HURRICANE READINESS

Administrative Details

ADMIN DETAILS

- **Course application – FF119-25-2**
 - Student Identification (SID) Number required
 - Include your email address
 - Sign the application
- **EMI Evaluation Form (scantron)**
 - Evaluate instruction and content
 - Provide comments and suggestions
- **EMI certificate**
 - Must attend the entire course to receive credit
 - EMI certificates will be sent via email

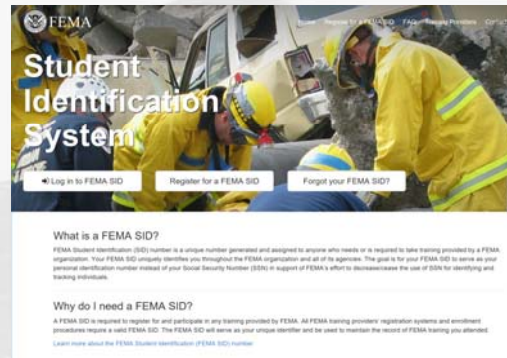

HURRICANE READINESS

Administrative Details

STUDENT IDENTIFICATION (SID)

- <https://cdp.dhs.gov/femasid>
- **Select 'Register for a FEMA SID'**
 - Follow instructions and you will receive an email with your SID #
- **If you think you have an SID #**
 - Call 866.291.0696

HURRICANE READINESS

Evaluations

APPROPRIATE WORDING :)

- “This has been the best learning experience!”
- “The instructors totally blew me away with their insightful knowledge and presentation skills.”
- “I feel 1000% ready for the next hurricane threat.”
- “You had me at hurricanes.”

HURRICANE READINESS *Evaluations*

HURRICANE READINESS

Hurricane Basics

HURRICANE READINESS

There is a Storm. What's the Info?

HURRICANE READINESS

Forecast Uncertainty. What, Me Worry?

HURRICANE READINESS

Making Better Decisions

HURRICANE READINESS

A Short Course

AGENDA

- **Hurricane Basics: Lifecycle, Climatology and Hazards**
830 am – 10 am
- **There is a Storm. What's the info?**
1030 am – 12 pm
- **Forecast Uncertainty. What, Me Worry?**
130 pm – 3 pm
- **Making Better Decisions**
330 pm – 5 pm

HURRICANE READINESS
A Short Course

UNIT ONE
Hurricane Basics

HURRICANE BASICS
Life Cycle. Climatology. Hazards.

TROPICAL CYCLONES

Hurricane. Typhoon. Tropical Storm.

FEMA

TROPICAL CYCLONES

- **Large, long-lived low pressure system**
(Can be hundreds of miles wide, lasting for days)
- **Forms over sub/tropical oceans**
- **No fronts attached**
- **Produces organized thunderstorm activity**
- **Has a closed surface wind circulation around a well-defined center**

TROPICAL CYCLONES

Classified by Maximum Wind Speed

FEMA

- **Tropical Depression: < 39 mph**
- **Tropical Storm: 39-73 mph**
- **Hurricane: 74 mph or greater**
 - *Major Hurricane: 111 mph or greater*

TROPICAL CYCLONES

Surface Circulation? Organized?

TROPICAL CYCLONES

Ernesto 2006

CYCLONES

Tropical, Subtropical and Extratropical

Hurricane Katrina 2005

March Superstorm 1993

Subtropical Storm Ana 2015

TROPICAL CYCLONES

Atlantic since 1851. Pacific since 1949.

MAJOR HURRICANES

Atlantic since 1851. Pacific since 1949.

FEMA

CLIMATOLOGY

What do you know?

FEMA

QUIZ QUESTION

What month has the most hurricane activity in the Atlantic?

- A. December
- B. August
- C. June
- D. September

CLIMATOLOGY

Atlantic Hurricanes & Tropical Storms

FEMA

CLIMATOLOGY

June Formation Areas

FEMA

- On average about 1 storm every other year.
- Most June storms form in the NW Caribbean Sea or Gulf of Mexico.

CLIMATOLOGY

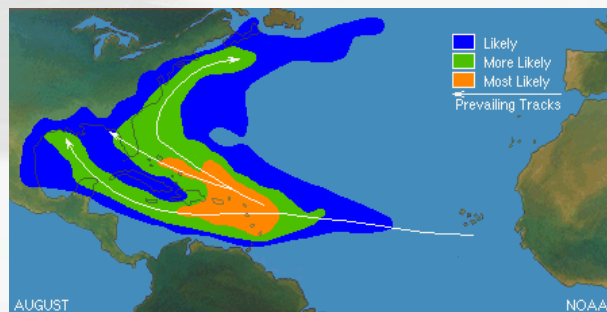

July Formation Areas

- On average about 1 storm every year.
- July development areas spread east and covers the western Atlantic, Caribbean, and Gulf of Mexico.

CLIMATOLOGY

August Formation Areas

- On average about 2-3 storms form each year.
- The Cape Verde season usually begins in August.

CLIMATOLOGY

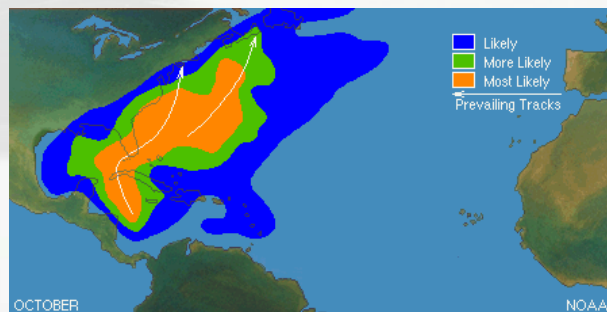

September Formation Areas

- September is the climatological peak of the season.
- Storms can form nearly anywhere in the basin; Long track Cape Verde storms.

CLIMATOLOGY

October Formation Areas

- Secondary peak of season in mid-October.
- Cape Verde season ends. Development area shifts back to the Gulf, Caribbean and western Atlantic.

CLIMATOLOGY

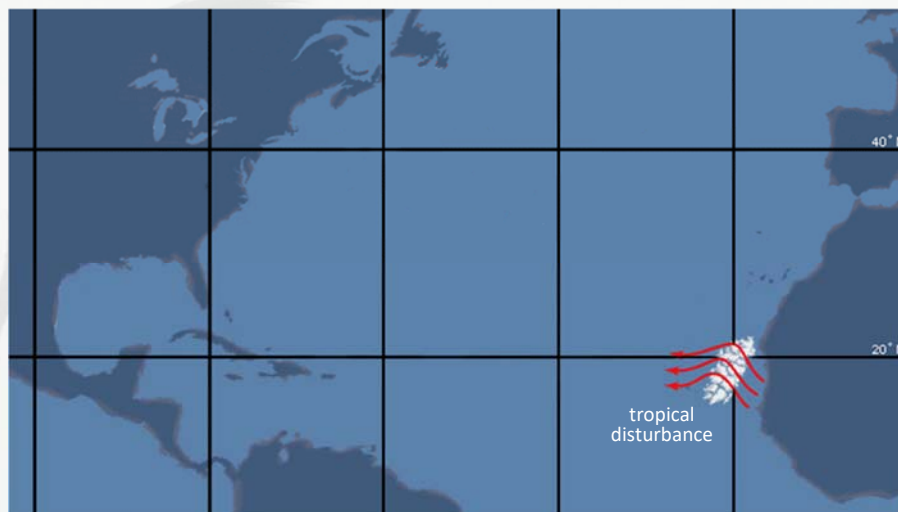

November Formation Areas

- On average about 1 storm ever other year.
- Storms that do form typically develop in central Caribbean or western Atlantic.

HURRICANE FORECASTING

What do you know?

QUIZ QUESTION

Which of these are ingredients for hurricane development?

- A. Warm Water
- B. Cold Air
- C. Lots of Moisture
- D. Strong Winds Aloft
- E. Icebergs

HURRICANE LIFECYCLE

Ingredients for Formation

BUILDING BLOCKS	FUEL
1) A pre-existing disturbance (vorticity or spin) 	4) Warm sea-surface temperatures (usually at least 80°F) 
2) Location several degrees north of the equator 	5) Unstable atmosphere (temperature goes down as you go up) 
3) Little change in wind speed and/or direction with height (vertical wind shear) 	6) High atmospheric moisture content (relative humidity) 

HURRICANE FORECASTING

Pre-existing Disturbances

DISTURBANCES

- **Tropical Waves**
 - About 70% of all Atlantic basin formations
 - Most major hurricanes
- **Decaying cold fronts**
 - Formation often near Gulf and SE States
 - Typically early or late season storms
- **Non-tropical lows and thunderstorm complexes**
 - Often subtropical systems

HURRICANE FORECASTING

Storm Motion and Track

FORECASTING

- **Track forecast is usually controlled by large-scale weather features**
 - Cork in the stream analogy
- **Numerical computer models forecast track quite well**
 - Constantly upgrading model physics and resolution
 - Long ago surpassed statistical models in accuracy

HURRICANE FORECASTING

Factors that Influence Intensity

INTENSITY FACTORS

- **Upper Ocean Temperatures**
More heat favors a stronger storm
- **Interaction with Land/Topography**
More land increases weakening
- **Vertical Wind Shear**
Shear limits strengthening
- **Moisture in Storm Environment**
Dry air can limit strengthening
- **Structural Changes, Eyewall Replacement**
Difficult to forecast and not straightforward
- **Interactions with other weather systems**

HURRICANE FORECASTING

One size does not fit all.

FEMA

Charley

Wilma

HURRICANE HAZARDS

What do you know?

FEMA

QUIZ QUESTION

Which hazard has the greatest potential for large loss of life?

- A. Wind
- B. Rain induced flooding
- C. Tornadoes
- D. Storm Surge

HURRICANE HAZARDS

Water is responsible for vast majority

FATALITIES

U.S. tropical cyclone fatalities
– from 1963 - 2012

HURRICANE HAZARDS

Surge. Wind. Flood. Tornadoes. Waves.

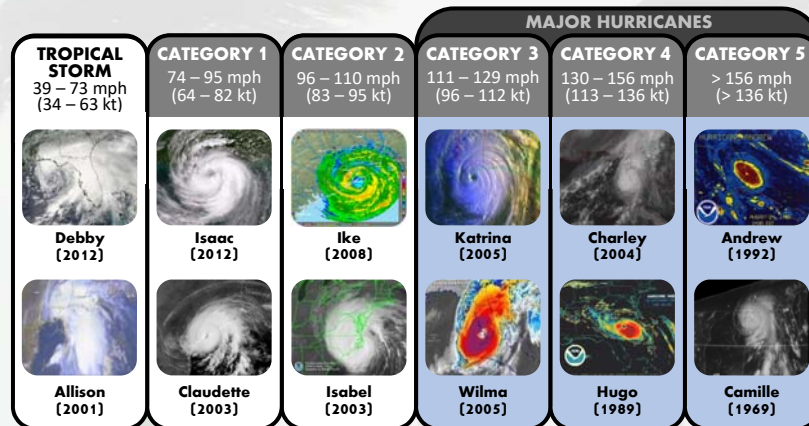

HURRICANE WINDS

Saffir-Simpson Scale

SAFFIR-SIMPSON SCALE

- Estimates wind damage

HURRICANE WINDS

Category 1 (74 – 95 mph)

CATEGORY ONE

- Some Damage
 - Well-constructed frame homes could have roof damage.
 - Large branches of trees will snap and shallow-rooted trees may topple.
 - Damage to power lines and poles; Outages could last a few to several days

HURRICANE WINDS

Category 2 (96 – 110 mph)

CATEGORY TWO

- **Extensive Damage**
 - Well-constructed frame homes could sustain major roof damage.
 - Many shallow-rooted trees will be snapped or uprooted.
 - Near total power loss is expected that could last several days to weeks.

Ike (2008) Houston, TX

Juan (2003) Halifax, NS

Wilma (2005) SE Florida

HURRICANE WINDS

Category 3 (111– 129 mph)

CATEGORY THREE

- **Devastating Damage**
 - Well-built framed homes may incur major damage.
 - Many trees will be snapped or uprooted.
 - Electricity and water will be unavailable for several days to weeks.

Jeanne (2004) Cape Canaveral, FL

Rita (2005) Orange, TX

Rita (2005) Orange, TX

HURRICANE WINDS

Category 4 (130 – 156 mph)

CATEGORY FOUR

- **Catastrophic Damage**
 - Well-built framed homes can sustain severe damage.
 - Most trees will be snapped or uprooted and power poles downed.
 - Power outages will last weeks to possibly months.

Charley (2004) Punta Gorda, FL

Hugo (1989) Sullivan's Island, SC

Ike (2008) Holguin, Cuba

HURRICANE WINDS

Category 5 (>156 mph)

CATEGORY FIVE

- **Catastrophic Damage**
 - A high percentage of framed homes will be destroyed.
 - Fallen trees and power poles will isolate residential areas.
 - Power outages will last weeks to possibly months.

Andrew (1992) Florida City, FL

Felix (2007) Nicaragua

Andrew (1992) South Dade, FL

STORM SURGE

Greatest potential for large loss of life.

FEMA

Hurricane Sandy (2012)

73 deaths

\$65 billion damage

Hurricane Katrina (2005)

1200 deaths

\$108 billion damage

STORM SURGE

Storm Surge vs Storm Tide

FEMA

STORM SURGE

An abnormal rise of water generated by a storm, over and above the predicted astronomical tide.

STORM TIDE

The water level rise due to the combination of storm surge and the astronomical tide.

STORM SURGE HISTORY

Hurricane Sandy (2012)

STORM SURGE

Factors Affecting Storm Surge

STORM SURGE FACTORS

- **Intensity**
Stronger storm = More storm surge
- **Size (Radius of Maximum Winds)**
Larger = More storm surge
- **Forward Speed**
Slower storm = Storm surge farther inland
- **Width and Slope of Shelf (Bathymetry)**
Gradual sloping shelf = More storm surge
- **Angle of Approach**
Alters focus of storm surge

STORM SURGE

What's the effect of forward speed?

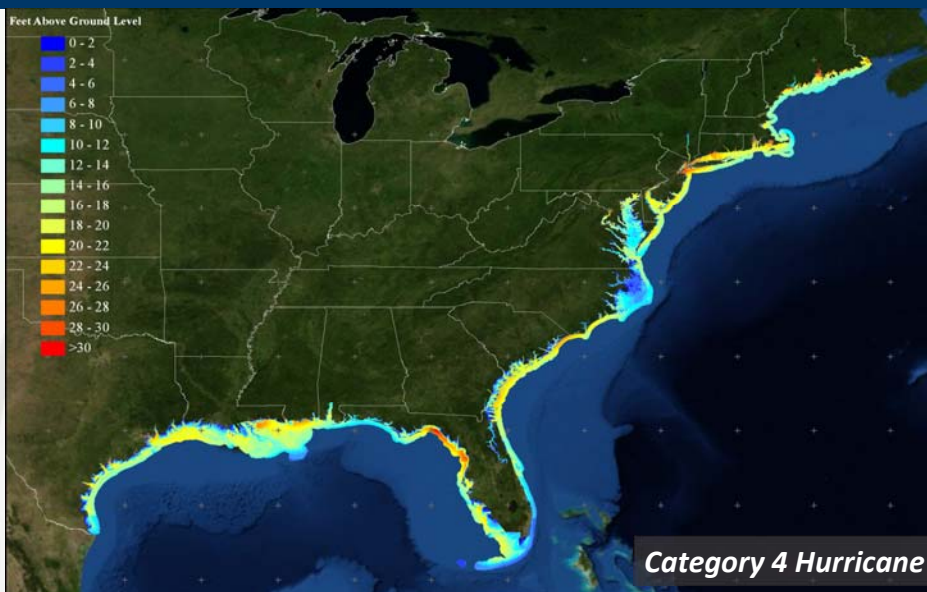

Fast Speed (25 mph)

- Higher maximum

STORM SURGE

Location. Location. Location.

Category 4 Hurricane

STORM SURGE

What's the effect of width/slope of shelf?

Wide shelf – Gentle slope

Narrow shelf – Sharp slope

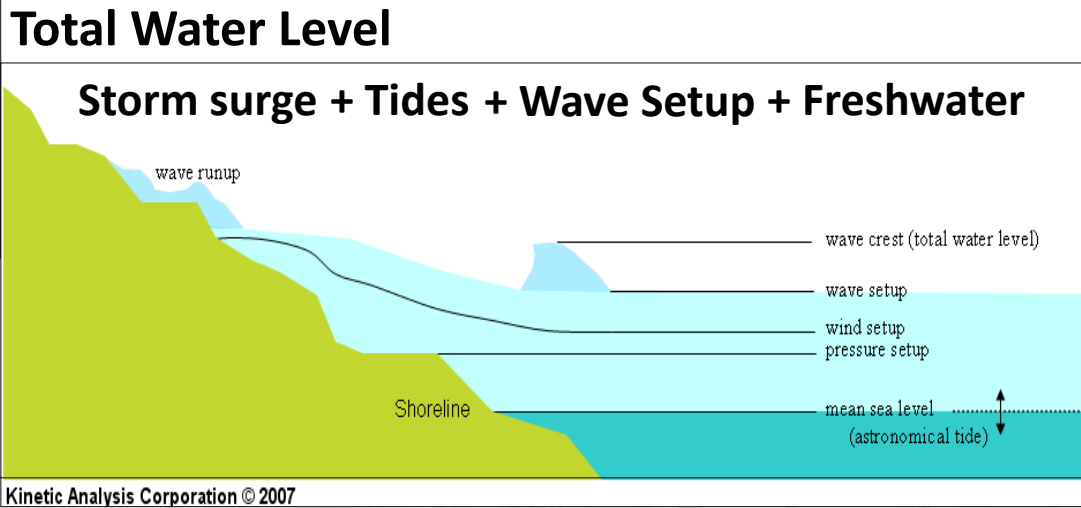

STORM SURGE

Wave Setup

STORM SURGE

FRESHWATER FLOODING

Hurricane Irene (2007) – New York and Vermont

Rochester, VT Flash Flooding

Gilboa Dam – Significant scouring & erosion

FRESHWATER FLOODING

Factors Affecting Tropical Cyclone Rainfall

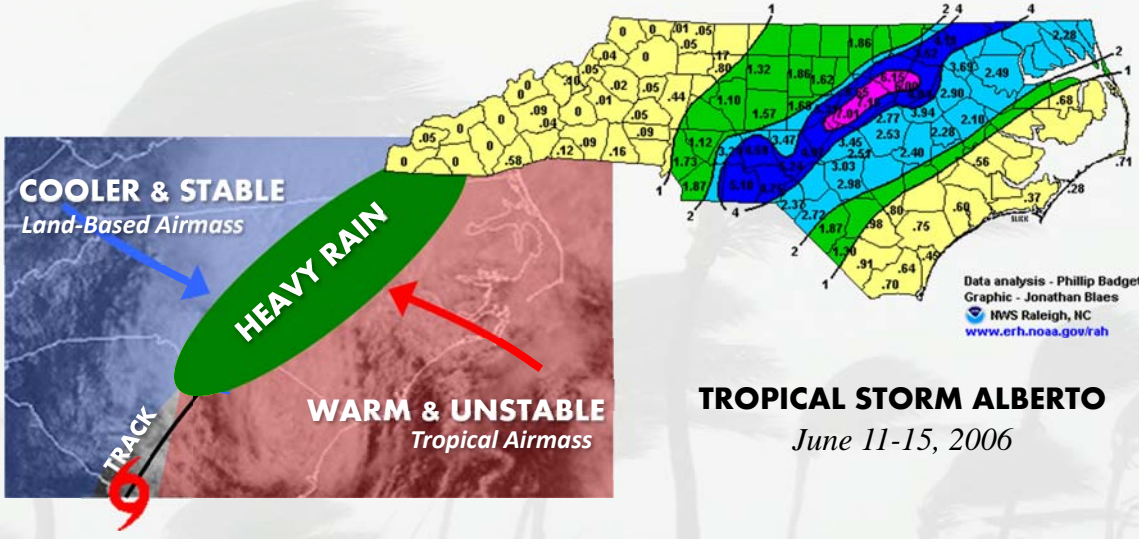

RAINFALL FACTORS

- **Forward Speed**
Slower storm = More rain
- **Size**
Larger storm = More rain
- **Topography / Mountains**
More rain on windward side
- **Fronts / Upper-level troughs**
Enhance rainfall

FRESHWATER FLOODING

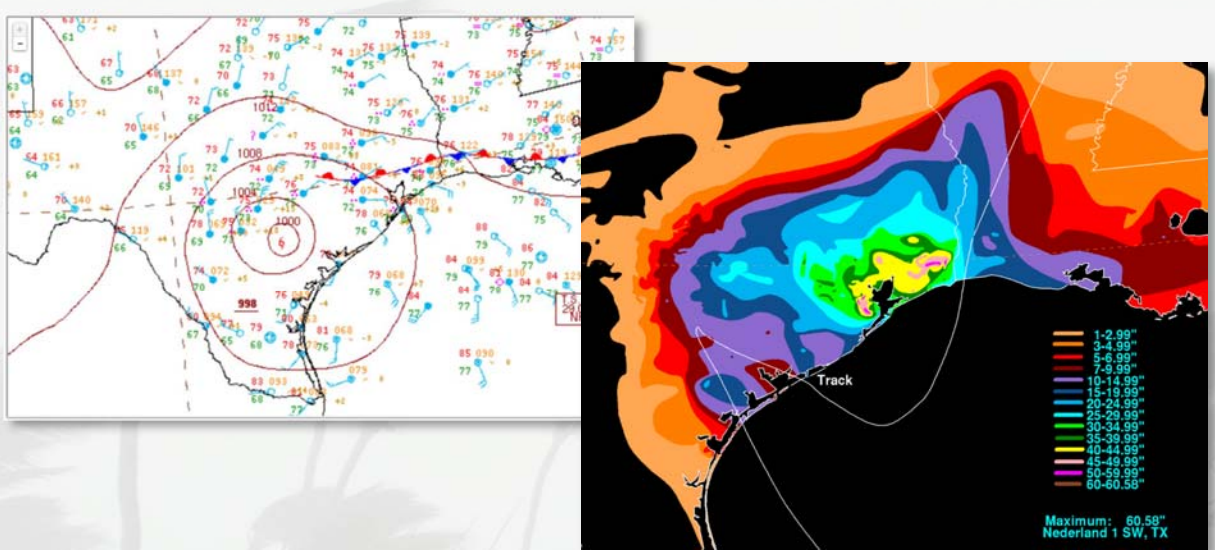

TS Alberto (2016)

TROPICAL STORM ALBERTO
June 11-15, 2006

FRESHWATER FLOODING

Hurricane Harvey (2017)

TORNADOES

Landfalling hurricanes spawn tornadoes.

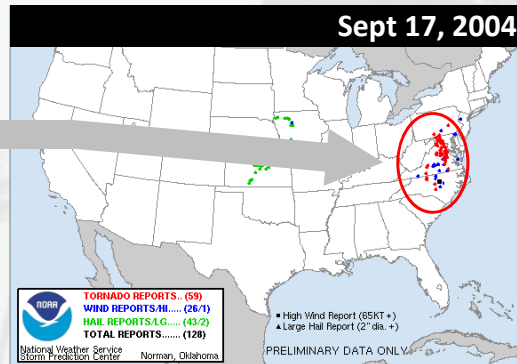

TORNADOES

- 70% produce at least 1 tornado
- 40% produce more than 3 tornadoes

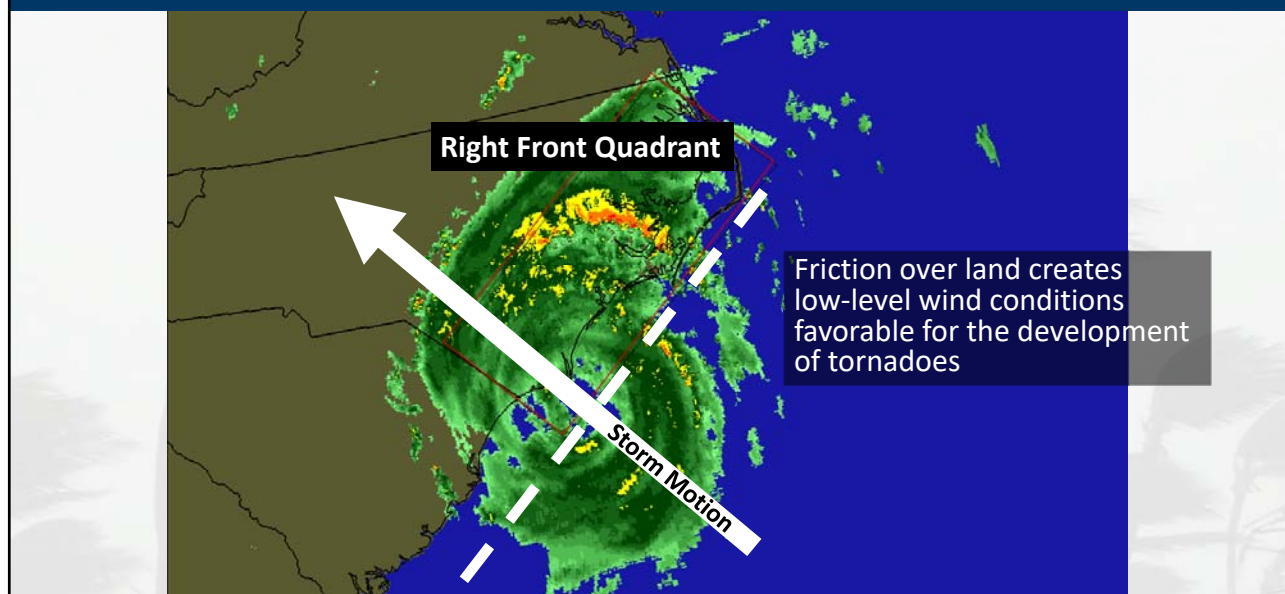

Tornado "outbreak"

Hurricane Ivan (2004)
 - 117 Tornadoes

TORNADOES

Landfalling hurricanes spawn tornadoes.

WAVES AND RIP CURRENTS

Can occur when a storm is well offshore

Swells from a large hurricane can affect the beach of the entire western Atlantic

Hurricane Bertha (2008)

- Over 1500 rescues in Ocean City, Maryland
- 3 people drowned along the coast of New Jersey

- IF CAUGHT IN A RIP CURRENT**
- Don't fight the current
 - Swim out of the current, then to shore
 - If you can't escape, float or tread water
 - If you need help, call or wave for assistance

- SAFETY**
- Know how to swim
 - Never swim alone
 - If in doubt, don't go out
