#### DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION

Interim Final 2/5/99

# RCRA Corrective Action Environmental Indicator (EI) RCRIS code (CA725) Current Human Exposures Under Control

Facility Name: International Paper, Inc. – Non-Treated Wood Products (TWP) Area

Facility Address: 10 International Way, Longview, Washington

Facility EPA ID #: WAD 010745917

1.	Has <b>all</b> available relevant/significant information on known and reasonably suspected releases to soil, groundwater, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been <b>considered</b> in this EI determination?				
	X If yes - check here and continue with #2 below.				
	If no - re-evaluate existing data, or				
	if data are not available skip to #6 and enter "IN" (more information needed) status code.				

## **BACKGROUND**

## **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

## **Definition of "Current Human Exposures Under Control" EI**

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

# **Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

## **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "**contaminated**" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

**Rationale and Reference(s):** The former International Paper facility was located on the north side of the Columbia River, approximately 66 miles upriver from the Pacific Ocean. The former facility is located less than two miles downstream of the confluence of the Columbia and Cowlitz rivers. The former facility lies within the 100-year floodplain but is protected by control levees.

International Paper operated a wood treatment facility at this location from 1956 to 1983. The Treated Wood Product (TWP) area, the site of the former wood treatment operation at the former southwestern corner of the International Paper facility, encompassed the retort building, associated structures (e.g., tanks, sheds, water treatment facilities, and the locations of former Ponds 1 and 2). The original International Paper facility was approximately 900 acres. The former TWP area consists of approximately 4 acres; the rest of the original International Paper facility is called the non-TWP area and includes a number of solid waste management units (SWMUs) and areas of concern (AOCs) identified in the 1991 RCRA facility assessment (RFA) report.

SWMU 6 (Site C) is located at the eastern edge of the former International Paper facility and was reportedly used for the disposal of various wastes and liquids. International Paper investigated Site C in October 1996. The investigation determined that there were residual concentrations of carcinogenic polycyclic aromatic hydrocarbon (cPAH) compounds, pentachlorophenol, bis(2-ethylhexyl)phthalate, arsenic, barium, and copper in soil at concentrations exceeding MTCA residential groundwater protection standards. Levels of arsenic and bis(2-ethylhexyl)phthalate in groundwater exceeded MTCA residential groundwater standards. Based on the results of that investigation and subsequent groundwater modeling that indicated that MTCA residential groundwater standards would not be exceeded at the boundary of Site C, Ecology determined that a deed restriction was required to prohibit extraction of groundwater in the vicinity of Site C. The deed restriction was filed with the Cowlitz County auditor in February 2000.

International Paper investigated AOC 23, a former below-grade concrete enclosure located within the foundation of the former flakeboard plant building, in November 1996. The results of field screening tests

indicated that some soil filling the concrete enclosure had concentrations of total petroleum hydrocarbon (TPH) compounds above the current MTCA Method A industrial soil cleanup level. The soil within the concrete enclosure was excavated and disposed of at an appropriate offsite location.

International Paper investigated SWMU 30, the former site of two aboveground storage tanks within an unlined concrete bermed area, in 1994 and 1996. The results of investigations indicated that TPH compounds above MTCA Method A industrial soil cleanup level were present in surface soils. Soils inside and surrounding the bermed area were excavated in November 1996 and disposed of at an appropriate offsite location. Verification samples were collected from the excavation areas and analyzed for total recoverable petroleum hydrocarbons (TRPH) by Ecology Method WTPH-418.1. The concentrations of TRPH compounds in the verification samples were all less than 50 mg/kg.

International Paper investigated SWMU 9, the retort loadout area, in March 1996. The results of investigations indicated that TPH compounds above MTCA Method A industrial soil cleanup level were present in surface soils. Carcinogenic PAH compounds were also present in surface soil above MTCA industrial soil cleanup levels. Approximately 205 tons of soil were excavated from the retort loadout area in November 1996 and hauled offsite to ChemWaste Management Northwest, a RCRA-permitted hazardous waste landfill in Arlington, Oregon. Verification samples were collected from the excavation areas and analyzed for total recoverable petroleum hydrocarbons (TRPH) by Ecology Method WTPH-418.1 and PAH compounds by Method 8270 SIM. The concentrations of TRPH compounds in the verification samples were all less than 50 mg/kg. The individual concentrations of cPAH compounds were below the MTCA Method C industrial soil cleanup levels for those compounds.

In a consent decree filed August 18, 1997, Ecology determined that the following SWMUs and AOCs in the non-TWP area identified in the 1991 RFA report require no further investigation or implementation of remedial measures: SWMU 2 (Long Bell Cabinet Ditch), SWMU 3 (Infiltration Trench), SWMU 4 (Ditch 2), SWMU 6 (Site C), SWMU 7 (Wood Pulp Discharge Area), SWMU 8 (Drum Burial Area), SWMU 9 (Retort Loadout Area), SWMU 10 (Poleyard), SWMU 19 (Pipe from API Separator to Recovery Pond 1), SWMU 20 (Pipe from Recovery Pond 1 to Recovery Pond 2), SWMU 23 (Drum Storage Area 1), SWMU 24 (Drum Storage Area 2), SWMU 25 (Cabinet Factory Solvent Storage Area), SWMU 26 (Cabinet Factory Cleanup Temporary Storage), SWMU 27 (Storage Tanks), SWMU 29 (Elevated Diesel Fuel Tank), SWMU 30 (Solvent Tanks), SWMU 32 (Plywood Treatment Area), SWMU 33 (Flakeboard Plant), SWMU 34 (Cabinet Factory), MIBK Tank, and Maintenance Shop (3.5 acre parcel).

#### Footnotes:

<sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>&</sup>lt;sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

## **Rationale and Reference(s):**

Residences: There are no residential areas at the facility or immediately adjacent to the facility.

<u>Workers</u>: Workers at the facility are not exposed to groundwater or to contaminated subsurface soils that have not been covered or from areas where the cover has been removed for site remediation.

<u>Day care</u>: There are no known day care businesses at the facility or nearby.

<u>Construction</u>: Construction activities at SWMU 6 (Site C) may expose workers to contaminants in groundwater and subsurface soils.

<u>Trespassers</u>: Entrance to the facility is controlled by the Port of Longview and other property owners. While there is a chance that trespassers may gain access to the facility, this institutional control satisfactorily interrupts this pathway.

<u>Recreation</u>: There are no recreation activities at the facility. Recreational use of nearby waterways is present, but there is no evidence that contaminated groundwater reaches nearby waterways.

Food: There may be some subsistence and other fishing or food collection activities in and along nearby

waterways, but there is no evidence that contaminated groundwater reaches nearby waterways.

 $<sup>\</sup>overline{\ }^3$  Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

4	"significant" (i. greater in magnit "levels" (used to though low) and	Can the <b>exposures</b> from any of the complete pathways identified in #3 be reasonably expected to be " <b>significant</b> " (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps even though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?			
	_X_	If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."			
		If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."			
		If unknown (for any complete pathway) - skip to #6 and enter "IN" status code			

The deed restriction (AKA the restrictive convenant) for SWMU 6 (Site C) requires the owner or successor owners of the property to alter or modify the property in any way that may result in a release or exposure of contaminants in a manner that presents a threat to human health or the environment. Groundwater use for

any purpose, including domestic, agricultural, commercial, or industrial, is prohibited.

Rationale and Reference(s):

<sup>&</sup>lt;sup>4</sup> If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

5.	Can the "significant" <b>exposures</b> (identified in #4) be shown to be within <b>acceptable</b> limits?	
	If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing <u>and</u> referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).	
	If no (there are current exposures that can be reasonably expected to be "unacceptable")- continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.	
	If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code

Interim Final 2/5/99

# RCRA Corrective Action Environmental Indicator (EI) RCRIS code (CA750) Migration of Contaminated Groundwater Under Control

Facility Name:
International Paper Company, Non-Treated Wood Products (TWP) Area
Facility Address:
10 International Way, Longview, Washington
WAD 010745917

1. Has all available relevant/significant information on known and reasonably suspected releases to the groundwater media, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been considered in this EI determination?

\_\_X\_\_ If yes - check here and continue with #2 below.

\_\_\_\_ If no - re-evaluate existing data, or

if data are not available, skip to #8 and enter "IN" (more information needed) status code.

## **BACKGROUND**

## <u>Definition of Environmental Indicators (for the RCRA Corrective Action)</u>

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

## Definition of "Migration of Contaminated Groundwater Under Control" EI

A positive "Migration of Contaminated Groundwater Under Control" EI determination ("YE" status code) indicates that the migration of "contaminated" groundwater has stabilized, and that monitoring will be conducted to confirm that contaminated groundwater remains within the original "area of contaminated groundwater" (for all groundwater "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

# **Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Migration of Contaminated Groundwater Under Control" EI pertains ONLY to the physical migration (i.e., further spread) of contaminated ground water and contaminants within groundwater (e.g., non-aqueous phase liquids or NAPLs). Achieving this EI does not substitute for achieving other stabilization or final remedy requirements and expectations associated with sources of contamination and the need to restore, wherever practicable, contaminated groundwater to be suitable for its designated current and future uses.

#### **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2.	Is <b>groundwater</b> known or reasonably suspected to be " <b>contaminated</b> " above appropriately protective "levels" (i.e., applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action, anywhere at, or from, the facility?			
	_X_	If yes - continue after identifying key contaminants, citing appropriate "levels," and referencing supporting documentation.		
		If no - skip to #8 and enter "YE" status code, after citing appropriate "levels," and referencing supporting documentation to demonstrate that groundwater is not "contaminated."		
		If unknown - skip to #8 and enter "IN" status code.		

Rationale and Reference(s): The former International Paper facility was located on the north side of the Columbia River, approximately 66 miles upriver from the Pacific Ocean. The former facility is located less than two miles downstream of the confluence of the Columbia and Cowlitz rivers. The former facility lies within the 100-year floodplain but is protected by control levees.

International Paper operated a wood treatment facility at this location from 1956 to 1983. The Treated Wood Product (TWP) area, the site of the former wood treatment operation at the former southwestern corner of the International Paper facility, encompassed the retort building, associated structures (e.g., tanks, sheds, water treatment facilities, and the locations of former Ponds 1 and 2). The original International Paper facility was approximately 900 acres. The former TWP area consists of approximately 4 acres; the rest of the original International Paper facility is called the non-TWP area and includes a number of solid waste management units (SWMUs) and areas of concern (AOCs) identified in the 1991 RCRA facility assessment (RFA) report.

SWMU 6 (Site C) is the only SWMU in the non-TWP area investigated for groundwater contamination. Site C is located at the eastern edge of the former International Paper facility and was reportedly used for the disposal of various wastes and liquids. International Paper investigated Site C in October 1996. The investigation determined that there were residual concentrations of carcinogenic polycyclic aromatic hydrocarbon (cPAH) compounds, pentachlorophenol, bis(2-ethylhexyl)phthalate, arsenic, barium, and copper in soil at concentrations exceeding MTCA residential groundwater protection standards. Levels of arsenic and bis(2-ethylhexyl)phthalate in groundwater exceeded MTCA residential groundwater standards. Based on the results of that investigation and subsequent groundwater modeling that indicated that MTCA residential groundwater standards would not be exceeded at the boundary of Site C, Ecology determined that a deed restriction was required to prohibit extraction of groundwater in the vicinity of Site C. The deed restriction was filed with the Cowlitz County auditor in February 2000.

In a consent decree filed August 18, 1997, Ecology determined that the following SWMUs and AOCs in the non-TWP area identified in the 1991 RFA report require no further investigation or implementation of remedial measures: SWMU 2 (Long Bell Cabinet Ditch), SWMU 3 (Infiltration Trench), SWMU 4 (Ditch 2), SWMU 6 (Site C), SWMU 7 (Wood Pulp Discharge Area), SWMU 8 (Drum Burial Area), SWMU 9 (Retort Loadout Area), SWMU 10 (Poleyard), SWMU 19 (Pipe from API Separator to Recovery Pond 1), SWMU 20 (Pipe from Recovery Pond 1 to Recovery Pond 2), SWMU 23 (Drum Storage Area 1), SWMU 24 (Drum Storage Area 2), SWMU 25 (Cabinet Factory Solvent Storage Area), SWMU 26 (Cabinet Factory Cleanup Temporary Storage), SWMU 27 (Storage Tanks), SWMU 29 (Elevated Diesel Fuel Tank), SWMU 30 (Solvent Tanks), SWMU 32 (Plywood Treatment Area), SWMU 33 (Flakeboard Plant), SWMU 34 (Cabinet Factory), MIBK Tank, and Maintenance Shop (3.5 acre parcel).

   December 23, 1997; response to Ecology's comments in a letter dated April 4, 1997, regarding the report of the investigation of SWMU 6 (Site C)

### Footnotes:

<sup>1</sup>"Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriate "levels" (appropriate for the protection of the groundwater resource and its beneficial uses).

3.	to remain within	on of contaminated groundwater <b>stabilized</b> (such that contaminated groundwater is expected "existing area of contaminated groundwater" as defined by the monitoring locations time of this determination)?
	_X_	If yes - continue, after presenting or referencing the physical evidence (e.g., groundwater sampling/measurement/migration barrier data) and rationale why contaminated groundwater is expected to remain within the (horizontal or vertical) dimensions of the "existing area of groundwater contamination" <sup>2</sup> ).
		If no (contaminated groundwater is observed or expected to migrate beyond the designated locations defining the "existing area of groundwater contamination" <sup>2</sup> ) - skip to #8 and enter "NO" status code, after providing an explanation.
		If unknown - skip to #8 and enter "IN" status code.

3.

Rationale and Reference(s): Based on the results of that investigation and subsequent groundwater modeling that indicated that MTCA residential groundwater standards would not be exceeded at the boundary of Site C, Ecology determined that a deed restriction was required to prohibit extraction of groundwater in the vicinity of Site C. The deed restriction was filed with the Cowlitz County auditor in February 2000.

<sup>&</sup>lt;sup>2</sup> "existing area of contaminated groundwater" is an area (with horizontal and vertical dimensions) that has been verifiably demonstrated to contain all relevant groundwater contamination for this determination, and is defined by designated (monitoring) locations proximate to the outer perimeter of "contamination" that can and will be sampled/tested in the future to physically verify that all "contaminated" groundwater remains within this area, and that the further migration of "contaminated" groundwater is not occurring. Reasonable allowances in the proximity of the monitoring locations are permissible to incorporate formal remedy decisions (i.e., including public participation) allowing a limited area for natural attenuation.

4.	Does "contaminated" groundwater <b>discharge</b> into <b>surface water</b> bodies?
	If yes - continue after identifying potentially affected surface water bodies.
	X If no - skip to #7 (and enter a "YE" status code in #8, if #7 = yes) after providing an explanation and/or referencing documentation supporting that groundwater "contamination" does not enter surface water bodies.
	If unknown - skip to #8 and enter "IN" status code.

Rationale and Reference(s): Groundwater modeling conducted after the investigation of Site C indicated that MTCA residential groundwater standards would not be exceeded at the boundary of Site C. (See: Letter from RueAnn Thomas (International Paper) to Howard Steeley (Department of Ecology); December 23, 1997; response to Ecology's comments in a letter dated April 4, 1997, regarding the report of the investigation of Site C.)

5.	Is the <b>discharge</b> of "contaminated" groundwater into surface water likely to be " <b>insignificant</b> " (i.e., the maximum concentration <sup>3</sup> of each contaminant discharging into surface water is less than 10 times their appropriate groundwater "level," and there are no other conditions (e.g., the nature, and number, of discharging contaminants, or environmental setting), which significantly increase the potential for unacceptable impacts to surface water, sediments, or eco-systems at these concentrations)?
•	If yes - skip to #7 (and enter "YE" status code in #8 if #7 = yes), after documenting: 1) the maximum known or reasonably suspected concentration of key contaminants discharged above their groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) provide a statement of professional judgement/explanation (or reference documentation) supporting that the discharge of groundwater contaminants into the surface water is not anticipated to have unacceptable impacts to the receiving surface water, sediments, or eco-system.
	If no - (the discharge of "contaminated" groundwater into surface water is potentially significant) - continue after documenting: 1) the maximum known or reasonably suspected concentration <sup>3</sup> of <u>each</u> contaminant discharged above its groundwater "level," the value of the appropriate "level(s)," and if there is evidence that the concentrations are increasing; and 2) for any contaminants discharging into surface water in concentrations <sup>3</sup> greater than 100 times their appropriate groundwater "levels," the estimated total amount (mass in kg/yr) of each of these contaminants that are being discharged (loaded) into the surface water body (at the time of the determination), and identify if there is evidence that the amount of discharging contaminants is increasing.
	If unknown - enter "IN" status code in #8.
	Rationale and Reference(s):

<del></del>	

 $<sup>^3</sup>$  As measured in groundwater prior to entry to the groundwater-surface water/sediment interaction (e.g., hyporheic) zone.

Can the <b>discharge</b> of "contaminated" groundwater into surface water be shown to be " <b>currently acceptable</b> " (i.e., not cause impacts to surface water, sediments or eco-systems that should not be allowed to continue until a final remedy decision can be made and implemented <sup>4</sup> )?			
	If yes - continue after either: 1) identifying the Final Remedy decision incorporating these conditions, or other site-specific criteria (developed for the protection of the site's surface water, sediments, and eco-systems), and referencing supporting documentation demonstrating that these criteria are not exceeded by the discharging groundwater; OR 2) providing or referencing an interim-assessment, appropriate to the potential for impact, that shows the discharge of groundwater contaminants into the surface water is (in the opinion of a trained specialists, including ecologist) adequately protective of receiving surface water, sediments, and eco-systems, until such time when a full assessment and final remedy decision can be made. Factors which should be considered in the interimassessment (where appropriate to help identify the impact associated with discharging groundwater) include: surface water body size, flow, use/classification/habitats and contaminant loading limits, other sources of surface water/sediment contamination, surface water and sediment sample results and comparisons to available and appropriate surface water and sediment "levels," as well as any other factors, such as effects on ecological receptors (e.g., via bio-assays/benthic surveys or site-specific ecological Risk Assessments), that the overseeing regulatory agency would deem appropriate for making the EI determination.  If no - (the discharge of "contaminated" groundwater can not be shown to be "currently acceptable") - skip to #8 and enter "NO" status code, after documenting the currently unacceptable impacts to the surface water body, sediments, and/or eco-systems.		
Rationale and Reference(s):			

<sup>&</sup>lt;sup>4</sup> Note, because areas of inflowing groundwater can be critical habitats (e.g., nurseries or thermal refugia) for many species, appropriate specialist (e.g., ecologist) should be included in management decisions that could eliminate these areas by significantly altering or reversing groundwater flow pathways near surface

water bodies.

<sup>5</sup> The understanding of the impacts of contaminated groundwater discharges into surface water bodies is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration to be reasonably certain that discharges are not causing currently unacceptable impacts to the surface waters, sediments or eco-systems.

7.	Will groundwater <b>monitoring</b> / measurement data (and surface water/sediment/ecological data, as necessary) be collected in the future to verify that contaminated groundwater has remained within the horizontal (or vertical, as necessary) dimensions of the "existing area of contaminated groundwater?"			
	If yes - continue after providing or citing documentation for planned activities or future sampling/measurement events. Specifically identify the well/measurement locations which will be tested in the future to verify the expectation (identified in #3) that groundwater contamination will not be migrating horizontally (or vertically, as necessary) beyond the "existing area of groundwater contamination."			
	X_ If no - enter "NO" status code in #8.			
	If unknown - enter "IN" status code in #8.

# Migration of Contaminated Groundwater Under Control Environmental Indicator (EI) RCRIS code (CA750)

8.	Check the appropriate RCRIS status codes for the Migration of Contaminated Groundwater Under Control EI (event code CA750), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (attach appropriate supporting documentation as well as a map of the facility).			
	_X_	YE - Yes, "Migration of Contaminated Groundwater Under Control" has been verified. Based on a review of the information contained in this EI determination, it has been determined that the "Migration of Contaminated Groundwater" is "Under Control" at the International Paper facility, Non-Treated Wood Products Area, EPA ID # WAD 010745917, located at 10 International Way, Longview, Washington. Specifically, this determination indicates that the migration of "contaminated" groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the "existing area of contaminated groundwater" This determination will be reevaluated when the Agency becomes aware of significant changes at the facility.		
		<ul><li>NO - Unacceptable migration of contaminated groundwater is observed or expected.</li><li>IN - More information is needed to make a determination.</li></ul>
