# CMS Studies Confirm Significant Savings Through Medicare-Approved Drug Discount Cards 

Updated September 23, 2004

## Overview

The Centers for Medicare \& Medicaid Services (CMS) has conducted several studies analyzing the discounted prices available through Medicare-approved drug discount cards over the past several months. ${ }^{1}$ These studies have been updated to reflect September pricing information on www.medicare.gov. The studies continue to find that significant savings are available through Medicare-approved drug discount cards for beneficiaries purchasing drugs at retail pharmacies or mail order pharmacies. In addition, low-income beneficiaries can take advantage of very large savings when the discounts, the annual \$600 in transitional assistance, and large "wrap-around" programs from many drug manufacturers are taken into account. The attached tables reflect the updated analyses. Except as otherwise noted, the updated CMS analyses reflect drug card prices on www.medicare.gov for the week of September 13, 2004.

## Updated CMS Findings

- Overall savings. Beneficiaries can obtain discounted prices that are about 12 to 21 percent less than the national average prices actually paid by all Americans (including the higher prices paid by cash paying customers and the lower prices paid by people with public or private insurance) for commonly used brand-name drugs at retail pharmacies. These savings are 1 to 3 percentage points higher than the savings highlighted in our previous analyses conducted during the initial weeks of the program.
- Savings compared to mail order pharmacies. Beneficiaries enrolling in Medicareapproved discount cards can also obtain significant savings on prescription drugs purchased through mail order pharmacies. For 10 commonly used drugs we examined, our analysis found the best Medicare-approved drug discount card offered prices at least 5 to 33 percent lower compared to Drugstore.com and 11 to 34 percent lower compared to Costco.com. Further, the Medicare-approved cards with the best retail prices even beat Internet mail order prices most of the time.
- Special savings for low-income beneficiaries. For the 4-month period of September through December 2004, we estimate that low-income beneficiaries can save much more-nearly 44 to 92 percent over national average retail pharmacy prices-when using the Medicare-approved drug discount card with the best prices and the \$600 transitional assistance. Once the $\$ 600$ credit is exhausted, many low-income beneficiaries can get significant additional savings from the special discounts offered by several manufacturers in conjunction with Medicare drug discount cards.

[^0]- Savings on drugs used to treat common health conditions. The updated CMS analysis on drugs used to treat common health conditions shows that savings of about 10 to 75 percent over average retail prices (depending on the individual drug) are available by enrolling in a Medicare-approved drug discount card, with some of the greater savings available on generic drugs.
- Savings on generics. Beneficiaries who currently use generic drugs can obtain large savings by using a Medicare drug discount card, saving 45 to 75 percent below typical prices paid by Americans for commonly used generic drugs. Beneficiaries currently using brand name drugs who are able to switch to generics can achieve even greater savings of 46 to 92 percent.

Savings on Commonly Used Brand-Name Drugs at Retail Pharmacies (Table 1) Many Medicare beneficiaries prefer to buy drugs from retail pharmacies because they offer service in-person. CMS updated its studies released in the early weeks of the program that examined the prices of brand-name drugs commonly used by beneficiaries to determine discounts available through Medicare-approved drug discount cards at retail pharmacies across the country. The updated analysis found that seniors could save 12 to over 21 percent on baskets of commonly used drugs compared to national average retail pharmacy prices actually paid by all Americans (including the higher prices paid by cash paying customers and the lower prices paid by people with public or private insurance). Before the Medicare-approved prescription drug card program was implemented, beneficiaries without drug coverage paid among the highest prices in the nation for their prescriptions. Savings of 12 to 21 percent over national retail pharmacy prices means significant savings for Medicare beneficiaries.

The national average retail pharmacy prices used in this study-and referred to throughout this document-represent the total price paid to the pharmacy, regardless of whether the person has insurance. The average is generally lower than the "cash" prices paid by Medicare beneficiaries without drug coverage. It includes both the relatively high retail cash prices paid by people without insurance and the lower negotiated prices paid by people with insurance. Savings would be higher if cash retail prices were compared directly to Medicare-approved drug discount card prices found on Medicare’s Price Compare Website.

Savings Compared to Popular Online/Mail-Order Pharmacies (Tables 2a and 2b) Some beneficiaries use mail order for some or all of their prescriptions. Beneficiaries enrolled in a Medicare-approved discount card can get large savings on their prescription drugs through mail order options offered by many participating card sponsors. There had been efforts to discredit the savings offered by Medicare-approved drug discount cards by comparing the retail prices offered through the Medicare-approved cards to mail order prices offered through popular mail order pharmacies. ${ }^{2}$ In order to assess the validity of

[^1]such claims, we conducted analyses comparing the mail order prices offered by Medicare-approved cards to other mail order prices. We also compared the retail prices offered by Medicare-approved cards to mail order prices. Our results indicate that the mail order programs of the best Medicare-approved cards beat the prices offered by popular Internet pharmacies. And, in many cases, the retail prices of Medicare-approved cards also beat popular Internet mail order prices.

Using data from the week of September $13^{\text {th }}$ again CMS looked at savings available to beneficiaries when the drug card was used at a mail-order pharmacy. The study compared mail order prices from Medicare.gov to prices found at Drugstore.com and Costco.com. CMS consistently finds that the Medicare-approved drug discount cards offer significant savings for 10 commonly used drugs when compared to these web-based services. Our analysis found the best Medicare-approved drug discount cards ranged from at least 5 to 33 percent compared to Drugstore.com and 11 to 34 percent lower compared to Costco.com. ${ }^{3}$ Clearly, seniors can see significant savings by purchasing drugs at mail-order pharmacies available through their card program.

Savings and Transitional Assistance for Low-Income Beneficiaries (Tables 3a and 3b) A June 2004 study examined how low-income beneficiaries (below 135 percent of the Federal Poverty Level, or FPL) are being helped by Medicare-approved drug discount cards, including the $\$ 600$ in transitional assistance. Recently updated analysis on the savings available to low-income beneficiaries indicates that beneficiaries eligible for transitional assistance who pick the card with the lowest price can save about 44 to 92 percent off of national average retail prices over a four-month period (SeptemberDecember 2004) on brand name drugs purchased at retail pharmacies. Those who pick a card that is $5^{\text {th }}$ down the list also save a significant amount- 42 to 91 percent. Given the availability of discounts and $\$ 600$ in transitional assistance, lower income Medicare beneficiaries are better off enrolling in any number of Medicare-approved drug discount cards than not enrolling at all.

Some low-income beneficiaries can save even more by taking advantage of special pricing arrangements many brand name manufacturers have with card sponsors once a beneficiary's $\$ 600$ is spent. Drugs may be available at no cost (other than a pharmacy dispensing fee), or, for example, a low, flat co-pay (e.g., \$12-\$15) after the $\$ 600$ credit is exhausted. The benefits for a low-income individual of enrolling in a Medicareapproved drug card are clear and substantial.

## Savings for Beneficiaries with Common Conditions (Table 4)

Ninety-one percent of Medicare beneficiaries fill at least one prescription each year. Many of these beneficiaries take drugs to treat conditions such as diabetes, depression, or hypertension. Given the prevalence of chronic conditions and the savings available

[^2]through the discount program, many seniors and persons with disabilities can get significant savings by signing up for a card. CMS updated its June 29, 2004 study that examined the savings available to beneficiaries on 23 drugs indicated for the treatment of nine very common conditions. Depending on the individual drug, our updated analysis indicates that beneficiaries being treated for diabetes can save about 10 to 56 percent with the best-price card, and even 8 to 49 percent with the card fifth down the list. Those beneficiaries being treated for congestive heart failure can save 25 to nearly 74 percent with the best card and 16 to almost 70 percent with the card fifth down the list. The drug card may be valuable to beneficiaries with chronic conditions, particularly since most beneficiaries with chronic conditions frequently take more than one drug to treat their conditions.

Generic Substitution Means More Savings (Table 4)
A previous CMS study indicated that beneficiaries could save by substituting generic drugs for brand-name drugs when they are available. Generic drugs are chemically equivalent, work in the same way, and are regulated by the FDA in the same way as their brand name counterparts- but they cost much less. That study indicated that beneficiaries who switch to generics can save between 46 and 92 percent off the prices of branded drugs. The savings come only in part from the fact that generic drugs are generally much less expensive than brand-name drugs. In addition, the discount cards provide even larger discounts for generic drugs. For example, updated data from the week of September 13, 2004 indicates that for several commonly used generic drugs the best Medicare-approved drug discount cards are offering prices that are 45 to 75 percent less than the national average retail pharmacy price actually paid by Americans for these generic drugs. Generic drugs are a safe and inexpensive alternative for beneficiaries who can use them. For low-income beneficiaries, switching to generics stretches the \$600 transitional assistance further.

## Other Drug Card Studies

Others have found similar results of savings from the Medicare-approved drug discount card program. Henry J. Kaiser Family Foundation released a report on July 28, 2004 (Medicare Drug Discount Cards: A Work in Progress, July 28, 2004), indicating that all seven Medicare-approved discount drug card programs they examined "had prices that were significantly less than those reported by the Maryland Attorney General as typical retail prices." Further, the report indicates that beneficiaries could save 8 to 61 percent over these typical retail prices for the 10 drugs they studied. Another report, prepared by The Lewin Group for the Healthcare Leadership Council and released on August 12, 2004, indicated savings, on average, of over 20 percent. Lewin found that nationally, the best Medicare-approved drug discount cards offer savings of almost \$10 per prescription, representing a discount of more than 20 percent overall. More than half of the drug discount cards yield savings of over $\$ 8.48$ (over 17 percent) per prescription. Another study finding was that, across the 150 drugs most commonly prescribed to seniors, the best available price from any card sponsor represents an average savings per prescription of over \$17 (23 percent). A report published by the American Enterprise Institute for Public Policy Research (Private Discounts, Public Subsidies: How the

September 23, 2004

Medicare Prescription Drug Discount Card Really Works, 2004) also indicates that real savings are available for beneficiaries, particularly low-income beneficiaries.

| (1) Note: CMS computed a monthly 30 day supply based on dosing schedule using the FDA per day estimate based on analysis of IMS Health, National Prescription Audit PlusTM; 1st Quarter 2004; extracted April 2004. Prices are average retail prices (for generic drugs median average retail prices among generic manufacturers was used) in brick-and-mortar pharmacies (i.e. chain, independent and foodstore pharmacies, excluding internet, mail order and long-term care pharmacies) across all payer types (cash-only, Medicaid and other 3rd party payers) for the first quarter of 2004. <br> (2) Data Source: Medicare Price Compare, at www.medicare.gov, accessed 9/13/04. An asterisk (*) denotes a generic drug. |  |  |  |  |  |  |  |  |  |

[^0]:    ${ }^{1}$ CMS analyses related to Medicare-approved drug card pricing can be found at http://www.cms.hhs.gov/medicarereform/drugcard/drugcardreports.asp

[^1]:    ${ }^{2}$ Medicare Drug Card Prices Remain High. United States House of Representatives Committee on Government Reform—Minority Staff. June 2004. This study contained data that could not be replicated

[^2]:    by CMS. It also included an inaccurate comparison between retail and mail-order prices: mail-order prices are generally lower than retail due to lower fixed costs, 90-day supplies, and other factors.
    ${ }^{3}$ Total savings are actually greater because the Internet sites did not include membership fees and shipping in the prices indicated at the websites. The Medicare-approved drug card mail order prices include shipping costs.
