Group identified a third set of restoration projects for implementation under the one million dollar (\$1,000,000) authorization of the Oregon Resource Conservation Act of 1996. These projects include federal, state or local matches and are listed as follows:

1. Restoration of springs in the Sprague and Williamson River systems, proposed by the Klamath Tribes, \$160,000.
2. Field trials for an integrated pest management plan on the Tulelake and Lower Klamath National Wildlife Refuges, proposed by New Horizons Technology, contractor to the U.S. Fish and Wildlife Service, \$30,000.
3. Development of a Juniper management program, proposed by the Oregon Department of Fish and Wildlife, \$100,000.
4. Riparian fencing and wetland restoration at various locations, proposed by Ducks Unlimited, Western Regional Office, Rancho Cordova, CA., \$150,000.
5. Riparian protection and stream structures on three parcels of private lands, proposed by the Klamath Soil and Water Conservation District, \$243,350.
6. Wetlands restoration of Sevenmile Creek, proposed by Water for Life, \$200,000.
7. Support for a Geographic Information System center at Oregon Institute of Technology, \$123,000.
8. Implement a Bull Trout restoration strategy, proposed by the Bull Trout Working Group, \$50,000.
9. Install fish barriers to protect Bull Trout in Sun Creek, proposed by the Bull Trout Working Group, \$20,000.

The Working Group also developed a consensus to recommend an additional budget request to fund:

1. The continuation of wetlands restoration work on the Wood River Ranch by BLM, \$500,000. This is an on-going restoration project of 3,200 acres.
2. Implementation of "Sump Rotation" as a tool for wetlands management and development on the Tulelake National Wildlife Refuge, \$1,220,000.

The Upper Klamath Basin Working Group continues to be supported by a wide range of differing interests, Klamath Tribes, Oregon Department of Fish and Wildlife, Agriculture, Grazing, Industries, City of Klamath Falls, Klamath County, Conservation Groups, Oregon Governor's Office, Federal agencies and private citizens. There is also coordination within the two state (Oregon and California) area with the Klamath Rivers Fisheries Task Force, the Klamath River Compact Commission, and the Trinity River Task Force. These groups work on developing support through consensus building so that all may agree and support the resulting actions and funds.

Therefore, the City of Klamath Falls respectfully requests that you appropriate the \$1 million, as authorized under the Oregon Resources Conservation Act of 1996, for the nine restoration projects identified above for the Upper Klamath Basin in fiscal year 1998. In addition, supplemental funding to accomplish the Wood River Wetlands restoration and the "sump rotation" on the Tulelake National Wildlife Refuge. The total restoration effort will provide solutions that can lead to recovery of the endangered sucker, downstream salmonids, and potential future endangered species listings. These projects will also help the agriculture communities, the City and County, Native American tribes, as well as commercial interest on the Klamath River both in Oregon and California.

Respectfully submitted,

TODD KELLSTROM,
Mayor.

PREPARED STATEMENT OF COMMISSIONER JOE JUDD, ON BEHALF OF THE KANE COUNTY, UTAH COMMISSION

Fiscal year 1998 Request: \$820,000 for the "Partnership Demonstration" program with the Bureau of Land Management for the Grand Staircase-Escalante National Monument

Mr. Chairman, and members of the Subcommittee on Interior and Related Agencies; I would like to express my great appreciation to you, on behalf of the Commissioners and people of Kane County, for allowing us to testify regarding the Grand Staircase-Escalante National Monument—and the resulting impacts of the monument on both the land and residents of Kane County.

Let me begin by saying that our initial reaction to the surprise announcement by the President was one of great anger and frustration at being left out of the deliberations. However, despite our disappointment, we collectively decided to be included in any future deliberations and decisions that will so greatly affect our lives. We subsequently accepted an offer by the Secretary of the Interior to participate with the Bureau of Land Management in the three-year assessment and planning process.

We signed a Cooperative Agreement with the Bureau which will provide up to \$200,000 in fiscal year 1997 to " * * * facilitate the improvement of the economic, cultural, and other resources of the county and to facilitate the BLM's planning process for the Monument." Our first responsibility is to develop an analysis of county infrastructure requirements, law enforcement, transportation needs, search and rescue and other impacts due to the designation of the monument.

Through our initial assessments, we estimate that Kane County's funding requirement to continue in the planning process in fiscal year 1998 is \$250,000. We are requesting that this agreement be established in the appropriations bill as a "Partnership Demonstration" line-item for the planning effort with the BLM.

Additionally, there will be a great increase in the demand for basic emergency services as a direct result of the monument designation and will require a minimum of \$570,000 in fiscal year 1998.

This comes to a total of \$820,000.

It is clear that we must quickly prepare for the consequences of putting this area on the tourist map. The character of the area is seductive and inviting, but very harsh and unforgiving on those who are unprepared. We anticipate a very sharp increase in persons getting lost in the area, or stranded, hurt or worse. Kane County, at this point, is simply unable to adequately carry out public safety services of search and rescue and related health, sanitation and law enforcement requirements that will be immediately essential.

Mr. Chairman, this is not a Kane County Monument, this is a National Monument. It was created by the President of the United States on behalf of the American people. The proclamation was widely and warmly supported by the American people. And, as far as I know, it has never been deliberate U.S. policy or practice to simply dump all of the responsibilities and costs of a National Monument off on the citizens who happen to live adjacent to the boundaries.

The costs to provide a suitable monument experience, both inside and outside of the boundaries will be significant. I doubt that there are few people, including the President, who have an appreciation for just how large and diverse these monument lands are. This was an enormous decision with enormous consequences. The area takes in about 2 million acres. That is 3,125 square miles. About 70 percent of this, about 2,590 square miles, is in Kane County. The monument is larger than Manhattan and Long Island combined—it is about the size of the state of Delaware. But it is much more than big. It is a very diverse topography that ranges from the very stark—without any vegetation—to the more familiar red cliffs and forests highlighted by the media.

We believe, as the President does, that it should be seen, and certain segments could provide an outstanding monument experience with sufficient care and with sufficient resources. Of course, large parts of the area are less accessible, and will be difficult to view, resulting in very low visitations. Some areas are very fragile and should be protected from visitations.

But whether we want people come to the monument or not, or if there is adequate access or not, it is too late. They are arriving already and will continue to come in larger and larger numbers. The President's proclamation has, in effect, changed the character of the area forever.

The infrastructure to support visitors (access roads, basic sanitation facilities, good accommodations and information, both in and beyond the boundaries of the monument) simply does not exist. That, of course, is the purpose of our planning process. And because the facilities and infrastructure adjacent to the monument are

as critical as those within, we believe our participation is not a privilege but an obligation on the part of the government; even a responsibility on our part.

But within the obligation, we have seen an opportunity—an opportunity for the Federal Government to establish a Partnership with Kane County. Not just some vague “input,” but a separate and essential role in that partnership.

This is an opportunity to demonstrate to other, and very skeptical, local governments, throughout the United States, that the Federal Government is sincere when it states, as the President did, that this is “* * * the beginning of a unique three-year process during which the Bureau of Land Management will work with state and local governments * * *” to set up a land management process.

Fiscal year 1998 funding will allow us to continue in the direction we have already begun with the Cooperative Agreement. The agreement is a very “unique” beginning and it is working. We have begun a planning process that is based on cooperation, open communications, and fledgling trust. We have been persuaded to reach out to the government and say—“Okay we will give it a try. We will take a risk.” But there are any number of people who are saying that we are crazy to trust the government.

Well, I hope not. So we are asking you, the Federal Government: Do not abandon us now that we have made a commitment.

I met with Secretary Babbitt and I was convinced of his sincerity when he said he wanted this process to work. And the BLM has said repeatedly that they believe a local partnership with full cooperation is a great benefit to them in managing the largest national monument in the lower 48 states.

As the members of the committee know, this is the first National Monument for the Bureau of Land Management. We support the decision by the President to retain management of the area with the Bureau. The President stated in his announcement at the Grand Canyon that the monument was to be continued in multiple-use management. That is a critical consideration both in the retention of the BLM and the inclusion of the local government’s participation in planning, and where appropriate, decision making.

It is my understanding that the President’s budget calls for an additional \$5,000,000 for the monument. We think that is an important level of funding, but Kane County requires the additional amount of \$820,000, at least for fiscal year 1998. It may be ultimately possible to discover or create the means for the monument to pay for itself through fees or other mechanisms. But for the immediate future a sufficient level of funding is critical to provide the basic services for these new visitors. Kane County simply does not have the money.

We have heard it said already, Mr. Chairman, that Kane County will experience an amazing and lucrative boom—a windfall—because of all the increased tourism that the monument will generate. The truth is, we fervently hope that the predicted flood of tourists does not occur—especially in the next year or two. For each tourist dollar brought in, it costs the county \$1.25 to provide all of the needed services: law enforcement, visitor aid, indigent care, as well as other community resources to provide for fire protection, and water and sewer services.

Tourism on its own does not provide a stable economy. It is both seasonal and a second wage-earner employer. Kane County, is an area of 4,800 square miles, but the county has less than 7,000 permanent residents. Public lands comprise 95 percent of the county. There are very few families supported by primary jobs; for the most part our families are forced to survive on minimum wage jobs. This provides a very low tax base. And, because of the lack of primary jobs, young people are unable to stay in the county. In Utah, persons in the 25–34 age group make up 25 percent of the population. But in Kane Co., it is 17 percent. When our young people graduate from college, we say, “Congratulations, and goodbye.” We have a disproportionate share of 25–30 year old heads of households earning less than \$15,000 per year. The poverty level for a family of five is \$14,990 per year.

The hope for Kane County was to have been in the Smoky Hollow mine, an underground coal mine which was being reviewed through the EIS process as established by the Environmental Policy Act. The mine was to provide jobs—primary jobs—and provide desperately needed revenues for the schools and for basic county services. Our county’s recreation and transportation special services district loses \$500,000 per year and will continue to do so for a period beyond our life spans. Our county has an assessed tax base of \$300 million. The Andalex facility would have added \$90 million to our tax rolls.

Any prospect for the mine has apparently been eliminated. In fact, the President mentioned the mine by name in his declaration statement at the Grand Canyon. He said “I am concerned about a large coal mine proposed for the area * * *” and went on to say that he hoped that “Andalex” will find a way to pursue its mining oper-

ations elsewhere. He said “* * * we shouldn’t have mines that threaten our national treasures.”

Well, we did not agree with that assessment, but that is way beyond our ability to affect. All we can do now is look forward and try to build a future for our children. We can also help to build a monument. Together, we can provide a proper monument experience without degrading the environment or the quality of life of a people who have lived in harmony with the land for generations.

Mr. Chairman, we are hopeful that the cooperation between the Federal government and local government will continue to be supported. We are beginning to record the history of this partnership and at the same time create a video and other materials which will provide information to the public, and we welcome your participation.

We do not represent any narrow point of view or philosophy. We have a planning process that is open to all citizens and the very diverse citizen groups. All we ask of the Congress is the opportunity to continue to be a part of this new and unique opportunity to create a great monument that protects the landscape and provides a variety of multiple uses for the benefit of all people.

We do not have any money, we have very few votes, and no power. We do not come here today with threats—just a simple request that we not get brushed aside—discarded—as others rush in to command or make convenient and “low-cost” but short-sighted decisions that will foreclose the hopes and expectations of the American people who warmly supported the decision to create a new monument.

We invite you to come to Kane County—come see it for yourselves. The subcommittee staff have visited the area, but snow conditions decreased mobility even while increasing the aesthetic qualities of one of the most beautiful areas of the world.

Thank you again for the opportunity to testify on behalf of the county and I welcome whatever questions you may have.

PREPARED STATEMENT OF JACK A. BARNETT, EXECUTIVE DIRECTOR, COLORADO RIVER BASIN SALINITY CONTROL FORUM

This testimony is in support of funding for the Colorado River salinity control program. The Bureau of Land Management has chosen to reformulate its budgeting process so as to support ecosystems and watershed management. The activities needed to control salinity being contributed from the BLM lands are a part of ecosystem and watershed management. Because the budgeting process lumps all activities together, we can only presume that there is adequate dollars in the President’s budget to move ahead with the water quality enhancement and protection programs needed in the Colorado River drainage to ensure that the salts in excess amounts are not contributed to the river system. Our analysis indicates that the Bureau of Land Management needs to specifically target the expenditure of funds in the amount of \$4,500,000 to salinity control in fiscal year 1998.

OVERVIEW

The Colorado River Basin salinity control program was authorized by Congress in 1974. The Title I portion of the Colorado River Basin Salinity Control Act responded to commitments that the United States had made via a treaty with Mexico with respect to the quality of water being delivered to Mexico below Imperial Dam. Title II of the Act established a program to respond to salinity control needs of Colorado River water users in the United States and to comply with the mandates of the then newly legislated Clean Water Act. Initially, the Secretary of the Interior and the Bureau of Reclamation were given the lead Federal role by the Congress. This testimony is in support of funding for the Title II program.

After a decade of investigative effort, the Basin states concluded that the Salinity Control Act needed to be amended. Congress revised the Act in 1984. That revision, while keeping the Secretary of the Interior as lead coordinator for Colorado River Basin salinity control efforts, also gave new salinity control responsibilities to the Department of Agriculture, and to a sister agency of the Bureau of Reclamation—the Bureau of Land Management. Congress has charged the Administration with implementing the most cost-effective (dollars per ton of salt removed) program practicable. The Basin states are strongly supportive of that concept, as the Basin states cost share between 25 and 30 percent of these federal expenditures for the salinity control program, while in addition proceeding to implement their own salinity control efforts in the Colorado River system.

Since the congressional mandates of nearly two decades ago, much has been learned about the impact of salts in the Colorado River system. The Bureau of Rec-

lamation has recently completed studies on the economic impact of these salts. Reclamation recognizes that the damages to United States' water users alone may soon be approaching \$1 billion per year.

The Colorado River Basin Salinity Control Forum (Forum) has become the seven-state coordinating body for interfacing with federal agencies and Congress to support the implementation of a program necessary to control the salinity of the river system. Forum members are appointed by the governors of the seven Colorado River Basin states. In close cooperation with the Environmental Protection Agency (EPA) and under requirements of the Clean Water Act, every three years the Forum prepares a formal report analyzing the salinity of the Colorado River, anticipated future salinity, and the program necessary to keep the salinities at or below the levels measured in the river system in 1972.

In setting water quality standards for the Colorado River system, the salinity levels measured at Imperial, Parker, and Hoover Dams in 1972 have been identified as the numeric criteria. The plan necessary for controlling salinity has been captioned the "plan of implementation." The 1993 Review of water quality standards includes an updated plan of implementation. The level of appropriation requested in this testimony is in keeping with the agreed to plan. If adequate funds are not appropriated, state and federal agencies involved are in agreement that the numeric criteria will be exceeded and damage from the high salt levels in the water will be widespread and very significant.

JUSTIFICATION

The BLM is, by far and away, the largest landowner in the Colorado River Basin. Much of the lands that are controlled and managed by the Bureau of Land Management are heavily laden with salt. Past management practices, which include the use of lands for recreation; for road building and transportation; for oil, gas, and mineral exploration; and most importantly, for grazing, have led to man-induced and accelerated erosional processes. When soil and rocks heavily laden with salt erode, the silt is carried along for some distance and ultimately settles in the streambed or flood plain. The salts, however, are dissolved and remain in the river system causing water quality problems downstream.

The Forum believes that the federal government has a major and important responsibility with respect to controlling pick-up of salt from public lands. Congress charged the federal agencies with proceeding with programs to control the salinity of the Colorado River, with a strong mandate to seek out the most cost-effective options. It has been determined that BLM's rangeland improvement programs can lead to some of the most cost-effective salinity control measures available. These salinity control measures are more cost-effective than some now being implemented by the Bureau of Reclamation and by the Department of Agriculture. They are more environmentally acceptable, as they will prevent erosion, increase grazing opportunities, increase dependable stream runoffs, and enhance wildlife habitats.

Through studying hundreds of watersheds in the States of Utah, Colorado, and Wyoming, the BLM has selected several watersheds where very cost-effective salinity control efforts could be implemented immediately. In keeping with the Congressional mandate to maximize the cost-effectiveness of salinity control, the Forum is requesting that out of the overall requested and authorized budget the Congress appropriate and the administration allocate adequate funds to support the Bureau of Land Management's portion of the Colorado River salinity control program as set forth in the adopted plan of implementation.

DETAILS CONCERNING THE REQUESTED APPROPRIATION

After conferring with BLM officials, the Forum believes there needs to be spent in fiscal year 1998, by the Bureau of Land Management, \$4,500,000 for salinity control. We are particularly concerned that the line-item titled Management of Lands and Renewal Resources is adequately funded.

The Forum believes that although it is commendable for the administration to formulate a budget that focuses on ecosystems and watershed management, it is essential that funds be targeted on specific sub-activities and the results of those expenditures reported; this is necessary for accountability and for the effectiveness of the use of the funds. The Forum requests that the Committee require accounting by the Bureau of Land Management in such a way that the results of their activities in connection with the expenditures the funds can be reviewed and measured.

PREPARED STATEMENT OF CYRUS M. JOLLIVETTE, VICE PRESIDENT FOR GOVERNMENT
RELATIONS, ON BEHALF OF THE UNIVERSITY OF MIAMI

Mr. Chairman and Members of the Subcommittee: I appreciate the opportunity to present testimony on behalf of the University of Miami. The University is seeking your continued support for a major environmental initiative within your purview, the South Florida Ecosystem Restoration Prediction and Modeling Program (SFERPM).

Florida Bay is a triangularly shaped body of water about 2200 sq. km in area. Over 80 percent of the Bay lies within Everglades National Park. The Bay is bounded by the Florida Everglades on the north and the Florida Keys on the southeast. In the Bay over 200 small islands or "keys" occur, many of which are rimmed with mangroves and have interior, irregularly flooded, "flats" with calcareous algal mats. The Bay is shallow, often hyper-saline, and, until recently, was characterized by clear waters, and lush sea grass meadows covering a mosaic of shallow water banks and numerous relatively deeper water basins or "lakes". Deep narrow channels connect neighboring basins. Hard bottom habitats in southwestern Florida Bay support sponge and hard and soft coral communities.

Florida Bay is known as the principal inshore nursery for the offshore Tortugas pink shrimp fishery, for providing critical habitat for juvenile spiny lobster, stone crab, and many important finfish species. While the Bay is the site of an extensive sport fishery, it is also important as a nursery area for many recreationally important finfish in the Florida Keys National Marine Sanctuary. Moreover, the Bay supports numerous protected species included the bottlenosed dolphin, several species of sea turtles, manatees, and the American crocodile.

There are many indications that the environmental health of Florida Bay has deteriorated. Fishing success has declined for many of the species that depend upon the Bay as a juvenile nursery habitat. Atypical algal blooms, attributed to sponge and manatee dieoffs, are occurring in the Bay and Florida Keys. Mangroves appear to be in decline. While the causes of the various problems and the relationships between them are not well understood, there is no question that, like the sawgrass habitat of the Everglades, the coastal marine ecosystem of Florida Bay is in jeopardy.

The objective of the South Florida Ecosystem Restoration Prediction and Modeling Project is to provide decision-makers who are working to restore and maintain a healthy South Florida coastal ecosystem with reliable scientific information. At present there is insufficient knowledge to predict with confidence the consequences of alterations in freshwater input to Florida Bay.

Since no one can turn back the clock and South Florida's rapid development will almost certainly continue, a series of compromises and tradeoffs will have to be made in restoring and maintaining a healthy South Florida coastal ecosystem including Florida Bay. It is essential that decisions be made based on reliable scientific information. That is the objective of the South Florida Ecosystem Restoration Prediction and Modeling program. Which is collaboratively managed and conducted by the National Oceanographic Atmospheric Administration's Atlantic Oceanographic and Meteorological Laboratory and the National Marine Fisheries Service Miami Laboratory and the Rosenstiel School of Marine and Atmospheric Science.

My colleagues at the Rosenstiel School of Marine and Atmospheric Science urge you, Mr. Chairman, to provide \$6 million in dedicated funding for SFERPM. This project is a multi-agency activity in which more than 80 Florida entities are at work seeking solutions to these critical issues.

Mr. Chairman, my colleagues and I know what a difficult appropriations year you face. However, again, we respectfully request that you give very serious consideration to providing dedicated support for the South Florida Ecosystem Restoration Prediction and Modeling program so that sufficient information is available upon which to base decisions for maintaining a healthy South Florida coastal ecosystem including Florida Bay.

LETTER FROM B. SHARON MEEKER, CHAIRPERSON, LAMPREY RIVER ADVISORY
COMMITTEE

NEW MARKET, VA, *March 17, 1997.*

Hon. SLADE GORTON,
Chair, U.S. Senate, Interior Appropriations Subcommittee,
Washington, DC.

DEAR SENATOR GORTON: The Lamprey River Advisory Committee is writing request your support of appropriations for two National Parks Service programs: The

Wild and Scenic River Coordinator Program; and the Watershed implementation Program, under the Rivers and Trails Conservation Assistance Program.

A. WILD AND SCENIC RIVER COORDINATION PROGRAM

The Lamprey River was designated into the National Wild and Scenic Rivers System in November of 1996. Our local River Management Advisory Committee has successfully developed a River Management Plan with the invaluable assistance of the National Parks Service. To foster the implementation of this Plan, our Committee hopes to have the continued support of the Parks Service in coordinating efforts between us and appropriate state and federal agencies—an often daunting role for local citizens.

While our goals have been defined and accepted by our towns, our Committee frequently relies upon the knowledge and experience of Parks Service staff to help us choose the best means for accomplishing those goals. We are in particular need of NPS technical advice in reviewing development proposals affecting the river and in designing future studies which will help us in our mission.

Some specific examples: First: a golf course on miles of river frontage has been proposed. The NPS has helped our Committee to contact the state and federal agencies able to help us evaluate and comment on the proposal. Second: in order to meet the River Management Plan goals of preserving important habitat, our Shoreland Conservation Subcommittee needs fieldwork done to identify key lands. The NPS helps to find those experts, oversees the studies, and connects us with public and private organizations which can offer landowners incentives for protecting those areas. Third: an early dam and mill site on the National Register of Historic Places, long neglected, has become a public safety hazard and was being closed off from the public. An NPS planner is working with neighbors and town officials to redevelop the area so it is a safe passive recreation and historic area with good access.

The Lamprey River Advisory Committee is counting on the continued help of the National Parks Service under this program to make the nation's newest Wild and Scenic River an asset to all.

B. WATERSHED PLAN IMPLEMENTATION

After achieving Wild and Scenic designation for the lower three towns in the Watershed, it has become obvious that achieving our Management Plan goals must involve the whop Lamprey Watershed. Based on surveys of riverfront landowners and data from State agencies, the Lamprey's Local River Advisory Committee has taken a particular interest in point- and nonpoint-source pollution originating both within and upstream of the Wild and Scenic designated river segment. We are also concerned about the need for river resource protection in some upstream towns.

With the help of the National Parks Service, the Lamprey River Management Advisory Committee has just initiated an outreach effort to support other conservation groups throughout the Watershed. Our goal is to coordinate more consisted protective land and water use policies and public education/public support efforts in the nine towns.

The Parks Service has helped us break the ice with upstream towns. Expanding our efforts to include another 30 miles of river and hundreds of square miles of watershed is a challenge, and we are relying heavily on NPS expertise. The Northeast Regional Office has proven invaluable in guiding our initial efforts, arranging for an intern from the Quebec-Labrador Foundation to help produce the first watershed-wide newsletter. This effort connected conservation-minded groups throughout the area in a common effort that is already bearing fruit.

As drought strikes the Northeast more frequently, we are also concerned-with water withdrawals from the river, especially coupled with wastewater treatment plant discharges into it. This must be addressed in a watershed-wide effort. We are looking forward to Parks Service technical assistance in researching options and negotiating with the various interests involved.

In sum, the Lamprey River Management Advisory Committee is deeply appreciative of the support of the National Parks Service in providing guidance, technical assistance and coordination with public and private organizations in helping us reach our goals for the enhancement and protection of the Lamprey River. We ask that you support the appropriations for the Wild and Scenic River Coordination Program and the Watershed Plan Implementation program under the Rivers and Trails Conservation Assistance Program.

Sincerely,

B. SHARON MEEKER,
Chair.

PREPARED STATEMENT OF ERIC HERTFELDER, EXECUTIVE DIRECTOR, ON BEHALF OF
THE NATIONAL CONFERENCE OF STATE HISTORIC PRESERVATION OFFICERS

NATIONAL CONFERENCE OF STATE HISTORIC PRESERVATION OFFICERS REQUEST FOR
FISCAL YEAR 1998 FROM THE HISTORIC PRESERVATION FUND¹

State Historic Preservation Programs	\$31,000,000
National Trust for Historic Preservation	3,500,000
Tribal grants/Tribal Preservation Offices	2,750,000

NATIONAL CONFERENCE OF STATE HISTORIC PRESERVATION OFFICERS

The National Conference of State Historic Preservation Officers is the professional association of the State Historic Preservation Officers, the officials designated by each State's governor to act for the Secretary of the Interior in carrying out the National Historic Preservation Act (16 U.S.C. 470) within each State.

HISTORIC PRESERVATION FUND: THE KEYSTONE OF HISTORIC PRESERVATION

The Nation's approach to historic preservation is based on team work. Beginning in the 1960's, the federal government defined a national approach to the preservation and productive use of our heritage and asked the States to do the work—and pay half the cost.

The Historic Preservation Fund provides the essential foundation for the national historic preservation program. The federal dollars attract the State, local and private match; the federal dollars provide the incentive for States to team up for preservation and run the nation's preservation program within their borders.

Without that federal investment, States lack the incentive and the ability to run the nation's program and would focus solely on State initiatives.

WHERE THE HISTORIC PRESERVATION FUND GOES: THE STATES²

A. Survey: "Ground zero" for the national historic preservation program is historic sites survey: locating and recording places that are part of the nation's 13,000 year history. State Historic Preservation Offices maintain maps, photographs and written descriptions of the historic places within their borders.

B. National Register: The National Register of Historic Places is the national standard for defining historic significance, defining which properties should receive historic preservation treatments and, importantly, which will not.

C. Planning: State Historic Preservation Offices, working with the public, take a comprehensive look at their State, their State's historic resources, opportunities and needs and craft a set of priorities for historic preservation actions.

D. Local governments: Since 1980, local governments have had the option of becoming official partners with State Historic Preservation Offices. Certified local governments' primary responsibility is participation in the National Register nomination process. However, States and certified local governments agree on other partnership activities. In Georgia, several certified local governments assume the State Historic Preservation Office's role in consultation with federal agencies.

E. Rehab tax credit: State Historic Preservation Offices' work with developers interested in investing in the rehabilitation of National Register-listed buildings.

F. Federal agency coordination and consulting: State Historic Preservation Offices assist federal agencies and applicants, on roughly 100,000 projects nationally each year, in avoiding harmful effects to historic places.

G. Monitoring past restoration grant easements: State Historic Preservation Offices continue to monitor the covenants placed on properties that received grants (Pre-1981).

H. Public education: Providing information and training on historic preservation is an on-going responsibility of State Historic Preservation Offices from monthly newsletters, to annual conferences, to local government training.

WHAT THE FEDERAL INVESTMENT HAS EARNED

A. Construction generated through historic rehabilitation credits:³ \$757,000,000 for fiscal year 1996 from 509 projects rehabilitated following the Secretary of the Interior's Standards for Rehabilitation. State Historic Preservation Offices assisted developers in the three-part review process prior to the National Park Service staff re-review.

B. New housing units: 6,009 units of housing of which 3,513 are low/moderate income were created in fiscal year 1996 because of the rehab credits.

C. Interest in heritage: In the thirty years since the National Historic Preservation Act, historic preservation has entered the American vocabulary. The success of such magazines as *Colonial Homes*, and television programs as “This Old House,” attests to the interest in historic preservation among the general public. Analysis of tourism statistics shows that visiting historic sites ranks high (second highest motivator for tourists—in Massachusetts, Virginia and Maryland) among the reasons for tourism. The spontaneous popularity of heritage areas across the country spans the nation from Tracks Across Wyoming, to Silos to Smokestacks in north-eastern Iowa, to the Ohio and Erie Canal, to Essex County in Massachusetts.

D. Inventories are the foundation for heritage area development and cultural tourism:

1. The Alaska Gold Rush Centennial Task Force is co-chaired by the State Historic Preservation Officer and the State director of tourism and involves a decade-long program. 1996 projects included commemorative license plate, a Gold Rush Era Pioneers and Properties Recognition Program, a U.S. postage stamp and a historic signage project in cooperation with the State transportation department.

2. Pennsylvania heritage parks program started with research done by the Bureau of Historic Preservation from their inventories of historic sites. Currently the Pennsylvania Office is preparing a historic context on the anthracite coal industry making it easier to assess the significance of coal industry resources and providing information for interpretation of historic sites.

3. California State Historic Preservation Office is working with Mexico’s National Institute of Anthropology and History on the El Camino Real Misionero de Las Californias Heritage Corridor. The international agreement was signed on April 27, 1997. The New York Times on Sunday January 26, 1997, recognized the work of Mario Sanchez of the Texas State Historic Preservation Office on the Los Caminos del Reo heritage area.

4. The Alabama Historical Commission’s long-time research historic places related to the civil rights movement set the foundation for the Federal Highway Designation of designation of U.S. 80 between Selma and Montgomery as an All American Highway and National Historic Trail.

E. Benefits from consultation with federal agencies on section 106:

1. The Section 106 process opened a dialog between the Alabama Historical Commission and federal agencies to prevent the demolition of the Montgomery Greyhound Bus Station, a major Civil Rights movement historic site, and led to its restoration as a museum and a long-distance learning center with connections to students across the nation.

F. Affordable housing:

1. The Ohio State Historic Preservation Office initiated discussions among federal, state and local agencies with housing responsibilities which resulted in a State task force on affordable housing and historic preservation to facilitate compliance with federal standards.

2. The Illinois State Historic Preservation architect working with a HUD-funded rehabilitation in Chicago showed the developer how the housing goals could be met within the Secretary of the Interiors Standards for Rehabilitation therefore making the National Register-eligible building eligible for historic rehabilitation tax credits.

3. The New Hampshire State Historic Preservation Office encouraged the Drewsville Mansion Affordable Housing and Head Start Project in Walpole to use the historic rehabilitation tax credit in addition to the low-income housing credit for the preservation aspects of the 1880’s stick style building creating links between Southwestern Community Services, the New Hampshire Housing Finance Authority, the Office of State Planning, and the Preservation Office.

G. Historic Preservation and industry work together:

1. American Samoa Historic Preservation Office established a partnership with the American Samoa Power Authority to identify historic sites, prepare National Register nominations and expedite the construction of a sewer line.

2. The Georgia Power Company funded the reprinting of the Georgia State Historic Preservation Office’s driving tour publication *Preserving the Legacy: A Tour of African American Historic Resources in Georgia* in time for the Olympics.

3. The First Hawaiian Bank funded the publication of the Hawaii State Historic Preservation Office’s book *On Bishop Street* tracing a century of history of Honolulu’s financial and corporate center.

H. Rural preservation: historic barns:

1. The Illinois State Historic Preservation Office’s subgrant to Kane County, a certified local government, resulted in “That Darn Barn” calendar which has become a successful tool for promoting the significance of rural heritage as citizens face land use planning decisions.

2. The Ohio State Historic Preservation Office and the Ohio State University Extension Service conducted workshops for and provided notebooks to rural property owners on technical issues related to the continued use and preservation of barns.

3. The New York State Historic Preservation Office provided the Governor with ideas on the preservation of historic barns which resulted in legislation creating tax incentives for barn owners.

4. The Wisconsin State Historic Preservation Office's barn preservation program includes workshops on preservation techniques and a 14,000-entry publication to help owners understand the significance of their buildings, prepare National Register nominations and apply for federal rehabilitation tax credits.

VI. CONCLUSION

The State Historic Preservation Office expresses their appreciation to the Subcommittee for its past support. The need to identify our nation's historic properties, and to find ways to preserve them is continuous, and is a responsibility borne by all levels of government as well as the private sector. The Historic Preservation Fund programs are key components of the federal government's contribution to this effort, and enable the intergovernmental partnership that has accomplished so much in the past 30 years.

Although directed toward appropriations from the Historic Preservation Fund, our testimony would not be complete without requesting continuing support for our key federal government partners the Advisory Council on Historic Preservation at \$2.745 million and the National Park Service, National Recreation and Preservation, at \$42.063 million.

END NOTES

1. NCSHPO request for federal preservation partners: Advisory Council on Historic Preservation: \$2.745 million, National Park Service National Recreation and Preservation: \$42.065 million.

2. The National Conference testimony addresses the State Historic Preservation Office programs, not the National Trust or tribal grants.

3. Source for figures on the rehabilitation tax credit: Heritage Preservation Services Program, National Park Service, "Federal Tax Incentives for Rehabilitating Historic Buildings, fiscal year 1996 Report and Analysis," Washington, DC, 1997.

PREPARED STATEMENT OF SAMUEL N. PENNEY, CHAIRMAN, NEZ PERCE TRIBAL EXECUTIVE COMMITTEE

Mr. Chairman, members of the subcommittee, my name is Samuel Penney, and I appreciate the opportunity to submit testimony for the record. The Nez Perce Tribe appreciates your efforts to solicit our views and to stretch scarce federal dollars to meet our needs.

CADASTRAL SURVEY STATION

As the Committee knows, we have repeatedly sought an appropriation to the Bureau of Indian Affairs real property program to assist in the establishment of a Bureau of Land Management cadastral survey station on the Nez Perce Reservation. The survey is necessary for several reasons including the successful management of our natural resources. It is also necessary to help Indian and non-Indian residents of the reservation in the resolution of boundary disputes. Our reservation has been heavily checker boarded through the allotment process over the years. Because of the lack of accurate survey data, we are encountering a growing number of disputes that arise because of uncertainty of property boundaries. The boundary disputes create ill will among the residents of the reservation and lead to unnecessary expenditures of public and private funds.

We have recently executed an interagency agreement with the Bureau of Indian Affairs and the Bureau of Land Management to establish a cadastral survey station on the reservation, if funds are allocated. The agreement calls for a budget of \$100,000 for fiscal year 1998, with an additional \$450,000 to be spent over the following four years. Establishment of a survey station is a significant commitment by the Bureau of Land Management and they have requested at least a three-year funding commitment. Currently, there are enough boundary disputes to require a survey station for at least three years. Given the recent experience in only two of these disputes that became highly controversial, we believe that the expenditure of funds on a cadastral survey is the most cost-effective use of federal funds.

WOLF RECOVERY PROGRAM

We have been proud to participate in the Wolf Recovery Program with the U.S. Fish and Wildlife Service. This is the only effort in the nation in which a tribe is leading the recovery effort for an endangered species. Through a contract with the Service, the Tribe has produced the recovery plan for wolves in Central Idaho and is implementing the plan, now approved by the Service.

However, the project is badly under funded. The funding shortfall threatens our ability to adequately monitor the new pairs, which are scattered throughout fifteen million acres, to determine whether they will produce litters this spring. The recovery standard for these wolves is reaching ten breeding pairs for three consecutive years. If sufficient funds are not available to determine how many pairs are breeding, we will be unable to determine when the recovery standard is met. We are very pleased with the progress the project has made over the last two years, but need additional funds to accurately assess the extent of its success. We are asking for a supplemental appropriation for fiscal year 1997 of \$100,000 and for annual appropriations for fiscal year 1998 and following fiscal years of \$250,000.

INDIAN HEALTH SERVICE CLINIC CONSTRUCTION FUNDS

The IHS clinic which serves the largest tribal community on the reservation is an antiquated, inadequate, hazardous facility. We are seeking congressional funding and support for an IHS joint venture authorization to replace it. The IHS architectural survey completed over two years ago calculated construction costs for a 17,000 square foot facility at approximately 2.2 million dollars. Land has been identified on which this facility could be build. The need for a new clinic is urgent.

SNAKE RIVER BASIN ADJUDICATION NEGOTIATIONS FUNDING

Since 1987, the Nez Perce Tribe has been engaged in an adjudication of its water rights in the Snake River basin. This litigation commenced by the State of Idaho, is the largest water rights adjudication in the entire nation. We are represented in this proceeding by our own in-house counsel and by the Native American Rights Fund (NARF) in Boulder, Colorado. The litigation has been stayed for most of the last year. During this time the Tribe has worked intensively on negotiations of its water rights in four separate sets of negotiations, each relevant to a particular geographic area covered by the tribal claims. The parties, including the Tribe, the Departments of Justice and Interior, the State of Idaho, and the private water users in each area have been quite successful in narrowing issues. Currently, we are in a critical period of negotiations which may determine whether they can ultimately succeed. The trial court judge has made it very clear to all parties that he will not stay this litigation indefinitely. Therefore, our negotiations are increasingly intensive and our funding needs for the negotiations are that much more critical.

For fiscal year 1998, we are requesting \$710,000 be made available in the BIA's Water Resources and Rights Protection account to NARF for its work on the Tribe's behalf. Of that amount, \$520,000 would cover consultant contracts with experts assisting the Tribe and NARF in the negotiations. These would include experts in fisheries and engineering, an economist, and the tribal attorney assigned to the case. The remaining \$190,000 would cover the NARF staff time and expenses for the two attorneys and an assistant assigned to the case.

This concludes our written testimony. Again, thank you for this opportunity to submit testimony before the Senate Interior Appropriations Interior Subcommittee. Please do not hesitate to contact me if I can provide further information regarding our requests on behalf of the Nez Perce Tribal Executive Committee.

LETTER FROM BOBBY WHITEFEATHER, CHAIRMAN, RED LAKE BAND OF CHIPPEWA INDIANS

RED LAKE, MN, *March 7, 1997.*

Hon. BILL FRIST,
Public Health and Safety Subcommittee, Senate Labor and Human Resources Committee, Dirksen Senate Office Building, Washington, DC.

DEAR SENATOR FRIST: I thank you for the opportunity to provide written testimony on behalf of the Red Lake Band of Chippewa Indians on the Indian Health Service Budget for fiscal year 1998.

The Indian Health Service (IHS) provides vital health care services to Red Lake Band members. Recent attempts by Congress to balance the federal budget, at the expense of the health care needs of the Red Lake people, has to stop. The continued

downsizing and streamlining of the Federal government should not be at the expense of the IHS or the tribes. We demand that the IHS be spared from future cuts to balance the federal budget. We recommend that a separate line of funding be established and/or that additional dollars be earmarked for IHS to fully fund the health care needs as identified by tribes. If Congress cannot fund IHS at 100 percent of actual need, then they should authorize the \$2.4 billion for fiscal year 1998 as recommended by the National Indian Health Board.

The budget for the Indian Health Service continues to be identified as discretionary funding. We recommend that Congress acknowledge the IHS as a guaranteed annualized budget line item which is a result of treaties made between the United States Government and Indian Nations in which the federal government guaranteed health care to Indians in exchange for land, timber, minerals and other natural resources. Trust responsibility cannot be categorized as discretionary.

We support the concept of Congress designating IHS as their own Department, separate from the Department of Health and Human Services or legislation that would elevate the IHS to the Assistant Secretary level within Health and Human Services. Either concept would eliminate unnecessary bureaucracy and reductions in the IHS budget.

The concept of "means testing, or taking into account tribal income when making federal appropriations," should not be allowed. Language needs to be restored that prohibits the billing of an Indian for health care based on the Ability to pay and Congress cannot use gaming revenues against tribes when funding health care. The health care of Indian people is a trust responsibility of the federal government and cannot be based on means testing, gaming revenues or financial status.

The Indian Health Service receives funding for only 42 percent of the health care needs of Red Lake members. As a result, the Red Lake Indian Health Service Hospital and the Red Lake Tribe has had to rely on, and subsequently has become dependent on, collections from third party sources to provide health care for the Red Lake people. The majority of the Hospital's third party collections are from Medicaid, totaling almost \$3.5 million dollars in fiscal year 1996. Third party collections now provide 25 percent of the operating budget at Red Lake. Medicaid collections should not be used as a means to reduce or not to increase the IHS budget. As Medicaid and welfare reform progress and third party collections decrease, we would expect the federal government to fund inevitable shortfalls. Medicaid reform proposals should include guarantees for full funding of Medicaid eligible Indians with a direct set aside for IHS and tribes that is not based on state caps.

The Red Lake IHS Hospital and the Red Lake Tribe have effectively used these third party dollars to provide needed health services for the Red Lake people. Medicaid recipients at Red Lake are able to seek additional health services at other health care facilities throughout Minnesota when needed. They do not have to wait until funds are available through the IHS to get their health care needs taken care of. When Medicare and Medicaid recipients are referred to other health facilities, there is very little cost to the IHS. The facility where the receipts are sent, bill Medicaid for the services that they provide. As the Medicaid and Welfare Reform develops many of these people may no longer qualify for this benefit and will have to use the IHS Contract Health Services dollars where the priority system is used to determine who needs care now and who can wait. This will increase the rationing of health care to the Red Lake people. We would also have to decrease direct health care services to the people.

One of the Red Lake Indian Health Service Hospital's major under funded cost of providing health care is Contract Health Services. This cost occurs when one of our tribal members is referred for additional medical services at off reservation private or public hospitals and health facilities. The Red Lake Hospital only receives \$1 million dollars a year for this critical need. These dollars only last about six months of each fiscal year. The only reason the dollars last this long is that only life threatening emergencies are approved. Many of our Indian people are denied this service because their need to be referred to alternative and/or continued care is considered non-life threatening. They have to wait until the problem is life threatening and then it may be to late. Some of our members never get their health problem taken care of. It is outrageous and irresponsible of the federal government that Red Lake people needing alternative health care are frequently put on a waiting list, and only if their health problem is deemed life-threatening will IHS authorize services. One of the requirements when and before IHS authorize contract health services, Red Lake people, who are guaranteed health care, are frequently forced to apply for Medical Assistance in order to receive this service. This is an unnecessary burden and embarrassment for Indian people. Our Elders have dollars taken out of their small security checks to pay for their health care. They feel and we feel that this is wrong. Their health care was prepaid, they should not have to pay again.

If IHS wants Medicare as a form of third party collection for our elderly then they should pay the premiums.

According to the National Indian Health Board, IHS Contract Health Service needs are currently \$20.6 million. We support the need for an increase in Contract Health Service dollars, Red Lake's request alone is an additional \$5 million for fiscal year 1998. As Medicaid and Welfare Reform progress Contract Health Service dollars for Red Lake will increase up to \$10 to \$15 million dollars annually.

We implore Congress to restore \$104 million for mandatory cost increases to pay for the mandated pay act increases and the growing cost of inflation. These pay act increases should be equally distributed between IHS and Tribal Health Services.

We need Congress to appropriate an additional 75 million for contract support costs. As we take over more functions of the federal government using Public Law 93-638, the Indian Health Service is informing Red Lake that there is no money for contract support. The Red Lake Band of Chippewa Indians should not have to bear the cost of administrating these services on behalf of the federal government.

We implore Congress to reauthorize Public Law 102-537, The Indian Healthcare Improvement Act and provide the full funding needed to carry out the intentions of the Act. This Act is critical to the continued success of the tribes and the IHS in providing healthcare. The major problem with the act is that not all programs and services identified in the Act were funded.

Congress needs to appropriate dollars for Indian Health Service to provide for elders needing short term and long term care in skilled nursing or extended care facilities. The authorization is in the Indian Healthcare Improvement Act for Indian Health Service to provide skilled nursing care, but, they say there was no dollars that were appropriated for this purpose. We have operated our own 47 bed Extended Care Facility since 1989. Our facility is added on the Red Lake IHS-PHS Hospital and was built on the premise that we would be 100 percent reimbursed by the federal government. This happened for about the first 8 months of operation, then Indian Health Service informed the State that in their opinion we were not a "facility of the service". Since that opinion we have not been able to collect the 100 percent reimbursement from the federal government.

The Red Lake Tribal Council, has worked extensively over the years to acquire funding for our unique and culturally sensitive programs that treat drug, alcohol and other forms of substance abuse. We need these services to continue and we do not want to have the dollars that we have used to operate these services reprogrammed by the federal government and given to the States for the general population. We need more dollars and a separate set-aside allocation specifically for tribes. Our share of the set aside could come directly to the Red Lake tribe as a federal block grant, or it could be administered by the IHS and come directly to tribes through our Public Law 93-638 Programs.

We direct your attention to the fact that our Red Lake Indian and Free Drug Program, which was established in 1973, continues to be funded as a direct block grant and that this is the only federal funded block grant in the United States that goes directly to an Indian tribe.

The Red Lake Chippewa Nation has given up land, minerals and other natural resources as a prepayment for health services. We refuse to be identified as part of the minority population or a special organization or people of color that receives health care. We are a Nation. We cannot support Federal or State Health Care Reforms if they threaten our sovereignty and ignores or relieves the federal government of its treaty obligations and trust responsibilities and the government-to-government relationship between the Red Lake Band of Chippewa Indians and the United States

Government or authorizes State's control over tribes in providing health care.

We need you to support the Tribes and fully fund the Indian Health Service budget, protect our prepaid health services and to remind those that feel that the IHS is a welfare program that it is not. Indian Health Care is based on the trust responsibility of the federal government and that Congress has the legal obligation to provide these benefits to Indian Nations, regardless of the tribes or individual American Indians financial status.

Respectfully Submitted,

BOBBY WHITEFEATHER,
Chairman.

PREPARED STATEMENT OF THE INDIGENOUS PEOPLE'S COUNCIL FOR MARINE
MAMMALS

Mr. Chairman Gorton, Members of Interior and Related Agencies and the Senate Subcommittee of the Appropriations Committee. On behalf of the Alaska Native Community, the Indigenous People's Council for Marine Mammals (IPCoMM) is requesting the Senate Subcommittee of the Appropriations Committee to appropriate, for fiscal year 1998, \$750,000 to the Secretary of Interior to implement Section 119 of Public Law 103-238, 1994 Amendments to the Marine Mammal Protection Act (MMPA). It is our understanding the Congressional add-on of \$250,000 for fiscal year 1997 will be continuing appropriations to the Department of the Interior in future years. Section 119 authorizes the Secretary of Interior to * * * "enter into cooperative agreements with Alaska Native Organizations to conserve marine mammals and provide management of subsistence use by Alaska Natives." It also authorizes Congress to appropriate \$1 Million annually for fiscal years 1994-99 to implement Section 119. The only funding provided since 1994 was a \$250,000 congressional add-on to the Department of the Interior's fiscal year 1997 budget which allowed U.S. Fish and Wildlife Service (USFWS) to enter into co-management agreements with Alaska Native Organizations for conservation and subsistence use of walrus, polar bears and sea otters.

Despite the lack of funding, significant progress has been made in Alaska in terms of implementing Section 119 of the MMPA. The Alaska Native Community, represented by IPCoMM, the Alaska Federation of Natives (AFN), and the Alaska Inter-Tribal Council (AI-TC) recently completed negotiations on an umbrella "Memorandum of Agreement for Negotiation of Marine Mammal Protection Act Section 119 Agreements" to conserve marine mammals and provide co-management of subsistence use with the Department of the Interior—Fish and Wildlife Service. Final negotiations with the Department of Interior was completed on March 5, 1997. This umbrella agreement between IPCoMM and USFWS will provide the foundation and direction for how individual co-management agreements will be negotiated between the federal agencies and Alaska Native Organizations for the three (3) species under USFWS jurisdiction. The parties are in the process of planning a formal signing ceremony to commemorate the historic agreement which will enhance the conservation and utilization's of the marine mammal resources for subsistence uses consistent with the public policy embodied in Section 119 of MMPA. In addition, to the successful negotiations with NMFS and USFWS on the umbrella agreement, three Marine Mammal Commissions (Eskimo Walrus Commission, the Alaska Nanunq Commission and the Alaska Sea Otter Commission) recently signed individual co-management agreements with the USFWS for specific co-management agreement activities involving three species used for subsistence purposes in Alaska (walrus, polar bear and sea otters). These Agreements were made possible due to the \$250,000 appropriation to the Department of the Interior for fiscal year 1997.

Although significant progress has been made in implementing Section 119 of the MMPA, it is imperative that Congress fully fund Section 119 of MMPA if this progress is to continue for the three (3) marine mammal species used by Alaska Natives. Congress has recognized that the best way to conserve and wisely utilize marine mammal resources used for subsistence purposes is to allow the full and equal participation by Alaska Natives in decisions affecting the management of marine mammals taken for subsistence. That can only happen if Congress provides adequate funding for co-management activities.

Background.—Early in the discussions leading to the 1994 reauthorization of the Marine Mammal Protection Act, a number of Alaska Native Marine Mammal groups banded together and formed the Indigenous People's Council for Marine Mammals (IPCoMM) to insure a united Native voice during the reauthorization process. As a result, the Native exemption for taking of marine mammals for subsistence uses was retained, and language was added in Section 119 to authorize the Secretaries of the Department of Commerce and Interior to enter into co-management agreements with Alaska Natives Organizations for the conservation and co-management of subsistence uses of marine mammals.

In the spring of 1994, Congress enacted Public Law 103-238, the 1994 amendments to the Marine Mammal Protection Act. In doing so, Congress expressed its intent that the Secretary of Commerce and the Secretary of the Interior extend full cooperation as partners to Alaska Native Organizations in the development and implementation of marine mammal management plans. In order to insure proper implementation of Section 119, the Alaska Native Community requested that NMFS and USFWS work with IPCoMM in the development of an "Umbrella" Agreement with specific language that the federal agencies would consider when developing individual co-management agreements with Alaska Native Tribes and organizations

pursuant to Section 119. The purpose of the umbrella agreement is to provide the direction and foundation for individual co-management Agreements. It will serve as a guide to the Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS) and Biological Resources Division, Geological Survey (USGS) when these federal agencies enter into individual agreements with Alaska Native Organizations or Alaska Native Tribes for the co-management of subsistence use of marine mammals.

At this time IPCoMM is concerned about all marine mammals which are utilized by Alaska Natives, however harvest limitations are allowed and discussions have taken place concerning three listed species for which we have grave concern; bowhead whale (endangered), North Pacific Fur Seal (threatened), Steller Sea Lion (threatened).

The Alaska Native Community stands ready to work with USFWS and NMFS in implementing Section 119 of Public Law 103-238 to its fullest extent. It has already made significant progress toward that end. While Section 119 provides an effective way for Alaska Natives to participate in decisions affecting the management of marine mammals taken for subsistence, full realization of that goal will not be possible unless Congress provides adequate funding for co-management agreements. For that reason, we urge this Committee to appropriate \$750,000 to the Department of Interior to enable it to enter into individual co-management agreements pursuant to Section 119 of the MMPA. We trust that our request will be given due consideration during the deliberations of the Committee.

PREPARED STATEMENT OF JOHN BLACKHAWK, CHAIRMAN, WINNEBAGO TRIBE OF NEBRASKA

This testimony addresses the fiscal year 1998 budget and appropriations for the Bureau of Indian Affairs and the Indian Health Service. The Tribe is concerned about funding for the Tribal Priority Allocation program and the Tribally Controlled Community Colleges program within the BIA and about funding needs at the IHS.

The Tribe and Economic Development.—The Winnebago Tribe of Nebraska is a federally recognized Indian Tribe organized pursuant to Section 16 of the Indian Reorganization Act of June 18, 1934. Our forefathers were forcibly relocated from lands in and near what is now the state of Wisconsin. Our Treaty of 1865 is the first in history to require that the United States provide health care services to tribal members. The Tribe's 120,000-acre reservation includes lands in both Iowa and Nebraska and only about 30,000 acres of land within the reservation is now tribally controlled. There are 3,780 enrolled members, of whom about 1,150 reside on the reservation.

The Winnebago Tribe of Nebraska is very active on the economic front. The Tribe operates several business enterprises, including the WinnaVegas Casino in Sloan, Iowa, and the Heritage food store and the Company A Convenience Mart, both in Winnebago, Nebraska. Additionally, the Tribe has developed a small strip mall located on the reservation; added tribal revenue is generated by leasing tribal land to outside agricultural interests. Ho-Chunk, Inc., a wholly-owned tribal development corporation, owns a Rodeway Inn in Sloan, Iowa, approximately 3 miles from the Tribe's casino. Ho-Chunk has also opened hotels in Omaha and Lincoln. Even with the economic contribution of these projects, tribal per capita income remains significantly below the poverty level at just over \$5,000.

Unlike states, the tribes have little or no tax base or other revenue sources with which to operate tribal government programs. Gaming has given a jump start to our economy but those revenues are decreasing because of commercial competition. The Tribe still relies heavily on federal funds to provide even the most basic level of services to tribal members.

BUREAU OF INDIAN AFFAIRS

Tribal Priority Allocation (TPA) Program.—Under the BIA's TPA program, the Tribe contracts to operate aid to tribal government, judicial services, employee assistance, higher education, credit, law enforcement communications, real estate services related to land management, and wildlife and parks. The total 1997 TPA master contract was \$817,500, a decrease of \$42,000 from the contract amount for 1996 which was \$866,000; the Tribe supplemented this amount with \$380,259 from tribal gaming revenues. In the 1998 budget, the Administration requests \$889,000 for the Winnebago Tribe TPA, an increase of just \$23,000 from 1996, and \$71,500 from the current year level.

Aid to tribal government funds three positions, an intergovernmental liaison person and 2 receptionists to assist the Tribe's administrative functions. We have sig-

nificantly cut back on this function to make more money available for direct services which are sorely needed. For example, the judicial services program averages 500 cases a year; since October, 1996, our court has received 402 new civil, criminal, juvenile, family and traffic cases. The Tribe needs funds for court automation. Because we have only one probation officer for all adults and juveniles, we are unable to monitor compliance with court orders. We are also having difficulty in enforcing child support orders simply because we do not have the necessary staff. The Tribe needs at least another \$55,000 for judicial services. The Tribe's Supreme Court which hears all appeals is funded entirely by the Tribe.

The Tribe uses the real estate services function to help locate homesites for tribal members, many of whom own fractional interests in larger pieces of land. The program is also responsible for ensuring that trust and fee land is managed in accordance with environmentally sound practices to guarantee a solid future for generations to come. The funds are sufficient to hire a program director and administrative assistant to assist the land consolidation process. The Tribe pays for a lease monitor for the Tribe's agricultural lands from tribal funds. The TPA-contracted social service program is also underfunded and pays for only one director and one caseworker to service all of the Tribe's welfare caseload. Children with behavioral and/or emotional problems are sent to a detention center off the reservation because we do not have services on the reservation for them. The center is about an hour away and, while the facility does allow the Tribe to provide services for tribal children, there are rarely sufficient funds to provide the kinds of services the children need. There is a significant need to enhance prevention programs aimed at this group. Most state and federal programs focus on treating symptoms, leaving the tribe responsible for funding and implementing prevention.

The Tribe is reorganizing the social service program to try to realize more benefit from the dollars expended. For example, people are often referred to different places for needed services. We are implementing a more holistic approach to stretch dollars by making sure that as a condition for income support, the individual enrolls in treatment, if needed, or job training, if needed, or both. In other words, we hope to consolidate all referrals so that money, time and energy will be saved. This is difficult to do as federal and state funds are extremely compartmentalized and laden with bureaucratic red tape.

The wildlife and parks program funds three conservation officers and one part-time biologist. Without them, there would be no law enforcement for hunting on the reservation. The Tribe has an agreement with the State of Nebraska whereby the Tribe monitors and manages the reservation wildlife. We must maintain at least the current level of funding for this vital governmental program.

The Tribe is very supportive of the increases shown in the President's budget request for the TPA account and strongly urges the Subcommittee to recommend these increases or even higher levels if possible. While these increases won't meet the full need, they will prevent us from slipping further behind. We cannot function at the most basic level of services if more cuts are made: in 1996 we lost 16 percent from 1995 levels, and in 1997, we lost over 5 percent from the 1996 level of \$866,000. While the Tribe has been able to supplement TPA federal funding with gaming revenues, the opening of non-Indian competitive gaming has caused these revenues to decrease significantly. Given the dual hit caused by depletion of gaming revenues and reductions in federal funds, coupled with an increasing reservation population—more children and people living longer—we are in for some very hard times.

Other BIA Contracts.—For the Subcommittee's information, the Tribe has separate contracts for other programs, including Indian Child Welfare, Johnson-O'Malley, Social Services, and Water Resources. We supplement all but the ICWA program with \$124,000 from gaming revenues. We also have a contract to maintain Bureau of Indian Affairs offices and employee quarters and receive road maintenance funds which the Tribe matches (\$40,234).

Tribally Controlled Community Colleges.—The President's budget requests an increase of \$3,000,000 for this vitally needed program. The Winnebago Tribe formerly participated as a member of a Nebraska Intertribal Consortium in establishing the Nebraska Indian College. Last year, for various good reasons, the Tribe elected to go its own way and is now operating Little Priest Tribal College. We are very pleased with the first year of operations and hope to become a candidate for accreditation in the very near future. This means that while we lost our eligibility for funding in the current year, in fiscal year 1998, the new College will probably be participating in the formula distribution of funds to tribal colleges based on Indian student count.

As the members of the Subcommittee are aware, the current distribution to colleges on the basis of per student count is less than \$3,000. The authorized amount

if \$5,820 per student. No other government funds its college on so low a per student basis. The average for public colleges is about \$4,500.

INDIAN HEALTH SERVICE

The Tribe's community health programs, including CHRs, Public Health Nursing (PHN), National Child Health (NCH), Health Education, and the Diabetes and Podiatry programs, have positively impacted tribal preventive health efforts. For example, amputations have decreased, immunizations have increased, and infant mortality and morbidity rates are declining. The Tribe has proven its ability to plan, develop, and implement outreach programs but we desperately need trained staff to provide services.

The dental program has been extremely successful in educating and providing early treatment which is vital in a community plagued with diabetes. One dentist averages between 200–225 appointments per month.

The PHN program averages about 2,000 patient contacts per year and coordinates an additional 1,500 contacts for patient care. This level of service is provided by 2 RNs and 2 assistants. The Public Health Nurses provide Maternal Child Health outreach for over 200 clients each year—reaching 80 percent in the first trimester. This work has resulted in a significant reduction in fetal deaths and an increase in live births without serious complications. The Tribe's immunization clinics and outreach has exceeded our goal of reaching 60 percent of the eligible population by 8 percent (reaching 68 percent).

Mammography and cervical cancer screening programs were initiated in 1994, and tribal staff have worked hard to provide cost-free services to all eligible clients. This has significantly reduced the more costly treatment of advanced cancers and increased life expectancy for tribal members.

Health care for American Indian and Alaska Native (AI/AN) people must be guaranteed through an amendment to Title XIII (Medicare) of the Social Security Act. Treaties initiated by the federal government obligated this nation to provide health care, education, and protection services in exchange for the very lands upon which this nation now resides. The existing appropriation for AI/AN programs has never been adequate to meet the health care needs of our people. Historically, only 75 percent of IHS level of need has ever been funded. This has now eroded to 40 percent and is still dropping which is directly attributable to Tribal "compacting" under Public Law 100–713 (and its subsequent amendments) and NO program increases. There is a very real risk that decreased access to needed health care is imminent as well as a set-back for the advancements thus far made by IHS.

The legislation also mandated that there be "no adverse impact" for "non-compacting" Tribes, it also mandated a report be submitted on this critical issue. To date we have not seen that report! Even though not a single Tribe in the Aberdeen Area, who all have Treaties, has elected to compact, we have suffered cutbacks directly related to this legislative process. The Aberdeen Area is notorious for its high infant mortality rate: 18.5 percent per 1,000 live births versus the national level of 14.5 percent (it's a victory when a newborn lives beyond the age of three!), high morbidity rate, and high incidence of diabetes. These conditions will only worsen under the policies and practices of the current director of IHS. We understand that he succumbed to pressure by the "compacting" Tribes and authorized that they be funded at 100 percent of their level of need at a great sacrifice to the "non-compacting" Tribes as well as to IHS! We demand that this issue be investigated and that the IHS Director be held accountable for his abuse and neglect of duty and power, and that the mandated report on "adverse impact" to "non-compacting" Tribes be immediately undertaken.

Our Service Unit's budget supports only 71 positions out of an authorized 163. They are mandated to collect third party resources to augment operational costs. In fiscal year 1996 our local service unit collected \$135,000 out of their mandated amount of \$185,000. The national projection for third party resources was set at an unrealistic amount of \$4 million. Although additional resources are used to augment critical operational shortfalls, this optimistic but deceptive methodology must be realistic and based on historical collections and data.

IHS's goal is to raise the health status of AI/AN people to the highest possible level. We quote from a recently published paper written by Everett Rhoades, MD, former director of IHS: "[A]t first glance (the goal) appears to be abstract and platitudinous. It has consistently proven otherwise. On the contrary, it includes the extremely important concept of community-oriented preventive, as well as curative, care. It is a concept that the country should immediately adopt as it struggles with new approaches to health care for the nation." Notwithstanding IHS's flaws, AI/ANs have long known this approach to be efficacious and cost effective. The Tribe strong-

ly suggests that the Congress use it as a prototype for the rest of the nation in your health care reform strategy, and that you call upon our cooperation and experience in developing your strategy.

We're curious about the GAO's 1995 study on "Issues Related to the Need for the Public Health Service's Commissioned Corps." We understand that substantial savings, estimated at roughly \$1 billion, could potentially be realized by converting this quasi military group to civilian employees. The PHS Corps has the same benefits as the armed military without the risk. Even though they wear an officer's uniform, they are performing civilian jobs and will never see combat. They don't pay taxes on subsistence and housing allowances and are entitled to other types of tax exclusions; they don't keep track of hours on the job; and they don't pay for health care. Even without being privy to the GAO study, we recommend that the PHS Corps be converted to the work force of tax paying civilian employees, and that the savings be redirected to local IHS hospitals and clinics serving AI/AN country, Tribal "638" contractors, and especially to the Community Health Representative (CHR) program. Resources that now support one PHS Corps officer could support 3 to 5 CHRs who work at the grassroots level promoting health and preventing disease as well as support for their program operations. Thank you.

PREPARED STATEMENT OF DAVID M. GIPP, PRESIDENT, AND RUSSELL "BUD" MASON,
BOARD CHAIRMAN, UNITED TRIBES TECHNICAL COLLEGE

SUMMARY OF REQUEST

United Tribes Technical College (UTTC)¹ and its board of directors submits this testimony regarding the fiscal year 1998 BIA appropriations for our institution. We want you to know of the success of UTTC in moving Indian families into self-sufficiency and why we deserve the continued support of this Subcommittee.

United Tribes Technical College, which is chartered by the five tribes in North Dakota, is a "full service" postsecondary vocational education institution—we provide vocational education services for adults, run a nursery, pre-school and elementary school for the children of our adult students, and operate a dormitory system and a health clinic. We believe that this community setting has a great deal to do with the success of our students—students who, by and large, come from impoverished homes and communities.

The UTTC fiscal year 1998 request is for a \$728,000 increase over the fiscal year 1997 enacted level, consisting of the following: (1) \$86,000 for personnel costs; (2) \$250,000 to improve facilities for computer technology, (3) \$200,000 to improve course offerings and student services, and (4) \$192,000 for emergency maintenance and facilities. A \$728,000 increase would bring the UTTC funding in the BIA budget to \$2,538,000.

FUNDING HISTORY/SHORTFALLS

BIA funding for UTTC has not even come close to meeting basic cost-of-living increases. From fiscal year 1990 through fiscal year 1997, BIA funding for UTTC has increased only 1.06 percent (from \$1,708,000 in fiscal year 1990 to \$1,810,000 in fiscal year 1997). The operating and purchasing strength of our budget has diminished by some 20 percent since 1991. As described the section of this testimony regarding our need for personnel funding, our faculty and staff receive salaries that are lower than even the lowest paid faculty in any state college system.

While our funding has remained flat since fiscal year 1990, our expenses have increased. The College has experienced a large increase in the cost of utilities, with electricity expenses rising about 20 percent per unit and the per unit gas cost increasing approximately 113 percent. Over the years the College has been able to partially offset utility rate increases by implementing stringent conservation measures such as improved weatherization and reductions in building temperatures. However, energy consumption cannot be further reduced because of the College's location and the harsh winters in the northern plains.

Lack of available resources has also meant a limitation on the repair and maintenance of physical facilities. The College occupies the old Fort Lincoln Army Post. Other than the more recently constructed skills center and part of the community center, UTTC's core facilities are 80 to 90 years old. Estimates for new facilities total over \$12 million, according to a 1993 U.S. Department of Education report to Congress. Continuing a course of nonrepair will ultimately prove more costly as the repairs will be greater. This is especially true of the water and sewage systems on campus. Fire and safety reports document these needs. Neither UTTC nor other

tribal colleges are included in the BIA Facilities budget through the Office of Construction and Management.

Finally, the fixed and related costs approved under our annual Indirect Cost proposal to the U.S. Inspector General have decreased in recovery by over \$100,000 annually (fiscal year 1996), with another possible loss of \$110,000 for fiscal year 1997. We are in dire need of adequate recovery for this year, as well as prior years.

THE RECORD OF UTTC AND THE NEED FOR OUR SERVICES

At United Tribes Technical College most of all our students receive some form of public assistance. Yet we have a job placement rate of 80 percent—a record sustained over the past 10 years. This is well above the job placement rates required in the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (Public Law 104-193). Our calculations show that a UTTC graduate pays back in taxes over a 6.4 year period the costs of receiving an education at our institution.

The enactment last August of welfare reform legislation makes the work of UTTC even more critical. We want to be a full partner in moving Indian families into jobs with living wages, but as it stands now we have to turn away students due to lack of institutional resources. We do no recruiting at UTTC, but yet we have a current waiting list of about 200 students who want to attend our institution. Some potential students do not apply, knowing of the waiting list.

Our 300+ students come from all over Indian country—some years we have students representing 45 tribes. A large proportion of our students are from the 14 tribes in North Dakota and South Dakota. Indian people in the Dakotas, as you know, have enormously high jobless rates. BIA Labor Force data reports unemployment rates among Indian people on and near reservations at 50 percent and 59 percent in North Dakota and South Dakota, respectively. Of Indian people on and near reservations in South Dakota who are employed, only 17 percent earn over \$7,000. The comparable figure in North Dakota is 19 percent.

As far as we are concerned, we would be justified in asking for a very large budget increase—based on our success rate, based on need, and based on the financial return which comes from an educated and employed population.

ADDITIONAL INFORMATION ON OUR BUDGET REQUEST

While we would like to ask for funding to meet our construction needs, we are realistic enough to know that such funding is simply not in the cards for fiscal year 1998. We are limiting our request for a \$728,000 increase over the fiscal year 1997 level for a total of \$2.5 million. The funding would be utilized for the following purposes, all of which have been identified through accreditation agency visits and observations:

\$86,000 for costs of staff and faculty (\$44,000 over the BIA request). The request we make would provide a 4 percent salary and fringe benefit increase. Our staff and faculty work for considerably lower compensation compared to other similar institutions. We are at a critical juncture, and face an eminent risk of losing qualified, capable staff and faculty due to low salaries. The dedication of our staff cannot sustain them indefinitely.

North Dakota salaries for higher education faculty rank 50th—the lowest in the nation—but the average faculty salaries at UTTC are lower even than those in the North Dakota state system.² The average faculty salary at UTTC is \$24,476, while the average faculty salary at the community colleges in North Dakota range from \$29,900 to \$32,800. This translates to our faculty receiving an average salary which ranges from \$5,500 to \$8,400 less than their peers at neighboring community colleges. Salaries for non-faculty staff would show a disparity at least as wide as that for faculty. Unlike most federal and private institutions which are able to provide salary increases to employees based on the length of service (unrelated to cost of living increases), UTTC does not have the financial ability to provide a guaranteed system of incremental salary increases based on length of employment.

\$250,000 to improve facilities for computer technology, life science laboratories, and building trades.

\$200,000 to improve course offerings and student services. This funding would allow hiring/training of faculty so that existing programs can be improved to meet new market demands. For example, we want to expand the allied health professions program and also to expand the business clerical program into the business administration area.

In the area of student services, we want to expand our diagnostic capabilities in tribal-specific areas and also in the areas of literacy and math-science deficiencies. This will allow us to provide better remediation services to students. Finally, we want to make improvements in our student follow up, career development, and job

market research efforts. While \$200,000 is inadequate to meet all these needs it would allow us to make progress in some of these areas.

\$192,000 for emergency maintenance on both single and family student housing, instructional facilities, and support facilities. This amount will obviously not cover major renovations or new facilities.

UTTC SERVICES

United Tribes Technical College offers ten (10) Certificate and ten (10) Associate of Applied Science degree programs.³ Entrepreneurship and new technology skills are being integrated into appropriate curricula. All programs are accredited through the North Central Association of Colleges and Schools at the certificate and two-year degree granting levels.

We also provide institutional services that are fundamental to the delivery of quality vocational education, including those related to its residential nature. These services include:

Adult education for students needing advanced basic education skills or who desire to pursue vocational programs requiring GEDs or high school diplomas;

Academic instruction which allows our graduates who wish to pursue additional college education a sufficient background;

Instructional supplies and equipment for all vocations;

Services including student housing, cafeteria, local student transportation, library, financial aid office, counseling and placement, facilities maintenance, and overall administrative and fixed costs for UTTC's 105 acre campus base;

Early childhood (nursery and pre-school) services for approximately 100 children, ages 8 weeks to five years. Nearly half of these children are under age two, and so the staff to child ratio of necessity is very high in order to provide proper supervision and to meet the North Dakota licensing requirements;

The Theodore Jamerson Elementary School (K-8th grades) serving over 100 Indian students;

Modest offering of cultural, athletic, and recreational activities to supplement student learning experiences and campus-based family services.

UTTC's enrollment now averages 300 students annually. Combined with family members and our pre-school and elementary students, the UTTC campus population exceeds 500. Our students represent as many as 45 different Indian Nations and 15 states. The majority of the students have never spent more than one continuous year away from their home reservations. They have also experienced chronic unemployment due to the extremely depressed local economy and to education limitations which are well below the national average.

Thus, UTTC is committed to not only its post-secondary mission, but to the economic, social, and cultural advancement of American Indian and Alaska Native people. The mission of UTTC is to provide an environment where students and staff can preserve and transmit knowledge, values, and wisdom to ensure the survival of native people and Indian Nations along with the vocational training and job placement of native students. There is no other post-secondary vocational education institution in the country that in a residential setting is Tribally-controlled, culturally-based, family-oriented, and focused on both Tribal economic needs and mainstream employment training.

Thank you for your consideration of our request. We need your assistance to ensure that the unique educational opportunities offered by United Tribes Technical College will be available for what we hope will be an increasing number of Indian and Alaska Native students and their families next year and in the future.

ENDNOTES

1. Established in 1969, United Tribes Technical College is a unique, inter-Tribal vocational technical education institution located on a 105 acre campus in Bismarck, North Dakota. The Tribal college is owned and operated by five federally-recognized Tribes situated wholly or in part in North Dakota. These Tribes are the Devils Lake Sioux Tribe, the Sisseton-Wahpeton Sioux Tribe, the Standing Rock Sioux Tribe, the Three Affiliated Tribes of the Fort Berthold Reservation, and the Turtle Mountain Band of Chippewa. Control of the institution is vested in a ten-member board of directors comprised of elected Tribal chairpersons and Tribal council members.

2. Source: Integrated Postsecondary Education Data Systems (IPEDS) Report of the U.S. Bureau of the Census and the Department of Education Office of Education Statistics.

3. The following Certificate Programs are offered: Administrative Office Support, Automotive Service Technician, Building Trades Technology with options in Carpentry, Electrical, Plumbing, and Welding; Early Childhood Education; Criminal Justice; Hospitality Management: Food & Beverage Specialization; Medical Secretary.

The following Associate of Applied Science (A.A.S.) degrees are offered: Arts/Marketing; Automotive Service Technology; Building Trades Technology with options in Carpentry, Electrical,

Plumbing, and Welding; Criminal Justice; Early Childhood Education; Health Information Technology; Hospitality Management; Food & Beverage Specialization; Office Technology with emphasis in Computer Applications or Accounting; Practical Nursing; Small Business Management.

PREPARED STATEMENT OF THE NATIONAL INDIAN CHILD WELFARE ASSOCIATION

The National Indian Child Welfare Association¹ submits this statement on those portions of the fiscal year 1998 Bureau of Indian Affairs budget concerning the Indian Child Welfare Act programs—the Indian Child Welfare Act (ICWA), Title II grant program under the Tribal Priority Allocations (TPA) budget category and the ICWA, Off-Reservation program which was funded through fiscal year 1996, but is not identified in the Administration's request for fiscal year 1998.

Our organization is requesting that the Subcommittee:

(1) Recommend an increase to TPA similar to the Administration's fiscal year 1998 request so that additional funding would potentially be available to assist tribal ICWA programs;

(2) Recommend an increase of \$2 million in the Special Programs and Pooled Overhead category for the express purpose of restoring historic funding for the Off-reservation ICWA grant program; and

(3) Require the BIA to utilize additional data in developing its budget request regarding ICWA services and to provide this data to Congress. We have listed on page two of our statement the types of data we believe should be utilized in this process.

THE BIA DOES NOT MEASURE TRIBAL CHILD WELFARE NEEDS

Under TPA tribes are essentially provided a block grant from which they must fund a broad variety of services. Under this system tribes must make decisions about which services they can fund and at what level. However, many times tribes encounter situations when they must transfer funding from one financially strapped service to another, even though both services are overwhelmed by the human need they face. The BIA looks at this transfer as a measure of decreased need, which they use when developing its budget request. This measure does not take into consideration any information on human need. Under this method, Congress and the Administration will never know what the actual need for any program under TPA is and how well funds being allocated are doing in trying to meet that need.

Data provided to Congress should accurately describe human need not just budget priorities. Amazingly, the BIA has been allowed to provide only superficial data to justify budget requests and evaluate their performance in the area of human services. To our understanding, no other federal agency that administers human services funding is allowed to provide such incomplete information to Congress. The BIA should be held to no less of a standard.

Another important factor in determining the need for ICWA program funding is tribal access to other program services and funding. Of the top four federal sources of child welfare funding guaranteed to states under the Social Security Act, tribes only have guaranteed access to one, Title IV-B Child Welfare Services, and the amounts of funding available from this source for tribes are extremely limited (approximately \$5.0 million projected for fiscal year 1998). This situation combined with dwindling state resources, lack of expertise, and states reluctance to provide community-based services in Indian communities based on financial and jurisdictional issues, has created a serious crisis for tribes in their efforts to protect their children and establish permanency and stability for those children who need help. Funding from the ICWA, Title II grant program is the only viable, ongoing source of child welfare funding for all tribes. Without strong ICWA programs tribes have few options available to them to protect their children from child abuse and help them secure a safe, permanent home.

¹The National Indian Child Welfare Association is based in Portland, Oregon and provides a broad range of services to its constituents. These services include, (1) professional training for tribal and urban Indian child welfare professionals; (2) consultation on social service program development; (3) facilitating by request child abuse prevention efforts in reservation communities; and (4) analysis and dissemination of policy information that impacts Indian children and families. Our constituents consist of tribal governments and urban Indian child welfare programs throughout the United States. Our organization works closely with the Affiliated Tribes of Northwest Indians and National Congress of American Indians, as well as having members on the Indian Child Welfare Committees of both organizations. This will be our fifth year in providing written testimony to this Subcommittee.

TRIBAL ICWA, TITLE II GRANTS

Until fiscal year 1995 with the revised Final Rule for the Indian Child Welfare Act, Title II grant program taking effect, Tribes have been forced compete for child welfare funding from year to year. This competitive process has been extremely disruptive and in most years only allowed approximately 50 percent of the tribes nationwide to receive any ICWA funding. Improvements in the grants process and increases to funding have enhanced tribal access to this resource, but there is still a need to continue the effort to make ICWA funds more available and reflective of tribal needs. These efforts must include:

A more careful analysis of the child welfare needs for tribes by the BIA for the purposes of budgetary recommendations. This analysis should be based on more than just population figures and how tribes are able to prioritize their limited Tribal Priority Allocation funds. Data should be provided on: types of services provided; number of children and families to whom services were provided; number of out-of-home placements of children; average length of time children are in out-of-home care; numbers of children who are able to receive permanence through reunification, guardianship kinship care, or adoption.

Funding increases for the tribal portion of ICWA, Title II that reflect need as identified through careful analysis of several factors, such as access to other child welfare funding, relative costs of providing basic child welfare services on tribal lands, and needs data identified in the paragraph above. This is data that is routinely used with other federal child welfare programs and provides Congress with meaningful data that can define need.

Current estimates provide a picture of need that is clearly as high as that of any ethnic group for these services. The most recent research on risk assessment of child abuse for Indian children indicates that 34.4 percent of Indian children are at risk for being abused (1993 National Indian Justice Center study on Indian child maltreatment funded by the Indian Health Service). In 1986, the most current year for which data is available, it was reported that Indian children were placed in substitute care at a rate that is 3.6 times that of non-Indian children (1988 study entitled, "Indian Child Welfare: A Status Report." Funded by the Departments of Health and Human Services and Interior). Many other documented indicators of the need for these services are also highly visible in many Indian communities such as extreme poverty and high rates of substance abuse.

OFF-RESERVATION ICWA, TITLE II GRANTS

Off-reservation programs can provide a number of important services to tribes, states, and individual Indian children and families. The ICWA does not make a distinction between who should benefit from the Act, and is designed to protect Indian children and families everywhere. These off-reservation programs, where they have been able to exist, can provide key linkages to tribes when their members become involved in state child welfare systems, all of which are designed to meet the purpose of the Indian Child Welfare Act. Common services that these programs can provide include:

Monitoring compliance with the Indian Child Welfare Act in urban areas;

At the request of tribes, provide case advocacy or other services such as foster care to tribal children who do not live on the reservation and whose tribe may not even be in the state;

Provide training to state administrators, child welfare workers, and court personnel on how to improve compliance with the Indian Child Welfare Act and provide more cost-effective services;

Recruiting and licensing Indian foster and adoptive families, an activity that states often do not have resources for and at which they are not successful.

Off-reservation programs have suffered from the instability of inadequate funds and a competitive grants process. Historically, funding levels for off-reservation ICWA programs have been between \$1.5 to \$2.0 million. This has enabled the BIA to minimally fund about 40 programs a year that serve the 65 percent of the Indian population that lives in primarily urban settings. These programs have also tried to access private foundation funding and state contracts to supplement their ICWA grants. However, these funds have been increasingly difficult to secure, especially in light of increased competition for these resources due to reductions in state and federal funding.

We also know that many of these children may be served by state child welfare agencies at some point. Because of the small number of off-reservation ICWA programs operating in the United States, many of these children in urban areas are at great risk for not being given the protections of the Indian Child Welfare Act. This seems especially relevant when you consider the budgetary problems that

states are experiencing that result in minimal resources for staff training and services in general.

CONCLUSION

The ICWA, Title II program is a resource that has shown to be extremely effective in protecting Indian children and helping Indian families stay together. A study in 1988 commissioned by the Department of Health and Human Services and Department of Interior entitled, "Indian Child Welfare: A Status Report", revealed that tribal ICWA programs outperformed the BIA and state child welfare programs, notwithstanding the limited funding available to tribes. Specifically, Indian children in substitute care had shorter stays in foster care and higher rates of permanency when served by tribal programs. In 1994 the Office of Inspector General issued a report entitled, "Opportunities for ACE to Improve Child Welfare Services and Protections for Native American Children", which clearly showed that most states were either not willing or able to share federal funds for child welfare services with tribes. This clearly demonstrates that tribes, when provided the opportunity, are able providers of child welfare services, while currently not being able to depend on other funding sources or services outside of the ICWA, Title II grant program.

We must also take into consideration other factors which impact the ability of tribes and off-reservation programs to protect their children and give them a sense of permanence. The new welfare reform law provides tribes with an opportunity to operate their own welfare programs, but does not provide the additional resources that will be needed to achieve full self-sufficiency for Indian families. States will have additional pressures under the new law to target their resources carefully. This will most likely mean that states historic reluctance to provide services on tribal lands will continue and possibly get worse. In addition, Congress and the Administration have set out to increase adoptions and permanence for children in this country. If tribes are not given the resources to help achieve this goal, then Indian children will likely continue to be the most unprotected class of children in this country with the least access to services that help provide permanency.

Please consider our request carefully and help tribal governments and off-reservation ICWA programs continue to offer proven, locally designed and controlled programs for Indian children and families.

PREPARED STATEMENT OF HARRY WILDE, CO-CHAIR, LOWER YUKON; AND GILBERT HUNTINGTON, CO-CHAIR, UPPER YUKON OF THE YUKON RIVER DRAINAGE FISHERIES ASSOCIATION

RESOLUTION 97-8

In support of Federal appropriations to implement the Interim Agreement on Yukon River Salmon and the Yukon River Salmon Act of 1995

Whereas the Yukon River Drainage Fisheries Association (YRDFA) represents commercial, subsistence and sport users of salmon and other fish within the Alaska portion of the Yukon drainage;

Whereas the Interim Agreement on Yukon River Salmon, affirmed by Congress in the Yukon River Salmon Act of 1995, necessitates effective management and research programs for both U.S. and Canadian spawning stocks;

Whereas the Interim Agreement also established a Yukon River Panel and said Panel requires significant administrative and operational support to assure effective user and agency participation in the implementing the Agreement as well as continued negotiations towards a long-term treaty;

Be it *Resolved* That the YRDFA hereby requests the U.S. Congress to fully fund the following items necessary to implement the U.S./Canada Interim Agreement on Yukon River Salmon and the Yukon River Salmon Act of 1995; \$1,062,100 for Yukon River research and management by the Alaska Department of Fish & Game, funded via the U.S. Department of Commerce; \$400,000 deposit to the Yukon River Restoration & Enhancement Fund; \$200,000 for Panel operations and administration; \$210,000 for additional USF&WS programs in the Yukon drainage; \$713,000 for NMFS to conduct salmon radio telemetry studies; \$100,000 to USGS/BAD for chum salmon ecology studies; \$1,000,000 to the Bering Sea Fishermen's Association, from the Bureau of Indian Affairs Western Alaska Salmon Investigations.

Copies of this resolution to be sent to the Alaska Congressional delegation and to the members of the U.S. House and Senate Appropriations Committee.

Approved unanimously this 13th day of February 1997 by the Board members and Delegates of YRDFA assembled at their Seventh Annual Meeting held in Mountain Village, Alaska.

Certified:

HARRY WILDE,
Co-Chair, Lower Yukon.
GILBERT HUNTINGTON,
Co-Chair, Upper Yukon.

Attest:

DAN SENEAL-ALBRECHT,
Executive Director.

PREPARED STATEMENT OF GORDON JAMES, CHAIRMAN, SKOKOMISH INDIAN TRIBE

ABSTRACT

CONSTRUCTIVE RESOLUTION OF SKOKOMISH RIVER FISHERIES AND WATER CONFLICTS
[\$400,000]

The Tribe requests that Congress direct the Bureau of Indian Affairs to provide the Tribe \$400,000 in fiscal year 1998 for technical and legal assistance required to achieve constructive resolution of fisheries and water conflicts associated with the Cushman hydroelectric project on the Skokomish River in western Washington.

Congressional funding during the last four fiscal years for essential technical and legal assistance has allowed the Tribe to make substantial progress in developing and building consensus for a pragmatic and equitable settlement of Cushman Project related issues. Absent a negotiated settlement, a cascade of costly and divisive litigation and political conflict is imminent.

It is apparent that further conflict can be avoided and all parties' reasonable interests can be accommodated through a creative, pragmatic negotiated settlement of all Cushman Project related issues. However the window of opportunity for a settlement is rapidly narrowing. This is it—there will not be another opportunity to constructively resolve Cushman Project issues.

The Tribe asks that Congress support continued funding for necessary technical and legal assistance in this pivotal year. This will allow the Tribe to capitalize on progress to date—and on Congressman Norm Dicks' settlement initiative—to secure the enormous public benefits of a negotiated settlement.

CONSTRUCTIVE RESOLUTION OF SKOKOMISH RIVER FISHERIES AND WATER CONFLICTS
[\$400,000]

The Tribe requests that Congress direct the Bureau of Indian Affairs to provide the Tribe \$400,000 in fiscal year 1998 for technical and legal assistance required to achieve constructive resolution of fisheries and water conflicts associated with the Cushman hydroelectric project on the Skokomish River in western Washington.

The Skokomish Tribe is committed to achieve a constructive, win-win settlement of Cushman hydroelectric project issues that will produce enormous public benefits and avert an imminent cascade of costly and divisive litigation and political conflict.

Congressional funding during the last four fiscal years for essential technical and legal assistance has allowed the Tribe to make substantial progress in developing and building consensus for a pragmatic and equitable solution to Cushman Project-related issues.

The Tribe asks that Congress support continuation of funding in this pivotal year, so that progress achieved to date can be converted into a constructive settlement. This long and arduous process is now coming to a conclusion, aided by settlement initiatives from Congressman Norm Dicks. There will not be another opportunity to constructively resolve Cushman Project issues.

For nearly 70 years, the heretofore unlicensed Cushman hydroelectric project has diverted the North Fork Skokomish River out of its watershed. This has severely disrupted the Skokomish River watershed/ecosystem and wreaked environmental, social, economic and cultural havoc on the Skokomish Tribe and general public.

Working collaboratively with local, state and federal agencies, Skokomish Valley residents and a host of public-interest groups, the Tribe has achieved substantial consensus on a plan for future Cushman Project operation that would restore damaged salmon runs, reverse degradation of the largest estuary on Hood Canal, and reduce the Cushman Project's contribution to flooding problems on the main stem Skokomish River.

The Tribe's collaborative approach has also achieved unprecedented consensus with Mason County on a Skokomish River flood plan. The flood plan, Cushman Project plan, and South Fork forest plan are being folded together into an overall plan to reduce public costs and increase public benefits from the Skokomish River watershed.

The Federal Energy Regulatory Commission's final licensing proposal for the Cushman Project would perpetuate tens of millions of dollars in annual damages to the Tribe and general public. It would satisfy no one and set off an uncontrollable chain reaction of legal conflict and political turmoil with far reaching consequences, if allowed to stand.

The Tribe believes strongly that further conflict can be avoided and all parties' reasonable interests can be accommodated through a creative, pragmatic negotiated settlement of all Cushman Project related issues. Continued funding in fiscal year 1998 will allow the Tribe to build on substantial progress to date—and on Congressman Norm Dicks' recent settlement initiative—to secure the enormous public benefits of a negotiated settlement.

Proposed budget

Legal consultants	\$90,000
Technical consultants	300,000
Meeting and travel expenses	10,000
	400,000
Total costs	400,000

Technical Consultants: Negotiation and implementation of a global settlement for Cushman Project related issues by the Tribe, City of Tacoma, and Federal Government requires that the Tribe have the assistance of highly skilled, specialized professionals. Consultants will include a project manager/coordinator; planner/negotiation advisor; tribal negotiating team members; and specialized technical consultants including engineers, economists, anthropologists, biologists, geophysicists, hydrologists.

Legal Consultants: Legal advice and representation will be required to assist in finalizing a negotiated settlement of Cushman Project issues among the City of Tacoma, the Tribe and Federal Government.

Meeting and Travel Expenses: Cost of meeting space, meals and travel for tribal advisory committee and negotiating team members.

PREPARED STATEMENT OF BRISTOL BAY AREA HEALTH CORP.

The Bristol Bay Area Health Corporation ("BBAHC") is a private, non-profit corporation organized in June, 1973, by the Alaska Native villages of the region. BBAHC provides a wide variety of health services, including hospital services, family medicine, and other preventive and community health services. BBAHC serves more than 7,000 year-round residents and 32 villages within the Bristol Bay and Calista regions, two of the twelve regions into which Alaska was divided under the Alaska Native Claims Settlement Act of 1971. In 1980, BBAHC became the first tribal organization in the United States to take over the operation of a hospital from the Indian Health Service ("IHS") under the authority of the Indian Self-Determination and Education Assistance Act ("ISDEA"). In 1994, BBAHC entered into the Alaska Tribal Health Compact and, since that time, has been administering its health programs under Title III of the ISDEA. Since 1973, the Kakanak Hospital in Dillingham has been accredited by the Joint Commission on the Accreditation of Healthcare Organizations.

BBAHC Priority Budget Items. Focusing specifically on fiscal year 1998 IHS budget items which are of highest priority in our region (as well as in other regions within the state of Alaska) we respectfully ask the Subcommittee to: fund mandatory cost increases—\$80 million above the administration's request; fully fund contract support costs; provide requested \$90 million for IHS Sanitation Facilities Account; provide \$5 million in recurring funds for patient travel costs; provide the Administration's requested amount for the Community Health Aide Program in Alaska; increase authority and funding for the Alaska Area Office so that 10 additional leases may be funded under the clinic-built village leasing program and provide additional funds for improving existing clinics; provide BBAHC \$1.5 million to support Phase I of Kakanak Hospital building rehabilitation plan, including roof replacement; and reinstate the statutory prohibition on charging a co-payment to any IHS beneficiaries or to means testing beneficiaries.

Mandatory Cost Increases.—BBAHC respectfully requests the Subcommittee to appropriate sufficient funds in fiscal year 1998 to cover all mandatory cost increases incurred by the IHS and tribal health care providers, including medical inflation, mandatory payroll increases, and population growth. The fiscal year 1997 funding level for IHS included a less than one percent increase for inflation and no adjustment for population growth. Consequently, tribal and IHS health programs had to absorb over 50 percent of mandatory cost increases in fiscal year 1997. The fiscal year 1998 budget would require absorption of 90 percent or \$80 million in mandatory cost increases.

Underfunding of IHS mandatory cost increases is particularly inequitable when compared to other federally-funded health care programs. In fiscal year 1997, while IHS received less than a one percent funding increase for inflation—far below the actual inflation rate, which exceeded 10 percent in some areas—the Medicare and Medicaid programs received a 7 percent funding increase for inflation. In addition, the IHS, which provides services to over 1.4 million patients residing primarily in rural areas, is limited in its ability to realize the same kinds of cost savings which other federally-funded health care programs have been able to achieve through managed care programs in urban areas.

Contract Support Costs.—Contract Support Costs (“CSCs”) is an area of the IHS budget that is chronically underfunded. While we are pleased that the Administration has requested a \$12 million increase in fiscal year 1998 over the fiscal year 1997 level, it still is not sufficient to cover anticipated shortfalls in funding for CSCs. If the \$12 million request is fully funded, the shortfall for the Indian Self-Determination Fund alone is still estimated by IHS to be \$39 million. The National Indian Health Board estimates the unmet need for contract support for existing contracts at \$12 million and the projected need for new contracts at \$60 million.

We urge the Committee to work with the Department of Health and Human Services to assure that sufficient funds are included in the fiscal year 1998 budget to meet the contract support requirements set forth in section 106(a)(2) of the Indian Self-Determination Act (“the Act”). Furthermore, we urge that reporting requirements be changed so that the IHS is required to provide the Congress with information on every contract or compact which is in the negotiation process and which will require funding from the contract support fund. Presently, the IHS is only required to report a shortage of Contract Support funding for the current and previous year.

Sanitation Facilities.—We appreciate efforts by Congress and the Administration to systematically address the need for sanitation facilities. As pointed out in the Administration’s fiscal year 1998 budget request, there is a direct link between improved sanitation conditions and improved health. The IHS, as required by the Indian Health Care Amendments of 1988, has prepared a 10-year plan to address sanitation facility deficiencies and also prepares an annual report to Congress to identify the current inventory of deficiencies. The Administration’s request for fiscal year 1998 for construction of sanitation facilities nationwide is \$90 million, \$2.2 million above the fiscal year 1997 enacted amount of \$87.9 million. The IHS has estimated that annual appropriations of \$146.5 million would be required to meet the 10-year plan by the year 2000 to serve existing Indian homes.

Even with full funding of the IHS 10-year plan, however, Alaska would still be seriously deficient in sanitation facilities. In Alaska, alone, there is an unmet sanitation need exceeding \$1 billion. Much of rural Alaska lives without an adequate supply of safe drinking water and without essential sanitation facilities. It should also be noted that the calculation of need for the 10-year plan only includes the estimated cost of so-called “economically feasible” projects. We believe the IHS should also include on this list those projects which they consider “not economically feasible.” Many of the villages in Alaska, which have very high construction costs due to climatic and geologic conditions, were not even considered in this cost estimate. Therefore, even if the 10-year plan were fully-funded, a number of Alaskan villages would still have inadequate sanitation facilities.

Patient Travel.—A special concern for BBAHC, and rural Alaska, generally, is the high cost of patient travel. BBAHC serves a 45,000 square mile area—an area larger than the state of Ohio. Therefore, we depend on local air taxi services to assist with medical evacuations from our 32 villages. The difficult nature of travel within BBAHC’s service area, and the need to transport patients to the Alaska Native Medical Center in Anchorage for health care which cannot be provided in Dillingham make adequate funding of patient travel imperative. In past years, patient travel has been seriously underfunded. One result of inadequate funding for patient travel is that many patients are forced to forego or postpone care until an easily treatable condition has become a full-blown emergency. Thus, underfunding patient travel in fiscal year 1998 will actually cost more and will force BBAHC to choose between funding patient travel, an absolute necessity for providing access to services in Alas-

ka, and paying for actual patient care. BBAHC fully supports the Alaska Native Health Board's request for a separate appropriation in the IHS budget of \$5 million for travel costs.

The Community Health Aide Program in Alaska.—The Community Health Aide Program ("CHAP") is the primary health care delivery system for approximately 171 rural Alaskan villages and is a very cost-effective program. We appreciate the funding that was provided in fiscal year 1997 to update the Community Health Aide/Practitioners Manual which we understand is currently underway. We urge the Subcommittee to support the President's request for fiscal year 1998 which maintains the fiscal year 1997 level of funding of \$43.9 million.

Village Built Clinic Leasing Program.—BBAHC strongly urges that the leasing authority of the Alaska Area Native Health Service ("AANHS") under the Village Built Clinic leasing program ("leasing program") be increased from the current level of 170 to 180, and that a commensurate increase in funding be appropriated for the ten additional leases. BBAHC has two outstanding requests for clinic leases under the leasing program, one for a clinic at Portage Creek and the other for a clinic at South Shore Aleknagik. According to the AANHS, it has already funded 169 out of the 170 leases it is authorized to fund and the remaining lease will go to another tribally-operated clinic in the Alaska Area which is not within the BBAHC service area. Part of the problem for BBAHC is that, under the leasing program, we need four additional health aides (two per clinic) to meet eligibility requirements for the two requested leases, amounting to a total estimated cost of \$150,000. An additional \$50,000 would be required for training of these individuals, thus amounting to a total cost of \$200,000 per year for staffing of the two new clinics.

We would also like to request additional funds for making upgrades, modifications and additions to existing village-built clinics and where appropriate, replace existing clinics. These much-needed improvements, which could be funded through a new program similar to the Maintenance and Improvements (M&I) Program, are above and beyond the realm of the current leasing program.

Kanakanak Hospital.—BBAHC has recently concluded a long range facility plan for upgrade and expansion of the existing Kanakanak Hospital in Dillingham to accommodate changing and growing, health care and housing needs. BBAHC requests \$1.5 million to support Phase I of the planned \$20 million overall project which would be used for expansion of the Hospital Emergency Room. The long range facility plan addresses a number of existing facility needs, including replacement of the hospital roof which is in danger of collapsing. The flat roof is designed to withstand a snow load of only 40 pounds per square foot in an area where the minimal design load for buildings is 70 pounds per square foot. At least nine similar flat roofs have collapsed in other southwest Alaska facilities, including a roof of a local Dillingham school. The estimated cost of replacing the roof alone is \$1.6 million.

Renew the statutory prohibition on charging a co-payment to IHS beneficiaries.—On behalf of the Alaska Native patients we serve, BBAHC urges Congress to reinstate appropriations language which would prohibit the Indian Health Service from establishing means-testing for IHS beneficiaries, or charging a co-payment fee for any IHS program or service. The provision of Indian health care is one of several responsibilities the United States took on in return for land and other resources relinquished by tribes. We believe that this responsibility should not be diminished and respectfully request that the statutory prohibition language which was removed from the fiscal year 1997 appropriations bill be reinstated.

We appreciate the opportunity to voice our concerns in connection with the proposed IHS budget for fiscal year 1998 and would be happy to provide any additional information concerning our testimony to the Committee.

PREPARED STATEMENT OF MARGIE MEJIA, CHAIRPERSON, LYTTON RANCHERIA/LYTTON BAND OF POMO INDIANS OF CALIFORNIA

The Lytton Rancheria/Lytton Band of Pomo Indians wishes to submit this testimony for the record regarding the fiscal year 1998 budget for programs in the Bureau of Indian Affairs. Specifically, we express our support for the requested \$4 Million increase for the Small and Needy Tribes Program, for a proposed fiscal year 1998 total of \$8 Million.

Located in Sonoma County, California, Lytton Rancheria is a newly restored/recognized Tribe [*Scotts Valley Band of Porno Indians, et al v. United States of America et al.* USDC No. Civ. No. C-86-3660-WWS; Sept. 6, 1991]. The Tribe has been removed from federal services for the past thirty years—the efforts to restore our status as a Tribe spans a period of ten years, five of which were spent in legislation. During this time the ill effects of termination have continued to take their toll on

our people in terms of loss of property; education and health benefits; increased poverty; high unemployment; disruption of families; death of Tribal members due to alcohol and related illnesses or accidents; and the destruction of hope.

The Tribe is currently landless, comprised of approximately 200 Tribal members, and governed by a Council consisting of seven Tribal Officers, elected on May 14, 1995. Mrs. Margie Mejia is the current Chairperson and representative of the Tribe. The Tribal membership is 47 percent male and 53 percent female, of these 40 percent are adults and 60 percent are children under 18. Tribal member residences are primarily in Sonoma County (57 percent), followed by Del Norte County (27 percent), with the remainder scattered throughout the State of California and the continental United States (16 percent).

The Tribe plans to empower its constituents through education and training. The general membership approved a constitution on January 20, 1996, to establish laws that the Tribal members have agreed to live and abide by. Other empowering documentation which has recently been developed and is currently being utilized include: Enrollment Manual, Election, Enrollment and Voting Procedures Code, Tribal Government Tribal members have agreed to live and abide by. Other empowering documentation which has recently been developed and is currently being utilized include: Enrollment Manual, Election, Enrollment and Voting Procedures Code, Tribal Government Operations Manual, Tribal Court Procedures and related codes. The Tribe is willing to devote its time, energy and resources in order to become self-sufficient.

Currently, the Tribe operates under several grant programs sponsored and overseen by the BIA, IHS, HHS, ANA, EPA, etc. A Library Services Grant provides publication materials needed for education and advancement. A Health Services Grant provides for the position of a Community Health/Alcohol Abuse Prevention Worker, which the Tribe only recently hired and expects to have a fully operational program running within three months. Other programs educate and support our leadership (ANA, ATG), tend to the health needs of members (SCIHP, CRIHB), our children (ICWA) and empower us with the ability to create our own economic development project(s) to ensure our future self-sufficiency and self-sovereignty (ANA, ATG, BIA Multi-Year). Since we are a landless Tribe with critical needs in the area of land acquisition and housing development, I would recommend that funding for the Native American Housing Assistance and Self-Determination Act of 1996 (Public Law 104-350) be increased to \$850 Million for funding an Tribes. In addition, I would like to have monies set aside within the bill for small and needy Tribes funding.

Without continued funding, especially in the crucial formative years for new Tribes, our membership will stagnate and revert back to the downward spiral of life quality experienced by so many Native Americans for so many years.

PREPARED STATEMENT OF JAIME PINKHAM, PRESIDENT, INTERTRIBAL TIMBER COUNCIL

SUMMARY

Mr. Chairman, I am Jaime Pinkham, President of the Intertribal Timber Council. I hereby submit the following summary and comments regarding the Bureau of Indian Affairs Forestry program and its proposed fiscal year 1998 budget: Add \$300,000 to Area Forestry for four adrenal foresters, and add \$150,000 to Central Office Forestry for two additional foresters; add \$1 million to Forest Management Inventory arid Planning; add \$500,000 to Woodlands Management, and add \$3 million for a new I.R.M.P. line item.

INTERTRIBAL TIMBER COUNCIL BACKGROUND

The Intertribal Timber Council (I.T.C.) is a twenty one year old organization of sixty forest owning tribes and Alaska native organizations that collectively possess more than 90 percent of the 7.3 million forest acres—and a substantial portion of the 8.6 million woodland acres—that are under B.I.A. trust management. These lands are vitally important to their tribes. They provide habitat, watershed, cultural and spiritual sites, recreation and subsistence uses, and through commercial forestry, income for the tribes and jobs for their members. In Alaska, the forests of Native corporations and thousands of individual allotments are equally important to their owners. To all our membership, our forests are essential to our physical, cultural and economic well-being, and assuring their proper management is our foremost concern.

OVERVIEW OF DECLINING BIA FOREST MANAGEMENT PLANNING

Mr. Chairman, the Intertribal Timber Council's fiscal year 1998 testimony focuses, for the third year in a row, on the growing deficiency of the B.I.A.'s forest planning capability. Mr. Chairman, it is an unfortunate truth that the Bureau, despite its legal obligations as trustee, has never fully provided current and appropriate management plans for the forest and woodland resources it holds in trust for tribes across the country. Prior to 1985, B.I.A. records document that only 21 percent of the nation's Indian forestlands were managed under approved forest management plans. To help redress this appalling state of affairs, Congress instituted a separate \$1.2 million program in fiscal year 1985 for forest management inventory and planning (FMI&P). That, along with increased levels of Forestry staffing at the B.I.A. Area and Central Offices, enabled the status of Native American forest planning to begin to improve. With continued vigilance by Congress and consequent attention from senior Bureau officials, along with an fiscal year 1991 funding increase to FMI&P of \$300,000, the volume of trust forestland acres in compliance with planning requirements rose to above 80 percent in 1993.

However, since then, that figure has steadily declined. According to the B.I.A.'s most recent Status of Forest Management Inventories and Planning report, dated September 30, 1995, the volume of trust forestland acres covered with current management plans has declined to 62 percent. But even that figure does not present the true scope of B.I.A. forest management planning shortcomings. Most of the acreage with current plans is concentrated among a relatively few reservations with large forests whose comparatively large staffs can develop forest management plans on their own. On a reservation-by-reservation basis, only 36 percent of forested reservations had current plans in place as of 1995.

Since 1995, although we are not aware of any updated tables or records, we are certain the situation has continued to decline, most likely at an accelerated rate. Because, since 1995, funding for B.I.A. forest management inventory and planning, while remaining flat, has effectively been further eroded by both inflation and the increasing complex requirements of forest management planning. Moreover, since 1995, B.I.A. Forestry personnel at the Area and Central Office levels, who provide the planning expertise for the great majority of smaller forested reservations, has been roughly cut in half.

This is intolerable. With increasingly insufficient funds for FMI&P activities, and with sharply reduced manpower needed to oversee those activities, interpret data, and develop the actual plans, it is quite possible that soon only 25 percent or less of reservation forests will have current management plans. A forest without a current management plan is, in effect, out of control. For even the most basic commercial forest activity, timber harvest, the managers have little certainty they are harvesting too many trees or the right trees. The consequences are nothing more than guesswork, and given the long term production cycles of forests, the cumulative effects could easily be the severe damaging of a tribe's forest resource, if not its outright destruction.

To assure that the most basic rudiments of forest planning can be provided tribal forestlands, we request that \$300,000 be added to the Area Office Forestry budget for four additional professional foresters, that \$150,000 be added to the Central Office Forestry budget for two additional professional foresters, and that \$1 million be added to Forest Management Inventory and Planning.

In addition, we request that Woodlands Management be increased by \$500,000, and that \$3 million be added for integrated resource management planning.

Each of these four requests are discussed in further detail below.

ADD \$300,000 TO AREA FORESTRY AND \$150,000 TO CENTRAL OFFICE FORESTRY FOR
ADDITIONAL PROFESSIONAL FORESTER CAPABILITY

Between fiscal year 1995 and today, B.I.A. Area Office Forestry personnel have been reduced from about 25 to about 15. In the same time, Central Office Forestry personnel have been reduced from about 19 to about 8. Although reduced by roughly half from fiscal year 1995 levels, these personnel are called upon to try to provide the professional and scientific expertise required for the successful trust planning and management of 7.3 million forest acres and 8.6 million woodland acres on more than eighty reservations throughout the entire United States. They are trying to do this at a time when forestlands are being recognized as never before for their biological significance and when forestlands are being intensely scrutinized and challenged on many aspects of their management, and particularly on any commercial utilization. Yet, with or without current plans, many tribes have little choice but to rely on the commercial use of their forest for at least some portion of essential tribal revenues.

Of the 83 reservations with economically viable timberlands, many with smaller forests have no resident professional forestry personnel. And the great majority of the 83 reservations do not have personnel with the specialized expertise necessary for the development of a forest management plan. So those tasks, by necessity, fall upon the 15 Area Forestry personnel spread throughout the B.I.A.'s twelve Area Offices, and upon the four technicians in the Central Office's Branch of Forest Resources Planning. It is, quite simply, well beyond any realistic expectation that such limited manpower can develop, review, and oversee implementation of management plans required by law for the 83 reservations. In fact, the Branch of Forest Resources Planning has been forced by staff reductions to eliminate any forest planning capability, and today principally provides only inventory analysis.

Today's request for six additional personnel is an exceptionally modest plea to begin the restoration of the B.I.A. forest planning capability, because tribal forests, without plans, are open targets for mismanagement or legal challenge, either of which would diminish or interrupt what for many tribes is a critical source of essential operating revenue.

ADD \$1 MILLION TO FOREST MANAGEMENT INVENTORY AND PLANNING

The Forest Management Inventory and Planning budget covers the special one time costs associated with the periodic development of forest management plans. These funds are scheduled for application to various tribal forestlands as they renew their management plans. The funds are supposed to cover the costs of planning activities not provided in a reservation's regular, on-going forestry budget, such as remote sensing, mapping, inventory, management and implementation planning, and environmental assessments. These funds are particularly needed for those smaller tribal forests where there are few or no forestry personnel. But since fiscal year 1985, when the program was funded at \$1.2 million, these funds have not kept pace with either inflation or the expanding requirements of forest planning and management.

One particular example where additional FMI&P funding is needed is N.E.P.A. compliance. As of the end of fiscal year 1995, which is the most current data available, approximately 30 percent of Category 1 forests (a major forested reservation with more than 10,000 acres of trust commercial timberland or an annual allowable cut of more than one million board feet) were without current environmental assessments, rendering them technically out of compliance with the National Environmental Protection Act and so subject to possible challenge and shut down. One of the larger tribal forests, that of the Navajo Nation has been shut down for several years because of challenge to planning and N.E.P.A. assessments.

For the smaller Category 2 forests, the shortcomings are even more appalling. Only about 39 percent have accepted annual allowable cuts or a current plan. Less than a quarter of them have environmental assessments.

To correct these deficiencies, the I.T.C. requests that the program be increased by \$1 million for fiscal year 1998. While B.I.A. documents indicate a needed FMI&P increase of \$5.1 million a year, the I.T.C. is seeking a \$1 million increase in hopes that a more modest sum may be more achievable and provide at least a modicum of desperately needed improvement in the Bureau's planning capability.

ADD \$500,000 FOR WOODLANDS MANAGEMENT

We also request an increase of \$500,000 for B.I.A. Woodlands Management, a doubling of the requested level. Mr. Chairman, in 1988, the B.I.A. Division of Forestry was formally assigned responsibility over the 8.6 million acres of tribal woodlands, including 4 million acres with commercial capability. At that time, B.I.A. data indicated \$3 million was needed to properly initiate trust management of woodlands. \$500,000 was provided, and has essentially stayed at that level ever since. Today, those funds cover the costs of woodlands managers at three Area Offices in the Southwest and the costs of on-the-round projects. None of these woodlands have formal management plans, and only a few have rudimentary inventories. With little or no firm data, the three Area Woodlands Managers are essentially flying by the seat of their pants in trying to cover the millions of acres within their responsibility. Yet woodlands are intensively used across a wide range of activities, particularly for subsistence and small economic undertakings. An additional \$500,000 would allow a greater degree of inventory and planning, a few additional personnel for increased oversight, and the implementation of an increased percentage of the annual backlog of submitted projects.

ADD \$3 MILLION FOR FUNDS FOR A NEW I.R.M.P. LINE ITEM

Finally, Mr. Chairman, I would like to request that \$3 million be added as a new line item for Integrated Resources Management Planning in Non-Recurring Natural Resources Management.

Mr. Chairman, it is generally accepted today that forestlands are vital, complex ecosystems, and that the harsh "cut and plant" approach of the past is grossly inadequate for the perpetuation of a healthy forest resource. Everywhere you look, whether it is the forest industry, state forestry, or federal forestry on B.L.M. and U.S. Forest Service lands, you see a new focus on comprehensive ecosystem management. Tribes are gratified by the growing understanding that our natural resources are precious and must be nurtured. Yet it is also frustrating to tribes that our Federal trustee, while heaping attention on comprehensive land management in other agencies, is turning a blind eye on its land management obligations to tribes. Other than one person in the B.I.A. Division of Forestry, the Bureau has no funds dedicated to comprehensive ecosystem management planning, also referred to as integrated resource management planning. Yet, among all Federal agencies, I.R.M.P.s are most appropriate, and needed, for tribal trust lands.

Mr. Chairman, the Indian people live on and from their land. While our population is rapidly expanding, our land base is generally static. As a result, our land base is under increasing pressure. As noted in the 1994 report of the Indian Forest Management Assessment Team, tribes are progressive, dedicated stewards of our land, but the severely limited planning resources available to us are precluding options and flexibility. Moreover, should I.R.M.P.s not be available for tribal lands, reservations will become management blank spots in the broader fabric of surrounding land.

B.I.A. has recently estimated an annual need of \$15 million for ten years to develop I.R.M.P.s for all tribes. And on Indian forestlands alone, the I.F.M.A.T. report noted that \$94 million is needed annually to bring B.I.A. other-than-direct timber production management activities up to parity with the U.S. Forest Service. Yet, B.I.A. has next to nothing. Accordingly, we request the establishment of a new I.R.M.P. line item, and that it be funded at \$3 million to begin to address these shortcomings.

Mr. Chairman, that concludes my testimony. Thank you.

 PREPARED STATEMENT OF STEPHEN A. JANGER, PRESIDENT, CLOSE UP FOUNDATION

Mr. Chairman, distinguished members of this Subcommittee, my name is Stephen A. Janger and I am President of the Close Up Foundation. It is a privilege for me to submit this testimony regarding Close Up's efforts to provide citizenship education opportunities for American Indian and Alaska Native students and educators.

Before I begin to discuss Close Up's funding request for fiscal year 1998, I want to thank the Subcommittee for its past support. The civic education of thousands of American Indian and Alaska Native students has been enhanced by funds this Subcommittee made available through the Bureau of Indian Affairs (BIA). Unfortunately, no funds were made available for current Close Up programs in the fiscal year 1997 Appropriations Act. Through this testimony, I hope to convince this Subcommittee that Close Up's work with American Indian and Alaska Native students and educators is a very worthwhile expenditure of scarce federal funds. In this regard, we respectfully request \$300,000 in fiscal year 1998 funding.

OVERVIEW

American Indian students hold a unique place in American society as citizens of both the United States and their Indian Nation, yet there are few opportunities in school to examine the implications of this "dual citizenship."

Nearly a half million American Indian and Alaska Native students are enrolled in schools across the nation, and there are many indications that their education is not comprehensive and needs enhancements to enable these students to be competitive. In 1991, the Indian Nations At Risk Task Force established a set of education goals to guide the improvement of all federal, tribal, private and public schools that serve American Indians and Alaska Natives and their communities. These goals call for all Native American students to "demonstrate civic, social, creative and critical thinking skills necessary for ethical, moral and responsible citizenship and important in modern tribal, national and world societies." Simply, native students must understand the implication of their dual citizenship to be actively involved in both tribal governments and the democratic process.

Close Up's Washington High School Program responds to the need for educational tools for Native students and their teachers. The Close Up Washington program uses a hands-on approach to civic learning that picks up where traditional textbooks leave off. Close Up participants don't just listen to lectures, they take part in debates, role-play activities, simulation exercises, group work, cooperative learning situations, and directed discussions. They are challenged to apply what they learn to real world scenarios.

Close Up participants meet with the people who make government work. In seminars, students discuss the process of government with leading decisionmakers, policy experts, diplomats, and journalists. They also have the opportunity to hear their leaders' views first-hand, and share their opinions and concerns directly with their elected officials. These opportunities serve to de-mystify U.S. government and its elected members, making the system of government accessible and engaging to young people.

Based on the unique relationship between the federal government and the tribes, it is especially important that Native American students understand the process.

THE NEED FOR CIVIC EDUCATION

In February 1997, the Washington Post Magazine featured an article on Native American issues that included statistics outlining the status of Native Americans in society. While not new, the statistics reflected an alarming reality: of any ethnic group in America, Indians have the highest rates of poverty, unemployment, and disease. In his article, Peter Carlson asserted that "Native Americans remain at the bottom in almost every measurable economic category." With Indians making up less than 1 percent of the population in the United States, it is vital that Native students learn to be leaders on behalf of their tribes if these statistics are to ever change for future generations.

The Native American people of the United States are embarking on a new course in their relationship with the federal government. As federal funding decreases each year, those living on federally recognized Indian reservations will require educated, skilled leaders who can be vocal advocates for the needs of their tribes. Senator John McCain, former chairman of the Senate Indian Affairs Committee, confirmed this need when he stated that few legislators know " * * * about the clause in the Constitution that says Congress has a special responsibility in dealing with Native Americans." Without appropriate education, American Indian struggles will continue with nominal support from voters and politicians who could have an impact on the lives of American Indian people.

But balancing these worlds and their role in them can be very difficult for young people. Close Up's American Indian and Alaska Native program provides Native students with an opportunity to study what it means to have a foot in two cultures, or "two worlds." For Native students, traditional values taught at home often conflict with what is taught in school. Through their Close Up experience, students start to see a circle being woven: They learn to respect tribal elders for their roles in the tribal council; They realize if they want to protect their sovereign rights as American Indian citizens, they need to obtain a comprehensive knowledge of government at all levels, federal, state, and tribal; and by sharing their life experiences with students from completely different backgrounds, Native students develop more pride in, and recognize the value of, their own culture.

This increased pride enables students to begin looking at their culture from other perspectives. By visiting their nation's capital, students have the opportunity to see first-hand how vital it is for them to take a role in preserving their sovereign rights. They observe first-hand how their tribal leaders represent the tribe to the federal government. Students also study the process of working directly with the federal government. This information is particularly relevant to Native American students who may one day use this familiarity with the government as a vehicle to preserving their rights as both American citizens and members of their tribe.

This is perhaps best enunciated by a social studies teacher at Santa Fe Indian School who wrote, "Our young people are living in two worlds, and in the non-Native world they need to learn to be just as competitive as everyone else. Our tribal leaders and elders always tell our young people that they'll be the future leaders, but no one's doing anything to prepare them. That's what this program is all about."

Close Up's message of informed participation is not limited to the federal government. The Foundation encourages educators to develop civic education programs at the local level. We know that we have inspired Native American educators to conduct local programs, one example is the local program held annually at the Santa Fe Indian School. The 1995/96 topic, "Unity and Sovereignty/Empowerment of Youth," involved student participants most of whom were enrolled members of one

of the New Mexico Pueblos. The goal of this two-day program conducted for New Mexican Native American youth, tribal leaders, community leaders, and educators was to train youth to become responsible and knowledgeable in the areas of sovereignty, Indian law, tribal government systems, cultural awareness, leadership, and citizenship.

Another example is a program established by Marilyn King-Johnson (Navajo), the project manager for the Navajo Nation Youth Incentive Program. Ms. King-Johnson said her interest in establishing a local program came to her while attending the Close Up Washington program. "I kept thinking 'why can't we do this at home?' We tell our youth to learn about the state and national government, but we don't teach about the Navajo Nation. I wanted to teach the young people something not taught in school."

The enthusiasm generated by attending the Close Up Washington program multiplies the reach of expanded civic learning many times over. Teachers and students return home with newfound knowledge, teaching methodologies, and self-esteem, and they are anxious to share all of this with their community. Without federal funding, however, this program and its contribution to Native American students and their teachers will cease to be available to most of them.

AMERICAN INDIAN AND ALASKA NATIVE PARTICIPATION

For more than twenty-five years, the Close Up Foundation has promoted responsible participation in the democratic process through educational programs in government and citizenship. With the help of this Subcommittee, Close Up has developed and tried to sustain an outreach policy to act on the belief that civic education is important to all students regardless of their families' financial status. This outreach policy, supported by fellowships to assist students with financial need, has ensured that a diverse student body is able participate in the Close Up program.

During the last year that Close Up received federal support (1995-96 program year), we had 248 students and teachers from 38 BIA high schools, and 103 Alaska Native students from remote villages, rural settings, and urban areas participate in the Close Up Washington High School Program. The vast majority of these students received fellowship support. We now find that without federal fellowship support we are losing the participation of many schools, and our forecast is that we will lose many more schools next year.

Most of the schools no longer able to participate are exactly the schools you want to reach with a program like Close Up. These are schools in the most remote and isolated regions of the country, schools that have few, if any, outside educational opportunities, and, generally speaking, schools with a student population that would receive the greatest benefit from our program. Although Native students, as they have in the past nine years, are conducting fundraising drives to try to raise at least some of the money themselves, the desperate financial situation of many of these students and their communities makes it impossible for them to raise the necessary funds. The lack of a financial base within the community that could sustain a student fundraising effort makes the need for federal support all that more urgent.

Despite all of the challenges these communities face, Close Up enjoys strong support in the Native American community. One example is at their January 1997 conference the National Congress of American Indians adopted a resolution of support for the Close Up program. We are very proud to have received such an endorsement.

Mr. Chairman, the glaring need for civic education opportunities for American Indian and Alaska Native students has been clearly demonstrated by many educators and experts. The past support of this Subcommittee has made it possible for the Close Up Foundation to try to address this need. We are very proud of what we have been able to accomplish. Without federal support, however, we cannot continue our work with the multiplier effect that leads to important learning productivity. Therefore, we respectfully request \$300,000 from the fiscal year 1998 Interior and Related Agencies Appropriations bill for our programs for American Indians and Alaska Natives. We would be glad to respond to any questions and to provide any additional programmatic or budgetary detail. Thank you very much.

PREPARED STATEMENT OF VIRGIL J. MURPHY, CHAIRMAN, STOCKBRIDGE-MUNSEE COMMUNITY BAND OF MOHICAN INDIANS

The Stockbridge-Munsee Tribe appreciates this opportunity to present our requests for funding in fiscal year 1998 for the Indian Health Service. We request that this Subcommittee provide fiscal year 1998 funding for our two priority projects: \$3.6 million for a new wastewater treatment facility for the Stockbridge-Munsee

Community, and \$2.8 million for a new health clinic for the Stockbridge-Munsee Community.

The Stockbridge-Munsee Tribe was once located in what is now the northeastern United States. However, in the early 1800's, we were removed from our ancestral lands to Indiana, and later relocated to what became the State of Wisconsin. Since 1856, our homeland has been a 46,000-acre reservation in central Wisconsin. The Mohican Nation has nearly 1,600 tribal members, over 800 of whom live on the reservation. The Tribe's major economic opportunity has been our small but successful casino and bingo operation. In 1996, the Mohican North Star casino employed some 550 people, about one-third of whom are tribal members. As a result of gaming, we are now the largest employer in Shawano County, WI. The Community uses gaming proceeds to supplement funding for such tribal governmental programs as Elderly Assistance, Higher Education and Vocational Training, Housing Assistance, and Economic Development. In addition, we have built two homeless shelters and made numerous donations for assistance for needy tribal members from our gaming proceeds. The Tribal Council has two funding requests we have determined to be of highest importance, and we submit them for this Subcommittee's consideration.

WASTEWATER TREATMENT FACILITY AND SEWAGE COLLECTION SYSTEM

The fiscal year 1998 budget request for the Indian Health Service's Sanitation Facilities Construction account proposes a modest increase of \$2.2 million over the fiscal year 1997 enacted level. While we support this requested increase, we note that the age of deficit reduction is evident here, because in the fiscal year 1997 budget request, the Administration requested an increase of \$43 million over the previous year's funding level for sanitation facilities construction. Clearly, the Administration, Congress and tribes are forced to struggle to determine priority programs which will receive funding as efforts to balance the federal budget continue.

As this Subcommittee knows, over the last several years, roughly one-half of the Sanitation Facilities Construction account has been used to address the backlog of sanitation facilities deficiencies in Indian communities which are included in the congressionally-directed 10-year funding plan. The total need in Indian communities for water and sewer facilities is currently some \$1.8 billion. Using the Administration's fiscal year 1998 budget request as a starting point, unless Congress appropriates additional funding over the budget request for Sanitation Facilities, only some \$40–50 million of the requested \$90 million will go toward the backlog. At this rate, Indian country is looking at 40 years before the existing backlog of water and sanitation—something most Americans take for granted—is addressed.

The Stockbridge-Munsee Community itself is in the Bemidji IHS Service Area, which serves Wisconsin, Michigan, Minnesota and Indiana. The total level of need in our Service Area last year was more than \$27 million. The amount provided, by allocation to the Bemidji Area, was slightly over \$1 million.

With this in mind, the Stockbridge-Munsee Tribe is in desperate need of a wastewater treatment facility and sewage collection system. The Tribe currently does not have a regional treatment facility, but uses a three-cell lagoon system community water and wastewater system. Concerns about the health and safety risks associated with an outdated and inefficient wastewater system—including some seepage of wastewater out of the lagoon cells during drought years, and groundwater seepage into the cells during wet years—led to the Tribe receiving joint funding in fiscal year 1996 through IHS and HUD to repair and upgrade the existing lagoon system.

The Tribe is grateful that fiscal year 1996 funding was provided to upgrade our existing system, which services our main housing development area. However, that area is made up of only 30 households. Even the upgraded lagoon system is not able to meet all current community sanitation needs. The Tribe's Planning Department projects that the Tribe will need to build 50 to 60 new homes for our members in the course of the next 10 years. Although several existing residential units on the reservation utilize individual septic tanks, due to the soil types on the reservation, it is very unlikely that these new homes will be able to utilize individual septic tanks. According to data stored on the Geographical Information System, almost 93 percent of the soil types located on the Tribe's trust lands have severe septic limitations. The remaining 7 percent of the land has moderate limitations. These limitations make it is very difficult to find suitable areas on which to build housing for our members. As a result, the Tribe is seeking funding to construct a master wastewater treatment facility which will enable us to construct these homes on lands that would otherwise be unsuitable because of the septic limitations.

The proposed wastewater treatment facility would service an existing 80 residential dwellings within the regional service area, tribal offices, our health clinic, and

the casino. In addition, the new facility would service the contemplated new housing development and other commercial development, including a planned hotel. It would also be able to handle future increases in wastewater flow.

The IHS Field Engineer has estimated that the cost of the new master wastewater treatment facility and collection system will be \$3.6 million. The need for such a system has been documented and submitted to the Indian Health Service for inclusion on the Sanitation Deficiency System (SDS) Listing. But, as this Subcommittee well knows, there are many tribal projects currently on the SDS list.

Without adequate funding to the IHS, necessary and essential projects like the Stockbridge-Munsee's wastewater treatment facility and sewage collection system will not be constructed. We ask that the Subcommittee support the Administration's requested increase of \$2.2 million to the Sanitation Facilities Construction account, and provide the necessary \$3.6 million to the IHS to fund our Tribe's very needed project.

NEW HEALTH CLINIC AND WELLNESS CENTER

For the IHS Facilities account, the President's fiscal year 1998 budget request proposes an increase of \$39 million over the fiscal year 1997 enacted level for construction of two replacement health facilities in Arizona. The Stockbridge-Munsee Community strongly supports this request, and urges the Subcommittee to support it. We know from our Tribe's own experience that many tribes throughout the country share our great and urgent need of a new health facility.

The Tribe has a small health clinic on our reservation which was built in 1973. It is only 14,000 square feet, while the Facilities Management Office of the IHS recommends a facility between 17,000 and 20,000 square feet in size. In addition to being severely limited in space, the clinic is in poor condition, with existing structural problems such as leaking roofs. After a point, further additions to the clinic—and there have already been two—are not economically efficient.

During a typical month, the clinic provides medical services to over 1,200 patients, dental care to 200 patients, and fills over 1,000 prescriptions at the pharmacy. Annually, the current staff of 35 full-time and 14 part-time employees and 6 full-or part-time physicians and dentists provides necessary and essential medical treatment to over 2,300 people—Mohican tribal members and Indians who are members of other tribes but live on our reservation, and numerous non-Indians who live within the original boundaries of the reservation.

The severe space limitations and poor condition of the clinic make providing necessary medical services very difficult. As a result, in 1996, the Tribe applied for and received a Community Development Block Grant from the Department of Housing and Urban Development. A grant of \$300,000 was provided in fiscal year 1997 to design a new health clinic and wellness center. Currently, the Tribal Council is preparing a Request for Proposals for the purpose of contracting with an architectural firm to prepare the final construction and design of the new facility. The Tribe is seeking fiscal year 1998 construction funding in the amount of \$2.8 million through the Indian Health Service.

We are very proud of the services we provide our people and members of the surrounding community. We appreciate this Subcommittee's consideration of providing us with additional resources in fiscal year 1998 through the Indian Health Service to improve our programs and services. Thank you very much.

PREPARED STATEMENT OF FRANCES G. CHARLES, CHAIRWOMAN, LOWER ELWHA
KLALLAM TRIBE

SUMMARY

Lower Elwha Klallam Tribal requests:

Support the Administration's request for an additional \$76.4 million in Tribal Priority Allocations.

Continuation of Elwha River Restoration funding through the Tribe's BIA Self Governance Annual Funding Agreement: from the Water Management and Development account or Water Rights Negotiation Litigation account.

Support National Park Service funding of \$25 million toward the dam acquisition cost pursuant to Elwha River Restoration, Public Law 102-495. And, authorization for \$83.3 million to complete dam removal.

\$405,000 to implement initial phases of the Elwha chum salmon recovery program, as outlined in the Elwha River Restoration Environmental Impact Statement; and, \$100,000 for salmon habitat improvements building upon the work begun in 1996.

Increase in treaty shellfish implementation, management and enforcement, to \$350,000 (as part of Point No Point Treaty Tribes' request for \$1,400,000 for shellfish implementation).

Full Contract Support (indirect cost) funding for BIA compact and IHS contract amounts for fiscal year 1998.

LOWER ELWHA KLALLAM TRIBE: ELWHA RIVER RESTORATION

The Lower Elwha Klallam Tribe has been involved as one of the principal participants in examining the full restoration of the Elwha River through the removal of the Elwha and Glines Canyon Dams on the Olympic Peninsula in Washington State. Since 1989, the Tribe's involvement has been supported through the Bureau of Indian Affairs—usually through the Water Rights Negotiation/Litigation account. Funding for the Tribe's efforts has decreased from a steady funding level of \$470,000. The fiscal year 1995 amount was reduced to \$375,000 and in fiscal year 1996 the grant to the Tribe was only \$94,000. The Tribe requests the assistance of the Committee in restoring the funding for the Lower Elwha Klallam Tribe. Since the 104th Congress amended the Elwha Act to include the State of Washington in the process, the Tribe is facing brand new challenges with regard to treaty rights protection.

The Administration has requested \$25 million for acquisition of the dams. The Tribe requests \$405,000 for the initial phases of the chum salmon recovery program, including enhancement of the tribal hatchery to achieve the production of the fish needed to restore the fisheries. The Tribe also supports the Administration's request for authorization of \$83.3 million in additional funds toward the removal of the dams.

FISHERIES PROGRAM

The specific needs in the fisheries services program are: Shellfish implementation, management and enforcement funding increase to \$1,400,000 for the Point No Point Treaty Tribes (\$350,000 for each of the four Tribes).

Continuation of Jobs for the Environment program. The Tribe has done restoration work on the Little Hoko River in which several miles of river were rehabilitated and are once again suitable for salmon spawning. This project has provided three years of employment for five displaced timber workers, both Tribal and non-Indian.

Support continued funding for US/Canada Pacific salmon negotiations to resolve the current impasse in the development of fishing regulations, as well as to continue management of fisheries under US/Canada jurisdiction.

Continuation of Wild Stock Initiative funds for the Tribes and State of Washington.

INDIAN HEALTH SERVICE

The Administration has requested a small increase from clinical services and contract support. We ask the Committee to support these requests: they are funds which go directly to the tribes for health care delivery.

PREPARED STATEMENT OF THE SAULT STE. MARIE TRIBE OF CHIPPEWA INDIANS

Mr. Chairman and members of the Committee. On behalf of the Sault Ste. Marie Tribe of Chippewa Indians, I want to thank you for this opportunity to appear before you to discuss our fiscal year 1998 appropriations concerns.

The Sault Ste. Marie Tribe of Chippewa Indians is the largest federally recognized tribe in Michigan. The Tribe is dedicated to achieving true self-determination and self-governance. Over the past few years we have opened schools, built health centers, established a tribal court system and worked to restore and enhance our economy and our land base. While much has been done, considerably more is needed to enable us to fulfill the promise of the self-determination policy. We urge this Committee and Congress to reaffirm its commitment to providing funding sufficient to enable tribes to maintain basic core services funded through the BIA and IHS.

INDIAN HEALTH SERVICE

One key to a brighter tribal future is ensuring that adequate health care services are provided to our people. Along these lines, we strongly urge the Committee, at a minimum, to support the Administration's request for funding levels for all IHS programs. In particular, we stress that many health care services for our people must be provided through contract health care—a program that has been chronically and severely underfunded. In this time of growing Indian populations and ris-

ing health care needs and costs, it is vitally important to provide a significant increase in funding for contract health services.

The Tribe is a strong supporter of Self-Governance. We firmly believe that the best way to provide governmental services is to administer programs at the tribal level—tailored to the needs of our people. We entered a Self-Governance compact with the Indian Health Service on October 14, 1994, to maximize our ability to manage our own health care delivery systems and programs. While we see Self-Governance as the proper federal policy for government to government relations between the United States and our Tribe, we also have experienced some frustrations regarding how IHS implements Self-Governance. For example, while we have been an IHS Self-Governance Tribe for well over two years, we have not yet received any contract support costs regarding the administration of our tribal shares. These are funds which were negotiated as part of our annual funding agreement. They are critical to the success of Self-Governance. But the IHS continues to indicate that it does not have the funds to pay these key contract support costs.

We also have found that another key promise of Self-Governance—the reduction of the federal bureaucracy and the transfer of resources to the tribes—has been painfully slow to take place. We urge the Committee to take additional steps to assure that Self-Governance leads to appropriate downsizing of the IHS, and a corresponding increase in the transfer of those savings to the tribes.

BUREAU OF INDIAN AFFAIRS

The programs funded by Tribal Priority Allocations within the BIA are at the heart and soul of tribal governments. They include police protection, education, social services, tribal courts and other government functions necessary to protect the well being of our people. TPA is vitally important to Indian people and communities—and cuts in TPA would have devastating impacts on crime, education and tribal justice systems. We urge the Committee to increase funding for TPA, supporting at least the Administration's modest requested increase.

The Sault Ste. Marie Tribe has recently entered into a Self-Governance compact with the BIA. Here again, we are concerned that full funding for Self-Governance is not being provided. With respect to the BIA, no Central Office tribal shares are being made available, as was required by language included in this year's Appropriations Act. We ask the Committee to revisit this issue, and to require that BIA Self-Governance compacts include Central Office tribal shares.

OFFICE OF THE SPECIAL TRUSTEE

The Office of the Special Trustee for American Indians was established by Congress to examine the longstanding and well documented mismanagement of trust assets by the BIA, and to recommend the reforms needed to correct these broad ranging problems. The Special Trustee has recently issued a draft "Strategic Plan" outlining his recommendations in this regard. Among other things, the Special Trustee calls for the consolidation of trust resource management, trust funds management and land title and records management in a new agency—the American Indian Trust and Development Administration. The thrust of the proposal is that the United States must dramatically change the manner in which it manages its trust responsibility to American Indians, and that the regulatory standards and best practices of private sector bank trust departments must be incorporated into the federal management of Indian trust assets.

The work of the Special Trustee is long overdue. For too long, the mismanagement of trust assets by the BIA has been well documented—but no comprehensive solutions were advanced. Now, the Special Trustee is proposing a major overhaul of this key area. The proposal of the Special Trustee has significant implications for the future of federal/tribal relations and the trust responsibility. Accordingly, it is vitally important that the work of the Special Trustee be fully funded—both to enable his work to advance, and to provide an appropriate level of guidance and consultation from the Tribes. We urge the Committee to concur with the Administration's recommendation of providing \$37.5 million (a \$5 million increase) for the Office of the Special Trustee. We must not repeat the mistakes of history by failing to provide the resources necessary for the government to fulfill its responsibilities regarding the management of Indian trust assets.

POLICY INITIATIVES

The trust responsibility—as well as elementary notions of fairness—require that tribes have an opportunity to express their views to Congress before any significant changes in federal Indian policy are undertaken. Nevertheless, over the last couple of years there have been a number of major legislative initiatives that, if enacted,

would have had a major impact on Indian tribes and their members—but which were advanced in a manner that limited tribal participation in the process. These included provisions to waive tribal immunity from suit, to prohibit land from being taken into trust without a tribal-state tax agreement, to prohibit new gaming compacts and prevent the Secretary of the Interior from issuing gaming procedures, and to reformulate the manner in which the BIA provides funding to tribes, among others. These were advanced within the context of the appropriations process—as riders to the Interior appropriations bill—without any hearings from the Committees with jurisdiction over Indian affairs, and without any prior opportunity for tribes to have input in the process.

We urge the Committee to resist any such efforts this year, and in the future. Congress must not enact legislation that fundamentally alters the rights of tribes, without at least hearing from the tribes themselves. If there is a view that changes in Indian policy are needed, let them be considered and debated through the normal legislative process, in the light of day, with the full participation of the tribes. The appropriations process is simply not a proper vehicle for overhauling key elements of the relationship between the United States and the tribes.

CONCLUSION

We thank you for this opportunity to address the Committee on behalf of the Sault Ste. Marie Tribe of Chippewa Indians.

PREPARED STATEMENT OF THE ASSINIBOINE AND SIOUX TRIBES OF THE FORT PECK INDIAN RESERVATION

Mr. Chairman and members of the Committee, I am Caleb Shields, Chairman of the Assiniboine and Sioux Tribes of the Fort Peck Indian Reservation, in Montana. It is an honor to appear before you today to present the Tribes' fiscal year 1998 appropriations testimony. While our concerns are many, we would like to focus on certain areas regarding BIA and INS appropriations. We attach a list describing all of our needs in the BIA and IHS.

TRIBAL PRIORITY ALLOCATIONS

The Tribal Priority Allocations system is intended to give tribes an additional measure of flexibility in determining how to use available funds to best meet local needs. The Administration has requested an increase of \$46 million for programs under TPA. This request would essentially restore overall funding for TPA to fiscal year 1995 levels. While we support this restoration it would still fall far short of allowing the Fort Peck Tribes to meet the needs of our people in key areas including law enforcement, education, welfare assistance and housing. We urge the Committee to do all it can to increase TPA above the level requested by the President.

Law enforcement

The President's budget requests \$79 million for BIA/tribal law enforcement nationwide. This is an \$8.2 million increase over last year's level, but is about \$1 million less than was provided in fiscal year 1995. This modest funding must meet the needs of 200 Indian Reservations with 198 BIA and tribal law enforcement agencies covering approximately 100,000 square miles. At Fort Peck alone, we have a \$1.3 million shortfall in our law enforcement department. Our Reservation covers 6,000 square miles. We have a population of 13,000 living on the Reservation. We only have a police force of 18. We need a minimum of 25 police officers to safely patrol the Reservation. Although our officers are well trained and dedicated, there are simply not enough of them to meet the day to day law enforcement needs of my community.

In addition, our law enforcement department is in desperate need of equipment. We have only 8 aging police cars, to patrol the entire Reservation. Our Department also needs additional criminal equipment such as car radios, bulletproof vests, roll bars and protective shields. Several recent incidents of violent crime have plagued our Reservation. The community is currently working to understand the causes of these crimes and to develop mechanisms to lessen the risk of such crimes in the future. While there will undoubtedly be many parts to any solution, it is clear that one fundamental component is a strong police presence. This will send a strong message that violent crimes will not go unpunished in our community. It is critical that this Committee endorse the Administration's full request for law enforcement.

Education

The President's budget requests \$30 million for scholarships for Indian students to accredited post-secondary schools, an increase of \$3 million. We support this request. Encouraging our people to take the step to attend post secondary school is one of the Tribes' top priorities. Attending college—particularly for those individuals from families that have not previously sent anyone to college—takes courage and often considerable personal sacrifice. We believe it is our responsibility to support the efforts of our people to attend college. Unfortunately, current funding provides scholarships to only 60 percent of the people who applied for assistance. This means that 40 percent of our eligible people who wish to further their education are shut out. This is tragic, as it diminishes the number of educated Tribal members who would return to our communities to work with our youth, our elders and otherwise enhance the well-being of the Tribes.

Welfare assistance

We strongly support the Administration's requested increase for welfare assistance. However, this request is still \$7 million less than what was provided for this program in fiscal year 1995. Since 1995, the caseload for assistance under this program has increased substantially. The BIA and the tribes expect the caseloads to rise significantly, particularly during the initial stages of the implementation of the welfare reform law. As Indians are denied assistance under state plans, they will increasingly turn to the tribes.

In communities like mine with an unemployment rates as high as 59 percent, welfare assistance ensures that at least some of our people will not go without the most basic needs in life. Currently, we need an additional \$600,000 for welfare assistance. Because of the significant shortfall, we can provide assistance to only 66 percent of the people who apply. The other 34 percent must do without. The Administration's requested increase will not even meet the existing needs for this program, let alone the expected increases. While we support the increase as a minimum, we urge this Committee to restore funding to this critical program to at least the fiscal year 1995 level.

The Fort Peck Tribes are very concerned that the Administration has failed to request any money for programs under the Indian Child Protection and Family Violence Prevention Act. The Administration budget includes a new funding line item, but that tiny step does not provide any services to prevent child abuse, or help its victims. I cannot accept the Administration's statement that neither the BIA nor the entire Department of the Interior could "secure resources to begin operation of these programs." These programs should be a priority for all of us who choose to work for the people of our communities and the Nation. Congress recognized the significance of this problem when it enacted the Act. This Act must be funded. I urge this Committee to provide \$10 million to begin the operation of these programs.

TRIBAL SCHOOL (\$102,200)

In the fall of 1995, the Fort Peck Tribes authorized the operation of the Fort Peck Tribal School, an alternative school to meet the educational needs of our children who have problems that prevented them from continuing in the public schools. The Fort Peck Tribes realized that unless we stepped in and took on the responsibility to educate these children, they would not be able to complete their education and would likely be lost to us forever. The Tribes were able to open the tribal school with a small grant from the Walmart Corporation and in kind contributions by the Tribal College and our parents. The school now has an enrollment of fourteen children. These are children who were expelled from public school for behavioral or other reasons and had no hope of completing their public education. Because of a lack of space and personnel, we have had to turn away ten additional children. We are now asking this Committee for \$102,200 to continue this important initiative.

The school provides a full day of instruction. Academic classes include instruction not only in math, biology, and history, but also in the languages of my people. We are proud of our children in this school and the progress that they have made in improving their lives. We understand that there is a freeze on adding schools to the BIA system, but if we do not try to address the needs of these at risk children through education programs, we will almost certainly be forced to meet their needs through our juvenile justice programs, our substance abuse programs and our welfare programs. Our innovative approach to alternative education must be explored and rewarded. I am confident that it will prove to be an investment that not only helps students, but saves the government money in the long run.

DETENTION FACILITY RENOVATIONS (\$2.4 MILLION)

In June 1995, the BIA completed a needs assessment of the Fort Peck Detention Facility, the only adult detention facility on our Reservation. The needs assessment found that the facility was in need of several repairs to address structural deficiencies that would result in violations of both building codes and BIA standards for detention facilities. As the report makes clear, the facility needs additional inmate housing. It also needs new fire alarms and monitoring systems and a new intake/booking area with holding cells. The estimated cost of these items is \$2.4 million dollars. We request this Committee to include this amount in the BIA's construction budget.

TRIBAL COLLEGES

We support the Administration's \$30 million request for tribal colleges. This request is consistent with the President's Executive Order on Tribal Colleges, which supported enhancing federal support to tribal colleges and universities nationwide. The twenty-four tribal colleges are important institutions to remote tribal communities. On the Fort Peck Reservation, we operate the Fort Peck Tribal College, a fully accredited institution, offering Associate Degrees in arts, science and applied sciences. We also offer a vocational certificate for our students. We have a current enrollment of 366 students. Last year twenty-eight of our students graduated. Of these twenty-eight who graduated, 7 went on to continue their education in a four-year institution.

INDIAN HEALTH

We strongly support the Administration's requested increase for contract health care, which provides valuable assistance on Reservations like mine where there is no IHS hospital. On the Fort Peck Reservation, we have a shortfall of \$1.1 million in contract health care. The Administration's request of \$374 million for contract health care will certainly not enable us to meet all of the health care needs of our people, but it will allow us to provide services to additional people. We urge the Committee to provide additional funds for contract health care.

 PREPARED STATEMENT OF TOM MAULSON, TRIBAL CHAIRMAN, LAC DU FAMBEAU
 BAND OF LAKE SUPERIOR CHIPPEWA INDIANS

Mr. Chairman and members of the Committee. My name is Tom Maulson and I am the Tribal Chairman of the Lac du Flambeau Band of Lake Superior Chippewa Indians, located in Wisconsin. I am here to testify on behalf of my people, to discuss their issues, concerns and needs.

The message from my people is that the United States must keep its obligations to the Lac du Flambeau Band. The United States is obligated by Treaty to provide critically needed social, education, health and governmental services to the Band and its members in exchange for the land and peace provided by our forefathers. This is the heart of the federal government's trust responsibility to the Band. And, this trust responsibility is very much on the minds of my people—who know how much we gave up in exchange for the promises of the federal government. We urge you to keep this in mind as well, as you consider funding for Indian programs.

I turn now to some specific funding issues arising out of the President's fiscal year 1998 Budget.

HEALTH CARE

Health care on the reservation remains a major concern of our tribal members. Currently, the IHS Budget for our service unit funds only about 60 percent of the Band's need for health care services. The overall IHS Budget of \$2.12 billion must serve a rapidly expanding Indian population, now in excess of 2 million people, in a time of rising health care costs. The impact of the shortfalls is seen most dramatically at the Reservation level. At Lac du Flambeau, most of the health care for our people is provided through the IHS contract health care system. Funding for contract health care meets less than half of our need. We are forced to undertake a terrible rationing of health care—addressing only emergencies. If a child requires an MRI or CT scan, we cannot provide these services—unless a life is in imminent danger. We cannot provide eyeglasses or hearing aids for our elderly. In many ways, current funding levels are leaving our people without funds for health care which, by any humane view, should be provided. We urge the Committee to provide an in-

crease of 10 percent (about \$36 million) for contract health services to enable tribes to provide an appropriate and decent range of health care services to our people.

INDIAN EDUCATION

I was glad to note that the President has set education as one of his fundamental priorities. I urge the Committee, and Congress, to join with the President in providing the resources and programs necessary to improve the educational opportunities throughout the United States. At the same time, I urge the Committee to work with the tribes to find ways to target the particular educational needs that arise in Indian country.

For example, the BIA Higher Education Program provides desperately needed scholarship funds to tribal members. But, while we strongly support this program, it does not meet a critical need of many of our members—payment for child care and transportation expenses to enable them to attend college.

We currently have 41 students participating the Higher Education Program. Most of these are older students, who have families and did not pursue higher education immediately after high school. The average age of these students is 29. Our Reservation is in a remote area of northern Wisconsin, with the nearest 4 year college located 90 miles away. Transportation to and from school is a major burden for many. Likewise, child care is very expensive in our area. In many cases, the costs of transportation and child care create insurmountable barriers for qualified students who wish to remain in school. Currently, most financial aid programs, including those for individuals with very low incomes, do not cover child care and transportation costs. The Band urges the Committee to provide funding for needed child care and transportation within the BIA Higher Education Program—to enable more of our students to be able to stay in school and pursue their dreams.

NATURAL RESOURCES

The natural resources of the Lac du Flambeau Band are our most valuable and significant asset—apart from our children. Our natural resources provide my people with cultural, spiritual, subsistence, social and economic opportunities. The Reservation is located in the heart of Wisconsin's tourism and sportfishing region. Tourism and related industries provide livelihoods for Indians and non-Indians alike. The land, the water, the air and all the animals and plants that live along with us on this Reservation, help make us what we are as a people. We need funding to assure that we can fulfill our responsibilities to keep these resources clean and available for the generations to come.

The Lac du Flambeau Band has developed considerable expertise in the management of our natural resources. We have a fish hatchery that is a central element of our overall natural resources program. Our activities also include conservation law enforcement, development of tribal management codes, fish population studies and habitat improvement. Unfortunately, there are growing stresses on our natural resources from increased local development. We have a dedicated staff of 20 in our Natural Resources Department. But funding for our staff and these critical programs has not increased since 1990, a period which saw our costs escalate rapidly. Unless there is an increase in funds, we will either have to reduce services, or lose some of our qualified staff. We urge the Committee to increase our Tribal Management and Development funds by \$125,000 to enable us to maintain our critical natural resource programs.

We strongly support full funding for the Circle of Flight program (also known as the Wetlands and Waterfowl Management program). This program addresses the critical problem of the decreasing number of waterfowl and the deterioration of our wetlands. The program emphasizes locally developed tribal programs, involving wetlands restoration, refuge creation, waterfowl nesting site development and others. Under this program, tribes are contributing needed wetlands and some of the best waterfowl areas in the Nation. We urge the Committee to provide a total of \$1 million (an increase of about \$400,000) to promote worthy Circle of Flight programs.

The Band is responsible for managing 55,000 acres of forest land on our Reservation. We must handle broad needs including tree planting, prescribed burning, timber road design and maintenance, timber sale administration, and integration with wildlife management. In addition, our Forestry program is responsible for cultural resource surveys under section 106 of the National Historic Preservation Act, although we receive no funds for that labor intensive and important responsibility. We request an additional \$40,000 to enable our Forestry program to undertake the necessary activities in managing our forest lands.

LAW ENFORCEMENT

Police protection is a major government function in every community. At Lac du Flambeau, our tribal police have cross-deputization responsibilities—which require that they obtain a full measure of federal and state law enforcement training and certification. Moreover, because the local Vilas County Sheriff's Department in our area has reduced patrols on the Reservation, increased law enforcement presence by the Band is necessary. To provide the required services, we need 10 law enforcement officers. We need an additional \$224,000 to assure the safety of residents of our communities.

TRIBAL PRIORITY ALLOCATIONS

At Lac du Flambeau, our education, law enforcement, forestry and other key programs are included within Tribal Priority Allocations. The TPA system allows the Band to move funds from one TPA program to another, in line with the priorities set by the Band. But, particularly for the last two years, TPA programs have been insufficiently funded across the board, and have not met the needs of the tribes. This has forced tribes to “rob Peter to pay Paul”—even though neither Peter nor Paul had enough in the first place. For fiscal year 1998, the President has called for an increase of \$53.3 million. While this is a good start, it falls short of the actual needs in Indian country. We urge the Committee to increase TPA by an additional \$50 million, above the Administration's request.

Thank you.

PREPARED STATEMENT OF THE FOND DU LAC BAND OF LAKE SUPERIOR CHIPPEWA

Mr. Chairman, Members of the Committee, the Fond du Lac Band of Lake Superior Chippewa would like to thank you for this opportunity to present our testimony on fiscal year 1998 appropriations for the Department of Interior and Related Agencies. We urge the Committee's continued support for tribal programs, which are so important to the lives of our people. In particular, we seek your support for our natural resources and forestry initiatives, which are essential to protect the resources on which our people depend. We also seek your support for our Fond du Lac Ojibwe School which is needed to provide a safe setting in which we can educate our children.

The Fond du Lac Reservation is one of six Chippewa Bands in the Minnesota Chippewa Tribe. The Reservation was established by Treaty with the United States on September 30, 1854. The Reservation encompasses approximately 100,000 acres. There are currently about 3,350 members of the Fond du Lac Band.

Our message to the Committee is this: There continues to be substantial unmet needs in health, education, and the protection/management of our natural resources. Any reductions in funding, no matter how small, for Indian programs would have severe, adverse impacts on our people. While the BIA may not be as efficient or accountable as it should be, that is no reason to reduce federal funding in ways that will harm Indian people. The relatively small amount of federal funds that actually reaches the Tribes and serves the needs of Indian people must be preserved.

On-Reservation Needs.—The waters, wildlife, wild rice, and forest resources of our Reservation are vitally important to the members of the Band, as these resources provide the foundation of our culture, subsistence, employment, and recreation. The Fond du Lac Reservation includes some 3,200 acres of lakes, 1,900 acres of wild rice lakes and associated wetlands, 66 miles of cool water streams, and 17,500 acres of forest. Unfortunately, our resources are under great stress. The loss of wild rice lakes and wildlife habitat, and the decline of forest biodiversity are of great concern to the Band. Therefore, we are seeking an additional \$240,000 for our natural resources and forestry program to enable us to address the challenges we face in this critical area. The main area of concern is the Aquatic Resource Protection and Restoration. It is imperative that we continue to protect these resources for the future generations on Fond du Lac by the implementation of anti-degradation monitoring program with emphasis on mitigation of contaminants.

Likewise, it is essential that we provide proper management of our forests, to assure that those resources are properly managed and remain productive over time. Our original white pine forests were largely destroyed by uncontrolled cutting early in the century. We need to manage our remaining forests with selective cuts, extended rotations and smaller staged cuts, to conserve the resource. Our goals are to increase our harvest from 130 acres to 350 acres per year, to enhance the forest wildlife habitat [particularly for game species], and to increase biodiversity. We will accomplish these objectives through our Integrated Resource Management Plan,

with the cooperation of state, county, and private forest and wildlife managers. We also feel it is important to support the funding of the BIA's Forest Development, and Inventory and Management Planning add-on funds.

A third component of our natural resources initiative involves our waterfowl and related wetlands resources. The Band has been a participant in the "Circle of Flight" program, by which a number of tribes have had a high level of success with local initiatives in wetlands and waterfowl habitat restoration. We urge the Committee's continued support for this critical program.

Ceded Territory Needs.—The Fond du Lac Band has had its rights re-affirmed in the 1837 Ceded Territory. This means the Band is responsible for an approximate 3,000,000 acres of land and must implement a system similar to the one used in the 1854 ceded territory to protect the exercise of treaty reserved rights. We are seeking an additional \$186,551 to be added to the Bureau of Indian Affairs base budget and earmarked for Fond du Lac and the 1837 ceded territory. We also ask that you to support the joint request of the 1854 Authority and Fond du Lac to increase the base budget of the 1854 Authority by an additional \$255,507. This request is important to continue the enforcement, monitoring and assessment activities in the 1854 Ceded Territory.

Fond du Lac Ojibwe School.—Our top priority is education. Our greatest concern in this area is that our children are currently forced to attend a school that is unsafe. Four years ago a BIA report examined our existing grant school, and concluded that "The building poses a clear and immediate danger to its occupants. Any attempt to continue to use this facility on other than a short-term, interim basis, is imprudent." 1992 BIA Construction Validation Report. As this conclusion reflects, our current school, which serves students from kindergarten through 12th grade, is in a decrepit and unsafe condition. The building does not meet building codes or BIA space guidelines. We are concerned that the physical plant of our school leaves our children in serious jeopardy, and places them at a significant disadvantage in terms of education opportunity. Children can not be properly educated in an inadequate and deteriorating school.

In 1992, the Fond du Lac Reservation submitted an application to the Bureau of Indian Affairs for New School Construction. Following an October 1992 Construction Validation Study, the Fond du Lac Ojibwe School was ranked 14 on the "Education Facilities Construction Priority List of fiscal year 1993." In 1996, Fond du Lac received a Public Law 100-297 Grant in the amount of \$578,989 for the planning and design phase of the school project. Planning and Design will be completed by July 1, 1997. It would be expedient if construction funding were appropriated at this time rather than fiscal year 2000 or later as the BIA has projected.

We urge the Committee to provide additional funding in the amount of \$12 million for a new school on the Fond du Lac Reservation.

Additional Education Program Needs.—The Band strongly supports the Administration's request for Indian Education programs including: \$296 million for the Indian School Equalization Program (ISEP); \$34 million for Student Transportation; \$74 million for Facilities Operation and Maintenance; \$44 million for Administrative Cost Grants; and \$5.4 million for Early Childhood Development. Funding should also be continued for flow through programs serving tribes including: Title I; Individuals with Disabilities Act (IDEA); Substance Abuse and Title IX. We are however very concerned that the Administration has requested only \$17.2 million for the Johnson-O'Malley program. This is a \$1 million cut from last year's level. A number of our youth go to public schools and the Johnson-O'Malley program is critical to their success in the public school system. I urge this Committee to reject this cut.

We support the Administration's \$30 million request for tribally controlled Community Colleges. However, it is clear that this amount of funding is not sufficient to meet the growing need of tribal colleges. The Fond du Lac Tribal and Community College is unique in the United States as it is jointly a tribal college and a member of the Arrowhead Community College Region in Minnesota. Continued financial support for American Indian students and educational programs at this Tribal College is vitally important. Tribal Colleges provide an important and unique educational opportunity for many of our students. These institutions must be strongly supported.

CONCLUSION

The needs at Fond du Lac and on other Reservations throughout the country remain massive. We appreciate the Committee's consideration of our appropriations request and we urge the Committee to do all it can to preserve funding for Indian programs.

Attachment.

SUPPLEMENTAL INFORMATION ON FOND DU LAC OJIBWE SCHOOL CONSTRUCTION
PROPOSAL

The Fond du Lac Band of Lake Superior Chippewa proposes to construct and equip a new facility for its tribally-controlled school, the Ojibwe School, in order to replace its present, run-down facility.

The existing Ojibwe School is a grant school under the Tribally Controlled Schools Act of 1988 (Public Law 100-297, Title V, Part B.; the "Tribally Controlled Schools Act") serving approximately 210 children in grades K-12. The facility is old and decrepit. It utilizes four temporary portable buildings to house its Middle School (Grades 6-8) and library. It is not large enough to handle existing enrollment. The facility is in violation both of applicable building codes and BIA space guidelines. The 1992 BIA Construction Validation Report stated that, "The building poses a clear and immediate danger to its occupants. To not replace the facility could be construed as negligence in the event a fire occurred. Any attempt to continue to use this facility on other than a short-term interim basis, is imprudent."

Notwithstanding these facility handicaps, the school has been able to provide high quality education to the students it is able to admit. The Fond du Lac Community, School Board, Reservation Business Committee, Education Administration and Staff have continually sought to improve Indian Education since the inception of the Ojibwe School. The involvement of the community has been instrumental to the existence of the school. With the help of tribal, state and federal programs, the Ojibwe School has evolved into a leader in tribal education. The school has been in operation since 1980 with a current annual operating budget of \$3.3 million.

The school operates as a pre-K-12 optional school by North Central Association (NCA) of Accreditation. As an accredited school, the program is required to satisfy all the components established by the NCA. In 1996, the Ojibwe School was second-warned for violation of Standard XII, School Facilities. A school may be dropped from NCA membership if steps are not taken to correct the cause for warning. In the meantime, serious health and safety problems, outlined by annual BIA and Indian Health Service surveys, continue at the Fond du Lac Ojibwe School.

NEW SCHOOL

The new 90,000 square foot school proposed by Fond du Lac, to be built at an estimated cost of \$12 million, would serve approximately 365 students in grades K-12. It would be built on the Reservation, near the existing school in accordance with BIA educational space guidelines, North Central Accreditation Standards and educational space recommendations of the Minnesota Department of Education.

PREPARED STATEMENT OF JOHN WILMER, SR., CHAIRMAN, THE BAD RIVER BAND OF
LAKE SUPERIOR CHIPPEWA INDIANS

Mr. Chairman and members of the Committee. I am John Wilmer, Sr., Chairman of the Bad River Band of Lake Superior Chippewa Indians, of Wisconsin. I appreciate this opportunity to provide the Committee with the Band's testimony on fiscal year 1998 appropriations.

HEALTH CARE

A. Contract health services.—The need for health care services has risen dramatically at Bad River—with our user population increasing from about 1100 in 1991 to about 2500 today. But funding has failed to keep pace. The shortfall is particularly critical with respect to contract health services—which is the major source of funding for most of our health care needs. As a result of funding limitations, contract care must be limited to emergency care only. (We urge the Committee to increase funding for contract health care.)

B. Dental services.—Our dental program is able to pay only for emergency dental work for adults. With a current budget of \$104,000 our dental program has a list of 221 adults waiting for dental services, for which no funds are available. Of these, 33 are elders. Often, the inability to obtain needed dental work for elders makes it difficult for them to eat—which in turn leads to further medical problems. We need an additional \$200,000 to provide services to those now waiting for needed dental care.

C. Diabetes.—As the Committee is well aware, diabetes is a major problem in Indian Country. At Bad River, we have 215 diabetes patients. Among these patients, we have witnessed a tragic increase in the number of amputations in the past year. To help address this, our diabetes patients need education and counseling on a range of nutrition issues. We request \$50,000 for nutrition services for our diabetes

patients. In addition, our diabetes patients need preventative and acute foot care. We seek \$18,000 to contract with a podiatrist to promote healthy foot care among our diabetes patients.

EDUCATION

A. Johnson-O'Malley program.—A key to the success of many of our students in the public school system is the Johnson-O'Malley program. Our JOM program provides needed counseling and support services—and study skills training—to about 475 students. There is no question that the personal attention provided by JOM staff has helped innumerable students complete high school and go on to higher education. But, over the past four years, funding for our JOM program has been seriously cut, diminishing our ability to provide the level of personal care that our students need and deserve. This year, the President is proposing to cut JOM again—this time by \$1.1 million. We urge Congress to reject such a cut, and restore full funding for the JOM program.

B. Mashkisibi School.—Over the years, we have learned at Bad River that not all of our students thrive in a typical public school environment. Some students—particularly those with a history of difficulties in the public schools as a result of emotional or other problems—need an alternative environment. At Bad River, we have taken the initiative to address the needs of these children—by establishing the Mashkisibi School, an alternative school for grades 9–12. The School, established in 1995, serves 12 to 15 students each year. These are students who would drop out if public school was their only option. The Mashkisibi School seeks to engage these students by integrating Ojibway language and culture into all aspects of the curriculum, and by focusing on the practical impact of all areas of learning. The School also provides a higher teacher/student ratio than the public schools, and seeks to provide a more personalized approach to learning. The School has demonstrated considerable success, keeping these children in school, and helping them to thrive.

We have had no federal funds supporting this worthwhile endeavor. While we have been able to begin the School on a shoestring, to be able to survive in the long term, we will need federal support. To operate the school—providing salary to our fine staff—we need \$82,000 for fiscal year 1998. And, to have a proper facility for our School, we need \$200,000. We recognize that there is currently a moratorium on new BIA funded schools. But, in this case, where the Band has stepped in to educate a segment of the student population that was not otherwise receiving the services needed to keep them in school, an exception should be made.

NATURAL RESOURCES

Our natural resources are key to our cultural and economic survival as a people. Wild rice, deer and walleye are central to our lives, and subsistence use of these resources is widespread and increasing. The population on our Reservation has grown sharply over the past few years, as our members return from urban areas. Unfortunately, employment has not kept pace. With greater numbers of tribal members and too few jobs on the Reservation, more stress is placed on our finite natural resources. Proper management and enforcement efforts are more critical than ever to preserve the integrity of our Treaty rights and resources for members of the Band.

In 1995, the Band entered a cooperative agreement with the State of Wisconsin regarding subsistence and commercial fishing in Lake Superior. This agreement enhanced the practical opportunities for tribal members to exercise their Treaty rights in Lake Superior. At the same time, it has increased the Band's regulatory and monitoring responsibilities. Among other things, the Band is required to perform on-board monitoring and patrol activities. This requires the allocation of trained staff. Beyond the increased costs involved in these cooperative activities on Lake Superior, our overall fish and game program costs (cost of living, insurance, equipment, fuel, supplies, etc.) have been spiraling. We request an additional \$50,000 to enable us to meet our responsibilities under the Tribal-State agreement and to protect our resources for future generations.

We also support full funding for the Circle of Flight program and BIA Fish Hatchery Maintenance, and the restoration of funding for BIA Fish Hatchery Rehabilitation.

INDIAN CHILD WELFARE

Our Indian Child Welfare staff works with the victims of child abuse and neglect, and with families at risk of child abuse and neglect. They investigate incidents, provide on-call services for crisis situations, and serve as advocates for children in the

court systems. They provide educational services to families to prevent abuse and neglect. The program is also involved in the placement of

Indian children. The staff undertakes home studies for foster care and adoptive care placements. They seek Indian adoptive homes for Indian children—to assure continuity within our tribal community. And, they protect the interests of Indian children and the Tribe, by seeing that the terms of the Indian Child Welfare Act are met. All of these critically needed services are being provided with a staff of 3 and federal funds of a meager \$55,000. We urge you to provide additional funds for Indian Child Welfare programs—to help us limit child abuse and neglect, and to find suitable Indian families for our Indian children.

WHITE PINE MINE

The people and resources of Bad River face a significant threat from a proposed mining project at White Pine, Michigan. This project would involve injecting massive quantities of sulfuric acid into a copper mine in an effort to leach copper from the rocks. In preparation for mining activities, railroad cars filled with sulfuric acid have repeatedly crossed our Reservation on their way to the mine. Both the mining, and the transportation of the sulfuric acid, present terrible risks to our Reservation and our tribal members. Among other things, a spill of sulfuric acid would be a major catastrophe.

Unfortunately, the proposal to undertake this mining is advancing rapidly. The owner of the mine, Copper Range Company, is seeking a permit from EPA to begin the solution mining activities. It is also seeking a permit to construct a smelter adjacent to the mine. And, EPA is currently undertaking an environmental analysis (EAn) to examine a broad range of issues associated with the proposed mine and related transportation.

The Band needs resources to enable it to adequately participate in the permitting and EAn processes—to address the potential adverse impact of the mine and transportation activities on the Band, its resources and its members. We need expertise in the following areas (1) a transportation engineer, to evaluate the risk of a spill, (2) a mining engineer, to study safety issues relating to the mining activities, (3) an hydrologist, to study the potential movement of fluids in the groundwater, (4) an environmental toxicologist, to determine the adverse impacts of a potential discharge on plants, animals and humans, (5) a geochemist, to examine the interaction of the sulfuric acid and rocks, to determine if containment is possible, and (6) an economist, to determine the feasibility of the proposal to pump and treat fluids in the mine site forever.

The Band requests \$200,000 from the BIA for a mining assessment program to enable us to obtain baseline data and analysis and to be full participants in the permitting and EAn process. This participation is vitally important to the future of the Band, as a wrong decision on this mining proposal could jeopardize the health of our people and the integrity of our Reservation homeland.

CONCLUSION

We emphasize to the Committee that your work affects the lives of my people, and urge you to preserve adequate funding for Indian programs.

PREPARED STATEMENT OF LEONARD LORETTO, GOVERNOR OF THE PUEBLO OF JEMEZ

Mr. Chairman and members of the Committee, I am Leonard Loretto, Governor of the Pueblo of Jemez in New Mexico. Thank you for the opportunity to testify before the Committee today concerning the Pueblo of Jemez.

JEMEZ IRRIGATION PROJECT PHASE III (\$3.0 MILLION)

Farming is a fundamental part of the Pueblo's culture. We have grown corn and chili since prehistoric times. These products are not only a vital food source, but also necessary to our religious ceremonies. Our goal in this area is to maintain our culture and tradition and improve our economy by expanding our agricultural base.

We need to complete the work on our irrigation system that is in the last phase of completion. We thank the Committee for its support for the first two phases. The first two phases have already resulted in a significant improvement in our farming capabilities due to the concrete lining of the main canals. This permits us to save water that was previously being lost through seepage. However, we still have more than 27 miles of lateral ditches that must be lined.

As the Committee knows, the BIA priority list for these types of projects results in only the large projects being funded. Last year, one irrigation project—the Navajo

Irrigation Project—received more than \$20 million in funding. While projects like Jemez's that is only one phase away from completion was left unfunded. We request the Committee to complete this work, by directing the BIA to provide enough money to complete Jemez's irrigation project. The benefits that this will produce for our People will be well worth the investment.

WALATOWA CULTURAL CENTER (\$700,000)

The Pueblo of Jemez wishes to enhance our tourism and outdoor recreation programs: (1) through the establishment of a Walatowa Cultural Center; and (2) by implementing the infrastructure required to accommodate outdoor enthusiasts who frequent the Holy Ghost and Dragon Fly fishing lakes. We are requesting \$500,000 in support of construction of Phase 2, Walatowa Cultural Center, which is a 4,600 square foot facility. We are further requesting and additional \$200,000 in support of infrastructure development for our fishing lakes.

The establishment of the Walatowa Cultural Center for the Pueblo of Jemez will expand economic development potential through tourism by: (1) offering quality tourism attractions to the visiting public; (2) providing information which will facilitate a safe and enjoyable recreational learning experience; and (3) generating a higher expenditure per visitor, thus creating new revenue for the Pueblo. The establishment of the Cultural Center will support the preservation of tribal traditions, cultural values, arts and crafts and beliefs among new generations of Towa people.

BUREAU OF INDIAN AFFAIRS

Tribal priority allocations

We strongly support the President's request for Tribal Priority Allocations. TPA funds the core services of every tribal government. It includes funding for education, welfare, roads and tribal courts, which are necessary for any sovereign to prosper. While, we strongly support the President's budget request, we echo the Senate Committee on Indian Affairs' concern that the funding for Indian programs has steadily declined since 1978. Thus, tribes are continuously forced to do more with less.

Social service funding (\$126,000)

In 1993, the Pueblo working with the Department of Justice developed a pilot project to address issues surrounding juvenile justice and delinquency. This project enabled the Tribe to work with its youth in a traditional counseling program. In addition, through the program we were able to assess the many factors that affect the life, styles and behaviors of our youth and develop solutions to the problems experienced by them.

Since this program was initially only a three-year pilot project, DOJ did not renew the funding. When this project ended in 1996, the Pueblo was left without a specific program designated for youth. The Pueblo believes that this pilot program was a success and must be supported. We request an earmark of \$126,000, to continue this valuable program. We are also concerned that while the BIA has created a line item for programs authorized under the Indian Child Protection and Family Violence Prevention Act, the BIA failed to request any funding for these programs. After several years, the BIA has finally completed the regulations for this Act. It is now time to fund the programs under this Act.

Detention facility

We are pleased that the Administration recognizes the critical need for additional detention facilities in Indian country. We support the requests for the Ute Mountain and Gila River facilities. Even with these two facilities going on line, there continues to be a tremendous need for detention facilities in Indian country. In the Albuquerque Area, there are 19 tribes, yet there is no tribal detention facility to serve the needs of these tribes. As a result, our law enforcement agencies must contract with non-Indian agencies at a significant cost. This cost is shared 50/50 between the tribes and the BIA. Thus, contracting is not only costly to the BIA, but to the tribes as well.

We would like to know the cost of contracting with outside detention facilities. While we are not certain, we believe that building a new facility may, in fact, be a more cost effective way to meet the detention needs in Indian country. We believe it would be helpful if this Committee requested such a report from the BIA.

Abousselman case—water rights negotiation (\$300,000)

The Pueblo is a party in the *United States v. Abousselman* Stream Adjudication. This case, which involves the precious water resources of the arid Rio Jemez Basin, has been in litigation for well over ten years. Litigation is time-consuming, expensive and focuses on only reallocation of water supplies to parties to the litigation.

The United States has already committed a water rights settlement negotiation team to help the Pueblo with these negotiations. To further the Pueblo's efforts in seeking a positive resolution of this matter the Pueblo is requesting an earmark of \$300,000 from the BIA's Water Rights Negotiation Fund.

In 1996, a tremendous amount of progress has taken place in the case. Specifically, because of the record drought this last summer, there was a call by the Pueblo and the United States to enforce senior priority rights. This forced the parties to the negotiation table. The Pueblos and the non-Indian irrigators negotiated an irrigation rotation schedule for the summer, which was approved and adopted by the federal court. This marked the first time in New Mexico history that the Pueblos and the non-Indian water users agreed to share the valuable water resource.

Despite the tremendous progress that we have made in the *Abouseman* case the Bureau of Indian Affairs failed to provide any funding for the Pueblo to continue our work. Additional funding is essential to achieve the ultimate objective of a comprehensive negotiated water settlement in the basin. We request \$300,000 be earmarked for the Pueblo to continue our work in the *Abouseman* case.

INDIAN HEALTH SERVICE

Support for continued research on asthma among Jemez Children (\$100,000)

A 1992 study by faculty from the University of New Mexico School of Medicine reported that the rate of acute asthma for children living within the Pueblo of Jemez is twice the national average. This is particularly alarming because it was previously thought that asthma was not a prevalent disease among Indian people. In 1996 the Pueblo of Jemez conducted baseline research on asthma and the relationship between our dependency on wood as a primary source of heating and cooking. Our preliminary research indicates that over 45 percent of households are significantly at risk to the effects of indoor air pollution. We request \$100,000 to design and administer a comprehensive environmental health-epidemiological assessment to determine existing environmental factors which contribute to the known prevalence of asthma among Jemez tribal members, primarily focused on protection of our children and elderly.

Emergency medical services

We request an increase in the IHS appropriations to provide for two additional full time emergency medical technicians to be stationed at the Pueblo of Jemez. Currently, 2,566 motorists pass through the Pueblo on an average day. This amount doubles during the peak tourist season. We are 45-50 miles away from the nearest hospital our EMT service is crucial to saving lives that would otherwise be lost. However, we cannot now provide twenty-four-hour emergency medical technicians, to ensure the health and protection of our visitors.

We have only two EMT's and eight volunteers, serving as First Responders. They cover 415 square miles, including more than 100 of miles of isolated roads and tourist sites. Consequently, the First Responders answer most night and weekend calls, as the two EMT's are unable to meet these needs. While these individuals have done an excellent job with limited resources, two additional EMT's would allow the Pueblo to provide comprehensive emergency services, through trained professionals twenty-four hours a day seven days a week.

PREPARED STATEMENT OF RUBY ATWINE, CHAIR, TRIBAL BUSINESS COMMITTEE, THE UTE INDIAN TRIBE OF THE UINTAH AND OURAY RESERVATION

INTRODUCTION

My name is Ruby Atwine. I am the Chair of the Tribal Business Committee of the Ute Indian Tribe of the Uintah and Ouray Reservation located in northeastern Utah. I am providing this written testimony in support of the Department of the Interior's proposed appropriation for the Ute Tribe's water settlement. The proposed appropriation of \$41.5 million is partial fulfillment of the obligations and promises made by the United States to the Ute Tribe in 1965 and reconfirmed by Congress in 1992. Those obligations and promises are set forth in the Ute Indian Rights Settlement, Title V of the Central Utah Project Completion Act, Public Law 102-575, 106 Stat. 4600, 4650 (Oct. 30, 1992). The purpose of the Settlement is, in part, to settle long-outstanding claims held by the Tribe relating to the failure to construct features of the Central Utah Project contemplated in the September 20, 1965 Agreement between the Tribe, the United States and the Central Utah Water Conservancy District. This particular appropriation is to partially fund the Tribal Development Fund provided for in section 506 of the Settlement.

The Ute Indian Tribe is pleased with the opportunity to present its views to this distinguished Subcommittee. The Tribe looks forward to working with the members to implement the proposed appropriation, which will provide a critical step in completing the funding of the Tribe's Water Settlement; funding which is vital to the economic development of the Tribe and its members.

THE UTE INDIAN TRIBE

The Ute Indian Tribe is made-up of three bands, the Uintah, Whiteriver and Uncompahgre. The Reservation is made up of two separate reservations: the Uintah Valley Reserve established in 1861; and the Uncompahgre Reserve established in 1882. Together they encompass nearly 4.5 million acres of Indian trust, fee and federal land. The Tribe holds approximately 1,000,000 acres of Reservation land in trust. The Duchesne River and its tributaries, Rock Creek, Lake Fork, Yellowstone, Uinta and Whiterocks Rivers are among the stream systems that pass south from the Uinta Mountains through the Reservation to the Green River and then on to the mainstem of the Colorado River.

Approximately 3,300 tribal members live on the Reservation. They suffer from the highest unemployment rate in the entire Uintah Basin. While the Reservation is blessed with oil and gas resources, employment opportunities are limited. Other "modern" employment opportunities are proscribed by the lack of additional economic development. The Tribe and a few tribal members do engage in agricultural enterprises which provide only limited economic returns. Fish and wildlife resources are extremely important to the Tribe and could, if properly developed and managed, offer greater economic opportunities.

THE UTE INDIAN RIGHTS SETTLEMENT

The Ute Indian Rights Settlement was passed by Congress and signed by the President in October, 1992. The facts surrounding this Settlement make it distinct from other Indian water settlements. The United States had a contractual obligation to the Tribe which it failed to fulfill. The Settlement represents substitute consideration not enticement to enter a settlement of the Tribe's water rights.

As I previously noted, in 1965 the Tribe, United States and Central Utah Water Conservancy District entered into what is commonly referred to as the Deferral Agreement. In the Deferral Agreement, the Tribe provided the United States and the Central Utah Project 60,000 acre-feet of water annually to assure the funding and completion of the Bonneville Unit of the Central Utah Project. The Bonneville Unit of the CUP is the principal component of Utah's water supply future. It is one of the most complex and expensive transmountain diversion projects ever built by the Bureau of Reclamation. The project diverts water, including the 60,000 acre-feet made available by the Tribe, from the streams in the Uinta Basin and transports the water westward across the Wasatch Mountains to Salt Lake and Utah counties. In exchange for its substantial and essential contribution, the Tribe was to receive storage in two large dams and replacement water for the 60,000 acre-feet made available to the Bonneville Unit. The dams were never built, the replacement water never delivered and, if the Settlement is fully funded, the 60,000 acre-feet of tribal water will continue to be transported annually across the Wasatch Mountains. The Settlement is an attempt to place the Tribe in an economic position similar to that it would have achieved had the promised structures been built and the promised water delivered. As funding is delayed, that goal remains unachieved and the opportunities promised (once again) unfulfilled.

While the sums of money authorized in the Settlement and included in the Department of the Interior's proposed 1998 budget, may appear, to some, generous, they are in reality relatively small when compared to the unfulfilled promises made to the Tribe beginning over 30 years ago in the Deferral Agreement or to the enormous economic potential offered by the Bonneville Unit, which could not have been completed without the Tribe's contribution. To date, Congress has fully funded the Tribe's farming programs, found in section 504 of the Settlement, and partially funded various reservoir, stream and habitat improvement projects provided for in section 505. The Tribe has begun initiating the various farm and habitat improvement programs established in the Settlement and is in the process of developing its long-range plans for utilization of those funds. However, funding of the "Tribal Development Fund", the largest and most important program in the Settlement, was only initiated in fiscal year 1997, in an amount far less than is contemplated in the Settlement.

THE TRIBAL DEVELOPMENT FUND

Section 506 of the Settlement establishes a Tribal Development Fund "to be appropriated [in] a total amount of \$125,000,000 to be paid in three annual and equal installments * * *." (Due to inflation factors statutorily applied to the 1992 authorization, the authorized amount has increased over the past four years to approximately \$145 million.) In fiscal year 1997, Congress made the first appropriation for the Tribal Development Fund in the amount of \$25 million. This appropriation, however, did not meet the statutory requirement of an equal one-third installment. Instead, Congress decided to reduce the appropriation and "adjust" future appropriations in accordance with section 506(b). That subsection provides that an adjustment will be made by the Secretary which represents the interest income "that would have been earned on any unpaid amounts" if Congress fails to fully fund the Development Fund in three annual and equal installments. It is the Tribe's understanding that the proposed \$41.5 million appropriation for fiscal year 1998, includes an adjustment of approximately \$1.5 million. This amount represents the interest the Secretary has determined the Tribe would have received on approximately \$23 million Congress failed to appropriate in fiscal 1997.

The Settlement limits the Tribe to spending only the interest derived from the Development Fund on it economic projects. Moreover, the Tribe is required, under section 506, to prepare a Tribal Development Plan setting forth its economic development projects. That Plan must be approved by two independent financial consultants approved by the Secretary.

Following receipt of the initial \$25 million appropriation, the Tribe began a broad review and analysis of potential on-Reservation economic development programs. It soon became apparent that until funding of the section 506 Development Fund is complete, the Tribe cannot fully evaluate, develop or initiate a comprehensive plan to both create and foster economically viable enterprises on the Reservation and invest in outside economic ventures. It is vital, therefore, that funding of the section 506 Development Fund be completed as quickly as possible, albeit not in three equal installments, to allow the Tribe and its economic advisors to determine with some accuracy the amount of interest that will be available for project development on an annual basis. The Tribe can only develop a comprehensive, well planned economic development program that will provide the greatest possibility of success when it knows the amount available to the program for economic investment on a year-to-year basis.

THE PROPOSED FISCAL YEAR 1998 APPROPRIATION

The Tribe is fully aware of the fiscal constraints under which both the Department of the Interior and the Federal Government as a whole must operate. However, Congress clearly recognized and understood in 1992, that it was essential to fully fund the Development Fund as quickly as possible to foster economic development on the Reservation; economic development which should have begun over 30 years ago with the projects promised to the Tribe in the Deferral Agreement. The Fund is a critical component of the Tribe's efforts to secure economic self-sufficiency in the future and that process cannot truly begin until funding is complete.

The Tribe recognizes that in this time of fiscal constraint, the proposed appropriation of \$41.5 million represents a substantial contribution of limited financial resources toward assuring full funding of the Tribe's Settlement as quickly as possible. The Department of Interior has recommended this appropriation within an overall \$10 million reduction in the Indian Land and Water Claim budget. The Tribe appreciates the efforts of the Department and this Subcommittee on its behalf.

It is important to recognize in reviewing this proposed appropriation, that \$41.5 million falls short of what was clearly anticipated and promised by Congress in 1992. It does not amount to a full one-third of the overall authorization and it does not replace the shortfall in the 1997 appropriation. At the present rate, the Tribe estimates that it will take four to six years, fiscal years 2000-2002, before the Development Fund is fully funded. Until then, the Tribe can only initiate an extremely limited economic development program that will fall well short of that envisioned by the Department of the Interior and Congress and is vital to the Tribe and its members.

CONCLUSION

On behalf of the Tribal Business Committee of the Ute Indian Tribe of the Uintah and Ouray Reservation, I would like to express my gratitude to the Subcommittee for this opportunity to present the Tribe's statement in support of the proposed \$41.5 million water settlement appropriation for the Ute Indian Tribe. The Tribe

and the United States have worked together for many years to assure that the Tribe would at least receive the economic benefits promised when it provided water to assure the construction of the Bonneville Unit of the Central Utah Project. We are now close to completing what has been a long process. The proposed appropriation of \$41.5 million is a critical step in bringing this matter to a close and fulfilling the obligations undertaken by the United States in 1965 and reaffirmed by Congress in 1992.

PREPARED STATEMENT OF ANDREW GREY, CHAIRMAN, SISSETON-WAHPETON SIOUX
TRIBE, LAKE TRAVERSE RESERVATION

My name is Andrew J. Grey, Sr., and I am Tribal Chairman of the Sisseton-Wahpeton Sioux Tribe. Our Tribe currently has over 11,200 enrolled members and more than 5,500 of them live on the Lake Traverse Reservation in Northeast South Dakota and Southeast North Dakota. More than half of our reservation population is 18 years of age or younger.

The Tribe currently employs more than 1,300 persons and is the largest single employer in the area. However, our unemployment rate still exceeds 30 percent.

Our economy and jobs base is becoming increasingly diversified, but the Tribe is still overly dependent on jobs in our gaming industry and government services. Major efforts are underway to expend our small business sector, add manufacturing facilities to our economic mix and more fully utilize our land and natural resources to create jobs and generate income. By the year 2000, we plan to have 40 percent of our jobs outside of gaming and government services.

Federal funds not only serve a Tribal function in our economic diversification efforts, but they are also essential in providing basic services to our members. That is why I appreciate this opportunity to provide testimony on the Bureau of Indian Affairs fiscal year 1998 budget request.

Our staff has analyzed the BIA's proposed budget, and although it provides for an increase in current funding levels, it contributes little to restoring the substantial losses that tribes have suffered since fiscal year 1994.

Before I discuss the specific impact of current funding levels and the BIA's proposed fiscal year 1998 budget on our Tribe and its people, I will make some general observations on BIA funding in "Indian Country," including the Lake Traverse Reservation.

Historically BIA budgets proposed by past Administrations (and President Clinton's) have often provided for increases, but those increases have generally gone to support the BIA's Central and Area Office functions and staff. Few new or additional dollars actually reached the tribes or local BIA agencies.

We appreciated the attention Assistant Secretary for Indian Affairs, Ada Deer, paid to this issue in her recent testimony, but we remain very skeptical of her claims relative to "streamlining" the BIA structure. Our view is supported by the fact that the fiscal year 1988 budget includes for both the Central and Area Offices.

I must also note that the fiscal year 1998 budget also provides for a \$76.5 million increase for Tribal Priority Allocations (TPA), supposedly those funds go directly to tribes via Self Governance Compacts or Public Law 93-638 contracts. However, the increase when shared by 550 tribes, becomes quite minimal, particularly when local tribal allocations have historically decreased almost every year previously. Simply, the proposed funding increase does not restore prior losses.

In addition, the population and employment data used to justify or demonstrate local need is frequently outdated and based on US Census information derived from substantial under counts of Native people on reservations. For example, almost 30 percent of the people living on our reservation were not counted in 1990. We are currently completing our own census and would like to contract the US Census for our reservation in 2000.

Finally, the BIA's efforts to promote Public Law 93-638 contracting and Self Governance Compacts are laudable, but until tribes are convinced that all federal departments and agencies accept and clearly demonstrate their trust responsibility to and for tribes, most tribes will continue to believe that any diminishment of the BIA's role and function diminishes the Federal Government's trust responsibility.

This assumption is supported by the fact that only 60 of the 550 federally recognized tribes (after five years) have entered into Self Governance Compacts and only an additional 10 tribes will be added in fiscal year 1998.

There is also little financial incentive for tribes to seek compacts, unless Tribal Shares (residuals) from Area and Central Office budgets are included. It will be very difficult to develop an equitable process in this regard, however, because residual

funds have already been committed to 60 tribes based on a tribe-by-tribe approach and not an approach that includes all or most tribes.

Our Tribal members (by referendum vote) have also rejected Self Governance, in part for those reasons. On the other hand, the SWST has taken full advantage of the contracting options and we have sixteen contracts with the BIA and a Master Contract with the Indian Health Service (for six programs) that total over \$2.2 million.

With that perspective in mind, let me now address the specific situation on the Lake Traverse Reservation.

First, virtually all of our Public Law 93-638 contracts, historically, have been under funded and are usually further reduced each year. My comments, however, will be limited to the last two years of BIA allocations to our reservation.

Between fiscal year 1996 and 1997, our Land Operations, Agriculture and Fish and Wildlife and Parks (contracts) programs have suffered the most severe reductions. Funding support has been cut over 40 percent, resulting in the elimination of two full time positions and the conversion of five other to part-time, seasonal jobs. We've also had to return our lease compliance contract to the BIA.

In addition, our Natural Rights Protection contract has been cut by almost 25 percent since fiscal year 1995 and only \$11,000 is now available, hardly enough to hire staff or mount a credible program. The funds currently augment our National Resources Planning activities.

Fortunately, our Tribal Realty staff are supported by land lease income and are not effected. These cuts have seriously undermined the Tribe's efforts to protect and manage its natural resources, including its agricultural lands. According to the BIA's fiscal year 1998 budget each of these areas is set for an increase, but we assume little of the money will reach us.

The funds for our Tribal Court have been cut by 15 percent in the last two years resulting in delays, backlogs, increased caseloads, and reduced services. We are already operating with a part-time Judge and prosecutor. Our Tribal Court currently operates on an annual budget of \$188,500. Again, since the BIA's 1998 budget provides for only a slight increase in this area, we expect little improvement at the local level.

Our Law Enforcement Agency is also seriously under funded, but BIA funding has been relatively stable for the last two years. Law Enforcement is scheduled for a substantial increase in the BIA's 1998 budget, so we encourage the Congress to support it and target all of it to reservations.

The SWST also needs a new detention (law enforcement complex) facility, but we recognize that even though the BIA's 1998 construction budget proposes an increase for detention facilities, the urgent demand far exceeds the recommended \$16.5 million.

Education continues to be a SWST priority and the BIA's budget does provide for increases for tribal schools (K-12) and Community Colleges. We have both a Tribal School and Community College, so we urge Congressional support for the requested increases.

However, we are discouraged that the BIA's support for new school construction since fiscal year 1996 has decreased substantially. We need to replace a sub-standard, deteriorating facility now and are prepared to commit Tribal resources to that effort. Construction on the \$10.325 million complex can begin this year, but we need the \$1.5 million that's available to Sisseton in the BIA's Facilities Management and Construction budget to match \$1.5 million from the Tribe. A replacement facility for Sisseton was on the BIA Priority List (6) as early as 1990. We also intend to seek a direct appropriation from Congress and issue revenue bonds for the remainder of the costs.

Relative to the BIA's lack of support for Economic Development, we strongly oppose the earlier elimination of its grants and technical assistance programs and we oppose its current plans to further reduce its funding for Economic Development in fiscal year 1998. In addition, the level funding (with inflation) proposed for its guaranteed loan programs will have limited impact due to the continuing needs of 550 tribes. Most tribes do not have revenues from gaming or the leasing/sale of natural or mineral resources to support economic development.

We do support the BIA's request for increased funding for Services to Children, Elderly and families, but we join with most tribes in opposing the transfer of this program (function) to the TPA system. There's already too little TPA money to go around at the local level and adding another priority to the list would only make a difficult situation worse. In addition, these funds have the greatest direct and immediate impact on the most vulnerable of our people and perhaps most clearly demonstrates the Federal Government's trust responsibility to all of us. The responsibility to adequately fund this function should remain with the BIA.

In conclusion, our response to the BIA's fiscal year 1998 budget proposed is mixed and we remain skeptical of many of its claims (e.g., streamlining) and intentions. However, we encourage the Congress to provide increased funds to support priorities I outlined in my testimony.

Our own particular interest is to have at least the \$380,000 that we lost in the last two years restored to our Public Law 93-638 contracts and the local (BIA) agency's operating budget. We also urgently request that the Congress provide an fiscal year 1997 supplemental appropriation of \$150,000 to reimburse the SWST and the local BIA agency for those cost incurred (and not budgeted) in responding to our recent Winter emergency. These are costs that will not be reimbursed by FEMA.

I appreciate your time and attention.

PREPARED STATEMENT OF JOE MOSES, CHAIRMAN, TRIBAL COUNCIL, THE
CONFEDERATED TRIBES OF THE WARM SPRINGS RESERVATION OF OREGON

Mr. Chairman, I am Joe Moses, Chairman of the Tribal Council of the Confederated Tribes of the Warm Springs Reservation of Oregon. Our address is P.O. Box C, Warm Springs, Oregon, 97761. My testimony, submitted for the record, addresses the proposed fiscal year 1998 appropriation for the Bureau of Indian Affairs with the following requests and comments:

(1) Adopt the BIA Tribal Priority Allocations budget, which restores the program to approximately fiscal year 1995 levels.

(2) Increase BIA Construction Resources Management Survey and Design by \$3 million for tribal and BIA participation in hydroelectric relicensing activities before the Federal Energy Regulatory Commission.

(3) Reject "means tested" distribution of BIA funding, an "Istook" amendment, and other legislative policy riders on appropriations bills.

(4) Do not use the appropriations bill to carry out any part of the Strategic Plan to Implement the Reforms Required by the American Indian Trust Fund Management Reform Act of 1994.

Below, I discuss each of these requests in further detail

(1) *Adopt the BIA Tribal Priority Allocations budget, which restores the program to approximately fiscal year 1995 levels*

The B.I.A. Tribal Priority Allocation (T.P.A.) budget is the heart of BIA support to tribes. These funds are spent at the local level according to specific tribal priorities. They fund essential tribal governmental functions and on-the-ground services to the Indian people. For years, tribes have sought to achieve some measure of stability in this critical part of the Bureau's budget so they may have some programmatic and administrative consistency from year to year. Just a few years ago, we thought a significant step had been made toward that end with the adoption of the B.I.A. Tribal Budget System, the central purpose of which was to provide tribal governments with stable recurring funding, flexibility, and tribal control. It was understood by many of us that, within the Tribal Budget System, T.P.A. was supposed to be the most reliable portion of the B.I.A. budget. Despite that, in recent years, T.P.A. has been funded at levels exceptionally below the fiscal year 1995 level. Now, for fiscal year 1998, the Administration's proposed budget for T.P.A. will roughly restore this critical program to that fiscal year 1995 level, with a very small increase for increased personnel costs over those years. It does not, however, reflect any cost-of-living adjustment for the remainder of the program. We urge the Committee to, at the very least, accept the Administration's T.P.A. budget proposal of \$757 million.

(2) *Increase BIA Construction, Resources Management Survey and Design by \$3 million for tribal and BIA participation in hydroelectric relicensing activities before the Federal Energy Regulatory Commission*

Over the next ten to fifteen years, federal licenses for hydroelectric projects involving close to 50 Indian tribes will expire and come up for renewal before the Federal Energy Regulatory Commission. Under the Federal Power Act, the Department of the Interior, as trustee for Indian land and water, is obligated to directly participate in those relicensing activities to establish appropriate conditions within the new licenses. Because these proceedings are of a quasijudicial nature, the Department of the Interior must develop and present expert testimony on a very wide range of highly technical issues.

In addition, the affected tribes may very well seek to become involved in the relicensing proceedings on their own behalf, and many, because of the expense of such proceedings, must look to the Bureau of Indian Affairs for some assistance. Our Tribe is confronting this exact situation. We are in the hydroelectric business and are joint licensees with Portland General Electric on the Pelton Project, which sub-

stantially occupies our Reservation. The current license expires in 2001 and the Tribe has already formally engaged the F.E.R.C. relicensing process by filing a Notice of Intent to seek the license. We estimate the effort will cost \$4 million between now and 2001. We will be able to cover about two thirds of those expenses, but must seek Bureau help if we are to mount a credible application.

In fiscal year 1997, the B.I.A. requested a budget increase of \$4.5 million to provide for active participation in the F.E.R.C. relicensing proceedings. Only \$500,000 of the request was appropriated. For fiscal year 1998, the B.I.A. has scaled back its request to an additional \$1 million. We support that increase and request additional funding of \$3 million, to bring funding for this critical trust function to the level of need anticipated by the Bureau. The funding is essential if the Interior Department is to comply with the Federal Power Act and its trust responsibilities to the tribes, and if the tribes are to become less dependent on federal assistance by more completely realizing the economic benefits of hydroelectric projects involving their resources.

(3) Reject "means tested" distribution of BLA funding, an "Istook" amendment, and other legislative policy riders on appropriations bills

Mr. Chairman, in recent years, a perception has arisen that Indian tribes are suddenly wealthy, and that, in this time of federal fiscal constraint, federal appropriations to these "wealthy" tribes ought to be curtailed. This is referred to as "means testing", and I want to urge you to resist it on three basic grounds: tribes generally are not wealthy, it would be discriminatory, and it would be contrary to our treaties.

First, Indian tribes are not wealthy. By almost any measure, Indian people today are still among the most needy in the United States. The perception that tribes are suddenly wealthy is attributable to the overblown press coverage of a few, perhaps a dozen or so, tribes that have found substantial success in gaming. For most other tribes engaging gaming, such as ourselves, returns are far less spectacular, and most frequently offer only modest or marginal benefits. Most tribes still operate on budgets that are anemic compared to those of counterpart towns and counties.

To the degree that gaming does provide some measure of financial benefit to tribes, it may also be short-lived, under constant challenge from states, the non-Indian gaming industry, and some elements in Congress. If gaming is eliminated or diminished, tribal economic circumstances will revert right back to their former status, which is far from vigorous. So, it would be mistaken and shortsighted to limit a tribe's appropriation based on the perception that it is somehow wealthy.

Second, the distribution of federal funding to tribal governments based on their relative financial success, or lack thereof, would be discriminatory, not only among the tribes, but between the tribes and states and other units of government.

Third, determining a tribe's funding on its comparative wealth is contrary to the treaties. Treaties are binding agreements for tribal cession of vast tracts of land and peaceful settlement on reservations in exchange for U.S. protection and support. That support is not contingent upon wealth or poverty, and for the U.S. to now propose withdrawing from part of those agreements because it asserts the tribes can somehow afford it is a unilateral violation of the intention of the treaties.

We further urge that the Committee resist attempts to add other legislative "rider" amendments onto the fiscal year 1998 Interior Appropriations bill, specifically including any "Istook" type amendment to force tribes to sign agreements with states and local governments for the collection of sales and excise taxes as a condition of having any new lands placed in trust. Last Congress, Rep. Ernest Istook had such an amendment added to the House Interior Appropriations bill on a very close vote, and it was dropped from later versions of that legislation. In this Congress, Rep. Istook has recently introduced a very similar free-standing bill. Today, as last year, we very strongly oppose such legislation. The Istook amendment is a direct intervention of not only states, but undefined "local" governments as well, into the unique Constitutionally-based government-to-government relationship between Indian tribes and the United States. Pursuant to long-established laws and treaties, the Federal government has the responsibility to designate, hold, and protect land for Indian tribes. Rep. Istook's amendment, mandating the intrusion of state and local governments into that relationship, drastically alters a fundamental principle of tribal government and its relationship with the U.S. Such a proposal is highly objectionable to tribes on its face, and the prospect of having it moved as an amendment, without hearings or the full discourse of Congressional debate, is especially objectionable.

Moreover, Rep. Istook's provisions are unnecessary. Rep. Istook, actively backed by commercial special interests, has grossly overdramatized the subject of his amendment. Just like most neighboring states with differing sales and excise tax structures, a great many tribes and states have voluntarily entered agreements to

address the situation that Rep. Istook asserts demands the heavy-handed intrusion of big government.

Amendments such as Rep. Istook's particularly serve to highlight the distortions and shortcomings that arise when legislating by rider. Accordingly, we ask that the Committee resist such legislative amendments, which not only complicate and cloud the appropriations process, but which also dismiss the standards of Congressional procedure and deliberation.

(4) Do not use the appropriations bill to carry out any part of the Strategic Plan to Implement the Reforms Required by the American Indian Trust Fund Management Reform Act of 1994

Finally, Mr. Chairman, our Tribe recently received a copy of the draft "Strategic Plan to Implement the Reforms Required by the American Indian Trust Fund Management Reform Act of 1994". While certain aspects of the plan have merit, we are concerned that other aspects need considerable study. The most significant item proposed in the draft is the creation of an independent organization, outside the Department of the Interior, which would assume all trust asset management functions, including natural resources. This proposal needs considerable review and examination. In that regard, we strongly urge restraint in any appropriations actions which would implement any portion of the proposal as it relates to removal of further functions from the Bureau of Indian Affairs. We expect to continue our review and actively participate with other tribes in evaluating the plan. As you know, plans for Indian Country of the past have not worked well when they don't have the full participation of the tribes in their development. We will expect to communicate further with your Committee as the process moves forward.

That concludes my remarks. Thank you.

PREPARED STATEMENT OF HON. ISMAEL JOHN, SENATOR, NITIJELA OF THE MARSHALL ISLANDS; AND HON. NEPTALI PETER, MAYOR OF ENEWETAK ATOLL, ON BEHALF OF THE ENEWETAK/UJELANG LOCAL GOVERNMENT COUNCIL

Mr. Chairman and distinguished members of this Subcommittee: Thank you for providing this opportunity to the people of Enewetak to describe issues relating to food production and the environmental situation on Enewetak Atoll. We would also like to inform you of the initiatives we have taken these past few years to improve not only food production but also the health and education of our people. These initiatives include a complete overhaul of our agriculture program; the institution of a nutrition education program; the renovation of a three story building which now houses our sixteen classroom elementary school; the hiring of two highly qualified American teachers to help us with our education effort; and, attempts at the economic development of our atoll to permit fishing and/or tourist activity.

Mr. Chairman, at the outset we wish to express our gratitude to the United States Congress for the appropriation of funds these past ten years to provide food to our people through a program which has become known as the Enewetak Food and Agriculture Program. We are also grateful that the Administration has included funding in the amount of approximately \$1.091 million for the Enewetak Food and Agriculture Program in its fiscal year 1998 Budget. However, we must note that the \$1.091 million in the Administration's budget is the same amount as the amount appropriated in fiscal year 1987. That is, the funding for the program has substantially declined these past 10 years in real dollars. Applying a 3.5 percent inflation factor, the \$1.091 million appropriated in 1987 now has the purchasing power of approximately \$700,000. In short, the program over the years has experienced over a 35 percent cut in funding. At the same time our population has increased from approximately 1,000 persons to over 1,400 persons. We have been successful in employing strategies to cut costs and to maximize the funds available to us. However, in order for the program to achieve its intended purpose, funding needs to be increased to at least keep pace with inflation. Consequently, we ask that the amount of \$1.5 million be appropriated by this Subcommittee for the Enewetak Food and Agriculture Program to reflect the impact of inflation on the \$1.091 million over the past 10 years. (Applying a 3.5 percent inflation factor to the \$1.091 million for the past ten years results in an amount of approximately \$1.5 million.)

In addition, we note that authorization for funding of the Enewetak Food and Agriculture Program expires at the end of fiscal year 1997. We trust that the Congress recognizes the necessity and importance of continued funding of the food and agriculture program to assist the peoples affected by the United States Nuclear Testing Program. Accordingly, we trust that the Congress will amend Section 103(h)(2) of

Public Law 99-239 (Compact of Free Association Act of 1985) to authorize funding for an additional five years, through fiscal year 2001.

Below, we briefly describe why the Enewetak Food and Agriculture Program is necessary, and report to you efforts made by us to put these funds to the best possible use.

CLEANUP OF RESIDUAL RADIATION CONTAMINATION

Our objective is the cleanup of Enewetak Atoll from radiation contamination to a level which would allow full and unrestricted use of our atoll. This objective would permit us to feed and house our growing population and would permit us to pursue economic development.

PRESENT SITUATION

Between 1977 and 1980 the United States undertook to rehabilitate Enewetak from the devastation and radiation contamination which occurred as a result of nuclear weapons testing conducted by the United States. Forty-three nuclear devices were exploded on the atoll including the first thermonuclear device (hydrogen bomb) detonated by the United States. Although that rehabilitation effort was a good start, it remains unfinished. We presently have use of less than 50 percent of our atoll for living and food producing purposes. Even that figure is misleading because of the poor soil conditions of the 50 percent of the land available to us. The soil is in poor condition because most of it was covered by asphalt and concrete during use of Enewetak by the United States for nuclear weapons testing.

ENEWETAK FOOD AND AGRICULTURE PROGRAM

The Enewetak Food and Agriculture Program enables us to live on Enewetak. It provides funding for imported food, continued agriculture rehabilitation, operation of a motor vessel which brings us the imported food, a nutrition education program, and an operation and maintenance component conducted out of a facility on Enewetak known as the field station.

1. Efforts made to increase food production. As we previously explained to this committee, we were unhappy with the state of the agriculture rehabilitation program when we inherited the program from the Department of Energy. Accordingly, in 1993 we had an assessment of our agriculture situation conducted by experts affiliated with universities in the Pacific. The purpose of such assessment was to determine the current agriculture situation and to develop a plan for increased food production. The plan was completed and implementation of a new program occurred in late summer 1993. The most significant aspect of the program is the reinfusion of nutrients into the soil. This is accomplished by digging trenches and placing organic material in the trenches along with a compost mixture of copra cake and chicken manure. The reinfusion of nutrients into the soil is extremely labor intensive and requires the importation of copra cake and chicken manure. Although the work is progressing, additional funding is required to provide greater manpower and the necessary equipment, materials and supplies. The inflation adjusted funding of \$1.5 million as requested in this statement would greatly assist in accelerating the agriculture rehabilitation of the atoll.

2. Importation of food. Imported food is required because of the poor soil condition of the land available to us and the radiation contamination of other lands. Since we have taken over the program we have increased the quantity of imported food by 50 percent without any increase in the overall program budget. We have accomplished this by utilizing bidding procedures for food purchases; elimination of transportation charges by use of our motor sailer (Wetak II); elimination of import tax on food; and reduction of other program expenses.

3. Nutrition education program. Since our people cannot rely on traditional foods we must import food, the nutritional value of which is unfamiliar to us. Several years ago we became aware that some of our people, particularly our children, suffered from malnutrition. Accordingly, we instituted a nutrition education program. We are pleased to report that we have been apprised by physicians that malnutrition among our children has been greatly reduced.

4. Wetak II (waterborne transportation). The Wetak II, a fifty foot motor sailer, is used to primarily transport our imported food purchases and agriculture material from the region to Enewetak. Food and agriculture material is transported from Majuro, a distance of 600 miles from Enewetak. We are extremely proud of the hard work and perseverance of our local crew and local captain in carrying out this assignment. Transportation in this manner permits us to save substantial shipping costs.

5. Field Station. Operation and maintenance of the entire program is conducted out of a facility referred to as the Field Station. The machinery and equipment required by the agriculture, food and transportation components of the program are kept at the Field Station. Field Station personnel provide all the required agricultural work; maintain, service, and operate the equipment required by the various components of the program; make payments and maintain books of accounts; and coordinate the procurement of food, material and equipment. The overall manager of the program is Johnson Hernest. Other management personnel include Samson Yoshitaro and Mathan David. The program employs 39 full and part-time employees.

RADIOLOGICAL MONITORING AND HEALTH CARE

We have noticed an increase in the incidence of thyroid nodules and cancers in our population. Accordingly, we must be assured that our people are adequately monitored on a whole body basis and for plutonium inhalation or ingestion. Similarly, we must be assured that the environmental monitoring of residual radionuclides in the soil continue at the frequency and type of work indicated by Lawrence Livermore Laboratory. We also note that we were told that the Defense Nuclear Agency was curtailing its monitoring activities of the Runit nuclear waste containment site (the Dome). We consider the monitoring of the Runit dome to be a continuing responsibility of the United States. Accordingly, we asked that an agency of the U.S. assess the current condition of the dome and its effect on the surrounding environment. In addition, we asked that a plan for the long term monitoring of the dome be developed. We understand that the assessment work has begun. We trust that the remainder of our request will also be undertaken by the United States.

Our concerns regarding the exposure of our people to radiation is underscored by our belief that we were contaminated by radiation from the fallout of the 1952 Mike test while we were living on Ujelang Atoll. This belief, and the fact that our people reside on an atoll that contains residual radiation, emphasizes the need for better monitoring and better medical care of our population than has occurred to date. We are included in the 177 Health Care Program (also known as the Four Atoll Health Care Program). However, that program is burdened by an enrollment of over 11,000 persons which limits the medical care available to our population. In fact, the administrator of the program has calculated that the program is able to spend only \$11 per person per month. Clearly, such an amount is inadequate to provide any semblance of adequate medical care let alone the type of care required by a population resettled on an atoll that contains residual radiation from the testing program.

ENVIRONMENTAL SITUATION

The issues that we have mentioned above are directly related to the environmental condition of Enewetak. We are trying to do the best we can with the little arable land available to us. However, the real issue for our long-term well-being is the environmental remediation of our entire atoll so that all of it can be used without fear of increased health risk from radiation contamination. We are aware of the commendable efforts made in the United States to cleanup radiation contaminated sites. Oakridge, Tennessee is undergoing environmental remediation at a cost of several hundred million dollars per year and cleanup is projected to require thirty years of such effort. Other sites such as Hanford, Rocky Flats and Los Alamos are just a few of the areas receiving environmental cleanup. We understand that the standards to which the contaminated areas in the United States are being cleaned-up are standards much more stringent than those employed in the cleanup of Enewetak. For example, the dome on Runit island on our atoll is used to store radioactive material collected from throughout our atoll. We understand that the storage of such material in the manner stored on Runit would not be permitted in the United States. Furthermore, the dome is only a small portion of Runit. The remainder of Runit is contaminated with the extremely dangerous radioactive element, plutonium. Although we understand that the United States intended to cleanup those plutonium affected areas of Runit, no such cleanup ever took place. Worse, no effort was ever taken to ensure that adequate warnings, fencing and other methods generally used for the protection of people from contamination were maintained and/or put in place. We understand that this situation would not be permitted in the United States. Runit is but one example of how the cleanup methods used on Enewetak differ from those later employed in the United States. Another example is the level to which the land itself would be cleaned up to allow full and unrestricted use. The level of cleanup employed on Enewetak does not permit full and

unrestricted use of large portions of our atoll. Our environmental situation must be addressed to permit us to make as much use of our atoll as possible.

EDUCATION REHABILITATION

Several years ago we became concerned with the educational system on Enewetak Atoll. We had an assessment of our education situation conducted. As a result of that assessment, we hired two very qualified American teachers to assist us in upgrading our elementary school. We are very pleased with the development of our education program and the enthusiasm for learning that such program has engendered in our schoolchildren and community. In addition to a new and more effective education program, we rehabilitated a three story structure which is now used as a sixteen classroom elementary school for our 320 schoolchildren. We are proud that our new school building is one of the finest such facilities in Micronesia.

ECONOMIC DEVELOPMENT

We are attempting to have Enewetak developed as a fishing base, fresh fish transshipment facility, and a tourist diving destination. Enewetak seems to be in a good location for such endeavors. In addition, there are some existing facilities (runway and fuel tanks) which could be upgraded to facilitate economic development. A feasibility study and business plan was completed for the fishing base and fish transshipment concept. We were negotiating with an interested private sector operator. Unfortunately, there was serious concern about the residual radiation on the Atoll and the perception in the Japanese market of radiation contamination on Enewetak atoll. This concern and perception about the residual radiation contamination at Enewetak presents a major impediment to economic development and underscores the need to finish the environmental clean-up of the Atoll. We hope to have cost figures for such remediation within the next twelve months.

CONCLUSION

In closing, we thank the Congress for funding the Enewetak Food and Agriculture Program and trust that it will give due consideration to the necessity for an inflation adjustment to that funding. We also trust that the issues describe herein, particularly the remediation of radiation contamination at Enewetak, will be addressed by the United States.

PREPARED STATEMENT OF THE CIRCLE OF NATIONS WAHPETON INDIAN SCHOOL BOARD (WAHPETON, ND)

For over ninety years, the Circle of Nations Wahpeton Indian School has been an important place to people from many areas of the country. It is a tribal community within the town of Wahpeton, a traditional tribal meeting ground where three rivers bring together the Plains, Woodland, and Mountain cultures. The states of North Dakota, South Dakota, and Minnesota intersect here

Tribal leaders count on this school to help families who are having troubles and whose children have not been able to get the services they need in their own home areas. The Circle of Nations School is a residential boarding school that offers special education, counseling, health and nutrition services in a 24 hour daily home living program for the nine-month academic year.

The provision of education and health services to Indian people has been established by numerous treaties and agreements in United States history. This was recognized when the school was created by an act of Congress in 1904. The continued federal-Indian trust responsibility was underlined when the school converted from BIA to tribal control in 1993 under Public Law 93-638, the Indian Self-Determination and Education Assistance Act. The school is now administered under a grant contract to the Sisseton-Wahpeton Dakota Nation.

The school was made a therapeutic model with Public Law 103-382, the Improving America's Schools Act of 1994. This concept is a positive departure from the old boarding school system that has been widely criticized as a contributor to family dysfunction and cultural breakdown in tribal communities throughout the United States. But the concept must be staffed and funded to be carried out to its full potential.

We, the school board, represent tribal nations with the largest populations of students enrolled at Wahpeton. The school board wishes to express their true and unequivocal support of the Circle of Nations School. The program at Wahpeton is our concentrated effort to create a sensible and cost-effective approach to problems that affect the future of our youth and our communities.

"It takes a village to raise a child." This saying is currently popular as the new answer to nationwide symptoms of social ills such as crime, drugs, poverty, illiteracy, diseases, and the breakdown of the family. This country's Indian people have always known that it takes a village. Today, the Wahpeton therapeutic residential school community is what must serve that purpose for many Indian children.

There is no social or financial safety net that ensures that all Indian children will get adequate healthcare or educational assistance in their home communities. Having these programs all concentrated in one place, with a good school and highly skilled, dedicated workers is the only logical solution to the needs these children have.

Students come to Wahpeton for reasons that are all too familiar with the Circle of Nations School. Homelessness is a common condition among students and their families, as are chemical dependency and mental health problems. Most students have been physically and/or sexually abused. Traumatic brain injury and learning disabilities are not an unusual factor in the mix. Some have major hidden health problems like FAS/FAE. It is impossible to diagnose all who are affected by fetal drug and alcohol exposure.

All of these things have to be taken into consideration and addressed for each child. This takes a number of staff of different disciplines to teach and guide these students all around the clock for the whole school year. No student has just one problem that brought them to Wahpeton. They all come into play to put the student at risk. A few cases can be cited as an illustration of the sorts of challenges we are faced with as a school.

One student was found living in an abandoned urban warehouse, physically abused and neglected by an alcoholic, mentally ill, and indigent parent. Indian Child Welfare found a foster placement in the student's home state, but the student could not adjust to the public school and was truant, using drugs and alcohol, and involved in gang fights. The student completed two school years at Wahpeton and experienced success in drug and violence prevention, sports, academics, social development and cultural activities. Meanwhile a suitable guardianship was arranged for the student's transition from CNS to the higher grades. Although the school gets many such applications from agencies trying to place students from similar circumstances, it is not realistic to admit a large number of these high-risk street kids without the resources to deal with them effectively.

Most students have some degree of homelessness and frequent moves in their history. Families of students may move from place to place and use a relative's mailing address or phone for messages. Often students will try to call home after being at school for a period, only to find the phone disconnected. Parents who are forced to move feel that their children are safe at the school when family upheaval occurs.

An example: Three siblings were enrolled at Circle of Nations School for the fall semester with a permanent mailing address given on the student admissions application. In the winter a story appeared in the state's largest newspaper which featured the students' homeless parents and older siblings living in a van. Yet the parents had always been in regular contact by phone and mail to the school.

Another student came to Wahpeton from another state and soon began to get infractions for AWOL, chemical abuse, assault, and angry disruptions. The student was placed in a structured counseling and behavior program on campus. While counselors and social workers applied to various adolescent treatment programs and tried to elicit funds from various state, tribal, and federal entities, the student revealed a history of abuse in the household, which was ongoing. The alleged perpetrator lived in the household and was reportedly abusing other children. Although the abuse had been previously reported and investigated, the charges did not stick.

The student feared to return home for the summer. No agency would take custody of the student even though the parent voluntarily relinquished custody. No state, tribe, or county would assume jurisdiction or responsibility for this child's welfare. No treatment center would accept the student for varying reasons. The Indian Service Regional Youth Treatment Centers in the student's home area rejected this student because the student's dual CD/mental health treatment needs were specifically outlined (the school had a psychological evaluation done for this student) and judged as too high. Unfortunately, this scenario is not atypical.

For decades now the school has been a last resort for students with nowhere else to go. There are numerous success stories: teachers, scholars, administrators, business and professional people, actors, artists, public officials and senators. The present superintendent, an alumnus and graduate of the Wahpeton Indian School, knows well the experience of these students, having spent the year round through elementary and middle school grades. Developing children have time and resilience in their favor. If given the skills, they can learn how to cope and to pull themselves through life.

Life today is more complicated for all children in this country. The students at Wahpeton need more specialized help than in the past. We would like our students to grow up to be successful. However, we realize that our task is to help students overcome difficulties that they already have, and prevent a costly outcome in the future. For without our "village" pitching in to raise the child, the child becomes an adult without a social conscience or the strength of spirit to be self-sufficient.

It makes sense to pool resources at a residential school. In the ideal plan, the kind of funding that is concentrated on an isolated youth treatment center would instead be used to create a comparable center on campus for the youth who need it most. These students are going to end up requiring the use of different health, social service, and law enforcement services anyway, if they are left on their own in a problem environment.

BIA and Indian Health Service funds and service do not follow these students to Wahpeton. Once removed from their home tribal areas, they will probably lose eligibility for Medicaid as well. Indian Health Service provides a school nurse and basic health service only. There is no psychiatrist, psychologist, or mental health clinician.

The Circle of Nations School is requesting funds to further develop and staff the Behavioral Health Center on-campus. These are start-up funds for a program that has been operating on a small scale during the 1996-97 school year. This program could pay for itself in five years if the necessary staffing and supervision were available.

In this era of dwindling resources and budgetary cuts, the obvious solution is to consolidate and serve a population with the most potential benefit. This is the purpose of school reform and in agreement with the whole village, whole child concept.

PREPARED STATEMENT LORENE WILLIS, PRESIDENT, NATIONAL INDIAN EDUCATION ASSOCIATION

The National Indian Education Association (NIEA), the oldest national organization representing the education concerns of over 3,000 American Indian and Alaska Native educators, school administrators, teachers, parents, and students, is pleased to submit this statement on the President's fiscal year 1998 budget regarding Indian education. NIEA has an elected board of 12 members who represent a broad cross-section of the national Indian education community. NIEA's annual convention provides our members with an opportunity to network, share information, and hear from Congressional leaders and staff and federal officials on policy and legislative initiatives impacting Indian education.

First, we want to commend President Clinton for a budget that emphasizes the importance of education for all American citizens, including the First Americans. His school construction and education technology initiatives are critically needed by Bureau of Indian Affairs (BIA)-funded schools. Yet, we must not forget that programs such as the Office of Indian Education (OIE) in the Department of Education (DOE), Impact Aid, and higher education scholarships deserve further consideration for possible increases. Our testimony will discuss Indian education and related programs administered by the BIA and the Indian Health Service (IHS) as well as the school construction initiative.

Second, we have noted the transfer of funding for OIE programs from the Interior to the Labor-HHS-Education Appropriations Subcommittee. Prior to this development, OIE was the only DOE program funded from an appropriation other than Labor-HHS-Education, which often placed it at odds with the BIA's other priority programs. Our testimony also address OIE. We believe education is part of the federal trust responsibility regardless of what type of school—public or tribal—Indian and Alaska Native students attend.

A. BUREAU OF INDIAN AFFAIRS (BIA)

NIEA concurs with the BIA's fiscal year 1998 budget investment of \$467 million for school operations. An additional \$58 million is requested for Continuing Education, Tribal Priority Allocations (TPA), and Special Programs.

Adult education.—Adult Education is a vital, yet continually under-funded, program that is desperately needed by adult American Indians and Alaska Natives who did not complete high school to help them obtain General Educational Development degrees (GEDs). The program's funding has decreased over the past three years to the fiscal year 1998 request level of \$2.3 million—itself a \$85,000 decrease from fiscal year 1997. All tribes need adult education programs and, with the elimination of OIE's Adult Education Program in 1997, funding for the BIA's program is critical. We urge a minimum of \$4 million for BIA adult education in fiscal year 1998.

Higher education scholarships.—NIEA supports the President's request of \$29.5 million for higher education scholarships. This program provides grants to tribally-contracted programs to provide financial aid for eligible Indian and Alaska Native students attending accredited post-secondary institutions. While scholarships are based on need, the program funds about 25 percent of a student's need. However, the unmet financial need for Indian and Alaska Native students nationwide is about \$80 million.

Johnson-O'Malley (JOM) program.—The fiscal year 1998 request is \$17.216 million, a \$1.040 million decrease from fiscal year 1997 and a \$7.143 million decrease from the fiscal year 1995 level of \$24.359 million. This is the only BIA program which provides for culturally relevant and supplementary academic needs of Indian children attending public schools. Given an increasing, rather than decreasing, student population, NIEA recommends funding for JOM at \$24 million in fiscal year 1998.

Indian school equalization program (ISEP) formula.—The President's fiscal year 1998 request is \$296 million for this program, which provides formula-based funding for 185 BIA-operated, elementary and secondary contract and grant schools. The amount, representing a \$10.5 million increase over fiscal year 1997, would provide about \$3,094 per Weighted Student Unit (WSU) compared to \$2,904 per WSU in School Year (SY) 1996–97. NIEA continues to support a funding level of \$3,500 per WSU, which we have recommended since fiscal year 1993. We note that the proposed \$3,094 per WSU is still far below the average per student expenditure by public elementary and secondary schools of \$6,300 per student in SY 1995–96 as reported by the National Center for Education Statistics (NCES).

Family and child education (FACE) program.—The fiscal year 1998 request of \$5.5 million for this program is an amount that for two years has remained unchanged despite a growing population. It is also \$1 million less than the enacted fiscal year 1995 level of \$6.5 million, itself a reduction by \$1.1 million from fiscal year 1994. We urge funding for this program at the fiscal year 1995 level with a 4 percent adjustment for inflation.

Student Transportation.—NIEA supports the fiscal year 1998 request of \$34.3 million for student transportation. BIA-funded schools, which are located primarily in rural, isolated areas, remain well below the national average. According to the latest School Bus Fleet information, the national average for student transportation costs in SY 1993–94 was \$2.94 per mile for public schools. But, the BIA-funded transportation cost in fiscal year 1996–97 was at \$1.60 per mile for 15,197 miles driven for day and boarding schools—a difference of \$1.34 per mile.

Administrative Cost Grants.—NIEA supports the fiscal year 1998 request of \$44.7 million. With at least 10 of the remaining 49 BIA-operated schools on the Navajo reservation indicating they will convert to grant status after July 1997, at a projected cost of \$4.6 million, the BIA will need another \$1.6 million for this expense. Severance costs may or may not be factored into the Administration's request, and there may be additional school conversions in fiscal year 1998.

Education facilities operation and maintenance (O&M).—The fiscal year 1998 request for Facilities O&M is \$74.6 million, a slight increase from fiscal year 1997. We support this level with misgivings because funding continues to fall below the level needed for this area.

Tribal departments of education (TDOE's).—Since the President's budget fails to provide funding for this item, NIEA recommends at least \$3 million for TDOE's, which are authorized by Public Law 103-382, the "Improving America's Schools Act." We believe sufficient funding should be provided to assist tribes to accomplish the original intent of the Act.

Tribal Colleges/Post-secondary Schools.—NIEA supports the President's request of \$29.3 million for tribally-controlled colleges operating grants, although the real need is about \$40 million based on an estimated 6,815 Indian Student Count (ISC). NIEA also supports \$2 million for tribal college endowments, \$2 million for economic development, and \$1.8 million for emergency facility repair and renovations. In addition, tribal colleges have never received facilities construction or renovation/repair money from the BIA. While the national average for Full-Time Equivalent (FTE) funding at mainstream community colleges is approximately \$6,200 per year, the level of FTE funding for some special population colleges is about three times that provided to the tribal colleges. NIEA also supports separate funding levels in fiscal year 1998 for BIA-funded post-secondary vocational institutions including Haskell Indian Nations University at \$8.1 million, Southwest Indian Polytechnic Institute (SIPI) at \$4.6 million, the Institute for American Indian Arts (IAIA) at \$5.5 million, and the United Tribes Technical College (UTTC) at \$2.5 million.

Graduate scholarships.—The fiscal year 1998 request of \$1.33 million for the Special Higher Education Graduate Program, which is the primary funding source for

American Indian and Alaska Native graduate students, is totally inadequate to help these individuals meet the costs of achieving an advanced degree. NIEA requests a funding level of \$3 million for fiscal year 1998. The program, which is administered by the American Indian Graduate Center (AIGC) of Albuquerque, New Mexico, has been woefully underfunded for the last 3 years. For school year 1995–96 the actual unmet need was \$10 million. During the fiscal year 1995–96 year the program funded an estimated 500 students at an average award of \$3,300—considerably lower than the \$6,750 per student award for fiscal year 1991–92. Scholarship awards have been decreasing despite an ever-increasing demand for these limited funds.

Replacement school construction.—The fiscal year 1998 request of \$14 million for Replacement School Construction is to complete the Many Farms High School on the Navajo reservation in Arizona. While we support this request, we must also point out that the current request list for new schools also deserve Congress's attention and support.

Education facilities improvement and repair (FI&R).—NIEA supports the fiscal year 1998 request of \$32.2 million for Education FI&R. Furthermore, since there is a backlog of over \$600 million in this program, we request that Education FI&R be funded at the fiscal year 1995 level of \$34.3 million with a 4 percent adjustment for inflation.

B. INDIAN HEALTH SERVICE (IHS)

Indian health professions scholarships.—The President's fiscal year 1998 request is \$28.3 million, a \$1.5 million increase over the fiscal year 1997 enacted level. However, NIEA supports the National Indian Health Board's (NIHB) recommended level of \$29.7 million. The Indian Health Professions Sections 103, 104, and 114 under Title I of the "Indian Health Care Improvement Act" provides authorizations to support scholarship recipients, loan repayment to health professionals, and temporary employment during non-academic periods.

School-based health education programs (IHS and BIA).—NIEA successfully advocated in 1992 to obtain a new authorization in the Indian Health Care Improvement Act (IHCIA) to establish school-based health education programs. Our fiscal year 1998 request is \$5 million for both programs (\$3.5 million for IHS and \$1.5 million for BIA). Under Section 215 of the Act, the Secretary of HHS is authorized to award up to \$15 million in grants to tribes to develop school health education programs for reservation-based children in grades K–12 which could be set up in public, contract, grant and private schools. The Interior Secretary is directed to develop, in consultation with the Secretary of DHHS, a comprehensive school health education program for children ages pre-school through Grade 12 in BIA-funded schools. The Secretary of HHS is directed to do likewise within IHS.

The curricula in BIA-operated schools would include programs such as nutrition education, personal health and fitness, mental health wellness, substance abuse prevention, safety education, and activities for the prevention and control of communicable diseases. The Interior Secretary is also directed to provide training in health curricula to teachers in BIA-operated schools to ensure coordination and integration with existing programs and services and to encourage tobacco-free school environments. The area of school health education currently receives minimal support from both the BIA and IHS. Through an intra-agency agreement, IHS receives \$230,000 annually from the Centers for Disease Control and Prevention (CDC) for school health education programs, which is the entire budget for this effort. Otherwise, BIA has no specific funds for this purpose. We urge the Committee to support funding for this authorization by at least \$3.5 million for grants to tribes and \$1.5 million for the BIA to fulfill its requirements under Section 215.

HIV/AIDS prevention.—According to the CDC, there were 1,434 reported and verified diagnosed cases of AIDS among Native Americans as of June 1996, approximately a 12 percent increase over the amount CDC reported in October 1995 (1,283). Although the CDC's announcement on February 27, 1997 that the number of deaths nationally from AIDS had declined, including a 32 percent drop among American Indians and Alaska Natives, it did not address the issue of individuals living longer with AIDS and needing long-term care. We have noted there is no line item for AIDS medication in IHS's budget and that the President's budget does not cover the cost of drugs to treat Indian and Alaska Native people infected with HIV. The fact remains, however, that for these individuals, IHS is the only source for their medical care. Despite recent improvements in the treatment of HIV/AIDS, such as the development of more effective drugs, far too many of our people are being denied this type of care because IHS is not being funded to provide it. NIEA supports the National Congress of American Indians' (NCAI) recommendation that

a restricted line item be included in IHS's budget to cover the cost of AIDS-related treatment.

Furthermore, while NIEA supports the fiscal year 1998 request of \$3.8 million for HIV/AIDS Prevention, which is only a slight increase from fiscal year 1997, we cannot impress strongly enough upon the Committee the need for additional funding to combat this dreaded disease. NIEA recommends a significant increase in actual funding to all HIV/AIDS education and prevention programs within IHS, and urges the Committee to impress upon HHS to implement the final recommendations of the President's Advisory Council on AIDS Services Committee regarding Native American AIDS Care Issues.

C. PROPOSED NATIONAL SCHOOL CONSTRUCTION INITIATIVE

President Clinton has proposed a \$5 billion school construction initiative which would provide funds over the next four years for nationwide school construction and renovation. The proposed \$5 billion would help pay for up to half the interest that local school districts incur on school construction bonds, or for other forms of assistance that will spur new state and local infrastructure investment. Interior Secretary Bruce Babbitt has asked the Office of Management and Budget to include a 10 percent set-aside for BIA-funded schools rather than the 2 percent which is being considered by the legislation's sponsors.

The proposed 10 percent set-aside would allow the BIA to address its backlog of school repair projects, including school replacements. The estimated backlog of BIA schools needing repair and renovation is \$675 million. NIEA wholeheartedly supports the Secretary's request for a 10 percent set-aside for BIA-funded schools if the President's school construction initiative is enacted.

In conclusion, we want to thank the Subcommittee for continuing to give its attention to the issues and concerns we have raised in our testimony. In light of the federal government's trust responsibility for the education all American Indians and Alaska Natives, and on behalf of our members, we urge the Subcommittee's support for maintaining or increasing the funding for the Indian education and related programs discussed herein at the levels we have recommended.

PREPARED STATEMENT OF JAMES E. BILLIE, CHAIRMAN, THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe of Florida is pleased to submit this statement regarding the Tribe's fiscal year 1998 request for \$1.21 million from programs in the Department of Interior. The Tribe asks: that Congress provide \$840,000 from the National Park Service, Everglades research budget for the Seminole Tribe for activities related to the Everglades Restoration Initiative on the Big Cypress Reservation; that Congress provide \$199,500 from the Bureau of Indian Affairs for water quality studies, as a part of the Tribe's Everglades restoration efforts for; and that Congress provide an additional \$173,000 from the Bureau of Indian Affairs for the design and construction of the best management practices on the Big Cypress Reservation.

The Tribe's Everglades Restoration Initiative is a \$63 million project to construct a comprehensive water conservation system. This project is designed to improve the water quality and natural hydro patterns in the Big Cypress Basin. This project will contribute to the overall success of both the federal and the state governments' multi-agency effort to preserve and restore the delicate ecosystem of the Florida Everglades. In recognition of this contribution, the Seminole Tribe's Restoration Initiative has been endorsed by the South Florida Ecosystem Restoration Task Force (see attachment) and has been found to be consistent with the recommendations of the Governor's Commission for a Sustainable South Florida.

THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe lives in the Florida Everglades. The Big Cypress Reservation is located in the western basins, directly north of the Big Cypress National Preserve. The Everglades provide many Seminole Tribal members with their livelihood. Our traditional Seminole cultural, religious, and recreational activities, as well as commercial endeavors, are dependent on a healthy Everglades ecosystem. In fact, the Tribe's identity is so closely linked to the land that Tribal members believe that if the land dies, so will the Tribe.

During the Seminole Wars of the 19th Century, our Tribe found protection in the hostile Everglades. But for this harsh environment filled with sawgrass and alligators, the Seminole Tribe of Florida would not exist today. Once in the Everglades, we learned how to use the natural system for support without harm to the environ-

ment that sustained us. For example, our native dwelling, the chickee, is made of cypress logs and palmetto fronds and protects its inhabitants from the sun and rain, while allowing maximum circulation for cooling. When a chickee has outlived its useful life, the cypress and palmetto return to nourish the soil.

In response to social challenges within the Tribe, we looked to our Tribal elders for guidance. Our elders taught us to look to the land, for when the land was ill, the Tribe would soon be ill as well. When we looked at the land, we saw the Everglades in decline and recognized that we had to mitigate the impacts of man on this natural system. At the same time, we acknowledged that this land must sustain our people, and thereby our culture. The clear message we heard from our elders and the land was that we must design a way of life to preserve the land and the Tribe. Tribal members must be able to work and sustain themselves. We need to protect the land and the animals, but we must also protect our Tribal farmers and ranchers. Recognizing the needs of our land and our people, the Tribe, along with our consultants, designed a plan to mitigate the harm to the land and water systems within the Reservation while ensuring a sustainable future for the Seminole Tribe of Florida. The restoration plan will allow Tribal members to continue their farming and ranching activities while improving water quality and restoring natural hydroperiod to large portions of the native lands on the Reservation and ultimately, positively effecting the Big Cypress National Preserve and Everglades National Park.

The Seminole Tribe's project addresses the environmental degradation wrought by decades of federal flood control construction and polluted urban and agricultural runoff. The interrupted sheet flow and hydroperiod have stressed native species and encouraged the spread of exotic species. Nutrient-laden runoff has supported the rapid spread of cattails, which choke out the periphyton algae mat and sawgrass necessary for the success of the wet/dry cycle that supports the wildlife of the Everglades.

The Seminole Everglades Restoration project was designed to allow the Tribe to sustain ourselves while reducing impacts on the Everglades. The Seminole Tribe is committed to improving the water quality and flows on the Big Cypress Reservation. We have already committed significant resources to the design of this project and to our water quality data collection and monitoring system. We are willing to continue our efforts and to commit more resources, for our cultural survival is at stake.

In addition to addressing the ecosystem concerns related to the Big Cypress Reservation, the Tribe has been actively involved in the development of the ecosystem-wide restoration plan. The Tribe, as an active member of both the Governor's Commission for a Sustainable South Florida and the South Florida Ecosystem Restoration Task Force and Working Group, has worked cooperatively with our neighbors to design a sustainable future for all of South Florida.

SEMINOLE TRIBE EVERGLADES RESTORATION INITIATIVE

The Department of Interior, through the BIA, has provided the Tribe with about \$200,000 in each of the fiscal years 1994 through 1997. In addition, through the NPS, Interior provided the Tribe with \$390,000 in fiscal year 1997. The Tribe has used these funds to monitor and analyze the quality and quantity of water coming onto and leaving the Reservation. The Tribe has also developed a conceptual plan that will enable us to meet new water quality standards essential to the cleanup of our part of the Everglades ecosystem and to plan for the storage and conveyance of our water rights. The appropriated funds have also been used to design the Tribe's best management practices program, with the assistance of the Department of Agriculture's Natural Resources Conservation Service. We continue to use available funds to further the design and planning work necessary to implement our Everglades Restoration Initiative.

The Tribe's Everglades Restoration Initiative is designed to mitigate the degradation the Everglades has suffered through decades of flood control projects and urban and agricultural use and ultimately to restore the nation's largest wetlands to a healthy state. Our Everglades Restoration Initiative will enable the Tribe: to collect and monitor data to establish a baseline and to evaluate performance of the overall system design; to design and construct surface water management systems to remove phosphorus, convey and store irrigation water, improve flood control, and rehydrate the Big Cypress National Preserve; to commit to the long-term operation and maintenance of new water management systems; and to design and implement comprehensive best management practices for the Big Cypress Reservation.

The Initiative will cost approximately \$63,427,496. This project will enable the Tribe to meet the numeric target for phosphorus concentration that is being used for design purposes by state and federal authorities. It will also provide an important public benefit: a new system to convey excess water from the western basins

to the Big Cypress National Preserve, where water is vitally needed for rehydration and restoration of lands within the Preserve.

In addition, a portion of the Tribe's project is being considered as a "critical project," under Section 528(b)(3) of the Water Resources Development Act of 1996. This authority allows the Corps of Engineers (COE) to begin construction of a number of Everglades restoration projects on a fast track. On the basis of consensus agreements reached at a series of meetings, the Tribe's critical project is expected to be funded. The planning and design funding requested in this testimony is crucial because the funds will allow the Tribe to continue to move the critical project portion of the Initiative along in order to meet the Congressional deadline.

CONCLUSION

Improving the water quality of the basins feeding into the Big Cypress National Preserve and the Everglades National Park is vital to restoring the Everglades for future generations. By granting this appropriation request, the federal government will be taking a substantive step towards improving the quality of the surface water that flows over the Big Cypress Reservation and on into the delicate Everglades ecosystem. Such responsible action with regard to the Big Cypress Reservation, which is federal land held in trust for the Tribe, will send a clear message that the federal government committed to Everglades restoration.

The Seminole Tribe is ready, willing, and able to begin work immediately. Doing so will require substantial commitments from the Tribe, including the dedication of over 9,000 acres of land for water management improvements. However, if the Tribe is to move forward with its contribution to the restoration of the South Florida ecosystem, a substantially higher level of federal financial assistance will be needed as well.

The Tribe has demonstrated its economic commitment to the Everglades Restoration effort; the Tribe is asking the federal government to participate in that effort, also. This benefits not just The Seminole Tribe, but all Floridians who depend on a reliable supply of clean, fresh water flowing out of the Everglades, and all Americans whose lives are enriched by this unique national treasure.

In closing, I must also urge you to give careful consideration to increasing the funding set-aside for Tribal Priority Allocation (TPA) accounts. The BIA budget has already absorbed a disproportionate share of the cuts which Congress has made to discretionary funding. TPAs, of all categories within BIA accounts, most directly boost tribal economies by providing direct funding to tribal priority infrastructure, health, and education needs. With growing populations and annual inflation, even "holding the line" on TPA's amounts to a reduction in funding. Although the federal government is working through tight budget times, I urge you not to try to balance the federal deficit on the backs of the Tribes. The federal government has a trust responsibility to the Tribes. Severe cuts to the BIA budget, and to TPA's specifically, violate that trust responsibility. All Tribes, including the Seminole Tribe of Florida, are struggling with increasing needs and decreasing funding. For the sake of our children and the survival of Tribal culture, I urge you to fund fully the TPA's.

I appreciate the opportunity to present my views to this Subcommittee and would be happy to provide additional information upon request.

PREPARED STATEMENT OF THE COLORADO RIVER INDIAN TRIBES

The Colorado River Indian Tribes is pleased to have the opportunity to submit the foregoing statement to the Senate Appropriations Subcommittee on Interior and Related Agencies regarding the fiscal year 1998 appropriations that are necessary to effectively operate our tribal government programs.

BUREAU OF INDIAN AFFAIRS

The proposed BIA budget of \$1.73 billion would restore \$126.1 million to the BIA for fiscal year 1998. This \$126.1 million increase is less than half the amount that was lost in fiscal year 1996. None of the funding lost in fiscal year 1996 has been restored.

The BIA budget request for fiscal year 1998 emphasizes funding for Tribal Priority Allocations (TPA) programs, which include tribal Self-Determination contracts and Self-Governance compacts. The requested increase is necessary to keep pace with the transfer of additional Indian programs into TPA by the BIA. Tribal Priority Allocations funds will support this transfer of programs and funding from the BIA to tribal governments will allow more local control of programs with less federal

bureaucracy. Although this increase is, it is hardly adequate to meet the needs of the programs that serve Native American people.

INDIAN HEALTH SERVICES

IHS

The proposed IHS budget of \$2.4 billion requests an increase of \$68 million over the fiscal year 1997 appropriated level. However, the funding is not adequate to keep pace with medical inflation costs, population growth and newly-recognized tribes, and would not reduce the backlog of unmet health care needs. The Colorado River Indian Tribes are particularly concerned about the lack of increases for Contract Health Services for the past two years.

Construction of Parker Out-patient Facility

The Colorado River Indian Tribes (Tribes) believe that the long overdue replacement of the Parker Out-patient Facility should be a top priority with IHS. Total funding of \$20,291,320 is needed to complete the design and construction of the Parker Health (Ambulatory) Center. This included \$661,020 to complete the design phase of the project and \$19,630,300 for the construction phase and medical equipment. After many years of delay in the planning process to begin replacement of the health care facility, the Tribes assumed responsibility of the project and a contract for the design and construction of the facility was awarded. Since then, Architectural/Engineering services for the design is near completion and construction is expected to begin in the spring of 1998, provided that funding is appropriated in the fiscal year 1998 budget.

Funding for construction of this project is needed in order to bring this project to completion. The current facility is old, originally constructed in 1930 with additions made in the 1950's, and functionally obsolete and cannot serve the medical needs of the population. In the past the Tribes have received Congressional support for the construction of the facility. Funding for the construction and staffing of the new facility has been rated top priority for the last ten years and construction has yet to be initiated.

SPECIFIC APPROPRIATION REQUEST

Colorado River Indian Irrigation System

In 1993, \$1.9 million was allocated for the Colorado River Indian Irrigation Project. Although rehabilitation work on the Colorado River Indian Tribes Irrigation Project has made much progress, much work is still needed to complete the rehabilitation work. Funding in the amount of \$3,450,000 is requested for the following components of the project:

1. Replacement of existing large gate check structures (8) which are old hand-operated wooden gates that severely reduce the amount of water delivered to the farms and cause numerous breaks in the canal banks. These failing structures need to be replaced with numerous breaks in the canal banks. These failing structures need to be replaced with modern radial gate control structures with automated level controls at an estimated cost of \$1,600,000.

2. Replacement of six existing large radial gate structures, which are extremely corroded and cannot be effectively operated due to old controls. These gates are failing and should be rehabilitated. Structural rebuilding, and installation of modern electric controls and automation will allow them to effectively control the large amount of water flowing through them. They currently serve over 40,000 acres. The cost is estimated at \$600,000.

3. Replacement of existing wooden wasteway structure which maintains the water level in one of the largest laterals in the CRIT Irrigation System which leaks (wastes) a very large amount of water to a drain emptying to the Colorado River. This structure needs to be replaced with a modern concrete and metal sluice gate with electric controls and automatic level sensors to prevent flooding damage to the neighboring cropped fields at an estimated cost of \$300,000.

4. Lateral 73-36, which serves a substantial portion of the southeastern quarter of the Reservation, has inadequate irrigation water carrying capacity to meet the needs of the crop lands in that area. If the Tribes are to use that land, it must be enlarged to increase the culvert and gate structures and related field turnouts at an estimated cost of \$300,000.

5. There are currently no farm water delivery measurement devices for the 80,000 acres of irrigated crop land on the Reservation. The Tribes must have the means to carefully control and distribute their water and regulate the farm lessees to keep water use at its most efficient. In addition, the Tribes cannot make full use of their

irrigable land without these measurement devices and good efficient water control. Estimated cost of \$400,000.

6. All improvements to the irrigation system will require professional engineering design and supervision when constructed. Estimated cost for such engineering design consultant services is \$250,000.

CONCLUSION

The Colorado River Indian Tribes ask for your support in protecting the funding for BIA and IHS in fiscal year 1998. In 1995, the Senate Budget Committee included the following language in its 1996 Concurrent Resolution on the Budget, calling for protection of the BIA and IHS funding at the 1995 levels for the next seven years:

“The [Senate Budget] Committee recognizes the unique trust relationship between the U.S. Government and the nation’s Indian tribes and pueblos. That trust relationship is based on a government-to-government principle embodied in treaties and subsequent actions by both the Executive and Legislative Branches of Government, and the courts. The Committee acknowledges this trust relationship, and assumes that programs serving Native Americans through the Bureau of Indian Affairs will be given consideration for ongoing federal support.” (Senate Report 104–82)

To uphold this Congressional commitment, the Colorado River Indian Tribes request this language to be included in the 1998 Concurrent Resolution on the Budget.

The Colorado River Indian Tribes thank you for the opportunity to bring these matters to your attention. Please feel free to contact the Tribes If you have any additional questions.

PREPARED STATEMENT OF BRUCE WYNNE, CHAIRMAN, SPOKANE TRIBE OF INDIANS

Thank you for the opportunity to submit this testimony on behalf of the Spokane Tribe. The Tribe is located in Eastern Washington, has 2,145 members and a Reservation of 156,000 acres. While the Spokane Tribe was historically a fishing tribe, we now rely primarily on timber for tribal income. There are three program areas within the Bureau of Indian Affairs for which the Tribe is asking for increased funding over the Administration’s fiscal year 1998 request: Tribal Priority Allocation (\$195,900); Upper Columbia United Tribes (\$400,000); and Lake Roosevelt Management (\$100,000). We also support the President’s proposed increase of \$3 million for funding for the Tribally Controlled Community Colleges. In the Indian Health Service, the Tribe is asking the Subcommittee to support funding for new modular units to house the Tribe’s clinic programs (approximately \$500,000); funding for an elderly assisted living program (\$200,000); and funding for operational costs of the Healing Lodge of the Seven Nations youth treatment facility (\$2.1 million). In addition, there are two policy matters the Tribe wishes to bring to the Subcommittee’s attention: the first is the proposal to remove the trust responsibility office from the BIA which we oppose at this time and the second is the need to include tribes in the decisions related to restructuring of the Pacific Northwest Energy System.

BUREAU OF INDIAN AFFAIRS

Tribal Priority Allocation (TPA) Account

The BIA budget request shows a modest increase in TPA funding. As you know, TPA represents nearly 50 percent of the total budget for the BIA but it is the lifeblood of tribal governments. It is the money tribes receive to support services for their people. We do not have a tax base; the United States owns legal title to all our lands and they are not taxable. The United States obligation to provide funds for tribal health, education and welfare programs is part of the treaty guarantees made to tribes by the United States in return for the cession of millions and millions of acres of land.

Because of the decreases in fiscal year 1996 and fiscal year 1997 funding for the TPA account, the proposed increase will leave tribes barely even with the fiscal year 1995 actual dollar level but actually losing in terms of adjustments for inflation. At Spokane, our TPA funding in fiscal year 1997 was \$593,200; the anticipated funding in fiscal year 1998 would be \$635,700, an increase of \$42,500. Mr. Chairman, we use these funds for many purposes, including tribal government infrastructure, services for children and the elderly, scholarships, education, courts, law enforcement, adult vocational training, agriculture and forestry. As you can see, the funds must be stretched very thin for all programs. The services the Tribe is expected to deliver versus the amount of our contracts for these programs does not fulfill the BIA’s

trust responsibility. For example, our contract for natural resources is \$2,800, obviously not enough to fund even a support staff person; community fire protection is funded at \$4,100; public safety at \$12,700. Our additional identified needs total \$195,900 as shown below: \$40,000 for scholarships; \$40,000 for fire protection; the Tribe currently loses 98 percent of all structure fires because of bad equipment, inadequate communications, and remote fire stations; \$115,900 for tribal courts. The Tribe's court caseload has increased fourfold in two years.

We ask the Subcommittee to support the President's proposed increase for TPA and to add more if possible to this account which targets spending at the local level. An across-the-board ten percent increase over the President's budget would be of great benefit to all tribes nationwide.

Tribally Controlled Community Colleges Act

The President's budget requests an increase of \$3 million for the TCCC's. We believe this minimum amount is necessary to maintain stable and productive colleges on Indian reservations. The Spokane Tribal College is in its early stages of development as a sister college of the Salish-Kootenai College at the Flathead Reservation in Montana. We are proud of our accomplishments to date and look forward to full participation in the TCCC's program in the near future.

Upper Columbia United Tribes (UCUT)

The primary purposes of the UCUT program is to mitigate the harm to fish and wildlife caused by the construction and operation of hydroelectric facilities on the Columbia River and its tributaries. The tribal portion of this program has helped the Northwest Power Planning Council to understand the fundamental importance of fish and wildlife resources to the religious, cultural and economic livelihood of the Indian Tribes. UCUT funds are used to implement, monitor and evaluate fish and wildlife plans, as well as for regulatory enforcement, for planning, and for coordination between state, federal and tribal governments.

The President's budget request of \$297,000 includes a return of \$74,000 that had been transferred in fiscal year 1997 to the Kootenai Tribe under its self-governance program. Because UCUT involves management of a shared resource by four tribes in the Northwest, it is also a shared responsibility and thus is not a program that is amenable to separation of funding. We believe the proposed transfer is correct and hope that the Subcommittee will concur.

We have recently completed an assessment of total funding needs for this program and found it to be just over \$700,000. The four UCUT tribes would be most grateful if the Subcommittee would recommend an increase of \$400,000 to \$700,000 for fiscal year 1998. This increase is needed for the tribes to continue to leverage funding from other sources such as BPA and EPA; to implement new fish and wildlife projects approved by NPPC in 1995; and to maintain and improve existing projects approved in 1987, 1994, and 1995. In addition, funds are needed to assist tribes in developing recommendations for a NPPC amendment process being initiated this year.

Lake Roosevelt

Lake Roosevelt was formed when the Grand Coulee Dam was constructed in the early 1940's. Both the Spokane and Colville Tribes participate in the management of the environment and the recreational uses of the area surrounding the Lake. The Tribes implement the cooperative management agreement entered into between the Tribes and the Department of the Interior for management of this resource. The BIA has asked for an increase from \$577,000 in fiscal year 1997 to \$590,000 in fiscal year 1998. The Tribe supports the proposed increase. For the Subcommittee's information, the Spokane Tribe's contract amount is \$185,000; the actual, documented need is \$285,000. Right now, the contract supports salaries and vehicle costs for three rangers; it does not fund the parks maintenance staff, vehicles or supplies. The Tribe must pay these costs from its own revenues. Therefore, the Spokane Tribe requests an additional \$100,000 earmarked for the Tribe's management contract for Lake Roosevelt.

The Tribe also supports the testimony of the Northwest Intertribal Court System requesting funding for the Indian Tribal Justice Act and for the NICS program through the BIA.

INDIAN HEALTH SERVICE

As a general comment, the Spokane Tribe is concerned about the inadequate funding base for the Indian Health Service, particularly the lack of funds for Alcohol and Substance Abuse, and the inadequate base for Mental Health Services. We note that the fiscal year 1998 budget request does not include increases for inflation and to

meet the cost of implementing managed care throughout the IHS system. The Tribe is also concerned about the ongoing need for additional resources for construction funds, since many of the clinics in the Northwest are outdated, and unable to meet standards for quality health care.

An IHS service unit clinic at Spokane serves all of the Indians residing on and near the Spokane Reservation. The clinic is small and is housed in a substandard facility. It is understaffed, with not enough doctors, dentists and other needed health personnel. We understand that Representative Nethercutt, who is the Tribe's representative in the Congress, is working with the IHS to obtain modular units to house the clinic. We ask the Subcommittee's support for his efforts. The cost will be about \$500,000.

In addition, Mr. Chairman, we would like to begin an assisted living program for our elderly citizens through the CHR program at IHS. The Tribe would need a minimum of \$200,000 to establish such a program.

Our third request under IHS is for \$2.1 million in fiscal year 1998 for operational costs of the Healing Lodge of the Seven Nations. The Healing Lodge is a residential program that utilizes a holistic and traditional American Indian approach as well as the 12-step principles of recovery for the treatment of chemically dependent youth. The Healing Lodge is governed by seven tribes in Washington, Idaho and Oregon. In addition to the Spokane Tribe, the Colville, Kalispel, Nez Perce, Kootenai, Coeur d'Alene and Umatilla Tribes participate. Last summer, the facility moved to a new site in the Spokane Valley. Within a 32-youth and 12-family bed facility on a forested 38-acre site, the treatment team responds to the needs of Native youth by offering such treatment services as group and individual therapy; culturally-relevant therapy; life skills instruction; chemical dependency lectures; family therapy; aftercare and transitional planning; and health and mental health, nutrition and fitness assessments. At the end of February, the Healing Lodge completed its first cycle under a new, eight-week treatment program, having provided services to 151 youth aged 13 to 18. Of that total number, 62 completed treatment and were transitioned to aftercare programs.

Finally, the Spokane Tribe also supports the testimony of the Northwest Portland Area Indian Health Board in its entirety. We are particularly supportive of the proposed bill language that would allow use of maintenance and repair funds to be used for new construction when the costs of repair exceeds the costs of new construction. The Tribe also supports the request for \$200 million to cover unfunded mandatory costs increases.

POLICY MATTERS

The Tribe is very concerned about the proposed plan to implement reforms required by the American Indian Trust Fund Management Reform Act of 1994. In particular, the Tribe has determined that further study must be undertaken of the proposal to create an independent organization, outside the Department of the Interior, that would assume all trust asset management functions. Because of our concerns, we strongly urge that the Subcommittee not take any action to implement any part of the proposal until the Tribes have reached some agreement on the matter.

In addition, the Tribe is involved in an effort to develop a truly comprehensive restructuring plan for the Pacific Northwest Energy System. A steering committee, appointed by the governors of Washington, Oregon, Idaho, and Montana, developed recommendations for energy system restructuring that was driven largely by utility and industrial interests; it did not involve the affected Tribes. These same governors recently appointed a Transition Board to expedite implementation of the Steering Committee's recommendations but, again, the Transition Board does not include any tribal representatives nor have they attempted to involve the Tribes in their deliberations. The Tribes are concerned that the recommendations now under review do not address impacts on fish and wildlife and cultural resources, nor do they assure continuation of conservation programs or support for renewable energy efforts. We wanted the Subcommittee to be aware of our concerns in this area. Tribal efforts to organize to respond to these threats to federal law and treaty obligations are costly. We do not now ask for appropriations for this purpose but wanted you to know our concerns and the kinds of issues Tribes face almost constantly and to which they have little or no resources to respond.

The Tribe appreciates the opportunity to submit this testimony, and we look forward to working with the Subcommittee during the fiscal year 1998 appropriations cycle.

PREPARED STATEMENT OF DR. EDWARD SLOCUM, SUPERINTENDENT, NEW TOWN
PUBLIC SCHOOL DISTRICT NO. 1

My name is Edward Slocum. I am superintendent of the largest school district on the Fort Berthold Indian Reservation in western North Dakota. Our school district provides an education for 47 percent of the Native American children on Fort Berthold. Over 80 percent of the K-12 enrollment of the New Town Public School District No. 1 are Native American students. Ironically, our district is one of only two districts on this reservation which are not able to receive funding as a BIA ISEP Grant School through the U.S. Department of the Interior. This written testimony will focus on why it is so important for Congress to provide the funding necessary for ISEP to allow the current moratorium on new school starts to be lifted.

You may wonder why, if this district wanted to be a BIA funded school, did we wait so long to decide to apply? Historically, New Town was not believed to be located on the reservation when the U.S. Army Corps of Engineers created the city of New Town by relocating three smaller towns, which were flooded when the federal government built the Garrison Dam. Then, in 1974, the U.S. Supreme Court ruled that a large piece of land, including the city of New Town, was indeed located on the Fort Berthold Indian Reservation. The delayed effects of these two major federal decisions were eventually reflected when the K-12 student enrollment reached over 50 percent Indian students in the New Town Public School District in 1986. Since then, that percentage has been climbing every year and the student enrollment has been increasing steadily.

On February 23, 1995, the New Town Public School District's Board of Education met with the Tribal Council of the Three Affiliated Tribes and obtained a resolution authorizing the New Town School Board to apply for BIA grant funding for school operations, as provided for in Public Law 100-297, Title V, Parts A & B. By that time, K-12 student enrollment was nearing 50 percent Indian students, and three of the five School Board Members were Native Americans. The district has been applying every year since then only to be denied due to the moratorium on new school starts.

The most recent State data, School Finance Facts, January 1997, showed New Town Public School District's average cost per pupil as \$4,076.09, while Mandaree School District, a Bureau funded ISEP school also located on the Fort Berthold Reservation, has been able to spend \$10,967.45 per pupil. The New Town Public School District has been averaging nearly 70 percent of its students on Free and Reduced meals over the past several years due to the high unemployment rate on the reservation. The strong correlation between the economically disadvantaged and academically disadvantaged is abundantly evident in our district. Nearly 50 percent of our elementary aged students qualify for Title I assistance as educationally disadvantaged. The New Town Public Schools can not afford any Gifted and Talented Programs. The district has just finished replacing all buses originally purchased during the 1970's and many textbooks are far older than the recommended five year replacement age. The district's tax base only yields \$337,000 per year towards our 3.9 million dollar General Fund. Impact Aid is never fully funded and so those revenues do not adequately compensate for the lands taken off the tax rolls.

Of our 589 Indian students, 125 do not generate Impact Aid dollars because they do not live on qualifying Indian Trust Lands. It has been calculated that our district would be eligible for an increase in funding of approximately \$3.5 million if approved as a BIA funded ISEP grant school. These funds are badly needed to provide for the educational needs of the students of the district.

In summary, it is our hope that adequate funding levels will be provided by Congress to enable districts such as ours to be allowed to become a BIA funded school. It is unimaginable that the Three Affiliated Tribes of Fort Berthold Reservation can have half of their enrolled member students ineligible for the quality of education intended for Native American children in the passage of Public Law 100-297.

PREPARED STATEMENT OF MERVIN WRIGHT, JR., CHAIRMAN, PYRAMID LAKE PAIUTE
TRIBE

Good morning, Chairman Gorton, Members of the Committee and Honorable Tribal leaders. My name is Mervin Wright, Jr. and I am the Tribal Chairman for the Pyramid Lake Paiute Tribe of Nevada. On behalf of the Pyramid Lake Paiute Tribe, I appreciate the opportunity to testify before the Senate Sub-Committee on Interior Appropriations. We express our gratitude for Committee support in the past, and respectfully request the Committee to fund the Tribe's priorities for fiscal year 1998: High School Construction, Education, Water Rights Settlement, Resource Manage-

ment, Indian Health Services, Environmental cleanup, Law Enforcement, and Cultural Preservation. A brief history will support this request for funding.

TRIBAL HISTORY

The Pyramid Lake Paiute Tribe is one of many Paiute band of the Northern Paiute Nation and was affirmed by the Indian Reorganization Act of 1934. The Pyramid Lake Indian Reservation is the largest Indian reservation in the State of Nevada covering approximately 476,000 acres. The reservation contains entirely within its boundaries, a natural desert lake from which the Tribal name was derived. It is the largest terminal lake in the United States and has a surface area of 110,000 acres and is deep as 330 feet. A prehistoric indigenous fish species called the Cui-ui (pronounced Kwee-wee) has existed in Pyramid Lake for thousands of years and is the foundation of our Paiute culture. The Cui-ui is currently listed as an endangered species, while another inhabitant fish species the Lahontan Cutthroat Trout is listed as threatened species. The Lahontan Cutthroat Trout is an important aspect of our livelihood, as is the Cui-ui and was once the primary economic support for our Paiute People.

The enrolled membership of the Tribe is approximately 1,800 people. As a Tribal Government, the Tribal Council responsibility is to provide primary services to our elderly, our children, and the support for social order within our reservation. Cultural identity is becoming a prevalent matter of importance in preserving the well being of our people. Education is a primary focus for the betterment of our People. Health care is an area that requires professional care at an affordable price. Social Services will enhance the well being of our People in addressing social ills of our modern day society. These are issues which have additional pressures that we are managing and require financial resource support for eventual success.

Pyramid Lake High School: \$10,000,000

The planning and architectural design phase of our high school is 100 percent complete. As one of many Tribes who have placed education as an important asset of our People, unfreezing of the Tribal high school construction list will be a major step to assist in preparing our children for future endeavors in career and professional advancement. A high drop out rate and low self esteem among our high school students causes parents and administrative staffs to react, sometimes negatively, to address the problems of drop out rates. The physical conditions of school modular facilities are often equivalent to trailer parks; children who attend such facilities often have increased feelings of low self-esteem. A new high school will enhance the acceptance of an educational standard of achievement that will promote post secondary education and the well being of our communities.

Unfreezing the construction list will provide the means for advancement of all Indian Tribes currently on the construction list to begin recognizing the effort by each government to achieve an objective that promotes consistent objectives in our societies. In promoting and supporting a high standard of achievement, and from personal experience, each child entering high school must be provided the opportunity to realize the challenge of successful completion of an educational institution. Tribes have become better prepared and educated to deal with social disorders and recognize the goal of motivating our children to strive for better conditions for their lives than the experiences we hold from our past.

Water rights settlement/water resources management: \$6,500,000

The Pyramid Lake Paiute Tribe has a long history of water litigation on the Truckee and Carson Rivers in Northern Nevada. Since the inception of the Newlands Reclamation Project in 1902 and the accompanying Derby Dam construction in 1908, the degradation of the Pyramid Lake aquatic habitat and environmental structure has been seriously damaged. Litigation was costly and the Tribe decided to enter negotiations in the mid-1980's in an attempt to resolve outstanding issues through talks with upstream municipalities, the States of Nevada and California and the federal government. A settlement act was achieved in 1990 with the Congressional passage and Presidential signing of Public Law 101-618, the Truckee-Carson-Pyramid Lake Water Settlement Act.

The Pyramid Lake Paiute Tribe is in the process of settling two outstanding lawsuits which were filed in the early 1980's against the Truckee Meadows Water Treatment Plant. The lawsuits have been dismissed. However, the water rights purchase program to augment instream flows to the Truckee River during July, August, and September was agreed to by the parties to resolve concerns about future expansion of the wastewater plan. Six million dollars has already been appropriated and is in the federal system. The United States Department of Interior, on behalf of the Tribe, is obligated to purchase \$12 million worth of water rights from willing water

right holders in the Truckee River Basin. We are concerned that if the Bureau of Indian Affairs gains control of any amount of these tribal funds, the Tribe will lose some of the benefit intended for the Tribe. The Tribe is quite capable of managing and administering this program.

We are currently involved with negotiating the final stage of the Truckee-Carson-Pyramid Lake Water Settlement Act (Title II of Public Law 101-618); however, the management and monitoring enforcement measures will not conclude with achievement and approval of this settlement. The Pyramid Lake Paiute Tribe is one of five principle signatories of the settlement act. As we begin the initial implementation phases of the settlement act, it is acknowledged of the immense administrative responsibility accompanying implementation of this law. The Tribal Water Resources Management Contract will require \$500,000 in funding support for a highly technical advanced operation associated with monitoring flows and water quality criteria, scheduling releases, managing released flows, accounting of water supplies and participating in further implementation and regional water negotiations. The decision to enter negotiations was one to avoid litigation expenses, plus to achieve resolution by compromising from each side to lessen the ability to create and support adversarial positions.

Health Services: \$1,000,000

The social structure on our reservation is one of fragile capacity. The problem associated with the lack of adequate services to our People is a reflection of funds appropriated for unnecessary purposes. The Health Service provided through Indian Health Services is not adequate. The services reaching our People are not reflective of the amount of funding support in the Area and Headquarter Offices of this agency. The Tribe has built its own clinic facility, but the bureaucracy surrounding the service absorbs much of the funding before actual services can be provided. This amount will support contract health, dental, mental health, substance abuse, child abuse, and social based services.

Cultural resource preservation: \$300,000

The Pyramid Lake Paiute Tribe is affected by the enactment of various federal laws and State statutes associated with the protection and preservation of cultural resources. Some issues have the effect of compromising and damaging existing resources. The Tribe has the ability to represent concerns and issues before federal and state agencies, but does not have the financial ability to organize an effort to work cooperatively and in conjunction with such agencies. The Tribe will be responsible for planning and developing important representation to protect and preserve cultural resources. This amount will provide the Tribe the ability to work with other Paiute Tribes in an effort to utilize necessary resources to protect cultural resources.

Environmental clean-up: \$250,000

Pyramid Lake received substantial impacts associated with the New Year's Flood in the Truckee River Basin. Two sewer mains were broken, the Sparks industrial area suffered serious flooding which resulted in a number of unidentifiable contaminants reaching the Truckee River and eventually ending up in Pyramid Lake. Several bird species have been taken for toxicology studies to determine the extent of contamination. The impact to the micro-organism habitat is not yet known and our fear is that the beginning of a food chain so important to the rest of this habitat has suffered consequential damage. This fund will support activities in an effort to maintain control measures for water quality. As we proceed into monitoring requirements under a water quality agreement (stated above) and proceeding with implementing tribal water quality standards, it is important to establish and implement a hazardous material response against environmental degradation.

Law enforcement: \$500,000

Tribal law enforcement requires financial support for effective enforcement of tribal laws and regulations. In enforcing the regulatory requires for law and order, fish and game and ordinance compliance, this funding will support the ability to work cooperatively with federal officials, state officials, and local jurisdictions. It is important that our tribal government accept and support the needs of adequate law enforcement for proper enforcement measures to meet our community needs.

Policy Issues

BIA and IHS Reorganization.—As Congress begins to review the reorganization of the federal agency, BIA, there are serious concerns with respect to the structure of the BIA which provides actual services to reservation communities. When tribes view their resources, certain considerations must be acknowledged to the trust obligation of the federal government. In recent years the federal agencies have strug-

gled for power and authority in Indian affairs. The BIA is not recognized as a force within Interior in representing the trust responsibility directly to Indian Tribes. The authority vested in the Interior Department to uphold the trust responsibility does not exist with the proper authority, BIA.

Now, in reviewing the structure of the BIA, it is the BIA Area Offices and the BIA Agencies that tend to regulate the authority of this federal agency. The services provided through the Interior appropriation process gets into the system, but normally the area and agency offices tend to absorb the funds intended for tribal programs. In some cases, the federal laws are misinterpreted and BIA officials misguide Tribes in complying with statutory requirements. It is a matter of reducing the bureaucracy causing setbacks, but not cutting funding for services. This Congress should seriously consider strategy thinking in recourse management. The focus must view the trust assets as priority.

The IHS is in the same situation. The services are not received at adequate levels. It is the Area Office and the Headquarters where the bureaucracy absorbs the funding intended to provide services on the ground. A comparison in one case, is the commissioned officials making six digit salaries, and the Tribe receives \$152,000 to serve 1,300 patients in contract health services. The purpose or reorganizing the IHS should be viewed as one to increase the services at the reservation. It is recommended that the process of restructuring the IHS not result in less services. Deficit spending is occurring in this agency, and the Area Offices are not accepting responsibility in balancing the deficit. The Tribes who have provided needed services through contracting must not be penalized for the efforts we are making. Tribal members eligible for Medicaid and Medicare, but the IHS system offers their services as a supplement, not as an addition to the care provided. Either way the system provides the best method to serve our patients.

School construction.—While the bulk of the responsibility for Indian school construction falls now within the BIA, the President has asked for \$5 billion to fund school construction needs in the United States and we are hopeful that the Congress will accept this proposal. However, we know that funds for this would be appropriated by the Subcommittee on Labor and HHS Appropriations. We understand that Interior Secretary Babbitt has suggested that 10 percent of these funds, if appropriated, be set aside for school construction. We agree. The federal government owns the legal title to our lands and we have no tax base. In our view, the first responsibility of the federal government to the nations's school construction needs should be on Indian lands. Ten percent of \$5 billion would take care of much of the unmet school construction needs in Indian country.

Trust responsibility.—The federal trust responsibility is one that our People know well and is one that I cannot allow to be overlooked or placed secondary to resources of material content. We are People of this land, the first People of this land and express our concern for equal, if not better, services for our People than has been provided by the Congress over the past 20 years.

PREPARED STATEMENT OF JOSEPH C. SAULQUE, CHAIRMAN, OWENS VALLEY INDIAN WATER COMMISSION

This appropriations request is for the U.S. Department of the Interior, Bureau of Indian Affairs, Water Resources Protection Program. The amount of funding being requested for fiscal year 1998 is \$258,068. This money will be used for capital start-up costs for the Owens Valley Tribes' comprehensive Groundwater Monitoring Program and negotiation support costs.

BACKGROUND INFORMATION ABOUT ORGANIZATION TO BE FUNDED

In 1991, the Paiute people commonly known today as the Owens Valley Paiute Indians, but to themselves are known as Nume which means people, chartered the Owens Valley Indian Water Commission (Commission) to serve as their water department to: negotiate the tribes' water rights with the federal government and the Los Angeles Department of Water and Power (LADWP); address the impacts of LADWP's water extractions and diversions on reservation environments; and improve water-related conditions on the reservations.

The Commission is comprised of two tribal members from each tribe for a total of ten Commissioners. Six of the Commissioners also serve on their respective tribal councils and the others are appointed by tribal resolution.

The Owens Valley Tribes are part of the greater Northern Paiute Nation whose original territories encompassed the greater part of western Nevada, parts of Oregon and Idaho and east central California. The Owens Valley Tribes include the Big Pine Paiute Tribe of the Owens Valley, the Bishop Paiute Tribe, the Fort Inde-

pendence Paiute Tribe, the Lone Pine Paiute-Shoshone Tribe, all located in Inyo County, CA, and the Utu Utu Gwaitu Paiute Tribe located in Mono County, CA. California's Owens Valley stretches for 100 miles along the eastern flank of the Sierra Nevada range. At present, the tribes occupy only a small fraction of their ancestral lands. The majority of these lands are now owned by the City of Los Angeles Department of Water and Power for water gathering activities or are administered by the Inyo National Forest Service and the Bureau of Land Management. The Owens Valley supplies 70 percent of Los Angeles' domestic water supply.

EXPORTATION OF OWENS VALLEY WATER

At the turn of the century, the City of Los Angeles (City) began acquiring land and water rights in the Owens Valley which at present total 300,000 acres in Inyo and Mono Counties, comprising 97 percent of the privately held land. In 1913, the City completed a surface aqueduct (the first) between the Owens Valley and Los Angeles and began exporting Owens Valley water.

In 1941, the City completed the Mono Basin Project which gathered the natural run-off from the Mono Basin and delivered water to Los Angeles through the first aqueduct. Since 1917, the City has drilled more than 360 wells in the Owens Valley to access groundwater to be used as a supplementary source of water during dry years.

In 1959, the City proposed the construction of a second aqueduct to carry water from Owens Valley to Los Angeles for the purpose of completing the development of the Inyo-Mono supply and to ensure the City would not lose certain water rights on which it had filed. At the time the City finished constructing the aqueduct in 1969, it had not yet started increasing its exportation of groundwater when the California Environmental Quality Act (CEQA) became law in 1970. Because the groundwater extraction was viewed as a separate project dividable from the construction of the second aqueduct, the Court of Appeal required the City to prepare an Environmental Impact Report (EIR) under the CEQA. The City has prepared two EIR's (1976, 1981) and both of these have been declared legally inadequate by the Third District Court of Appeal for the State of California.

In 1984, the Court granted permission to the City and the County of Inyo (County) to enter into an interim long-term groundwater management agreement and attempt to negotiate a resolution of the pending lawsuits. The final EIR submitted to the Court on October 21, 1992, contains the final agreement of the parties which describes a long-term groundwater management plan. Neither the Tribes nor the United States are parties to this agreement.

While the County has found the City's final EIR to be adequate, the Third District Court of Appeal has retained jurisdiction of the lawsuit. The State of California's Department of Fish and Game, as well as other environmental groups and concerned individuals, have challenged the adequacy of the City's EIR. It now appears that a settlement has been reached by the parties and that this settlement was presented to the Court of Appeal on January 24, 1997. The Commission had no input concerning this proposed settlement.

In 1990, the Big Pine Tribe (who at that time was the lead tribe of the Commission) prepared comments concerning the City's proposed EIR. After the filing of these comments, the Commission requested and received amicus curiae status with the Third District Court of Appeal.

During this same time, the Commission began negotiations with the Los Angeles Department of Water and Power (LADWP) concerning its environmental concerns, as well as the issues of reserved water rights for lands traded to the City in a 1939 land exchange with the United States. In this exchange, the United States has traded 3,126 acres of land throughout the Owens Valley for 1,391.5 acres of land which are now the reservations of the Bishop, Big Pine, and Lone Pine Tribes. In this agreement, the water rights were reserved on the traded lands, with the City agreeing to provide, in perpetuity, four (4) acre feet of water per acre per year annum to the present reservation lands. The United States reserved the water rights to the 3,126 acres traded to the City and the City retained the water rights to the present reservation lands.

The Commission believes the present FEIR and long-term groundwater management agreement fails to recognize the off-reservation water rights of the Tribes, and fails to protect these rights, as well as the vegetation and general environment on the present reservations. The negotiations with the LADWP center around these issues.

COMMISSION GROUNDWATER MONITORING AND NEGOTIATION ACTIVITIES

In recognizing its trust responsibilities and in support of the Commission's efforts, the Bureau of Indian Affairs, Central Office, provided \$219,000 to the Commission in fiscal year 1991-92. This money was used to support the negotiation activities with the LADWP and to hire Commission technical consultants. The Commission hired a hydrologist, Dr. Woldezion Mesghinna of Natural Resources Consulting Engineers, Inc. and a research specialist, Mr. Daniel Gallacher, of Historical Research Associates Inc., to investigate and quantify the reserved water rights held by the United States on the lands traded to the LADWP.

In August 1992, the Bureau of Indian Affairs agreed that the Commission would have the lead role in negotiating with the LADWP while the United States would support the negotiations and provide technical assistance. The Commission had been in discussions and negotiations with the LADWP since early 1992 and had made substantial progress in addressing areas of concern to the Owens Valley Tribes. At a meeting held in April 1993, discussions between the Commission, its experts and the LADWP centered on the reserved water rights retained by the United States and the methodology used to quantify those rights.

Unfortunately, in 1993 negotiations stalled when the Bureau of Indian Affairs chose not to continue funding the Commission's efforts until the 1993 fiscal year had almost expired in September. It was not until October 1993 that the Commission was able to confirm that \$88,500 had been contracted. These funds were used to fund additional studies concerning the Practicably Irrigable Acreage Quantification.

In December 1993, a federal fact-finding team was appointed to investigate the water claims filed by the Commission on behalf of the Tribes. In September 1994, the team completed its investigation and prepared a final report.

As the negotiations continue, the Tribes' water rights, water resources and reservation environments continue to be negatively impacted by the City's water gathering activities. In 1994, the Commission was successful in securing BIA funding in the amount of \$200,000 to initiate a groundwater monitoring program and protection system for the Owens Valley reservations. Rather than directly contract with the Commission to oversee the development of the system, the BIA provided these funds to the United States Geological Survey (USGS) to develop the system. The system was never developed. The BIA informed the Commission that USGS reported having spent over \$90,000 to drill monitoring wells for the Owens Valley Tribes. In actuality, there were no wells drilled by the USGS on any of the Owens Valley reservations with these funds. The Commission has on several occasions requested from the BIA a copy of the USGS report of work completed. No report has been provided. In November 1994, the Commission was informed by the BIA that the balance of these funds had been returned to the BIA Central Office in Washington and redistributed to another tribe. Consequently, the Owens Valley Tribes are without a groundwater monitoring system to safeguard their water rights, water resources and reservation environments.

Based on the fact-finding team's report, a federal negotiation team consisting of Mr. Dan Jackson, Mr. Bob Laidlaw, and Mr. Curtis Milsap was appointed in July 1995, to help facilitate a settlement between the Commission and the LADWP. During the rest of 1995 and 1996, the parties have met on numerous occasions and have made steady progress. Currently, the parties and their consultants are meeting to discuss and agree on a quantification of the federally-reserved water rights belonging to the Owens Valley Tribes.

In fiscal year 1995 the Commission received Water Resources Protection Funding in the amount of \$150,000 and initiated a comprehensive Groundwater Monitoring Program. Due to limited funding the program is being developed in four phases. The first phase was completed in fiscal year 1995 (\$34,056). The second phase will be completed in fiscal year 1996 (\$75,316) and it is anticipated the third (\$40,546) and fourth phases (\$39,534) will be completed in fiscal year 1997.

The Commission is requesting continued funding to complete these negotiations and to provide for the capital start-up costs of actual groundwater monitoring. The capital costs include the installation of a shallow and a deep aquifer monitoring well on each of the five reservations. The amount being requested for fiscal year 1998 is \$258,068.

FUNDING FOR CALIFORNIA TRIBES

The Commission strongly feels there has been inequities in the amount of funding being provided to California Tribes. For over 100 years, studies conducted by federal, state and private agencies have reached the same conclusion: California Indians are not receiving a fair share from federal Indian programs; and because they

have received less support from the federal government, California Indians have suffered in social-economic well-being relative to other Indian groups in other states.

Well-documented reports have come from both Republican and Democratic administrations concluding that per capita spending for California Indians was below that in other areas. For example, in 1975, per capita spending for California Indians was \$309.97 of the total Bureau allotment, while spending in the Minneapolis Area was \$859 per person and spending in Portland averaged \$1,576 per person. The degree of inequity is understated because the Bureau systematically undercounts California Indians. In 1989 the Bureau's California service population count was 28,815 and the 1990 census count for California Indians was 236,078. Approximately 100,000 of the 236,078 California Indians are actual Native California Indians.

The history of federal policy toward California Indians offers insight into the weakness of the Bureau's service population criteria. The failure of the federal government to ratify the 1852 treaties it negotiated with California Indians and to establish a suitable reservation land base for them means that the general criteria limiting service population to Indians "on or near reservations" should not be applied in California. This geographic criterion is currently not applied to Indians in Oklahoma and Alaska. The number of California Indians who participated in claims awards based on past deprivation of land proves that the federal government views them as Indians, yet the Bureau refuses to recognize their tribal groups.

Budget analysis from the 1980's and 1990's confirms that these inequities have persisted. Based on the Operation of Indian Programs and the BIA's official service population figures for the years 1990 to 1994, California Indians are receiving only one-third to one-half the funding received by all other Indians. In 1994, for example, the Sacramento's per capita funding was \$700.30 while the rest of the BIA-served Indian population enjoyed per capita funding of \$1,310.51.

REDUCTION IN NATURAL RESOURCE FUNDING

The continual reduction in appropriated funds for the BIA's natural resources budget, including water resources, is unjust. Only five tribal governments in California have quantified their water rights. Consequently, there is a lot of future work to be done on tribal water rights issues in the State of California, let alone in the Owens Valley, and funding is needed to perform this work.

BIA NATURAL RESOURCES FUNDING REDUCTIONS

FUNDED FIGURES
[In thousands of dollars]

Category	1991	1992	1994	1996
Water resources	\$11,123	\$10,353	\$5,507	\$3,682
Total natural resources (including water resources)	79,992	78,041	64,224	53,489

The Commission requests that Congress increase the BIA's Water Resources funding to \$10 Million in fiscal year 1998, with at least \$1 Million earmarked for California Tribes for each of the next five years. In addition, the Commission urges the House Appropriations Committee on Interior Appropriations to recognize the inequities in funding for California Tribes and provide per capita funding for California Tribes that is equal to the rest of the BIA-served Indian population.

PREPARED STATEMENT OF JONES BEGAY, PRESIDENT, ASSOCIATION OF NAVAJO
COMMUNITY CONTROLLED SCHOOL BOARDS

I am honored to submit this statement on behalf of the Association of Navajo Community Controlled School Boards—an association of 13 BIA-funded schools on the Navajo Reservation operated by local tribal school boards under contracts or grants with the BIA. In addition to serving as President of the Association of Navajo Community Controlled School Boards, I am also a delegate to the Navajo Nation Council and am President of the Black Mesa Community School Board which operates a small school for 100 Navajo children in a very isolated area of the Navajo Reservation in Arizona.

Our comments focus on the portions of the BIA School Operations budget most in need of your serious attention.

STUDENT TRANSPORTATION

We need a significant increase in funding for this budget which supplies the funds for operation of our school bus systems. These funds are allocated on a per-mile basis, but the per-mile rate—currently at only \$1.60—is far, far below the costs we incur. At Black Mesa, our 100 students are scattered over a large geographic area that requires a daily bus run of just under 500 miles. Our buses run primarily on un-improved roads. This makes for a very long bus ride in both the morning and afternoon. Our bus driver costs, fuel costs and bus maintenance expenses are very high—far higher than \$1.60 per mile.

Our problems will get worse very soon, as the moratorium on increases in the school bus lease rate charged by GSA will soon end. We expect large increases in these lease rates.

Funding for student transportation has never been sufficient to meet our costs. This means we must take scarce dollars from the funds you supply for our instructional programs to supplement student transportation. We have no choice. If we cannot bring the children to school, we cannot educate them.

We ask you to significantly increase the BIA budget request for student transportation to a level that can provide us with the national average per-mile rate for public schools: \$2.92 per mile.

ADMINISTRATIVE COST GRANTS

This is the budget that enables tribal school boards to exercise the Indian self-determination rights guaranteed by Congress. It funds our indirect and administrative costs. Without adequate funding in this account, tribal school boards do not have the funds they need to properly run the administrative responsibilities they take on when they decide to operate a school.

BIA asks for an increase of \$2.5 million for Administrative Cost Grants. This does not mean that individual schools Administrative Costs are increasing. Rather BIA seeks the increase because 12 more schools will convert from BIA operation to tribal operation in school year 1998-99, the school year funded by the fiscal year 1998 budget request. Ten schools will convert to tribal operation in the upcoming school year.

We are not sure that the \$2.5 million increase will be sufficient to supply the Administrative Cost Grants of the “converted” schools because the BIA’s budget does not explain how it was calculated. If it is not enough, all the existing schools will suffer a reduction in funding. We ask you to find out now if it is enough. Please do not wait for us to come back in two years to tell you it was insufficient.

Severance costs

When a school “converts” from BIA operation to tribal school board operation, two funding events occur: (1) the school becomes eligible for an annual Administrative Cost Grant; and (2) the BIA incurs a one-time severance cost for the federal employees who worked at the school. These severance costs must be paid even if these former federal employees are re-hired by the tribal school board.

The BIA budget justification does not identify the amount of severance costs that will be incurred, nor does it state from which budget category the funds will be supplied. The BIA education law does not permit these severance costs to be paid from any of the funds Congress supplies for School Operations. The reason is, of course, that School Operations funds are intended for program and administrative costs of the schools, not for severance pay for former federal personnel.

We ask you to include report language that reminds BIA it may not use ISEF funds, Administrative Cost grant funds, student transportation funds or any other School Operations monies for employee severance pay.

FACILITIES OPERATION AND MAINTENANCE

The federal government owns the buildings in the BIA school system. This means that Congress and BIA should be as interested as we are in making sure these buildings are maintained properly. But year after year, insufficient funds are provided for operation and maintenance of our federally-owned school buildings.

Several years ago Congress ordered BIA to develop a formula for calculating the amount of funding that should be provided for facilities maintenance. For the past several years, we have received only about two-thirds of the amount this formula requires.

When this happens, building maintenance is sacrificed. We cannot cut corners on our electricity bills, or water bills or heating bills. We have to pay these in full. And we must make sure our boilers and fire safety systems are operating properly and that the buildings are kept clean. This leaves very few dollars for preventive main-

tenance and minor repairs. When these do not get done, our buildings deteriorate at a fast rate.

We ask that you increase the school facilities O&M budget by one-third (to \$99 million) to preserve the investment the United States has made in these buildings.

TEACHER HOUSING

The final word I want to offer is about the need for decent housing for teachers at reservation schools. At Black Mesa, we have to supply housing for our teachers because there is no private rental housing available. This is the situation at nearly every school in the BIA system.

We would be grateful if Congress could establish even a small recurring funding program for employee housing construction—perhaps \$1–2 million per year. Without teachers, even the finest school in the BIA system would not be able to do its job. And without housing, we cannot recruit teachers.

We thank you for your interest in the welfare of the Indian children in the BIA school system.

PREPARED STATEMENT OF APESANAHKWAT, CHAIRMAN, MENOMINEE INDIAN TRIBE OF WISCONSIN

On behalf of the Menominee Indian Tribe of Wisconsin, I wish to submit this statement on the President's fiscal year 1998 budget request for programs in the Bureau of Indian Affairs (BIA). Our specific concerns include: Adequate funding for Law Enforcement; funding for Road Maintenance above the President's requested level of \$27.5 million; increased funding for Conservation—Other Rights Protection program; adequate funding for the tribal judicial systems; funding for Construction—Infrastructure Development; full funding of Contract Support Costs; funding Education—School Operations, at a minimum, the President's requested level of \$467 million.

As the Subcommittee may know, the Menominee Tribe was one of the recognized tribes terminated in the 1950's. Since regaining our federal recognition 20 years ago, we have endeavored to exercise our self-determination to achieve the self-sufficiency that is the goal of all tribes. We have made strides in improving the quality of life for our tribal members through careful management of our natural resources and economic development ventures such as the Menominee Nation Gaming Corporation. Yes, we are a gaming tribe but our business is only moderately successful—generating about \$750,000 a month in revenue. The Menominee Tribe utilizes this much needed income to not only supplement federally-funded programs but to fund programs for which there are no other available resources. Some examples of uses for these revenues include: solid waste disposal (\$500,000/yr.), graduate scholarships (\$62,9000/yr.), tribal and youth recreation programs (\$360,500/yr.), and infrastructure development (\$2 million since 1994 for water and sewer systems in the new Middle Village tribal housing development, community-wide road projects and updated telephone system, etc.).

We are, however, experiencing increased demands on these limited revenues due to decreased funds from the state and/or county in areas such as welfare assistance and support for the public library located on our reservation. We bring these matters to your attention to highlight that while self-sufficiency is our goal, we require the continued assistance of the federal government through adequate funding of the federal programs we operate for the benefit of our tribal members.

BUREAU OF INDIAN AFFAIRS

Tribal law enforcement.—The Menominee Police Department is a 38-member force, funded by \$866,200 through the BIA and supplemented by \$1.23 million in tribal funds. Still this amount is not adequate for providing the level of public safety and enforcement of tribal, federal, and state laws necessary for the size of our community—which covers 360 square miles and serves a tribal population of over 4,000 members. As noted above, tribal revenues are limited and the need to supplement other programs increases with each fiscal year. We, therefore, request that Congress support, at a minimum, the Administration's request for a general increase of \$46.7 million to the Tribal Priorities Allocation ("TPA") account, which includes an \$8.7 million increase for law enforcement.

Road maintenance.—The Administration's request of \$27.5 million for Road Maintenance shows only a small increase—less than \$2 million over the amount for the past two fiscal years, and still less than one-third of the annual need in Indian country. Funds in this line item are not only utilized for routine maintenance and

administration of roads, but also for maintenance of bridges, airstrips, ferry boat operation and maintenance and emergency maintenance (snow removal, ice control, washout repair, etc.). The transfer of Road Maintenance to the Tribal Priority Allocations account has negatively impacted the availability of funds. In fiscal year 1997, the Menominee Tribe suffered a 16 percent decrease in Roads funds. Coupled with extreme weather conditions and heavy snowfall, we now face extreme funding problems as we have only \$10,000 balance for the remaining half of the fiscal year. With these remaining scarce dollars, we seriously doubt the Menominee Tribe will be able to maintain its 308 miles of BIA roadway in accordance with the mandates of Federal Highway Safety guidelines.

We would urge Congress to fund Road Maintenance at 100 percent of need to enable tribes to address the backlog, and to order Road Maintenance removed from TPA.

Other rights protection.—The Menominee Conservation Department is charged with establishing and enforcing the tribal hunting laws within the boundaries of the reservation. This area encompasses over 235,000 acres, with 80 lakes and more than 300 miles of rivers and streams. The Conservation Department also conducts wildlife studies, direct fish and wildlife management projects and conduct research projects. These activities not only ensure the protection and conservation of our natural resources but will also, hopefully, reclaim some of the traditional food sources of the Menominee. Currently, the Conservation Department is comprised of six game wardens, one Fish and Wildlife Biologist/Manager and one support staff, operating on a budget of \$375,000 (one-third of which amount is provided by the tribe).

In order to adequately enforce the laws and properly manage the Tribe's natural resources, we request that Congress increase funds for this vital program.

Tribal courts.—We have testified previously on the need to properly fund the tribal court systems. As you may recall, the Indian Tribal Justice Act, Public Law 103–176, was enacted to provide additional resources for the development and enhancement of tribal judicial systems. Unfortunately the Bureau has never requested additional funds for tribal courts as authorized by Public Law 103–176 and the Special Tribal Courts program has been eliminated. Furthermore, even if Congress funds Tribal Courts at the Administration's requested level of \$11.1 million, it would be \$3 million less than the fiscal year 1995 enacted level. The Menominee Tribe, like many other Indian nations and courts in general, is facing increased burdens on the court due to a rising number of cases and understaffing. In spite of the approximately \$217,000 tribal supplement to the Tribal Court budget, we are not able to adequately meet the need. We ask this Subcommittee to continue to assist all tribes in meeting the judicial needs of their people by appropriating an increased and specified funding level for Tribal Courts apart from the TPA account.

Construction.—A critical need for many tribes is in the area of infrastructure development, e.g. water and sanitation systems, new roads, installation of utilities. As you are no doubt aware, many tribes, including the Menominee, are faced with increasing populations—due to an influx of tribal members returning to the reservation, an increased birth rate and increased longevity. We recommend that the Subcommittee consider a separate funding category under the Construction account for infrastructure development initiatives.

Contract support.—The Menominee Tribe is disappointed that the Administration only requests \$105.8 million for Contract Support Funds (CSF), as funding at this level would not fully fund the need. According to the Bureau's Budget Justification, the \$105.8 million would enable the BIA to pay only 95 percent of the CSF need. In fiscal year 1997 they paid only 87 percent of need. Every time CSF is not fully funded, our programs suffer.

The Indian Self-Determination Act is clear that the Secretary must fully fund contract support cost needs. The transfer of CSF to the Tribal Priority Allocations account merely masks the true level of need since tribes must make up for contract support cost shortfalls by using direct program funds. In doing so, we diminish services in those programs. We urge that Congress fully fund this essential program cost as required by law.

Education—school operations.—The Menominee Tribe urges Congress to fund, at a minimum, the Administration's requested level of \$467 million for School Operations. The Menominee Tribal School, a tribal contract school, serves 248 students in grades K to 8. We note that although the requested level may result in a nominal increase to the amount per student we receive for each student, there will continue to be severe funding shortages in the Transportation and Facilities Operation and Maintenance activities. We hope Congress will improve the Administration's request and supply additional funding for these critical activities.

The Menominee Tribe appreciates the support this Subcommittee has given to our Tribe over the years and thank you for the opportunity to provide our views on the proposed fiscal year 1998 budget for the Bureau of Indian Affairs.

PREPARED STATEMENT OF W. RON ALLEN, PRESIDENT, NATIONAL CONGRESS OF AMERICAN INDIANS

INTRODUCTION

Greetings Chairman Gorton, Senator Byrd and distinguished members of the Interior and Related Agencies Appropriations Subcommittee. On behalf of the National Congress of American Indians and our 200 plus member Tribes, I appreciate this opportunity to submit testimony regarding the President's budget request for fiscal year 1998 Indian programs and services under this subcommittee's funding jurisdiction. My name is W. Ron Allen. I am President of the National Congress of American Indians ("NCAI"), the oldest and largest Indian organization in the nation devoted to protecting Tribal sovereignty, and Chairman of the Jamestown S'Klallam Tribe located in Washington State.

BACKGROUND INFORMATION

Mr. Chairman, it has rarely, if ever, occurred that programs serving the American Indian and Alaska Native population have received the federal funding required to fulfill even the most basic needs of tribal members. American Indians and Alaska Natives rank at the bottom of most social and economic indicators. Of the 557 federally-recognized Indian Tribes, a great majority of their populations are characterized by severe unemployment, high poverty rates, ill-health, poor nutrition and other sub-standards living conditions. In 1989, the average unemployment rate in Indian Country was 52 percent, and by 1990 the rate had jumped to 56 percent.¹ The 1990 Census shows the percentage of Indian people living below the poverty line is 31.6 percent, or three times the national average.

Tribes have faced extraordinary challenges throughout the appropriations process in recent years. Unprecedented reductions in federal Indian program funding have left many Tribes facing extreme circumstances. Non-funding riders attached to Interior Appropriations bills reached well past the scope of the appropriations process and attempted to diminish Tribal sovereignty and change the basic fabric of the federal-tribal relationship. Further, while we appreciate the commitment to balance the federal budget, we maintain that such a laudable initiative does not and should not preclude the federal government from fulfilling its trust responsibilities to Indian Tribes throughout this great nation. As Congress begins to shape the fiscal year 1998 budget, the NCAI urges the reversal of the downward direction the annual appropriations process has taken on Indian programs. We believe that the President's fiscal year 1998 budget request has taken a very positive step in that direction.

THE PRESIDENT'S FISCAL YEAR 1998 BUDGET REQUEST

A. Bureau of Indian Affairs

The President's fiscal year 1998 budget calls for \$1.7 billion to be allocated to the BIA, an increase of \$127 million over the 1997 enacted levels. As important as these increases in funding are to Tribes, and despite the apparent commitment to Tribal self-governance, this increase is but a mere step in the direction of providing adequate funding and only begins to correct the recent unprecedented reductions in critical tribal programs.

Tribal priority allocations.—Tribal Priority Allocations (TPA), the mainstay in the BIA budget for Tribal operations funding, were decreased by nearly \$100 million in fiscal year 1996. This occurred during the same cycle that over \$200 million in programs and services were shifted from other areas of the BIA budget into TPA in an effort to give tribal governments more control over those tribal operations. The President's fiscal year 1998 budget for TPA is \$757.3 million, an increase of \$76.5 million over the fiscal year 1997 enacted level. The majority of these increases are earmarked for Tribal Government Operations and Human Services, which combined cover a broad spectrum of services provided at the Tribal level for its communities, children and families, elderly and poor, and government operations such as police and fire protection. Of special concern to our member Tribes is the lack of funding

¹See generally "1990 Census Population—Characteristics of American Indians by Tribe and Language," U.S. Department of Commerce, economic and Statistic Administration, Bureau of the Census.

for the Indian Tribal Justice Act (Public Law 103-176) and the Indian Child Protection and Family Violence Prevention Act (Public Law 101-630, Title IV), both considered "New Starts" under current Congressional budget categorization, for which no funding is appropriated. We urge this Congress to consider the mounting needs for these programs, especially their significance in supporting a Tribe's ability to implement welfare reform in Indian Country, and fund these line-items at their authorized levels. Mr. Chairman, TPA funding in particular must be increased in order to improve the quality of life for Indian communities.

BIA construction.—The NCAI urges support of the President's request of \$125 million for Construction funding. Our schools, courts, police and fire departments all have facilities that are in desperate need of repair or replacement. Many Tribal communities are still awaiting much needed new construction project funding to rehabilitate or replace these and other facilities, including dams and other resource projects. Every year, these facilities face increased safety hazards that must be addressed through proper maintenance and re-engineering projects. The President's request for BIA Construction projects is a step in the right direction.

Indian trust funds.—Management of Indian Trust Funds is in dire need of reform. Without a commitment from the Administration and Congress that ensures adequate funding levels and that oversight is provided, the overwhelming amount of mismanaged and unidentified trust fund accounts over the last 50 years will never be reconciled. It is in the best interest of all parties that the reconciliation of individual Indian Monies (IIM) accounts and trust land asset accounts are resolved.

The Office of Special Trustee for American Indians (OSTAI) has submitted a draft strategic plan for trust fund management. This plan would fundamentally change the way trust activities are managed by the federal government. The Special Trustee has recommended that all trust management duties, responsibilities and activities including Trust Resources Management, Trust Funds Management and Land Title and Records Management be carried out by a new federal government sponsored entity that would exist outside of the Department of Interior. This strategic plan has gone far beyond its initial mandate to review the financial condition of Indian trust accounts. NCAI would urge the Committee to not support this plan until complete and meaningful consultation has occurred with Tribal governments.

Indian education.—NCAI joins with the Administration and the Congress in renewing our country's commitment to education and in supporting ambitious elementary and secondary education proposals. NCAI also welcomes the significant investment in Indian education. The \$500 million request, which represents an increase over fiscal year 1997 enacted levels, will help meet some of the needs of Indian students attending Bureau-funded schools. The increase of \$16.8 million over fiscal year 1997 for School Operations will help the Bureau deliver quality education, provide safe transportation, and convert Bureau operated schools to grant schools. However, the funding levels for other primary and secondary Indian education programs fail, once again, to meet the growing needs of our Indian students attending Bureau-funded schools.

Major educational programs that further opportunities for learning, enhance the learning environment of Indian students, and merit particular attention include: Adult Education—with the elimination of OIE's adult education program, BIA adult education must at least be funded at \$4 million; Johnson O'Malley (JOM)—the real need in JOM is \$54 million which will help alleviate current program funding restraints heightened by a 5 percent increase in JOM students in fiscal year 1997; Indian Student Equalization Program (ISEP)—the \$296 million request will provide \$3,094 per Weighted Student Unit (WSU). This per student outlay is significantly below the average per student expenditure of public elementary and secondary schools which had a \$6,300 per student outlay in school year 1995-96; Replacement School Construction—\$14 million is requested, an increase of \$10 million over fiscal year 1997 which is needed for completion of the Many Farms High School. Although we support this project, we urge additional funding for the construction of additional new schools; Facilities Improvement and Repair (FI&R)—\$32.2 million is requested for education FI&R which will help to address the material weakness in Bureau schools. However, additional funding is still needed to address the current backlog of over \$600 million in this program. The NCAI supports the National Indian Education Association (NIEA) statement to this Subcommittee on the President's fiscal year 1998 budget as it affects Indian Education.

Cultural and historical preservation.—The Native American Graves Protection and Repatriation Act, Public Law 101-601 (NAGPRA), provides the legal basis for the return of sacred objects and human remains, as well as for the protection of burial sites, and is critical in correcting many errors of the past and present. However, NAGPRA cannot bring about a better future until adequate funds are appropriated so that Tribes can complete the repatriation process, and continue to protect our

people's heritage. Despite a continual joint Tribal-museum request of \$10 million from fiscal year 1994 through fiscal year 1997, Congress has appropriated only a fraction of that amount—\$2.3 million—for NAGPRA related grants. This funding level is far below the projected need to comply with the provisions of the Act and well below the \$10 million request. The President's fiscal year 1998 budget request of \$2.3 million must be increased by Congress in order for Tribes to implement the goals of NAGPRA.

Many of our member tribes also rely on the protections available under the National Historic Preservation Act, Public Law 89-665 (NHPA). There are currently 14 tribes which have signed agreements with the National Park Service regarding the assumption of State Historic Preservation Offices (SHPO) duties. That number is expected to triple within the next year with more Tribes continuing to take on the role of SHPO'S. This activity alone supports the need for increased funding, however NHPA allocations fell from \$2 million in fiscal year 1996 to \$1.8 million in fiscal year 1997. In order to preserve our nations vast history and the cultural traditions of our people, the President's fiscal year 1998 budget request of \$2.3 million must be supported by Congress as the minimum standard funding level to allow Tribes to carry on this important work.

National Indian Gaming Commission (NIGC).—The NIGC performs critical functions in overseeing Tribal gaming operations and should be funded at an annual appropriation of \$10 million. The NIGC receives \$1.5 million annually from fees on Class II gaming and receives approximately \$1 million from appropriations. The NIGC has been functioning at approximately a \$4.2 million annual operating expense level, but this level of funding is threatened because the NIGC will run out of start-up monies in fiscal year 1997. Under this scenario, the NIGC will have a \$1.7 million deficit in fiscal year 1998. In order to remedy this situation, the \$1.5 million dollar cap on fees from Class II gaming should be removed, and fees should be extended to Class III gaming. If the cap is not removed, the Administration contributions should be increased to \$2.7 million in order to maintain the current minimum operations. The NIGC has the regulatory authority that is necessary and appropriate to ensure that Tribal gaming can continue with the same exemplary record that it has compiled to date. In the absence of adequate funding, NIGC's abilities to meet its responsibilities will be severely impaired, and the future of Tribal gaming will be at risk.

B. Indian Health Service

Funding for the Indian Health Services (IHS) is allocated in two distinct categories—Services and Facilities. The President's fiscal year 1998 budget request of \$2.1 billion for the IHS is a marginal increase over the fiscal year 1997 enacted levels; however, approximately \$367 million more is needed to restore the funding decreases over the past few fiscal years. These reductions have led to an increase in unmet needs surrounding mandatory costs, mandatory contract support, facility construction costs, and inflationary costs under Contract Health Care programs and must be rectified.

IHS services.—The President's \$1.8 billion request is a \$29 million increase over the fiscal year 1997 enacted level. Although Services funding continues to show marginal increases every year, these slight increases do not meet the current needs of approximately \$2.04 billion. It is estimated that nearly half of the nation's Indian population live in the urban areas of this country. Tribal governments continue to share in the duties and responsibilities of providing health care for those individuals living in urban areas in conjunction with the federal government. For these reasons it is critical that our clinical services, including hospitals and health clinics, as well as our preventative health care programs receive adequate funding to keep pace with the increased needs of our service area populations, both in the Tribal communities and the urban areas.

For example, the IHS budget for the HIV/AIDS program does not cover the cost of drugs to treat Indian people infected with HIV. We are aware that the cost of these drugs is significant; however, we are also concerned that Indian people infected with HIV whose only source of medical care is the IHS may not receive proper care if they and their physicians do not have access to these life-saving drugs. NCAI recommends a restricted line item in the IHS budget that covers the cost of AIDS-related medications.

IHS facilities.—The President's request for \$300 million for IHS Facilities—an increase of nearly \$39 million over last year, is a welcomed change in the direction of Facilities funding. However, funding levels for IHS Facilities must be increased to approximately \$149 million in order to maintain health care facilities in Indian Country. Tribes have reported that facilities are struggling to keep pace with the needs of the service areas. Old facilities are in need of major improvements and

some service areas require the erection of new facilities. I urge this Congress to make one of its goals the renewed support for increased health care facilities in Indian Country and to start this commitment by supporting the President's fiscal year 1998 budget request for IHS Facilities.

Indirect costs.—Although funding levels for the Indian Health Services have gradually increased over the last two years, changes in allowable costs associated with these operations have created additional financial burdens on Indian health care systems. Of concern to every Tribal program manager was Congress' elimination of funding for indirect costs associated with the administration of Indian programs and services. This action, which began with the passage of the fiscal year 1995 Rescissions bill and continued through the fiscal year 1996 appropriations process, creates substantial reductions (up to one-third in some cases) in actual operating budgets. Indirect costs associated with health care services are inherently higher than other areas of operation. In the non-Indian communities, health care operations were better able to absorb these indirect cost restrictions by passing on those additional costs to the states, their patients, and other forms of cost reimbursements. Tribes do not have this ability and are forced to absorb these costs by eliminating or reducing funding for other tribal operations.

Welfare reform.—Federal welfare reform has created an even greater need for Tribal governments to directly administer certain Medicaid and other welfare services closely tied to the health care arena. IHS must provide technical assistance and other support funding for Tribal governments faced with developing new Tribal programs and services, or operating through state initiated programs that do not meet the unique needs of Indian people. Direct funding for these new Tribal programs will protect the ability of Tribal governments to provide for their members.

CONCLUSION

Mr. Chairman, we urge the Congress to fulfill its fiduciary duty to American Indians and Alaska Native people and to uphold the trust responsibility as well as preserve the Government-to-government relationship, which includes the fulfillment of health, education and welfare needs of all Indian Tribes in the United States. Tribes throughout the nation relinquished their lands as well as a great multitude of resources in exchange for this trust responsibility. The President's fiscal year 1998 budget acknowledges the fiduciary duty owed to Tribes. We ask that the Senate consider the funding levels in the President's budget for the Department of Interior and Related Agencies as the minimum funding levels required by Congress to maintain the federal trust responsibility and by Indian Country to continue on our journey toward self-sufficiency. This concludes my statement. Thank you for allowing me to present for the record, on behalf of our member tribes, the National Congress of American Indians' initial comments regarding the President's fiscal year 1998 budget.

PREPARED STATEMENT OF TED STRONG, EXECUTIVE DIRECTOR, COLUMBIA RIVER INTER-TRIBAL FISH COMMISSION

Mr. Chairman, on behalf of the Columbia River Inter-Tribal Fish Commission (CRITFC), thank you for the opportunity to present the Commission's views on how the budget for the Bureau of Indian Affairs (BIA) should be structured to meet tribal fishery resource needs. For fiscal year 1998, the CRITFC has identified needs totaling \$9,506,433 for Columbia River fisheries management and associated programs, an increase of \$7.014 million over the fiscal year 1997 appropriated level of \$2.493 million. The total needs identified includes continued funding for fisheries management, the Columbia River tribes' planning efforts involving the Columbia River Gorge Scenic Act, Columbia River Habitat Programs, Columbia River Endangered Species Program, and critical Watershed Restoration activities, as well as past under-recovered pay cost adjustments, totaling \$103,903, mandated by law. In addition, the administration has proposed, and we support, funding enforcement activities at "in-lieu" fishing access sites at \$250,000 in fiscal year 1998. Finally, the Columbia River tribes receive funding for participation in the Pacific Salmon Treaty process, consistent with annual recommendations of the U.S. Section of the Pacific Salmon Commission. We support the U.S. Section recommendation for fiscal year 1998, at the funding level of \$3,152,046 for the Pacific Salmon Treaty program in the BIA, with CRITFC and its member tribes to receive \$861,305 of that amount, plus fiscal year 1997 and fiscal year 1998 pay cost adjustments.

DIRECTION TO INTERIOR AND RELATED AGENCIES

In addition to the funding levels identified above, we ask that you direct the Bureau of Land Management, United States Forest Service, National Biological Survey, and the U.S. Fish and Wildlife Service to enter into cooperative agreements or 638 contracts as provided for under Public Law 103-413, with the CRITFC and with each of the individual member tribes in order to provide funding for coordination, participation, and project implementation under the several recovery plans. Each of the listed federal agencies has had several years during which to apply appropriated funds to implement authorized programs that would provide for healthy and sustainable fisheries; the tribes believe that it is now time for them to be given the opportunity to reach this goal.

MISSION STATEMENT

The CRITFC was formed by resolution of the Nez Perce, Umatilla, Warm Springs and Yakama Tribes for the purpose of coordinating fishery management policy and providing technical expertise essential for the protection of the tribes' treaty-protected fish resources. Since 1979, the CRITFC has contracted with the BIA under the Indian Self-Determination Act (Public Law 93-638) to provide this technical support. The CRITFC's primary mission is to provide coordination and technical assistance to the member tribes to ensure that outstanding treaty fishing rights issues are resolved in a way that guarantees the continuation and restoration of our tribal fisheries into perpetuity. The Commission's technical experts, in coordination with the tribes' technical experts, have identified where the land and water managers as well as state and federal fishery managers have fallen short in protecting and restoring the habitat and production of all salmon stocks and we have, at the request of the tribes, provided recommendations for correcting management practices that have led to the loss and destruction of salmon and its habitat. The tribes' restoration plan documents the threats to their fisheries, identifies hypotheses based upon adaptive management principles for addressing these threats, and provides specific recommendations and practices that must be adopted by natural resource managers to meet their treaty obligations. The tribes' ultimate goal is to restore a sustainable resource for the benefit of all peoples in the Pacific Northwest, the following programmatic descriptions briefly describe how the tribes hope to achieve that goal.

WATERSHED RESTORATION COST SHARE

For the Fisheries Services programs, \$5.5 million of the proposed increase is for the watershed-based salmon restoration program. The tribes have identified \$30 million in habitat restoration work that must take place in the Columbia River Basin in order to begin to restore salmon populations. Of this work, about half is located on tribal reservations and ceded lands; therefore, the tribes must be prepared to manage and administer at least \$15 million in watershed restoration activities, and will need to provide the required 25 percent match. The \$30 million will come from regional sources, for example, from the Northwest Power Planning Council's Fish and Wildlife Program funded by the Bonneville Power Administration. So, out of the \$5.5 million, \$3.75 million will provide the required 25 percent match for \$15 million of tribal watershed restoration activities. That is, every dollar provided through appropriations for this program will leverage a three dollar match from regional funds. The cost share monies will go directly to tribal governments implementing projects. Of the balance of the \$5.5 million, \$1 million will be used to support building tribal capacity to administer and manage the habitat restoration activities and \$750,000 will be used to direct a Columbia Basin habitat monitoring program to monitor the effectiveness of the \$30 million in watershed projects. In lieu of the \$3.75 million identified for BIA cost-sharing on watershed restoration projects, the Bureau of Indian Affairs could facilitate efforts between each of the four tribes and their Commission and the Bureau of Land Management, United States Forest Service, National Biological Survey, and the U.S. Fish and Wildlife Service to enter into cooperative agreements or 638 contracts as provided for under Public Law 103-413, in order to provide funding for this cost share.

WATERSHED RESTORATION OUTREACH

An important aspect of implementing the watershed restoration program throughout the Columbia River Basin will be explaining the benefits of the program to the potential partners in out year programs. The tribes believe that additional benefits might be realized through private corporations or citizens participating in the watershed restoration effort, either directly through identified projects or through the independent development of complementary projects. Developing and encouraging

this type of participation, as well as explaining the benefits of the underlying program, will require extensive public outreach efforts. The estimated cost for this component is \$200,000 for fiscal year 1998.

COLUMBIA RIVER ENDANGERED SPECIES PROGRAM

In January 1991, at the Bureau of Indian Affairs' request, the Commission submitted an assessment of our foreseeable needs regarding outstanding hunting and fishing rights. We requested \$600,000 for determining the proper allocation of the conservation burden among all sources of salmon mortality in the Columbia and Snake basins and \$400,000 for implementing hatchery production reform. The majority of these funds are to be distributed to the tribal fishery programs, with the remainder to the Commission for coordination and additional technical support. These programs represent on-going needs; thus far only \$300,000 has been provided under the Columbia River Endangered Species Program, leaving an unmet need of \$700,000. The tribes and Commission would utilize the balance of the funds consistent with both salmon restoration plans and our on-going programs.

ENFORCEMENT AT "IN-LIEU" SITES

Under Public Law 100-581, the Congress authorized the U.S. Army Corps of Engineers to acquire and develop access sites and facilities along the Columbia River to replace usual and accustomed fishing places inundated as a result of the construction of Bonneville Dam, known as "in-lieu" sites. Once these in-lieu sites are acquired and developed by the Corps, they will be turned over to the Department of the Interior, Bureau of Indian Affairs, for administration as Treaty Fishing Access Sites. Administration of these sites will involve increased enforcement responsibilities, which is estimated at \$250,000 for fiscal year 1998.

PROTECTION OF CULTURAL RESOURCES

Under the several salmon restoration plans being reviewed for implementation in the Columbia River basin, there are several proposals that will affect river operations, ranging from reservoir pool draw downs to naturalized river flow options. Under any of these scenarios, river level elevations will decline, leading to exposure of tribal cultural sites, including tribal burial sites. Protection of these cultural and religious resources, including criminal and civil penalties, are provided pursuant to the Archaeological Resources Protection Act and the Native American Graves Protection and Repatriation Act. The additional costs associated with enforcement activities to protect these resources are estimated at \$500,000.

As for the Commission's ongoing programs, the work of the Commission's staff is being undermined by the manner in which the Bureau of Indian Affairs is providing funds for the indirect costs of these programs:

Contract support/indirect costs

Each of the last three years, indirect cost reimbursement to the CRITFC has fallen between \$80,000 to \$100,000 below legislated levels. We are concerned that this shortfall will continue to increase, unless Congress takes action to ensure that contract support requirements are fully financed.

Current estimates indicate the BIA will have a 10 percent shortfall in paying indirect costs for 1997.—While a separate fund has been established to provide indirect cost reimbursements for new contracts, indirect cost funds for ongoing contracts still fall far short of program requirements. This continuing trend has serious ramifications for the Commission's operations, such as deferring computer equipment purchases, and curtailing support services needed to meet the organizational mission.

In addition, indirect cost shortfalls have the effect of amplifying the Commission's indirect cost rate due to the under-recovery of indirect costs. That is, the Commission operates with an indirect cost recovery deficit and must attempt to cover that deficit when applying for other federal and non-federal grants in order to have the capability to support the grant project. On the other hand, if the BIA provides full indirect cost reimbursements on BIA funds, our indirect cost rate will be dramatically reduced and we will be better able to persuade other governmental and non-governmental entities to provide program funding.

Pay-cost adjustments

Add \$103,903 to provide for under-recovered pay cost and inflation for adjustments for 1992, 1993, 1994, 1995, and 1996. Direct BIA to insure that all Public Law 93-638 contracts are treated in accordance with these annual adjustments.

Several years ago the Committee directed the BIA to stop ignoring the Commission contract in making the normal annual pay cost and inflation adjustments being

afforded BIA operations and other Public Law 93-638 contractors. For a number of years the BIA complied, prior to 1992. While the BIA has provided pay cost adjustments for fiscal year 1997 and fiscal year 1998, we would ask that the Committee direct the BIA to provide full adjustments for the fiscal years 1992, 1993, 1994, 1995, and 1996.

Finally, only last week we received a copy of the draft "Strategic Plan to Implement Reforms Required by the American Indian Trust Fund Management Reform Act of 1994." While certain aspects of the draft plan may have merit, we are concerned that it still require considerable study. Relative to this Commission's primary mission, we are concerned about the new proposal in the draft plan to create an independent organization—outside the Department of the Interior—to assume all trust asset management functions. How this might relate to fishery resources is unclear; in fact, there are many unanswered questions. Clearly, this proposal requires considerable review and examination by the tribes. We believe that appropriations to fund implementation of those parts of the plan that relate to removing functions from the Bureau of Indian Affairs should not be provided until the tribes have had a full opportunity to review and evaluate that plan. We expect that our member tribes will continue to review and actively participate with other tribes in evaluating this draft plan and that they will communicate with you further as this draft plan moves forward.

Mr. Chairman, in summary, we believe that the Commission is an excellent working model of the Indian Self-Determination Act. Through a governing body of leaders from four tribes working together to protect their treaty fishing rights and a staff of biologists, hydrologists, law enforcement personnel, and other experts advising tribal policy-makers, this Commission has demonstrated that tribes are able to take the lead on natural resource issues, provided that adequate resources are available. We are asking for your continued support of our efforts. We trust the Subcommittee will take these concerns into account when considering the fiscal year 1998 Bureau of Indian Affairs budget. We are prepared to provide any additional information you may require in analyzing the BIA's budget.

PREPARED STATEMENT OF WM. RON ALLEN, COMMISSIONER, U.S. SECTION OF THE
PACIFIC SALMON COMMISSION

Mr. Chairman, my name is Ron Allen, I am the tribal Commissioner representing the United States of America on the Pacific Salmon Commission. For the record, I have provided the executive summary of the proposed budget prepared by the U.S. Section Budget Committee for implementation of the Treaty. It details budgets for Tribal, Federal, and State agencies involved in the Treaty. The U.S. Section has identified a required funding level of \$3,152,046, plus pay cost adjustments for fiscal year 1997 and fiscal year 1998, for tribal research projects and participation in the United States/Canada Pacific Salmon Treaty process for fiscal year 1998. These program recommendations have been integrated with those of the state and federal agencies so as to avoid duplication of effort and provide for the most efficient expenditure of scarce funds. In the BIA's budget in past years, these funds have been allocated between Self Governance compacts and the United States/Canada Pacific Salmon Treaty line item. This year, in a move endorsed by the U.S. Section, the BIA will transfer \$924,000 from the self governance compacts back to the Salmon Treaty account. Please note that this amount falls \$134,046 short of the amount necessary to fully restore this account. This is due to recent cuts in self governance funding. In order to ensure the effective implementation of the United States/Canada program, the U.S. Section recommends that this committee, in addition to the base transfer, restore the additional \$134,046 to our base funding, thereby funding the United States/Canada account at \$3,152,046 in fiscal year 1998. I would note that, at that amount, you would only be restoring this program to its fiscal year 1995 combined funding level.

The United States and Canada established the Pacific Salmon Commission, under the Pacific Salmon Treaty of 1985, for the purposes of conserving salmon stocks, providing for the optimum production of salmon stocks, and controlling salmon interceptions. While the first few years of the Treaty provided tangible benefits for both countries, the Commission's work has become increasingly difficult over the last few years: the status of some of chinook and coho stocks originating in Washington, Oregon, Idaho, and British Columbia continues to grow worse while the demands to maintain culturally and economically important fisheries increases. The Commission could not meet one of these needs without sacrificing the other. While both country's managers agreed that conservation needs should be addressed first, we found it increasingly difficult—if not impossible—to agree on which fisheries

should bear the sacrifice necessary carry out that responsibility. In the last year, though, we have initiated two important changes: within the United States, we have adopted an abundance based approach for chinook management; with Canada, we have embarked upon a "Regional Stakeholders Process" in an attempt to resolve our ongoing debate over "Equity" under the Treaty.

Until the last two years, the United States watched in frustration as Canada ignored our requests for significant harvest reductions in Canadian fisheries harvesting U.S. origin coho, and chinook. This stance by Canada only increased the pressures on harvest management within the U.S. Chinook conservation concerns, particularly for stocks originating in Idaho, Oregon, and Washington, finally resulted in a lawsuit within the United States in 1995. This lawsuit was the result of the United States and Canada's inability to develop a more responsive chinook management regime, one that took into account the annual fluctuations in the abundance of stocks. The tribes and the states of Washington and Oregon, through litigation, enjoined Alaska's chinook fishery in 1995, while Canada undertook some chinook harvest reductions as well. These actions addressed the chinook conservation requirements in the short term, but left many questions unanswered.

In 1996, the U.S. Section, after lengthy negotiations, adopted an internal agreement on how to manage the Southeast Alaska chinook fishery, utilizing an abundance based management mechanism. We only took this step in the United States after negotiations with Canada did not provide us with a coastwide management mechanism. The approach adopted by the United States allows for the harvest of chinook to go up in Southeast Alaska as the aggregate abundance of stocks increase, but, equally important, this approach reduces the allowable harvest as the aggregate stock abundance goes down. In this way, the United States hopes to be able to more proactively address conservation concerns for chinook stocks in U.S. fisheries. But because this effort cannot work without Canada's participation, it is our intention to negotiate a compatible management regime for Canadian fisheries through the Salmon Commission process, using our agreement as a starting point.

As for Equity, the United States proposed and Canada agreed to use, a regional forum to address our continuing debate over how to implement this important Treaty principle. Under this approach, we have enlisted fishers, the people that know the fisheries and their problems the best, to provide us with recommendations on how to resolve the several long standing issues in this area. Using one group for Alaskan and Northern British Columbia fisheries and another group for Southern British Columbia and Fraser River fisheries, the parties have tasked these fishers with reviewing past management regimes and asked them to come back with innovative solutions. While they will be struggling with difficult issues, I believe there is reason to be optimistic about solutions coming out of this process.

Mr. Chairman, considering the explanations I have just provided for some of the things you may have heard, the signing of the United States/Canada Pacific Salmon Treaty must still be recognized as an essential step forward for the conservation and enhancement of the truly renewable salmon resource of the Pacific Northwest, Alaska, and Canada. Under the Treaty, both countries committed themselves to a coastwide rebuilding program for chinook salmon stocks, to the conservation of the coho stocks of both countries, and to a harvest sharing of Fraser River sockeye and pink salmon stocks in order to provide for stable United States and Canadian harvests. Even with the difficulties outlined above, the Commission continues to work towards those goals. There is no doubt that the resource would be in much worse shape today had the Treaty not been in place for the last ten years. Prior to this Treaty, fish wars often erupted with one or both countries overharvesting fish that were returning to the other country, to the detriment of the salmon resource. Now, under the Treaty, we share a mutual commitment—if at times a rocky one—with Canada to rebuild chinook stocks, to conserve salmon populations coastwide, and to insure that each country is receiving the benefits of its salmon production.

Especially in years of difficult negotiations, you should recognize that the information provided by the programs becomes even more critical from a management perspective. When there is no agreement between the United States and Canada, the burden on U.S. resource managers of domestic fisheries increase by well more than twofold—without adequate technical information, they must take much more conservative management actions to avoid overfishing the stocks.

Beyond our budget recommendations, it is important to remember that a primary consideration of Pacific Salmon Treaty negotiators was that the Treaty would allow for both the United States and Canada to proceed with planned enhancement activities. You should recognize that additional funding should be provided, as promised at the time the Treaty was signed, to carry out these enhancement activities. Within the region, we are developing cooperative arrangements to further region-wide efforts to rebuild salmon stocks. Continued delay in undertaking enhancement activi-

ties is placing considerable strain on those bearing the burden of conserving the salmon resource—largely fishermen coastwide, and all too often the tribal fishermen. Enhancement of this resource will provide for a stable, diversified economy coastwide. Of course, enhancement under the Treaty means the use of both natural and artificial methods and includes restoring the spawning habitat of a river, enhancing passage to the spawning and rearing areas, and using supplementation to rebuild weak or depressed stocks. And again, since they have been developed to rebuild or conserve salmon populations, these enhancement activities would also be expected to complement and hasten the recovery of salmon stocks listed under the Endangered Species Act.

Finally, you should take into account the fact that the annual value of the commercial harvest of salmon subject to the Treaty is worth well over \$500 million when stocks are at productive levels, supporting the infrastructure of many coastal and inland communities. The value of the recreational fisheries, and the important economic diversity they provide for local economies throughout the Pacific Northwest and Alaska, is also immense. And, of course, the value of these fish to tribes of Washington, Oregon, and Idaho goes far beyond their monetary value and reaches the cultural and religious lives of Indian people. Lastly, continued attention—and significant monetary investments—is focused on salmon as a result of listings of Pacific Northwest salmon populations under the Endangered Species Act. Given the resources, we manage a resolution to this complex situation, especially if we are allowed to work towards the true intent of the Treaty: mutually beneficial enhancement of the shared resource.

Mr. Chairman, that concludes my written testimony submitted for consideration by your Committee. I want to thank the Committee for the support that it has given the U.S. Section in the past. Rolland Rousseau, Chairman of the U.S. Section Budget Committee, will be able to answer any written questions you or Committee members may have regarding the U.S. Section of the Pacific Salmon Commission budget.

Summary of tribal program under the United States-Canada Pacific Salmon Treaty

<i>Fiscal years</i>	<i>BIA total</i>
1997 actual appropriation	¹ \$3,018,000
1998 recommendation	3,152,046
Shortfall/restoration	134,046

¹This amount is the total of self governance account funds (\$924,000) and the United States-Canada Pacific Salmon Treaty account (\$2,094,000). As a result of targeted cuts in funds that were provided under Tribal/Agency Operations for tribes participating in the Self-Governance Compacts, this amount is a reduction in program funding provided by Congress in earlier years. In order to carry out the programs endorsed by Congress in past years, an additional \$134,046 should be restored to the United States-Canada Pacific Salmon Treaty.

PREPARED STATEMENT OF WM. RON ALLEN, COMMISSIONER, U.S. SECTION OF THE PACIFIC SALMON COMMISSION

Mr. Chairman, my name is Ron Allen and I am a Commissioner on the Pacific Salmon Commission, established by the Treaty between the United States and Canada for the purposes of conserving salmon stocks and controlling salmon interceptions. I am providing this testimony as a member of the U.S. Section Budget Committee. The Committee's staff has also been provided with a copy of the recommended budget prepared by the U.S. Section for implementation of the Treaty. It details budgets for Tribal, Federal, and State agencies involved in the treaty. For the U.S. Fish and Wildlife Service, the U.S. Section recommends funding the fiscal year 1998 base program for Pacific Salmon Treaty activities at \$615,000, an increase of \$150,000 over the amount provided by Congress in fiscal year 1997, providing a necessary add-on to the USF&WS base budget for the Regional Mark Center. All of the funds are needed for data collection and analysis directly related to the implementation of the Treaty and are used in cooperative programs involving Federal, State, and Tribal fishery agencies and the Department of Fisheries and Oceans in Canada. The monetary commitment of the United States is matched by the commitment of the Government of Canada.

The United States/Canada Pacific Salmon Treaty continues to be important to the wise management of the salmon of the Northwest and Alaska. The cost to manage this resource is small compared to the value of the salmon to the economies of both countries. The value of the annual commercial harvest of salmon subject to the Treaty is estimated, when stocks are healthy, at over \$1 billion, supporting the infrastructure of many inland and coastal communities in Southeast Alaska, Canada, Washington, Oregon and Idaho. The value of the recreational fisheries, and the important economic diversity they provide for local economies throughout the Pacific

Northwest and Alaska, is also immense and in some ways incalculable relative to the societal benefits they provide local communities. Recent downturns in stock productivity make the USF&WS programs, especially the Regional Mark Center, critical to managing currently depressed stocks. And, of course, the value of these fish to tribes of Washington, Oregon, and Idaho goes far beyond their monetary value and reaches the cultural and religious lives of Indian people.

As part of the U.S. Section's management activities, millions of young salmon are marked each year with coded wire tags that allow the U.S. Section to evaluate its fishery management decisions. The adult salmon that return to the fisheries and spawning areas are sampled and the tags are recovered, providing important migratory and catch rate information to both researchers and managers. This information continues to be the backbone of evaluating the Treaty's programs and successes and is also an invaluable tool in gauging the recovery programs being evaluated by the Pacific Northwest and Alaska as part of the Endangered Species Act process. This critical work is facilitated by the Regional Mark Center.

For fiscal year 1998, we are requesting that the Committee provide the Fish and Wildlife Service with a \$150,000 add-on to fund the Pacific States Marine Fisheries Commission's (PSMFC) Regional Mark Center. The Regional Mark Center coordinates the standards of the Treaty's comprehensive, long-term activity and acts as the central computerized repository for the information on tag releases and recoveries. The Fish and Wildlife Service will contract with the PSMFC to provide this service. Because of the added concern for salmon stocks generated by the Endangered Species Act, this information has become even more critical to Alaska and the Pacific Northwest, as well as Canada, in order to evaluate fishery management decisions. Because the responsibilities of the Regional Mark Center will continue to grow as the demand for this information grows, the U.S. Section is recommending that \$150,000 be added to the Service's base Resource Management program funding for this critical Treaty activity.

Mr. Chairman, that concludes my testimony submitted for consideration by your Committee. I want to thank the Committee for the support that it has given to the Treaty in the past. I am available to answer any questions you or Committee members may have regarding the U.S. Section of the Pacific Salmon Commission budget.

SUMMARY OF U.S. FISH AND WILDLIFE SERVICE PROGRAM NEEDS FOR UNITED STATES-CANADA
PACIFIC SALMON TREATY

	Fiscal years—		Shortfall
	1997 appropriation	1998 recommendation	
Fisheries (staff and tagging activities)	\$465,000	\$465,000
Pacific States Marine Fisheries Commission	150,000	\$150,000
Total	465,000	615,000	150,000

PREPARED STATEMENT OF JOYCE BURR, SUPERINTENDENT, CIRCLE OF NATIONS
SCHOOL

Honorable Senators: My name is Joyce Burr I am the superintendent of Circle of Nations School, an off-reservation boarding school operating under a contract from the BIA to the Sisseton-Wahpeton Sioux tribal governing body under Public Law 100-297. The 6-member school board represents tribes with the largest enrollment of students, from the states of North Dakota, South Dakota, Minnesota, Montana, Wisconsin, and Nebraska.

The Circle of Nations School is located on a 53-acre campus in Wahpeton, ND. It has 3 dormitories, 1 instructional building, and 10 other buildings. The program was established by Congress in 1904 as an agricultural and vocational training school administered by the BIA. It changed to a more conventional academic focus by the 1940's. Day schools had been established on reservations following the 1928 Merriam Report, which spurred national reform in Indian education.

By the 1970's, the remaining boarding school system was home to a troubled student population who did not fit with schools at their home agencies. The concept of a therapeutic school began to be discussed among Indian health and education leaders. Several papers from 1973 to 1988 document needs of the off-reservation boarding schools and the recommendations of BIA, Indian Health Service, and Indian school organizations toward a therapeutic model.

In 1993 the school converted to tribal grant status. That year, a Therapeutic community School Model Meeting had been held in Washington, DC whereby Indian Health Service, BIA, mental health experts, and boarding school officials conceived a plan to implement the model in 4 schools, including Wahpeton. This was hailed as "an historic meeting, a collaborative effort between the Bureau of Indian Affairs and Indian Health service" and "a cooperative endeavor in more than name only." Again the mental health needs of students were emphasized, as were staffing and funding improvements.

Indian Health Service stated that an "underfunded, understaffed model should not be attempted." The off-reservation boarding schools (ORBS) asserted that the Indian School Equalization Program (ISEP) formula could not even marginally meet the high needs of students with chronic substance abuse, mental health, behavior and learning problems. Concept papers from the ORBS recommended changing the ISEP formula. To date this has not happened, and the boarding schools continue to struggle with a seemingly impossible proposition: to provide—on a shoestring budget—a total program for each child, where various other agencies and resources have failed or been exhausted. For years, the boarding schools had the image of a "last resort" "dumping ground" "warehouse" and "escape hatch" for troubled and disadvantaged Indian youth.

These children were abandoned by parents, schools, professional service providers, and the juvenile justice system without a second thought. They came from psychiatric wards, detention centers, abusive homes or no home, and other problematic circumstances with no documentation or resources for their care while at school. Yet there has never been a suicide or a drug or alcohol-related death of any student at the Wahpeton Indian boarding school—even though a dozen such incidents have occurred in the school-age population of the surrounding small community in as many recent years.

As a result of the numerous studies and adverse publicity regarding boarding schools, the Circle of Nations (Wahpeton Indian School) was designated a therapeutic model demonstration project under Public Law 103-382, Improving America's Schools Act of 1994. A one-year funding award allowed for a reduced enrollment of 150 students in 1994, as compared to nearly 300 the previous fall, in order to lower the student-to-staff ratio.

The school is charged with the responsibility of providing a program, based on an annual written plan, that "links clinicians, counselors, and mental health professionals with academic program personnel in a culturally sensitive residential program tailored to the particular needs of Indian students."

The school operates a 24-hour-a-day, 7-days-a-week, 9-month therapeutic residential school program. We currently enroll 200 children in grades 4 through 8 from around 33 tribal groups and 18 different states. Our largest student enrollment are from the Aberdeen, Bemidji, and Billings Indian Health Service regional areas. However, the school does not receive Indian Health Service support other than technical assistance and the school clinic program which employs a nurse and intermittent nurse assistance.

Last year's budget for the school clinic was \$185,016 (\$101,316 from Hospitals & Clinics program and \$83,700 for Contract Health Service funds). With 200 students, that works out to \$925 per student for the 252 days per school year that a student is on campus, or \$3.00 per day. If a student requires emergency psychiatric placement, their entire yearly allotment will buy 1.5 days or one-half of a standard 72-hour emergency inpatient assessment. Longer-term mental health or chemical dependency treatment is the usual recommendation for these students, although funds can rarely be accessed.

Circle of Nations revised its admission requirements to include a psychological evaluation, chemical dependency assessment, court report, and social history for each student's application. This eliminated some costs and provided a planning document for each student. The majority of students have multiple health risk factors—environmental, biological, and behavioral. Typically, students have a history of low academic or personal achievement and have learning impairments.

Most of our students can be diagnosed with more than one co-existing mental health, substance abuse, or learning disorder. 75 percent are eligible for Special Education services in either Emotionally Disturbed (80 percent) or Learning Disabled (20 percent) diagnostic categories. At least 90 percent meet diagnostic criteria for Conduct Disorder. 75 percent report a history of physical, sexual, or psychological abuse. 25 percent or more have family-reported risk factors for prenatal alcohol or other drug exposure known to cause birth defects such as Fetal Alcohol Syndrome of Effect. Traumatic brain injury is a significant factor as well.

The goals of the Circle of Nations therapeutic model are: 1. Successful transition through levels of learning; 2. Health promotion/disease prevention; 3. Mental health promotion; and 4. Promote spiritual, cultural, social, and emotional development.

We can provide a comprehensive residential education program that includes housing, nutrition, special education, school health services, recreation, cultural, and leisure activities, and a network of referral. We use all available resources for the prevention and early intervention/remediation of health and learning problems, including mental health and substance abuse disorders. Students may be referred elsewhere if their problems turn out to be beyond the scope of our services, for example, psychiatric emergencies and longer-term inpatient recommendations. There are no clinical mental health providers on staff, such as a psychologist, psychiatric nurse, etc. although we can contract limited assessment services from providers (not treatment).

The therapeutic residential school is conceived of as a cost-effective approach which aims to prevent or ameliorate lifetime problems, the costs of which are already being obligated to different agencies, programs, or resources. The total cost per student is currently \$50 per day at Circle of Nations School, compared to \$125 for youth detention, \$480 for inpatient substance abuse treatment, or \$650 for inpatient psychiatric care. The overall federal average cost of housing an adult prison inmate presently exceeds \$21,350 per year. A year's stay in the state hospital or regional treatment center is far more costly.

Experts on the treatment of conduct-disordered children agree that developing a "system of care" that is designed to improve the child's ability to function in all areas of his or her life—at home, in school and in the community is the best approach, rather than short-term treatment or counseling. Circle of Nations is a structured system of care for children who do not have an adequate system elsewhere.

The idea is to help these children change their emotional and belief system before it solidifies and is entrenched in their lives (a childhood history of conduct disorder is a diagnostic requirement of adult antisocial personality disorder). Circle of Nations School promotes normal socialization, skills acquisition, and remediation modalities in the least restrictive environment possible. The therapeutic community approach teaches personal and social responsibility and allows the student to practice adaptive coping skills.

Circle of Nations is not a locked facility as are the state corrections school and other inpatient or residential programs where youth are physically contained, requiring fewer staff to operate. In comparison, the students at Circle of Nations School require constant staff supervision, a higher staff effort, and a higher staff to student ratio.

When our students are assessed by expert providers and clinicians, they have over and over again recommended long term inpatient therapy, group or foster home placement, specialized learning and behavior programs, and dual track mental health/substance abuse treatment. But there is no such placement available to our students—Circle of Nations School is the closest thing to this ideal although it is not yet a truly therapeutic model.

During the 1996–97 the Behavioral Center Pilot Project was implemented on a small scale at Circle of Nations School. This is a structured 24-hour care program for high-risk students such as dual disordered, chronic substance abusing, and assaultive kids. It serves up to 10 children at a time with an individual Master Treatment Plan. The team treatment approach utilizes the participation of clinical mental health providers, licensed addiction counselors and social workers, counseling and psychological support staff, and residential and child protection staff.

The majority of kids go through the behavior modification and counseling program and are then mainstreamed into the general population again instead of being suspended or expelled. Some are placed in longer-term psychiatric or CD treatment programs directly from the Behavioral Center and are able to return school upon successful completion of these off-campus programs. This project is successful in that only 2 of 24 students were dropped from Circle of Nations School after leaving the Behavioral Center. Both were placed directly into longer-term psychiatric treatment through CNS referral work.

While this program is effective for the children it serves, it does strain our staff resources that are needed by the rest of the student population. If a clinical program director and mental health providers and workers could be hired to operate the Behavioral Center and generate third-party billings, this program could serve many more students and become self-sufficient in 3–5 years. What Circle of Nations School proposes to do is to further develop and staff the Behavioral Center whereby students can be served by a three-phase onsite therapy program, eliminating the cost of outside provider contracts and emergency facilities and improving student performance and retention.

The on-campus Behavioral Center is our priority task in carrying out the therapeutic residential school mission. We are requesting \$1.7 million to implement this project. A complete proposal and budget are available for review.

Lives are being wasted every day in this country. Students drop out and leave school without learning the crucial things for their success. The boarding schools are a microcosm of reservation and urban society today with all its ills. It's time to quit the Band-Aid approach. Inadequate funding, understaffing, outdated programs, restrictive policies, and lack of coordination between agencies have characterized Indian boarding schools for the past 25 years. We must move decisively, for these children are our future.

PREPARED STATEMENT OF STANLEY HERRERA, PRESIDENT, ALAMO-NAVAJO SCHOOL BOARD, ALAMO, NM

Mr. Chairman: I am Stanley Herrera, President of the Alamo-Navajo School Board. With me today is Burton Apache, a Member of the School Board. We offer testimony on the School Operations budget submitted by the Bureau of Indian Affairs, and on certain aspects of the fiscal year 1998 Indian Health Service budget.

First, let me point out that the Alamo School Board does more than operate a school. Since our 10-square mile reservation is in an isolated area of south/central New Mexico, far away from the "big" Navajo Reservation, the Alamo-Navajo Community has had to learn and practice self-sufficiency on a daily basis. Through the authorization of the Navajo Nation Council and the Alamo Chapter (a political subdivision of the Navajo Nation), the School Board has become the central service organization for all education, health, roads maintenance and community programs serving the 1,800 residents of the Alamo reservation.

BUREAU OF INDIAN AFFAIRS—SCHOOL OPERATIONS

Each year Congress provides us with funds under the Indian School Equalization Formula (ISEF) to pay the costs of our instructional program. But you should know that we are not able to devote these ISEF monies solely to our instruction needs. The chronic shortages in the other accounts that must support our school operations force us to use our precious ISEF dollars to make up those shortages. For example:

Our student transportation (daily round-trip to/from homes) costs \$180,000 annually. We are reimbursed for only \$136,600, or only 70 percent of the costs. Thus, we have to make up the \$43,400 difference from our ISEF instructional funds.

GSA will increase the bus lease rates next year, but there is no additional funding in the budget request to cover these costs. Thus, the percentage of our transportation costs for leasing will increase from 40 percent of our budget to perhaps 60 percent. But we cannot pay lower wages than we already pay our bus drivers. Thus, this additional shortfall will take even more of our ISEF dollars.

The facilities operation & maintenance funding has never been able to meet the Congressionally-ordered formula. Currently, we are falling 34 percent short of the formula, and this shortage will be even greater under the proposed fiscal year 1998 budget. The BIA acknowledged that over 750,000 square feet of facilities space were added to the system, but they do not request the additional \$3 million needed to cover this. Thus, all schools will suffer an even greater reduction in the funds provided for facilities maintenance.

What does this mean for Alamo? Since we have to pay in full our utility costs, must perform preventive maintenance and cover emergency repairs, we have little money left for custodial expenses. What does this mean for the federal facilities we operate? They will deteriorate at a far faster rate.

Where do we look to make up the shortage? ISEF, again.

When the Administrative Cost Grant funding is not enough to pay all schools at the rate required by law, we institute severe cost reduction efforts. But there is a level below which we cannot drop without compromising sound management principles. When this happens, we again must make up the shortage with ISEF dollars.

We fear there could be a significant shortage in the A.C. Grant request for fiscal year 1998, as some 12 schools currently operated by BIA will be converted to tribal operation. This makes these schools eligible for AC Grant funds. We know BIA has not asked for enough additional funds to cover these conversions. This means all schools will suffer sizable reductions in their A.C. Grants.

A note about severance pay: We ask you to make sure that BIA does not use any of the funds you appropriate for School Operations to pay federal employee severance costs at the converting schools. Such use is not authorized in the law. Severance costs should be funded from the BIA's contract support line item, and we ask you to assure that sufficient funds are provided there for this purpose.

BIA—FIRE PROTECTION

Three years ago, a lot of media attention was focused on the lack of fire protection at BIA-funded schools on the Navajo Reservation. Immediately afterward, the then Director of the Office of Indian Education Programs authorized schools to use facilities operation & maintenance funds for fire services. We have received some minor equipment (such as fire suits) and some training for volunteer firemen. But we received no additional funding for fire services and no really significant improvements in fire protection since then.

As a result Alamo still has only one fire truck—a 25-year-old vehicle that carries 500 gallons of water. This is the sole fire fighting capability we have on a reservation that is the size of the District of Columbia. With this one vehicle, we have to protect \$25 million of federal facilities and the homes of 1,800 reservation residents.

INDIAN HEALTH SERVICE

We could spend hours reciting various funding problems with the IHS clinic the School Board operates, but we will focus on only one of them here: environmental health systems such as water, sewer and solid waste disposal.

IHS funds new environmental health systems development on a limited basis for new federal facilities (such as our recently-expanded clinic) and tribal housing programs. But, when completed, IHS turns the utility systems over to the local tribal governmental authority and provides neither upkeep nor replacement costs.

In a number of New Mexico tribal settings, the existing environmental health infrastructures are old, inadequate and badly deteriorated. Some provision must be made for replacement and maintenance, as we do not have the funding base at the local level to support this needed activity.

I wish I could close on a hopeful note, but I cannot. The recent Welfare Reform Law will put additional pressure on our existing inadequate health, education, and community programs and facilities. Many Indian people who now live off-reservation will be forced to return to their reservations when they are cut off from the social support programs previously funded by federal program dollars. When this happens, how will we be able to manage this added responsibility?

PREPARED STATEMENT OF GEORGE CUKRO, EXECUTIVE DIRECTOR, BLACK MESA
COMMUNITY AND SCHOOL OF THE NAVAJO NATION

The Black Mesa Community School is a K-8 Grant School located on the Navajo Nation Reservation in northern Arizona. We are a rural Native American community within the Black Mesa Mountains, on unpaved route 8066. The nearest post office is in Pinon, Arizona, 25 miles south of Black Mesa.

We appreciate the opportunity to submit our statement on the proposed fiscal year 1998 Bureau of Indian Affairs budget. Our statement focuses on Navajo children, their education, and the facilities that are needed for them to obtain the rich resources that are available in ways that most take for granted. In summary those needs are: adequate teaching facilities and a safe road to the school; a dependable, efficient telephone system; capability to access the internet and on-line computer services; adequate, safe housing for instructional staff.

The Black Mesa Community School opened in 1976 in used trailers converted into small classrooms. Later, the Bureau of Indian Affairs constructed a small school building consisting of four instruction classrooms, a library/conference room combination, an all-purpose room with an attached kitchen, a small office unit, and 2 student restrooms. The school was built to house 80 students but we have grown to more than 100 children. Since 1991, our student population has been consistently averaging 100 students, as follows:

Number of students

1991	100
1992	92
1993	112
1994	98
1995	105
1996	105

The needs of Black Mesa's children are not any different than kids who live in large metropolitan areas. We are, however, restricted in meeting those needs due to our isolation, lack of outside resources, limited housing, and no phone lines.

OVERCROWDING

We have applied for grants to build additional modular classroom buildings to help meet the children's needs, but to date we have not even received acknowledgment that they were being considered. To serve an ever increasing student population, we have had to combine several grade levels into single classrooms. This limits our capacity to provide a well-rounded curriculum for our children such as shop, home economics and arts. Clearly, these are classes that most children take for granted throughout America. In order to adequately provide for our students, we need:

- Two additional classrooms to reduce the pupil/teacher ratio in classes that are currently combined across grades because of our limited facilities.
- Two classrooms for pre-vocational training for our middle school students. One room would be used for a wood working shop, as well as for cultural arts. The second room would be used for home economics, including cooking, sewing, home management and life skills.
- One computer lab for technological training and internet access.
- One classroom for advanced instruction for gifted and talented students.

UNSAFE ROAD

At present, the unpaved road limits access to Black Mesa School. If there is an emergency, help is a long time coming. It is often dangerous for buses and parents to navigate 12 inch ruts, mud, snow, and ice. Consultants who come to our school for staff development would rather pay the expense of renting a car than pay the repair bills for replacing tires, shocks, windshields, motor mounts and wheel bearings. Believe me when I tell you that I am not exaggerating.

For the health and safety of our people, especially the children, we need funds to lay gravel on the unpaved road and maintain a consistent repair schedule throughout the year.

TECHNOLOGICAL NEEDS

The utilization of modern technology is the only way possible to provide for the health and educational needs that will offer Navajo children the opportunities enjoyed by other children in this country. We at Black Mesa have committed to the use of technology in linking our local educational standards to the national, state, and Bureau of Indian Affairs standards.

We need your help in obtaining for our school a modern communication system. Black Mesa School has the only available telephone for the people in a 25-mile radius. This phone is operated by radio waves and is very unreliable. There are days when the phone goes out for hours at a time. If we ever had an emergency during one of those blackout times someone might lose their life. A dedicated phone line would not only provide a more reliable communication system for the health and safety of the Black Mesa community, but we could also be linked to the rest of the world technologically. Most Americans now have the world at their fingertips, but Navajo children at Black Mesa struggle to utilize the 10 computers we were able to purchase.

With a dedicated phone line, our students, too, will be able to access database services including the internet and on-line computer services which can provide a rich learning experience for our children. We have committed ourselves to use technology to provide our children with modern opportunities. We are already moving in that direction, but we cannot accomplish this goal without your help.

STAFF HOUSING

The housing for the teachers of Black Mesa School is woefully inadequate. Staff are currently housed in four trailers which are 10 years old, and 5 houses which are approximately 30 years old. Due to the age of these units, they are in need of refurbishing, replacement of appliances and have little or no heat during the freezing winter months. We ask you to re-establish a recurring education quarters construction budget in order that we can provide decent, safe and affordable housing for our staff.

On behalf of the Navajo people living at Black Mesa, we thank the Subcommittee for the opportunity to comment on matters which may seem simple and of little consequence, but they are of monumental concern to us. We are isolated, but we hope that you will assist us in obtaining the essentials of life that are taken for granted by other Americans. President Clinton has stated he was committed to excellence and technology for all American children. I believe all of you in Congress would agree that all of America's children should be well-educated for the twenty-first cen-

ture. Please do not leave the children of Black Mesa behind. Thank you for your support.

PREPARED STATEMENT OF FAYE BLUE EYES, EXECUTIVE DIRECTOR, SHIPROCK
ALTERNATIVE SCHOOLS, INC., NAVAJO NATION, SHIPROCK, NM

Shiprock Alternative Schools, Inc. (SASI) administers an alternative education program for 159 high school students, and an elementary education program for 180 students from Kindergarten through Sixth grade. SASI is unique in its concept of a holistic learning environment conducive to the highest level of learning for our diverse elementary and high school students. For 20 years we have successfully managed our alternative and elementary programs under a Public Law 93-638 contract. We are now in our seventh year of successful Public Law 100-297 Grant administration and maintain a Staff Quarters Program of ten units, serving Shiprock Alternative Schools, Inc.

So that SASI may continue its successful "alternative" high school and elementary programs, we respectfully ask this Subcommittee to fund at least two projects per year on the New School Construction Priority List. We were very disappointed that the BIA only requested funding for one new school construction project in the fiscal year 1998 budget. Our facilities are in desperate need of replacement and your commitment to funding at least two priority list projects per year will ensure that Shiprock's replacement school can receive funding within the next three years.

SASI'S "ALTERNATIVE" PROGRAMS

Our high school and elementary programs are "alternative" because they offer non-traditional education programs. The fundamental philosophy of SASI is based on Dine', and other American Indian philosophies of life, and incorporates the positive attributes for the well being of our native People. The innovative high school program was established by the Navajo Nation in 1976 to serve "at risk" Navajo high school youth experiencing social and academic problems in the conventional education program. We are the school of last resort for students who have previously dropped out of school, have become pregnant and need child care in order to continue studies, or have had disciplinary problems at previous schools. Our "alternative" high school program provides a second chance—perhaps the only chance—for those youth that are most likely to be lost to society.

The elementary program is based on the principles of early intervention and prevention. The program focuses on the academic and social needs of the individual students, blending conventional and traditional educational methods. Accordingly, the class sizes are intentionally kept small to encourage substantial teacher-student interaction and individual attention. A few years ago, BIA approved our request to advance one grade per year, with the ultimate goal of providing grades K through 8. To do this, however, we have to reduce by one kindergarten class each year in order to have the space to provide the new grade level. The program has been such a success that, since its inception, we have not been able to accommodate all students wishing to participate. This year, for instance, 37 students are on our waiting list.

NEW SCHOOL CONSTRUCTION

In January, 1993, SASI was added as the 12th school on the New School Construction Priority List and we are currently undertaking the planning and design phases that precede construction. Facilities replacement is the only option for the schools on the priority list because their facilities are in such dreadful conditions that rehabilitation and upgrading are not feasible. Below is a sampling of the conditions faced by SASI that caused it to be placed on the priority list, and a glimpse at how these conditions and our current space inadequacies have caused us to configure some of our classes.

SASI's buildings are nearly 50 year-old dormitories whose non supportive interior walls have been knocked out in order to create classroom space. As a result, numerous fire code violations exist. According to a 1988 facility code compliance survey and BIA inspection validation by architects and engineers, the "buildings were originally designed as dormitories and are not safe or suitable for use as educational occupancies." The report identified code/safety items requiring immediate attention including inadequate egress from the classrooms; flame spread rating of finishes in the corridors; fire-rated separation between boiler room; and updating of the fire/smoke alarm system in the buildings. For instance, the classrooms do not have direct exits to the outside or rescue and ventilation windows. Most of our doors do

not meet fire code standards. SASI has only an audio fire alarm system. Safety codes require an audio-visual and communication system. Only one of our three buildings has a working sprinkler system and even that is not up to code standards.

The building interiors are not handicapped accessible. No doorways, bathrooms, or water fountains were built for or have been modified to accommodate the handicapped students, particularly those in wheelchairs.

The heating system is in complete disarray. For example, our boiler creates such uneven heating that our children at one end of a building must wear gloves and coats, while staff and students at the other end open windows to cool off their classrooms. In addition, because the boilers are inadequate to handle heating each of the entire buildings, they shutdown frequently from the overload, causing our children to go without heat at all. The cast-iron radiators in the building where our classrooms are located take up some of the much needed space.

None of the buildings have rain gutters. Rain often accumulates around the breezeway areas, sometimes up to a foot. The students cannot avoid tracking water and mud into the school which creates dangerous slipping and falling. Roof shingles are loose or missing in patches, causing leaks that make the problem worse. Some leaking even occurs in the main line electrical area.

One of the most egregious conditions that we and our students must face is the presence of asbestos underneath all our school buildings and in some walls. No Facilities Management personnel are available to check for asbestos fragmentation or undertake removal. This also prevents repair work on electrical and water lines. The water in all buildings is rusted, so bottled drinking water must be brought in. The hot water is orange in color, rendering it useless.

Despite all of the foregoing inadequacies, which are not unique among Indian educational facilities, our "alternative" programs are so successful that we have a substantial waiting list for both the high school and elementary. We are making a difference in the lives of the young people that attend our programs. Nevertheless, for us to continue this success, we must have a facility that will not place our students in constant danger, but, instead, will nurture their educational experiences.

Shiprock Alternative Schools, Inc. has, for the past 20 years, been forced to operate in outdated and unsafe school buildings. Unfortunately, similar dilapidated school facilities exist throughout Indian Country which must be renovated or replaced. We were thus disappointed to see that the BIA request for fiscal year 1998 only seeks funding for construction of the Many Farms High School Replacement, a school ahead of SASI on the priority list. Education for our children is fundamental for self-sufficiency; therefore we strongly urge Congress to increase funding for Education Construction within the Department of Interior Appropriations. We hope that Congress will provide not only the money for construction of the Many Farms High School, but also money for at least one other school on the priority list, so that our need will eventually be met.

We ask that Members of the Subcommittee imagine one of your young loved ones attending a school in the same condition of our current facility. If you could provide this loved one a newer, safer school environment, would you not do so? Accordingly, we strongly urge you to take the steps necessary to fund at least two New School Construction Projects per year.

PREPARED STATEMENT OF HON. JACK BOOTH, MAYOR, METLAKATLA INDIAN COMMUNITY

The Metlakatla Indian Community, Annette Island Reserve, provides this statement on the fiscal year 1998 budget requests for the Bureau of Indian Affairs and the Indian Health Service. The Council is the federally-recognized governing body of Metlakatla Indian Community, Annette Island Reserve, the only existing statutory Indian reservation in Alaska. The Community population is over 1,500 and has a land base of 87,000 acres in southeast Alaska. The economic base of the community is based on timber and fishing industries, which provide seasonal employment. The Community administers BIA and IHS programs on the reservation under contracts pursuant to the Indian Self-Determination and Education Assistance Act.

SUMMARY OF RECOMMENDATIONS

- Special allocation for Walden Point Road project
- Increase funding for Tribal Priorities Allocation account
- Funding for construction of Metlakatla clinic

BIA FISCAL YEAR 1998 BUDGET

The Community's concerns and comments specific to the Bureau of Indian Affairs budget are as follows.

Walden Point road project.—Since 1995, the Metlakatla Community has been actively pursuing the construction of a 13 mile road and three mile shuttle ferry connection which will provide, for the first time, a safe, affordable means by which our people can access services and business opportunities in Ketchikan. Presently, our transportation links off the Annette Islands Reserve are either a commercial air transportation service or the Alaska Marine Highway System ferry service. The air service is not only expensive but subject to/limited by the weather and daylight. The ferry service makes one or two stops per week most of the year, with more stops scheduled during the summer months.

We are proud to report that we are in the final stages of negotiating a Memorandum of Agreement with the Department of Defense (who will do the actual construction under the DOD's Civil-Military Innovative Readiness Training Program), Federal Highway Administration (the project designer), Alaska Department of Transportation and Public Facilities (charged with addressing the environmental and permitting requirements) and the Bureau of Indian Affairs (lead agency for the environmental process). Other cooperating agencies include the Corps of Engineers and the Environmental Protection Agency.

While much of the costs for this project is being assumed by non-Interior agencies, the DOD is prohibited from purchasing the construction materials, which is estimated to reach \$10 million for the entire project. We have sought alternative sources to fund the materials component, including the Bureau—who advised us to seek a specified appropriation of \$2 million per year for the five-year period the project is expected to be completed. We have been informed that the necessary funding should come from either the State of Alaska or the Bureau. Both of these entities, however, have already stated that they do not have \$2 million available to transfer to this project from the funding they receive under the Federal Highway Trust Fund. Pending finalization of the MOU, all participants are ready to initiate the processes which will lead to the actual construction phase beginning May 1998.

Recommendation: We urge that Congress authorize a line item within the fiscal year 1998 Bureau of Indian Affairs budget in the amount of \$2 million for the Walden Point Road Project construction materials.

Tribal priority allocation.—The Metlakatla Community is encouraged by the Administration's request for a general increase of \$46.7 million to the Tribal Priorities Allocation ("TPA") account. Within the TPA allocation are Wildlife and Parks funds which the Community utilizes for fisheries enforcement activities. The present level of funding has limited us to just one enforcement officer. The fisheries industry, however, has developed into a major economic development and employment source for the Community. With the sea cucumber and sea urchin fisheries coming on line, our enforcement activities have increased as there are now overlapping seasons, an increased number of vessels in the waterways, and an expanded area to be covered. You can see that one person cannot adequately patrol and enforce compliance with the codes that the Metlakatla have established for the fisheries.

With each fiscal year, more and more inadequately funded programs are being transferred to TPA. Additionally, tribes are expected to adjust their TPA funds to cover any shortfalls in these programs, including Contract Support. Without a significant increase in the TPA allocation, the Community will not be able to adequately protect its resources in the waterways surrounding the 87,000 acre island occupied by the Metlakatla.

Recommendation: The Community requests that Congress provide, at a minimum, the \$46.7 million general increase to the Tribal Priority Allocations account.

IHS FISCAL YEAR 1998 BUDGET

Metlakatla health center.—The Metlakatla Indian Community has been pursuing for several years funds for the replacement of the current facilities. At present, our clinic services are housed in four modular buildings built in the mid-1970's. These facilities are set on pilings and connected by open, elevated, wooden walkways. Over time these buildings have settled unevenly, posing an unsafe environment for those seeking health services (about 28,000 visits per year) as well as staff. In addition, we face overcrowding and utility systems which are inadequate to support the modernization or updating of medical equipment.

The Community's program justification document (PJD) for construction of a replacement health center was approved by IHS and included in the IHS Health Care Facilities Construction priority list for design and construction funding in fiscal year 1997. According to the fiscal year 1997 projections, we were to receive project design

funds (estimated at \$1.3 million in 1995) in fiscal year 1999 (January, 1998) and the design phase would be completed in late 1999. We were disappointed to see in the fiscal year 1998 budget justification that the IHS projections now show we will not receive a design award until 2001 (fiscal year 2002) even though our priority ranking at number 8 has not changed.

Please understand, the Community is in desperate need of this facility now! We recently received from IHS the report on a comprehensive inspection of our current facilities. The total cost for repairs necessary to achieve compliance with current fire, mechanical, electrical and life-safety codes, as well as the Uniform Building Code and the Americans with Disabilities Act guidelines is almost \$1 million dollars—almost the same amount needed to complete the project design. As this Subcommittee is well aware, the IHS Maintenance and Improvement funds has never been adequate to address the level of need. The budget justification states that in the first quarter of fiscal year 1996, the IHS Backlog of Essential Maintenance and Repair was estimated to be \$188 million. Yet the Administration's request for this account is the same as the fiscal year 1997 appropriation (\$39.3 million). This is in spite of the fact that the agency expects the need to increase as a result of "the addition of numerous tribal facilities, new seismic and security requirements, and environmental projects generated by the on-going environmental assessment program, * * * ." (page IHF-12).

We realize it will be virtually impossible to obtain adequate funding through the Maintenance and Improvement account to address the life-safety and other code deficiencies cited at our existing facility if funding remains at the totally inadequate level proposed. We also fear that without a significant increase to the Health Care Facilities Construction account, we will be no closer than we are this year to obtaining project design funds.

Recommendation: We urge that Congress fund the IHS Facilities Construction account at a level which would fund the projects on the IHS Construction priority list, providing for the Metlakatla project in fiscal year 1998 at least the funds estimated by IHS to complete the design of the project (\$1.3 million). We also recommend that Congress provide a general increase for Maintenance and Improvement to address a greater percentage of the backlog.

Indian Self Determination Fund (Contract Support Costs).—We note that the \$12 million requested for contract support costs on new or expanded health programs operated by tribes under the Indian Self-Determination Act leaves a \$39 million deficit in the Indian Self Determination Fund, including \$107,588 to cover the overhead costs of our "638" health program based on its fiscal year 1997 expansion. When IHS funds are not provided for a new and expanded IHS contracts and compacts, funds intended for health services are reduced by the need to cover overhead costs. We urge Congress to fund the full amount of ISDF need identified by the Indian Health Service.

On behalf of the Metlakatla Indian Community, thank you for the opportunity to provide our views on the Indian Health Service and Bureau of Indian Affairs budgets for fiscal year 1998.

PREPARED STATEMENT OF NICOLAS J. PADILLA, ON BEHALF OF THE SUSANVILLE
INDIAN RANCHERIA

The Susanville Indian Rancheria (Rancheria) provides this statement on the fiscal year 1998 budget request for the Indian Health Service. The Rancheria provides health care to more than 2,500 American Indian beneficiaries located in Lassen County in Northern California. Since 1986, when the Rancheria first began contracting with the Indian Health Service (IHS) under Title I of the Indian Self-Determination and Education Assistance Act, we have continuously improved the quality, quantity and scope of health care services delivered to eligible American Indians located in our service area. The increasing level of health services that we have been able to provide through our Lassen Indian Health Center is directly related to the amount of funds which Congress makes available for Title I contractors through the IHS.

The Susanville Indian Rancheria's specific concerns with regard to the fiscal year 1998 budget request for the Indian Health Service are as follows: Institute policy to ensure full funding for calendar year contractors out of existing year appropriations; fully fund Contract Support Costs; provide \$1.4 million for Regional Youth Treatment Facility in northern California; correct inequitable funding and increase Contract Health Services to California tribes and tribal organizations; increase Equipment funding; provide requested \$28.3 million for Health Professions account, including IHS Scholarship funds.

We also request the Committee's assistance in the following issues which are not related to the fiscal year 1998 budget, but which impact our ability to provide health care services to our people: Adopt clarifying language regarding Federal Tort Claims Act coverage for tribes and tribal organizations; impact of Managed Care on tribally operated health programs; support transfer of certain Sierra Army Depot facilities and lands to the Rancheria.

Full funding for calendar year contractors.—For a number of years Susanville Indian Rancheria ("Rancheria") has utilized a calendar year for contracting under Section 105(d) of the Indian Self-Determination and Education Assistance Act (the Act), rather than the fiscal year. The advantages of being a calendar year contractor are significant: it provides the Rancheria with a stable funding base for its health programs and permits the Rancheria to generate additional funds in the form of interest. Historically the Rancheria's calendar year contract has been funded with funds entirely from the fiscal year in which the contract begins, although the calendar year contract period extends three months beyond the end of the fiscal year.

In calendar year 1998 the IHS has implemented policies which violate the intent of Congress when it enacted Section 105(d). The Agency has taken funds appropriated in fiscal year 1997 for the Rancheria's calendar year 1998 contract and used them for other purposes, namely to fund activities at the Area Office level. These policies violate Congress' intent when it enacted Section 105(d) by threatening the Rancheria's stable base budget and by eliminating the Rancheria's ability to generate interest revenue to supplement funds which the IHS transfers to the Rancheria.

The IHS' policy of retaining funds appropriated by Congress in fiscal year 1997 for the Rancheria's calendar year 1998 contract and using those funds for other purposes (while allocating fiscal year 1998 funds which have not yet been appropriated to make up the deficiency in the contract). This violates the Anti-Deficiency Act, as well as two other provisions of the Act—Sections 106(b)(1) and (b)(3)—which both prohibit reduction in contract funds to make funding available for various federal functions.

We urge Congress to make clear to the Indian Health Service that the Agency is required under the Act to fully fund calendar year contracts out of funds appropriated by Congress in the previous fiscal year. Only this policy can ensure that Congress' full intent behind Section 105(d) is fully implemented by the Agency.

Contract support costs deficiency.—The Rancheria is disappointed that the Administration requests only \$12 million in Contract Support Costs for the Indian Self-Determination Fund. Although this amount is an increase over the fiscal year 1997 enacted level of \$7.5 million, it leaves a \$39 million ISD Fund shortfall (demonstrated by a table at page IHS-117 of the IHS Budget Justification). This means that tribes which contracted new or expanded IHS programs in fiscal year 1995, 1996 and 1997, will still go without the funding to which they are entitled under section 102(a)(2) of the Indian Self-Determination Act and be forced to absorb contract overhead costs from funding intended for health services. While it appears that the \$12 million request is sufficient to address our Tribe's \$218,009 ISD Fund requirement, one hundred percent funding of all identified Contract Support Costs is vital if California Tribes are to continue to assume administration of federal programs, for the benefit of Indians without being penalized by a reduction in the level of services.

We urge the Committee to work with the Department of Health and Human Services to ensure that sufficient funds are provided in the fiscal year 1998 budget to meet the contract support requirements set forth in section 106(a)(2) of the Indian Self-Determination Act. We would also urge that reporting requirements be changed so that the IHS is required to provide the Congress with information on every contract or compact which is in the negotiation process and which will require funding from the contract support fund, in advance, not after the contract is signed. Presently, the IHS is only required to report a shortage of Contract Support funding for the current and previous year.

Regional Youth Treatment Center.—Due to the size of the Native American population (over 200,000) and the geographic size of the state, the California Area has been authorized to operate two Regional Youth Treatment Centers (YRTC)—residential alcohol and substance abuse treatment facilities. Because these facilities are not yet available, services for the youth in our area have been contracted through existing public and private rehabilitation programs. The fiscal year 1998 budget request for all regional treatment centers (youth and adult) includes \$1.4 million for the California Area.

After much time and effort by the California tribes, the research and deliberation has resulted in two appropriate sites for these facilities. We anticipate the Southern California location will come on line in early 1998. The Northern California site,

which would serve the Susanville as well as other tribes, will be available late this year. The Susanville Indian Rancheria requests that an additional \$1.4 million be allocated from the fiscal year 1998 appropriations to fund the operation of the second YRTC. Funding the second YRTC will ensure the availability of treatment across the State and will enable the tribes and tribal organizations of California to provide a coordinated approach for the full range of preventive, YRTC and aftercare essential for successful prevention and treatment of alcohol abuse among our youth.

Inequity of funding for California tribes and tribal organizations.—Since 1970, when Federal funding of IHS services was partially restored for Indians in California, IHS budget allocations have not provided an equitable base of recurring funds or an equitable level of health services. The GAO issued a report in 1991, entitled *Indian Health Service—Funding Based on Historical Patterns, Not Need*, GAO/HRD 91-5, February 1991, which confirms these facts. The report concluded that “IHS does not attempt to provide the same level of health services in all IHS areas; in fact services vary widely.” See (p. 3)

Part of the reason IHS has never provided the Area Office a full and equitable share of the Contract Health Services appropriation is due to the level of service previously provided by the State through the Medi-Cal program (the state Medicaid program). In response to the budget crisis within California, however, the state instituted a massive reorganization of Medi-Cal, which drastically reduced both the scope and number of services available to Indians in California. California tribes are also no longer eligible for certain state-funded supplements and various categorical grants as these funds have been subsumed into block grants to clients. These actions combined have led to a reduction of health services to Indians in California.

Any reductions to the IHS budget which does not protect the amount of contract health funds which the IHS is to provide California Tribes will cause additional reductions of health services to Indian in California and could disrupt the existing system of Indian owned and operated health centers. We urge that Congress (1) earmark the level of funds to be made available for the Indian owned and operated health delivery systems of California; and (2) from within the appropriation, earmark and increase the amount of funds for contract health services to be allocated to California tribes.

Equipment funds.—The Tribe is disappointed that the Administration has requested only \$13 million for Equipment, a decrease of \$1.5 million from fiscal year 1997. Of this amount, only \$3 million (the same as in fiscal year 1997) will be used to purchase equipment for new and replacement clinics built by tribes using non-IHS resources. As we have testified before, in order to be certified to participate in the Medi-Cal Managed Care program, California tribal health clinics must purchase and install certain essential medical equipment. Be assured that unless there is a significant increase in Equipment funds, our Lassen Indian Health Center will be no closer to obtaining the over \$300,000 necessary to complete the equipping which has been pending since we finished construction of the facility in 1994.

We urge the Committee to not only increase the Equipment allocation but also direct IHS to develop a distribution methodology that factors for differences experienced by the small tribally-owned facilities.

IHS scholarship fund.—The Rancheria urges Congress to fund, at a minimum, the Administration’s requested level of \$28.3 million for the Health Professions account. We urge the Committee to fund the IHS Scholarships allocation within this account to not less than the fiscal year 1997 level.

Impact of managed care on tribally operated health programs.—The tidal wave of “managed care” efforts among state governments is having a negative impact on tribally-operated health care programs. The goal of managed care is not improving the health status of or providing the best quality of care to U.S. citizens. It is instead focused on how to provide those services at the lowest cost. This philosophy is in direct conflict with the circumstances of most tribally operated health programs. Tribal programs are often small, and located in rural and isolated areas, which drives up not only the costs of supplies but contract medical services. Consequently, our programs must be heavily weighted toward prevention, early detection, community outreach and primary care. Under this model of health care, we have a proven record of success in elevating the health status of our communities. But, this model does not fare well in the state managed care programs, where prevention and community outreach have little emphasis.

In moving toward the market based managed care, consideration must be given to the impact on the tribally operated programs. As it stands, tribal consultation and input during state planning processes is not consistently sought. In some cases only the knowledge that the affected tribes can place a hold on a state’s plan through HCFA has ensured our being at the table. We recommend that a waiver from being included in the state’s managed care plan be available to tribally oper-

ated programs if the state will not recognize the health care model used by the tribe as a viable part of their plan. Furthermore, reimbursements should be commensurate with the services provided, not limited to the very lowest rates as is often the case now.

Federal Tort Claims Act coverage.—The State of California is rapidly moving into a managed care environment. The Susanville Indian Rancheria has recently experienced difficulties in its efforts to participate with a major Health Maintenance Organization to provide services in the new managed care environment as a preferred provider. Based on our experience, few state officials fully understand the Federal Tort Claims Act (FTCA) and are reluctant to accept its coverage in lieu of malpractice insurance for Public Law 93–638 contractors who manage ambulatory health centers or inpatient facilities. State reluctance to accept U.S. Tort Claims protection places the tribal contractor at risk of not being accepted as a state provider under its Medicaid or managed care programs.

Most recently, representatives from the HMO requested that the Rancheria provide a letter from an attorney representing the federal government which would be the equivalent to a “certificate of insurance” in the private insurance industry. They requested that such a letter make clear that the government, through the FTCA, provide coverage to the Rancheria for any and all tort lawsuits that may be filed.

We would appreciate any assistance the Committee may provide, perhaps through clarifying report language, to make clear to HMOs in California that the FTCA provides tribes and tribal organizations with a level of liability coverage that is equivalent to the “certificate of insurance.”

Sierra Army Depot lands and facilities transfer.—Under the Base Realignment and Closure Act, the Rancheria has been negotiating with the Army on two proposals to transfer certain lands and facilities located on the Sierra Army Depot to the Rancheria. These proposals, which are pending final approval and which have been widely supported by the various appropriate agencies, would transfer: (a) 120 housing units and a large administrative building to be used for tribal housing, administration functions, and economic development and (b) a facility known as the “the Mods,” comprised of single apartments, a large fully equipped dining area and the adjacent land to be used as the Regional Youth Treatment Center referenced above.

Although we have received support and assistance from the IHS, BIA as well as the Army, and obtaining the necessary approvals does not appear will be problematic, we request that this Committee adopt language similar to that which effected the transfer of modular housing units from the Grand Forks Air Force base to the North and South Dakota tribes.

On behalf of the Susanville Indian Rancheria, thank you for the opportunity to provide our views to the Committee on the Indian Health Service budget for Fiscal year 1998.

PREPARED STATEMENT OF ROCK POINT COMMUNITY SCHOOL

The representatives of Rock Point Community School located on the Navajo Nation Reservation, respectfully express our deep gratitude to this Subcommittee and the Congress for the past consideration of providing a replacement building for an unsafe secondary school. Construction was completed and our students have already been in the new facility of over 60,000 square feet now for the second year. We are also grateful for the provision for the Facilities Improvement and Repair (FI&R) funding, soon to begin as the next step to this construction.

With the same hope as in the past, we wish to submit the following critical budget issues on behalf of Rock Point Community, the students and the staff of this school for favorable consideration.

Rock Point Community which is located in the interiors of Navajo Nation reservation has a defined goal of providing quality bilingual education, with due emphasis for family values, and respect for our culture and language. On the other hand we also aspire to see that our children are true citizens of the United States. As such, we also concentrate on our children’s achievement of core curricular knowledge of subjects like English, Math, Science, History and the governments of our state and the USA at par with or better than the national average.

We have realized partial success in spite of funding shortages when we find our students graduating, some of them from colleges. In a community like ours, properly trained youth is the most important asset for our economic and social growth. Hence, we believe investment in the proper education of our students is an investment in the most appropriate direction. We also believe that our students presently in our school should not lag behind to meet the challenges of the technologically fast advancing world ahead of them.

FUNDING FOR THE CLASSROOM INSTRUCTION

The Indian School Equalization Program (ISEP) which provides for the basic instruction of Navajo and other Native American students has chronically been short of the minimum needs. The ISEP Task Force which had studied the minimum need of Weighted Student Unit (WSU) value about five years ago had recommended \$3,499. This would have provided a standard education to Indian students comparable to average national standard. This amount was estimated to be comparable also with the national average in expenditures per student at that time. But regretfully, neither the Congress nor the Administration has been sympathetic to this need.

The appropriation for this purpose in fiscal year 1996 yielded at \$2,904 for school year 1996-97, \$74 less than in the previous year. Appropriation for school year 1997-98 is estimated to produce \$3,075 in school year 1997-98 if the student enrollment does not increase more than the 3.2 percent the BIA estimates. We can argue that, with an average WSU of 800, Rock Point School will get about \$339,000 less for school year 1997-98 than the average per pupil expenditure for public schools in school year 1992-93. The result is that we have great difficulty competing to hire trained and qualified teachers who can stay and enjoy teaching at this school.

The cost of classroom instruction has gone up by 6.13 percent per year. But the Congressional appropriation has been unpredictable to match with the increase, sometimes even less than the preceding year, as is the case in the current school year.

This results in (a) a large turnover of qualified and experienced teachers, leading to disrupted curricular efforts in meeting the national standard; and (b) many BIA-funded schools, including this school, having to cut down instruction hours, or lay off experienced teachers or impose a salary freeze.

Whereas the national concern is putting more funds toward educational efforts to produce the best high school graduates with separate funding for advanced technology in the schools, ISEP funding is far short in providing an education to match with the national standards. This is not to talk of the need for preparing our students technologically for tomorrow's world.

If the 1868 Treaty obligation of providing quality and results oriented education to Navajo children has to be honored, the WSU value for fiscal year 1998 must at least be as much as recommended by the ISEP Task Force for School Year 1993-94, i.e., \$3,499. Thus the ISEP appropriation should not be less than \$333.8 million.

STUDENT TRANSPORTATION

Transportation of the students from home to school is as important as classroom instruction. For Rock Point Community, which is scattered over a radius of 15 miles, most of the students' homes or a meeting point is accessible only by dirt roads. These roads become very muddy or icy during the winter, necessitating extra expenditures for maintenance and repair.

Not only that, the mileage count does not include most of the extracurricular activities nor mileage incurred for repair or maintenance and, in the case of some schools, for fueling the buses. For Rock Point, the nearest place for maintenance and servicing is around 250 miles round trip. Our buses are 6 to 8 years old, guzzling more gasoline and requiring more frequent repairs. It is unfortunate that whereas GSA rental rates have again been increased, the mileage rate that BIA provides is almost constant.

The cost of transportation is short at least by 30 percent on average at the rate the mileage has been provided in the last several years. The statistics below will illustrate the fact. This is mainly because our transportation funding has so far fluctuated at \$1.51 to \$1.55 a mile. The actual cost of transportation for Rock Point is \$2.43 per mile. It is worth noting that the national average of transportation funding two years ago was \$2.34 a mile.

COST OF TRANSPORTATION

School year	Minimum need	BIA provided	ISEP dollars used	Percent of shortage
1995-96	\$479,316	\$323,800	\$155,516	32.5
1996-97	523,732	359,100	164,632	31.4
1997-98 (estimate)	523,455	401,300	122,155	23.3

We have tried to minimize our transportation costs by cutting down on extra-curricular trips for the students. As the mileage remains almost constant, the dip-

ping into classroom instruction funds does not increase. But we cannot ignore the fact that extracurricular activities are an important part of education.

We cannot keep our transportation cost limited to the funding provided, because, if the students are not brought to school from home, we will neither be fulfilling our obligation to the community nor will there be much of a class.

We, therefore, urge that transportation be funded at a level that each BIA-funded school gets at least a rate of \$2.43 per mile. This will require Congress to appropriate at least \$47.7 million. Then and only then, will we be able to stop using ISEP funds for transportation.

OPERATION & MAINTENANCE OF FACILITIES

This fund for which the minimum need for a school is determined by the use of a FACCOM formula is another area chronically short of funds. On the average not more than 67 percent of the needs assessed by the formula has been provided in the last several years. This results in continual deterioration of the facilities, creating an unhealthy and counter productive educational environment. The deterioration of the facilities causes further need of Facilities Improvement & Repair fund which is lagging so far behind. Though there has been a slight increase of \$5.3 million in this fund for the fiscal year 1997 budget, we doubt that it will be able to fund even 90 percent of the need. If a similar amount is added in the fiscal year 1998 budget, we estimate it will again meet about 90 percent of the need based on the fact that some new schools have been constructed and the area to maintain has increased or will increase by nearly 800,000 square feet, as a consequence.

QUARTERS REPAIR AND IMPROVEMENT FUNDING

Rock Point Community School has 57 units of housing for an average of 130 employees each year. Out of the total, five units have been vacated for life safety reasons. Most of the units were built in the 1960's and all of them need renovation to meet minimum safety requirements.

Also, as in the past, we again request to build 15 to 20 new housing units to meet the shortage and to replace 22 portable houses, all of which have asbestos contamination.

We urge this subcommittee to approve this request again and provide an adequate sum for the purpose.

ADMINISTRATIVE COST FUND

Distribution of the Administrative Cost fund has been somewhat encouraging in the last couple of years as it was distributed 100 percent in the last year and it is expected at 94.4 percent in the current year. However, the increase of \$5.6 million for fiscal year 1997 should not be counted to increase the percentage of the payment as slated for the number of BIA-operated Navajo schools converting to Grant or Contract Schools. Since more and more BIA-funded schools are intending to turn grant or contract every year, we find that an addition of a similar amount each year to the previous year's allocation will merely keep up with the increase in the number of those additional schools for whom Administrative Costs will be needed.

We, therefore, respectfully urge this Committee to increase the fiscal year 1997 appropriation for the Administrative Cost Fund by at least the same amount, or \$5.6 million.

CONCLUSION

The Rock Point Community, its school students and staff understand and appreciate the necessity of balancing the national budget. However, we have observed in the course of several years that Indian Education and its concerns, more specifically its funding needs, have been treated as a low priority for the Administration as well as the Congress. This has resulted in pushing our students farther and farther behind the national norm. We believe that an increase of \$40-\$50 million for Indian Education would have a negligible impact on efforts to reduce the national deficit, but it really would help Native American students to meet the national standards.

We also believe that our students are the main resource of the economic and social advancement of our community and that proper education at par with the national average is an investment of which they should not be deprived.

We hope that the Navajo Community of Rock Point and other Native Americans will not be disappointed by inadequate funding for the education of our children in fiscal year 1998 and that the Congress and the President will honor the Treaty obligation with the tribes for the quality education of their children.

We are thankful again to this subcommittee for its past support to Indian Education in general and to the Rock Point Community School particularly. We hope that our request today will receive the Committee's due consideration. Thank you.

PREPARED STATEMENT OF THE PINON COMMUNITY SCHOOL BOARD, INC.

The Pinon Community School Board submits this statement on behalf of the Navajo people in the Pinon Chapter and surrounding communities of the Navajo Nation.

IHS CLINIC FOR PINON COMMUNITY

Our community (Pinon and seven other Chapters of the Navajo Nation) has not had a health facility capable of addressing even a fraction of our health needs for several decades. Infrastructure development in our area was totally halted for 18 years while the Navajo-Hopi boundaries were worked out. And after that boundary was established in 1979, our efforts to obtain a decent health facility have been prevented by a lack of funding. How much longer must we wait?

The clinic IHS has planned is not a luxurious one. It would provide full-time basic and emergency medical services, optometry, some physical therapy, community health services, a mental health and substance abuse unit, community health representatives and related community-oriented health services.

What we have now is called a "health station" which operates only three days per week. The only services provided are minimal nursing support, a pharmacy, some lab work, and dental services. The nearest location with a doctor is in Chinle—50 miles from Pinon, and even further away for the Chapters to the west of Pinon. The 11,000 people in the Pinon clinic service area deserve to have more accessible health care than this.

The first formal approval of the Pinon Clinic came in 1992 when PHS approved the project justification document. Basic planning, site selection and most of the design has been done, but the design money will be exhausted this summer and all work will halt unless Congress provides funding for fiscal year 1998 to at least complete the design.

IHS estimates that we need \$31.7 million to finish the design and perform the construction phase. That estimate will increase every year—especially if we have to stop the design work this year. We urgently request that Congress make a commitment this year to this urgently needed clinic. Please provide at least the \$873,000 to complete the design and put this project on line to receive first phase construction funding in fiscal year 1999. Even at that rate, we will have waited a full generation for basic medical services to be made available in our Community.

BIA SCHOOL OPERATIONS BUDGET

Indian student equalization program.—The total request of \$296.3 million is not sufficient for the ever-increasing operating cost of the operation of schools and dormitories in Indian Country. In recent years, growth in enrollment in Bureau-funded schools has averaged between 2–5 percent per year. And between this school year (1996–97) and school year 1998–99, BIA expects enrollment to jump 6.5 percent. Yet the budget request would supply only \$19 per weighted student over the base amount for next year. As you can see, this would not even cover inflation-related cost increases, let alone cover the costs associated with additional students or provide any meaningful dollars for program improvement.

We hope Congress will not be satisfied with the fiscal year 1998 budget request. At least provide enough money to keep up with enrollment.

The Pinon Community School Board further suggests that there is a need to re-examine the ISEP Formula by which funds are distributed to the schools and dormitories in the BIA system. When Congress established this formula methodology in 1978, it expected that the formula would be re-examined by BIA on a periodic basis and that up-dating alterations would be made. This has not occurred. Rather, the only changes in the formula have been made by Congress itself, through statutory directives such as additional weights to recognize the additional costs of operating seventh and eighth grade programs, and for gifted and talented student programs.

We ask you to supply direction and funding for BIA to perform the needed re-examination of the ISEP Formula to more appropriately measure the true total funding needs of the schools and dormitories in the 21st Century. That formula should be based on the highest standards of program quality and educational opportunity for the Indian students enrolled in these federally-funded schools.

Student transportation.—The President's Budget requests \$34.302 million for student transportation—a slight increase of \$2.5 million over the fiscal year 1997 level. For many years, this program has been underfunded, requiring us to use ISEF monies to supplement our transportation costs.

The budget request would provide only \$1.60/mile, while our School's transportation costs are about \$2.35/mile. These costs will definitely increase due to two circumstances beyond our control:

- This year GSA has been relieved of the moratorium on increases in its bus rental rates. Yet there is no additional funding in the budget request to help us meet these additional expenses.
- One hundred percent (100 percent) of our bus routes are on BIA road systems and these roads need improvement. Since these roads are not properly maintained, they cause great wear and tear on our buses. And there is no additional funding in the student transportation budget request to help us meet these added expenses, either.
- Please bring some common sense to the student transportation budget. In view of the average cost per mile to public schools—\$2.92, according to the BIA—a doubling of the funds for the BIA system would not be out of line.

Administration cost grants.—Pinon Community School Board is equally concerned about the President's Budget request of \$44.7 million, an increase of only \$2.55 million from the fiscal year 1997 amount. The biggest concern is insufficient funds to accommodate the anticipated Bureau schools converting to Contract and Grant Schools, thereby making them eligible for Administrative Cost Grants.

Please ask the BIA to supply full, detailed information about the estimated Administrative Cost Grant need for each of the schools that will convert in School Year 1998–99. As you know, unless there is sufficient funding in this budget item, BIA will reduce every schools Administrative Cost Grant amount and thus none of us will get the funding level directed by law.

Facilities operation & maintenance.—The facilities O&M funding will continue to shrink as new square footage is added to the BIA school facilities inventory. This year alone (fiscal year 1997), a total of 800,351 in new square feet will be added which will require an additional \$3.1 million in additional facilities O&M funding. But this added amount is not requested in the BIA budget request. As a result, the percentage of need that is funded will fall even lower than the 66 percent of need we currently get.

It makes no sense to us for the Federal Government to build new schools and dormitories—such as the \$16 million construction project we just finished at the Pinon Dorm—and then fail to provide enough funding to maintain these buildings so that can be utilized for their full expected life. Next year, after the warranty on our new buildings expires, we will have to provide the full array of maintenance services, but we will not have the funds we need to properly protect the big investment the Federal Government has made in them.

We appreciate the opportunity to offer our views on the President's fiscal year 1998 IHS and BIA budgets.

STATEMENT OF WALLACE TSOSIE, VICE PRESIDENT, GREASEWOOD SPRINGS
COMMUNITY SCHOOL, INC., NAVAJO NATION, GANADO, AZ

The Greasewood Springs Community School, Inc. is located on the Navajo reservation in the community of Lower Greasewood, which is approximately 70 miles west of Gallup, New Mexico, and 110 miles northeast of Flagstaff, Arizona. Our school serves the educational needs of over 390 students, in grades Kindergarten through eighth. Since July 1, 1996, the School has been operated by a local Board of Directors through a Grant from the Bureau of Indian Affairs pursuant to the Tribally Controlled Schools Act, Public Law 100–297. The Greasewood School currently faces two serious problems: the need for a safe gymnasium facility, and the lack of an adequate health care facility.

A GYMNASIUM IS BADLY NEEDED BY THE SCHOOL

The Bureau of Indian Affairs has requested \$3.14 million in fiscal year 1998 for construction of a gymnasium facility for the Greasewood School, as an education Facility Improvement and Repair Project. We respectfully ask this Subcommittee to approve funding for this project, but would ask you to make two additions to it:

- \$206,000 for unexpected demolition costs. When the original budget estimate was calculated several years ago, the BIA estimated that the cost to remove an existing structure on the site would be \$150,000. Now that the demolition is complete, the BIA has informed us that the actual cost was \$356,000, due to

the discovery of significant asbestos in the previous structure, and that we must reimburse BIA for this amount once construction funds are appropriated. Since the \$3.14 million request does not include this additional cost, we respectfully ask that this Subcommittee approve an additional \$206,000 for our gymnasium. —\$125,600 for basic design elements not provided for in the current construction budget, including: a pitched roof for the gymnasium (lasts longer in our climate); hardwood gymnasium floor (standard in all gymnasiums); asphalt paving (to reduce dust and mud); and landscaping. These items will greatly improve the quality of the gymnasium, for a modest additional cost.

In sum we request a total of \$3.47 million to allow for the construction of quality gymnasium that will last for many years. We also ask this Subcommittee to approve the other projects contained within the President's request of \$32,139,000 for Facility Improvement and Repair Projects.

This gymnasium facility is desperately needed by our School, and was promised to the School over ten years ago. In 1985, declining enrollments lead the Bureau of Indian Affairs to seek consolidation of Toyei and Greasewood Schools, both located in communities southwest of Ganado on the reservation of the Navajo Nation. To induce Greasewood to consent to this consolidation, the Central Office of the Office of Indian Education Programs agreed in 1985 that a new gymnasium would be constructed at the Greasewood School once the consolidation was completed, since the existing facility had no gym and the space used for physical education was inadequate. The communities consented, and the consolidation occurred with the consolidated facility called Greasewood Springs Community School. Over ten years have passed since Toyei and Greasewood were consolidated, yet a new gymnasium has still not been constructed.

The space currently used for physical education was not built as a gymnasium; it had to be modified to provide some space for physical education training to be held. According to a recent evaluation by the BIA's Navajo Area Engineering Office, this physical education space is undersized by 5988 square feet, representing a 110 percent deficiency for a student body the size of Greasewood. The space used for physical education is situated in the center of the school building and is surrounded by classrooms. This configuration hinders instruction, as the noise and flow of student traffic associated with gym classes often interrupts classroom instruction.

Further, there is not adequate outdoor space adjacent to the current facility for student athletic activities or parking. In fact, the outdoor space around the current facility is hazardous to the safety of the students because of its close proximity to several major access roads. Thus, the need for safe outdoor athletic space and adequate parking for sporting events is particularly acute.

At present, the gymnasium project is being handled by the Navajo Nation Design and Engineering Service (NDES) through a Public Law 93-638 contract with the BIA's Facilities Management and Construction Center (FMCC). NDES has completed the planning phase of the project; the design phase is nearing completion and should be concluded within a few months. The local Board of Directors is in the process of assuming control over this project from NDES. Once this transfer has been accomplished, the Board of Directors will complete any remaining design work, and then oversee actual construction of the gymnasium. If the necessary construction phase funding is provided by Congress, actual construction of the gymnasium should take less than a year.

The Board of Directors hopes that a new gymnasium for the Greasewood School will finally be constructed in fiscal year 1998. The planned gymnasium will be approximately 13,500 square feet, which is consistent with BIA space guidelines for a school of this size.

We respectfully ask this Subcommittee to provide \$3.47 million for completion of the Greasewood gymnasium. This facility is desperately needed by the School. Providing this funding would keep a promise made to the Greasewood School over ten years ago, and ensure that the students of Greasewood have a safe facility suitable for their physical education needs. Please do not make us wait any longer.

A HEALTH CLINIC IS NEEDED FOR GREASEWOOD SCHOOL

We also would like to alert the Members of this Subcommittee to the inadequate level of health care available to the Greasewood community. Despite an estimated service population of over 3,000 people, the only health facility in our community is a small clinic located on the campus of the Greasewood School, which is only staffed by a doctor one day a week. This level of service is totally inadequate for the medical needs of the Greasewood community.

The Greasewood Clinic is currently operated by Sage Memorial Hospital, a contract care provider, but the Hospital has proposed to eliminate this clinic program.

The next closest health facility, Sage Memorial Hospital, is over 40 miles away, and the nearest IHS facility is over 80 miles away.

The Board of Directors is in the process of developing a plan to improve the existing clinic, possible through a Self-Determination Act contract with the IHS, or a joint services arrangement with Sage Memorial Hospital. Once an adequate plan is developed, the Board of Directors will return to this Subcommittee with a request for earmarked funds in the IHS budget for a properly staffed health clinic for our community. Thank you.

CONCLUSION

We appreciate this opportunity to present the needs of our School to the Members of the Subcommittee. We strongly urge you to take the steps necessary to provide adequate construction funding for a gymnasium for our school, and to be alert to the health care needs of our community. Thank you.

PREPARED STATEMENT OF PAUL A. ROOKS, CHIEF OF POLICE, OGLALA SIOUX TRIBAL PUBLIC SAFETY COMMISSION

The Oglala Sioux Tribal Public Safety Commission ("Commission"), the law enforcement agency on the Pine Ridge Indian Reservation, submits this statement in support of the Administration's request for an increase of \$46.665 million to the Tribal Priorities Allocation ("TPA") account, which increase includes \$8.7 million for law enforcement. We request that Congress place law enforcement allocations in a special account outside of the TPA account to insulate tribal law enforcement programs from any future cuts to the TPA account. We request that Congress continue efforts in funding programs under the Violent Crime Control and Law Enforcement Act of 1994 (the "Crime Bill").

The commission.—Under the Act of February 28, 1877 (19 Stat. 25), in consideration for the confiscation of Sioux lands and hunting rights worth billions of dollars today, the United States undertook to provide the Oglala Sioux with "all aid necessary for civilization" and "an orderly government," and to "protect [each Oglala] in his rights of property, person, and life." Originally, law enforcement was performed on the Pine Ridge Indian Reservation by the BIA. Since 1977, the Commission has provided public safety and enforcement of tribal, federal, and state laws pursuant to a contract with the BIA under the Indian Self-Determination Act, Public Law 93-638, as amended. The Commission currently employs approximately 36 officer positions under its Self-Determination Act contract with the BIA, and 62 officers using Crime Bill grants from the Department of Justice ("DOJ").

Pine Ridge Indian Reservation.—At 4,800 square-miles, the Pine Ridge Reservation is the second largest Indian reservation in the United States. It includes Shannon County, the poorest county in the United States according to the 1980 and 1990 censuses. The unemployment rate on the Reservation is about 85 percent, and is expected to increase due to federal budget cuts. The alcoholism rate is also very high. Poverty is expected to increase as a result of the Welfare Reform Act.

Need for increase for BIA & tribal law enforcement.—The BIA Budget Justification (p. BIA-62) for fiscal year 1998 notes that national standards recommend three law enforcement officers per 1,000 citizens, but that the BIA has adequate funds for only one officer for every 43 square miles of reservation and for every 465 members of service population. The proposed \$8.7 million increase for law enforcement would be sufficient to hire 400 additional officers in Indian country—not enough to meet the unmet need, but a step in the right direction.

The Commission's unmet needs.—The Commission is in urgent need of its share of the requested increase within the TPA account to meet some of its more severe unmet needs. If Congress approves the requested general increase of \$8.7 million, the Commission could realize an increase of approximately \$450,000. These added funds could assist the Commission in the following manner:

Need to hire more officers on a permanent basis.—The Commission has historically not received adequate funding from the BIA under its Self-Determination Act contract. With a service population of about 50,000, the Commission would need 150 officers to meet the national standards mentioned above. In fact, the Commission would need about 110 officers just to meet the BIA average level of law enforcement services, based on its service area and population. But the Commission has never been able to hire anywhere near this many officers.

In fact, as the result of the fiscal year 1995 BIA budget cut, which decreased the Commission's BIA contract funding by nearly \$284,000, the Commission had to reduce the number of officers funded under its BIA contract from 56 to 36. This would

have nearly crippled law enforcement on the Pine Ridge Indian Reservation if the Commission had not applied for and received DOJ grants.

The DOJ recognized the severe underfunding and understaffing of the Commission, and provided the Commission with grants under the Crime Bill, which enabled the Commission to hire an additional 62 officers starting in July 1995. A recent BIA study of the Commission (the "Review Team Report") stated: "These grants represent an impressive and determined effort on the part of Public Safety to secure additional resources." The DOJ grants have helped immensely to alleviate the shortage of officers, but only on a temporary basis. The grants last only 2¼ years, and the oldest of the three grants expires in February 1998. Thus, additional funding must be obtained in the interim in order to retain these officers; otherwise, the Commission will be left eventually with only 36 officers—fewer than it has ever had and far fewer than the numbers needed, as noted above.

Officers are being trained to do "Community Policing" throughout the Reservation under these grants. The Commission is also utilizing a cultural approach coinciding with community policing that emphasizes a traditional "Akicita" (warrior) society which complements community policing. It is the intention of the Commission to implement this concept through all facets of law enforcement in the next three years in conjunction with community policing. Other grants under DOJ have allowed the Commission to mobilize towards automation, additional training, and specialized services.

Adequate salaries for officers.—After the Federal Law Enforcement Pay Reform Act of 1990, Public Law 101-509, raised the minimum wages for federal law enforcement officers, Congress increased the BIA appropriation by \$5.8 million (fiscal year 1992 and fiscal year 1994 total) to bring the salaries of BIA and tribal police officers up to Pay Reform Act levels. The BIA distributed this money proportionately to all BIA-funded law enforcement programs, however, rather than according to each program's need. The Commission's share of these increases (\$188,400) was about \$400,000 short of the amount needed to bring Commission salaries to the mandated levels. The Commission was able to bring salaries up to or close to the mandated levels in fiscal year 1994 by reprogramming other funds, but our officers' wages have lagged behind the Pay Reform Act levels since July 1995, when the reprogrammed funds ran out.

It is ironic that the recent BIA Review Team Report found "a high rate of turnover at the police officer position," which "is very costly" to the Commission, but also stated that the Commission need not pay its officers the salaries set by the Pay Reform Act. The Report should have acknowledged the obvious—that the high rate of turnover has been due in large part to the Commission's inability to pay adequate salaries.

Overall need for equipment.—The BIA Review Team Report supports what the Commission has been saying for years—we need more equipment. The report shows that officers and criminal investigators do not have all of the equipment they need to perform their jobs. We agree, and we have been working to correct the situation, but we cannot remedy the problem without increased funding. Perhaps the best example of this is the report's recommendation that the communications system be upgraded and enhanced. For several years we have requested (either through a one-time appropriation or out of the BIA's law enforcement budget) \$235,000 to remedy this situation, but the funds have not been provided.

Special need for equipment for new hires.—The Commission has no funds to purchase basic equipment for the 40 new officers hired in September 1996 with DOJ funds. A total of \$350,800 is needed for uniforms, service revolvers, radios, leased vehicles, and other items. The DOJ funds cannot be used for these expenses. Due to lack of funding for these items, new hires have had to borrow equipment from other officers, buy the equipment using their own money, or make do without the least essential items.

Conclusion.—In furtherance of its recognition and support for law enforcement generally, and for the safety and welfare of the Indian people, Congress should support the Administration's request for an increase of \$8.7 million in the TPA account for law enforcement. Congress should also continue funding under the Crime Bill.

PREPARED STATEMENT OF THE NARRAGANSETT TRIBE

The Narragansett Tribe appreciates the opportunity to address the subject of Indian Health Service (IHS) and Bureau of Indian Affairs (BIA) funding needs for fiscal year 1998. Since Federal acknowledgment in 1983, we have exercised our right of self-government to contract programs serving Indians under the Indian Self-Determination Act. We contract and operate 13 BIA-funded programs as well as a com-

prehensive health program from the IHS, employing many of our tribal members to provide essential services to our more than 2,000 members. Our comments on the fiscal year 1998 budgets for IHS and BIA are as follows:

- IHS (Hospitals and Clinics). Fully fund staffing and equipment needs for our new health clinics through an earmarked appropriation of \$947,949 to bridge the shortfall we face in bringing our new clinic fully on-line.
- Fund mandatory pay increases for salaries, inflation and population growth.
- Fully fund Contract Support Costs.
- BIA (Tribal Priority Account). Support, as a minimum, the President's fiscal year 1998 budget request for TPA.
- Fully fund Contract Support Costs.

IHS budget (staff and equip Narragansett health clinic).—In 1991, the first year we testified before this subcommittee, we identified as our goal the establishment, on our reservation, of a tribally operated, out-patient health clinic to provide essential health services to our tribal members. We are proud to report to you that in November 1996 our goal was achieved with the construction and dedication of a 5,000 square foot health clinic. We obtained private financing to build our health clinic from Washington Trust Bank. This would not have been possible, however, without a 90 percent BIA loan guarantee from the Eastern Area Office. The facility contains a Primary Health Clinic, Community Health program, Behavioral Health/Family Services, and Administrative Services. This is a proud achievement for our Tribe, but we will only recognize a portion of the clinic's potential due to a shortage of funds. We need your assistance if we are to realize the full potential of our direct service clinic.

The IHS has informed us that they are without funds to staff and equip our facility. In a February 24, 1997, letter from the IHS to the Tribe (enclosed), we have been informed that "there are no health service funds available from the IHS at this time to support your new facility" and any additional funding for our Tribe's program needs "would have to come from the Congress." With the exception of "some" Maintenance & Improvement and equipment replacement funds in the fiscal year 1998 budget, the agency is without funds to meet our needs. On top of this, the IHS expects to absorb approximately \$100 million in inflationary costs this year.

In a meeting with Dr. Trujillo, his staff, and a representative of the Nashville Area Office February 3, we were informed that IHS policy does not recognize our clinic as an "expanded" program, thereby making us ineligible for existing IHS dollars. We are neither a "new tribe" nor are we an "expanded" program in the eyes of the IHS. We alerted the IHS Nashville Area Office in 1995 that we would soon have our clinic. They informed us then that we could not submit a new scope of work and budget for the clinic until it was actually built. Nonetheless, we thought that they were anticipating our clinic coming on-line and would include the required funding for staffing, maintenance and improvement funding and other start up expenses in the upcoming IHS budget request to Congress. We certainly believed that under existing law, as we expanded our scope of service, building a clinic which did not previously exist and transferring from a referral health care service to a direct care, out-patient facility, we would be eligible for "new and expanded" health program funds. This turns out not to be the case.

Dr. Trujillo did not know where additional funds could be made available to the Tribe. We are greatly distressed by the position of IHS which regards tribes such as us, which prior to contracting health services under Public Law 93-638, received no health services from the Department, as ineligible for "new and expanded" program funds.

Today, we are presently in transition from a referral based health program, whereby we referred our members to the surrounding medical community for their health care needs, to a more cost-effective direct service, health care system where we will hire local health care professionals to work full and part-time at our health clinic. Direct service health care provided under one roof will ensure that each dollar goes farther and that better health care will be administered to our members. Contract Health Service (CHS) referral costs totaled \$700,000 in 1996 alone. We have cut our CHS budget by more than 50 percent, using these funds for staffing needs, but this only permits us to fill 17 of 27 health care positions, leaving us with a 37 percent staffing shortage. By moving CHS funds to staffing needs, we are increasing our need for Contract Support Costs which are already inadequate. Staffing funds require Contract Support funds. We will, however, save money in the long term.

Our current operating budget of \$1.2 million will allow us to only bring on-line a portion of our clinic. Without additional appropriations we cannot afford to hire: a nurse technician; a pharmacist; a licensed practical nurse; a social services medical social worker; a social services patient services coordinator; a Behavioral Health

Service psychologist or psychiatrist; a Health and Human Services Director to manage the clinic; an Administration Planner; a Business Office Manager and Patient Services Coordinator; and maintenance personnel.

Until our full-time physician begins work in July, we have contracted with two local physicians to work part-time (2 days/wk) at the clinic. A licensed psychologist is working 1 day a week at the clinic. Our Community Health Service staff is conducting one-on-one sessions and intake for on-going contract referral health care needs until the clinic is officially open for business. Additional staffing needs alone will account for 48 percent of the additional \$948,000 we are requesting. If we could afford a pharmacy, that would reduce our pharmaceutical costs by some 40–50 percent, saving us some \$75,000 to put toward staffing needs. Pharmaceutical expenses totaled \$170,000 in 1995 alone. We enclose a budget of our health care needs.

Third party billing of Medicare and Medicaid will allow us to make up some of the funding shortfalls and we hope that future health care reform will not deprive us of this necessary revenue source. The University of Rhode Island has offered us resources from their Audiology, Speech Pathology, Pharmacy and Nursing departments, and Rhode Island College has made a graduate level student in Social Services available to us as well as other resources. We are grateful for their assistance, but we still face severe funding shortfalls.

Our greatest medical challenge is monitoring and addressing the needs of our diabetic patients. Screening, preventive care and treatment of our 75 existing patients is very costly. Our Tribe has an unemployment rate near 40 percent. Of the last 10 cases of diabetes discovered, 8 were uninsured. To meet minimal standards requires a commitment of roughly \$2500 per patient, or \$187,500 annually. Through clinic screening and early detection, we estimate that the number of diabetic patients we serve may double in 1997, as we must now serve all Indians who enter our clinic. CHS referral funds, however, are only available to members residing in Washington County.

In addition, new welfare reform legislation has decreased funding for welfare mothers receiving Ritecare funds administered by the State. Children remain eligible for this funding through age 7, after which the Tribe becomes responsible. These children must now be covered under our Contract Health Services funding which we reduced 54 percent to cover staffing needs. We have some 37 pregnancies, 90 percent of which are low-income, most of which are high-risk.

In conclusion, we do not know how we are going to cover these shortfalls as well as absorb the costs associated with population growth, medical inflation and pay increases. By moving from a contract referral health care program to a direct service program, we anticipate cost savings which will help but not fully cover our start up needs. We are doing our part to stretch existing funding to provide essential health services to our members. Without additional funding from Congress, we have no choice but to limit the health services we can provide to our members. We ask that Congress continue to assist all tribes in meeting the health needs of the Nation's First Americans by adequately funding the IHS budget to increase the level of need we provide.

BIA budget.—We request that Congress, at a minimum, fund TPA at the President's fiscal year 1998 budget amount. As with the IHS budget, we continue to experience chronic shortfalls in carrying out contracted programs from the Bureau of Indian Affairs. Human Services programs such as Indian Child Welfare Act are so underfunded (and actually will decrease in fiscal year 1998 from the fiscal year 1997 level) that we simply cannot afford legal representation to monitor foster care placement of our tribal children. Education funding under Johnson O'Malley is slated for about a million dollar decrease under the President's fiscal year 1998 budget. Our Adult Vocational Training and Scholarship programs cannot keep pace with our need. Law Enforcement funding remains at the "feasibility study" phase of \$10,000. For the past several years, we have emphasized the need for law enforcement funding. We have no alternate revenues (we possess no natural resources and have been denied the ability to raise revenue through gaming on our settlement lands by the 104th Congress) and cannot take funds from other TPA programs, which are strapped for funding, to establish an adequate law enforcement program.

Since the 1994 First Circuit decision, there is no longer a question that we exercise civil, criminal and civil regulatory jurisdiction over our settlement lands concurrent with the State. The local police do not patrol our lands and the State police are more than 20 minutes away. We have a new health clinic and community center which must be patrolled. We have applied for and been denied grants from the Department of Justice (COPS FAST and COPS MORE) because we didn't have even one full-time law enforcement officer.

Finally, Congress must fully fund contract support costs which enable tribes to meet their administrative expenses associated with carrying out our programs. Con-

gress has long recognized the need to fund this essential component. Each year tribes like us must make up for contract support cost shortfalls by using direct program funds, limiting the effectiveness of our already financially strapped programs. The Indian Self-Determination Act is clear—the Secretary must fully fund contract support cost needs. We request that Congress fully fund this essential program cost as required by law.

Thank you for providing the opportunity for the Narragansett Tribe to provide comments regarding the fiscal year 1998 BIA and IHS budgets.

PREPARED STATEMENT OF ERIC R. DAVENPORT, CHAIRMAN, INTERTRIBAL MONITORING ASSOCIATION

The Intertribal Monitoring Association on Indian Trust Funds (ITMA) submits this statement in support of the Administration's fiscal year 1998 budget request for the Office of Special Trustee for American Indians within the Department of the Interior. While we support the budget request, we also want to make it clear that an appropriation of the \$39.3 million which has been requested will not be sufficient to enable the Special Trustee to implement the trust fund management systems which are necessary to correct the century of mismanagement of Indian trust funds and assets.

The Intertribal Monitoring Association on Indian Trust Funds is an organization composed of 34 Indian Tribes which represent over 80 percent of the trust funds managed by the Office of Special Trustee. ITMA was created in 1990 to monitor federal efforts to improve management of Indian trust funds and to keep the Congress and the trust fund account holders more fully informed. Among the tasks charged to ITMA by our member tribal governments are preparing tribes for account settlement by providing analysis of the reconciliation reports and technical assistance in analyzing tribal specific reports; assisting in the development of objective, fair and accurate methodologies for the reconciliation of the IIM accounts; and obtaining tribal input on continued implementation of the Trust Fund Management Reform Act.

ITMA supports the proposed fiscal year 1998 level totalling \$39.3 million, an increase of \$5.2 million over the fiscal year 1997 level. The \$5.2 million requested increase would provide additional resources for trust systems improvements, but is far short of the funding needed to implement a plan to correct the existing flawed systems. ITMA also supports the proposal to increase staff of the Office of Special Trustee by 22 Full-Time Equivalent employees over last year, for a total staff of 310.

We appreciate the fact that the Administration's request contains \$250,000 in fiscal year 1998 for ITMA, however we must note that this amount is not sufficient for ITMA to be able to fully meet its responsibilities to Tribes, the Congress and the Department. Our experience since the formation of ITMA in 1990 tells us that annual funding of \$400,000 is needed to enable us to promptly and accurately monitor developments in the management of trust funds and provide timely information to the account holders and the Congress. We respectfully request that the Subcommittee consider funding for ITMA at the level of \$400,000 for fiscal year 1998. ITMA does not support the use of any of the funding requested for fiscal year 1998 for purposes of litigation. The Department of Justice has the responsibility for representing the Department of the Interior in any litigation. We see no justification for taking the scarce resources that are so desperately needed to implement improvements in the management of the trust funds and diverting them to defray any of the costs or expenses incurred by the Department of Justice in its defense of the past mismanagement of the trust funds.

The objectives ahead in fiscal year 1998, as the Office of Special Trustee and Office of Trust Funds Management continue trust management reform efforts, are demanding: putting in place an accounts receivable system to track, collect and account for funds derived from Indian trust assets, and an automated accounting system for IIM accounts. ITMA has strongly advocated that adequate resources must be made available to the Special Trustee for the necessary systems and personnel—including building the infrastructure required for the daily collection, investment, accounting, and disbursement of trust funds—to accomplish the required management reforms. Until these and other reforms are completed, the government's "breach of trust" to tribal and individual Indian account holders continues and the federal government's liability increases. In fact, until these reforms are achieved, the Department remains in violation of the provisions of the American Indian Trust Fund Management Reform Act.

In addition, the Special Trustee is holding consultation meetings with tribes throughout the country on his draft Strategic Plan. Elements one through eight of Phase I of the draft plan are supported by ITMA. We have concerns with element

nine of the plan, which calls for the transfer of all trust functions and the related funding to the American Indian Trust Development Authority (AITDA). We believe that the AITDA element of the Strategic Plan needs more thorough thought and note that it has been strongly opposed by most Tribal governments. We have not had sufficient time to consider elements ten through sixteen of the draft plan.

Phase II of the draft Strategic Plan calls for the creation of a Development Bank. This portion of the plan is virtually identical to the proposal for a comprehensive settlement which has been proposed by the Special Trustee's Advisory Committee. ITMA does not support the establishment of a Development Bank as part of a settlement at this time for a variety of reasons, not the least of which is a concern about how such an institution would be capitalized and owned.

ITMA has reviewed the settlement options which were proposed by the Department on December 11, 1996. ITMA has officially taken a position opposing those options. We understand that the Department is refining a proposal for a comprehensive settlement of trust fund mismanagement claims based on consultation with Tribes during January of this year. We will, of course thoroughly review any such proposal when it becomes available. However, if it contains the options identified in the December 11, 1996, proposal ITMA will oppose it because of its inherent unfairness on a host of issues ranging from the payment of interest to the netting of amounts deemed to be due to or due from Tribes as a result of the reconciliation project. As we have stated previously, the task before all of us right now is to repair the system for management of the trust funds. Very few, if any, of the account holders have sufficient and reliable information at this time on which to base a reasoned judgment about settlement.

ITMA believes that the emphasis for the use of federal resources should be on fixing existing management systems, so that account holders will have reliable information and the possibility of new claims against the federal government will be minimized. We are committed to doing everything we possibly can to assist the Congress, the account holders and the Special Trustee to complete this important work and bring the management systems into compliance with the Trust Funds Reform Act.

The Intertribal Monitoring Association on Indian Trust Funds looks forward to continuing to work with the Office of Special Trustee, the account holders, and the Congress to support efforts to improve management of Indian trust funds. We believe that we all share a common vision—that tribal and individual Indian account holders should achieve the simple justice any other citizen would expect from the institutions, be they commercial or governmental, entrusted with the management of their money: a fair accounting and a fair return.

PREPARED STATEMENT OF THE NAVAJO NATION

INTRODUCTION

Mr. Chairman and Members of the Subcommittee the Navajo Nation, America's largest Indian nation. On behalf of the Navajo people, greatly appreciates this opportunity to present our views and recommendations regarding the fiscal year 1998 appropriations for the Department of the Interior and Related Agencies (DOI). This testimony highlights our request for fiscal year 1998 appropriations.

THE NAVAJO NATION

The Navajo Nation is the largest Indian Nation in America with a population of 250,000 members. Spanning Arizona, New Mexico and Utah, the Navajo Nation encompasses 17.5 million acres—one-third of all Indian lands in the lower 48 states—and is larger than the States of Connecticut, Delaware, Maryland, Massachusetts and Rhode Island. Unlike those states, however, the Navajo Nation is home to the poorest of America's rural poor. While the average unemployment in America today is 5.8 percent, the unemployment rate on the Navajo Nation averages 38 percent to 50 percent, depending on the season. Over 56 percent of the Navajo people live in poverty. Per capita income averages \$4,106, less than one-third of that in the surrounding states. Only a few Navajos enjoy basic "necessities" of life that are taken for granted elsewhere in the United States—77 percent of Navajo homes lack plumbing, 72 percent lack adequate kitchen facilities, and 76 percent lack telephone service. Though the Navajo Nation is slightly larger than the state of West Virginia, only 2,000 miles of our roads are paved. This is barely 11 percent of West Virginia's 18,000 miles of paved roads. Until recently, we had just three banking facilities within our entire 27,500 square mile land area.

Ironically, Mr. Chairman, the Navajo Nation is perceived as one of the more prosperous of Indian nations. Tragically, these types of living conditions exist on hundreds of other Indian nations throughout the United States. Nationwide, unemployment rates on Indian nations average 56 percent.

Mr. Chairman, I focus my testimony on several of the Navajo Nation's specific requests for fiscal year 1998 funding for critically-needed projects. But in a larger sense, I urge the Committee to "reinvent" its own approach to Indian country funding. Rather than, chipping away year-after-year, generation-after-generation, in a piecemeal approach at existing conditions in Indian country, why not marshal all available federal resources in a coordinated, comprehensive and government-wide effort similar to the plans used to rebuild Germany and Japan after World War II. Such efforts can rectify the massive infrastructure deficiencies that prevent us from competing on a level playing field against even the most economically-distressed non-Indian communities.

Such approach would redirect, government-wide federal resources and programs from those program which have already realized their purposes to Indian programs. Scarce federal resources can be targeted and invested in areas, like the Navajo Nation, where they are really needed. The goal must be to develop self-sustaining reservation economies consistent with Indian self-determination and self-governance.

Enactment of welfare reform marks a significant reversal of federal entitlement policy that will greatly affect Indian nations. With respect to Indian reservations, the rationale that ending welfare assistance will force people to work simply ignores the lack of economic development, and subsequent employment opportunities. America must acknowledge the grim reality on Indian reservations—there are no jobs. The chronically high unemployment rate on Indian reservations is indicative of a seriously flawed economic development climate. The Navajo Nation has consistently pointed out major barriers to economic development, most significant are double taxation and the lack of infrastructure and economic development incentives that Congress must address before economic development opportunities can occur.

Navajo culture encourages individual self-sufficiency and resourcefulness. However, there is a limit to the ability of Indian nations to unilaterally improve their unemployment situation. If our needs are not addressed, the unemployment situation will only worsen. Terminating welfare assistance, without creating the necessary job opportunities for welfare recipients, will severely reduce on-reservation spending, thereby negatively affecting reservation economies. The limited reservation businesses will not only be forced to lay off employees, but some may even be forced to close their doors. This will in turn increase our 38 percent unemployment rate and 56 percent poverty rate.

While current efforts to eliminate the accumulated federal deficit are commendable, the Navajo Nation cannot stress enough that the federal budget should not be balanced at the expense of the Navajo Nation and other Indian nations for several reasons. First, such efforts will result in termination of treaty obligations that the federal government has with the Navajo Nation. Secondly, Indian nations did not benefit from the enormous build up of the deficit beginning in the 1980's. Lastly, Indian nations, due to consistent inadequate funding, have and will remain severely impoverished and underdeveloped compared to the rest of the United States.

Congress's own analysis, prepared by the Congressional Research Service, unequivocally shows that since 1985, per capita federal expenditures on Indians equaled approximately \$2,400. This is \$1,000 per person less than the rest of the U.S. population. During the years of federal deficit spending many programs, principally benefiting non-Indians, received enormous funding increases while Indian program funding remained constant or actually decreased. Now that the bill has come due on the federal debt, Indian programs are slated to receive the burden of cuts. The unfairness and the inequity of this result surely was not the federal government's intent.

The U.S. Government entered into a solemn treaty with the Navajo Nation in 1868. This treaty has the force of law and imposes explicit contractual obligations upon the United States government. These obligations for such matters as education, agricultural, natural resources preservation, and others require adequate federal funding to execute and fulfill. Budget cuts for Indian programs would, therefore, violate these treaty obligations, and amount to termination of such obligations by appropriations.

In great part, due to the neglect of the United States to live up to its trust and treaty obligations and very little or no assistance from states in which Navajo People are also citizens, living conditions on the Navajo Nation are comparable to third world conditions. The Navajo Nation has an enormous deficit in all aspects of development when compared to other rural areas of America. These conditions are perpetuated by inadequate funding or lack of funding and the federal agencies lack of

awareness or unwillingness to fulfill trust and treaty responsibilities to the Navajo Nation.

The Navajo Nation has identified, through a preliminary needs assessments, a minimum of \$2.97 billion needed in the six primary areas of rural development to achieve a level playing field with the rest of America. These needs prevent the Navajo People from achieving prosperous rural livelihoods and from realizing full potential for social and economic productivity and well-being. The "pursuit of life, liberty and happiness," the cornerstones of American democracy, are therefore denied to the original inhabitants of this great land.

We recognize that budget cuts are inevitable. But, we also recognize the compassion and fairness of this Committee, the Congress, the American leadership, and the American People. That compassion and fairness are demonstrated by the consistent large funding for foreign countries. The compassion and fairness of the American people can also be demonstrated by living up to promises made to the Navajo people in the Treaty of 1868.

REQUESTS FOR DOI FISCAL YEAR 1998 BUDGET INCLUSIONS

Today, the Navajo Nation merely highlight parts of our overall request for fiscal year 1998.

Education

The Navajo Nation strongly requests \$14 million for Many Farms High School Construction. The Navajo Nation also requests \$13.9 million for Navajo undergraduate scholarships. In 1996, the Navajo Nation Higher Education Grant Program received over 17,000 applications and only 3,152 students were awarded scholarships. The Navajo Nation requests that a funding formula be based on native population that fairly distributes scholarship funds accordingly to Indian nations. For the Johnson O'Malley Program, the Navajo Nation requests that the Subcommittee request \$18 million (the fiscal year 1997 enacted level) for services to support over 51,209 eligible Indian students between grades K-12 and employ over 224 professional/para-professional staff in major Navajo school districts. The Navajo Nation requests that the Subcommittee provide funding for the Indian Adult Education program at the fiscal year 1997 level of \$2.5 million.

The Navajo Nation requests \$467 million for funding of Bureau operated schools and dormitories on the Navajo Nation, school operations, particularly the \$296.2 million for Indian Schools Equalization Program (ISEP). The Nation has 66 Bureau funded schools and expects an increase in enrollment for the school year 1996-97. Ten (10) Bureau-operated schools will be converting to Public Law 100-297 Grant Schools by July 1, 1998 and will require an additional \$1.589 million above the President's \$2.5 million increase for Administrative Cost Grants; the Navajo Nation also requests that full funding be provided for severance pay to federal employees upon conversion of Bureau-operated schools to Grant schools, estimated at \$5.7 million. The Navajo Nation requests \$500,000 for tribal departments of education to enhance their capacity to manage BIA education programs. Additionally, the Navajo Nation requests that the Subcommittee restore funding for the Institutionalized Handicapped which will allow Navajo schools to provide important specialized services.

For the Navajo Community College (NCC), the Navajo Nation requests \$7.5 million for the operating budget. Furthermore, \$2 million is requested for desperately needed funds for renovation and construction. This funding will address health and safety requirements and compliance with the American with Disabilities Act at the NCC campuses. For its Shiprock campus, the Navajo Nation requests \$1.2 million for the mandatory asbestos abatement and roof replacement.

Natural resources development

The Navajo Nation very strongly recommends \$38.5 million for the Navajo Indian Irrigation Project (NIIP). Much of this will be used toward the construction, operation, and maintenance of NIIP. NIIP was authorized by Public Law 87-483 and further amended by Public Law 91-406, but is currently 30 years behind schedule. An additional \$6.33 million is requested to fund operation, maintenance, and replacement costs of NIIP's existing canal system.

The Navajo Nation requests \$5.375 million for water resource development and maintenance programs, including: \$3.98 million for the development and rehabilitation of livestock water facilities; \$500,000 for operation and maintenance of irrigation projects; \$570,000 for the Navajo Nation water monitoring and inventory program; \$100,000 for technical studies for Navajo Nation San Juan Irrigation projects; and \$225,000 for technical studies for Navajo Nation Clear Creek/Chevelon Water Supply Protection. Further, the Navajo Nation requests \$1.535 million for Navajo

water rights protection and to conduct technical studies in the Little Colorado and San Juan River Basins. This funding would allow the Navajo Nation to adequately prepare for litigation over water rights.

The Navajo Nation requests \$1.9 million for non-renewable resources programs, including: \$1 million per year for establishment of a Navajo Nation Surface Mining Program; \$220,000 for Inspection of Navajo Oil and Gas Leases and Operating Agreements; and \$700,000 for Minerals Audit Program. Additionally, the Navajo Nation requests \$4.3 million for the abandoned mine lands reclamation program (\$3.96 million) and UMTRA program (\$344,178).

The Navajo Nation requests \$2.07 million for forest management and wildlife projects, including: \$1.5 million for the management of 600,000 acres of timberland and 4 million acres of woodlands. Management will consist of using the "best management practices" with modern techniques and equipment, while addressing the Navajo public's concerns. The Navajo Nation also requests \$298,710 for the Navajo Natural Heritage Program and \$275,000 for wildlife management and enforcement.

The Navajo Nation requests \$21.95 million for Navajo cultural and historic preservation projects, including: \$10 million for direct grants to Indian nations to support tribal preservation projects and programs; \$10 million for grants to Indian tribes to repatriate human remains and sacred and ceremonial items; \$1.487 million for the development of a comprehensive historic preservation and cultural resource management plan; and \$463,000 for public protection, management, research, and interpretation of the Chacoan Outliers sites. To meet the responsibilities of the Navajo Nation Safety of Dams Program, the Navajo Nation requests \$13.7 million, of which, \$13 million will be used for the rehabilitation of the Many Farms Dam; \$200,000 for the development of an early warning system for dams located on the Navajo Nation; and \$500,000 for maintenance and administration funds.

Economic development

The Navajo Nation requests \$10,503,000 to develop Antelope Point Infrastructure near Page, Arizona. The appropriation would provide basic utilities and power distribution, telephone service, internal roads, public launch ramp, parking trails and walkways, signage, fire and police facilities, and landscaping for public areas to the Antelope Point Recreation Area.

The Navajo Nation requests \$3,925,000 to plan, develop and construct a regional water and sewer system to support future business and community development efforts near Monument Valley (Arizona and Utah). This includes basic utilities for the development of a gift shop, visitors center complex, hotel/motel designation, resort and rest area, and public signage.

Indian Health Service facilities requests

The Navajo Nation supports the President's fiscal year 1998 Budget Request for \$25 million for Phase I construction of the Fort Defiance Comprehensive Health Care Facility. The proposed facility will have 58 beds and will provide medical/surgery, pediatric, adolescent psychiatric, intensive/CCU, nursing and ambulatory services. The adolescent psychiatric unit will be the only one of its kind within the IHS health care system. This facility is one of two special initiatives on the IHS priority list.

The Pinon Health Center is fourth on the national IHS priority listing for outpatient facilities construction. The Navajo Nation request \$966,000 for the architectural and design phase of the proposed health center in Pinon, Arizona.

In the Indian Health Service (IHS) budget, the Navajo Nation requests \$1.249 million in supplemental appropriations for Red Mesa Health Center's architectural design. The design phase of the health center will commence upon approval of the planning documents by the IHS Headquarters. Approval is projected by the end of April 1997.

Environment

The Indian Lands Open Dump Cleanup Act of 1994 (Public Law 103-399) mandated the Indian Health Service (IHS) to address the closure of open dumps on Indian lands. Navajo Area-IHS has failed to meet the requirements of the Act due to lack of funding. The Navajo Nation is greatly concerned that both the IHS and the BIA have grossly underestimated the severity of the Navajo Nation's open dump problem. For example, BIA has claimed responsibility for only 25 active dump sites on the reservation and has committed to proceeding with closure activities only on these sites. Likewise, Navajo Area-IHS submitted a list of 65 dump sites to IHS Headquarters for inclusion into a final report for Congress, as required under Public Law 103-399. Yet, in June 1996, the Navajo Nation completed its own open dump site inventory—sites that are used by four or more families—and have estimated that there at least 465 sites that need to be closed by October 1997. The Navajo

Nation estimates that \$5 million will be needed in order to complete Phase I closure (which consists of consolidating small dump areas where there is no mechanical manipulation of the site into larger community dump sites and closing and covering the larger community dumpsites). The Navajo Nation requests that the Subcommittee provide this amount and direct both IHS and BIA to reevaluate their inventory processes to include the sites identified by the Navajo Nation and request funding accordingly.

Social services

The Navajo Nation requests \$2.5 million to continue providing prevention, intervention and treatment services to Navajo children, who are victims of child sexual abuse and child abuse and their families. In recent years, child sexual abuse and molestation crimes has become one of the most reported criminal activity on the Navajo Nation. Also, the incidents of child abuse and neglect is on the rise, as well. This becomes an issue, especially when there is no one to advocate on their behalf and our Navajo children cannot protect themselves. On the Navajo Nation, our Navajo children are our most important vital resource, therefore, their health, safety and welfare must be made a priority, at all cost. At this time, the Navajo Nation Child Sexual Abuse Prevention Project is assigned the responsibility of providing services for children who have been sexually abused and their families. The therapeutic and treatment services is provided using the Western Medicine approach or if the family wishes, by use of the traditional medicine and ceremonies. There are currently five direct service offices located on the Navajo Nation, one at each of the agency office, and one office at the Central Office, that oversees the administration of the program and the funds.

The Navajo Nation has to address its domestic violence issues and problems to curb the incidents of family violence. This is done by subcontracting with five non-profit domestic violence organizations or battered families shelter homes located on the Navajo Nation, who provide the therapeutic and treatment services needed by the victims of domestic violence and their families. Currently, the facilities are under funded and have limited resources to address their overburdened caseloads and for the daily operation of shelters and safehomes. Therefore, the Navajo Nation requests full appropriation, as originally authorized by Congress, in Public Law 101-630, Indian Child Protection and Family Violence Prevention Act, an Indian-Specific Legislation designed to combat child sexual abuse, child abuse and neglect and domestic violence in Indian country.

The Navajo Nation requests restoration of a 17 percent funding cut to the fiscal year 1995 level for welfare assistance programs which include child welfare services and adult care. Without restoration of the 17 percent cut some programs will receive a 38 percent funding reduction and over 2,300 eligible Indian beneficiaries per month will be denied services.

Navajo-Hopi

The Navajo Nation seeks \$31 million for special rehabilitation projects in the Former Joint Use Area and Western Navajo Agency. Due to the federal relocation program, litigation over ownership, and the related construction freezes, little or no development has taken place in the last 27 years. During the freeze period, Navajo residents were denied assistance from federal, state and Navajo Nation programs that target low income citizens. Hundreds of millions of dollars are needed to elevate the living conditions of the people in these areas.

Of the amount requested, \$15 million would be for planning, housing, community services and infrastructure development in the Hopi Partitioned Land. Over 250 Navajo families remain on the Hopi Partitioned Land. Due to the construction freeze, these families now live in deplorable conditions.

This funding request also includes \$15 million for housing, community services, and range restoration in the Navajo Partitioned Land. Influxes of relocatees and refugees created by the federal relocation program have led to overuse of already limited land and infrastructure, high rate of unemployment, and overcrowding and dilapidated housing. Finally, \$1 million dollars is requested for planning purposes in anticipation of the lifting of a 27-year federal construction freeze in the Bennett Freeze Area.

The Navajo Nation also requests the reauthorization of appropriations for the Navajo Rehabilitation Trust Fund for fiscal year 1998 through fiscal year 2001 in an amount not to exceed \$10,000,000 in each fiscal year. This fund has provided critically needed resources to address the tremendous development and services deficiencies experienced in the "land dispute" area.

Public safety

In fiscal year 1998 the Navajo Nation requests \$29 million for law enforcement activities including, funding for corrections facilities and criminal investigators. A 1992 Consent Decree limits available detention space for criminals and requires the Navajo Nation to upgrade and replace jail facilities. All five Navajo adult detention facilities are listed on the BIA's Planning of New Institutions (PONI) priority list. No funding has been provided. The Navajo Nation requests \$2 million to renovate detention facilities and \$200,000 for needs assessments of adult detention facilities.

The Navajo Nation also requests \$1.4 million for the completion of the design and planning phase of three juvenile detention facilities: Crownpoint—\$400,000; Kayenta—\$300,00; and Shiprock—\$700,000. The Navajo Nation is experiencing an increase in crime rates, especially violent juvenile crime. The Navajo Nation does not have sufficient juvenile detention facilities and lacks rehabilitative services.

CONCLUSION

The Navajo Nation thanks Chairman Gorton and the Members of the Subcommittee for their leadership and support of these programs.

 PREPARED STATEMENT OF PEARL CAPOEMAN-BALLER, PRESIDENT, QUINULT INDIAN NATION

SUMMARY—QUINULT NATION APPROPRIATIONS REQUESTS: TRIBAL PRIORITIES

1. Quinault Cultural Preservation Center (QCPC) +\$300,000

Start-up funds for construction and development of a Cultural Preservation Center and Museum is needed to preserve the cultural heritage of the Quinault people—a nation which consists of 7 tribes. Through Self-Governance funding, a small cultural program was developed, however, a facility is needed in order to properly restore, preserve and display artifacts, family heirlooms and other archeological findings. Request start-up construction funds of \$300,000.

2. Seniors/Elders Assisted Living Program—I.H.S.—Community Health Program +\$250,000

As our elderly population increases, there has been an associated increase in the need for assisted living care. Our Public Health/Community Health Program is unable to provide continuous care due to lack of staffing. We are in great need of 24-hour care for many of our seniors in both villages on the Quinault Reservation. Request earmark of \$250,000 initial funding and \$150,000 on a recurring basis to establish an elders assisted living program in the villages of Queets and Taholah.

QUINULT INDIAN NATION REQUESTS AND RECOMMENDATIONS: NATIONAL LEVEL

Office of Special Trustee—American Trust Fund Management Reform Act of 1994.—Request language directing the Office of Special Trustee to complete analysis, true consultation and report back to Congress before implementing the Draft Strategic Plan of the Special Trustee for American Indians.

BIA/IHS contract support funds.—Provide sufficient contract support funding for increased tribal acquisition of programs, services and activities in all DOI/BIA and I.H.S. programs. Instruct the BIA to establish a contract support funding process similar to the process established by the Indian Health Service.

Tribal priority allocations.—Restore the BIA budget—Tribal Priority Allocations to the fiscal year 1995 levels, to ensure tribal programs are not diminished. The underlying principle for the establishment of the Tribal Budget System was to provide for each Tribe's base budget to receive annual adjustments for inflation. This has not happened since 1995. Request increase of \$73 million to TPA (to \$830 million) to bring funding levels to same level as fiscal year 1995 for Tribal Priority Allocations.

Welfare reform implementation programs.—Require establishment of necessary infrastructure on Indian Reservations of job training, adult and basic education and early childhood development programs.

Elevation of Indian Health Service.—The Indian Health Service is the largest direct health care provider within the Department of Health and Human Services and should answer directly to the Secretary to insure that issues which impact the agency are addressed. There are many legal and cultural issues which are unique to Indian Health programs and tribes rely on the Director of the I.H.S. to address these concerns. During the last Congress, the Honorable Sen. John McCain introduced legislation (S. 311) which would elevate the Director of the I.H.S. to the Assistant

Secretary level within the DHHS. Since the elimination of the Assistant Secretary of Health, the need for this legislation has increased.

IHS mandatories.—During fiscal year 1998, it is imperative that funding be provided for all mandatory costs increases incurred by the Indian Health Service, including medical inflation, mandatory payroll increases and population growth (including new tribes). In the Northwest where Indian Health programs must purchase all inpatient and specialty care from private providers, it is particularly important that inflationary cost increases for the Contract Health Services program be funded. In past years, deferred medical and dental services in the Northwest have been as much as \$4 million annually. This is a great disservice to Indian people and should not be allowed. Request full funding of mandatories for fiscal year 1998.

Joint BIA/I.H.S. issues.—Contract support funds are required for tribes to successfully manage their own programs. The IHS has an estimated shortfall of \$30 million and the BIA has an estimated contract support shortfall of \$5 million in fiscal year 1998 and \$16 million in fiscal year 1997. Even with the proposed \$10 million increase in fiscal year 1998, these shortfalls deprive Tribes of needed administrative services. These shortfalls prevent the realization of the Congressional goal of Self-determination for tribes awaiting these funds. Recommend full funding of contract support costs.

Northwest Portland area Indian Health Board.—Indian Health programs and services are provided to over 80,000 Indian people in the Northwest (Oregon, Washington and Idaho). The partnership forged by Congress with tribal governments and the Indian Health Service over the last 30 to 40 years has resulted in significant improvement in health care delivery to Indian people. Even though health status measurements of American Indians are still lagging, progress has been made. Death rates of Indian people from infectious diseases, gastrointestinal diseases and tuberculosis have dropped considerably; maternal death rates have declined by 65 percent since 1973 and immunization rates for Indian children exceed 90 percent, compared with the national average of 67 percent. As Congress is required to control spending, it should not cut out model programs that have demonstrated success. To dismantle this successful public health care system could create disastrous consequences for the health of all American people and could relegate health care services to Indian people to that of third world countries.

QUINULT INDIAN NATION FUNDING NEEDS

BIA Self-governance: Tribal Priority Allocations public safety and justice—tribal courts + \$100,000

Funding to enhance the judicial court system to provide adequate pretrial and post-trial services to clients of the Quinault Nation Court. The historically underfunded Quinault Tribal Court currently suffers from lack of funding in several areas including: research and law clerk functions, court appointments, guardian ad litem, preparation of written decisions, process services, and clerical services. Despite these many deficiencies, the Court has managed to operate relatively well due primarily to multi-talented, cross-cultural and hard-working staff who are dedicated to the field and to justice. With proper funding, the possibilities for an exemplary court system are limitless.

Tribal priority allocations: Resource management—water resources + \$50,000

Funding required to continue Coordinated Tribal Water Quality Program (CTWQP) to collect new water quality and stream flow data and to correlate all available scientific information. This program currently is funded by EPA, which will end in fiscal year 1998. Request increase to QIN TPA allocation to continue this critical data collection, interpretation and development of water quality standards.

Construction: Natural resources facility + \$500,000

Construction funds are needed to complete the construction of Phase II Administration Complex. This building will supply the facility and infrastructure necessary for the Nation to move into the 21st Century with its Natural Resource Management responsibilities. The Natural Resources Department consists of 47 employees located in four buildings scattered across the reservation. Request a Congressional earmark of \$500,000 towards construction of facility.

Tribal priority allocations: Wildlife and parks—“Shale Creek Pond” + \$75,000

This facility was built in 1988 by Washington State Department of Fisheries as part of a cooperative wild coho supplementation program, and has become an integral part of the Quinault Indian Nation's efforts to improve productivity of the Queets River wild stock of coho salmon. The level of salmon harvest opportunity in Washington ocean fisheries is often linked to the status of this stock, a key indicator

of wild coho stocks coast-wide. Increasing production of this wild stock provides for increased harvest opportunity to Indian and non-Indian ocean fisheries alike. Request \$75,000 to fund operating costs of this facility which will benefit commercial and recreational fisheries in the Pacific Ocean and Queets River.

Construction: Fisheries building + \$75,000

The fisheries building located in Queets is used to house biologists, technicians and equipment to conduct wild salmon studies. The building is in an extreme state of disrepair. Thirty years ago it was a fire station and currently the walls, roof and foundation are all crumbling. A garage with storage space and interior offices are required. Estimated cost is \$75,000.

National Park Service: Historic preservation fund Quinault Cultural Preservation Center (QCPC) + \$300,000

Start-up funds for construction and development of a Cultural Preservation Center and Museum are needed to preserve the cultural heritage of the Quinault people—a nation which consists of 7 tribes. Through Self-Governance funding, a small cultural program was developed. However, a facility is needed in order to properly restore, preserve and display artifacts, family heirlooms and other archeological findings. Request earmark in Historic Preservation Fund.

Indian Health Service: Elders assisted living program + \$250,000

The Quinault Nation Seniors program is in dire need of an ongoing assisted living program. More and more elders are in need of around-the-clock care. Families can provide some of the care, and the Nation's Community Health Program is able to provide only minimal assistance, however, more and more of our elders are requiring assisted care. We are unable to provide this care without hiring additional nurses and aides to provide this much-needed care. Request earmark of \$250,000 initial funding and \$150,000 on a recurring basis to establish an elders assisted living program in both villages on the reservation.

PREPARED STATEMENT OF BENITO VALENCIA, CHAIRMAN, PASCUA YAQUI INDIAN
TRIBE OF ARIZONA

INTRODUCTION

The Pascua Yaqui Tribe of Arizona is pleased to offer written testimony regarding the President's Budget Request for fiscal year 1998 Indian Programs and Services. We would like to acknowledge that the Tribe concurs with the comments submitted to the Senate Committee on Indian Affairs, by President Ron Allen of the National Congress of American Indians on February 26, 1997, concerning the proposed fiscal year 1998 budget. The fiscal year 1998 funding requests to this Subcommittee of the Pascua Yaqui Tribe include: Sufficient funding through the Indian Health Service to provide health services to all our eligible tribal members under our HMO arrangement estimated by IHS to be \$8 million over the budget request in fiscal year 1998 (the \$10.7 million originally stated in our House testimony has been revised by the IHS to more accurately reflect the costs); and \$200,000 through the Bureau of Indian Affairs to conduct seven critical studies that were authorized by the Congress in Public Law 103-357 in 1994.

BACKGROUND INFORMATION

As you may be aware, the Pascua Yaqui Tribe, through Congressional enactment of Public Law 103-357, was authorized to open tribal enrollment until October of 1997. The Tribe's population is expected to grow to approximately 14,000 to 16,000 tribally enrolled members. This fact will make us one of the largest tribes in the country. Having said this, however, we remain one of the most severely underfunded tribes. Let us illustrate this point with the following information concerning the Pascua Yaqui Tribe's Health Care funding crisis.

A. Tribal health funding

We are asking for your support and assistance in resolving a crisis situation regarding our future health care. As of today, we do not know what type of health care services we will be receiving or who will be providing the health services after October 1 of this year.

Since the time we received federal recognition, the Pascua Yaqui Tribe has received health care services through a pre-paid contract with a private HMO provider. When Indian Health Service approached the Tribe about participating in the HMO program in the early 1980's, our tribal leaders expressed concern about the

uncertainty of funding for future tribal members and the potential of changing providers every three years. They reluctantly agreed to the arrangement. In retrospect, the concerns our tribal leaders expressed then have become a reality. On December 13, 1996, the Indian Health Service advised us that they were no longer going to be able to continue funding the HMO program after the current contract expires on May 31 of this year. They identified a shortfall of \$844,588 needed to continue the HMO program through September 31, 1997. Since the notification, the IHS has provided emergency one-time funding of \$585,000 to continue the program until September 31. However, based on their financial projections, the Indian Health Service estimates they need an additional \$3.1 million dollars in fiscal year 1998 to fund the program just for the 4,500 tribal members currently enrolled in the HMO and capping enrollment in the HMO at 4,500. But, we currently have over 3,500 applications that are likely to be approved before the October open enrollment deadline. These new members will need health care services. Therefore, an additional \$4.9 million will be needed to fund the HMO program for the new tribal members. The Indian Health Service has provided us with financial information that outlines how much funding it will take to provide direct services to our current population and the new tribal members. Using their resource requirement formula, they estimate the cost for providing direct health care services at \$16 million dollars, compared to the \$4.1 million currently allocated for the HMO or the total of \$12.1 million needed to fund the HMO for all our tribal members. As you can see, the HMO arrangement is more cost effective than a direct IHS program and we want the HMO program to continue.

Health care is a priority for us. Utilizing our own tribal funds, we are nearing completion on a \$2.7 million health complex with 25,000 square feet. The complex will include a small satellite clinic, a ten-chair dialysis center and a public health wellness center. Also, an additional \$1.7 million in tribal dollars are approved annually to our tribal community health programs to supplement the \$1.3 million dollar funding we receive from the Indian Health Service.

The Indian Health Service has not been supportive or proactive in working with us to identify a long-term solution that will provide health services through the HMO program to all our eligible tribal members. We request the Committee direct the IHS to work with the Pascua Yaqui Tribe in developing a plan to submit to Congress no later than January 1, 1998. In addition, direct the IHS to continue to fund the HMO in fiscal year 1998 without an enrollment cap or reduction in the benefits package in the HMO program.

B. Department of Interior

Bureau of Indian Affairs

A second important issue to the Tribe is the appropriation of funds for the purpose of conducting 7 critical studies that were authorized by the Congress in Public Law 103-357 in 1994. Because of the Tribe's open enrollment, the studies were needed to adequately prepare for the expanded population. Let us specifically cite what those studies were. Among the authorized studies that we are requesting appropriations for are:

“(a) IN GENERAL.—The Secretary of the Interior shall conduct one or more studies to determine—

(1) whether the lands held in trust on the date of enactment of this section by the United States for the Pascua Yaqui Tribe are adequate for the needs of the tribe for the foreseeable future;

(2) if such lands are not adequate—

(A) whether suitable additional lands are available for acquisition by exchange or purchase; and

(B) the cost and location of the suitable additional lands;

(3) whether the Pascua Yaqui Tribe has sufficient water rights and allocations to meet the needs of the tribe for the foreseeable future;

(4) if such water rights and allocations are not adequate

(A) whether additional water can be acquired; and

(B) the potential sources and associated costs of such additional water;

(5) whether the Bureau of Indian Affairs and the Indian Health Service have limited funding to the Pascua Yaqui Tribe based on the determination of the tribal enrollment in 1978, rather than the current enrollment;

(6) if funding has been based on 1978 enrollment, how the funding levels can be adjusted to ensure that the Pascua Yaqui Tribe receives a fair and equitable portion of Bureau of Indian Affairs and Indian Health Service funding;

(7) the genealogy of the Pascua Yaqui Tribe; and

(8) the economic development opportunities available to the tribe as a result of the North American Free Trade Agreement.”

25 U.S.C. S 1300f-3.

To date, only the genealogy study was funded by the Bureau of Indian Affairs in fiscal year 1996 for \$35,000. We are requesting \$200,000 for fiscal year 1998 to commence studies on expansion of tribal land base, water allotment planning, additional water acquisition, and NAFTA economic development opportunities. The Tribe is prepared to provide matching funds of \$50,000. Thank you.

PREPARED STATEMENT OF THE BERING SEA FISHERMEN'S ASSOCIATION

ABSTRACT

The Bering Sea Fishermen's Association (BSFA) requests the Senate Appropriations subcommittee on Interior and Related Agencies to authorize an appropriation of \$1,000,000 to BSFA to conduct salmon research and restoration projects in western Alaska and Interior river systems. Funds would continue to be authorized under the BIA Wildlife & Parks, Tribal Management and Development program. As it has done with the fiscal year 1994—fiscal year 1997 appropriations, BSFA would design and implement cooperative projects with Alaska Native villages in Kotzebue Sound, Norton Sound and the Yukon and Kuskokwim rivers. This proposal aims to maintain the Western Alaska Salmon Investigations Program on the original course set by Congress in fiscal year 1994: the monitoring and restoration of depressed salmon stocks under the management of one organization that serves and represents all the affected fishermen.

BSFA: 17 years of service to western Alaska Native villages

Formed in 1980, the Bering Sea Fishermen's Association (BSFA) is non-profit extension service organization serving the needs of western Alaska commercial and subsistence salmon and herring fishermen. BSFA is governed by a 12-member Board of Alaska Native fishermen. BSFA provides services to Alaska Native villagers in four broad regions: Bristol Bay drainage, Yukon-Kuskokwim Rivers, Norton Sound and Kotzebue Sound. Services provided include: Assistance in dealing with state and federal regulations for seafood harvesting, processing and marketing; design and implementation of fisheries processing facilities; and scientific research to aid in management and development of local fisheries.

BSFA, through a combination of state, federal and private grants, has played the major role in ensuring Alaska Native participation in the development and management of dynamic fisheries. Some of these accomplishments include ensuring local control and sustainability in emerging fisheries, developing user participation in research and cooperative management regimes, and design and implementation of the Community Development Quota (CDQ) program for sablefish, halibut and pollock.

BSFA's western Alaska (Arctic-Yukon-Kuskokwim) salmon restoration & research program

In response to drastic declines in chum salmon, in fiscal year 1994 the Congress authorized a direct appropriation of \$800 000 to BSFA to conduct salmon monitoring research restoration and enhancement projects in western Alaska. From early 1994 to late 1995, BSFA conducted the following projects:

Kotzebue Sound.—Sikasuilag hatchery: annual operation costs/Kobuk River test fishery/regional subsistence harvest surveys/formation of regional aquaculture association.

Norton Sound.—Sockeye salmon: Habitat analysis, Chum salmon: habitat analysis, incubation units/Niukluk and Snake Rivers spawning escapement towers/regional subsistence harvest surveys.

Yukon River.—Chum salmon: Productivity analysis, egg incubation & rearing/public forums: Inseason management/Pilot Station main river sonar operations/Kaltag Creek spawning escapement tower & chum salmon incubation/Nulato River spawning escapement tower/Tanana Village salmon abundance test fishwheels/Anvik River terminal harvest fishery.

Kuskokwim River.—Public forums: Inseason management/Eek Island salmon abundance gillnet test fishery/Aniak River coho salmon escapement sonar/Nunivak Island salmon abundance study Bristol Bay Wood River coho salmon escapement tower

In fiscal year 1995 BSFA was awarded \$336,809 in a BIA competitive grant process and used the funds for the following projects:

Kuskokwim River.—Chum salmon migration timing and distribution study.

Yukon River.—Mountain Village fall chum test fishery/Andreafski River coho salmon escapement weir/Galena village fall chum test fishwheel/Tanana village fall chum test fishwheels/Tanana River fall chum population study.

For fiscal year 1996 BSFA was appropriated \$804,500 and used the funds for the following projects:

Kotzebue Sound.—Regional salmon spawning surveys/daily catch sampling public forums: Inseason management and project planning.

Norton Sound.—Eldorado River, Snake River and North River spawning escapement towers/Pilgrim River spawning reconnaissance/regional subsistence harvest surveys.

Yukon River.—Public forums: Inseason management and project planning/Andreafsky River weir/Pilot Station sonar/Kaltag Cr., Nulato River, Clear River spawning escapement towers/Mountain Village, Tanana Village and Ft. Yukon test fisheries/Toklat & Nenana Rivers spawning surveys/Tanana chum population studies.

Kuskowkim River.—Public forums: Inseason management and project planning/Kanektok, Takotna and Kwethluk escapement towers/George River weir/Aniak River sonar.

For fiscal year 1997 BSFA was appropriated \$805 000 by Congress and has just begun work on implementing many of the same projects above as well as designing new projects.

For all of these projects these last 3 years, BSFA has worked directly with and contracted with Alaska Native individuals, villages and regional Native non-profit associations. Through using the BIA appropriation as matching funds, BSFA has leveraged several thousands dollars of project support from the Alaska Department of Fish and Game and the U.S. Fish & Wildlife Service. Finally these BSFA-administered projects were implemented with a low indirect cost rate of only 18 percent.

Fiscal year 1998 proposed projects

The BSFA Board and staff, in consultation with Alaska Native organizations and tribes, would continue to exercise the leadership role in coordinating salmon research and restoration projects. BSFA is the only group that represents and works with all fishermen (commercial and subsistence) and villagers throughout the entire Arctic-Yukon-Kuskokwim region. BSFA Board and staff are intimately familiar with salmon research needs in the A-Y-K region.

BSFA will continue to contract with local and regional Alaska Native organizations and other appropriate entities as well as with individual fishermen. BSFA staff will work with these organizations and individuals as well as with state and federal agency staff to design, coordinate and implement projects. BSFA staff would include a Fisheries Biologist and Program Director as well as part-time administrative personnel to work directly with subcontractors and cooperating agencies. Having BSFA as the single responsible program management entity will assure both the development of tribal expertise and the fulfillment of Congressional intent to rebuild salmon returns in an efficient manner.

We request a continued direct appropriation of \$1,000,000 to Bering Sea Fishermen's Association for fiscal year 1998 to continue to conduct salmon research & restoration projects in the affected Arctic-Yukon-Kuskokwim region of western Alaska. Funding for BSFA would continue to come from the BIA's Wildlife & Parks/Tribal Management & Development program.

Projects meeting the following criteria would be implemented: Priority funds to continue scientifically-useful projects developed in fiscal year 1994 thru fiscal year 1997; must fill a gap in the database on western Alaska salmon; if applicable, work in cooperation with state and federal land agencies; and majority of contractors hired must work in the field and be local hire.

We appreciate the trust Congress has shown in BSFA by having us direct this program. The last few years of research has dramatically improved the ability of fisheries managers to meet the commercial and subsistence needs of western Alaska Native communities. Thank you for this opportunity to submit written testimony.

PREPARED STATEMENT OF ROBERT W. SUTTON, EXECUTIVE DIRECTOR, AMERICAN INDIAN GRADUATE CENTER

Mr. Chairman and Members of the Subcommittee: The American Indian Graduate Center (AIGC) is grateful for the opportunity to present testimony in support of the BIA's Special Higher Education Program (SHOP). AIGC has administered the SHEP since 1972, the only national scholarship program in the country focusing on Amer-

ican Indian and Alaskan Native graduate students. We respectfully request \$3 million for this Bureau of Indian Affairs Program in the 1998 fiscal year Budget.

BACKGROUND

AIGC is a national, Indian, non-profit organization established in 1969 to assist American Indian and Alaskan Native students needing financial aid for graduate school. From 1972 to the present, AIGC has administered the BLA Graduate program in all professional degree areas. Until this year the Graduate Center was assisting approximately 90 percent of all Indian graduate students nationwide. Nearly 90 percent of all SHEP funds goes directly to students in fellowship grants, and 10 percent or less is for administrative costs.

The Graduate Center also raises funds from private sources. However 90 percent of our fellowship awards come from the SHEP contract funds. There have been over 4,000 students served by this program in 25 years. Last year, the 1995-96 Academic Year, we awarded over 500 students over \$2 million. The fiscal year 1996 appropriation reduced our funding by 50 percent, from \$2.6 million to \$1.3 million. The fiscal year 1997 funding remained at \$0.3 million. Due to the devastating cut in funding, we were only able to help our 250 continuing students. There were over 800 requests from new students that we could not help. Many of these students were unable to continue their education and will probably never be able to continue. The continually increasing number of students, over 1,300 requests for next year, will substantially reduce the amount each student receives to a point where the SHEP award will be insignificant. This coupled with the continually increasing cost of education will have a significant impact on the student's ability to remain in school. As the Indian undergraduate student population increases this program will not be able to assist them in advancing their skills without increased funding. Former recipients of this program, such as Lorraine Edmo, Executive Director of NIEA and Assistant Secretary Ada Deer of the BIA, are successful leaders in the Indian community.

The report in "Indian Nations at Risk: An Educational Strategy for Action," issued by the Department of Education in October of 1991 stated: "An increase in funding to train Native educators for elementary, secondary, and university teaching and other professions in science, mathematics, law, engineering, and medicine, business, the social sciences and related fields as a national priority," was needed for the tribal communities throughout the country. These will be trained, Indian professionals who are not only critical to the well-being of American Indian communities, but to the country as a whole. We all know that Education is the key ingredient to self-sufficiency.

CURRENT FUNDING AND STUDENT STATISTICS

For the current 1997 fiscal year the contract amount is \$1,333,000. The following is a final breakdown of the number of students and their fields of study from the 1995-96 academic year and preliminary figures for the 1996-97 academic year.

NUMBER OF STUDENTS AND FIELD OF STUDY

Field of study	Academic year—	
	1995-96	1996-97
Business	49	20
Education	59	23
Engineering	8	2
Health	160	89
Law	164	99
Natural resources	3	1
Other	95	48
Number of males	196	110
Number of females	342	172
Total tribes represented	123	86
Total colleges represented	197	130
Masters candidates	230	87
Doctorate candidates	295	192
Dual degree programs	13	3

NUMBER OF STUDENTS AND FIELD OF STUDY—Continued

Field of study	Academic year—	
	1995-96	1996-97
Total	538	282

Applicants to AIGC must apply for campus-based aid through the federal financial aid process. Our program limits assistance to only a portion of their unmet need. The unmet need last academic year was \$7.3 million compared to this year of \$4 million. The average award this year is only \$3,300, which represents a small percentage of their costs. Over the last three years there has been a reduction in our maximum award from \$8,000 to \$4,000 because of the increasing number of eligible applicants and escalating college costs.

We have been able to operate the SHEP at a cost efficient level for the past ten years. The low overhead costs are due to a well-trained staff and the use of modern computer technology. This has enhanced our ability to service our students. We have perfected our methods of delivering services, office procedures and internal systems. We are confident we can continue to successfully administer the Special Higher Education Program, at a cost savings to the Government.

SUMMARY REQUEST

The American Indian Graduate Center requests Congress continue funding the Special Higher Education Program at the proposed level of support. Additionally, allowing for increases in student applicants and costs of education, we desperately need the program increased to at least \$3 million in the 1998 fiscal year BLA budget. We greatly appreciate your continued support of Indian graduate education. Your efforts will ensure a pool of skilled professionals to improve the economic conditions on Indian reservations and support the greater social environment as productive members of society.
