

Cook Inlet Planning Area

Oil and Gas Lease Sales 191 and 199

Final Environmental
Impact Statement

Volume III
(Tables, Figures, Maps, Bibliography, and Index)

COOK INLET PLANNING AREA OIL AND GAS LEASE SALES 191 AND 199

Final Environmental Impact Statement

OCS EIS/EA, MMS 2003-055, in 3 volumes:

Volume I, Executive Summary and Sections I through VI

Volume II, Section VII and Appendices

Volume III, Tables, Figures, Map, Bibliography and Index

The summary is also available as a separate document:

Executive Summary, **MMS 2003-056**.

The complete EIS is available on CD-ROM (**MMS 2003-055 CD**) and on the Internet (http://www.mms.gov/alaska/cprojec/Cook_Inlet/Cook_Inlet_Sale.htm).

This Environmental Impact Statement (EIS) is not intended, nor should it be used, as a local planning document by potentially affected communities. The exploration, development and production, and transportation scenarios described in this EIS represent best-estimate assumptions that serve as a basis for identifying characteristic activities and any resulting environmental effects. Several years will elapse before enough is known about potential local details of development to permit estimates suitable for local planning. These assumptions do not represent a Minerals Management Service recommendation, preference, or endorsement of any facility, site, or development plan. Local control of events may be exercised through planning, zoning, land ownership, and applicable State and local laws and regulations.

With reference to the extent of the Federal Government's jurisdiction of the offshore regions, the United States has not yet resolved some of its offshore boundaries with neighboring jurisdictions. For the purposes of the EIS, certain assumptions were made about the extent of areas believed subject to United States' jurisdiction. The offshore-boundary lines shown in the figures and graphics of this EIS are for purposes of illustration only; they do not necessarily reflect the position or views of the United States with respect to the location of international boundaries, convention lines, or the offshore boundaries between the United States and coastal states concerned.

The United States expressly reserves its rights, and those of its nationals, in all areas in which the offshore-boundary dispute has not been resolved; and these illustrative lines are used without prejudice to such rights.

LIST OF TABLES

Section I Tables

Table Number	Title
I.A-1	Blocks Offered and Deferred, Opportunity Index, and Lost Opportunity for Lease Sales 191 and 199 Alternatives

Section II Tables

II.B-1	Exploration and Production Activities for Cook Inlet Lease Sales 191 and 199
II.B-2	Impact Summary for Lease Sales 191 and 199
II.B-3	Impact Summary for Agency-Preferred Alternative

Section III Tables

III.A-1	Summary of Data for Streams and Rivers Flowing into Cook Inlet
III.A-2	Metal Concentrations in Sedimentary, Volcanic, and Plutonic Rocks Surrounding Cook Inlet in Suspended Sediment from the Susitna-Knik-Matanuska River System and in Average Continental Crust
III.A-3	Estimates of Natural and Anthropogenic Inputs of Metals to Cook Inlet
III.A-4	Summary of Published Data on Trace Metals (Percent or Parts per Million Dry Weight) in Suspended-Particulate Matter from Cook Inlet and Shelikof Strait
III.A-5	Municipal Wastewater Discharges into Cook Inlet
III.A-6	Anchorage Water and Wastewater Utility Port Woronzof Wastewater Treatment Facility Effluent Monitoring Data-November 1992 through October 1993
III.A-7	Fishery Harvests and Wastes in Cook Inlet
III.A-8	Oil and Gas Production Facilities – Cook Inlet Region
III.A-9	Chemical Analyses of Produced Water Samples: The Cook Inlet Discharge Monitoring Study
III.A-10	Chemical Analyses of Produced Water Samples: Source Samples from Shelikof Strait Sediment Quality Study and Produced Water Sample from the Trading Bay Production Facility Outfall
III.A-11	Estimates of Oil and Grease, Biological Oxygen Demand, and Zinc in Cook Inlet Petroleum-Production Discharges
III.A-12	Drilling Muds and Cuttings – MMS Estimates
III.A-13	Estimates of Drilling Muds and Cuttings Discharged into Cook Inlet
III.A-14	Selected Effluent Characteristics: Tesoro Refinery and Union Chemical for 1 Year
III.A-15	Estimates of Selected River and Point-Source Discharges into Cook Inlet for 1 Year
III.A-16	Selected Summary of the Average and Range of Low-Molecular-Weight Aliphatic Hydrocarbon Concentrations Measured in Various Alaskan Marine Environments
III.A-17	Summary of Published Data on Petroleum, Combustion, and Biogenic Contaminant Trends in Cook Inlet Area Marine Sediments
III.A-18	Summary of Cook Inlet Bioassays – 1993
III.A-19	Summary of Published Data on Trace Metals in Marine Sediments from Cook Inlet and Shelikof Strait: Earlier Studies
III.A-20	Summary of Published Data on Trace Metals in Marine Sediments from Cook Inlet and Shelikof Strait: Shelikof Strait Sediment Quality Study
III.A-21	Summary of Metal Concentrations in Mussel Tissues
III.A-22	Ambient Air-Quality Standards Relevant to the Cook Inlet Program Area

III.B-1	Federally Managed Fisheries Resources and Important Forage Fishes in the Gulf of Alaska
III.B-2	Endangered, Threatened and Candidate Species in Cook Inlet
III.B-3	Estimated Abundances of Belugas by Year and Location in Cook Inlet
III.B-4	Reported Sightings of Right Whales Since 1900 in the Eastern North Pacific East and South of the Aleutian Islands and North of Latitude 50° N.
III.B-5	Major Steller Sea Lion Rookery Sites
III.B-6	Major Steller Sea Lion Haulout Sites in Alaska
III.B-7	Counts of Adult and Juvenile (Nonpup) Steller Sea Lions at Rookery and Haulout Sites by Region
III.B-8	Common Marine and Coastal Birds That are Resident or Migrant in the Cook Inlet/Gulf of Alaska
III.B-9	Seasonal Bird Densities in Lower Cook Inlet
III.B-10	Counts of Steller's Eiders Observed During Boat Surveys in Kachemak Bay – 1999-2001
III.B-11	Counts of Sea Otters in the Aleutian Islands
III.B-12	Counts or Estimates of Sea Otters in the Southwest Alaska Stock
III.B-13	Numbers of Sea Otters Reported Taken and/or Tagged in the Range of the Southwest Alaska Stock (North Side of Cook Inlet West to the End of the Aleutian Islands)
III.B-14	Numbers of Sea Otters Reported Taken and/or Tagged in the Range of the Southcentral Alaska Stock (South Side of Cook Inlet around the Kenai Peninsula to Prince William Sound and South to Yakutat)
III.C-1	Wage and Salary Employment by Industry – 1990-1998, Kenai Peninsula Borough
III.C-2	Oil and Gas Industry Employment by Industry – 1990-2000, Kenai Peninsula Borough
III.C-3	Kenai-Soldotna Employment by Industry – 1990-1998
III.C-4	Homer Employment by Industry – 1990-1998
III.C-5	Tyonek Subsistence Salmon Harvest
III.C-6	Communities, Households, and Subsistence Inventories
III.C-7	Community Characteristics of Subsistence Harvests
III.C-8	Resource Percent of Total Subsistence Harvest
III.C-9	Population by Community and Place
III.C-10	Community Types by Demographic, Economic, and Sociocultural Characteristics
III.C-11	Ethnic Composition of the Population 2000 Count and Percentage of Total Count by Community
III.C-12	Selected Characteristics of the Population
III.C-13	Community Description – Cook Inlet Area, Alaska
III.C-14	Scenic Areas Identified in Kenai Peninsula Borough Coastal Plan
III.C-15	Blocks Having Potential for Prehistoric and Historic Resources
III.C-16	Cook Inlet Shipwrecks
III.C-17	Lake Clark National Park and Preserve Incidental Business Permits
III.C-18	Katmai National Park and Preserve Incidental Business Permits (Commercial Operators) as of 12/03/01
III.C-19	Kenai National Wildlife Refuge Commercial Vendors – 1997-2001
III.C-20	Kenai National Wildlife Refuge Visitor Use Summary
III.C-21	Kodiak National Wildlife Refuge Commercial Vendors – 1997-2001
III.C-22	Kodiak National Wildlife Refuge Visitor Use Summary
III.C-23	Alaska Maritime National Wildlife Refuge Commercial Vendors – 1997-2001
III.C-24	Alaska Maritime National Wildlife Refuge Visitor Use Summary
III.C-25	Alaska Peninsula and Becharof National Wildlife Refuges Commercial Vendors – 1999-2001
III.C-26	Becharof National Wildlife Refuge Visitor Use Summary
III.C-27	Alaska Peninsula National Wildlife Refuge Visitor Use Summary
III.C-28	State of Alaska Recreation and Tourism Near the Proposed Cook Inlet Sale Area
III.C-29	Nutritional Contribution of Annual Wild Food Harvests to Kenai Peninsula Borough
III.C-30	Nutritional Contribution of Annual Wild Food Harvests to Kodiak Island Borough
III.C-31	Nutritional Contribution of Annual Wild Food Harvests to Southern Alaska Peninsula Communities

Section IV Tables

IV.A-1	Large, Small, and Very Large Spill Sizes We Assume for Analysis in This EIS by Section
IV.B-1	Types of Regulated Pollutants
IV.B-2	Estimates of Exploration Well Drilling Discharges, Additives, and Usage Rates in Alaska OCS Waters
IV.B-3	Produced Water Monitoring Requirements
IV.B-4	Estimates of Natural and Permitted Anthropogenic Inputs of Metals to Cook Inlet in Tonnes Per Year
IV.B-5	Summary of Petroleum Production Adverse Impacts to Essential Fish Habitat
IV.B-6	Essential Species Habitat in Cook Inlet by Sub-analysis Area
IV.B-7	Annual Percentage Risk to Essential Fish Habitat on Cook Inlet Beaches and in Intertidal Areas if an Oil Spill Occurs
IV.B-8	Percentage Risk in Summer to Essential Fish Habitat on Cook Inlet Beaches and in Intertidal Areas if an Oil Spill Occurs
IV.B-9	Percentage Risk in Winter to Essential Fish Habitat on Cook Inlet Beaches and in Intertidal Areas if an Oil Spill Occurs
IV.B-10	Maximum Annual Percentage Risk to Essential Fish Habitat in Cook Inlet Estuarine and Marine Areas if an Oil Spill Occurs – By Spill Location
IV.B-11	Maximum Percentage Risk to Essential Fish Habitat in Cook Inlet Estuaries and Marine Waters if an Oil Spill Occurs in Winter – By Spill Location
IV.B-12	Maximum Percentage Risk to Essential Fish Habitat in Cook Inlet Estuaries and Marine Waters if an Oil Spill Occurs in Summer – By Spill Location
IV.B-13	Percentage Risk after 30 Days to Essential Fish Habitat on Cook Inlet Marine Waters if an Oil Spill Occurs
IV.B-14	Percentage Risk after 10 Days to Essential Fish Habitat on Cook Inlet Marine Waters if an Oil Spill Occurs
IV.B-15	Percentage Risk after 3 Days to Essential Fish Habitat on Cook Inlet Marine Waters if an Oil Spill Occurs
IV.B-16	Alternatives Comparison for Maximum Annual Risk to Estuary and Marine Essential Fish Habitat after 30 Days if an Oil Spill Occurs – Lower Cook Inlet
IV.B-17	Alternatives Comparisons for Maximum Winter Risk to Estuary and Marine Essential Fish Habitat after 30 days if an Oil Spill Occurs – Lower Cook Inlet
IV.B-18	Alternatives Comparisons for Maximum Summer Risk to Estuary and Marine Essential Fish Habitat after 30 days if an Oil Spill Occurs – Lower Cook Inlet
IV.B-19	Employment and Personal Income Effects of Alternative 1
IV.B-20	Population Forecast for the Kenai Peninsula Borough
IV.B-21	Commercial Fishing Income, Cook Inlet Region, 1991 through 2001
IV.B-22	2000 Census Income Data for the Kenai Peninsula, Kodiak Island, and the Lake and Peninsula Boroughs
IV.F-1	State of Alaska, Department of Environmental Conservation Response Standards (18AAC 75) for Cook Inlet Platforms
IV.F-2	Discharge Conditions for a Well Blowout to Open Water or Broken Ice
IV.F-3	General Mass Balance of Oil from a 120,000-Barrel Open Water Winter or Summer Spill
IV.F-4	Areas of Discontinuous and Thick Slicks from a 120,000-Barrel Open-Water Spill
IV.F-5	Length of Coastline a 120,000-Barrel Spill Might Contact Without Oil-Spill Response
IV.F-6	General Mass of Oil from a 120,000-Barrel Broken Ice or Winter Spill
IV.F-7	Conditional Probabilities That an Oil Spill Starting at Launch Area 2 Will Contact Certain ERA's
IV.F-8	Conditional Probabilities That an Oil Spill Starting at Launch Area 2 Will Contact Certain Land Segments

Section V Tables

V-1	Cook Inlet Basin Oil and Gas Discoveries by Operator
V-2	Cook Inlet Basin Oil and Gas Discoveries
V-3	Past Exploration Activities in Lower Cook Inlet and Cook Inlet Basin
V-4	Past and Present Operational Gas Pipelines in Cook Inlet and Cook Inlet Basin
V-5	Past and Present Operational Oil and Liquid Petroleum Pipelines in Cook Inlet and Cook Inlet Basin
V-6	Trans-Alaska Pipeline System and Future Natural Gas Projects
V-7	Future Cook Inlet Lease Sales
V-8	Past and Present Oil and Gas Production: July 1957 to December 2001 for Cook Inlet Basin, Alaska
V-9	Summary of Reserve and Resource Estimates We Use for Analytical Purposes in the Cumulative Analysis
V-10	Detailed Reserve and Resource Estimates We Use for Analytical Purposes in the Cumulative Analysis
V-11	Past Major Projects Considered in the Cumulative Effects Assessment
V-12	Present Major Projects Considered in the Cumulative Effects Assessment
V-13	Reasonably Foreseeable Future – Major Projects Considered in Cumulative Effects Assessment
V-14	Summary of Cumulative Effects by Resource Category
V-15	Cumulative-Oil-Spill-Occurrence Estimates Greater Than or Equal to 1,000 Barrels Resulting from Oil Development over the Assumed 15-20 Year Production Life of the Cook Inlet Lease Sale 191
V-16	Cumulative Employment and Personal Income Effects for Major Projects in the Reasonably Foreseeable Future

TABLES

**Table I.A-1
Blocks Offered and Deferred, Opportunity Index, and Lost Opportunity for Lease Sales 191 and 199 Alternatives**

Alternative	Whole or Partial Blocks Deferred	Whole or Partial Blocks in Alternative	Hectares Deferred	Hectares in Alternative	Acres Deferred	Acres in Alternative	Opportunity Index*	Lost Opportunity**
Alternative I – Proposed Action	0	517	NA	1,011,736	NA	2,500,000	100%	0%
Alternative II – No Action (defer entire program area)	0	NA	NA	NA	NA	NA	0%	100%
Alternative III – Lower Kenai Peninsula Deferral	34	483	65,965	945,771	163,000	2,337,000	99%	1%
Alternative IV – Barren Islands Deferral	36	481	63,941	947,794	158,000	2,342,000	99%	1%
Agency-Preferred Alternative***	70	447	129,609	882,127	321,900	2,179,000	98%	2%

Notes:

For purposes of analysis, we assume that a single field containing 140 million barrels of oil and 190 billion cubic feet of natural gas could be discovered and produced from either or both lease sales.

*The chance that commercial fields could be leased, drilled, discovered, and developed in the area offered for leasing is given by the Opportunity Index.

**The lost opportunity represents the estimated resource potential loss if the deferral is adopted. For example, an estimated 1% chance exists that a commercial field could be discovered and produced from the Lower Kenai Peninsula Deferral. As such, a 99% chance (the Opportunity Index) exists that the assumed single field containing 140 million barrels of oil and 190 billion cubic feet of natural gas could be leased, discovered, developed and produced in the area offered for leasing.

*** The agency-preferred alternative is the combination of Alternative III, the Lower Kenai Deferral, and Alternative IV, the Barren Islands Deferral. See Figure IA-2 for a representation of the agency-preferred alternative.

Key:

% = percent.

NA = not applicable.

Table II.B-1
Exploration and Production Activities for Cook Inlet Lease Sales 191 and 199

Phase Activity/Event	Estimated Range
Exploration	
Shallow-hazard geophysical surveys (years)	2006-2010
Area covered (square miles)	62.3
Total number of days required	14-35
Well drilling	2006-2010
Exploration wells (2 wells following Lease Sale 191, 2 wells following Lease Sale 199)	4
Delineation wells	3
Drilling discharges (years)	2006-2010
Drilling muds (150 dry tons/well)	1,050
Drilling cuttings (440 dry tons/well)	3,080
Support activities (years)	2006-2010
Helicopter flights	1,825-3,650
Supply-boat trips	912-1,825
Development and Production	
Shallow-hazard geophysical surveys (year)	2010
Area covered—platform (square miles)	8.9
Area covered—pipeline (square miles)	10.73
Total number of days required	4-10
Oil pipeline construction (years)	2010-2011
Platform to shore	25 miles
Landfall to processing plant	75 miles
Gas pipeline construction	2022
Platform to shore	25 miles
Landfall to gas-pipeline tie in	5 miles
Production and injection-well drilling (years)	2011-2014
Oil Production wells	42
Injection wells	12
Drilling mud required (dry tons)	4,050
Drilling cutting (dry tons)	29,700
Drilling discharge (dry tons)	0
Gas Production well (years)	2023-2024
Production well (total)	6
Drilling mud required (dry tons)	450
Drilling cuttings (dry tons)	3,300
Drilling discharge (dry tons)	0
Support activities (years)	2011-2014
Helicopter flights (total)	1,460-2,920
Supply-boat trips (total)	730-1,460

Table II.B-2
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Water Quality		
<p>Effects of Routine Activity: Discharge of drilling muds and cuttings and other discharges associated with exploration drilling are not expected to have any measurable effect on the overall quality of the Cook Inlet water.</p> <p>The remaining activities—exploration discharges, small spills, and construction activities—would not significantly affect water quality.</p> <p>Construction activities would increase the turbidity in the water column along segments of the 40-km (25 mi) pipeline corridors for up to a few months, but no significant water quality degradation would occur.</p> <p>Drilling fluids and produced waters are not anticipated to be discharged during production.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Would not significantly degrade the quality of Cook Inlet water. Concentrations of hydrocarbons in water would be less than the acute criterion within three days of spillage and concentrations above the chronic criterion would persist less than thirty days. These effects are considered unlikely given the chance of a spill occurring.</p>	<p>The effects are essentially identical to those for Alternative I. The permitted, routine discharges associated with oil and gas development and small (less than 1,000 barrels) oil spills are not expected to cause significant degradation of Cook Inlet water quality. A large spill is unlikely to occur and would not significantly degrade water quality if it did occur. If such a spill did occur in this alternative, it would be unlikely to reach the Lower Kenai Peninsula Deferral area.</p>	<p>The effects are essentially identical to those for Alternative I. The permitted, routine discharges associated with oil and gas development and small (less than 1,000 barrels) oil spills are not expected to cause any significant degradation of Cook Inlet water quality. A large spill is unlikely to occur and would not significantly degrade water quality if it did occur. If such a spill did occur in this alternative, it would be unlikely to reach the Barren Islands Deferral area.</p>
Air Quality		
<p>Effects of Routine Activity: Activities account for a very small percent of the maximum allowable Prevention of Significant Deterioration Class II increments and only a small percent of the Class I increments where they apply. The concentrations of criteria pollutants in the onshore ambient air would remain well within the air-quality standards. Consequently, it is estimated there would be only a minimal effect on air quality with respect to standards. The air-quality analysis is based on the specific emission controls and emission limitations that the</p>	<p>The effects are essentially identical to those for Alternative I. Air quality effects of all activities under this alternative would cause only small increases in the concentrations of criteria pollutants. Concentrations would be within the Prevention of Significant Deterioration Class I (where applicable) and Class II limits and National Ambient Air Quality Standards.</p>	<p>The effects are essentially identical to those for Alternative I. Air quality effects of all activities under this alternative would cause only small increases in the concentrations of criteria pollutants. Concentrations would be within the Prevention of Significant Deterioration Class I (where applicable) and Class II limits and National Ambient Air Quality Standards.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Air Quality (cont.)		
<p>operators would apply to meet the appropriate Environmental Protection Agency regulations and permit requirements for any development and production activities.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Concentrations of criteria pollutants would remain well within Federal air-quality standards. The overall effects on air quality would be minimal.</p>		
Lower Trophic-Level Organisms		
<p>Effects of Routine Activity: The presence of drill platform in the OCS area would cause very little benthic disturbance. This and other routine, anticipated activities during exploration, development, and production probably would not have measurable effects on local populations of lower trophic-level organisms.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Potential contamination of 17-38 kilometers (10-24 miles) of shoreline, most likely in southwestern Cook Inlet or western Shelikof Strait. The risk to intertidal habitats on the east side of Cook Inlet would be low; for example, if a spill occurred at a hypothetical production platform in the lease area at any time during the year, the probability of contact with Clam Gulch within 30 days would be less than 4%. In any areas affected by a spill and the likely responses to it, populations of intertidal organisms would be depressed measurably for about a year, and small amounts of oil would persist in shoreline sediments for a decade.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>The effects are essentially identical to those for Alternative I. The presence of drill platform in the OCS area near the Lower Kenai Peninsula would cause very little benthic disturbance, so, its absence from the deferred area would cause very little change. Further, the deferral would reduce only slightly the risk that a large oil spill would contact the adjacent shoreline because the spill would drift to the southwest with or without the deferral. In addition, the Lower Kenai Peninsula Deferral would not eliminate entirely the risk because spills could drift into the area from operations elsewhere in Cook Inlet.</p>	<p>The effects are essentially identical to those for Alternative I. The deferral area appears to be biologically productive. However, a lease sale with the Barren Islands Deferral would have similar effects on lower trophic-level organisms as leasing the whole area. The estimated chance of an unlikely large oil spill would be about the same. The chance of contact to the Barren Islands would be about the same with or without the deferral because any spills from the deferred area would drift mainly to the southwest toward the Alaska Peninsula rather than toward the Barren Islands. Offshore facilities in the rest of Lower Cook Inlet would pose a very small risk to the Barren Islands even with the Barren Islands deferral.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Fisheries Resources		
<p>Effects of Routine Activity: Fishes could be disturbed and displaced from the immediate vicinity of drilling discharges, within a radius probably not to exceed 100 meters. Displacement of demersal fishes very likely would be limited to only the short time periods of the discharge.</p> <p>Offshore construction also could temporarily disturb and/or displace fishes proximate to the construction activity. Any disturbance or displacement is expected to be short term (hours to days) and limited to only the time of construction activity and shortly thereafter.</p> <p>Although seismic surveys may kill or injure eggs and fry of some fishes, this injury is limited to within 1 or 2 meters from the airgun-discharge ports. Thus, seismic surveys probably would have no appreciable adverse effects on fish subpopulations.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Oiled intertidal areas could lead to considerable mortality of eggs and juvenile stages in the affected areas. Elevated levels of developmental malformations and physiological aberrations in eggs and juvenile stages can cause reduced survival to adulthood, thereby delaying recovery of subpopulations affected by an oil spill. Eggs and fry of some benthic-pelagic and demersal fishes may suffer lethal and sublethal effects from oil contact. Although multiple small spills or a single large spill may cause declines of multiple species' subpopulations. However, they are not expected to cause a measurable decline in abundance requiring three or more generations for an indicated population of the central Gulf of Alaska to recover to its former status.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>The effects are essentially identical to those for Alternative I. The deferral would eliminate any effects due to drilling discharges, offshore construction activities, and seismic surveys within the deferral area.</p> <p>However, drilling discharges, offshore construction activities, and seismic surveys are not expected to have measurable effects on fish resources anywhere in the sale area.</p>	<p>The effects are essentially identical to those for Alternative I. The deferral would eliminate any effects due to drilling discharges, offshore construction activities, and seismic surveys within the deferral area.</p> <p>However, drilling discharges, offshore construction activities, and seismic surveys are not expected to have measurable effects on fish resources anywhere in the sale area.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Essential Fish Habitat		
<p>Effects of Routine Activity: Effects on essential fish habitat from seismic surveys, turbidity, and pipeline construction (both offshore and onshore) are considered low. In most cases, impacts would be localized and habitats would recover within months to years.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release:</p> <p>Beach and intertidal fish habitats could be affected because oil could remain in the area contacted or prey could be impacted for more than a decade (three or more generations for some species, a significant effect). However, such habitat degradation would likely be limited to a very small proportion of habitat and the habitat of only subpopulations would be affected.</p> <p>Oil-spill effects on estuarine and marine essential fish habitats would generally be low because fish habitat would be expected to recover within a month or so. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>The effects are essentially identical to those for Alternative I. This deferral does not decrease the maximum risk in the estuarine essential fish habitats because the highest risk of contact is from oil spills on the east side of lower Cook Inlet or east of the Barren Islands. In this alternative, the maximum risk remains 44.8% in Kamishak Bay, the Barren Islands, Kennedy Entrance, and the upper Shelikof Strait. The greatest effect of this deferral on marine waters outside of Cook Inlet is to slightly lower the maximum risk in areas that are already at low risk. Assuming an oil spill occurs, Oil-Spill-Risk-Assessment modeling indicates the maximum risk of a summer oil spill contacting the resource area decreases from 3.9% without the deferral compared to 3.1% with the deferral east of the Kenai Peninsula toward Prince William Sound. The maximum risk for a winter oil spill contacting the resource area is reduced from 2% without the deferral to 1.5% with the deferral. The average annual maximum risk of an oil contacting the resource area decreases from 2.9% without the deferral to 2.2% with the deferral.</p>	<p>The effects are essentially identical to those for Alternative I. Although the difference between the relative effects of the alternatives is minor, the effects of an oil spill on essential fish habitat would be the least under the Barren Islands Deferral. Effects of a low-probability, large oil spill on the intertidal areas could persist over a decade, but habitat and populations would be expected to recover. All of the other effects of exploration and development would be similar to those of the other alternatives.</p>
Endangered and Threatened Species		
<p>Effects of Routine Activity: Adverse effects to threatened and endangered species from routine and common activities of exploration, development, or production should not exceed the significance thresholds.</p> <p>Effects to individuals (for example, displacement due to noise or other disturbance, collisions with structures, etc.) and effects that are relatively localized (for example due to pipeline placement or due to small oil spills) and short-term in impact could occur due to such activities.</p> <p>Because they are currently in serious decline, displacement of</p>	<p>Reduction of potential impacts on beluga whales from noise and disturbance and from spilled oil originating in the deferral area that traveled north from Kachemak Bay.</p> <p>Reduced noise and disturbance impacts to important Steller sea lion habitat and to seasonal beluga whale habitat. The deferral removes a portion of the Stellar sea lion critical habitat exposed to noise and disturbance.</p> <p>Reduction in the chance of exposure from extremely fresh oil to individual sea lions, and possibly humpbacks or beluga whales that might occur there.</p>	<p>Probable beneficial effects of the Barren Island deferral for several species of marine mammals that are designated as threatened, endangered or a candidate for listing under the ESA. These include the western stock of Steller sea lions, humpback whales, and possibly, but less likely, fin whales, all of which are listed as endangered under the ESA. Sea lions from the eastern stock of Steller sea lions could also benefit from deferral of this area. Another species for which deferral of this area could be beneficial is the Cook Inlet stock of the beluga whale, which is currently a candidate</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Endangered and Threatened Species (cont.)		
<p>western population Steller sea lions from important critical habitats, such as important feeding areas, could potentially result in a significant effect on the population if alternative equally valuable food areas were unavailable to them or their shift to alternative areas displaced other Steller sea lions. A significant effect on the western population of Steller sea lions could also occur if such sea lions were disturbed and potentially killed as a result of aircraft (primarily helicopter) disturbance near important rookeries or haulouts. This type of disturbance should be avoided by compliance with NMFS-specified flight practices that ensure that such noise does not affect sea lions on these terrestrial critical habitats.</p> <p>Individual American peregrine falcons could potentially suffer some adverse effect from disturbance. Such effects are unlikely due to their distribution and relative rarity in the area.</p> <p>For a more extensive description of potential effects, please see section IV.B.1.f(2).</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Sea otters from the southwest Alaska stock and Steller sea lions (particularly from the western population) could suffer significant effects. However, while the vulnerability of sea otters to oil spills is clear, the level of vulnerability of Steller sea lions is less certain.</p> <p>Steller’s eiders could be adversely affected by a spill during the late autumn, winter, or early spring.</p> <p>Fin whales are vulnerable if an unlikely large spill entered Shelikof Strait at any time of the year whereas humpbacks are primarily vulnerable only during the summer and late autumn months.</p> <p>Beluga whales could be adversely impacted in the non-summer months.</p>	<p>The deferral of this area could also reduce potential oil-spill impacts to Steller sea lions at Cape Douglas and sea otters from the southwest Alaskan stock. Deferral removes an area that has a relatively high probability of an unlikely large oil spill impacting important habitat for the endangered western stock of the Steller sea lion and probable year-round habitat for the southwest stock of Alaska sea otters.</p>	<p>species under the ESA and listed as depleted under the MMPA.</p> <p>The deferral reduces noise and disturbance related effects to ESA-list species resident in this area, primarily Steller sea lions, but also beluga and humpback whales.</p> <p>The deferral removes a portion Stellar sea lion critical habitat exposed to noise and disturbance.</p> <p>Deferral reduces the amount and level of noise detected by any deep water, large threatened and endangered cetacean in the Shelikof Strait and especially in the Gulf of Alaska.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Endangered and Threatened Species (cont.)		
<p>The likelihood that there would be oil spill effects on cetaceans, even in the unlikely event of a large spill is uncertain. Potential effects on fin whales or humpback whales are likely to be local and not have population-level effects.</p> <p>A significant effect on the Alaska breeding population of Steller’s eiders is unlikely.</p> <p>Individual American peregrine falcons could suffer adverse effects by catching and eating oiled prey. Such effects are unlikely due to their distribution and relative rarity in the area.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		
Marine and Coastal Birds		
<p>Effects of Routine Activity: Effects of helicopter flights (such as abandonment of roosting or foraging areas, nest abandonment, and lowered reproductive success) on those relatively few nesting or roosting individuals directly under or in close proximity (a few hundred feet) to the flight path. These impacts could continue for 1-2 years if birds adapt to the flights or the life of the project if birds fail to adapt. A few birds nesting within one-quarter mile of pipeline-landfall construction sites could suffer impacts during one breeding season. A limited number of birds could also be lost to small oil spills; recovery from small spills would probably require no more than 1 year. A limited number of birds could also be lost to small oil spills; recovery from small spills would probably require no more than 1 year.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Loss of hundreds of birds to possibly tens of thousands of birds, depending on the size, timing (summer versus winter), and movement of the spill in relation to seasonal patterns of bird abundance and distribution.</p>	<p>This Alternative could reduce oil-spill impacts to marine and coastal birds, particularly in Kachemak Bay and in waters off the lower Kenai Peninsula. Bird resources in these areas are probably most vulnerable in spring and summer, when waterfowl, seabirds (especially alcids and tubenoses), and shorebirds are present in great numbers, with densities of 200 birds per square kilometer or greater having been recorded in Kachemak Bay. Although densities are lower in winter, Kachemak Bay is an important wintering area for waterfowl and alcids, and densities of more than 100 birds per square kilometer have been observed. Although no exploration or development would occur in the deferral area, vessel and helicopter traffic and pipeline construction would be the same as for Alternative I.</p>	<p>This Alternative could reduce the risk that marine and coastal birds in the Barren Islands area would be contacted by fresh oil, because an oil spill would have to occur farther offshore, providing additional time for the oil to weather and for cleanup vessels to reach the spill. The largest concentration of seabirds in the lower Cook Inlet occurs on the Barren Islands, where current estimates indicate that the breeding population may number more than 500,000 birds. At-sea densities of more than 100 birds per square kilometer have been recorded in the area. Although no exploration or development would occur in the deferral area, vessel and helicopter traffic and pipeline construction would be the same as for Alternative I.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Marine and Coastal Birds (cont.)		
<p>Depending on the number of birds involved, recovery could require a few years to two generations. However, recovery could be even longer for a few species. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>A natural gas release and ignition could result in mortality to birds in the immediate vicinity. Blowouts of natural gas condensates that did not burn would be dispersed very rapidly at the blowout site; thus, it is unlikely that toxic fumes would affect birds or their food sources, except those very near the blowout source. Bird mortality associated with a blowout could range from a few to hundreds of individuals. However, such a loss would be expected to involve several species of marine and coastal birds, with no one population suffering losses that would not be replaced within about 1 year.</p>		
Nonendangered Marine Mammals		
<p>Effects of Routine Activity: No measurable effects to regional populations or migrant populations of nonendangered marine mammals. Noise and disturbance effects could include temporary displacement within 1 mile of air traffic (caused by up to 78 helicopter flights per month) and vessel traffic (caused by up to 40 round trips per month). Habitat alteration would include about 50 acres.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Loss of an estimated 20-100 harbor seals, a few fur seals, and small numbers (approximately 10-20) of cetaceans would be expected. Total recovery from these losses likely would take place within one year to less than 5 years. No measurable effects to regional populations or migrant populations of nonendangered marine mammals that occur within</p>	<p>The effects are expected to be essentially the same as for Alternative I. Reduced effects to the local habitat and population since no activities would take place and no oil would be produced from the deferral area, and an oil spill would have to occur farther offshore.</p>	<p>The effects are expected to be essentially the same as for Alternative I. Reduced effects to the local habitat and population since no activities would take place and no oil would be produced from the deferral area, and an oil spill would have to occur farther offshore.</p>

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Nonendangered Marine Mammals (cont.)		
<p>the Cook Inlet area are expected. Varying mortality to south central Alaska stock in Kachemak Bay could occur. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		
Terrestrial Mammals		
<p>Effects of Routine Activity: Regional populations of river otters, brown bears, Sitka black-tailed deer, and other terrestrial mammals likely would not be affected by the exploration and development activities. Noise and disturbance effects from air traffic (60 helicopter flights per month) and marine-vessel traffic (18-38 boat trips per month during exploration and 20-40 boat trips per month during development) are expected to have short-term (a few minutes to less than 1 hour) displacement effects on brown bears, moose, and other terrestrial mammals within about 1 mile of the traffic routes when near shore.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Regional populations of river otters, brown bears, Sitka black-tailed deer, and other terrestrial mammals likely would not be affected by the oil spill. The spill could cause an estimated loss of a small number of river otters (approximately 10-30), a small number of brown bears (approximately 10-30), and some Sitka black-tailed deer (100 or fewer). Recovery could take more than 1 year (perhaps 3 years) for river otter and brown bear intertidal habitats and prey and 1 year for deer. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>The effects are expected to be essentially the same as for Alternative I. Reduced effects to the local habitat and population since no activities would take place and no oil would be produced from the deferral area, and an oil spill would occur farther offshore.</p>	<p>The effects are expected to be essentially the same as for Alternative I. Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Cook Inlet Economy		
<p>Effects of Routine Activity: Estimated increases in Kenai Peninsula Borough property tax revenue of approximately 6% (approximately \$2.7 million per year for 15 years during production). Estimated revenue increases to the State of Alaska of less than 0.01% (approximately \$2 million per year for 15 years during production). No measurable change in employment and personal income over the 2000 baseline for the Kenai Peninsula Borough, although the activities will create jobs during exploration, development, and production.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release:</p> <p>Estimated employment to clean up an unlikely large oil spill ranges from 60 to 190 cleanup workers for 6 months in the first year, declining to zero by the third year following the spill. These effects are considered unlikely given the chance of a spill occurring.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>The effects are expected to be essentially the same as for Alternative I.</p>	<p>The effects are expected to be essentially the same as for Alternative I.</p>
Commercial Fisheries		
<p>Effects of Routine Activity: Drilling discharges from exploration are not expected to affect commercial fishing due to the limited area affected near the platform-discharge point. Offshore construction, platforms, and pipelines are expected to result in some space-use conflicts; however, these are expected to be few in number and minor in scope. Seismic surveys, planned and coordinated with the commercial-fishing industry, are expected to have a minimal effect on the Cook Inlet commercial-fishing industry. Small oil spills are not expected to result in closures, or reduced market values over the life of the proposal.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Based on the losses from a closure and</p>	<p>The effects are expected to be essentially the same as for Alternative I. The deferral would eliminate any effects due to drilling discharges, offshore construction activities, and seismic surveys within the deferral area. However, these activities are not expected to have measurable effects on commercial fishing anywhere in the sale area. We do not expect that precluding activity in the deferral area would measurably benefit commercial fishing.</p>	<p>The effects are expected to be essentially the same as for Alternative I. Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Commercial Fisheries (cont.)		
<p>average annual value of the Cook Inlet commercial fishery (about \$41 million), the unlikely 4,600-barrel-oil pipeline spill in lower Cook Inlet could cause closure of the fishery over tainting concerns and result in an estimated to loss of about 22% to 37% per year for 2 years. It is possible that fishery could be closed for a whole year resulting in a 100% loss for that year, not including losses due to damaged to boats and gear. Losses of such magnitude constitute a significant effect on the Cook Inlet and Kodiak commercial fishing industry. Losses to the commercial fishing industry from a spill of this size occurring in winter may be much reduced. These effects are considered unlikely given the chance of a spill occurring.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		
Subsistence-Harvest Patterns		
<p>Effects of Routine Activity: Short-term, local disturbance from routine activities associated with exploration, development, and production could periodically affect subsistence resources and subsistence-harvest patterns, but no resource or harvest area would become unavailable, no resource would experience an overall decrease in population, and no harvest would be curtailed for the harvest season. Construction disturbance and noise could briefly disturb subsistence species that include beluga whales, seals, sea lions, fish, birds, moose, bears, and Sitka black-tailed deer, and only a few actual animals would be temporarily displaced.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: The subsistence resources (including shellfish), harvest areas, and harvest patterns in traditional communities could be affected for at least one harvest season with some resource populations requiring longer to recover. Some harvest</p>	<p>Reduces potential noise and disturbance from routine exploration, development, and production activities in the deferral area. However, noise and disturbance from these activities would create only local and short-term impacts to subsistence resources and practices.</p> <p>The deferral could provide some protection from oil spills by eliminating potential platform spill locations from the vicinity, thus providing a buffer to onshore, nearshore, and coastal subsistence resources and subsistence harvest areas. Additionally, any potential spill would occur farther offshore which could provide additional time for cleanup vessels to reach the spill before it reached these critical use areas. Even though the likelihood of a large oil spill would decrease slightly under this alternative, overall, effects to subsistence resources and harvest patterns are expected to be the same as describe under Alternative I.</p>	<p>Reduces potential noise and disturbance from routine exploration, development, and production activities to harbor seal haulouts, Steller sea lion habitat, and possibly beluga whales passing through the Kennedy Entrance. Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Subsistence-Harvest Patterns (cont.)		
<p>areas and resources in these areas could be too contaminated to harvest. Some resource populations could suffer losses and, as a result of tainting, an even larger array of resources could be rendered unavailable for use.</p> <p>Tainting concerns in communities nearest the spill could seriously curtail traditional practices for harvesting, sharing, and processing resources and threaten pivotal practices of traditional Native culture. Harvesting, sharing, and processing of subsistence resources would continue but would be hampered to the degree these resources were contaminated. In the case of extreme contamination, harvests would cease until such time as local subsistence hunters perceived resources as safe. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		<p>expected to be the same as describe under Alternative I.</p>
Sociocultural Systems		
<p>Effects of Routine Activity: Exploration, development, and production activities contribute to the continuation of an important, longtime economic characteristic of the area. No qualitatively “new” activities are introduced to the area that alter existing sociocultural systems. Similarly, the relatively small number of new residents that come to the area should not alter the existing sociocultural systems. Analysis identified no measurable effects to subsistence harvest resources from routine operations. As such, sociocultural systems of Native Alaskan villages should not be affected.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: No effects were identified from a natural gas release. While subsistence harvest resources could be affected</p>	<p>The effects are expected to be essentially the same as for Alternative I. Deferral of the blocks from mid-Kachemak Bay and offshore the coast from south of Homer to Port Graham reduces the potential for oil-spill effects from potential production sites in the deferral area. That result should reduce, to an unknown extent, threats to subsistence resources and the attendant sociocultural effects to the Native Alaskan communities of Seldovia, Nanwalek, and Port Graham. Moving potential production sites farther offshore also increases the time available to respond to a production spill, should one occur.</p>	<p>The effects are expected to be essentially the same as for Alternative I. Deferral of the blocks around the Barren Islands reduces the potential for oil-spill effects from production sites in the deferral area. This should reduce, to an unknown extent, threats to subsistence resources and the attendant sociocultural effects on the Native Alaskan communities that use the area for subsistence harvest. Moving potential production sites farther offshore also increases the time available to respond to a production spill, should one occur.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Sociocultural Systems (cont.)		
<p>by an unlikely large oil spill, the analysis identified no long-term measurable effects to subsistence harvest resources that would fundamentally displace or alter sociocultural practices in the villages. Towns or cities could experience some short-term adverse effects. These effects are considered unlikely given the chance of a spill occurring.</p>		
Recreation, Tourism, and Visual Resources		
<p>Effects of Routine Activity: Space-use conflicts may arise. In the Cook Inlet area, these activities usually take place in different locations or at different times. When recreation and tourism activities coincide with routine oil activity, the duration normally will be very short. Visual resources will not be significantly affected.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Potentially significant effects to coastal-dependent and coastal-enhanced recreation and tourism values limited to those areas where oil made contact and would last the duration of the cleanup. The Oil-Spill-Risk Analysis indicates that the chance of an oil spill contacting most land segments in recreation areas is a maximum of 26%, but is usually much less.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>Moving the potential platform sites farther offshore reduces the area of the lower Kenai Peninsula that would be encompassed by the visual resource impact area (within a 5-mile radius of the platform). In addition, the action may reduce visual effects to passengers and potential space-use conflicts for charter vessels from Homer and Seldovia that transit the area en route to the Kennedy Entrance, Barren Islands, and Chugach Islands for wildlife viewing.</p>	<p>Moving the potential platform sites farther offshore reduces the area of the Barren Islands that would be encompassed by the visual resource impact area within a 5-mile radius of the platform. In addition, the action may reduce visual effects to passengers and potential space-use conflicts for charter vessels from Homer and Seldovia that transit the area en route to the Kennedy Entrance, Barren Islands, and Chugach Islands for wildlife viewing.</p>
Sport Fisheries		
<p>Effects of Routine Activity: Disturbance, displacement, or injury as a result of drilling or seismic activities also would not be measurable. We do not expect the various effects to sport fisheries taken altogether would cause population-level changes in sport fisheries resources and consequently in sport fisheries activities.</p>	<p>The effects are expected to be essentially the same as for Alternative I. The Oil-Spill-Risk Analysis shows some probability of spilled oil contacting land segments along the western side of the Kenai Peninsula, which result in effect similar to those for Alternative I.</p>	<p>The effects are expected to be essentially the same as for Alternative I. The Oil-Spill-Risk Analysis shows some probability of spilled oil contacting land segments along the western side of the Kenai Peninsula, which result in effect similar to those for Alternative I.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Sport Fisheries (cont.)		
<p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: The Oil-Spill-Risk Analysis shows some probability of spilled oil contacting land segments along the western side of the Kenai Peninsula. Oil contacting the beaches could affect the clam gathering, particularly for razor clams and other types of clams along the east and west side of Cook Inlet and mussels and steamer clams in small bays off Kachemak Bay. A potentially significant impact could occur in any area contacted by oil, because populations of the intertidal organisms could be depressed measurably for about a year, and small amounts of oil likely would persist in the shoreline sediments for more than a decade. The spill could limit the ability of sport halibut and salmon fishers from setting out from oiled locations as long as such locations were oiled. The fishers could use alternate locations, but some of the charter operators would lose business. The loss of business could be 20% or \$6 million in 2000 dollars for one year. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		
Environmental Justice		
<p>Effects of Routine Activity: Noise and disturbance from routine activities are not expected to produce effects on the Native minority populations residing in the subsistence-based communities.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: If spill occurred and contaminated essential subsistence harvest areas major effects could occur when impacts from contamination of the shoreline, tainting concerns, cleanup disturbance, and disruption of subsistence practices are factored</p>	<p>Overall, effects to subsistence resources and harvest patterns would be expected to be essentially the same as described under Alternative I. Environmental Justice would be enhanced because the deferral protects subsistence resources in the Lower Kenai Peninsula.</p>	<p>Overall, effects to subsistence resources and harvest patterns would be expected to be essentially the same as described under Alternative I. Environmental Justice would be enhanced because the deferral protects subsistence resources in the Barren Islands.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Environmental Justice (cont.)		
<p>together. Such impacts would be considered disproportionately high adverse effects on Alaskan Natives. Any potential effects to subsistence resources and subsistence harvests from a large oil spill are expected to be mitigated, though not eliminated, to some extent. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		
Archaeological Resources		
<p>Effects of Routine Activity: Potential damage to historic and prehistoric resource sites from activities that cause physical disturbance to the seafloor or coastal areas such as the placement of rigs and anchors, drilling wells, and pipeline construction. Small oil spills and gas releases are expected to have little effect.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Potential significant impacts from damage to an archaeological site. Accidental oil spills could affect beached shipwrecks, or shipwrecks in shallow waters, and coastal historic and prehistoric archeological sites. Oil spills and their subsequent cleanup could affect the archaeological resources of the Cook Inlet area directly and/or indirectly. Gross crude oil contamination of shorelines is a potential direct impact that may affect archaeological site recognition. Heavy oiling conditions could conceal intertidal sites that may not be recognized until they are inadvertently damaged during cleanup. Crude oil may also contaminate organic material used in dating. The major source of potential impacts from oil spills is the indirect effects that result from unmonitored shoreline cleanup</p>	<p>Archaeology resources could be affected by any activities that cause physical disturbance to the seafloor or coastal areas, such as the placement of rigs and anchors, drilling wells, pipeline construction and oil spill clean up after an unlikely large oil spill. Small oil spills and gas releases are expected to have little effect. The deferral area contains none of the blocks we identified as possibly containing prehistoric archaeological resources. The Alternative does eliminate some blocks identified as possibly containing potential historic resources, specifically, the wrecks of the vessels <i>Seldovia</i> and <i>Dynamite Kid</i>. (If the area is leased, these potential historic resources should be detected during the archaeological surveys.) Potential effects on onshore resources due to disturbance from oil spill clean-up activities do not differ from Alternative I.</p>	<p>The effects are expected to be essentially the same as for Alternative I.</p>

Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Archaeological Resources (cont.)		
<p>activities. Unmonitored booming, cleanup activities involving vehicle and foot traffic, mechanized cleanup involving heavy equipment, and high pressure washing on or near archaeological sites pose risks to the resource. Unauthorized collecting of artifacts by cleanup crewmembers is also a concern. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>		
National and State Parks and Special Areas		
<p>Effects of Routine Activity: No effects are expected during exploration. During development, onshore construction may cause the disruption and diminishment of recreational values of State recreational areas located along the Kenai Peninsula coast. Such effects, however, would be transient, encompassing two seasons, and could be mitigated.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Significant impacts could result from a large spill to either the coastlines of Katmai National Park and Preserve or Lake Clark National Park and Preserve. Actual effects on the intrinsic of the parks' coastline would be less than 3 years; however, public perception of damage could last for a greater time. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>An accidental gas release is expected to produce no measurable effects.</p>	<p>The effects are expected to be essentially the same as for Alternative I. The deferral may reduce some effects to park and recreation area resources; however, the effects of this deferral will not substantively change from those effects forecast for the Proposed Action. The probability of an oil-spill event occurring, the probability of it contacting certain segments, and the effects of spilled oil will be the same as analyzed for the Proposed Action.</p>	<p>The effects are expected to be essentially the same as for Alternative I. The deferral may reduce some effects to parks and recreational area resources; however, the effects of this deferral will not substantively change from those forecast for the Proposed Action. The probability of an oil spill event occurring, the probability of it contacting certain segments, and the effects of spilled oil will be the same as analyzed for the Proposed Action.</p>
Coastal Zone Management		
<p>No conflicts with the Alaska Coastal Management Program or the related district policies are anticipated. Table II.B-2 (continued)
Impact Summary for Lease Sales 191 and 199

Alternative I – Proposed Action	Alternative III – Lower Kenai Peninsula Deferral	Alternative IV – Barren Islands Deferral
Coastal Zone Management (cont.)		
<p>the implementation of the mitigating measures effectively address the consistency of the activities herein hypothesized with the Statewide standards of the Alaska Coastal Management Program and the enforceable policies of the Kenai Peninsula Borough and the Kodiak Island Borough Coastal Management Plans. The Coastal Zone Management Act requires that OCS exploration and development and production plans be consistent with the Alaska Coastal Management Program, including district enforceable policies.</p>		

**Table II.B-3
Impact Summary for Agency-Preferred Alternative**

Water Quality
<p>Effects of Routine Activity: Discharge of drilling muds and cuttings and other discharges associated with exploration drilling are not expected to have any measurable effect on the overall quality of the Cook Inlet water. The remaining activities—exploration discharges, small spills, and construction activities—would not significantly affect water quality. Construction activities would increase the turbidity in the water column along segments of the 40-km pipeline corridors for up to a few months, but no significant water quality degradation would occur. Drilling fluids and produced waters are not anticipated to be discharged during production.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Would not significantly degrade the quality of Cook Inlet water. Concentrations of hydrocarbons in water would be less than the acute criterion within three days of spillage and concentrations above the chronic criterion would persist less than thirty days. These effects are considered unlikely given the chance of a spill.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative avoids the effects from routine activities in the area deferred, shown on Figure I.A-2. However, these activities were not expected to have a measurable effect.</p>
Air Quality
<p>Effects of Routine Activity: The effects of exploration, development, and production activities would cause only small, local, temporary increases in the concentrations of criteria pollutants. Concentrations would be within the Prevention of Significant Deterioration Class II limits (and Class I limits where they apply) and National Ambient Air Quality Standards. The air-quality analysis is based on the specific emission controls and emission limitations that the operators would apply to meet the appropriate Environmental Protection Agency regulations and permit requirements.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Concentrations of criteria pollutants would remain well within Federal air-quality standards. The overall effects on air quality would be minimal.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: None, effects are essentially the same.</p>
Lower Trophic-Level Organisms
<p>Effects of Routine Activity: The presence of drill platform in the OCS area would cause very little benthic disturbance. This and other routine, anticipated activities during exploration, development, and production probably would not have measurable effects on local populations of lower trophic-level organisms.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Potential contamination of 17 to 39 kilometers of shoreline in southwestern Cook Inlet or western Shelikof Strait. The risk to intertidal habitats on the east side of Cook Inlet would be low. For example, if a spill occurred at a hypothetical production platform in the lease area at any time during the year, the probability of contact with Clam Gulch within 30 days would be less than 4%. In any affected area, populations of intertidal organisms could be depressed measurably for about a year, and small amounts of oil could persist in shoreline sediments for more than a decade. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative avoids the effects from routine activities in the area deferred, shown on Figure I.A-2. However, these activities were not expected to have a measurable effect. For an unlikely oil spill, it avoids some of the risk to organisms in the area deferred, shown on Figure I.A-2.</p>
Fisheries Resources
<p>Effects of Routine Activity: Disturbance, displacement, or injury as a result of drilling or seismic activities would not be measurable. Although seismic surveys may damage eggs and fry of some fishes, this injury is limited to 1 or 2 meters from the airgun-discharge ports. Thus, seismic surveys probably would have no appreciable adverse effects on fish populations. Offshore/onshore construction could cause disturbance to pelagic fish and displacement from their preferred habitat, as a result of increased turbidity. Any disturbance or displacement should be short term (hours to days), limited to only the time of construction and shortly thereafter. Offshore structures may attract and protect some species. Drilling discharges could cause disturbance on demersal fishes and displacement from the immediate vicinity, within a radius probably not to exceed 100 meters. These effects very likely would be limited to only the short time periods of the discharge.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Effects of a spill on fisheries resources would not be measurable at the population level. The likely effects would include the loss of some demersal fishes, and some eggs and fry of pink salmon, and some semidemersal fishes. Effects (short or long-term) that could be measured at even the stream population level are not likely.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative avoids effects due to drilling discharges, offshore construction activities, and seismic surveys within the area</p>

Table II.B-3 (continued)
Impact Summary for Agency-Preferred Alternative

deferred, shown on Figure I.A-2. However, drilling discharges, offshore construction activities, and seismic surveys are not expected to have measurable effects on fish resources anywhere in the sale area. For an unlikely oil spill, it avoids some of the risk to organisms in the area deferred, shown on Figure I.A-2.

Essential Fish Habitat

Effects of Routine Activity: Effects on essential fish habitat from seismic surveys, turbidity, and pipeline construction (both offshore and onshore) are considered low. The generally low effects of this lease sale on essential fish habitats are not expected to affect the ecosystem at a level that could be measured.

Effects of an Unlikely Large Oil Spill/Natural Gas Release:

Beach and intertidal fish habitats could be affected because oil could remain in the area contacted or prey could be impacted for more than a decade (three or more generations for some species, a significant effect). However, such habitat degradation would likely be limited to a very small proportion of habitat and the habitat of only small populations or subpopulations would be affected.

Oil-spill effects on estuarine and marine essential fish habitats would generally be low because fish habitat would be expected to recover within approximately a month. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.

Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative avoids effects from routine activities within the area deferred shown on Figure I.A-2. For an unlikely oil spill, it slightly lowers the maximum risk in areas that are already at low risk (marine waters outside of Cook Inlet). Although the difference between the relative effects is minor, the effects of an oil spill on essential fish habitat would be the least in the area around the Barren Islands which the agency-preferred alternative defers, as shown on Figure I.A-2

Endangered and Threatened Species

Effects of Routine Activity: Adverse effects to threatened and endangered species from routine and common activities of exploration, development, or production should not exceed the significance thresholds. Effects to individuals (for example, displacement due to noise or other disturbance, collisions with structures, etc.) and effects that are relatively localized (for example due to pipeline placement or due to small oil spills) and short-term in impact could occur due to such activities. Because they are currently in serious decline, displacement of western population Steller sea lions from important critical habitats, such as important feeding areas, could potentially result in a significant effect on the population if alternative equally valuable food areas were unavailable to them or their shift to alternative areas displaced other Steller sea lions. A significant effect on the western population of Steller sea lions could also occur if such sea lions were disturbed and potentially killed as a result of aircraft (primarily helicopter) disturbance near important rookeries or haulouts. This type of disturbance should be avoided by compliance with NMFS-specified flight practices that ensure that such noise does not affect sea lions on these terrestrial critical habitats. Individual American peregrine falcons could potentially suffer some adverse effect from disturbance. Such effects are unlikely due to their distribution and relative rarity in the area. For a more extensive description of potential effects, please see section IV.B.1.f(2).

Effects of an Unlikely Large Oil Spill/Natural Gas Release: Sea otters from the southwest Alaska stock and Steller sea lions (particularly from the western population) could suffer significant effects. However, while the vulnerability of sea otters to oil spills is clear, the level of vulnerability of Steller sea lions is less certain. Steller's eiders could be adversely affected by a spill during the late autumn, winter, or early spring. Fin whales are vulnerable if an unlikely large spill entered Shelikof Strait at any time of the year whereas humpbacks are primarily vulnerable only during the summer and late autumn months. Beluga whales could be adversely impacted in the non-summer months. The likelihood that there would be oil spill effects on cetaceans, even in the unlikely event of a large spill is uncertain. Potential effects on fin whales or humpback whales are likely to be local and not have population-level effects. A significant effect on the Alaska breeding population of Steller's eiders is unlikely. Individual American peregrine falcons could suffer adverse effects by catching and eating oiled prey. Such effects are unlikely due to their distribution and relative rarity in the area.

Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces potential effects to several species of marine mammals in the area deferred, shown on Figure I.A-2 that are designated as threatened, endangered or a candidate for listing under the ESA including the western stock of Steller sea lions, humpback whales, beluga whales, and possibly, but less likely, fin whales. The reduction in effects comes from the decrease in noise and disturbance primarily to Steller sea lions, but also beluga and humpback whales; noise and disturbance effects to important Steller sea lion habitat and to seasonal beluga whale habitat; and by decreasing the amount and level of noise detected by any deep water, large threatened and endangered cetacean in the Shelikof Strait and especially in the Gulf of Alaska. For an unlikely oil spill, it reduces the chance of exposure from extremely fresh oil to individual sea lions, and possibly humpbacks or beluga whales that might occur in the area deferred, shown on Figure I.A-2. It could also reduce potential oil-spill impacts to Steller sea lions at Cape Douglas and sea otters from the southwest Alaskan stock. The agency-preferred alternative removes an area that has a relatively high probability of an unlikely large oil spill impacting important habitat for the endangered western stock of

Table II.B-3 (continued)
Impact Summary for Agency-Preferred Alternative

<p>the Steller sea lion and probable year-round habitat for the southwest stock of Alaska sea otters.</p>
<p>Marine and Coastal Birds</p> <p>Effects of Routine Activity: Effects of helicopter flights (such as abandonment of roosting or foraging areas, nest abandonment, and lowered reproductive success) on those relatively few nesting or roosting individuals directly under or in close proximity (a few hundred feet) to the flight path. These impacts could continue for 1-2 years if birds adapt to the flights or the life of the project if birds fail to adapt. A few birds nesting within one-quarter mile of pipeline-landfall construction sites could suffer impacts during one breeding season. A limited number of birds could also be lost to small oil spills; recovery from small spills would probably require no more than 1 year. A limited number of birds could also be lost to small oil spills; recovery from small spills would probably require no more than 1 year.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Loss of hundreds of birds to possibly tens of thousands of birds, depending on the size, timing (summer versus winter), and movement of the spill in relation to seasonal patterns of bird abundance and distribution. Depending on the number of birds involved, recovery could require a few years to two generations. However, recovery could be even longer for a few species. These effects are considered unlikely given the chance of a spill occurring and contacting the resources. A natural gas release and ignition could result in mortality to birds in the immediate vicinity. Blowouts of natural gas condensates that did not burn would be dispersed very rapidly at the blowout site; thus, it is unlikely that toxic fumes would affect birds or their food sources, except those very near the blowout source. Bird mortality associated with a blowout could range from a few to hundreds of individuals. However, such a loss would be expected to involve several species of marine and coastal birds, with no one population suffering losses that would not be replaced within about 1 year.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces some potential noise and disturbance effects from routine operations in the area deferred, shown on Figure I.A-2. It could reduce effects from an unlikely oil to marine and coastal birds in the area deferred, shown on Figure I.A-2, particularly in Kachemak Bay and in waters off the lower Kenai Peninsula, and in the Barren Islands because an oil spill would occur farther offshore, providing additional time for the oil to weather and for cleanup vessels to reach the spill.</p>
<p>Nonendangered Marine Mammals</p> <p>Effects of Routine Activity: No measurable effects to regional populations or migrant populations of nonendangered marine mammals. Noise and disturbance effects could include temporary displacement within 1 mile of air traffic (caused by up to 78 helicopter flights per month) and vessel traffic (caused by up to 40 round trips per month). Habitat alteration would include about 50 acres.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Loss of an estimated 20-100 harbor seals, a few fur seals, and small numbers (approximately 10-20) of cetaceans would be expected. Total recovery from these losses likely would take place within one year to less than 5 years. No measurable effects to regional populations or migrant populations of nonendangered marine mammals that occur within the Cook Inlet area are expected. Varying mortality to south central Alaska stock in Kachemak Bay could occur. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces effects from routine activities to local habitat and populations within the area deferred, shown on Figure I.A-2. For an unlikely oil spill, it reduces effects to habitat and populations in the area deferred, shown on Figure I.A-2, because an oil spill would occur farther offshore providing additional time for the oil to weather and for cleanup vessels to reach the spill.</p>
<p>Terrestrial Mammals</p> <p>Effects of Routine Activity: Regional populations of river otters, brown bears, Sitka black-tailed deer, and other terrestrial mammals likely would not be affected by the exploration and development activities. Noise and disturbance effects from air traffic (60 helicopter flights per month) and marine-vessel traffic (18-38 boat trips per month during exploration and 20-40 boat trips per month during development) are expected to have short-term (a few minutes to less than 1 hour) displacement effects on brown bears, moose, and other terrestrial mammals within about 1 mile of the traffic routes when near shore.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Regional populations of river otters, brown bears, Sitka black-tailed deer, and other terrestrial mammals likely would not be affected by the oil spill. The spill could cause an estimated loss of a small number of river otters (approximately 10-30), a small number of brown bears (approximately 10-30), and some Sitka black-tailed deer (100 or fewer). Recovery could take more than 1 year (perhaps 3 years) for river otter and brown bear intertidal habitats and prey and 1 year for deer. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>A natural gas release will have little effect since the gas is likely to disperse before reaching coastal habitats of terrestrial mammals.</p>

Table II.B-3 (continued)
Impact Summary for Agency-Preferred Alternative

<p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces effects from routine activities to local habitat and populations within the area deferred, shown on Figure I.A-2 from diminished activity. For an unlikely oil spill, it reduces effects to habitat and populations in the area deferred, shown on Figure I.A-2, because an oil spill would occur farther offshore providing additional time for the oil to weather and for cleanup vessels to reach the spill.</p>
<p>Cook Inlet Economy</p> <p>Effects of Routine Activity: Estimated increases in Kenai Peninsula Borough property tax revenue of approximately 6% (approximately \$2.7 million per year for 15 years during production). Estimated revenue increases to the State of Alaska of less than 0.01% (approximately \$2 million per year for 15 years during production). No measurable change in employment and personal income over the 2000 baseline for the Kenai Peninsula Borough, although the activities will create jobs during exploration, development, and production.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Estimated employment to clean up an unlikely large oil spill ranges from 60 to 190 cleanup workers for 6 months in the first year, declining to zero by the third year following the spill. These effects are considered unlikely given the chance of a spill occurring.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: None, effects are essentially the same.</p>
<p>Commercial Fisheries</p> <p>Effects of Routine Activity: Drilling discharges from exploration are not expected to affect commercial fishing due to the limited area affected near the platform-discharge point. Offshore construction, platforms, and pipelines are expected to result in some space-use conflicts; however, these are expected to be few in number and minor in scope. Seismic surveys, planned and coordinated with the commercial-fishing industry, are expected to have a minimal effect on the Cook Inlet commercial-fishing industry. Small oil spills are not expected to result in closures, or reduced market values over the life of the proposal.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Based on the losses from a closure and average annual value of the Cook Inlet commercial fishery (about \$41 million), the unlikely 4,600-barrel-oil pipeline spill in lower Cook Inlet in spring could cause an estimated loss of about 22% to 37% per year for 2 years. It is possible that fishery could be closed for a whole year resulting in a 100% loss for that year, not including losses due to damaged to boats and gear, and a loss of this magnitude likely would have a significant effect on the Cook Inlet and Kodiak commercial fishing industry. Losses to the commercial fishing industry from a spill of this size occurring in winter are likely to be much reduced. These effects are considered unlikely given the chance of a spill occurring.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative avoids effects due to drilling discharges, offshore construction activities, and seismic surveys within the area deferred, shown on Figure I.A-2. However, these activities are not expected to have measurable effects on commercial fishing anywhere in the sale area.</p>
<p>Subsistence-Harvest Patterns</p> <p>Effects of Routine Activity: Short-term, local disturbance from routine activities associated with exploration, development, and production could periodically affect subsistence resources and subsistence-harvest patterns, but no resource or harvest area would become unavailable, no resource would experience an overall decrease in population, and no harvest would be curtailed for the harvest season. Construction disturbance and noise could briefly disturb subsistence species that include beluga whales, seals, sea lions, fish, birds, moose, bears, and Sitka black-tailed deer, and only a few actual animals would be temporarily displaced.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: The subsistence resources (including shellfish), harvest areas, and harvest patterns in traditional communities could be affected for at least one harvest season with some resource populations requiring longer to recover. Some harvest areas and resources in these areas could be too contaminated to harvest. Some resource populations could suffer losses and, as a result of tainting, an even larger array of resources could be rendered unavailable for use. Tainting concerns in communities nearest the spill could seriously curtail traditional practices for harvesting, sharing, and processing resources and threaten pivotal practices of traditional Native culture. Harvesting, sharing, and processing of subsistence resources would continue but would be hampered to the degree these resources were contaminated. In the case of extreme contamination, harvests would cease until such time as local subsistence hunters perceived resources as safe. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces potential noise and disturbance from routine exploration, development, and production activities to harbor seal haulouts, Steller sea lion habitat in the area deferred, shown on Figure I.A-2 and possibly to beluga whales passing through Kennedy Entrance. However, noise and disturbance from these activities would create only local and short-term impacts to subsistence resources and practices. For an unlikely oil spill, it reduces potential effects from oil</p>

Table II.B-3 (continued)
Impact Summary for Agency-Preferred Alternative

spills by eliminating potential platform spill locations from the area deferred, shown on Figure I.A-2, thus providing a buffer to offshore, nearshore, and coastal subsistence resources and subsistence-harvest areas. Additionally, any potential spill would occur farther offshore and in this way provide additional time for cleanup vessels to reach the spill before it reached these critical-use areas.

Sociocultural Systems

Effects of Routine Activity: Exploration, development, and production activities contribute to the continuation of an important, longtime economic characteristic of the area. No qualitatively “new” activities are introduced to the area that alter existing sociocultural systems. Similarly, the relatively small number of new residents that come to the area should not alter the existing sociocultural systems. Analysis identified no measurable effects to subsistence harvest resources from routine operations. As such, sociocultural systems of Native Alaskan villages should not be affected.

Effects of an Unlikely Large Oil Spill/Natural Gas Release: No effects were identified from a natural gas release. While subsistence harvest resources could be affected by an unlikely large oil spill, the analysis identified no long-term measurable effects to subsistence harvest resources that would fundamentally displace or alter sociocultural practices in the villages. Towns or cities could experience some short-term adverse effects. These effects are considered unlikely given the chance of a spill occurring.

Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces potential effects from mid-Kachemak Bay and offshore the coast from south of Homer to the Barren Islands which should reduce, to an unknown extent, threats to subsistence resources and the attendant sociocultural effects to the Native Alaskan communities of Seldovia, Nanwalek, and Port Graham. For an unlikely oil spill, moving potential production sites farther offshore also increases the time available to respond to a production spill.

Recreation, Tourism, and Visual Resources

Effects of Routine Activity: Space-use conflicts may arise. In the Cook Inlet area, these activities usually take place in different locations or at different times. When recreation and tourism activities coincide with routine oil activity, the duration normally will be very short. Visual resources will not be significantly affected.

Effects of an Unlikely Large Oil Spill/Natural Gas Release: Potentially significant effects to coastal-dependent and coastal-enhanced recreation and tourism values limited to those areas where oil made contact and would last the duration of the cleanup. The Oil-Spill-Risk Analysis indicates that the chance of an oil spill contacting most land segments in recreation areas is a maximum of 26%, but is usually much less. Effects to recreation, tourism, and visual resources are not expected from accidental releases of natural gas.

Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative eliminates possibility of significant visual impacts by moving the platforms further offshore from public viewing areas in the Lower Kenai Peninsula and reduces potential space-use conflicts for charter vessels from Homer and Seldovia that transit the area en route to the Kennedy Entrance, Barren Islands, and Chugach Islands for wildlife viewing.

Sport Fisheries

Effects of Routine Activity: Disturbance, displacement, or injury as a result of drilling or seismic activities also would not be measurable. We do not expect the various effects to sport fisheries taken altogether would cause population-level changes in sport fisheries resources and consequently in sport fisheries activities.

Effects of an Unlikely Large Oil Spill/Natural Gas Release: The Oil-Spill-Risk Analysis shows some probability of spilled oil contacting land segments along the western side of the Kenai Peninsula. Oil contacting the beaches could affect the clam gathering, particularly for razor clams and other types of clams along the east and west side of Cook Inlet and mussels and steamer clams in small bays off Kachemak Bay. A potentially significant impact could occur in any area contacted by oil, because populations of the intertidal organisms could be depressed measurably for about a year, and small amounts of oil likely would persist in the shoreline sediments for more than a decade. The spill could limit the ability of sport halibut and salmon fishers from setting out from oiled locations as long as such locations were oiled. The fishers could use alternate locations, but some of the charter operators would lose business. The loss of business could be 20% or \$6 million in 2000 dollars for one year. These effects are considered unlikely given the chance of a spill occurring and contacting the resources. No effects anticipated from the unlikely large release natural gas during exploration or production.

Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative reduces potential space-use conflicts for sport-fishing vessels in the area deferred, shown on Figure I.A-2.

Environmental Justice

Effects of Routine Activity: Noise and disturbance from routine activities are not expected to produce effects on the Native minority populations residing in the subsistence-based communities.

Effects of an Unlikely Large Oil Spill/Natural Gas Release: If spill occurred and contaminated essential subsistence

Table II.B-3 (continued)
Impact Summary for Agency-Preferred Alternative

<p>harvest areas major effects could occur when impacts from contamination of the shoreline, tainting concerns, cleanup disturbance, and disruption of subsistence practices are factored together. Such impacts would be considered disproportionately high adverse effects on Alaskan Natives. Any potential effects to subsistence resources and subsistence harvests from a large oil spill are expected to be mitigated, though not eliminated, to some extent. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency preferred alternative enhances Environmental Justice because the area deferred, shown on Figure I.A-2, protects subsistence resources in the Lower Kenai Peninsula and Barren Islands.</p>
<p>Archaeological Resources</p> <p>Effects of Routine Activity: Potential damage to historic and prehistoric resource sites from activities that cause physical disturbance to the seafloor or coastal areas such as the placement of rigs and anchors, drilling wells, and pipeline construction. Small oil spills and gas releases are expected to have little effect.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release:</p> <p>Potential significant impacts from damage to an archaeological site. Accidental oil spills could affect beached shipwrecks, or shipwrecks in shallow waters, and coastal historic and prehistoric archeological sites. Oil spills and their subsequent cleanup could affect the archaeological resources of the Cook Inlet area directly and/or indirectly. Gross crude oil contamination of shorelines is a potential direct impact that may affect archaeological site recognition. Heavy oiling conditions could conceal intertidal sites that may not be recognized until they are inadvertently damaged during cleanup. Crude oil may also contaminate organic material used in dating. The major source of potential impacts from oil spills is the indirect effects that result from unmonitored shoreline cleanup activities. Unmonitored booming, cleanup activities involving vehicle and foot traffic, mechanized cleanup involving heavy equipment, and high pressure washing on or near archaeological sites pose risks to the resource. Unauthorized collecting of artifacts by cleanup crewmembers is also a concern. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative defers the area shown on Figure I.A-2 which we identified as possibly containing potential historic resources, specifically, the wrecks of the vessels Seldovia and Dynamite Kid. (If the area is leased, these potential historic resources should be detected during the archaeological surveys.)</p>
<p>National and State Parks and Special Areas</p> <p>Effects of Routine Activity: No effects are expected during exploration. During development, onshore construction may cause the disruption and diminishment of recreational values of State recreational areas located along the Kenai Peninsula coast. Such effects, however, would be transient, encompassing two seasons, and could be mitigated.</p> <p>Effects of an Unlikely Large Oil Spill/Natural Gas Release: Significant impacts could result from a large spill to either the coastlines of Katmai National Park and Preserve or Lake Clark National Park and Preserve. Actual effects on the intrinsic of the parks' coastline would be less than 3 years; however, public perception of damage could last for a greater time. These effects are considered unlikely given the chance of a spill occurring and contacting the resources.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: The agency-preferred alternative may reduce some effects to park and recreation area resources; however, the effects of this deferral will not substantively change from those effects forecast for Alternative I.</p>
<p>Coastal Zone Management</p> <p>No conflicts with the Alaska Coastal Management Program or the related district policies are anticipated. The MMS regulatory requirements and the implementation of the mitigating measures effectively address the consistency of the activities herein hypothesized with the Statewide standards of the Alaska Coastal Management Program and the enforceable policies of the Kenai Peninsula Borough and the Kodiak Island Borough Coastal Management Plans. The Coastal Zone Management Act requires that OCS exploration and development and production plans be consistent with the Alaska Coastal Management Program, including district enforceable policies.</p> <p>Difference in Effects of the Agency-Preferred Alternative Compared to Alternative I: None. While the area deferred by the agency-preferred alternative, shown of Figure IA-2, provides additional protection to the Port Graham-Nanwalek Area Meriting Special Attention identified in the Kenai Peninsula Borough Coastal Management Plan, it does not change the conclusion of no conflicts with ACMP or related district policies.</p>

EBASCO Environmental (1990a).

Notes:

LC₅₀³ = lethal concentration at which half the organisms die

¹Environmental Protection Agency Method 413.2 - infrared, spectrophotometric method was used.

²Environmental Protection Agency Method 413.1 - gravimetric method was used.

³*Mysidopsis bahia* was the test organism. LC₅₀'s are in percent of effluent.

⁴Total aromatic hydrocarbons is the total of all parameters using Environmental Protection Agency Methods 602, 603, and 610. These include all the mono-, di-, and polycyclic aromatic hydrocarbons.

⁵Total naphthalenes is the total of all the diaromatic hydrocarbons.

Drilling Muds and Cuttings – MMS Estimates**

Weight Estimates and Composition of Drilling Muds and Cuttings		
Weight Estimates		
Well Type	Drilling Mud Components (Dry Weight – Tonnes)	Cuttings Produced (Dry Weight – Tonnes)
Development	70 to 340	510
Delineation	330	400
Exploration	30	400
Composition of Discharged Mud		
Component	Weight Percent	
Barite	63.0	
Clay	24.0	
Lignosulfonate ¹	2.0	
Lignite	1.5	
Sodium Hydroxide	1.5	
Other	8.0	

Note:

¹Chrome or ferrochrome lignosulfonates are the primary source of chromium in drilling muds. Two of the drilling muds authorized by the 1986 General National Pollutant Discharge Elimination System Permit (Environmental Protection Agency, 1986) allow up of 15 pounds per barrel of chrome or ferrochrome lignosulfonates to be added to the drilling mud. For drilling in Federal and State waters of Alaska, the petroleum industry has voluntarily replaced chrome lignosulfonates with defloculants that do not contain chromium (Neff, 1991).

Kachemak Bay (Outer)	100	1,369	1.43	78	98.8	0.86

Notes:

Bold numbers indicate possible contamination

¹ Amphipod 10-day static sublethal bioassay (*R. abronius*) in sediments. Survival rates differing by more than 20% from controls often are considered to be of concern.

² Mean fertilization rate of *D. excentricus* eggs in pore waters. Fertilization rates that are statistically different than controls could indicate toxic pore water.

³ Values less than 2% can be considered to indicate possible contaminated sediment.

Reduced Sulfur Compounds ²	*	*	*	*	*	50

Notes:

¹All-year averaging times not to be exceeded more than once each year, except that annual means may not be exceeded.

²State of Alaska air-quality standard (not national standard).

³Annual geometric mean.

⁴Class I and II standards refer to the Prevention of Significant Deterioration Program. The standards are the maximum increments in pollutants allowable above previously established baseline concentrations.

⁵The State ozone standard compares with national standards for photochemical oxidants, which are measured as ozone.

⁶The 1-hour standard for ozone is based on a statistical, rather than a deterministic, allowance for an "expected exceedance during a year."

⁷Annual arithmetic mean.

⁸PM10 is the particulate matter less than 10 micrometers in aerodynamic diameter.

⁹Attained when the expected annual arithmetic mean concentration, as determined in accordance with 40 CFR 50 subpart K, is equal to or less than 50 micrograms per cubic meter.

¹⁰Attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms per cubic meter, as determined in accordance with 40 CFR 50, subpart K, is equal to or less than 1.

¹¹Maximum arithmetic mean averaged over a calendar quarter.

Key:

* = indicates that no standards have been established

** = measurements are in micrograms per cubic meter

hr = hour

min = minute

Table III.B-1

Federally Managed Fisheries Resources and Important Forage Fishes in the Gulf of Alaska

Species	Scientific Name	Habitat Depth or Distribution
Groundfish		
Pacific Cod ²	<i>Gadus macrocephalus</i>	Shore to 500 m
Atka Mackerel ²	<i>Pleurogrammus monopterygius</i>	Kodiak Banks
Walleye Pollock ²	<i>Theragra calcogramma</i>	<300 m
Sablefish or Black Cod ²	<i>Anoplopoma fimbria</i>	>200 m Shelikof Strait and Kodiak Banks
Shallow Water Flatfish – (Mostly Bycatch)		
Yellowfin Sole* ²	<i>Limanda Aspera</i>	Entire Area South of Ninilchik
Rock Sole* ²	<i>Lepidopsetta bilineatis</i>	Entire Area South of Ninilchik
Starry Flounder ²	<i>Platichthys stellatus</i>	—
Butter Sole ²	<i>Isopssetta bilineatus</i>	—
English Sole ²	<i>Parophrys vetulus</i>	—
Alaska Plaice ²	<i>Pleuronectes quadrituberulatus</i>	<150 m
Sand Sole ²	<i>Psettichthys melanostictus</i>	—
Rex Sole ²	<i>Glyptocephalus zachirus</i>	Off Shelf
Flathead Sole ²	<i>Hippoglossoides elassodon</i>	Entire Planning Areas of Ninilchik
Deep Water Flatfish		
Greenland Turbot (Greenland Halibut) ²	<i>Reinhardtius hippglossoides</i>	—
Dover Sole* ²	<i>Microstomus pacificus</i>	Shelikof Strait and Off Shelf
Deep Sea Sole ²	<i>Embassichthys bathbius</i>	—
Arrowtooth Flounder (mostly by-catch) ²	<i>Atheresthes stomias</i>	Entire Planning Area
Rockfish		
Thornyhead Rockfish* ²	<i>Sebastolobus sp.</i>	Demersal Shelf Rockfish Complex
Yelloweye Rockfish* ²	<i>Sebastes ruberrimus</i>	100- to 200-m Slope Rockfish Complex
Shortraker Rockfish ²	<i>Sebastes borealis</i>	>25 m
Rougheye Rockfish ²	<i>Sebastes aleutianus</i>	>25 m
Pacific Ocean Perch ²	<i>Sebastes alutus</i>	Summer 180-250 m
Northern Rockfish ²	<i>Sebastes pollyspinis</i>	75- to 125-m Pelagic Shelf Rockfish Complex
“Light” Dusky Rockfish* ²	<i>Sebastes ciliatus</i>	Shelikof Strait and Banks
Other Managed Species (Mostly Bycatch)		
Capelin ²	<i>Mallotus villosus</i>	Beach to 200 m
Eulachon ²	<i>Thaleichthys pacificus</i>	50-1,000 m and in rivers
Skates ²	<i>Rajidae</i>	50-300 m
Sculpin ²	<i>Cottidae</i>	Mostly Shallow
Sharks ²	<i>Lamnidae and Squalidae</i>	Near Coast to Outer Shelf, Particularly Kodiak
Octopus ²	<i>Octopoda gilbertianis</i>	to 500 m
Red Squid ²	<i>Berryteuthis magister</i>	30-1500 m
Weathervane Scallop ²	<i>Patinopectin caurinus</i>	Intertidal to 200 m
Salmonids		
Pink Salmon ²	<i>Oncorhynchus gorbuscha</i>	Aquatic and marine waters of the region
Chum Salmon ²	<i>Oncorhynchus keta</i>	Aquatic and marine waters of the region
Coho Salmon ²	<i>Oncorhynchus kisutch</i>	Aquatic and marine waters of the region
Sockeye Salmon ²	<i>Oncorhynchus nerka</i>	Aquatic and marine waters of the region
Chinook Salmon ²	<i>Oncorhynchus tshawytscha</i>	Aquatic and marine waters of the region
Forage Fish Complexes in Lower Cook Inlet Region Identified as Prey of managed fishes in the Gulf of Alaska		
Herrings	<i>Clupeidae</i>	Intertidal to Off Shelf (see below)
Pacific Herring ^{1 3}	<i>Clupea pallasii</i>	Intertidal to Off Shelf
Deep Sea Smelts ²	<i>Bathylagidae</i>	Off Shelf (see below)
Northern Smoothtongue	<i>Leuroglossus schmidti</i>	Mostly Off Shelf
Stout Blacksmelt	<i>Pseudobathylagus milleri</i>	Off Shelf

Table III-B-1 (continued)
Managed Fisheries Resources and Important Forage Fishes in the Gulf of Alaska

Species	Scientific Name	Area
Forage Fish (continued)		
Slender Blacksmelt	<i>Bathylagus pacificus</i>	Off Shelf
Smelts	<i>Osmeridae</i>	(See below)
Capelin ^{1 2}	<i>Mallotus villosus</i>	Beach to 200 M
Surf Smelt	<i>Hypomesus pretiosus</i>	Beach Surf Spawners
Rainbow Smelt ¹	<i>Osmerus mordax</i>	Freshwater Spawn to 150 m
Bristlemouth ²	<i>Gonostomatidae</i>	—
Black Bristlemouth	<i>Cyclothone atraria</i>	Off Shelf
Lanternfish ²	<i>Myctophidae</i>	Probably Offshelf (see below)
Bigeye Lanternfish	<i>Protomyctophum thompsoni</i>	Usually Off Shelf
Blue Lanternfish	<i>Tarletonbeania crenularis</i>	Probably Off Shelf
California Headlightfish	<i>Diaphus theta</i>	Probably Off Shelf
Brokenline Lanternfish	<i>Lampanyctus jordane</i>	Probably Off Shelf
Pinpoint Lampfish	<i>Nannobranchium regale</i>	Probably Off Shelf
Cods	<i>Gadidae</i>	30-300 m (see below)
Walleye Pollock ^{1 2}	<i>Theragra chalcogramma</i>	30-300 m
Pricklebacks ²	<i>Stichaeidae</i>	(See below)
Arctic Shanny	<i>Stichaeus punctatus</i>	Subtidal to 50 m
Mosshad Warbonnet	<i>Chirolophis nugator</i>	Intertidal, Subtidal
Decorated Warbonnet	<i>Chirolophis decoratus</i>	Subtidal to 90 m
Longsnout Prickleback	<i>Lumpenella longirostris</i>	Outer Shelf, Upper Slope
Daubed Shanny	<i>Leptoclinus maculatus m</i>	Bottom, Usually <170 m
Whitebarred Prickleback	<i>Poroclinus rothrocki</i>	Bottom 46-128 m
Stout Eelblenny	<i>Anisarchus medius</i>	Nearshore to 150 m
Slender Eelblenny	<i>Pumpenus fabricii</i>	Intertidal to 100 m
Snake Prickleback	<i>Lumpenus sagitta</i>	Shore to 200 m
Blackline Prickleback	<i>Acantholumpenus mackayi</i>	Nearshore to 56 m
Lesser Prickleback	<i>Alectridium aurantiacum</i>	Intertidal and Subtidal
High Cockscomb	<i>Anoplarchus purpurescens</i>	Mostly Intertidal
Slender Cockscomb	<i>Anoplarchus insignis</i>	Mostly Subtidal
Ribbon Prickleback	<i>Phytichthys chirus</i>	Intertidal to 12 m
Black Prickleback	<i>Xiphister atropurpureus</i>	Kodiak Island, Intertidal to 8 m
Gunnels ²	<i>Pholidae</i>	(See below)
Penpoint Gunnel	<i>Apodichthys flavidus</i>	Kodiak Island Intertidal
Crescent Gunnel	<i>Pholis laeta</i>	Intertidal and Subtidal
Sand Fish* ²	<i>Trichodontidae</i>	Intertidal to 150 m (see below)
Pacific Sand Fish	<i>Trichodon trichodon</i>	Intertidal to 150 m
Sand Lance ²	<i>Ammodytidae</i>	Intertidal to 100 m (see below)
Pacific Sand Lance	<i>Amodytes hexapterus-</i>	intertidal to 100 m
Euphausiids (krill) ²	<i>Euphausiacea</i>	Intertidal into pelagic waters

Notes:

¹ Indicates the four major forage species for which there is more abundant knowledge.

Off shelf indicates species inhabits deep areas not analyzed in this EIS.

Indented shows species; nonindented with light shading indicates major taxonomic group.

² Species or species assemblages for which EFH has been described and identified (North Pacific Fishery Management Council, 1998, 1999).

³ The Pacific herring is managed by the state of Alaska. Hence, EFH has not been described or identified for this species. However and importantly, Pacific herring is a *ecologically significant* prey species for many other fish, seabird, and marine mammal species populations in the region.

Key:

*Most abundant in its group or complex; NPFMC uses it to represent habitat for group or complex.

— means no data are available

< = less than

> = greater than

m = meters

NPFMC = North Pacific Fisheries Management Council

Sources:

Initial family listing of forage fish from North Pacific Fishery Management Council (1999) Species in forage fish families, distribution and some habitat were derived from Mecklenburg, Mecklenburg, and Thorsteinson (2002)

Table III.B-2
Endangered, Threatened, and Candidate Species in Cook Inlet

Common Name	Scientific Name	Endangered Species Act Status
Steller Sea Lion (Western U.S. Stock)	<i>Eumetopias jubatus</i>	Endangered
Steller Sea Lion (Eastern U.S. Stock)	<i>Eumetopias jubatus</i>	Threatened
Blue Whale	<i>Balaenoptera musculus</i>	Endangered
Fin Whale	<i>Balaenoptera physalus</i>	Endangered
Humpback Whale	<i>Megaptera novaeangliae</i>	Endangered
Northern Right Whale (Eastern North Pacific Stock)	<i>Eubalaena japonica</i>	Endangered
Sei Whale	<i>Balaenoptera borealis</i>	Endangered
Sperm Whale	<i>Physeter macrocephalus</i>	Endangered
Beluga Whale (Cook Inlet Stock)	<i>Delphinapterus leucas</i>	Candidate
Steller's Eider (Alaska Breeding Population)	<i>Polysticta stelleri</i>	Threatened
Short-Tailed Albatross	<i>Phoebastria albatrus</i> (formerly <i>Diomedea albatrus</i>)	Endangered
Northern Sea Otter (Southwest Alaska Stock)	<i>Enhydra lutris kenyonii</i>	Candidate
Aleutian Canada Goose	<i>Branta canadensis leucopareia</i>	Delisted 2001
American Peregrine Falcon	<i>Falco peregrinus anatum</i>	Delisted 1999

Table III.B-3
Estimated Abundances of Belugas by Year and Location in Cook Inlet

Year	Northwest ¹	CV	Northeast ²	CV	South ³	CV	Total	CV
1994	580	47%	48	108%	25	19%	653	43%
1995	444	48%	31	43%	17	43%	491	44%
1996	542	30%	52	37%	0	—	594	28%
1997	362	9%	76	69%	2	43%	440	14%
1998	292	32%	55	60%	0	—	347	29%
1999	336	15%	31	25%	0	—	367	14%
2000	408	23%	27	82%	0	—	435	23%
2001	—	—	—	—	—	—	386	9%

Notes:

¹Northwest is described as West Forelands to Anchorage, including Beluga River, Susitna Rivers, and Knik Arm.

²Northeast is described as Anchorage to East Forelands, including Turnagain Arm and Chickaloon Bay.

³South is anywhere south of the Forelands down to the mouth of Cook Inlet.

Key:

— = not given

CV = coefficient of variation

Notes:

Counts of Adults Juvenile (Nonpup) Steller Sea Lions at Rookery and Haulout Trend Sites by Region. For the Gulf of Alaska, the eastern sector includes rookeries from Seal Rocks in Prince William Sound to Outer Island; the central sector extends from Sugarloaf and Marmot Islands to Chowiet Island; and the western sector extends from Atkins Island to Clubbing Rocks. For the Aleutian Islands, the eastern sector includes rookeries from Sea Lion Rock (near Amak Island) to Adugak Island; the central sector extends from Yunaska Island to Kiska Island; and the western sector extends from Buldir Island to Attu Island.

Table-III.B-11
Counts of Sea Otters in the Aleutian Islands

Island Group	1965¹	1992²	2000
Near Islands	27	955	368
Rat Islands	3,147	1,461 ²	192
Delarof Islands	2,798	995	NG
Western Andreanof Islands	3,264	1,527	NG
Eastern Andreanof Islands	421	1,562	NG
Central Aleutians	NG	4,102 ³	1,190
Islands of Four Mountains	NS	72	52
Fox Islands ⁴	43	1,449	NA
—	NA	1,458	640

Notes:

¹1965 data are from Kenyon (1969) as presented in Table 2 of Evans et al (1997).² 1992 data are from Evans et al. (1997)³ Data for 2000 and those 1992 values used for comparison with 2000 data are from USDOI, Fish and Wildlife Service (2000a:7, unnumbered figure entitled "Aleutian Islands sea otter aerial results").

²This likely is an underestimate, because the 1992 estimate for Amchitka Island probably is an underestimate due to survey conditions (Evans et al., 1997:8).

³Data for Central Aleutians in 1992 apparently include some island(s) not surveyed in 1965 and, thus, not included in one or more of the island group totals compared to Kenyon's (1969) data.

Inspection of the figure indicates the area called the Central Aleutians in the 2000 document is comprised of the Western and Eastern Andreanof Islands and the Delarof Islands.

⁴Data given for the Fox Islands that are compared to Kenyon's (1969) data apparently contain a subset of the total for Fox Islands; therefore, numbers comparable to Kenyon are not the same as those compared to 2000 data.

Key:

NG = not given
 NS = not surveyed
 NA = not applicable

Notes:

Some numbers provided on web site are given as “counts or estimates”. Some, but not all, of these same numbers are given in other documents as “original estimates”. Some numbers provided as “unadjusted estimates” are given as “number recorded” in the text of the originating document.

Survey Type:

¹ Summer boat survey; Included eastern and western Cook Inlet

² Aerial fixed-wing survey.

³ Helicopter survey of shoreline.

⁴ Aerial survey using strip transect method (Bodkin and Udevitz, 1995) to sample high and low sea otter density habitat.

⁵ Area surveyed from Unimak Island to Pavlof Bay and shoreline of Pavlof and Shumagin Islands. In 2001, FWS reported they used the “same study design” (see source d above).

⁶ Aerial survey of area from Seal Cape to Cape Douglas

⁷ Aerial fixed-wing twin engine survey of offshore areas from False Area to Pavlov Bay.

⁸ Aerial fixed-wing twin-engine survey (includes Sanak, Caton, and Deer Islands and the Shumagin and Pavlov island groups).

⁹ = Fixed-wing twin-engine aircraft survey.

¹⁰ = Fixed-wing twin-engine aircraft survey.

¹¹ = Aerial fixed-wing shoreline survey; Includes Near, Rat, Andreanof, Delarof, Four Mountain and Fox Island Groups.

**Table III.C-13
Community Description – Cook Inlet Area, Alaska**

Community	Culture/Economy
Upper Cook Inlet	
Tyonek	Tyonek is a Dena'ina Indian village practicing a subsistence lifestyle using salmon, moose, beluga whales, and waterfowl. Approximately 20 residents hold commercial fishing permits. Recreational fishing and hunting guiding are new economic activities. Some residents trap during winter.
Central Kenai Peninsula	
Clam Gulch	Clam Gulch is a geographic location with a lodge and post office serving the primarily non-Native population. Approximately 29 residents hold commercial fishing permits. The Kenai area economy provides a variety of employment opportunities to residents.
Cohoe	Cohoe is a geographic location. The Kenai area economy provides a variety of employment opportunities to residents.
Kalifornski	A geographic location with mostly non-Native residents. Kalifornsky Beach Road is well traveled by Kenai River sport fishing enthusiasts. The Kenai area economy provides a variety of employment opportunities to residents.
Kasilof	A geographic location with mostly non-Native residents. The Kenai area economy provides a variety of employment opportunities to residents.
Kenai	The Kenai River is a major sport-fishing location for Anchorage residents and tourists. The river is world renowned for trophy king and silver salmon. The City is the center of the oil and gas industry, providing services and supplies for Cook Inlet's oil drilling and exploration. Tourism is estimated as a \$95 million per year industry on the Kenai Peninsula. Other important economic sectors include sport, subsistence, and commercial fishing; fish processing; timber and lumber production; agriculture; transportation services; construction; and retail trade. Approximately 234 area residents hold commercial fishing permits. In 2000, the estimated gross fishing earnings of residents neared \$2.7 million.
Nikiski	Nikiski is the site of a Tesoro Alaska oil refinery, where Cook Inlet and some North Slope crude oil is processed into jet fuel, gasoline, and diesel. Agrium, Inc. employs 500 residents at its fertilizer plant, producing 1 million tons of urea and 600,000 tons of ammonia annually. Timber, commercial and sport fishing, government, retail businesses, and tourism-related services also provide employment. Approximately 56 residents hold commercial fishing permits.
Ridgewood	A geographic location with mostly non-Native residents. The Kenai area economy provides a variety of employment opportunities to residents.
Salamatof	A portion of the Salamatof population is a traditional Native village. Salamatof is attempting to develop a lake resort area.
Soldotna	The Kenai area economy provides a variety of employment opportunities to residents. Approximately 173 area residents hold commercial fishing permits. Soldotna is the site of the Central Peninsula General Hospital, the Kenai Peninsula Community College, the State Troopers' headquarters, the Kenai National Wildlife Refuge, and the Borough and School District offices.
Sterling	The community caters to the sport-fishing industry and summer influx of recreational enthusiasts. Approximately 16 residents hold commercial fishing permits. The Kenai area economy provides a variety of employment opportunities to residents.
Anchor Point	Many residents work in Homer in a variety of positions. The community caters to the sport-fishing industry, and several lodges provide services. A small sawmill helps to process timber from various Kenai Peninsula Borough sites. 80 residents hold commercial fishing permits. In 2000, the estimated gross fishing earnings of residents neared \$2 million.
Fox River	Wood, fiberglass, and aluminum boats; handbags, and canvas bags for fishermen are manufactured at Fox River. The school also provides employment
Fritz Creek	A geographic location serving the primarily non-Native population. Approximately 13 residents hold commercial fishing permits.
Halibut Cove	Halibut Cove residents include many artists. Paintings, prints, pottery and batiks are produced and sold locally. There is a local community association. The summer population grows to around 160. Approximately eight residents hold commercial fishing permits.

Table III.C-13 (continued)
Community Description – Cook Inlet Area, Alaska

Community	Culture/Economy
Happy Valley	A geographic location with mostly non-Native residents. The Kenai area economy provides a variety of employment opportunities to residents.
Homer	Homer is primarily a fishing, trade and service center, and enjoys a considerable seasonal tourist industry and has a large community of artists. Approximately 10 cruise ships dock in Homer each summer. During summer months, the population swells with students and others seeking seasonal employment. Sport fishing for halibut and salmon contributes significantly to the economy. Approximately 541 area residents hold commercial fishing permits. In 2000, the estimated gross fishing earnings of residents neared \$27 million. Homer is the "Halibut Capital of the World." A sawmill processes borough timber, and Circle De Pacific Corp. is exporting wood chips from Homer to Japan.
Kachemak	Kachemak is a non-Native community with nearby Homer offering a variety of employment opportunities. There are few businesses within the City boundaries.
Nanwalek	Nanwalek is a traditional Sugpiaq village. Subsistence activities are a large part of the culture. The school, subsistence activities, and summer employment at the Port Graham cannery provide income. Approximately seven residents hold commercial fishing permits.
Nikoloevski	The community includes Russian Orthodox, Russian Old Believers (Old Right Believers) and some non-Russians, living in three distinct settlements. The Old Believers in this area lead a family-oriented, self-sufficient lifestyle. They use modern utilities, and food sources are from gardening, small livestock, fishing and hunting. Families are typically very large (8 to 12 children.) Traditional clothing is worn, Russian is the first language. Boys typically marry at age 15 or 16, while girls are married at 13 or 14. Many residents are employed in the Anchor Point and Homer areas, primarily in fishing and construction. Approximately 17 residents hold commercial fishing permits. Boat building also occurs.
Ninilchik	Ninilchik is a traditional Native village, although the majority of the population are non-Natives. There is a strong Russian Orthodox following, and an historical Church is located in Ninilchik. Subsistence activities, commercial fishing, some tourism, and timber harvests from Native lands occur in Ninilchik. The Kenai area economy provides a variety of employment opportunities to residents. Approximately 49 residents hold commercial fishing permits.
Port Graham	Port Graham is a traditional Sugpiaq village with a fishing and subsistence lifestyle. A new fish cannery and hatchery opened in 1999. The cannery provides seasonal employment for 70 Port Graham and Nanwalek residents. Red salmon fry are raised for area lakes, and pink salmon are raised for the cannery. Approximately 12 residents hold commercial fishing permits.
Seldovia	Commercial fishing and subsistence are an integral part of the local culture. Seldovia is a commercial fishing and processing center. Timber operations at Jakolof Bay and Seldovia Bay have affected the community economy. Tourism is increasing. Approximately 57 residents hold commercial fishing permits.
Southern Kenai Peninsula	
Akhiok	Akhiok is an Alutiiq (Russian-Aleut) village dependent upon fishing and subsistence activities. Public sector employment and seasonal work provide cash flow in the community. Approximately, five residents hold commercial fishing permits. Almost all of Akhiok's residents depend heavily on subsistence fishing and hunting for food supplies.
Chiniak	The school, post office and local roadhouses are the primary year-round employers. There are no stores or gas stations in Chiniak. Several residents commute to Kodiak for employment. Many work in construction, fishing, or other seasonal industries outside of the community. Two residents hold commercial fishing permits. A 27-acre low-Earth orbit launch complex, Kodiak Launch Facility, is south of Chiniak at Cape Narrow
Karluk	An Alutiiq (Russian-Aleut) village with a fishing and subsistence lifestyle. Fish processing is the primary source of livelihood. The village corporation shares ownership of a cannery with the corporations of Larsen Bay and Old Harbor, but operations have remained idle in recent years. Residents actively participate in subsistence hunting and fishing activities.

Table III.C-13 (continued)
Community Description – Cook Inlet Area, Alaska

Community	Culture/Economy
Kodiak	The local culture surrounds commercial and subsistence fishing activities. The Kodiak economy is based on fishing, seafood processing, retail services and government. The Coast Guard comprises a significant portion of the community, and there is a large seasonal population. Kodiak is primarily non-Native, and the majority of the Native population are Alutiiq. Filipinos are a large subculture in Kodiak due to their work in the canneries. Adaptability and diversification in a variety of fisheries has enabled the Kodiak economy to develop and stabilize. In 1998, Kodiak was the nation's third highest port in seafood volume and value, with 358 million pounds of seafood landed, at a value of \$79.7 million. Thirteen fish processing companies operate here year-round. Approximately 665 area residents hold commercial fishing permits.
Kodiak Station	Kodiak Station is an U.S. Coast Guard Base, housing around 2,000 military personnel and their families. However, many Coast Guard families live off base in surrounding areas.
Larsen Bay	Larsen Bay is a traditional Alutiiq settlement with a large majority of the population depending on subsistence activities. The economy of Larsen Bay is primarily based on commercial fishing and work at Kodiak Salmon Packers. Approximately 17 residents hold commercial fishing permits. There are very few year-round employment positions.
Old Harbor	Old Harbor practices its traditional Alutiiq culture. Fishing provides income to the community, and tourism is an increasing part of the economy. Approximately 32 residents hold commercial fishing permits. Residents of Kaguyak, a summer fish camp, also live in Old Harbor.
Ouzinkie	Ouzinkie is an Alutiiq (Russian-Aleut) village. The economic base is primarily commercial salmon fishing. Approximately 26 residents hold commercial fishing permits.
Port Lions	The majority of the population are Alutiiq with all residents depending to some extent on subsistence activities for food sources. The economy of Port Lions is based primarily on commercial fishing, fish processing, and tourism. Approximately 24 residents hold commercial fishing permits.
Womens Bay	Due to its close proximity to Kodiak Station, many residents are Coast Guard families with many residents employed at the station.
Upper Alaska Peninsula	
Chignik	Historically a Kaniagmuit area with Russian and Scandinavian influences, the community is presently a mixture of non-Natives, Aleuts, and Eskimos. Subsistence is important to residents' livelihoods. Approximately 16 residents hold commercial fishing permits. Two fish-processing plants operate in Chignik. Between 600 to 800 people come to Chignik to fish or work in the plants each summer.
Chignik Lagoon	Chignik Lagoon is a traditional Koniag village. Fishing is the mainstay of the economy, which is dependent on the success of the salmon fleet. The village experiences an influx of fishermen during the summer months. The population swells by 200 during the fishing season. Approximately 29 residents hold commercial-fishing permits.
Chignik Lake	Chignik Lake is a predominantly Native village. Subsistence is important. Fishing is the mainstay of Chignik Lake's economy. Many residents leave the community during summer months to fish from Chignik Lagoon or work at the fish processors at Chignik. Approximately eight residents hold commercial fishing permits.
Ivanof Bay	Ivanof Bay has traditional Unangan influences. Subsistence is an important activity. In summer, most residents leave the community to live and fish near Chignik. Two residents hold commercial fishing permits. Many trap in the winter.
Perryville	The village maintains an Unangan culture. During the summer, the majority of residents leave Perryville to fish in Chignik or Chignik Lagoon. Only a few year-round jobs are available. Some trap during the winter, and all rely heavily on subsistence food sources. Commercial fishing provides cash income. Approximately 11 residents hold commercial fishing permits.

State of Alaska, Dept. of Community and Economic Development (2002).

**Table III.C-14
Scenic Areas Identified in Kenai Peninsula Borough Coastal Plan**

Area	Characteristics
Homer	High scenic value. Views of Homer Spit and Kachemak Bay.
Cape Starichkof	Outstanding scenic values. The beach at Cape Starichkof is characterized by a 1-mile-long sand spit with Stariski Creek forming an estuary immediately behind it. Gravel beaches occur north of the spit. The bluffs around Cape Starichkof are extremely high but decrease in height toward the southern portion of the area. Upland areas are vegetated with spruce-hemlock forest. This is the only location along the eastern coast of Cook Inlet south of Kenai and north of Homer with deep-water close offshore. Offshore oil and gas leases abut the area to the west.
Chuitna	Moderate to high scenic values. The area is characterized by relatively flat, poorly drained spruce forest with many small ponds and bogs. Tide flats and associated wetlands occur at Beluga and the mouths of the larger drainages. Deep water occurs nearest to shore at Granite Point, North Foreland, and Ladd. Oil and gas fields and related developments occur offshore adjacent to the area in the upper Cook Inlet.
Kasilof River	Moderately high scenic values. The area contains a large portion of the wetlands found at the mouth of the Kasilof River. Beach grasses and other salt-tolerant plant species are found in low-lying areas. Sandy beaches occur at the river mouth. Upland areas are relatively flat and vegetated with a spruce-hemlock forest interspersed with muskeg.
Nikiski Industrial Area	Unique scenic value. This area of focus from Lower Salamatof Lake to Boulder Point includes the Kenai Peninsula Borough's existing major oil- and gas-related industrial development, marine facilities, and the coastal bluff and tide flats in Nikiska Bay. Existing industrial development at Nikiski includes an oil terminal, two petrochemical refineries, a urea plant, a liquefied natural gas plant, and support services for oil and gas exploration and development. Additional lands are designated to the north and south for expansion of energy-related industries. These additional sites are in proximity of deep water, but the bluff is somewhat higher than at the existing sites. The Foreland lakes and related drainages serve as a scenic break between the Nikiska Bay and East Forelands industrial sites.
Ninilchik/Deep Creek	High scenic value. The Ninilchik River mouth includes a wide beach area and flat low-lying areas adjacent to the river and is separated from the uplands by a vegetation-covered bluff approximately 75 feet in height. The river mouth itself has been improved to create a small boat harbor and adjacent lands on either side cleared and filled for marine-related development.
Paint River and Chenik Lake Drainage	High scenic value.
Port Graham/English Bay	Outstanding scenic value.
Seldovia Watershed	Moderate to high scenic value. Steep slopes and alpine conditions in the upper watersheds. Along the lower elevations of the Fish Creek watershed, water-saturated alluvium, glacial drift deposits, and peaty soils form a thin mantle over the bedrock, and the stream gradient is gentle. Vegetation is characterized by spruce-hemlock forest interspersed with muskeg and bogs.

**Table III.C-16
Cook Inlet Shipwrecks**

Vessel	Vessel Type	Date	Where Lost	Cause of Wreck
<i>Washington</i>	Bark	1/1/1871	At Kasilof, Cook Inlet	On voyage to catch and salt fish, vessel was blown ashore and lost. Capt. Slocum and men built a large whaleboat from her timbers and continued fishing. They acquired a cargo of fish that was taken to market by a hired craft.
<i>Corea</i>	Bark	4/23/1890	Sandbar 6 miles south of Kalgin Island, Cook Inlet	Stranded in heavy weather and strong tide.
<i>Elizabeth Mary</i>	Steamer wood	10/18/1892	In Cook Inlet	Stranded in gale and heavy seas.
<i>Alice</i>	Schooner	7/10/1894	Anchor Point, Cook Inlet	Parted hawser, drifted ashore, and stranded in moderate seas.
<i>Anita</i>	Steamer	1/1/1898	Cook Inlet	Lost.
<i>Alton</i>	Schooner	5/27/1898	At the mouth of Cook Inlet	Lost in gale near mouth of inlet.
Unnamed	Sloop	9/1/1898	Near Sunrise City, Turnagain Arm, Cook Inlet	Heavily loaded passenger and freight vessel was caught in tidal bore and swamped. Vessel and nine men (including seven Copper River prospectors) were lost near Sunrise City on Turnagain Arm. Captain's dog was the only survivor.
<i>Emma and Louisa</i>	Schooner	10/12/1900	1/8 mile from Hope City, Cook Inlet	Grounded at ebb tide, and broke in two when tide went out.
<i>Farallon</i>	Steamer wood	1/5/1910	Black Reef, north entrance of Iliamna Bay, Cook Inlet	Went aground and wrecked in snowstorm. Everyone escaped to shore in six lifeboats and were rescued by steamer <i>Victoria</i> .
<i>Susitna</i>	Gas boat	11/11/1915	South end of Kalgin Island, Cook Inlet	Stranded and lost.
<i>Kate Davenport</i>	Bark	1/10/1916	Anchor Point, Cook Inlet	Anchor chain parted from ice pressure, and vessel was stranded.
<i>Bydarky</i>	Coal barge	9/4/1916	Bluff Point Coal Mine, Cook Inlet	While anchored 1 mile off Bluff Point, vessel dragged both anchors to shore in storm and wind, stranded, and burned.
<i>Outline</i>	Gas screw	1/1/1920	In Cook Inlet	Lost.
<i>On Time</i>	Gas screw	1/1/1920	In Cook Inlet	Stranded and lost.
<i>Tinea</i>	Gas screw	7/1/1920	In Cook Inlet	Lost.
<i>Agram</i>	Gas cannery tender	10/12/1923	On beach between Chenik Bay and Amakeddori Village, Cook Inlet	Caught in one of Cook Inlet's worst storms and was swept ashore when her gas engine broke down. Crew and passengers reached the rocky north shore of the inlet and lived on clams and porcupines until they were rescued by the halibut boat <i>Jugo-Slav</i> .
<i>Bolcom No. 8</i>	Scow	1/1/1924	At Bluff Point, Cook Inlet	Stranded and lost.
<i>Olaf</i>	Gas screw	7/12/1924	5 miles north of Kenai River	Vessel foundered in Cook Inlet while taking salmon from Salmato fish trap to cannery at Kenai.
<i>P.G. No. 4</i>	Scow	8/1/1924	In Cook Inlet	Stranded and lost.
<i>Acushla</i>	Gas screw	9/1/1927	In Cook Inlet	Burned.
<i>Minneapolis</i>	Gas screw, one-masted	10/16/1927	in Cook Inlet, near Halibut Cove	Vessel sank in northwestern gale.
<i>Delaware</i>	Gas screw	6/14/1931	12 miles north of the Barren Islands, entrance to Cook Inlet	Struck submerged object and sank quickly. Wreckage went ashore at Kamishak Bay.
<i>Libby, McNeill, and Libby</i>	Scow	8/3/1932	Salamatof Beach, Cook Inlet	Vessel was anchored near the Salamatof fish trap when a heavy southwest gale sprang up, broke its moorings, and caused the vessel to

Table III.C-16 (continued)
Cook Inlet Shipwrecks

Vessel	Vessel Type	Date	Where Lost	Cause of Wreck
<i>No. 9</i>				go on the beach where it was pounded to pieces.
<i>Discoverer</i>	Diesel screw	12/23/1932	At Ninilchik, Cook Inlet	Foundered.
<i>Kenai I</i>	Diesel screw	8/3/1948	At mouth of Kasilof River, Cook Inlet	Burned.
<i>Agate</i>	Gas Screw	7/12/1951	In Cook Inlet	Foundered.
<i>Thor</i>	Diesel fishing tender	7/10/1952	in Cook Inlet, off Oil Bay	Struck a reef and sank. Five-man crew rescued by F/V <i>Alice</i> and taken to Snug Harbor where a military aircraft flew them to Seldovia.
<i>Maggie</i>	Gas screw	5/26/1953	Near Anchor Point, Cook Inlet	Burned.
<i>Ferry Queen</i>	Scow	10/7/1953	At Iliamna Bay, Cook Inlet	Foundered.
<i>Winabob</i>	Diesel screw	7/10/1954	Southwest of Kalgin Island, Cook Inlet	Foundered.
<i>Donna Lee</i>	Gas screw	7/16/1954	Off Kalgin Island, Cook Inlet	Foundered.
<i>Lucky Boy</i>	Gas screw	7/22/1955	On beach, northeast end of Kalgin Island, Cook Inlet	Stranded and lost.
<i>Parks No. 2</i>	Gas screw	8/27/1955	At Harriet Point, in Cook Inlet	Foundered.
<i>A.S.P. No. 7</i>	Scow steel	5/22/1958	Approximately 20 miles north of Seldovia, in Cook Inlet	Foundered.
<i>Uncle Sam</i>	Diesel screw	7/14/1958	At the north end of Kalgin Island, Cook Inlet	Foundered
<i>Porifico No. 1</i>	Gas screw	8/5/1959	At Ninilchik, Cook Inlet	Burned
<i>Lew-Al</i>	Oil screw	12/16/1959	Lower Cook Inlet	Stranded and lost
<i>Peggy Foss</i>	Tug	11/24/1961	Anchor Point, Cook Inlet	Destroyed by ice
<i>Ketovia</i>	Crabber	11/20/1962	In Cook Inlet, near Kalgin Island	The captain had lost his crab pots for the season because of Soviet trawlers; vessel engaged in seismic oil exploration to make some money. While in this employ, 50 pounds of ammonium nitrate exploded, killing two crewmen, and the crabber burned and sank.
<i>Sandra</i>	Gas screw	7/11/1963	Off Kalgin Island, Cook Inlet	Stranded and lost
<i>Dynamite Kid</i>	Oil screw	5/4/1964	16 miles off Pt. Pogibshi, Cook Inlet	Foundered
<i>Virginia</i>	Gas screw	7/10/1964	In Cook Inlet	Foundered
<i>Rea</i>	Gas screw	5/2/1965	In Sukoi Bay, north of Cape Douglas, west side of Cook Inlet	Collided with an unidentified object and sank
<i>Polly</i>	Gas screw	6/27/1965	About 5 miles north of Anchor Point, Cook Inlet	Foundered
<i>Craig Foss</i>	Diesel tug	11/7/1965	Mid-channel in Cook Inlet, 17 miles north of Kenai	Capsized and sank in mid-channel of Cook Inlet after the tug became fouled with an anchor cable of the pipelaying barge it was towing. The tug heeled over and went down. All 10 crew members were rescued by nearby workboats. Originally called the <i>U.S. Army Maj. General Henry James</i> .
<i>North Cape</i>	Barge	11/1/1966	In Cook Inlet, near Anchorage	Sunk by a tidal wave.
<i>Kandu</i>	Marine survey vessel	12/1/1966	in Cook Inlet, north of Homer	Swamped and foundered in 10-foot seas; three lost. Formerly the USCG buoy tender <i>Rhododendron</i> .

Table III.C-16 (continued)
Cook Inlet Shipwrecks

Vessel	Vessel Type	Date	Where Lost	Cause of Wreck
<i>South Wind</i>	Tug	5/6/1967	In Cook Inlet	Struck mooring line of a barge it was approaching and capsized. 3-man crew rescued by USCG buoy tender <i>Sorrell</i> .
<i>M.P.E. 110</i>	Diesel screw	4/12/1968	Off Cook Inlet	Foundered.
<i>Babs</i>	Oil screw	9/16/1968	In Cook Inlet, near Anchorage	Foundered.
<i>Yukon</i>	Tanker	3/1/1969	In Cook Inlet	Struck an underwater object and ruptured four fuel tanks while outbound with 200,000 gallons of crude oil; some oil escaped before the rest was discharged at the Drift River Terminal. Went to Portland for repairs.
<i>Skilak</i>	Oil screw	8/26/1969	Between Chinitna Point and Anchor Point in Cook Inlet	Foundered.
<i>Pete Tide</i>	Oil rig supply boat	1/10/1970	Middle Ground Shoal, Cook Inlet	Collided with oil platform on Middle Ground Shoal, capsized, and sank; swept onto Middle Ground Shoal by incoming tide. Two ice pans later ran over the hull and sank it on January 15; all five aboard made it to safety.
<i>Kevalaska</i>	Barge	1/1/1971	In Cook Inlet, south of Anchorage	While southbound from Anchorage in tow of the tug <i>Daphne</i> , vessel collided with Japanese motor vessel <i>Shoyo Maru No. 5</i> ; towed to Seattle for repairs.
<i>Mr. George</i>	Oil screw	7/20/1973	In Cook Inlet	Stranded and lost
<i>Suzanna II</i>	Oil screw	2/4/1974	In Kachemack Bay, Cook Inlet	Foundered
<i>Anna Lee</i>	Barge	5/12/1974	In Kennedy Entrance, 60 miles from Homer	Foundered in rough seas. The tug <i>Knik Wind</i> also being transported to Alaska on the <i>Anna Lee</i> went overboard and sank. The tug was salvaged, but all other cargo was lost.
<i>David E. Day</i>	Tanker	5/23/1974	In Cook Inlet	Fire in motor room disabled main propulsion engine.
<i>Unnamed</i>	Small boat	5/26/1974	In Cook Inlet	Capsized.
<i>Tokyo Arctic</i>	Tanker	7/3/1974	Nikiski dock, Cook Inlet	Malfunctioning bow thruster caused vessel to ram the dock.
<i>Unnamed</i>	River boat	7/20/1974	5 miles past Pt. McKenzie, Cook Inlet	Sank; cause unknown.
<i>SS Galveston</i>	Freighter	7/22/1974	At Port of Anchorage city dock, Cook Inlet	Rammed dock, damaging the pier.
<i>Unnamed</i>	Small boat	9/14/1974	Near Beluga River, Cook Inlet	Sank; cause unknown; two lost.
<i>Unnamed</i>	Cabin cruiser	10/13/1974	8.5 miles west of Fire Island, Cook Inlet	Vessel foundered from lost anchorage due to a clogged gas line.
<i>David Foss</i>	Tug	1/11/1975	Near Cape Kasilof, 20 miles south of Kenai, AK, Kenai Peninsula, Cook Inlet	Vessel sank in 60 feet of water after taking on water in stern while tending an oil rig 4 miles off Kasilof in icy conditions. Six crew members escaped. Tug was not salvaged.
<i>Kevalaska</i>	Barge	5/25/1975	Near Seldovia, Cook Inlet	Capsized.
<i>George W. Ferris</i>	Offshore drilling platform	5/5/1976	In Kachemak Bay, 3 miles from shore	Sank when all four jack-up legs stuck in the mud when rig was being moved to a wellsite in west Cook Inlet; later the legs were blasted free and the rig towed south. NOAA says rig is still at 60-19-38 N, 151-27-00 W.
<i>Unnamed</i>	Small boat	9/28/1976	In Chinitna Bay, across Cook Inlet from Homer	One of 2 boats, carrying 14 clam diggers, swamped; 1 lost.
<i>Unnamed</i>	Small boat	9/28/1976	In Chinitna Bay, across Cook Inlet from	One of 2 boats, carrying 14 clam diggers, swamped; 1 lost.

Table III.C-16 (continued)
Cook Inlet Shipwrecks

Vessel	Vessel Type	Date	Where Lost	Cause of Wreck
			Homer	
<i>Sealift Pacific</i>	US Navy fuel tanker	10/5/1976	3.5 miles north of Nikiski, east side of Cook Inlet	Grounded and 3,100 to 7,200 barrels of oil leaked into the inlet.
<i>Winterwind</i>	F/V	8/7/1981	10 miles off Clam Gulch, Cook Inlet	Began to take on water, floated into tow line of barge and then sank after being run over by the barge.
<i>Norwegian Wood</i>	Crabber	11/29/1981	45 miles southwest of Homer, Cook Inlet	Capsized and sank; cause unknown; one lost.
<i>Miserable Skunk</i>	Cabin cruiser	7/3/1982	5 miles east of Homer, Kachemak Bay, Cook Inlet	Crab pot motor quit while pot was in mid-transport and vessel capsized; two lost.
<i>Unnamed</i>	River boat	9/28/1982	1 mile north of Anchor Point, Cook Inlet	Vessel lost with four aboard.
<i>Unnamed</i>	Fiberglass skiff	7/6/1985	3/4 of a mile west of Ninilchik, Cook Inlet	Anchor snagged in choppy water as tide rose and vessel capsized; four lost. Boat was later salvaged.
<i>Mari-Jana</i>	F/V	7/26/1985	6 miles out in Cook Inlet, off the mouth of the Kenai River	Vessel sank after a wave swamped the boat's stern.
<i>Unnamed</i>	Skiff	7/25/1986	Near Point MacKenzie, Cook Inlet	Boat swamped in strong wind and a changing tide, and two were lost.
<i>Night Owl</i>	Gillnetter	8/12/1986	In Cook Inlet	Vessel sank after taking on water; the three crewmen were rescued by USCG helicopter.
<i>Unnamed</i>	Jonboat	6/6/1987	In Cook Inlet between mouth of Susitna River and Ship Creek	Sank in 8-foot swells. Of the 4 on board, only 2 could be saved by another group of passing sport fishermen.
<i>Sea Turtle</i>	Houseboat	6/29/1987	In western Cook Inlet	Sank while on a trip to western shore of Cook Inlet. Body of Willfried Stache, 52, and a few pieces of debris from the vessel were found on the beach at Dry Bay, 30 miles east of Iliamna, by a family beachcombing. Stache had intended to truck his houseboat up a haul road to his home in Nondalton on Lake Iliamna. Body of Rodney Lauanders, the other man on board the <i>Sea Turtle</i> , was never found.
<i>Kitty Wake</i>	Gillnetter	7/3/1988	In Cook Inlet	Burned
<i>Yermon</i>	Gillnetter	8/1/1988	12 miles west of Ninilchik, Cook Inlet	Sank; two lost. All that was found were two hats floating in the water.
<i>Alaska Constructor</i>	Supply barge	11/2/1988	100 yards offshore of Trading Bay, Cook Inlet	Supply barge loaded with gas and diesel exploded; three of the four on board were killed. The burned barge was later blown up and sunk.
<i>Liberty</i>	F/V	4/28/1989	In Cook Inlet	Sank; four lost.
<i>Legend</i>	F/V	4/28/1989	In lower Cook Inlet	Capsized; three lost.
<i>Midnight Sun</i>	F/V	7/22/1989	In Cook Inlet	Sank; all saved.
<i>Lorna B</i>	Tug	8/19/1989	In Cook Inlet, 9 miles south of Tyonek; 400-600 yards northeast of the Steelhead platform in 235 feet of water.	Capsized while helping anchor a barge next to the Steelhead oil and gas platform. All 11 crewmen escaped. Initially leaked about 500 gallons of fuel.
<i>Coho</i>	F/V	6/7/1990	In Cook Inlet	Capsized in heavy seas while loaded and foundered.
<i>Debby Joann</i>	F/V	7/7/1990	In Cook Inlet	Vessel sank in five fathoms.
<i>Gladis M</i>	F/V	6/12/1993	In Cook Inlet	Flooded and sank; four rescued.

Table III.C-16 (continued)
Cook Inlet Shipwrecks

Vessel	Vessel Type	Date	Where Lost	Cause of Wreck
<i>Overseas Washington</i>	Oil tanker	2/17/1994	Near Nikiski, Cook Inlet	Boat lost power when a water pump lost power and shut down. Pump fed water to a boiler that turned a turbine. The crew started a backup pump and dropped anchor as a precaution.
<i>Spirit</i>	Longliner	9/14/1994	Perl Island, at the mouth of Cook Inlet.	Vessel took on water in a storm and submerged; the five crewmen abandoned ship and were picked up from a life raft by the USCG cutter <i>Roanoke</i> .
<i>Oregon</i>	Crowley Barge	1/25/1997	In Cook Inlet, six miles west of Ninilchik	Took on water after tug <i>Sea Valor</i> punched a hole in the Oregon's ballast tank; barge overturned, spilling 12,500 tons of urea fertilizer. There were also 1,600 gallons of fuel on board. The barge was towed to Kachemak Bay. After attempts to right the barge failed, it was eventually towed south in an overturned position.
<i>Machinator</i>	Seiner	6/10/1999	Near Kenai River entrance, east side of Cook Inlet	Fire in the engine room; vessel saved.
<i>Irene</i>	Charter boat	7/8/1999	Near entrance of Cook Inlet; 8 miles south of Flat Island	Took on water and sank; USCG helicopters hoisted the 8 aboard to safety.

Table IV.B-1
Types of Regulated Pollutants

Pollutant	Description
Conventional Pollutants	Conventional pollutants are contained in the sanitary wastes of households, commercial establishments, and industries. These wastes include human wastes, sand, leaves, trash, ground-up food from sink disposals, and laundry and bath wastes. Five specific pollutants are considered conventional pollutants, as listed below.
Biochemical Oxygen Demand	This parameter measures the quantity of oxygen used in aerobic oxidation of the organic matter in a sample of wastewater.
Total Suspended Solids	This parameter is a measure of the concentration of solid particles suspended in wastewater.
Fecal Coliform	The bacteriological quality of water is based on testing for nonpathogenic indicator organisms, principally the coliform group. Fecal coliform bacteria are used as a measure of health risk because they are more easily detected and pathogens. Fecal coliform bacteria are found in the digestive tracts of humans and animals. Their presence in water indicates the potential presence of pathogenic organisms.
pH	pH is a measure of acidity or alkalinity. pH is measured on a scale of 1 to 14:1 being extremely acidic, 7 neutral, and 14 extremely alkaline. Most healthy surface waters have nearly neutral pH; i.e., they are neither strongly acidic nor alkaline.
Oil and Grease	This parameter is a measure of the concentration of a variety of organic substances including hydrocarbons, fats, oils, waxes, and high-molecular fatty acids. These pollutants degrade receiving-water quality when present in excessive amounts. They also are a concern to municipal and industrial waste treatment because they reduce the biological treatability of the waste and produce sludge solids that are difficult to process.
Toxic Pollutants	Toxic pollutants represent a list of 126 pollutants that are particularly harmful to one or more forms of animal or plant life. They are primarily grouped into organics and metals.
Organic Pollutants	These pollutants include pesticides, solvents, polychlorinated biphenyls (PCB's), and dioxins.
Metals	The metals of concern include lead, silver, mercury, copper, chromium, zinc, nickel, and cadmium.
Nonconventional Pollutants	Non-conventional pollutants are any additional substances that are not in the grouping "conventional" or "toxic" that may require regulation. These include nutrients such as nitrogen and phosphorus.

— = not measured

BOD = Biological Oxygen Demand

Sources:

Tables III.A-2, III.A-3, III.A-4, III.A-19, and III.A-20 and Section IV.B.1.a of this EIS.

¹Calculated from BOD/oil and grease ratio for State of Alaska offshore.

²() indicates not expected to be discharged; therefore, they are not included in total.

**Table IV.B-5
Summary of Petroleum Production Adverse Impacts to Essential Fish Habitat**

Threat	Production Facility	Exploration	Oil Spill
Habitat Alteration			
Alteration of Original or Normal Habitat	X	X	X
Loss of Offshore Habitat	X	X	X
Pelagic Habitat Loss			
Loss of Nearshore Habitat	X	X	X
Loss of Benthic Habitat	X	X	X
Loss of Aquatic Vegetation	X	X	X
Loss of Wetland Value	X	X	X
Loss of Original Sediment Type	X	—	X
Detrital Matter Introduction	X	—	X
Topographic Alteration			
Change of Original Feature or Structure	X	X	—
Accretion/Overburden of Original Feature	X	X	—
Erosion/Dispersal of Feature	X	X	—
Organism Alteration			
Physical Damage to Organism	—	X	X
Mortality	X	X	X
Special Alteration	X	—	—
Gene Pool Deterioration	—	—	X
Introduction of Exotic Species	—	—	—
Introduction of Pathogens/Disease	X	X	X
Change in Photosynthetic Regime	X	X	X
Oceanographic Alteration			
Change in Temperature Regime	X	—	—
Change in Salinity	X	—	—
Change in Circulation Pattern	X	X	—
Water Quality Alteration			
Change in Dissolved Oxygen Content	—	—	X

USDOI, MMS (2002); Reedy et al. (2000).

**Table IV.F-3
General Mass Balance of Oil from a 120,000-Barrel Open Water Winter or Summer Spill**

Day¹	Oil Remaining on Water (bbl)	Evaporated (bbl)	Dispersed (bbl)	Sedimented (bbl)	Onshore (bbl)
0	90,000	30,000	—	—	—
3	54,000	34,000	11,000	700	14,400
10	32,000	38,000	25,000	1,800	17,000
30	Negligible	42,000	53,000	2,800	24,000

Notes:

Based on a 120,000-barrel spill size with 25% evaporated during the blowout. Assumes Cook Inlet crude, constant wind speed of 10 to 16 knots, and water temperature 5 to 8 °C.

¹ We assume day 0 is 15 days after the start of the spill, when 90,000 barrels of oil is in the water.

Key:

— = not occurring

bbl = barrels

Source:

USDOJ, MMS, Alaska OCS Region (2002); Calculated with the Reedy et al. (2000) weathering model assuming Cook Inlet Crude. Cook Inlet Crude analysis taken from S.L. Ross Environmental Research Ltd. (2000).

Table IV.F-4
Areas of Discontinuous and Thick Slicks from a 120,000-Barrel Open-Water Spill

Days after Spill Reaches Water Surface¹	Discontinuous Slick Area (km²)¹	Area of Thick Slick (km²)²
3	70	—
10	1,400	—
30	5,800	—
60	14,000	—

Notes:

¹Calculated from Ford (1985) and Kirstein and Redding (1987).

² Based on ocean-ice weathering model of Kirstein and Redding (1987).

Key:

— = area of thick slick not known

km² = square kilometers

Source:

USDOI, MMS, Alaska OCS Region (2002).

Table IV.F-5

Length of Coastline a 120,000-Barrel Spill Might Contact Without Oil-Spill Response

Days	Amount of Coastline Contacted in Kilometers ¹	
	Winter Open Water	Summer Open Water
3	345	277
10	505	399
30	568	430

Note:

¹Calculated from oil-spill-risk analysis conditional probabilities. We add the length of land segments with chance of contact greater than 0.5% to estimate the amount of coastline contacted. This calculation assumes no oil-spill response and includes land segments that have a very small chance of contact.

Source:

USDOI, MMS, Alaska OCS Region (2002)

Table IV.F-6
General Mass Balance of Oil from a 120,000-Barrel Broken Ice or Winter Spill

Day ¹	Oil Remaining on Water (bbl)	Evaporated (bbl)	Dispersed (bbl)	Sedimented (bbl)	Onshore (bbl)
0	90,000	30,000 ²	—	—	—
3	67,000	34,000	3,500	700	14,400
10	55,000	40,000	6,000	1,800	17,000
30	36,000	48,000	10,000	2,800	24,000

Notes:

Based on a 120,000-barrel spill size with 25% evaporated during the blowout. Assumes Cook Inlet crude, constant wind speed of 16 knots, and water temperature 5 °C.

¹ We assume day 0 is 15 days after the start of the spill, when 90,000 barrels of oil is in the water.

² Evaporation on day 0 attributable to evaporation during blowout or pooling between or on ice surface.

Key:

bbl = barrel

— = not occurring

Source:

USDOJ, MMS, Alaska OCS Region (2002); Calculated with the Reedy et al. (2000) weathering model assuming an Cook Inlet Crude. Cook Inlet Crude analysis taken from S.L. Ross Environmental Research Ltd. (2000).

Notes:

¹Kenai Mainline pipeline: Segments placed into service in various years beginning in 1961. Latest initial pipeline pressure test occurred in 1978.

²Year of Enstar pressure test and operational assumption

³Roughly estimated, there are 486 route miles for all gas pipelines off shore and on shore in the Cook Inlet region. Considering dual pipelines actual pipe length is approximately 598 miles. These figures do not include gathering and connection pipelines that are internal to a field. Pipeline mileage calculated only for those systems represented on Map 18.

⁴Pipeline not in use

Key:

CIGGS = Cook Inlet Gas Gathering System

Robertson (2000); USDO, MMS, Alaska OCS Region.

**Table V-6
Trans-Alaska Pipeline System and Future Natural Gas Projects**

Name	Estimated Pipeline Length (miles)	Project Description and Route
Active Project		
Trans-Alaska Pipeline (TAPS)	800	TAPS is the key transportation link for all North Slope oil fields. It has been in operation since 1977 and to date has carried nearly 13 billion barrels of oil. Approximately 16.3 square miles are contained in the pipeline corridor that runs between Prudhoe Bay and Valdez. The Dalton Highway (or Haul Road) was constructed parallel to the pipeline between Prudhoe Bay and Fairbanks. The pipeline design capacity is 2 million barrels per day, and it reached near-peak capacity in 1988. Presently, TAPS is running at about 1.0 million barrels per day. The lower operational limit is generally thought to be between 200,000 and 400,000 barrels per day. If oil production from northern Alaska cannot be sustained above this minimum rate, the TAPS system will become nonoperational, and all oil production is likely to be shut in.
Future Natural Gas Projects		
Trans-Alaska Gas System (TAGS)	800	The TAGS plan consists of a gas-conditioning plant on the North Slope; an 800-mile, 42-inch pipeline; a liquefied natural gas (LNG) plant and marine terminal at Valdez; and a fleet of new LNG carriers. LNG would be transported to Japan and other Pacific Rim countries. The Yukon Pacific Corporation has obtained permits for construction of TAGS and export of Alaska North Slope gas to Asia. The LNG facility and marine terminal in Valdez has received the Final EIS prepared by the Federal Energy Regulatory Commission. Yukon Pacific believes the large scale of the project (2.05 billion cubic feet per day to yield 14 million metric tons of LNG annually) will make this project competitive with other new LNG projects. The project is currently stalled by the lack of commitments from the North Slope gas producers, delivery contracts to Asian buyers, and high construction costs.
Alaska Natural Gas Transportation System (ANGTS) ¹	2,102	The ANGTS plan is a pipeline system connecting Alaska North Slope gas production through Canada to the lower 48 states. The new pipeline would run parallel to TAPS from the North Slope to interior Alaska and then cross the Yukon Territory to connect to existing pipelines in Alberta. The primary market would be a consumer in the U.S. Numerous permits, rights-of-way, and approvals have been obtained for the proposed pipeline route through Alaska and Canada. Downward revisions to construction costs and the increase in gas prices to the \$3-\$4 per million-cubic-foot range make this project more appealing today. Currently, several variations to routes are being considered for the overland gas pipeline system.

Table V-6 (continued)
Trans-Alaska Pipeline Systems and Future Natural Gas Projects

Name	Estimated Pipeline Length (miles)	Project Description and Route
Arctic Resources, Northern Gas Pipeline Project	326 offshore 874 onshore	The ARC project involves a 52-inch, high-pressure gas pipeline running offshore from Prudhoe Bay in Alaska to the Mackenzie delta in the Northwest Territory and then south through the Mackenzie River Valley to the existing gas pipeline network in northern Alberta. The 326-mile offshore portion would be trenched in 30-60 feet of water. The 874-mile onshore portion would also be buried. It is expected to deliver 2.5 billion cubic feet per day to markets primarily in the U.S. The project would involve a consortium of gas producers, pipeline companies, and Native corporations in both Alaska and Canada. Commitments of gas producers and gas buyers have not yet been obtained nor have right-of-way permits been issued.
Natural Gas to Liquids Conversion ²	Will use existing TAPS Pipeline	Atlantic Richfield Co. (ARCO) and Syntroleum Corp constructed a pilot-scale, natural gas to liquids (GTL) conversion facility in Puget Sound, Washington. More recently, BP-Amoco has begun design work on a GTL pilot project on the Kenai Peninsula in Alaska. As a result of the BP-Amoco-ARCO merger, BP-Amoco now holds an equal interest in the gas reserves in the Prudhoe Bay field. All of the major North Slope gas owners (BP-Amoco, Exxon-Mobil, and Phillips-Alaska) are studying the feasibility of various gas commercialization projects. GTL is an attractive option because it will use the existing TAPS pipeline (extending its life and lowering future tariffs) and produce clean-burning fuels to meet more stringent Environmental Protection Agency emission standards for vehicles. At the present time, the overall cost of a full-scale gas to liquids project is comparable to a similar-sized LNG project. As an emerging technology, new cost-reduction breakthroughs are expected for gas to liquids processing, improving the economic potential for future gas to liquid projects.

**Table V-7
Future Cook Inlet Lease Sales**

Sale	Proposed Sale Date(s)	Area/Description	Resources or Hydrocarbon Potential
Federal OCS			
5-Year Program – Cook Inlet Sales 191 and 199	May 2004, May 2006	The area consists of approximately 2.5 million acres. The area included only the Cook Inlet portion of the Cook Inlet/Shelikof Strait Planning Area (Federal Register, 2001c).	0.28 to 0.34 Billion barrels of oil and 0.38 to 0.58 trillion cubic feet of gas
State of Alaska			
Cook Inlet Basin	May 2002, May 2003, May 2004, May 2005, May 2006	The areawide sale will include uplands in the Matanuska and Susitna Valleys, the Anchorage Bowl, the western shore of Cook Inlet from the Beluga River to Harriet Point. The total proposed area is about 4.2 million acres.	Moderate to High
CIRI			
Cook Inlet Basin	—	As a result of its ANCSA land selections under the Alaska Native Claims Settlement Act, CIRI is the largest private landowner in Southcentral Alaska. CIRI promotes and actively encourages environmentally sensitive exploration of its properties by oil and gas and mining companies.	—

Key:

Table V-12

Present Major Projects Considered in the Cumulative Effects Assessment

Project Name	General Location	Resource Estimates	Infrastructure	Annual Production	Status and Comments
Ivan River, Lewis River, Pretty Creek, and Stumpy Lake Units	Located onshore along the north shore of Cook Inlet west of Susitna River	Gas reserves of 20 bcf	NA	3.79 bcf gas	Ivan River, Pretty Creek, and Stumpy River are in production. Produced gas is delivered to the Beluga Power Plant or pumped to Anchorage via the Enstar Pipeline.
Beluga River Unit	Located along the north coast of Cook Inlet just west of the Beluga River	Gas reserves of 600 bcf	Site of the Beluga electric power plant	35.98 bcf gas	Produced gas is burned for electricity.
Cannary Loop Oil Field	Kenai Peninsula	Gas reserves of 20 bcf	—	88.61 bcf gas	Production transported to Nikiski.
North Cook Inlet Unit	Far northern Cook Inlet	Gas reserves of 917 bcf	Field served by a single platform	51.60 bcf gas	Produced gas is piped to Nikiski for liquefaction and transported to Japan.
Granite Point Oil Field	Upper Cook Inlet	Oil reserves of 8 MMbbl; Gas reserves of 19 bcf	Served by three platforms and a production facility.	1.78 MMbbl	Produced crude is transported via a 20-inch pipeline to the Drift River Terminal.
Trading Bay Oil and Gas Field ¹	Trading Bay in Upper Cook Inlet	Oil reserves of 3 MMbbl; gas reserves of 27 bcf	Served by three platforms	0.64 MMbbl oil, 0.42 bcf gas	Trading Bay oil is shipped out through the Drift River Terminal. Gas is pipelined to Anchorage via the Enstar system or the Beluga Power Plant.
McArthur River Oil and Gas Field	Trading Bay in Upper Cook Inlet	Oil reserves of 22 MMbbl; gas reserves of 383 bcf	Served by four platforms	4.69 MMbbl oil, 67.77 bcf gas	Produced oil is carried by pipeline to Drift River Terminal. Gas is shipped to Anchorage via the Enstar system or the Beluga Power Plant.
Middle Ground Shoal Field	Central Upper Cook Inlet off the east Forelands	Oil reserves of 8 MMbbl; gas reserves of 8 bcf	Served by four platforms and production facility	1.96 MMbbl oil	Produced oil is pipelined to Nikiski.
North Trading Bay	Upper Cook Inlet	Gas reserves of 19 bcf	Served by a single platform	11.52 bcf gas	Operated by Phillips, produced gas is transported via pipeline to Nikiski.
Redoubt Shoal ²	Kenai Peninsula south of Nikiski	Oil reserves of 100 MMbbl	Served by a single platform	Present resource est. at 100 MMbbl	Osprey offshore drill rig has drilled four wells with production expected to begin in late 2002.
Sterling	Kenai Peninsula	Gas reserves of 30 bcf	—	2.66 bcf gas	Produced gas transported to Anchorage via the Enstar gas pipeline system.

Table V-12 (continued)

Present Major Projects Considered in the Cumulative Effects Assessment

Project Name	General Location	Resource Estimates	Infrastructure	Annual Production	Status and Comments
Swanson River Unit	Kenai Peninsula	Oil reserves of 2 MMbbl; gas reserves of 108 bcf	Served by eight production wells	0.79 MMbbl oil; 2.81 bcf gas reinjected to preserve oil production	Produced oil is pipelined to Nikiski for processing at the Tesoro Refinery.
Beaver Creek Unit	Kenai Peninsula	Oil reserves of <1 MMbbl; gas reserves of 97 bcf	Served by three production wells	0.10 MMbbl oil; 1.40 bcf gas	The field's oil potential is nearly depleted. Produced crude is transported to Nikiski via tanker truck for processing and transshipment. Gas is pipelined to the Nikiski petrochemical complex.
Kenai Gas Field	Coastal Kenai Peninsula south of Kenai	Gas reserves of 225 bcf	Served by 47 production wells	9.91 bcf gas	The field's production has a variety of end users.
Drift River Oil Terminal ⁵	West shore of Cook Inlet across from Kalgin Island	NA	Storage tanks and offshore loading	Loads and stores at least 8.2 MMbbl annually	Drift river crude oil is transported to the Tesoro Nikiski refinery. 25-30 tanker trips/year issue from the terminal with an average cargo of 280,000 bbl.
Alaska North Slope Crude ⁶	—	—	—	7.3 MMbbl moved to the Tesoro Nikiski Refinery annually	North Slope crude has been shipped via tanker to Nikiski since 1986. Presently 25-30 trips/year. Any new oil production in CI will back-out these imports of North Slope Crude. CI crude is superior in quality to the present imports.
Import Tankering ⁶	Nikiski	NA	Storage tanks and offshore loading	323,000 bbl imported from Australia in 1992	Foreign crude oil is intermittently imported to the Tesoro refinery, usually one shipment per year.
Export Tankering ⁶	Nikiski to West Coast Ports	—	Storage tanks and offshore loading.	3,000 bbls/day refined product	Approximately 25% of annual production of refined product shipped to West Coast during winter months.
Agrum ammonia-urea plant	Kenai Peninsula at Nikiski	Supplied by natural gas from Cook Inlet	Most of product shipped to West Coast markets, plant employs over 300 workers.	800,000 tons urea and 1 million tons ammonia fertilizer annually	Plant has been in operation since 1968; in 1977, two additional plants were added which doubled plant capacity and employment.

Table V-12 (continued)
Present Major Projects Considered in the Cumulative Effects Assessment

Project Name	General Location	Resource Estimates	Infrastructure	Annual Production	Status and Comments
Phillips-Marathon LNG Plant ³	Community of Nikiski on the Kenai Peninsula	NA	Two liquefaction trains; capacity 200 MMcf/day; process reduces volume by factor of 632	Liquefies 1.3 metric tons of natural gas annually or about 55,000 bbls/day	Natural gas is received from the North Cook Inlet and other fields. LNG is shipped to Japan 32-36 times a year with contract sales through 2009. Joint venture of Phillips and Marathon in plant and two LNG 80,000-m ³ tankers.
Chugach National Forest ⁴	Eastern Kenai Peninsula, Prince William Sound	NA	NA	Annual average harvest from 1985-1999 is 2.0 mmbf/year	Average of 227 acres harvested annually on the Kenai Peninsula, mostly bark beetle infested. Reforestation program 22% natural seeding, 78% planting.
Anchor Point Harbor	Kenai Peninsula	NA	No existing boat harbor	NA	A small-boat harbor and dredging project is under consideration by the U.S. Army Corps of Engineers and the State.
Port of Homer	Kenai Peninsula, on Kachemak Bay	NA	Includes three deepwater piers. Two inner-harbor docks for vessels up to 120 feet.	NA	Two harbors provide protected moorage for 650 vessels up to 150 feet in length.
Port of Anchorage	Municipality of Anchorage	NA	Multiple-use dock facilities, including rail service and petroleum products storage	NA	Port moves an annual average of 3 million tons of cargo. Port routinely serves a variety of carriers including bulk carriers, tug escorted barges, passengers ships and occasional military vessels.

Reasonably Foreseeable Future – Major Projects Considered in Cumulative Effects
Assessment

Project Name	General Location	Resource Estimates	Infrastructure	Annual Production	Status and Comments
State Areawide Lease Sales 2003, 2004, 2005, 2006	Cook Inlet basin – areawide	Moderate to High	N/A	—	Includes Cook Inlet and Matanuska and Susitna Valleys. Total area about 4.2 million acres.
Tyonek Deep (Sunfish)	North Cook Inlet Unit	25 MMbbl	Unknown	N/A	Sunfish Discovery wells 1 and 2 were drilled during the fall and winter of 1992. Development may occur in the reasonably foreseeable future (15-20 years).
Starishkof Oil Field	Cosmopolitan Unit	—	—	—	Offshore structure extending into federal waters being drilled from onshore. Production expected to come online in late 2003. ¹
Natural Gas Pipeline	Kenai to Ninilchik, then to Anchor Point and eventually to Homer. ³	—	—	—	Planning stages by Kenai Peninsula Borough.
Southern Intertie Project	Kenai to Fairbanks via Anchorage	—	—	—	Electric power corridor either to go inland or along the coast of the Kenai Peninsula. Cumulative effects expected to be with wildlife and visual resources.
British Petroleum Gas-to-Liquids Test Facility	Kenai Peninsula near Nikiski	—	Construction estimated at \$86 million. Long-term employment 15-30 persons.	300 barrels of synthetic crude or “white crude” per day	Process converts natural gas to a synthetic crude oil. Scheduled to begin operation in June. Will use fuel cell technology for power that is more efficient and produces fewer emissions than standard power systems. ²
Federal Lease Sales 191 and 199	Lower Cook Inlet	—	N/A	N/A	Area consists of about 2.5 million acres in Cook Inlet and Shelikof Strait. Sales scheduled for May 2004 and May 2006.

Table V-14
Summary of Cumulative Effects by Resource Category

Resources	Summary of Effects ¹
Water Quality	<p>The permitted, routine discharges, small oil spills, or possibly a large oil spill associated with the proposed oil and gas development are not expected to cause significant degradation of Cook Inlet water quality. In addition, a large oil spill is unlikely. A very large TAPS tanker spill in Prince William Sound or inshore Gulf of Alaska could partially enter Cook Inlet. Contamination from such a spill (i.e., the presence of hydrocarbons in amounts greater than 15 parts per billion) would be not expected and, therefore, such a spill would result in oil slicks but not toxic water concentrations of hydrocarbons. Because tanker spills tend to be larger than platform or pipeline spills, backing out of an equivalent tankering by the multiple sale production of 140 million barrels of oil would result in a reduction in total amount of projected spillage of oil into the inlet over the non-sale case. The permitted, routine discharges and small oil spills associated with municipal wastewaters, seafood processing, and other oil and gas development are also not expected to cause significant degradation of Cook Inlet water quality.</p>
Air Quality	<p>The effects associated with the cumulative analysis essentially would be the same, qualitatively, as those discussed for the Proposed Action. Effects on onshore air quality from cumulative-case emissions are expected to be 20.4% of the maximum allowable PSD Class I increments. Only the Tuxedni National Wilderness Area is designated Class I, with the remaining area in and adjacent to the sale area designated Class II. Therefore, the potential effects would be much less than the percentage of the Class I increments. These effects would not make the concentrations of criteria pollutants in the onshore ambient air approach the air-quality standards. Consequently, a minimal effect on air quality with respect to standards is expected. Principally because of the distance of emissions from land, the other effects of air-pollutant concentrations at the shore from exploration, development, and production activities, or accidental emissions would not be sufficient to harm vegetation. A light, short-term coating of soot over a localized area could result from oil fires.</p>
Lower Trophic-Level Organisms	<p>The overall cumulative effect of permitted discharges and construction on lower trophic-level organisms likely would be negligible or immeasurable. Small spills and the cleanup responses to them probably would affect a few coastal habitats, including lower trophic-level organisms. In the few affected areas, populations of some intertidal organisms probably would be depressed measurably for about a year, and small amounts of oil would persist in shoreline sediments for more than a decade. An unlikely large oil spill could contaminate up to 39 kilometers of shoreline, most likely in southwestern Cook Inlet or western Shelikof Strait. In the affected area, populations of some intertidal organisms would be depressed measurably for about a year, and small amounts of oil could persist in shoreline sediments for more than a decade.</p>
Fishes	<p>The estimated effects of an unlikely large oil spill would not be measurable on at the population level. The overall cumulative effect on fisheries resources may include reduced stocks of some fisheries resources (sockeye, coho, and Chinook salmon, some semidemersal fish such as pollock, and some shellfish), primarily due to the potential for over harvest of these stocks by commercial-fishing activities. This effect could persist for several generations, or longer. The proposed Lease Sale 191 is not expected to contribute measurably to these adverse effects. While some individual fishes may be disturbed, injured, or killed, effects measurable at the population level are not likely.</p>
Essential Fish Habitat	<p>The primary cumulative effects of this lease sale are a small incremental increase in human, industrial, and commercial fishing effects of development in Cook Inlet. The input of petroleum hydrocarbons to essential fish habitats from the use of the oil (primarily as fuel) is estimated to be approximately 8 times</p>

**Table V-14 (continued)
Summary of Cumulative Effects by Resource Category**

Resources	Summary of Effects ¹
	<p>greater than the effects of producing and transporting the crude oil. Commercial fishing also removes up to 10% of the adult populations of important forage fish and bottom trawling causes an order of magnitude more damage to bottom habitats than the estimated disturbance from pipeline construction. In the unlikely event that a large oil spill occurs, the beach and intertidal fish habitats could be affected because oil could remain in these areas or prey could be impacted for more than a decade, which is three or more generations for some species, and as such a significant effect for those species. However, such habitat degradation would likely be limited to a very small proportion of habitat and the habitat of only small populations or subpopulations would be affected. The cumulative impacts of all activities also include those from both local and global human activities that contribute to global climate change. Because of the complexity of the ecosystem that constitutes essential fish habitat, there is considerable uncertainty about, the extent to which ecologically complex essential fish habitats are changed by small sublethal effects on that habitat from cumulative human development such as fishing, chronic urban contamination, numerous small fuel spills in Cook Inlet. Furthermore, both for essential fish habitat locally in Cook Inlet and globally, the cumulative effects depend in part on whether the changes occur at a crucial time period or in a critical location.</p>
Endangered Species	<p>Activities that contribute to cumulative effects include marine and terrestrial habitat contamination with harmful contaminants; habitat loss and degradation at important feeding, nursery, and other habitats due to increased noise, disturbance, and alteration related to human settlement, development, and activities such as fishing, mariculture, and tourism; human-related and other changes in the size and composition of marine fish populations; human harvest; take associated with commercial fishing; and global warming. Pollution of marine and terrestrial habitats occupied by these species occurs from many human-related sources, such as sewage inputs, petroleum hydrocarbons from sources related to oil use and oil spills, contaminants from industrial and agricultural activities, and many other sources. Cetaceans other than the Cook Inlet beluga whale have not likely been exposed to adverse effects of State oil and gas leasing in the Inlet. No serious adverse effects from this activity have been identified on beluga whales. Available data do not indicate previous OCS oil and gas related adverse effects on the cetacean stocks that could be affected by the proposed Cook Inlet Lease Sales. Sea otters in the region of the designated Southwest Alaska stock of sea otters and in other regions have previously suffered serious adverse effects from oil spills. The impacts of increased noise in the marine environment on the species at issue are mostly unknown but could potentially have adverse effects such as disruption of communication and avoidance of important habitats.</p> <p>We expect potential incremental cumulative effects attributable to the Proposed Action to be insignificant for blue whales, sperm whales, sei whales, North Pacific right whales, short-tailed albatross, American peregrine falcons, and Aleutian Canada geese. We would expect any incremental effects attributable to the proposed Cook Inlet Lease Sales to be insignificant for all of the aforementioned species, all ESA-listed and candidate cetaceans, for the eastern population stock of Steller's sea lions, for Steller's eiders, and for the southwest Alaska stock of sea otters.</p> <p>The primary potential for significant incremental contributions to cumulative adverse effects on threatened and endangered species from routine operations could result from incremental increases in noise and disturbance at key western Steller sea lion stock terrestrial and foraging critical and other habitats, that resulted in Steller sea lions avoiding important feeding habitats or to direct mortality. Any large displacement, particularly of juvenile, Steller sea lions from important foraging habitats could result in a significant cumulative adverse effect</p>

**Table V-14 (continued)
Summary of Cumulative Effects by Resource Category**

Resources	Summary of Effects ¹
	<p>on this species. Any such displacement from marine critical habitats could result in a significant adverse cumulative effect on that critical habitat. Displacement from important feeding habitats would not have to be years in duration to have a potentially significant cumulative effect, especially if juveniles were displaced. Such a cumulative effect is considered unlikely from routine operations unless Steller sea lions avoided important foraging areas due to noise or other disturbing activities that occurred within or very near their critical habitats.</p> <p>Any disturbance of the western population stock of Steller lions at their terrestrial critical habitats that resulted in mortality (for example, due to trampling) could result in a potentially significant negative adverse effect on both the western population stock of Steller sea lions and on that critical habitat. Any potential increase in mortality of Steller sea lion prey species in sea lion critical habitat that resulted in a large decrease in prey available to the western stock of Steller sea lions could result in potentially significant cumulative effect on both the stock and on the critical habitat. Such a significant effect on prey is probably possible only in the unlikely event of a large or very large oil spill that contacted critical habitat or other important feeding areas and reduced availability of Steller sea lion prey. Such a large or very large spill could also conceivable result in a significant cumulative effect if it resulted in the exposure to large amounts of fresh crude oil by Steller sea lions, particularly if it resulted in the oiling of pups.</p> <p>In the unlikely occurrence of a large or very large oil spill, the incremental impact on the Southwest Alaska population of sea otters, and less likely, on the American breeding population of Steller's eiders, could result in a significant cumulative effect on these two populations. There is a small possibility that a large oil or very large oil spill that occurred in the upper part of Cook Inlet could result in a significant cumulative effect on the Cook Inlet stock of beluga whales. However, existing data indicate that such an effect would be unlikely.</p>
Marine and Coastal Birds	<p>A major source of seabird mortality in the North Pacific, including Alaskan waters, is incidental bycatch in commercial fisheries; however, marine and coastal birds nesting in the Cook Inlet region probably have not been seriously affected by such bycatches. Introduced predators are also a serious threat to burrow-nesting seabirds on many islands in Cook Inlet. Other sources of cumulative effects on seabirds include offshore oil and gas activities, vessel and air traffic, and commercial timber harvests. The effects, including direct mortality, reduced reproductive success, and habitat loss, are relatively localized but long term. Recovery would be expected to require multiple generations and in some cases, such as with declining populations, might not occur at all. The greatest risk to seabirds in the Cook Inlet region would be from an oil spill occurring during the summer (April-September), when hundreds of thousands of birds may be present in the lower Cook Inlet and northern Shelikof Strait. Although unlikely, a large spill occurring here during the summer months could kill thousands to tens of thousands of birds. The magnitude of mortality would depend on the size, exact timing, and movement of the spill. Recovery from this level of impact could require multiple generations, and species in population decline would not be expected to recover if this situation continued, a significant cumulative effect.</p>
Nonendangered Marine Mammals	<p>The overall potential cumulative effect on nonendangered marine mammals—particularly harbor seals—is estimated to include reduced distribution and abundance persisting for more than 1 year to several years, with the primary source being competition or conflict with commercial fishing for the same food sources in the marine environment. Other sources of effect, such as air and vessel traffic and local habitat alteration, are expected to cause short-term (less than 1 hour) disturbance of harbor seals, the Southcentral Alaska Stock of sea otters, and nonendangered cetaceans and/or cause local reduction in habitat or reduced habitat use by local assemblages of seals but are not likely to affect</p>

Table V-14 (continued)
Summary of Cumulative Effects by Resource Category

Resources	Summary of Effects ¹
	marine mammal populations. The contribution of the proposal is estimated to include 7% of the oil and gas activity long-term (life of the oil field) local effects on coastal habitats.
Terrestrial Mammals	The overall cumulative effect on terrestrial mammals is expected to be reduced distribution and/or reduced abundance of brown bears and, to a lesser extent, reduced numbers of river otters and Sitka black-tailed deer from habitat degradation due commercial logging and other onshore development. Total recovery likely would take several generations. The contribution of Lease Sales 191 to the cumulative case is estimated 7% of the oil and gas activity long-term (life of the oil field) local disturbance effects on terrestrial mammal habitat. No effect on regional populations likely would occur.
Economy	The reasonably foreseeable future projects identified in our cumulative analysis would generate increases in property taxes for the Kenai Peninsula Borough of 17%. These projects would generate revenue increases to the State of Alaska of less than 1.0% above the level without reasonably foreseeable future projects. We estimate a 1.5% increase of the 1999 work force of the Kenai Peninsula Borough and a corresponding percent increase for personal income for less than 5 years during development. We estimate that approximately 160 workers would be needed to clean up a 4,000-barrel spill; 520 workers for a 13,000-barrel spill, and 10,000 workers for a 250,000-barrel spill. For any given spill, they would work for 6 months in the first year the number would decline to zero by the third year following the spill. The above effects are additive. We anticipate no countervailing or synergistic effects.
Commercial Fishing	Drilling discharges, offshore construction, and seismic surveys that have occurred to date have not had a measurable effect on the commercial fishing industry of Cook Inlet, nor are the ones planned (including proposed Lease Sale 191) likely to have a measurable effect. While sportfishing reduces the number of fish in Cook Inlet, this reduction is not likely to have had a measurable cumulative effect on the commercial fishing industry, nor is it likely to unless current allocations between the sport and commercial fishing industries change substantially. If an unlikely oil spill of 4,600 barrels or greater that occurred in the spring caused State officials to close the fishery for a whole year over tainting concerns, this action could result in a 100% loss for that year, not including losses due to damaged to boats and gear. A loss of this magnitude likely would have a significant effect on the Cook Inlet and Kodiak commercial fishing industry.
Subsistence-Harvest Patterns	Cumulative effects on subsistence-harvest patterns include effects from Lease Sale 191 exploration and development activities and other past, present, and reasonably foreseeable projects in the Cook Inlet Region. Sources that could affect subsistence resources include potential oil spills, noise and traffic disturbance, and disturbance from construction activities associated with drilling, production facilities, pipelines, and landfills. Subsistence communities in upper Cook Inlet, the central Kenai Peninsula, the lower Kenai Peninsula, Kodiak Island, and the southern Alaska Peninsula would potentially be most affected. Expected effects would be subsistence resources being affected for a period less than 1 year, with no resource becoming unavailable, becoming undesirable for use, or experiencing overall changes in distribution or reductions in population. In the unlikely event that a large oil spill occurred and contaminated essential subsistence resources and harvest areas, major additive (but not synergistic) significant effects could occur when impacts from contamination of the shoreline, food-tainting concerns, cleanup disturbance, and disruption of subsistence practices are factored together.

Table V-14 (continued)
Summary of Cumulative Effects by Resource Category

Resources	Summary of Effects ¹
	Effects would be one or more important subsistence resources becoming unavailable or undesirable for use for at least 1-2 years or longer, which would be a significant adverse effect.
Sociocultural Systems	<p>The Proposed Action as part of the past, present, and reasonably foreseeable activities, should make a small, beneficial contribution to the continuation of an important economic activity which helps to maintain the existing sociocultural systems, while having little effect on Native Alaskan sociocultural practice associated with subsistence harvest activities. Given the importance of oil and gas to the Kenai Peninsula Borough and the sizeable infrastructure from past and present development, the Proposed Action will make a small contribution to the continuation of this important activity. Given the sizeable employment in the oil and gas sector, population growth caused by the reasonably foreseeable projects may be indistinguishable from the projected baseline population growth. Disruptions in existing sectors of the economy would tend to disrupt and produce stressful relations within families and within local public institutions. The reasonably foreseeable activities help maintain important existing sectors that should moderate potential disruptions from other sources. Cumulative sociocultural effects in villages that are caused by repeated significant disruption of subsistence-harvest activity and the attendant effects on wild-food consumption and distribution as the result of oil spills would be minimal. However, in the event of a significant impact to subsistence harvest activities, we would expect commensurate significant impacts to the Native Alaskan sociocultural system. Overall, the Proposed Action should have a small, beneficial effect to the continuation of an important economic and maintenance of the existing sociocultural systems without disrupting Native Alaskan sociocultural practice associated with subsistence harvest activities.</p>
Recreation, Tourism, and Visual Resources	<p>The contribution from Alternative 1 – Proposed Action to cumulative effects on tourism, recreation, and visual resources would be minimal and result from the introduction of offshore infrastructure from exploration and development. We estimate the incremental contribution from the Proposed Action to the cumulative effects on recreation and tourism to be approximately 7%. The industrial activities associated with the reasonably foreseeable projects, including those from the Proposed Action, will have little discernable effect on the supply or demand for recreational or tourism resources, will not modify a recreational site's characteristics (including its visual setting) or accessibility, and it will not foreclose opportunities for diversification or expansion of recreational and tourism activities. Potential population growth from the projects, which could increase demand for recreation services, is very small. Coastal policies of the State of Alaska and the Kenai Peninsula Borough prevent new facilities from degrading recreation and tourism uses. New offshore structures in Cook Inlet would be widely separated from each other and would either be placed outside the visual impact area or become an added element to an existing cluster of platforms when viewed from shore. The projects will have no effect on the identified opportunities for expansion of tourism or recreation nor will they aggravate the factors that would restrain the potential expansion. The cumulative effects of oil spills to recreation and tourism activities in the Cook Inlet could be significant if the area gained a reputation as being contaminated and that perception altered consumer choice of the area for recreation and tourism.</p>
Sport Fishing	<p>We anticipate some effects from unlikely large spills. The loss of business due to unlikely large or very large oil spills could be 20% or \$6 million for 1 year in 2000 dollars. Oil contacting the beaches could affect clam gathering, particularly for razor clams and other types of clams for sport along the east and west sides of Cook Inlet and mussels and steamer clams in small bays off Kachemak Bay. In any area contacted by oil, populations of the intertidal organisms would be</p>

Table V-14 (continued)
Summary of Cumulative Effects by Resource Category

Resources	Summary of Effects ¹
	<p>depressed measurably for about a year, and small amounts of oil would persist in the shoreline sediments for more than a decade, a significant effect. The overall cumulative effect on fisheries resources may include reduced stocks of some fisheries resources, primarily due to the potential for over harvest of these stocks by commercial-fishing activities. This effect could persist for several generations or longer. If a very large oil spill occurred in the Gulf of Alaska (like the Exxon Valdez – 250,000 bbl) it could drift into lower Cook Inlet and could eliminate sportfishing in Cook Inlet for 1 year. Including the total of all modes of sportfishing, 198,000 person-days of fishing, could be lost for 1 year. This includes 79,000 person-days on charters in lower and central Cook Inlet; 91,000 on private or bare-boat charters; and 28,000 on shore. We estimate \$35 million in year-2000 dollars would be lost in 1 year. Clam gathering would be affected by such a very large spill essentially the same as described in Section IV.F.3.o.</p> <p>Disturbance, displacement, or injury as a result of drilling or seismic activities also would not be measurable. We estimate the various effects to sport fisheries taken altogether would not cause population-level changes in sport fisheries resources and consequently in sport fisheries activities. We anticipate no effects from the release of natural gas during exploration or during development.</p>
Archaeological Resources	<p>Exploration, development and production, and crude-oil transportation activities in the Cook Inlet Planning Area, as well as State and civilian commercial activities, would cause a cumulative effect on onshore archaeological resources that would be higher than the effects expected for the Alternative 1 – Proposed Action. The cumulative effects on onshore archaeological resources of other than Federal activities would be additive. No effects on offshore archaeological resources from exploration or development activities are expected to occur. However, other non-Federal activities such as bottom trawl fishing, dredging, and anchoring may have a cumulative effect on offshore resources. Significant effects could result if significant archaeological resources were damaged.</p>
National Parks and State Parks and Special Areas	<p>The contribution from Lease Sale 191 to cumulative effects for National and State Parks and other special areas would come from spilled oil and related spill cleanup activity. The industrial and construction activities associated with the reasonably foreseeable projects will have little effect on the special areas under consideration and can be largely mitigated by the coastal management zone policies of the State of Alaska and the Kenai Peninsula Borough. These policies would prevent new facilities from degrading State and Borough Parks and other special-use areas. However, the cumulative effects of unlikely oil spills that contact National and State parks and other special areas could be significant. The public perception of damage caused by a spill could persist longer than the actual effects of the spill. The actual effects of any spilled oil would generally be the same as those forecast for the Proposed Action in Section IV.B.1.r.</p>
Land Use Plans/CMP	<p>The cumulative effects are not expected to generate conflicts with the Alaska Coastal Management Plan or the related district policies.</p>
Environmental Justice	<p>Cumulative Environmental Justice effects from the past present and reasonably foreseeable projects could be experienced by low-income, minority populations in the Cook Inlet/Shelikof Strait area and would focus on the Native, subsistence-based communities of the region. Cumulative effects on these communities could occur because of their reliance on subsistence foods and because overall cumulative effects may affect subsistence resources, subsistence-harvest practices, and sociocultural systems. Oil-spill contamination of subsistence foods is the main concern regarding potential effects on Native health. Potential cumulative effects would focus on the Native minority populations residing in the subsistence-based villages of upper Cook Inlet, Kenai Peninsula, Kodiak Island, and the Southern Alaska Peninsula. Sources for cumulative effects include</p>

Table V-14 (continued)
Summary of Cumulative Effects by Resource Category

Resources	Summary of Effects ¹
	<p>potential oil spills, noise and traffic disturbance, and disturbance from construction activities associated with drilling, production facilities, pipelines, and landfalls.</p> <p>Noise and disturbance from routine activities are not expected to produce cumulative Environmental Justice impacts. The contribution of Cook Inlet lease-sale activities to cumulative effects on Environmental Justice from oil spills is very small. In the unlikely event that a large accidental oil spill did occur and contaminate essential subsistence resources and harvest areas, major effects on subsistence-harvest patterns and sociocultural systems could occur when impacts from contamination of the shoreline, food-tainting concerns, cleanup disturbance, and disruption of subsistence practices are factored together. Effects from such an event would be one or more important subsistence resources becoming unavailable or undesirable for use for at 1-2 years or longer. Consequent sociocultural effects of distress, loss, and community disruption would accompany such an impact on subsistence practices. The additive subsistence and sociocultural impacts would be considered a significant adverse effect. This level of impact would be considered a disproportionate, high-adverse effect on Alaskan Natives. The occurrence of a large oil spill in the cumulative scenario is considered unlikely. Any potential cumulative Environmental Justice effects are expected to be mitigated to some extent though not eliminated.</p>

Notes:

¹Cumulative effects include effects from Lease Sales 191 and 199 under Alternative I exploration and development activities and other past, present, and reasonably foreseeable projects in the Cook Inlet region. Alternative I activities account for approximately 7% of the cumulative effects from offshore oil and gas projects.

Key:

PSD = Prevention of Significant Deterioration
 CMP = Coastal Management Plan
 TAPS = Trans-Alaska Pipeline System

Table V-15

Cook Inlet Tanker						
Present and Reasonably Foreseeable	0.135	0.88	≥1,000	5,300 to 14,600	0	0.11
Cook Inlet Sale 191	0	0.88	≥1,000	5,300 to 14,600	0	0
Total	0.135	0.88	≥1,000	5,300 to 14,600	0	0.11

Note:

The OCS spill rate was assumed for onshore spills until further information is available. The Cook Inlet Lease Sale 191 contributes to pipeline spills onshore. Cook Inlet tankering included production of oil shipped from Drift River to Nikiski and imports of Alaska North Slope crude oil from Valdez to Nikiski. Tankering spill rate is based on the Trans-Alaska Pipeline System tanker spill rate of Anderson and LaBelle (2000).

Table V-16
Cumulative Employment and Personal Income Effects for Major Projects in the Reasonably Foreseeable Future¹

Major Projects	Employment: Annual Average Jobs ²			Total Personal Income Annual Average in Millions of Constant ³ 1999 \$		
	Direct	Indirect and Induced	Total	For Direct Workers	For Indirect and Induced Workers	Total
State Areawide Lease Sales 2003-06 and Tyonek Deep⁴						
Exploration	15	5	20	1.2	0.2	1.4
Development	105	45	150	8.4	1.6	10
Production	35	15	50	2.8	0.3	3
Starichkof⁵						
Production	70	30	100	5.3	1.2	6.5
Natural Gas Pipeline⁶						
Development	38	12	50	1.07	.23	1.3
Production	6	2	8	.18	.06	.24
Southern Intertie Project⁷						
Development	45	15	60	4.5	1.5	6
Maintenance and Operations	6	2	8	.18	.06	.24
BP Gas to Liquids Plant⁸						
Maintenance and Operations	22	7	29	.66	.21	.87
Kenai Peninsula Borough Lease Sale 191⁹						
Exploration	30	10	40	2.4	0.3	2.8
Development	210	120	330	16.8	3.6	20.4
Production	70	30	100	5.6	0.9	6.5
Total						
Exploration	45	15	60	3.4	0.8	4.2
Development	398	192	590	30.9	6.8	37.7
Production (or M & O)	203	82	295	13.4	3.0	16.4

Notes:

¹ See Table V-13 for description of major projects and descriptive text in Section V.B.3. Table V-16 uses the framework of Table IV.B-19 discussed in Section IV.B.1.j. Totals may not sum exactly due to rounding.

² For definition of direct, indirect, and induced jobs, see Section IV.B.1.j.

³ Constant dollars 1999 means the value of dollars for that year so that probable increases due to inflation in the future are held constant.

⁴ We assume these projects generate employment and personal income one-half that of OCS Sale 191.

⁵ We assume the employment and personal income from Starichkof production will be the same as from Sale 191 production. Starichkof is estimated to have 300 million barrels and Lease Sale 191, 140 million barrels. However, one platform is assumed for each and it requires approximately the same number of workers per year per platform. The number of years of Starichkof production may be as much as twice as long as from Sale 191.

⁶ We estimate 38 direct jobs per year from USDO, MMS, "Sub-Arctic IMPAK: 1st Step Model" 2000.

⁷ For direct workers see U.S. Department of Agriculture (2001). We estimate maintenance and operations workers. We use USDO, MMS, "Sub-Arctic IMPAK: 1st Step Model" 2000 for estimating indirect and induced workers and personal income.

⁸ For direct workers, we take the average of long-term workers in Table V-13.

⁹ We use USDO, MMS, "Sub-Arctic IMPAK: 1st Step Model" 2000 and "Sub-Arctic IMPAK: 2nd Step Model" 2002 to estimate jobs and personal income for Sale 191. For further explanation and definitions see Section IV.B.1.j.

INDEX

Index

Index of selected headings and keywords in headings. The EIS analyzes the following alternatives and resources. *Alternatives:* Proposal for Sales 191 and 199 (Alternative I); No action (Alternative II); Lower Kenai Peninsula Deferral (Alternative III); Barren Island Deferral (Alternative IV) and the Agency-Preferred Alternative. *Resources:* Water Quality; Air Quality; Lower Trophic Level Organisms; Fisheries Resources; Essential Fish Habitat; Endangered and Threatened Species; Marine and Coastal Birds; Non-endangered Marine Mammals; Terrestrial Mammals; Economy; Commercial Fishing; Subsistence Harvest Patterns; Sociocultural Systems; Recreation; Tourism; Visual Resources; Sports Fishing; Environmental Justice; Archaeological Resources; and Coastal Zone Management.

Air quality

Description of air quality: III-33

Effects

summary: (ES-3, 5, 6); Table II.B-2, Table V-14

effects of the alternatives and sales: IV-28, Appendix H

unavoidable effects: IV- 215

short and long term effects: IV-219

irreversible effects: IV-225

effects of a very large spill from a well blowout: IV-229

cumulative effects: V-24

Air Quality ITL: II-19

Alternatives and deferrals

Section II of the EIS is devoted to describing the alternatives.

Section IV is devoted to analyzing the effects of the alternatives.

Description of the alternatives: (ES-2, ES-7), I-8, II-4 to II-11, II-20

Effects of the alternatives: (ES-3 to 8); Table II.B-2, Table II.B-3

Effect of Alternative I – Proposed Action: IV-12 to IV-193, Table II.B-2

Effects of Alternative II – No Action: IV-194

Effects of Alternative III – Lower Kenai Peninsula Deferral: IV-198; Table II.B-2,

Effects of Alternative IV – Barren Islands Deferral: IV-206 Table II.B-2

Effects of Agency-Preferred Alternative: II-20; Table II.B-3

For Proposed Action See also Water Quality; Air Quality; Lower Trophic Level Organisms; Fisheries Resources; Essential Fish Habitat; Endangered and Threatened Species; Marine and Coastal Birds; Non-endangered Marine Mammals; Terrestrial Mammals; Economy; Commercial Fishing; Subsistence Harvest Patterns; Sociocultural Systems; Recreation; Tourism; Visual Resources; Sports Fishing; Environmental Justice; Archaeological Resources; and Coastal Zone Management.

Archaeological resources

Description of archaeological resources: III-200

Effects

summary: (ES-4, 6); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-180
unavoidable effects: IV-217
short and long term effects: IV-222
irreversible effects: IV-223
effects of a very large spill from a well blowout: IV-258
cumulative effects: V-94

Beluga whales

See under Endangered and Threatened Species

Benthic communities

See under Lower Trophic Level Organisms.

Birds

See under Endangered and Threatened Species for the Steller's eider; see under Marine and Coastal Birds for other birds; see Appendix G for Kittlitz's Murrelets

Blue whales

See under Endangered and Threatened Species

Climate and meteorology

Description: III-6

Coastal management

See under Coastal Zone Management

Coastal Zone Management

Description of coastal zone management programs: III-215
summary: (ES-4, 6) ; Table II.B-2, Table II.B-3, Table V-14
effects of the alternatives and sales: IV-185
unavoidable effects: IV-218
short and long term effects: IV-222
irreversible effects: IV-225
effects of a very large spill from a well blowout: IV-260
cumulative effects: V-96

Commercial Fisheries

Description of commercial fisheries resources: III-159

Effects

summary: (ES-2, 5, 6) ; Table II.B-2, Table II.B-3, Table V-14
effects of the alternatives and sales: IV-133
unavoidable effects: IV-218
short and long term effects: IV-221
irreversible effects: IV-225
effects of a very large spill from a well blowout: IV-252
cumulative effects: V-73
stipulation: II-11

Cumulative effects

Section V of the EIS is devoted to cumulative effects.

Introduction and conclusion: V-1

Activities considered in the analysis: V-6

Cumulative effects: (ES-5); V-15 to V-96 ; Table V-14

Deferrals

See under Alternatives and Deferrals.

Discharges

Discharges: III-11, III-33 (water and air quality); IV-6 (water and air quality); Appendix B (estimates of muds and cuttings)

Disturbance

Description: IV-5

Effects: various pages between IV-12 and IV-215

See also Scenarios.

Economy

Description of the economy: III-157

summary: (ES-4, 5, 6) ; Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-130

unavoidable effects: IV-218

short and long term effects: IV-221

irreversible effects: IV-223

effects of a very large spill from a well blowout: IV-251

cumulative effects: V- 70

Effects

See under Alternatives and Deferrals (effects); Cumulative Effects.

Eiders

See under Endangered and Threatened Species for the spectacled or Steller's eider

Endangered and threatened species

Includes blue whale, fin whale, humpback whale., northern right whale(Eastern North Pacific Stock), sei whale, sperm whale, Steller sea lion (Western U.S. stock), Steller sea lion (Eastern U.S. stock), beluga whale (Cook Inlet stock), short-tailed albatross, Steller's eider (Alaska breeding population), northern sea Otter (Southwest Alaskan stock)

Description of Endangered and threatened species: III-57

summary: (ExecSum-4, 5, 6); Table II.B-2, Table III.B-3, Table V-14

effects of the alternatives and sales: IV-68

unavoidable effects: IV-215

short and long term effects: IV-219

irreversible effects: IV-223

effects of a very large spill from a well blowout: IV-233

cumulative effects: V-38

Endangered and Threatened Species ITL: II-16

Endangered Species Act consultation: Appendix C

Environment

Section III of the EIS is devoted to a description of the environment; Section IV to possible effects on the environment.

Environmental justice

Description of environmental justice: III-198

summary: (ES-4, 5, 6); Table II.B-2, Table III.B-3, Table V-14
effects of the alternatives and sales: IV-158
unavoidable effects: IV-217
short and long term effects: IV-222
irreversible effects: IV-224
effects of a very large spill from a well blowout: IV- 257
cumulative effects: V-92
Executive order: I-21

Essential fish habitat

Description of essential fish habitat: III-54
summary: (ES 4, 5, 6); Table II.B-2, Table II.B-3, Table V-14
effects of the alternatives and sales: IV-51
unavoidable effects: IV-215
short and long term effects: IV-219
irreversible effects: IV-225
effects of a very large spill from a well blowout: IV-233
cumulative effects: V-29
Coordination: Appendix D
See also Fisheries Resources

Fin whales

See under Endangered and Threatened Species

Fisheries Resources

Description of fishes: III-36
summary: (ES-4, 5, 6); Table II.B-2, Table II.B-3, Table V-14
effects of the alternatives and sales: IV-40
unavoidable effects: IV- 215
short and long term effects: IV-219
irreversible effects: IV-225
effects of a very large spill from a well blowout: IV-230
cumulative effects: V-27
See also Subsistence Harvest Patterns; Essential Fish Habitat.

Gas

See under Natural Gas.

Geology

Description: III-1, Appendix B

Humpback whales

See under Endangered and Threatened Species

Impacts

See under Alternatives and Deferrals (effects); Cumulative Effects.

Indian Trust Resources

summary: I-16

Information to Lessees (ITLs)

See under Mitigating Measures.

Laws and regulations

Laws and regulations: I-3; Appendix E

Lower trophic level organisms

Includes planktonic, benthic and intertidal communities.

Description of lower trophic level organisms: III-32

summary: (ES-3, 5, 6) ; Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV- 36

unavoidable effects: IV-218

short and long term effects: IV-219

irreversible effects: IV-225

effects of a very large spill from a well blowout: IV- 229

cumulative effects: V-26

Marine and coastal birds

Includes nonendangered marine and coastal birds, See appendix G for Kittlitz's murrelets

Description of birds: III-146

summary: (ES-4, 5, 6); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-106

unavoidable effects: IV-216

short and long term effects: IV-220

irreversible effects: IV-224

effects of a very large spill from a well blowout: IV-247

cumulative effects: V-60

See under Endangered and Threatened Species for information on the endangered Steller's eider.

Non Endangered Marine mammals

Includes pinnipeds, Pacific harbor seals; northern fur seals; Southcentral Alaska sea otters; harbor porpoises; Dall porpoises; and killer, gray, and minke whales

Description of marine mammals: III-150

summary: (ExecSum-4, 5, 6); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-113

unavoidable effects: IV-218

short and long term effects: IV-220

irreversible effects: IV-224

effects of a very large spill from a well blowout: IV-248

cumulative effects: V-64

See also Subsistence Harvest Patterns.

Northern Right whales

See under Endangered and Threatened Species

Northern sea otter

See under Endangered and Threatened Species

Mitigating measures

Mitigating measures: (ExecSum-8); I-16; II-11

National, State Parks, and other Special Areas

Description of resources: III-207

Effects

summary: (ExecSum-4, 5, 6) ; Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-183

unavoidable effects: IV-218
short and long term effects: IV-222
irreversible effects: IV-225
effects of a very large spill from a well blowout: IV-260
cumulative effects: V-95

Native peoples

See under Subsistence Harvest Patterns; Sociocultural Systems; Archaeological Resources; Land Use Plans and Coastal Management; Environmental Justice; Cumulative Effects; Traditional Knowledge; Scoping.

Natural gas

Natural gas release: IV-11 (effects of development); Appendix B (resource estimates)

Oceanography

Description: III-8

Oil

Petroleum geology: III-1
Resource estimates: II-1; Appendix B
Oil development and production: III-216, V-11
Lease sales: V-12

Oil spills

Description (risk, prevention, response) II-17; IV-6; V-15; Appendix A
Effects: (ES-4); Table II.B-2, Table II.B-3, various pages between IV-12 and IV-260; various pages between V-19 and V-96

Opportunity index

Opportunity index: (ES-3); II-1 oil and gas resource potential); Appendix B (changes in activities because of area deferrals), Table I.A-1

Pipelines

Stipulation: II-14
Pipelines: III-216; V-13, Appendix B
Pipeline oil spills and leaks: IV-6; Appendix A

Planktonic communities

See under Lower Trophic Level Organisms.

Recreation, Tourism, Visual Resources

Description of recreation, tourism and visual resources: III-196
Effects

summary: (ES-4, 6); Table II.B-2, Table II.B-3, Table V-14
effects of the alternatives and sales: IV-151
unavoidable effects: IV-217
short and long term effects: IV-222
irreversible effects: IV-225
effects of a very large spill from a well blowout: IV-255
cumulative effects: V-86

Royalty Suspension: (ES-3), Appendix B

Sales

See under Alternatives and Deferrals (description); Scenarios.

Scenario

Scenario: (ES-2); II-4; Appendix B

Scoping

Scoping: (ES-1); I-4; Appendix F

Sei whales

See under Endangered and Threatened Species

Short tailed albatross

See under Endangered and Threatened Species

Sociocultural systems

Description of sociocultural systems: III-190

summary: (ES-4, 6); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-147

unavoidable effects: IV-217

short and long term effects: IV-221

irreversible effects: IV-225

effects of a very large spill from a well blowout: IV-254

cumulative effects: V-84

Sperm whales

See under Endangered and Threatened Species

Spills

See under Oil Spills.

Sport Fisheries Resources

Description of sport fishery resources: III-197

Effects

summary: (ExecSum-4, 5, 6); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-155

unavoidable effects: IV-218

short and long term effects: IV-222

irreversible effects: IV-225

effects of a very large spill from a well blowout: IV-256

cumulative effects: V-94

Steller sea lions

See under Endangered and Threatened Species.

Steller's eider

See under Endangered and Threatened Species.

Stipulations

See under Mitigating Measures.

Subsistence harvest patterns

Description of subsistence harvest patterns: III-168

summary: (ExecSum-4, 5, 6) ; Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-140

unavoidable effects: IV-217

short and long term effects: IV-221

irreversible effects: IV-225

effects of a very large spill from a well blowout: IV-252

cumulative effects: V-74

Terrestrial mammals

Includes river otter, brown bear, black bear, red fox, arctic fox, wolf, coyote, mink, wolverine, Sitka black-tail deer and moose.

Description of terrestrial mammals: III-156

summary: (ES-4, 5, 6); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-124

unavoidable effects: IV-216

short and long term effects: IV-221

irreversible effects: IV-214

effects of a very large spill from a well blowout: IV-249

cumulative effects: V-67

See also Subsistence Harvest Patterns.

Threatened species

See under Endangered and Threatened Species.

Traditional knowledge

Traditional knowledge: I-8

Water quality and resources

Description of water quality: III-11

summary: (ES-3, 4, 5); Table II.B-2, Table II.B-3, Table V-14

effects of the alternatives and sales: IV-12

unavoidable effects: IV-218

short and long term effects: IV-218

irreversible effects: IV-225

effects of a very large spill from a well blowout: IV-227

cumulative effects: V-19

Whales

See under Endangered and Threatened Species for Blue whale fin whale, Humpback whale., Northern Right whale (Eastern North Pacific Stock), Sei whale Sperm whale, Steller sea lion (Western U.S. stock),

The Department of the Interior Mission

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering sound use of our land and water resources; protecting our fish, wildlife, and biological diversity; preserving the environmental and cultural values of our national parks and historical places; and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to ensure that their development is in the best interests of all our people by encouraging stewardship and citizen participation in their care. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

The Minerals Management Service Mission

As a bureau of the Department of the Interior, the Minerals Management Service's (MMS) primary responsibilities are to manage the mineral resources located on the Nation's Outer Continental Shelf (OCS), collect revenue from the Federal OCS and onshore Federal and Indian lands, and distribute those revenues.

Moreover, in working to meet its responsibilities, the **Offshore Minerals Management Program** administers the OCS competitive leasing program and oversees the safe and environmentally sound exploration and production of our Nation's offshore natural gas, oil and other mineral resources. The **MMS Royalty Management Program** meets its responsibilities by ensuring the efficient, timely and accurate collection and disbursement of revenue from mineral leasing and production due to Indian tribes and allottees, States and the U.S. Treasury.

The MMS strives to fulfill its responsibilities through the general guiding principles of: (1) being responsive to the public's concerns and interests by maintaining a dialogue with all potentially affected parties and (2) carrying out its programs with an emphasis on working to enhance the quality of life for all Americans by lending MMS assistance and expertise to economic development and environmental protection.
