# Domestic Migration Across Regions, Divisions, and States: 1995 to 2000 

Census 2000 Special Reports

Movement of people from one location to another at any geographic scale affects both the origin and the destination locations. When the rate of natural increase is low, an increasing share of population change may be attributed to migration, whether domestic or international. Domestic (or internal) migration is the movement of people within national boundaries, whereas international migration refers to movement across those boundaries. In the United States, according to Census 2000, over 22 million people were domestic migrants who changed their state of residence between 1995 and 2000. Of these domestic migrants, approximately half relocated to a state in a different region. This movement did not affect all states equally, however. Inmigration and outmigration levels varied widely, with markedly uneven results across the country.

This report, the first of several addressing Census 2000 migration topics, discusses migration between regions, divisions, and states between 1995 and 2000. It provides an overview of migration patterns at the three geographic levels and shows which parts of the country gained and lost most from the movement of people within the United States. Although movement from abroad represents an important component of the country's migration experience, this report concentrates solely on internal, or domestic, migration. Net migration rates complement migration flow numbers, and together the two measures summarize the effects of migration on regional,
division, and state populations in the United States between 1995 and 2000.

> The South had the highest inmigration and outmigration levels of the four regions.
Details of in- and outmigration flows from 1995 to 2000 for all regions,

## Common Migration Terms

Migration: Commonly defined as moves that cross jurisdictional boundaries. This report includes those moves that crossed state, division, or region boundaries within the United States.

Inmigration: Migration into an area during a given period.

Outmigration: Migration out of an area during a given period.

Gross Migration: The sum of inmigration and outmigration for an area for a given period. This measure shows, in other words, the total amount of movement in and out of an area.

Net Migration: The difference between inmigration and outmigration during a given period. A positive net, or net inmigration, indicates that more migrants entered the area than left it during that period. A negative net, or net outmigration, means that more migrants left the area than entered it.
divisions, and states are shown in Table 1.' The highest levels of both in- and outmigration of all four census regions occurred in the South. ${ }^{2}$ Just over 5 million people moved from the Northeast, the Midwest, and the West to the South between 1995 and 2000. ${ }^{3}$ During the same period, 3.2 million individuals left the South for one of the other regions. The resulting net inmigration rate was 20.2, meaning that the South gained 20.2 people through migration for every 1,000 individuals living there in $1995 .{ }^{4}$

The Northeast, the Midwest, and the West displayed different

[^0]migration patterns from the South. Between 1995 and 2000, net outmigration in the Northeast reached 25.5 for each 1,000 residents in 1995. In the Midwest, the net outmigration rate during the same period was much lower, at 9.1. Although the second-highest level of inmigration was in the West, at 2.7 million people, this figure was balanced by an almost equivalent number of outmigrants, creating a net inmigration rate for the West of just 0.2.

## The South Atlantic division drew most of the migrants who moved to the South.

When census regions are separated into their divisions, greater variation in migration patterns appears. ${ }^{5}$ Although the South as a whole experienced substantial net inmigration, the main driver of migration growth in the region was the South Atlantic division, where the net migration rate was 31.6. Net inmigration rates in the remaining two southern divisions, East South Central and West South Central, were 15.1 and 4.7 , respectively.

Similarly, net outmigration in the Northeast and the Midwest regions was concentrated in specific divisions. The net outmigration

[^1]rate for the Middle Atlantic division of the Northeast was 32.0 , but its companion division in the region, New England, had a net outmigration rate of 6.4. In the Midwest, the net migration rate for the East North Central division indicates that 12.5 individuals outmigrated during this period for every 1,000 residents in 1995. In contrast, net outmigration from the West North Central division resulted in a net outmigration rate of 1.1 , a much smaller net rate.

Although the West as a whole experienced negligible net inmigration between 1995 and 2000, its two divisions displayed noticeably different migration trends. The Pacific division, in spite of receiving 1.9 million domestic inmigrants, had an even greater number of outmigrants, resulting in a net outmigration rate of 17.4. In net terms, the Mountain division gained about the same number of migrants as the Pacific division lost (an approximate 724,000 net gain in the Mountain division compared with an approximate 712,000 net loss in the Pacific). The impact of net migration appears to be much larger in the Mountain division, where the net inmigration rate was 46.5.

## Nevada and New York were among the states with the most active internal migration.

Net migration rates indicate onesided migration flows - that is, flows dominated by either in- or outmigration - when they are either strongly negative, in the case of net outmigration, or strongly positive, in the case of net inmigration (see Figure 1 and Table 1). Nevada had the highest net inmigration rate of all the states, with a gain of 151.5 people for every 1,000 residents in 1995. Among all states, the highest net outmigration rate was in Hawaii

Table 1.
Domestic Migration for Regions, Divisions, and States: 1995 to 2000

| Wyoming . . . . . . | 72,834 | 85,361 | 158,195 | -12,527 | 154.9 | 181.6 | 336.5 | -26.6 |

[^2](65.4). Washington, DC, had a net outmigration rate of 81.7.

Figure 1 illustrates that migration in a few states differed markedly from trends in nearby states. Net outmigration from Illinois, for example, contrasted with net inmigration to four of its five adjacent states. Louisiana and New Mexico also experienced net outmigration, but were surrounded by states with net inmigration. Perhaps the most startling case is California, whose moderate net outmigration rate contrasted with high rates of net inmigration in the neighboring states of Nevada and Arizona.

The highest gross migration between 1995 and 2000, indicating the total movement in and out of an area during a particular period, was seen in California, Florida, Texas, New York, and Illinois. In California's case, gross migration exceeded 3.6 million people. Outmigration exceeded inmigration, however, resulting in a net loss of approximately 756,000 people. Outmigration greatly exceeded inmigration in New York and Illinois, as well. Florida, in comparison, had net inmigration of approximately 607,000 , or a net inmigration rate of 44.0 , with total migration of 3.1 million. Texas also experienced net inmigration, although to a smaller extent (8.1 net migration rate).

In summary, many of the highest state migration levels were in the South, largely in the South Atlantic division; Nevada's net inmigration rate was the highest in the country.

Many of the highest levels of migration were in the South. That region's South Atlantic division includes states that were among the top destination states in the country during the 1995 to 2000
period, especially Florida, Georgia, and North Carolina. Of the states, Nevada's net inmigration rate was the highest in the country.

The region with the lowest levels of inmigration, gross migration, and net migration was the Northeast. The high net outmigration rate reflects that the Northeast lost more population through outmigration than any other region, with most of the loss in the Middle Atlantic division and particularly the state of New York.

This report shows that, at each geographic level, internal migration was not uniformly balanced across the country; some locations gained population through inmigration, while others experienced a net loss. In still other locations, migration was characterized by a high degree of movement in and out of the area.

## ACCURACY OF THE ESTIMATES

The data contained in this report are based on the sample of households who responded to the Census 2000 long form. Nationally, approximately 1 out of every 6 housing units was included in this sample. As a result, the sample estimates may differ somewhat from the 100-percent figures that would have been obtained if all housing units, people within those housing units, and people living in group quarters had been enumerated using the same questionnaires, instructions, enumerators, and so forth. The sample estimates also differ from the values that would have been obtained from different samples of housing units, people within those housing units, and people living in group quarters. The deviation of a sample estimate from the average of all possible samples is called the sampling error.

In addition to the variability that arises from the sampling procedures, both sample data and 100-percent data are subject to nonsampling error. Nonsampling error may be introduced during any of the various complex operations used to collect and process data. Such errors may include: not enumerating every household or every person in the population, failing to obtain all required information from the respondents, obtaining incorrect or inconsistent information, and recording information incorrectly. In addition, errors can occur during the field review of the enumerators' work, during clerical handling of the census questionnaires, or during the electronic processing of the questionnaires.

Nonsampling error may affect the data in two ways: (1) errors that are introduced randomly will increase the variability of the data and, therefore, should be reflected in the standard errors; and (2) errors that tend to be consistent in one direction will bias both sample and 100-percent data in that direction. For example, if respondents consistently tend to underreport their incomes, then the resulting estimates of households or families by income category will tend to be understated for the higher income categories and overstated for the lower income categories. Such biases are not reflected in the standard errors.

While it is impossible to completely eliminate error from an operation as large and complex as the decennial census, the Census Bureau attempts to control the sources of such error during the data collection and processing operations. The primary sources of error and the programs instituted to control error in Census 2000 are described in detail in Summary File 3 Technical Documentation under

Chapter 8, "Accuracy of the Data," located at www.census.gov /prod/cen2000/doc/sf3.pdf.

All statements in this Census 2000 report have undergone statistical testing and all comparisons are significant at the 90 -percent confidence level, unless otherwise noted. The estimates in tables, maps, and other figures may vary from actual values due to sampling and nonsampling errors. As a result, estimates in one category may not be significantly different from estimates assigned to a different category. Further information on the accuracy of the data is located at www.census.gov/prod /cen2000/doc/sf3.pdf. For further information on the computation and use of standard errors, contact the Decennial Statistical Studies Division at 301-763-4242.

## FOR MORE INFORMATION

More detailed information on decennial migration products, including additional tables and other product announcements, is available on the Internet and can be accessed via the Census Bureau's decennial census migration Web page at www.census.gov/population /www/cen2000/migration.html.

The decennial migration Web page contains additional detailed migration tables not included in this report, a schedule of upcoming migration data releases, and migra-tion-related Census 2000 Special Reports.

For more information on decennial migration products, please contact:

Population Distribution Branch Population Division
U.S. Census Bureau 301-763-2419
or send e-mail to pop@census.gov.

Information on other population and housing topics is presented in the Census 2000 Brief and Special Reports Series, located on the U.S. Census Bureau's Web site at www.census/gov/population/www /cen2000/briefs.html. These series present information about race, Hispanic origin, age, sex, household type, housing tenure, and other social, economic, and housing characteristics.

Census 2000 information and data can also be accessed via the Census 2000 Gateway Web page at www.census.gov/main/www /cen2000.html.

For more information about Census 2000, including data products, call our Customer Services Center at 301-763-INFO (4636) or e-mail webmaster@census.gov.

[^0]:    ${ }^{\text {' }}$ All decennial census migration data refer to the population 5 years old and over in 2000. Movers are defined as those who did not live in their residence 5 years previously. Thus previous residence is measured 5 years prior to the census and does not track any other moves made within that 5 -year period. Similarly, the census question on residence 5 years ago did not capture those who moved away from a place of residence and later returned to that same residence during that 5 -year period.

    The estimates in this report are based on responses from a sample of the population. As with all surveys, estimates may vary from the actual values because of sampling variation or other factors. All comparisons made in this report have undergone statistical testing and are significant at the 90 -percent confidence level unless otherwise noted.
    ${ }^{2}$ The Northeast region includes Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. The Midwest includes Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. The South includes Alabama, Arkansas, Delaware, the District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The West includes Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.
    ${ }^{3}$ Figures appearing in the text have been rounded. See Table 1 for complete numbers.
    ${ }^{4}$ The net migration rate in this report is based on an approximated 1995 population, which is the sum of people who reported living in the area in both 1995 and 2000, and those who reported living in that area in 1995 but lived elsewhere in 2000. The net migration rate is the 1995-to-2000 net migration, divided by the approximated 1995 population and multiplied by 1,000 .

[^1]:    ${ }^{5}$ The New England division includes Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. The Middle Atlantic division states are New York, New Jersey, and Pennsylvania. The East North Central division includes Ohio, Indiana, Illinois, Michigan, and Wisconsin. The West North Central division includes Minnesota, lowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. The South Atlantic division comprises Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. The East South Central division states are Kentucky, Tennessee, Alabama, and Mississippi. The West South Central division includes Arkansas, Louisiana, Oklahoma, and Texas. The Mountain division states are Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada. The Pacific division includes Washington, Oregon, California, Alaska, and Hawaii.

[^2]:    - Net migration and the net migration rate for domestic migration for the United States are zero by definition.
    * Gross migration and the gross migration rate for region, division, and state totals are not computed.
    ${ }^{1}$ The net migration rate is based on an approximated 1995 population, which is the sum of people who reported living in the area in both 1995 and 2000 , and those who reported living in that area in 1995, but lived elsewhere in 2000. The net migration rate is the 1995-to-2000 net migration, divided by the approximated 1995 population and multiplied by 1000. ${ }_{3}$ Interregional migration.
    ${ }^{3}$ Interdivisional migration
    ${ }^{4}$ Interstate migration.
    Note: A negative value for net migration or the net migration rate is indicative of net outmigration, meaning that more migrants left an area than entered it, between 1995 and 2000 . sitive values reflect net inmigration to an area.
    Note: Census 2000 migration data include Puerto Rico among all movers from abroad. Because this report focuses solely on domestic migration, Puerto Rico has been excluded from this table. Puerto Rico migration data are available on the Census Bureau's Web site: www.census.gov/population/www/cen2000/migration.html.
