Disaster Management Initiative

President's Management Council E-Gov Subcommittee

Mark Zimmerman, Program Manager
Mark.Zimmerman@dhs.gov
Office: 202.646.2783

Mission and Goals

Goal 1: An easy to use, unified point of access to Disaster Management knowledge and services.

Goal 2: Accelerated and improved quality of disaster mitigation and response.

- Minimize loss of life and property
  - Prepare
  - Mitigate
  - Respond
  - Recover
- Provide consolidated source of disaster-related information and services (www.disasterhelp.gov)
- Establish information interoperability infrastructure
- Leverage existing assets
- Streamline disaster-related processes
- "Bottom up": responder/stakeholder driven requirements

What's the first problem?

Organization to organization interoperability tends to be inefficient

"Pass the rumor telephone chaos."
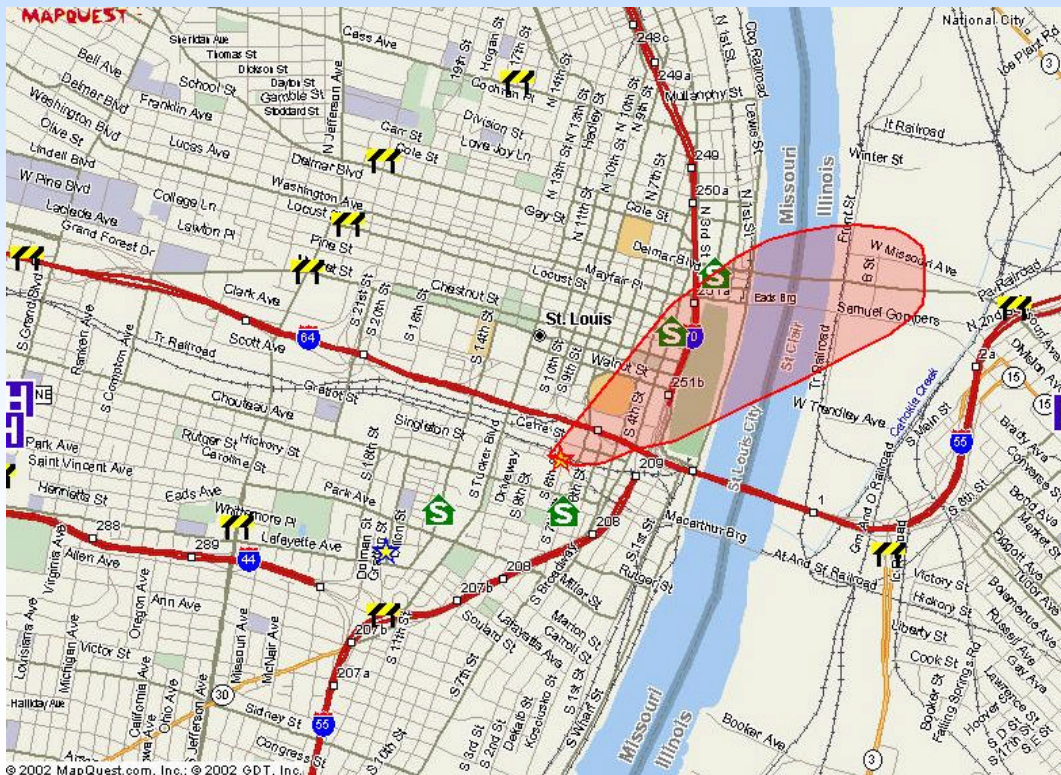

"Same room syndrome"

FAX hassles

"Grease pencil and acetate"

What's that mean in the real world?

Consider:
- **St Louis Riverfront Festival, July 4**
- **Terrorist rocket into chlorine tank car**
- **Lethal plume across:**
  - **Unprotected thousands**
  - **Multiple municipal jurisdictions**
  - **2 states**
  - **2 FEMA regions**

**With an interoperability service,
organizations can:**
- **Share information**
- **Gain early awareness**
- **Coordinate response**
- **Save lives and minimize property damage**
Despite differing automated systems

What's the solution?

- **Leverage technology to gain efficiency**
- **Develop a national emergency information interoperability service**

Interoperability Service enabling horizontal & vertical information sharing

What's an Interoperability Service?

An infrastructure with common service functions that enable <u>heterogeneous</u> automated information systems to "talk to each other."

BACKUP SLIDES

Rational Process/Stakeholder Experience

Beta Testing:
Cities: LA, Dallas, Seattle
States: IL, MA, NH
- 50 Application Test Cases

**- Roughly 500 Robustness Diagrams**
- Over 300 Sequence Diagrams

1,000 formal responder interviews

UML Domain Models for each component

• 3 formal responder surveys
•Regular advisory body prioritization

Over 1500 use cases

Roughly 50 functional concept descriptions

Engaged Stakeholders

Current DM Capabilities

Disaster Management Interoperability Services

DisasterHelp.gov

DM Current Capabilities

- Shared situation awareness tools, including interactive maps

- Open-source intelligence (OSInt)

- Private chat for responders

- Collaborative workspace with instant-messaging (IM), chat, document repository

- Data center / communications / access control / security / privacy

- 24x7 help desk / program support

- Transaction queuing during communication loss

- Prototype web-based access to DMI-Services

- Disaster information portal with search

- Threaded discussions

Planned Capabilities

- External systems interfaces - interoperability API

- Specific Needs Request

- Agent Indicator

- Desktop video teleconferencing

- Detailed weather forecasts for responders

- Target Folder

- Playbook

- Webify current client-server application (interactive mapping tool)

- Enhanced portal access control

- Web-services mapping

- Secure wireless access

- Alert notifications

- Electronic information campaigns

All are "bottom-up" responder-driven requirements

Future Capabilities

- Lessons Learned Repository
- On-scene Video
- Handheld Agent Indicator
- Weapons of Mass Destruction (WMD) Planning Tool
- Intelligence Reports (INTRep) (unclassified)
- Access to chem/bio weapons encyclopedia (BACWORTH)
- USDA Report Forms
- Sensor Interfaces
- Health Alert Network Interoperability
- Enhanced mapping Interoperability
- Distributed Exercises
- Agro-terrorism Database
- Blast FX- Tool for simulation of structure explosion
- Subject matter expert query capability

All are "bottom-up" responder-driven requirements

Saving Life and Property

Capability	Response Phase	
	Preparedness / Mitigation	*Response / Recovery*
Planning	- WMD Plans, Target Folder, and INTRep	-Playbook
Reference	- BACWORTH access - USDA Report Forms - OSInt - Lessons Learned - Portal Search	- Agent Indicator - HAN Interoperability - Weather Forecasts
Sharing	- HAN Interoperability - GIS Working Environments - Video Teleconference - Portal Collaboration Center - IM, Chat -Threaded Discussions	- Tactical information exch. - Specific Needs Request - On-scene video - GIS Interoperability - Messenger - Sensor Interfaces
Training	- Distributed Exercises	
Other	- Blast FX	- Agro-terrorism Database

Structured Processes + Engaged Stakeholders = Mitigated Risk

- Used enhanced Rational Unified Process for software development

- Involved responders and other stakeholders at all steps to mitigate risk

- Actively pursued outreach activities to get stakeholder buy-in

- Used proven integration technologies and vendors from AKO and CMI-S experience

- Deployed proven technical architecture

- Established outreach and requirements baseline

Functional Concept Description

Functional Concept Description
Lessons Learned Repository

1) Introduction

a) General Description. The Memorial Institute for Prevention of Terrorism (MIPT) is developing a Lessons Learned Repository (LLR) database that will serve as a comprehensive compendium of lessons learned from exercises and incident responses. CMI-Services stakeholders currently rely upon their own experiences, local lessons learned documentation, and anecdotal documentation available in literature. This effort will provide a national lessons learned database available to registered CMI-Services Operators throughout the emergency response community. Operators will be able to contribute local lessons learned to the database and draw lessons learned on selected topics from organizations throughout the nation.

b) Functional Scope. The scope of this work includes development of the LLR database, determination of the best location for hosting it and development of the mechanism for serving the LLR to CMI-Services Operators. MIPT will be responsible for development of the database and development/maintenance of its content. CMI-Services is responsible for access mechanisms within the CMI-Services environment. The host site will be collaboratively determined.

2) Background / Statement of Need

This initiative is in response to stakeholder needs collected during interviews in municipalities, June through August 2000. Although variously expressed, the functional requirement is summarized as, "Provide a national database with query capability for selected lessons learned topics from exercises and actual incident responses."

3) Objectives

a) Stakeholder Objectives

- Rapidly acquire legitimate lessons learned by others to facilitate response planning and training

- Acquire lessons learned from a single authoritative source

b) CMI-Services Team Objectives

- Partially satisfy the stakeholder statement of need and objectives within the constraints provided below

- Leverage capability developed by external organizations

- Provide controlled access by the nation's response community to lessons learned from exercises and incident responses

4) Constraints

a) Functional. The functionality and content of this CMI-Services sub-system will be constrained to that developed by the MIPT vendor. CMI-Services will serve out the resource "as is" within the CMI-Services application desktop environment. The MIPT

LLR database application will be called by a command item in the CMI-Services Expert Reference menu

b) Technical. No technical constraints are envisioned. However, peer-to-peer technical discussions among the collaborators have not yet begun.

c) Fiscal. Resources for development of the LLR Database product are contained by those allocated by MIPT. The resources to develop the CMI-Services menu command item, any data storage, and data transfer mechanisms are not yet defined but projected to be within Release 2 budget constraints.

d) Schedule. The CMI-Services effort shall begin upon successful demonstration of the LLR Database prototype.

5) User Encounter Description

A registered CMI-Services Operator has the task to develop or acquire a cost effective patient decontamination system.

The Operator logs on to CMI-Services, pulls down the Expert Reference menu and selects the "MIPT Lessons Learned Repository" command item. Selection of the item launches the CMI-Services browser addressed to the MIPT LLR Database resident on CMI-Services' servers.[3]

The Operator uses the MIPT Lessons Learned Repository application to query for "patient decontamination" records entered since January 1996.

The Operator finds sufficient information in this one resource to structure the acquisition plan and justify selection of specific items from specific manufacturers.

6) Interface Considerations

a) Human. No significant user interface issues are identified. The user interface to the MIPT LLR will be developed by the MIPT vendor and presented "as is" within the CMI-Services environment. Navigation and menu commands within the CMI-Services environment shall be consistent with standard CMI-Services graphic user interface style.

b) Database. The required database will be developed by the MIPT vendor.

c) Middleware. Technical discussions with the MIPT vendor will be necessary to determine any middleware requirements.

d) Other Applications. No interfaces to other applications are anticipated.

7) Resources

a) Stakeholder Advocate. Art Slavinski is the CMI-Services internal point of contact for this initiative.

b) References. None available to date; the MIPT Statement of Work to its vendor will be available soon.

---

[3] This is a presumption by the PCD author. No technical decision on this point has been made.

Use Case
