Project Summary Report

Executive Summary

Long-term preservation of digital information is one of the most critical challenges facing the information community. No single technology will meet that challenge. However, there is agreement that whatever technology, or technologies, may be adopted, success will depend on the availability of adequate metadata describing the technical characteristics of the digital materials being preserved. This report, prepared by Silver Image Management (SIM), proposes technical metadata elements appropriate for digital objects in the Defense Virtual Library (DVL). DVL is a collaborative effort of the Defense Technical Information Center, the Defense Advanced Research Projects Agency (DARPA) and the Corporation for National Research Initiatives (CNRI).

The Open Archival Information System (OAIS) framework was adopted to provide a conceptual structure for the metadata. Next, the International Organization for Standardization (ISO) International Electrotechnical Commission (IEC) Standard 11179 was used for naming the data elements and describing them with appropriate attributes. The expectation is that an XML DTD will be prepared based on these elements and their attributes. Finally, the guidelines reflect extensive review of the practices of a wide range North American, UK, European and Australian projects similarly concerned with developing technical metadata for preservation.

Documentation prepared for this project consists of a summary report of the project, the guidelines themselves and supporting documentation, including diagrams showing the relationships among the data elements and a table listing the data elements according to the OAIS framework.

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 2

Background

The Defense Virtual Library (DVL) was initiated by DTIC in cooperation with the Defense Advanced Research Projects Agency (DARPA) and the Corporation for National Research Initiatives (CNRI). DTIC contracted with Silver Image Management (SIM) to develop procedures and standard practices for describing technical metadata in a digital library application.[1] Dr. Marcia Hanna was DVL program manager at DTIC throughout the period of this contract.

DTIC is the central Department of Defense facility for providing access to and facilitating the exchange of scientific and technical information. DVL objectives are to examine new methods for managing digital information and to identify the metadata required for such long-term management. DVL is the Defense testbed for the Digital Object Architecture developed by CNRI. Uniform Resource Identifiers that use Handle System technology are a fundamental part of that architecture. DVL utilizes standard Internet browsers and advanced commercial search engines. Initially, DVL used the InQuery search engine but replaced it with Verity search technology.

Beginning in 1997, DTIC placed several contracts with SIM to create cataloging guidelines for digital materials in four format categories: still images, recorded sound, moving images and complex digital objects. The DVL currently includes digital files in five broad format categories. There are 1) photographic images from the Trinity project at Los Alamos; 2) audio files with music or documentary sound; 3) video from the DTIC Technical Reports (TR) collection and from Carnegie Mellon University's Informedia Digital Video Library; 4) complex digital objects from DTIC CDs and from the Web; and 5) full-text documents from DTIC's TR collection. SIM did not provide consultation for the TR documents since DTIC cataloging was already available for them. This report does not review the information provided in SIM guidelines or reports prepared for any of these previous components.[2] However, the earlier guidelines are available at the DVL web site and from DTIC's production systems.

Scope of work

In developing digital library applications, a primary concern is how to manage digital materials over time. Although research is continuing on long-term preservation, maintenance issues for digital materials are a major concern. One aspect of ensuring the long-term preservation of digital materials is creating the necessary metadata to communicate information about the materials and their requirements. Identifying the required metadata and defining its parameters will aid in future development of the tools for capture, rendering, management or maintenance. Technical metadata is the specialized metadata that identifies structural, administrative, and preservation details

---

[1] Contract SP4700-01-P-0152 was awarded on 14 September 2001.
[2] See Defense Technical Information Center contract numbers SP4700-97-M-0348, SP4700-98-M-0450, SP4700-99-M-0592 (with modification DTICZ00179001-A), and SP4700-00-M-0381. Additionally, contract number SP4700-99-M-0502 was awarded in 1999 to furnish Minaret cataloging support.

Refer to Sources Consulted (Appendix D) for acronym names and references.

related to digital files.[3] The DVL is an endeavor to be at the forefront of digital library applications identifying and defining required technical metadata and implementing its use.

The scope of work for the current contract builds upon SIM's previous DVL project work. During the previous contract, SIM began research on technical metadata and prepared two draft documents. The first was a preliminary effort to identify and define technical metadata requirements working within the framework defined by Consultative Committee for Space Data Systems (CCSDS) Open Archival Information System (OAIS). SIM prepared an accompanying table listing *DVL Data Elements Implementing OAIS Preservation Description Information.* That table grouped each element according to Preservation Description Information classes identified in the OAIS Reference Model.[4]

The work done during the current contract updates and expands on this preliminary work, detailing attributes of technical metadata elements following the six-part International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC) Standard 11179. This standard facilitates creation of sharable metadata registry content. SIM worked within ISO/IEC 11179 to make recommendations on field syntax, maximum occurrence, obligation, relationships and permissible values for DVL technical metadata.

The selection and description of proposed DVL technical metadata elements is informed by extensive review of related work in the United States, the United Kingdom, Europe and Australia. That work includes but is not limited to:

- Curl (Consortium of University Research Libraries, Cambridge, Oxford and Leeds) Exemplars in Digital Archives (CEDARS);
- Networked European Deposit Library (NEDLIB);
- National Library of Australia (NLA);
- International Research on Permanent Authentic Records in Electronic Systems (InterPARES);
- Metadata Encoding and Transmission Standard (METS);
- Dublin Core (DC);
- Moving Picture Experts Group *Multimedia Content Description Interface* (MPEG7);
- Online Computer Library Center/Research Libraries Group (OCLC/RLG) Preservation Metadata Working Group;

---

[3] The term 'technical metadata' is used throughout this report to refer to administrative, structural, and preservation metadata related to digital objects. According to *The Making of America II Testbed Project: A Digital Library Service Model* (Washington, DC : Digital Library Federation, Council on Library and Information Resources, December 1999, CLIR pub. 87, http://www.clir.org/pubs/abstract/pub87abst.html) structural metadata is metadata "relevant to the presentation of a digital object to the user" (p. 21) while administrative metadata is metadata that "allows the repository to manage its digital collection" (p. 23). This report does not distinguish between types of technical metadata related to the digital object.
[4] The table followed the pattern established in *Preservation Metadata for Digital Objects: A Review of the State of the Art*, A White Paper by the OCLC/RLG Working Group on Preservation Metadata, January 31, 2001, http://www.oclc.org/digitalpreservation/presmeta_wp.pdf.

Refer to Sources Consulted (Appendix D) for acronym names and references.

- World Wide Web Consortium (W3) Extensible Markup Language XML Schema; and
- IMS Global Learning Consortium projects for Learning Object Metadata (LOM).

Resource sharing among these projects contributes to the creation of a virtual library application that is both extensible and interoperable over the long-term.

Beyond the identified scope of work, SIM assisted DVL project officer Carrie Schwarten in her requests for information about initiating digitization projects in preparation for future DVL endeavors.

OAIS

DVL adopted the OAIS Reference Model as its framework for technical metadata for digital preservation. The Reference Model defines an OAIS as "an archive, consisting of an organization of people and systems, that has accepted the responsibility to preserve information and make it available for a Designated Community."[5] The OAIS model provides a theoretical framework for an archival system, and integrates its conceptual approach with a hierarchical structure for organizing information, particularly as it relates to digital material. The model does not specify an implementation strategy; instead it provides guidelines to address digital archiving concepts.

The OAIS model describes an Archival Information Package (AIP) as an aggregation of four types of Information Objects: content information object, preservation description information object, packaging information object and descriptive information object. Content information includes the data object as well as representation information (structural and semantic information about the object). Preservation Description Information (PDI) is comprised of reference information, provenance information, context information and fixity information.[6] In a publication reviewing recent digital preservation metadata developments, Michael Day, Metadata Research Officer at the United Kingdom Office for Library and Information Networking (UKOLN), noted that library projects tended "…to focus discussion on the terminology defined by the OAIS model" and identified this response as one of the most important consequences of the model.[7]

A White Paper prepared by the OCLC/RLG Preservation Metadata Working Group suggests, "The OAIS model may be a useful starting point for developing a preservation

---

[5] Reference Model for an Open Archival Information System (OAIS), Consultative Committee for Space Data Systems. CCSDS 650.0-R-1, May 1999, p. 1-11, http://www.ccsds.org/documents/pdf/CCSDS-650.0-R-1.pdf and http://www.ccsds.org/documents/pdf/CCSDS-650.0-R-2.pdf.
[6] The AIP elements and the four formats (image, audio, video, digital object) are not described in the DVL technical metadata documentation, but some summary information is available in the appendix.
[7] "Metadata for Digital Preservation: A Review of Recent Developments," by Michael Day, 2001 September 25, from paper delivered 5 September 2001, http://www.ukoln.ac.uk/metadata/presentations/ecdl2001-day/paper.html

Refer to Sources Consulted (Appendix D) for acronym names and references.

metadata framework of general applicability."[8] It outlines several points of convergence among state-of-the-art digital library applications (primarily CEDARS, NLA and NEDLIB) investigating long-term preservation issues. Areas of commonality include knowledge or adoption of the OAIS Reference Model, agreement about the need for technical metadata to facilitate management and access to archival objects, and the need for technical metadata to be independent of the object itself to support interoperability and preservation. The DVL project at DTIC shares the concerns expressed in this White Paper and has common goals with these state-of-the-art projects.

<u>ISO/IEC 11179 and Metadata Registries</u>

ISO/IEC 11179 specifies basic aspects of data element composition for inclusion in metadata registries. The standard applies to the formulation of data element representations and meaning as shared among people and machines. DVL initiated the use of the ISO/IEC 11179 standard in order to facilitate participation in metadata registry efforts. Metadata registries are authoritative semantic maps with associated procedures for storing and registering detailed metadata from multiple sources and diverse organizations in a common structured form. Extensions to the formats are recorded, as are agreed-upon mappings between diverse formats. Use of the ISO /IEC standard and participation in metadata registries promotes access, understanding, and sharing of data across time and space, all of which are goals of the DVL project.

Further, use of this structure makes it easier to check the metadata for consistent application. This standardized structure for registering metadata elements was used by CNRI in creating a metadata schema for the publication, *D-Lib,* an electronic journal focused on research in digital libraries, and for its participation in the D-Lib Test Suite, a consortium of five universities and *D-Lib*. The Royal Canadian Mounted Police (RCMP), Integrated Police Information Reporting System (IPIRS) Data Standards Secretariat is another example of an organization working to implement use of the 11179 standard.[9] The RCMP IPIRS project has created documentation to aid in the preparation of data taxonomies for data standards and data naming conventions for data dictionaries.

Despite the obvious advantages of working within the framework of ISO/IEC 11179, it was not easy to identify which version to use. The would-be user can locate different versions of each part of the six-part ISO/IEC 11179 standard. Official versions are available but working drafts are also available on the Web. In the early phase of the project, SIM implemented use of a different (and earlier) version of the document than CNRI anticipated. Once all involved realized that several versions were in use,

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 6

Christophe Blanchi at CNRI recommended the use of specific versions, namely ISO/IEC 11179, Part 3, "Basic Attributes of Data Elements" (1998) and Part 5, "Naming and Identification Principles" (2001). His recommendation was adopted. The 1998 version of Part 3 is not the most current version, but appears to be less confusing than the 2000 version. The 2001 version of Part 5 is very similar to the 1995 version, but clearer in defining naming principles.

Other Projects

The DVL document *Technical Metadata for the Long-Term Management of Digital Materials: Preliminary Guidelines* does not contain the detailed data elements included in other current work like the National Information Standards Organization (NISO) Draft Standard *Data Dictionary: Technical Metadata for Digital Still Images*, the METS schema, the W3 XML schema, or the Preservation Metadata Working Group's Content Information Recommendations. The DVL *Preliminary Guidelines* attempts to identify the most prominent elements required to begin long-term work. A more specific level of detail will be required later. In the meantime, there is the hope that a compelling standard will eventually emerge that will simplify future digital preservation project work.

In researching results from other projects, it was both educational and perplexing to learn that there were so many different ways to order and classify schema. Here are a few examples. The National Library of the Netherlands *Long Term Preservation Study* distinguishes between Intellectual Preservation, Media Preservation and Technology Preservation. The Making of America project distinguishes between descriptive, administrative and structural metadata. METS classifies administrative metadata into four types: technical metadata, intellectual property rights metadata, source metadata and digital provenance metadata. In "How to Preserve Authentic Electronic Records" InterPARES distinguishes between conservation actions and maintenance activities as part of preservation. Finally, the IMS Learning Object Metadata draft standard includes these categories: general; lifecycle; meta-metadata; technical; educational; rights; relation; annotation; classification. There are many possible levels of granularity and such different ways to categorize information. Working within the OAIS framework and ISO/IEC 11179 is sound strategy because it makes possible improved communication among divergent digital applications.

Future implementation

The documentation prepared by SIM will be used in the creation of an Extensible Markup Language (XML) Document Type Definition (DTD) for the long-term management of technical metadata. The DVL, CNRI and SIM teams are in agreement that XML is the appropriate technology for this purpose for several reasons. XML is both human readable and relatively machine friendly because it is a text-based file format. Many vendors have become supportive of XML technology since adding XML support to existing applications is not particularly difficult. XML makes data portable instead of relegating it to a proprietary format from which it may not be readily migrated. XML supports the Unicode standard for characters and is useable for a wide variety of languages and enjoys

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 7

international acceptance. XML provides structure for data and acknowledges the importance of establishing parent/child relationships. XML files tend to be relatively small and easy to compress and store in archives.

Once the DVL DTD is created, it can be tested and implemented by cataloging specialists. The resulting cataloging work can then be validated against the DTD to be certain that it conforms to the standards the DTD provides. This cyclical process will ensure that consistency of standards is used throughout the DVL application.

After the process is underway, it will be possible to identify new issues in developing digital libraries over the long-term based on actual digital library implementations. Day speculated on the OAIS framework, stating "…more time and effort has been expended on developing conceptual metadata specifications than in testing them in meaningful applications."[10] The next step for the DVL is to work through the technical metadata specifications using actual examples in order to raise issues about the model *per se* as well as its implementation.

**Technical Metadata for the Long-Term Management of Digital Materials:
Preliminary Guidelines**

These preliminary guidelines work within the OAIS framework to identify data elements and group them according to information classes following conventions established in ISO/IEC11179. Table 1, which appears on the next page, outlines the attributes used for DVL technical metadata elements. Attributes express the characteristics of an object or entity described in the data element. Tables are used in the remainder of the document to represent individual data elements and sub-elements and identify their characteristics.

The data elements are organized according to the OAIS reference model, which divides information into five categories. The first four categories are types of Preservation Description Information. They include reference information, context information, provenance information and fixity information. The fifth category is representation information. For DVL purposes, this category is further subdivided according to format (i.e., image, audio, video, and complex digital object) in order to distinguish the specific representation information that is appropriate to each.

The preliminary guidelines can be used in tandem with the supporting documentation in the appendices. Appendix A contains diagrams that illustrate the relationships between the DVL data elements. Appendix B lists each of the elements in order by identification number and name. It includes definitions of the five broad OAIS data types used to classify the data elements that do not have their own corresponding tables within the guidelines. Appendix C defines basic OAIS terminology for information classes and packages.

Appendix D contains a list of the sources consulted in creating this document, including bibliographic references. This appendix also serves as the key to the acronyms used throughout the guidelines for related project names. In order to conserve space and maximize the visual presentation of this information, acronyms are frequently used in the tables. It is important to consult this appendix in order to understand related work done in other projects.

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 9

Table 1. Characteristics of Attributes Used for DVL Technical Metadata Elements

Element name	Name of elements and sub-elements. Element names are composed of the hierarchical string (each term separated with a underscore) in order to keep track of their relationship within the grouping. Some sub-element names used are polymorphs because there are sub-elements with the same meaning within several different element categories (examples include Version, Link, and several sub-elements of Representation_Format).
Identifier	Identification number for the element and sub-element name. Corresponds to the identifiers used in the documentation in the appendices. In cases where a sub sub-element links to multiple sub-elements, 'x' is used instead of an integer (e.g., 1.1.x.1).
Version/version date	Identifies issue of version and date of registration. This version is 0.1.
Registration authority	Organization authorized to register data elements (i.e., Defense Technical Information Center).
Synonymous name	Represents the data element concept with synonymous expressions. Provides another name that is familiar in specific environments.
Context	States where the synonymous name originates if there is a specific application. Blank unless a Synonymous name is present.
Definition	Describes the essence of the element, including definitions provided by reference sources.
Classification scheme	Relates elements to other schemes or models.
Keywords	Search key words to use to retrieve the element.
Related data reference	Used in conjunction with Type of Relationship to explain qualification or hierarchy.
Type of relationship	Includes equivalents, derivatives, listing of sequences within a subset. Terms include: qualifier_of; qualified_by; subject_of; part_of; parent_of; child_of; attribute_of; has_attribute; and derived_from.
Category	Type of designation used to represent an element (bar code, character string).
Form of representation	Description of the form in which the data element is represented (including text; code; date; uri; time; measure; number; amount).[11]
Datatype	Form of representation depicting element's values (character; ordinal number; integer; decimal; real; scaled;

[11] Representation Term List taken from *Using Levels of Abstraction to Name Data Elements* by Judith J. Newton (National Institute of Standards & Technology), The Data Administration Newsletter, http://www.tdan.com/i007ht01.htm. The term 'uri' replaces 'url' as found in ISO11179-3.3 dtd in English.doc supplied by Christophe Blanchi, Corporation for National Research Initiatives.

Refer to Sources Consulted (Appendix D) for acronym names and references.

	bit; rational; date). ISO 11404: http://std.dkuug.dk/JTC1/SC22/WG11/docs/iso11404.pdf METS uses W3 XML schema datatypes, including string, Boolean, decimal, dateTime, and others (see http://www.w3.org/TR/xmlschema-2/#datatype)
Maximum size	Maximum number of units representing the element. ADN includes number of allowable characters per element; their specifications are incorporated here for several elements. Phrasing for attribute is "Unlimited" or "Not to exceed __ digits/characters" or a single integer (i.e. 3).
Minimum size	Minimum number of units representing the element. This attribute has been defaulted to zero (0) for each data element.
Layout of representation	Description of layout of characters in the element, used especially when a specific structure is necessary.
Example/Code	Actual text examples or codes followed by parenthetical explanations of the code as needed.
Permissible values	Set of permissible values (names, codes, and text) pertaining to the data element. Can include pick lists, controlled word lists or more formal schema. ADN uses vocabulary levels (restricted or expandable).
Responsible organization	Organization responsible for the attributes (Defense Technical Information Center).
Status	Registration life-cycle position (Final).
Submitting organization	Organization submitting the element (Defense Technical Information Center).
Comment	Details and notes about the element. For example, some elements include the notation: "Work from an expandable list of values for this element" which means that a controlled list should be maintained and expanded upon as necessary during production.
MARC/DC crosswalk	Indicates comparable MARC or Dublin Core field, if any apply. Some elements with corresponding MARC fields do not distinguish subelements at the subfield level.
Source	CDL uses "Source" to specify whether the source of data is automatically generated or supplied manually. All entries to this table that follow CDL attribution begin with 'CDL.' If entry states only "automatically generated from defaults," the assumption is that this data could be defaulted into a system. For example, many of the sub-elements of Provenance_Action contain technical metadata that would be recorded in batches as digitization occurred and then defaulted into the system.
Applicable to all formats	Indicates conditional use of element based on format

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 11

	(image, audio, video, digital object, etc.). If not "All," indicates which formats are valid or invalid ("Only ___" or "All but ___").
Obligation	Indicates input requirement. Terms include: mandatory, optional, desirable or conditional (i.e. mandatory if applicable).
Maximum occurrence	Indicates repeatability of element as well as repeatability patterns. If repeatable, indicates whether the attribute is repeatable or if multiple values should be entered within a single attribute (single, multi-valued attribute). Terms: Repeatable; Repeatable only as attribute; Repeatable only with multiple values; and Not repeatable.

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 12

1.0 Reference Information

1.1 Reference Identifier

Element name	Reference_Identifier_Uniform_Resource
Identifier	1.1.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	NLA: "An identifier or 'permanent name' for an object that identifies it uniquely and persistently, and enables links to different manifestations of it, to metadata about it, and to other objects related to it." EUL: Persistent identifier defined as "an identifier for an object that enables links to different manifestations of it, to metadata about it, and to other objects related to it."
Classification scheme	
Keywords	Handle; Persistent identifier; Digital object identifier; Uniform Resource Locator; Uniform Resource Identifier
Related data reference	Reference_Identifier_Version
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Not to exceed 1024 digits/characters
Minimum size	0
Layout of representation	To date, all DVL handles begin with the prefix hdl:100.1. This is followed with a forward slash and the alphanumeric code representing the digital object.
Example/Code	hdl:100.1/PH24 hdl:100.1/MIADM000385
Permissible values	Follow DTIC/MG
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Unique alphanumeric identifier designed by DTIC for DVL purposes.
MARC/DC crosswalk	856u / <DC>Identifier
Source	CDL automatically generated.
Applicable to all formats	All
Obligation	Mandatory
Maximum occurrence	Not repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 13

Element name	Reference_Identifier_Unique
Identifier	1.1.2
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Unique alphanumeric identifier representing the digital object.
Classification scheme	
Keywords	Identifier
Related data reference	Reference_Identifier_Version
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Not to exceed __ digits/characters
Minimum size	0
Layout of representation	The identifier is composed of alphanumeric code.
Example/Code	CXADM001018
Permissible values	Follow DTIC/MG
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Number designed by DTIC for DVL purposes. The URI may serve as the unique identifier. The identifier may be used to represent sub-elements of the object.
MARC/DC crosswalk	035 / <DC>Identifier
Source	CDL automatically generated.
Applicable to all formats	All
Obligation	Mandatory
Maximum occurrence	Not repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

Element name	Reference_Identifier_Electronic_File
Identifier	1.1.3
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Identifies the name of digital file. It can include a file extension. This identifier can represent elements and sub-elements.
Classification scheme	
Keywords	File name; Electronic file
Related data reference	Reference_Identifier_Version
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Not to exceed __ digits/characters
Minimum size	0
Layout of representation	The identifier is composed of alphanumeric code.
Example/Code	SD33.wav MIADM000285_1_clip_1
Permissible values	Follow DTIC/MG
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Identifier designed by DTIC for DVL purposes.
MARC/DC crosswalk	856f / <DC>Identifier
Source	CDL automatically generated.
Applicable to all formats	All
Obligation	Conditional
Maximum occurrence	Repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 15

Element name	Reference_Identifier_Label
Identifier	1.1.4
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Title/creator field linkage to display to end user for identification purposes.
Classification scheme	
Keywords	Label; Title; Creator
Related data reference	
Type of relationship	
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	A Stitch in time [videorecording]
Permissible values	
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	
MARC/DC crosswalk	1xx and 245 / <DC>Creator and <DC>Title
Source	CDL manually supplied in encoding.
Applicable to all formats	All
Obligation	Optional
Maximum occurrence	Repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002 p. 16

Element name	Reference_Identifier_Version
Identifier	1.1.x.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Names, codes, numbers, or text that distinguish one version of a digital file from others.
Classification scheme	
Keywords	Version
Related data reference	Reference_Identifier_Uniform_Resource Reference_Identifier_Unique Reference_Identifier_Electronic_File
Type of relationship	qualifier_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	alpha 3.0 1.2
Permissible values	
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	
MARC/DC crosswalk	562c / <DC>Identifier
Source	
Applicable to all formats	All
Obligation	Optional
Maximum occurrence	Repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 17

1.2 Reference Domain

Element name	Reference_Domain_Electronic_Address
Identifier	1.2.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Domain or host name (network address) for the electronic location
Classification scheme	
Keywords	Electronic address; Domain address; Web address
Related data reference	Reference_Domain_Name
Type of relationship	qualified_by
Category	Character representation
Form of representation	URI
Datatype	Character
Maximum size	Not to exceed __ digits/characters
Minimum size	0
Layout of representation	
Example/Code	dvl.dtic.mil
Permissible values	Follow DTIC/MG
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Work from an expandable list of values for this element.
MARC/DC crosswalk	856a / <DC>Identifier
Source	Automatically generated from defaults.
Applicable to all formats	All
Obligation	Mandatory
Maximum occurrence	Not repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 18

Element name	Reference_Domain_Name
Identifier	1.2.2
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Conventional name and location of the host.
Classification scheme	
Keywords	Domain name; Corporate name
Related data reference	Reference_Domain_Electronic_Address
Type of relationship	qualifier_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	Defense Technical Information Center, Fort Belvoir, VA
Permissible values	Follow DTIC/MG
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Work from an expandable list of values for this element.
MARC/DC crosswalk	856n / <DC>Rights
Source	Automatically generated from defaults.
Applicable to all formats	All
Obligation	Optional
Maximum occurrence	Not repeatable

2.0 Context Information

Element name	Context_Relation_Manifestation
Identifier	2.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Identifies or describes related material, both digital and analog. Contains textual description of resource and identification number. NLA: Relationships and links between manifestation and other objects. ViDe: Uses Relation field to bring together different instantiations of the information object (analog original, analog preservation format, digital master, use copy).
Classification scheme	
Keywords	Related material; Relationship; Manifestation; Instantiation; File group
Related data reference	Context_Relation_Manifestation_Type Context_Relation_Link
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	Accompanies: DTIC technical report, number, title, control number. This is the 5th generation copy of [unique identifier and type]. Executive summary also available from the DoD web site. Master Thumbnail Gottscho-Schleisner Collection (Library of Congress) (DLC) 85861312 Carnegie-Mellon Collection
Permissible values	
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	
MARC/DC crosswalk	530 (Additional physical form) and 787 (nonspecific relationship / <DC>Relation.
Source	

Refer to Sources Consulted (Appendix D) for acronym names and references.

Applicable to all formats	All
Obligation	Optional
Maximum occurrence	Repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 21

Element name	Context_Relation_Manifestation_Type
Identifier	2.1.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Qualifies type of relationship to resource, including relationship of a part to a whole. Used to relate subunit level of component part hierarchy to unit at collection level. Identifies collection title and identifier, sequence in a presentation or part or a whole (like a grid or detail). NAA: Relation element includes sub-elements Related Item ID, Relation Type (contains/contained in, next/previous, replaces/replaced by, refers to, derived from), and Relation Description. ADN: DLESE kept the old IsBasedOn and IsBasisFor and added HasThumbnail from NASA. GEM: Relation Element Controlled Vocabulary based on Dublin Core: http://www.geminfo.org/Workbench/Metadata/relationtable.html VRA: Contains proposed Relation types for Dublin Core Relation element, including larger entity, copy or, version of references, derived from. Whole/part or associative.
Classification scheme	
Keywords	Manifestation type; Relation type; Whole/Part; Association
Related data reference	Context_Relation_Manifestation
Type of relationship	qualifier_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	Is Part Of References Is Format Of
Permissible values	Could use Dublin Core controlled vocabulary of qualifiers as controlled terminology for this element. See: http://dublincore.org/documents/2000/07/11/dcmes-qualifiers/#relation
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center

Refer to Sources Consulted (Appendix D) for acronym names and references.

Comment	Work from an expandable list of values for this element.
MARC/DC crosswalk	787 (Nonspecific relationship) and 773 (Host item entry) / <DC>Relation.
Source	
Applicable to all formats	All
Obligation	Optional
Maximum occurrence	Repeatable only as attribute.

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 23

Element name	Context_Relation_Bibliographic_Record
Identifier	2.2
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	Control number
Context	MARC
Definition	A unique system-generated number identifying the MARC bibliographic record linked with the digital object.
Classification scheme	
Keywords	Bibliographic record control number; MARC control number
Related data reference	Context_Relation_Link
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Not to exceed __ digits/characters
Minimum size	0
Layout of representation	Alphanumeric identifier.
Example/Code	DTIC-000001
Permissible values	Follow DTIC/MG
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	
MARC/DC crosswalk	001 / <DC>Relation.Is Referenced By or References
Source	CDL manually supplied in data capture.
Applicable to all formats	All
Obligation	Mandatory
Maximum occurrence	Not repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 24

Element name	Context_Relation_Documentation
Identifier	2.3
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Details about documentation related to the material, including codebooks, manuals, and other documentation. PMWG: Documentation necessary or useful for display or interpretation.
Classification scheme	
Keywords	Documentation; Codebooks; Manuals
Related data reference	Context_Relation_Link
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	Documentation in 'readme' file. Glossary available at http://www.info

21 March 2002   p. 27

3.0 Provenance Information

Element name	Provenance_Location
Identifier	3.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Name of the organization or agency holding the material or providing access to it. This organization or agency is the source of the material being described.
Classification scheme	
Keywords	Organizational name; Institutional name; Corporate name; Source; Location
Related data reference	Provenance_Location_Address Provenance_Location_Uniform_Resource_Identifier Provenance_Location_Source_Code
Type of relationship	qualified_by
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	Air Combat Command Heritage of America Band
Permissible values	When available, use form of name listed in DTIC Corporate Source Authority System at: http://www.dtic.mil/corpsource/.
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	
MARC/DC crosswalk	852 / <DC>Rights
Source	Automatically generated from defaults.
Applicable to all formats	All
Obligation	Optional
Maximum occurrence	Repeatable

Refer to Sources Consulted (Appendix D) for acronym names and references.

21 March 2002   p. 28

Element name	Provenance_Location_Address
Identifier	3.1.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Address of the organization or agency holding the material or providing access to it. This organization or agency is the source of the material being described.
Classification scheme	
Keywords	Street address; Mailing address
Related data reference	Provenance_Location
Type of relationship	qualifier_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	[Street name], [City], [State abbreviation] [Zip code]
Example/Code	86 Hickory Street, Langley Air Force Base, VA 23665-2192 USA
Permissible values	When available, use form of address listed in DTIC Corporate Source Authority System at: http://www.dtic.mil/corpsource/.

3.4 Provenance_Action

Element name	Provenance_Action_Method
Identifier	3.4.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Technique used to perform processing or preservation actions, including format of the manifestation. NLA: Process element includes "all relevant details of any process applied to a digital object or file, including software, specific settings or actions that were required to produce the current manifestation, details of all equipment and responsible agencies or persons." IU/RKMS: sub-element of action is date/time, type, description, next action and next action due. LOM: Uses Life Cycle for history and current state of object, as well as those who affected it during its evolution.
Classification scheme	
Keywords	Action method; Process; Action type; Transformation; Lifecycle
Related data reference	Provenance_Action_Method_Specifications
Type of relationship	parent_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	MARC: "reformatted;" and "will reformat." NLA: conversion of .wav to .aiff; copy from floppy disk to CD-R. IU/RKMS: backed-up; imaged; medium refreshed; microfilmed; migrated.
Permissible values	
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Use this element only when describing processing or preservation action. Work from an expandable list of values for this element.

Element name	Fixity_Access_Inhibitor_Watermark
Identifier	4.2.2
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Webopedia definition: A pattern of bits inserted into a digital image, audio or video file that identifies the file's copyright information (author, rights, etc.). The purpose of digital watermarks is to provide copyright protection for intellectual property that's in digital format. Unlike printed watermarks, which are intended to be somewhat visible, digital watermarks are designed to be completely invisible, or in the case of audio clips, inaudible.
Classification scheme	
Keywords	Watermark; Steganography
Related data reference	Fixity_Access_Inhibitor
Type of relationship	child_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited

21 March 2002   p. 70

Element name	Fixity_Access_Inhibitor_Digital_Signature
Identifier	4.2.4
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	A digital signature ensures that the document originated with the person signing it and that is was not tampered with after the signature was applied. However, the sender could be an impersonator and not the person claimed. To verify that the message was sent by the person claiming to send it requires a digital certificate (digital ID) issued by a certification authority. NEDLIB "Metadata for the Long Term Preservation of Electronic Publications" defines digital signature as "a digital code that can be attached to an electronically transmitted message that uniquely identifies the sender." NAA: An encrypted, tamper-proof piece of data which creates a unique and unforgeable identifier of the Document Author, Record Creator, Transactors, or Action Officers.
Classification scheme

Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Expression of type of material (media/medium) being described. PITT: File modality (text, numeric, graphic, geographic, image, sound, video, multimedia, etc.) CEDARS: File modality is a "higher level of Element Name, similar to Dublin Core 'Type,' i.e. text, graphic, sound, video, etc." NLA/PMWG: Uses term 'structural type' to describe object (image, sound, video, text, database, software, web document or multi-media). NAA: Media format includes audio, compound, image, text and video. IU/RKMS: Media format identifies the type of data representation and file types; generic format. ADN: Controlled vocabulary for Educational.LearningResourceType.Langstgring includes list subdivided into the following areas: audio, data, learning materials, portal, service, text, tool, visual (http://www.dlese.org/Metadata/vocabularies/vocabs.htm).
Classification scheme	
Keywords	Media Type; Structural type; Media format; File modality
Related data reference	
Type of relationship	
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Not to exceed 512 digits/characters.
Minimum size	0
Layout of representation	
Example/Code	Image. Photograph. Clip of audio. Segment of videorecording. Interactive multimedia. Text. Audio. Video. Application.
Permissible values	

Refer to Sources Consulted (Appendix D) for acronym names and references.

Element name	Representation_Format_Details_Image_Color_Space
Identifier	5.9.1.2
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Method used to represent color for display and printing. CDL: Color space used, often needed by viewer; indicates whether image was initially created for onscreen display or for pre-press output. (Some color space parameters such as white point may require individual tags.) CDL Best Practices: Number of channels. DIG35: Specifies the colorspace of the decompressed image data. Details component information (e.g. RGB) separately. MOA: Scanner profile describes the color artifacts introduced by the scanner; need to map images into standard color space and adjust for display/printing. Indicates creation for onscreen display or prepress output. NISO: Uses "PhotometricInterpretation" to designate the color space of the decompressed image data. Uses SamplesPerPixel to designate the number of color components per pixel.
Classification scheme

5.9.2 Representation_Format_Details_Audio

Element name	Representation_Format_Details_Audio_Channel _Information
Identifier	5.9.2.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	LC/CORE and CF: Additional information about audio channel configuration (languages, channels to speakers). AVPP: Number and information about channels/tracks. NLA: Uses Track Number and Type to state number of tracks and their relationship. HAR: Uses Number of channels to designate the number of audio channels present. Uses Sound channel map (with subelements of assignment, number, and location).
Classification scheme	
Keywords	Audio channel; Track number; Track type; Number of channels
Related data reference	Representation_Format_Details_Audio
Type of relationship	child_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	2-trk 4-trk 8-trk 2 track stereo 5 channel surround
Permissible values	
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Work from an expandable set of values for this element.
MARC/DC crosswalk	<DC>Format
Source

Element name	Representation_Format_Details_Audio_Duration
Identifier	5.9.2.2
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Playing time of performance or recording, entered according to standard time format.
Classification scheme	
Keywords	Running time; Duration
Related data reference	Representation_Format_Details_Audio
Type of relationship	child_of
Category	Character representation
Form of representation	Time
Datatype	Integer
Maximum size	Not to exceed 12 digits/characters
Minimum size	0
Layout of representation	
Example/Code	01:20:45
Permissible values	Follow TIFF date/time format: [hh:mm:ss].
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment

Element name	Representation_Format_Details_Audio_Resolution
Identifier	5.9.2.4
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	LC/CORE: Number of samples per second. NLA: uses audio resolution for sampling frequency in kHz. Techtarget definition: "The more samples taken per second, the more accurate the digital representation of the sound can be. For example, the current sample rate for CD-quality audio is 44,100 samples per second." AVPP: Rate at which the audio was sampled. HAR: Uses Sample rate to designate the number of samples per second in sample frames.
Classification scheme	
Keywords	Resolution; Sampling frequency; kHz; Sample rate
Related data reference	Representation_Format_Details_Audio
Type of relationship	child_of
Category	Character representation
Form of representation	Measure
Datatype	Integer
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	44.1 kHz 96 kHz
Permissible values	Generally 32, 44.1, 48, 88.2, 96 or 192.
Responsible organization	Defense Technical Information Center
Status	Final
Submitting organization	Defense Technical Information Center
Comment	Work from an expandable list of values for this element.

Element name	Representation_Format_Details_Audio_Bit_Depth
Identifier	5.9.2.5
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	LC/CORE and CF: Number of bits per sample (bps). NLA: Audio bit rate is word length to encode audio, indicating dynamic range. AVPP: Number of bits in a digital audio sample. HAR: Uses bit depth to designate the number of bits per sample point of audio data.
Classification scheme	
Keywords	Bit depth; Audio bit rate; Bits per sample
Related data reference	Representation_Format_Details_Audio
Type of relationship	child_of
Category	Character representation
Form of representation	Measure
Datatype	Integer
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	16 bps 24 bps
Permissible values

5.9.3 Representation_Format_Details_Video

Element name	Representation_Format_Details_Video_Frame_Rate
Identifier	5.9.3.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	LC/CORE and CF: Rate at which a video plays back in frames per second (fps). NLA: Standard frame rate per second of the video. AVPP: Uses 'frames' to represent number of fames and frame rate of video source item.
Classification scheme	
Keywords	Video frame rate; Frames per second
Related data reference	Representation_Format_Details_Video
Type of relationship	child_of
Category	Character representation
Form of representation	Measure
Datatype	Integer
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	25 fps
Permissible values	
Responsible organization	Defense Technical Information Center

5.9.4 Representation_Format_Details_Digital_Object

Element name	Representation_Format_Details_Digital_Object_Code
Identifier	5.9.4.1
Version/version date	0.1
Registration authority	Defense Technical Information Center
Synonymous name	
Context	
Definition	Code type and version used to execute program. NEDLIB/MD: Uses Interpreter and compiler to reference programming that allows analysis and execution of source program or translation of program. Includes Name, Version, and Instruction. NLA: Code type used to compile the executable and version.
Classification scheme	
Keywords	Code type; Program executable; Interpreter; Compiler
Related data reference	Representation_Format_Details_Digital_Object_Code
Type of relationship	child_of
Category	Character representation
Form of representation	Text
Datatype	Character
Maximum size	Unlimited
Minimum size	0
Layout of representation	
Example/Code	Compiled using Intel code executable for Windows 95 environment. Compiled using Perl script. Java version 1.2.

Appendix B. Table Listing DVL Data Elements in OAIS Framework[12]

OAIS	Identifier	Element Name
1.0 Reference Information [13]	1.1	Reference_Identifier
	1.1.1	Reference_Identifier_Uniform_Resource
	1.1.2	Reference_Identifier_Unique
	1.1.3	Reference_Identifier_Electronic_File
	1.1.4	Reference_Identifier_Label
	1.1.x.1	Reference_Identifier_Version
	1.2	Reference_Domain
	1.2.1	Reference_Domain_Electronic_Address
	1.2.2	Reference_Domain_Name
2.0 Context Information[14]	2.1	Context_Relation_Manifestation
	2.1.1	Context_Relation_Manifestation_Type
	2.2	Context_Relation_Bibliographic_Record
	2.3	Context_Relation_Documentation
	2.4	Context_Relation_Finding_Aid
	2.x.1	Context_Relation_Link
3.0 Provenance Information [15]	3.1	Provenance_Location
	3.1.1	Provenance_Location_Address
	3.1.2	Provenance_Location_Uniform_Resource_Identifier
	3.1.3	Provenance_Location_Source_Code
	3.2	Provenance_Custodial_History
	3.3	Provenance_Conditional
	3.3.1	Provenance_Conditional_Jurisdiction
	3.3.1.1	Provenance_Conditional_Jurisdiction_Address
	3.3.1.2	Provenance_Conditional_Jurisdiction_Source_Code
	3.3.1.3	Provenance_Conditional_Jurisdiction_Authorization
	3.3.1.4	Provenance_Conditional_Jurisdiction_Authorized_Users
	3.3.1.4.1	Provenance_Conditional_Jurisdiction_Authorized_Users_Date
	3.3.2	Provenance_Conditional_Access
	3.3.3	Provenance_Conditional_Use
	3.3.3.1	Provenance_Conditional_Use_Rights/Restrictions
	3.3.3.2	Provenance_Conditional_Use_Rights_Holder
	3.3.3.3	Provenance_Conditional_Use_Credit_Line

---

[12] Based on OAIS research documented in the OCLC/RLG Preservation Metadata Working Group White paper, *Preservation Metadata for Digital Objects: A Review of the State of the Art* [http://www.oclc.org/digitalpreservation/presmeta_wp.pdf], January 31, 2001.

[13] Describes identifiers assigned to the content information, e.g. URN, ISBN.

[14] Documents relationship of Content Information to its environment, e.g. why created.

[15] Documents source of the content information, e.g. origins, actions, custody, migration.

Refer to Sources Consulted (Appendix D) for acronym names and references.

OAIS	Identifier	Element Name
	3.3.3.4	Provenance_Conditional_Use_Cost(Fee)
	3.3.3.5	Provenance_Conditional_Use_Permission
	3.3.3.5.1	Provenance_Conditional_Use_Permission_Name
	3.3.3.5.2	Provenance_Conditional_Use_Permission_Date
	3.4	Provenance_Action
	3.4.1	Provenance_Action_Method
	3.4.1.1	Provenance_Action_Method_Specifications
	3.4.2	Provenance_Action_Composition
	3.4.3	Provenance_Action_Software
	3.4.4	Provenance_Action_Hardware
	3.4.5	Provenance_Action_Date_Time
	3.4.5.1	Provenance_Action_Date_Time_Interval
	3.4.6	Provenance_Action_Modification_History
	3.4.7	Provenance_Action_Site
	3.4.7.1	Provenance_Action_Site_Place
	3.4.7.2	Provenance_Action_Site_Agent
	3.4.8	Provenance_Action_Agency
	3.4.9	Provenance_Action_Status
	3.4.10	Provenance_Action_Label
4.0 Fixity Information[16]	4.1	Fixity_Checksum
	4.1.1	Fixity_Checksum_Date_Time
	4.1.1.1	Fixity_Checksum_Date_Time_Qualifier
	4.1.2	Fixity_Checksum_Type
	4.2	Fixity_Access_Inhibitor
	4.2.1	Fixity_Access_Inhibitor_Encryption
	4.2.2	Fixity_Access_Inhibitor_Watermark
	4.2.3	Fixity_Access_Inhibitor_Password_Protection
	4.2.4	Fixity_Access_Inhibitor_Digital_Signature
5.0 Representation Information[17]	5.1	Representation_Composition
	5.2	Representation_File_Modality
	5.3	Representation_Format_Type
	5.3.1	Representation_Format_Type_File_Extension
	5.3.2	Representation_Format_Type_Version
	5.4	Representation_File_Size
	5.5	Representation_Compression
	5.6	Representation_Physical_Carrier
	5.7	Representation_Requirements
	5.7.1	Representation_Requirements_Installation

---

[16] Documents authentication mechanisms, e.g. checksum.

[17] Information needed to make the Data Object understandable, including structure information, semantic information, representation network, representation rendering software, and access software.

Refer to Sources Consulted (Appendix D) for acronym names and references.

OAIS	Identifier	Element Name
	5.7.2	Representation_Requirements_System
	5.7.3	Representation_Requirements_Software
	5.7.4	Representation_Requirements_Hardware
	5.7.5	Representation_Requirements_Operating_System
	5.7.6	Representation_Requirements_Peripheral
	5.8	Representation_Delivery_Method
	5.8.1	Representation_Delivery_Method_Format
	5.8.2	Representation_Delivery_Method_Display
	5.9	Representation_Format_Details
	5.9.1	Representation_Format_Details_Image
	5.9.1.1	Representation_Format_Details_Image_Orientation
	5.9.1.2	Representation_Format_Details_Image_Color_Space
	5.9.1.3	Representation_Format_Details_Image_Color_Management
	5.9.1.4	Representation_Format_Details_Image_Resolution
	5.9.1.5	Representation_Format_Details_Image_Dimension
	5.9.1.6	Representation_Format_Details_Image_Bit_Depth
	5.9.2	Representation_Format_Details_Audio
	5.9.2.1	Representation_Format_Details_Audio_Channel_Information
	5.9.2.2	Representation_Format_Details_Audio_Duration
	5.9.2.3	Representation_Format_Details_Audio_Sound
	5.9.2.4	Representation_Format_Details_Audio_Resolution
	5.9.2.5	Representation_Format_Details_Audio_Bit_Depth
	5.9.3	Representation_Format_Details_Video
	5.9.3.1	Representation_Format_Details_Video_Frame_Rate
	5.9.3.2	Representation_Format_Details_Video_Data_Rate
	5.9.3.3	Representation_Format_Details_Video_Duration
	5.9.3.4	Representation_Format_Details_Video_Sound
	5.9.3.5	Representation_Format_Details_Video_Resolution
	5.9.3.6	Representation_Format_Details_Video_Bit_Depth
	5.9.4	Representation_Format_Details_Digital_Object
	5.9.4.1	Representation_Format_Details_Digital_Object_Code

Refer to Sources Consulted (Appendix D) for acronym names and references.

Appendix C. Definitions of OAIS Terminology

Archival record equates to Content Information in an Archival Information Package.

Archive Information Package: aggregation of the four types of Information Object.

Content Information: data object of primary interest; data object and representation information. Content Information is information the archive is mandated to preserve.

Descriptive Information: facilitates access through search and retrieval; package descriptions to support order of information.

Information object: Data Object combined with Representation Information. 4 classes of information objects are: Content Information, Preservation Description Information, Packaging Information and Descriptive Information.

Information Package: aggregation of Content Information Object, Preservation Description Information Object, Packaging Information Object and Descriptive Information Object. It is a container for Content Information and Preservation Description Information, encapsulated by the Packaging Information, and discoverable with Descriptive Information.

OAIS: Open Archival Information System. Reference model establishes a conceptual framework for a digital archive.

Packaging Information: binds object and metadata into identifiable unit

Preservation Description Information: 4 types: Provenance, Reference, Fixity and Context Information (see Appendix B); information necessary to preserve Content Information.

Representation Information: Structure information (data structure concepts like bits and pixels) and semantic information (complex meanings associated with structure information elements).

Refer to Sources Consulted (Appendix D) for acronym names and references.
