

pharmacokinetic imaging in a non-invasive manner after non-toxic infusion of the spin probe.

However, the disadvantage of EPRI is the lack of proper orientation of the physiological image with respect to anatomy. On the contrary, Magnetic Resonance Imaging (MRI) methods are excellent for providing images with fine anatomical detail, but are often not possible methods that provide physiological information co-registered with anatomy with clinically relevant resolution.

The current invention complements a MRI with EPRI methods to solve each method's problem described above. A low-field MRI(5–30 mT) module is integrated into an EPRI(5–20 mT) system to provide an MRI scout image to properly orient the EPRI physiological information with respect to anatomy (A common magnet/gradient coil assembly is used for both MRI and EPRI scans).

Therefore, the EPR images contain spectral information regarding the local physiological conditions such as oxygen status. This data, when overlaid with anatomical images of MRI (Magnetic Resonance Imaging), co-register anatomical MR images and EPR physiological images.

Corrections

1. In Section II.A.2.d of the Guidelines (65 FR 51980, first column), change “human pluripotent stem cells,” at the end of the section, to “embryo.”

2. In Section II.B.1.a. of the Guidelines (65 FR 51980, second column), change “Section II.A.2” to “Section II.B.2.”

3. In Section II.B.2.a. of the Guidelines (65 FR 51980, third column), add the following at the end of the section: “and with 42 U.S.C. § 289g–2(b).”

4. In Section IV.B. of the Guidelines (65 FR 51981, first column), change “applications shall” in the first sentence to “documentation of compliance with the Guidelines will” and insert after “by HPSCRG and” the words, “all applications will be reviewed”.
