

June 18, 1999

Dear Colleague:

Information related to the 1998 BRFSS summary prevalence report of selected risk factors and preventive health measures from the core and modules is attached.

This report consists of four parts:

An introduction that contains:

An overview of the 1998 summary prevalence report.

An explanation of the tables for 1998 Behavioral Risk Factor Surveillance System (BRFSS) prevalence data.

Definitions of BRFSS risk factors and preventive health measures. When appropriate, Year 2000 Objectives are identified.

Analysis of selected questions from the 1998 BRFSS questionnaire. The set of analyses is divided into three sections:

Section I - selected risk factors and preventive health measures in the BRFSS core.

Section II - selected risk factors and preventive health measures from modules used by at least 13 states

Section III - preventive health measures that concern women only.

As soon as your schedule permits, please examine the enclosed materials closely.

Sincerely yours,

David E. Nelson, M.D.,M.P.H.

OVERVIEW OF THE 1998 SUMMARY REPORT

The report is divided into three sections. *Section I* displays tables for selected variables in the core. In *Section I*, there are three tables for each risk factor or preventive measure unless otherwise noted. Estimated prevalence and relevant statistics are provided for the total population sampled and by sex. Prevalence estimates for both 1997 and 1998, or where appropriate 1996 and 1998, and the percentage point difference between the estimates are given for variables in the core.

Section II shows tables for selected variables in modules used by at least 13 states. *Section II* contains two tables for each risk factor or preventive measure of interest in the modules. These tables show the estimated prevalence and relevant statistics for the total sampled population and both sex groups who responded to selected questions in the optional modules.

Section III contains tables for preventive health measures that are related to women's health issues. Estimated prevalence and relevant statistics are provided for the total population sampled. Prevalence estimates for both 1997 and 1998 and the percentage point difference between them are given.

Three tables (Tables 1.1-1.3) from Section I will be used as examples to explain the information contained in this report. Each table describes a behavioral risk factor or preventive health measure from the Behavioral Risk Factor Surveillance System (BRFSS) instrument.

Table 1.1 (page 1) shows the estimated prevalence and relevant statistics for each participant. (Participants refer to all states, and the District of Columbia and territories of the U.S.). The table shows the estimated prevalence and relevant statistics for "fair or poor health

status" in the population surveyed by each BRFSS participant. This prevalence estimate excludes respondents with unknown information on self reported health status.

The columns in Table 1.1 provide the following information:

<u>COLUMN HEADING</u>	<u>CONTENTS</u>
<u>Participant</u>	Name of the participant. Participants refers to all states including the District of Columbia and territories of the United States.
<u>Sample size</u>	The number of individuals who responded to the specific BRFSS question. These are unweighted numbers. These numbers <u>exclude</u> individuals who reported "not sure, don't know", those who refused to answer the question, or had no response coded (missing or skipped).
<u>Percent/Mean</u>	An estimate of the percent (or prevalence or mean number) of residents who report the behavioral risk factor of interest. This is weighted to the participant's population to estimate the true prevalence or mean in the population.
<u>Standard error</u>	A measure of the amount of variability that exists in the calculation of the prevalence estimate.
<u>95% confidence interval</u>	A range which contains the true population prevalence estimate 95% of the time, if repeated sampling of the population is performed.

SUMMARY STATISTICS are given at the bottom of the table:

<u>Number of participants</u>	The total number of participants who asked question(s) regarding the respective "risk factor".
<u>Median</u>	The middle value of all estimated prevalences.
<u>Range</u>	The lowest prevalence and the highest prevalence among all participants.

For example, in Table 1.1, there were 2234 individuals in the state of Alabama who responded to the "self reported health status" question. Of those responding, the estimated prevalence of Alabama's population who reported that they had fair or poor health status is 21.3 percent. This prevalence estimate has a standard error of 1.0. The 95% confidence interval for this estimate is (19.4, 23.2). Ninety-five percent (95%) of confidence intervals generated under repeated sampling will contain the true population prevalence of Alabama's population who "had fair or poor health status".

Table 1.2 (page 2) shows the estimated prevalence and relevant statistics by sex for each state participant. The same statistics are displayed in Table 1.2 as in Table 1.1, except that Table 1.2 shows the estimated prevalence of “ fair to poor health “ for males and females separately. An explanation of the terms was provided earlier. This side by side display of the tables permits each participant to compare estimates for males and females in their respective state.

Table 1.3 (page 3) shows the percent difference between the prevalence estimates, by participant, for the 1997 and 1998 survey years for having fair or poor health status. A negative change indicates a decrease in prevalence from 1997 to 1998, while a positive change indicates an increase in prevalence between the two years. This difference gives state health officials a quick method to examine changes that may have occurred in their respective state. Some of these changes may have resulted from legislative actions (or inactions) in the state, programs funded, or programs that came into existence because of results that states may have shown from the BRFSS. Since changes between two years may be attributable to many factors, conclusions drawn from this table should be interpreted with extreme caution.

Sample Size. Sample sizes vary by question. Some estimates may be based on responses from less than 50 respondents. Interpreting estimates that are based on a small number of respondents can mislead the reader into believing that a given finding is much more precise than it actually is. The BRFSS recommends not interpreting percentages where the denominator is based upon fewer than 50 unweighted respondents (sample size).

DEFINITIONS OF TERMS AND RISK FACTORS IN THIS REPORT

AIDS KNOWLEDGE/ATTITUDES

HIV TEST - Respondents, age 18-64, who have never had a test for HIV infection.

CHANCES OF GETTING HIV - Respondents, age 18-64, who believe that their chances of getting infected with HIV, the virus that causes AIDS are medium or high.

TEEN CONDOM USE - Respondents, age 18-64, who would not encourage sexually active teenagers to use a condom.

BREAST EXAM

BREAST EXAM (1)- Female respondents, age 18 and older, who report that they have never had a breast exam by a doctor.

BREAST EXAM (2)- Female respondents, age 40 and older, who report that they never had a breast exam by a doctor.

BREAST EXAM WITHIN 2 YEARS - Female respondents, age 50 and older, who report that they did not have a breast exam within the past two years.

CERVICAL CANCER

PAP SMEAR (1)- Female respondents, age 18 and older who report that they have never had a pap smear. This measures Year 2000 Objective 16.12. - Target $\geq 95\%$.

PAP SMEAR, WITH UTERINE CERVIX (2)- Female respondents, with uterine cervix, age 18 and older, who report that they never had a pap smear.

PAP SMEAR WITHIN 3 YEARS - Female respondents, with uterine cervix, age 18 and older, who report that did not have a pap smear within the last three years.

CLINICAL BREAST EXAM See BREAST EXAM

DIABETES

AGE AT ONSET - Mean age at onset of diabetes: age when respondent was told that they have diabetes, among those who report they were told by a doctor that they have diabetes.

DIABETES AWARENESS - Respondents who report they were told by a doctor that they have diabetes.

NOW TAKING INSULIN - Respondents who are now taking insulin, among those who report they were told by a doctor that they have diabetes.

NUMBER OF TIMES SEEN HEALTH PROFESSIONAL - Mean number of times respondents report they have seen a doctor, nurse, or other health professional for their diabetes in the past year, among those who report they were told by a doctor that they have diabetes.

FRUITS AND VEGETABLES

FRUITS AND VEGETABLES - Respondents who report they are not consuming five or more servings of fruits and vegetables a day. This measures Year 2000 Objective 2.6 - Target is not specified.

HEALTH INSURANCE

HEALTH INSURANCE (1)- Respondents age 18 and older who report they have no health care plan.

HEALTH INSURANCE (2)- Respondents age 18-64 years who report they have no health care plan.

HEALTH STATUS

ACTIVITIES LIMITED - Mean number of days in past 30 days activities were limited as reported by respondents.

MENTAL HEALTH NOT GOOD - Mean number of days in past 30 days mental health was not good as reported by respondents.

PHYSICAL HEALTH NOT GOOD - Mean number of days in past 30 days physical health was not good as reported by respondents.

SELF REPORTED HEALTH STATUS - Respondents who report having a general health status of fair or poor.

IMMUNIZATION

FLU SHOT - Respondents, age 65 and older, who report that they did not have a flu shot with in past 12 months. This measures Year 2000 Objective 20.11 - Target $\geq 80\%$.

PNEUMONIA VACCINATION - Respondents, age 65 and older, who report they have never had a pneumonia vaccination. This measures Year 2000 Objective 20.11 - Target \geq 80%.

MAMMOGRAPHY

MAMMOGRAM (1) - Female respondents age 18 and older, who report that they have never had a mammogram.

MAMMOGRAM (2) - Female respondents, age 40 and older, who report that they have never had a mammogram.

MAMMOGRAM WITHIN 2 YEARS - Female respondents, age 50 and older, who report that they did not have a mammogram within the past two years.

MAMMOGRAPHY AND BREAST EXAM

MAMMOGRAM & BREAST EXAM - Female respondents, age 40 and older, who report that they have never had a mammogram and a breast exam. This measures Year 2000 Objective 16.11 - Target \geq 80%.

MAMMOGRAM & BREAST EXAM WITHIN 2 YEARS - Female respondents, age 50 and older, who report that they did not have a mammogram and a breast exam within the last two years. This measures Year 2000 Objective 16.11 - Target \geq 60%.

OVERWEIGHT

OVERWEIGHT: BY MEDIAN - Respondents at or above 120% of their ideal weight. Ideal weight is defined as the mid-value of a median frame person from the 1959 Metropolitan Life Insurance Corporation height-weight tables.

OVERWEIGHT: BY BODY MASS INDEX - Females with body mass index(BMI) \geq 27.3 and males with BMI \geq 27.8. BMI is defined as weight in kilograms divided by height in meters squared ($w/h^{*}2$). This measures Year 2000 Objective 2.3 - Target \leq 20%. This should be used with extreme caution since people tend to underreport their weight. BRFSS may underestimate the prevalence of overweight.

PAP SMEAR See CERVICAL CANCER

PHYSICAL INACTIVITY

NO LEISURE TIME PHYSICAL ACTIVITY - Respondents who report no leisure-time physical activity during the past month. This measures Year 2000 Objective 1.5 - Target \leq 15%.

REGULAR AND SUSTAINED PHYSICAL ACTIVITY - Respondents who report no physical activity defined as: 5 or more sessions per week, 30 minutes or more per session, regardless of intensity. This measures Year 2000 Objective 1.3 - Target $\geq 30\%$.

REGULAR AND VIGOROUS PHYSICAL ACTIVITY - Respondents who report no physical activity or a pair of activities defined as: 3 or more sessions per week, 20 minutes or more per session, at 50% or more capacity. This measures Year 2000 Objective 1.4 - Target $\geq 20\%$.

SMOKELESS TOBACCO

EVER USED - Respondents who have ever used or tried smokeless tobacco.

CURRENT USE - Respondents who report that they currently use smokeless tobacco.

SMOKING STATUS

EVER SMOKED - Respondents who have ever smoked 100 cigarettes in their lifetime.

CURRENT SMOKER - Respondents who have ever smoked 100 cigarettes in their lifetime and reported smoking every day or some days. This measures Year 2000 Objective 3.4 - Target $\leq 15\%$.

WEIGHT CONTROL

CALORIES AND PHYSICAL ACTIVITY - Respondents at risk on BMI who report that they are not either eating fewer calories or less fat and not using physical activity or exercise to lose or maintain weight.

LIMITATIONS OF THE DATA

This report consolidates the most current data on selected risk factors and preventive health measures for states, the District of Columbia and Puerto Rico. The information was obtained from the data files of individual states. Therefore, while all participants use telephone surveys to collect the data, the data in this report vary somewhat with respect to data collection, sampling design and sample size.

Some states conduct interviews using a paper questionnaire, but most use a computer-assisted telephone interviewing (CATI) software program. All states use probability-based methods to select their sample. The BRFSS standard for sample designs is that sample records must be justifiable as a probability sample of all households with telephones in the state. All participating areas except Alaska, California, and Hawaii met this criterion in 1998.

For data year 1998, eleven states used the Mitofsky-Waksberg method of sampling. Thirty-seven states used a disproportionate stratified sample (DSS) design. Puerto Rico used a simple random sample design. The three remaining states—Alaska, California, and Hawaii—used a variety of other designs.

Alaska

Alaska's sample design is made up of three random digit-dialed strata and four listed strata, where phone numbers are selected from a list of putative household numbers. The sampling frame contains all of the household numbers in the random digit-dialed strata and an estimated 45% of all household numbers in the listed strata. This represents an exclusion of approximately 9% of all residential numbers in Alaska.

In 3 out of 4 geographic strata, prefixes are assigned to a high (RDD) or low (listed) density stratum depending largely on the number of active household numbers (about 2000 being the threshold) in the exchange (10,000 numbers). All numbers in the fourth geographic stratum are assigned to the listed density stratum. In the RDD strata, the probability that a number is selected depends on the number of active household numbers in its exchange. In the RDD strata, a number of prefixes equal to the target sample size are selected at random in proportion to their number of active HH's. (A prefix can be selected more than once.) Once a prefix is selected into the RDD sample, 48 suffixes are randomly generated. Once the entire sample for the stratum is generated duplicate numbers are deleted without replacement. The final result is h lists of phone numbers per stratum, each containing 48 or fewer unique numbers, where h is the target number of completes per stratum. Phone numbers are called sequentially from each list until one complete per list is obtained.

California

California, in July through December 1998, used a sample design in which only phone numbers from hundred blocks with one or more listed household numbers were included in the sampling

frame. Such hundred blocks are estimated to contain 97.8% of all household numbers in California. Numbers from this frame were selected with an equal probability of selection.

Hawaii

Hawaii uses a sampling frame obtained from the state's telephone company. The frame purportedly contains all working prefixes in Hawaii. The frame is divided into six strata, corresponding to the major islands of Hawaii. The working prefixes are used to randomly generate telephone numbers with a probability proportional to the number of known household numbers in the hundred block to which a number belongs. Telephone numbers from hundred blocks with no known household numbers have a zero probability of being included in the sample. The percentage of telephone households excluded from the sampling frame is unknown. The numbers generated are subsequently screened by GTE Hawaii, who screens out all but the listed and unlisted household numbers in the sample.

Other areas

In a few states, a portion of sample records intended for use during one month may have been completed in another month. This deviation should only affect analyses based on monthly, rather than annual, data.

B. Other 1998 limitations of the data

In addition to departing from the standard for sample designs, California modified the wording of mammography, Papanicolaou (PAP) smear questions, and are therefore excluded from those tables in the report. California also asked the HIV/AIDS section questions to persons 18-45 years of age rather than to those 18-64 years of age as specified, and are therefore not included in the tables for this topic.

Although almost all states collect data monthly, the annual number of interviews range from 1616 in Maine to 6005 in Texas. Estimates for some states are therefore based upon smaller sample sizes, and for rare events (e.g. diabetes), may yield unstable estimates. **Maryland** did not collect data in January, October, November and December. Some items, including drinking and driving and obesity, are affected by seasonality, and estimates for these items may be biased, especially for Maryland's subpopulations.

All data collection systems are subject to error, and records may be incomplete or contain inaccurate information. People may not remember essential information, a question may not mean the same thing to different respondents, and some individuals may not respond at all. It is not always possible to measure the magnitude of these errors or their impact on the data. The user must make his or her own evaluation of the data. Overall estimates generally have relatively small sampling errors, but estimates for certain population subgroups may be based on small numbers and have relatively large sampling errors. When the number of events is small and the probability of such an event is small, considerable caution must be observed in interpreting the estimates and/or differences between groups and areas.
