EXECUTIVE SUMMARY

The process of innovation is a subject of increasing interest and significance, and it is of special interest to those seeking to stimulate or support innovative activity. In this context, it is important to understand the relationships that exist between an innovating unit and the environment in which it operates. The desire to add to this understanding provided the impetus for initiating the research reported here.

This research focused on relationships between an innovating firm, and the industry of which it is a member, and innovative performance, with special emphasis on firm size. Industry characteristics singled out for study were concentration, growth, and capital intensity. The measures of innovation performance were the frequency of innovation and the speed at which innovation occurs.

All of the data on innovation performance were collected by Gellman Research Associates (GRA) either as part of this study or an earlier study commissioned by the National Science Foundation (NSF). Unlike many previous studies which employ proxies for innovative behavior, such as patented inventions or research and development (R&D) expenditures, the present effort examines in detail actual innovations brought to market. A total of 635 innovations were studied including 45 from the NSF study. To this information was added data on firm size, concentration, industry growth, and industry

capital intensity from various published sources. The data set was then used to examine various relationships.

The principal findings are:

1. Small firms produce 2.5 times as many innovations as large firms, relative to the number of people employed.
2. Small firms bring their innovations to market faster than large firms.
3. Large firms are 2.8 times more likely to be assisted in innovation by public funds.
4. Large firms in concentrated industries tend to acquire more of their innovations from other firms than do smaller companies.
5. Small-firm innovation rates based on employment are below the small firm average in diffuse industries (Concentration Ratio ≤ 0.2) and significantly above average in industries with $0.2 < CR \leq 0.4$.
- 6a. In industries where employment is increasing, large firms in highly concentrated industries ($0.6 < CR \leq 1.0$) innovate below the average of large firms in growing industries and above average for ($0.2 < CR \leq 0.6$).
- 6b. In industries where employment is decreasing, large firms in less concentrated industries ($CR \leq 0.4$) innovate above the average of large firms in declining industries and below average elsewhere.

7. Small and large firms exhibit substantially the same distributions of innovation with respect to concentration ratio. The intervals $0.2 < CR \leq 0.6$ in industries with increasing employment and $0 < CR \leq 0.4$ in industries with decreasing employment are the major producers of innovation.
8. Innovation performance by small firms is not affected by capital intensity.
9. Large firms innovate less in capital-intensive industries than in industries that are not capital intensive.

These principal findings have significant policy implications, including the following:

- o The finding that small firms produce significantly more innovations than large firms per employee, coupled with earlier findings that small firms are more efficient in their use of R&D dollars,* indicates that public R&D funding of small technologically-aware firms will be significantly more cost-effective than the funding of larger firms.
- o The cost-effectiveness of public funding of small firm R&D is further enhanced because small firm innovations are brought to market sooner than those of large firms.

Other findings are discussed in detail in the report.

*Science Indicators 1976, Report of the National Science Board 1977, p. 116-118.

Chapter 1

INTRODUCTION AND FINDINGS

I. Introduction

The process of industrial innovation is a subject of increasing interest and significance, and it is of special interest to those seeking to stimulate or support innovative activity. In this connection, it is important to understand the relationships that exist between an innovating unit and the environment in which it operates. The desire to add to this understanding provided the impetus for initiating the research reported here.

The focus of this research is on relationships between an innovating firm and the industry of which it is a member and innovation performance. Special emphasis was given to the role of firm size as it affects the propensity of a firm to innovate. Industry characteristics singled out for study were concentration, growth, and capital intensity. The measures of innovation performance were the frequency of innovation and the speed at which innovation occurs.

Inquiries were also made into how and to what extent public funding enters the innovation process, including the marketing and distribution of innovations, and into the effect of successful innovation on the ownership of an innovating firm.

This study is one of several recent efforts to add to the store of knowledge and to further understanding of this subject. To the extent that the data collection techniques employed are similar, it is an extension of an earlier National Science Foundation study¹ of 500 innovations introduced between 1953 and 1973. Unlike many previous studies which employ proxies for innovating behavior, such as patented inventions or R&D expenditures, the present effort examined in detail actual innovations brought to market.

Of the 500 innovations reported in the NSF study, 277 were introduced by United States manufacturing firms and, of these, 45 were introduced after 1969. Data on these 45 innovations were combined with the data of the present study.

This study examines the effect on innovation performance of the following:

- o industry concentration,
- o industry captial intensity,
- o firm size,
- o markets for innovations,
- o public funding of the innovation process,
- o ownership of innovating firms,
- o the effect of innovation upon ownership, and
- o transfer of product innovations abroad.

¹Indicators of International Trends in Technological Innovation, Washington, DC: National Science Foundation, 1976.

These questions were based on previous theoretical and empirical work on the relationships between innovation performance and firm and industry characteristics. One theory hypothesizes that highly concentrated industries should be more willing and able to undertake the process of innovation, a priori. This may be so if the process of innovation is costly and/or risky. By using their market power to attain higher profit levels, firms may be able to generate significant internal pools of funds which allow them to invest in relatively risky R&D without having to obtain capital from external sources.

Other theories concerning the beneficial effects of concentration on innovations include the following. Companies that are not subject to the short-run uncertainties of competition may be more willing to commit funds to long-range R&D projects. Moreover, monopolistic or oligopolistic firms may be better able to internalize the benefits from innovation through their more extensive distribution and marketing channels. Finally, because oligopolists often do not compete on a price basis, they may place more emphasis on non-price dimensions of competition such as product differentiation and innovation.

On the other hand, it has been hypothesized that firms in competitive industries have a greater incentive to innovate precisely because of the competitive nature of the market. (A small firm has more to gain from innovation.) A corollary to this view is that a high degree of market power breeds complacency and creates institutional

barriers to change. This point of view engenders the hypothesis that firms with considerable market power will innovate more slowly, but may be aggressive followers or imitators of smaller firms once the latter have completed the innovation process.

However, any attempt to test the above hypotheses requires that absolute firm size be distinguished from industry concentration (corresponding to some measure of market power). The above hypotheses have been cast in terms of industry concentration, but parallel arguments can be offered concerning the relationship between absolute firm size and innovation.

Specifically, it can be argued that large firms are better able to innovate because of their larger pool of financial resources. Conversely, those who believe that a small firm environment favors innovation would argue that increasing firm size leads to institutional inertia, thus slowing the desire to innovate.

Although the arguments concerning absolute firm size and industry concentration as they relate to innovation are somewhat parallel, it should be clear that the hypotheses themselves are quite distinct. Thus, for example, a result indicating that firms in competitive industries tend to innovate more than firms in concentrated industries does not, by itself, imply a relationship between firm size and innovating efficiency.

Because data on R&D expenditures per employee were not collected as part of this study, a direct comparison of innovative performance between small and large firms with respect to R&D expenditures

is not possible. On the other hand, a finding that small firms innovate at a greater frequency than large firms, based on the number of persons employed, would be consistent with earlier research which showed that small firms (less than 1,000 employees) produce about 4 times as many innovations as large firms per R&D scientist and engineer and that the cost per R&D scientist and engineer is almost twice as great in firms with over 1,000 employees than in firms with less than 1,000 employees.² A small firm in the present study is defined as a firm with less than 500 employees.

II. Principal Findings and Policy Implications

The detailed analyses leading to the findings of the study are given in Chapter 3. The principal findings are the following:

1. Small firms produce 2.5 times as many innovations as large firms, relative to the number of people employed.
2. Small firms require less time to take an innovation from performance specification to market introduction.
3. Large firms are 2.8 times more likely to be assisted in innovation by public funds.
4. Large firms in concentrated industries tend to acquire more of their innovations from other firms than do small firms.
5. Small-firm innovation rates based on employment are below the small firm average in diffuse industries (Concentration Ratio ≤ 0.2) and significantly above average in industries with $0.2 < CR \leq 0.4$.

²Small Firms and Federal R&D, 1977, Office of Management and Budget.

- 6a. In industries where employment is increasing, large firms in highly concentrated industries innovate below the average of large firms in growing industries ($0.6 < CR \leq 1.0$) and above average for ($0.2 < CR \leq 0.6$).
- 6b. In industries where employment is decreasing, large firms in less concentrated industries ($CR \leq 0.4$) innovate above the average of large firms in declining industries and below average elsewhere.
7. Small and large firms exhibit substantially the same distributions of innovation with respect to concentration ratio. The intervals $0.2 < CR \leq 0.6$ in industries with increasing employment and $0 < CR \leq 0.4$ in industries with decreasing employment are the major producers of innovations.
8. Innovation performance by small firms is not affected by capital intensity.
9. Large firms innovate less in capital-intensive industries than in industries that are not capital intensive.

Interpretation of Findings

One must proceed with caution in attempting to draw further inferences by combining two or more findings. For example, consider the following figure:

Innovation Performance of Large Firms

	<u>Capital-Intensive Industry</u>	<u>Non-Capital Intensive Industry</u>	<u>Average Innovation Performance</u>
Concentrated Industry	?	?	Below
Diffuse Industry	?	?	Above
Average Innovation Performance	Below	Above	

None of the relationships in the "boxes" shown above were explicitly tested. However, the results labeled "Average Innovation Performance" were tested. For example, large firms innovate less in concentrated industries than in diffuse industries. This finding, however, cannot be used to draw a conclusion about the innovation performance of large firms in either capital-intensive concentrated industries or non-capital-intensive concentrated industries.

Implications

The principal findings of the present study have unambiguous implications for public policy towards small businesses. First, the finding that small firms produce significantly more innovations than large firms per employee indicates that public R&D funding of small technologically-aware firms will be more cost-effective than the funding of large firms. The public benefits further from the fact that small firms bring their innovations to market sooner than large firms. However, the study indicates that large firm innovations are more likely to be assisted by public funds.

The results of this study support a conclusion that small firms more than carry their weight in terms of producing innovations and thereby add to the technological and economic progress of the United States. Increased public funding of such firms for innovative activities should therefore be encouraged.

III. Analysis

The industries generating the innovations reported in the survey are not homogeneous. Among other things, they vary with respect to growth, firm size, concentration, capital intensity, the age of their technological base, and the characteristics of their markets. These variables were used to partition the survey data into subsamples for further analysis.

One such partitioning reflects, in an approximate way, the familiar life cycle concept of product and industry development, with its stages of product introduction, market expansion, market stability, and finally, decline. The criteria for grouping the industries were formulated in terms of the changes in the number of establishments and the number of employees in an industry over a specified time interval.

Four groups, denoted by P1, P2, P3, and P4, were defined. Their definitions are given in Table 1.1, together with the number of innovating industries in each group and the number of innovations produced.

Table 1.1

DISTRIBUTION OF INDUSTRIES AND INNOVATIONS WITH RESPECT
TO CHANGES IN NUMBER OF EMPLOYEES AND NUMBER OF ESTABLISHMENTS

P1: Establishments Increased or Data Not Available for 1967

Employment Increased

Industries: 57

Innovations

Small Firms: 121

Large Firms: 207

Unknown: 50

P2: Establishments Increased or Data Not Available for 1967

Employment Decreased

Industries: 42

Innovations

Small Firms: 89

Large Firms: 109

Unknown: 21

P3: Establishments Decreased

Employment Increased

Industries: 6

Innovations

Small Firms: 2

Large Firms: 7

Unknown: 0

P4: Establishments Decreased

Employment Decreased

Industries: 16

Innovations

Small Firms: 14

Large Firms: 14

Unknown: 1

The data for determining changes in the number of establishments and employment are shown in Appendix C. These data were obtained from the United States Department of Commerce, Census of Manufactures.

Changes in the number of establishments were developed by comparing the number of industry establishments in 1972 with those in 1967. Changes in employment were obtained by comparing industry employment in 1976 with employment in 1967. Where 1967 employment figures were not available (NA), the comparison was made between 1976 and 1972 figures. Details are given in Chapter 3.

Industries in P1 are growing in terms of both number of establishments and employment; typically, these are newer industries in the sense that they either employ recently introduced technologies or compete in new markets, whether or not these markets were created by or exist independently of the new technology. In contrast, industries in P4 are in decline in terms of both employment and number of establishments; these industries typically employ old or developed technologies and compete in established but declining markets. Industry groups P2 and P3 are intermediate cases.

One might expect P1 industries to be more innovative than P2, P3, or P4 industries. This is illustrated in Table 1.2 which shows the frequency of innovations produced by industries for which ten or more innovations were reported in the survey. Appendix D provides additional details on the industries in each subsample.

DISTRIBUTION OF INNOVATIONS AMONG INDUSTRIES
REPORTING TEN OR MORE INNOVATIONS

<u>SIC Number</u>	<u>Industry Description</u>	<u>Population</u>	<u>Total</u>
2821	Plastics, Synthetic Resins, and Nonvulcanizable Elastomers	P1	18

Chapter 2
DATA COLLECTION

I. Selection of Innovations

GRA compiled a sample of 590 innovative products in selected industries. The objectives of the sample selection process were as follows:

- o to obtain a sample of innovations which, when combined with data from the NSF study on 45 innovations introduced after 1969, would be large enough to permit significant inferences to be drawn from an analysis of the innovation process;
- o to represent innovations from the broad spectrum of industries as measured by concentration, growth rate, and capital intensity;
- o to represent adequately innovations introduced by both large and small firms; and
- o to concentrate on innovations marketed in the U.S. since 1970.

The sample served to identify a set of innovations for which basic information was available and which met the objectives listed above.

The sources of the sample are the publications listed in Table 2.1. Approximately 43 percent of the sample was selected from among the award-winning innovations described in Industrial Research & Development Magazine. The publication spans the period 1970-1979.

Table 2.1

SOURCES OF SAMPLE

<u>Source Publication</u>	<u>Number of Innovations</u>	<u>Percentage of Total</u>
Automotive Engineering	16	2.7
Aviation Week & Space Technology	2	0.3
EDN Magazine/Electrical Design News	14	2.4
Engineering Newsrecord	17	2.9
Food Engineering	32	5.4
IEEE Spectrum	21	3.6
Industrial Research & Development	252	42.7
Mechanical Engineering	8	1.4
Modern Plastics	14	2.4
Optical Engineering	17	2.9
Product Engineering	72	12.2
Review of Scientific Instruments	44	7.5
Tooling & Production	47	8.0
Ward's Auto World	23	3.9
Other	11	1.9
Total	<u>590</u>	<u>100.0 %</u>

Articles and advertisements in the source publications were surveyed to identify products or processes that had been offered for sale in the marketplace and which incorporated some aspect of technical change. From the reference in the periodical, basic information about the product was recorded, including a description of the innovation, the identity of the innovating company, the date of market introduction, and the source publication. The data form used to record this information is reproduced as Figure 2.1. The process of identifying and selecting innovations for a sample is similar to that used in an earlier study of innovation prepared by Gellman Research Associates, Inc. for the National Science Foundation.³

The periodicals surveyed were selected for their coverage of seven product areas that had been well-represented in the earlier NSF study. Three areas were chosen from among relatively concentrated industries, and four from relatively competitive industries. By this procedure, GRA sought to insure that the sample incorporated a sufficient number of innovations in each type of industry to support inferences about industry structure and innovation. The three relatively concentrated industries were defined by the Standard Industrial Classification⁴ (SIC) Group Numbers 357 (Office, Computing and Accounting Machines); 371 (Motor Vehicles and Motor Vehicle Equipment); and

386 (Photographic Equipment and Supplies). The four relatively more competitive industries were defined by SIC Group Numbers 307 (Miscellaneous Plastics Products); 354 (Metalworking Machinery and Equipment); 355 (Special Industry Machinery, except Metalworking Machinery); and 383 (Optical Instruments and Lenses).

Collection of the Sample

The sample that resulted from this selection process represented a broader range of products than the seven areas originally chosen for emphasis. One reason is that products serving an industry come from a diversity of sources, including other industries that provide components and supplies. In addition, technologies developed in one industry may be applied to the products of numerous other industries. For example, many of the innovations in the machine tool industry involve numerical control equipment based on electronic and computer technologies.

The range of industries introducing innovations reported in the sample, including 45 post-1969 innovations from the NSF study, is shown in Table 2.2. A four-digit SIC number was assigned to each innovation on the basis of its characteristics as a product. In the hypothetical case of a laser alignment device for machine tools, for example, the SIC number assigned would be 3545, which covers machine tool accessories. At a later point in the study, the SIC numbers of the industry that first introduced the innovation would be assigned; in the case of a laser alignment device, it could have been a computer company, an electronics firm, or an organization in some other industry.

*Includes 45 post-1969 innovations from NSF study.

II. Collection of Survey Data*

More detailed and accurate information was obtained for a subset of the sample. Beginning with the company identified in the source publication from the sample, telephone interviewers attempted to locate people familiar with the history of the product, its development, and its marketing. These individuals may have participated in the innovation process at any of several stages and in various roles. Occasionally, several individuals contributed information about the development of a single innovation. The telephone inquiries, together with mailed questionnaires where necessary, proved to be a highly efficient means of locating and obtaining information about the development of a product and the innovating organization. Typically, this kind of information is not available from public sources or corporate records.

The information sought in the telephone/mail survey is described in Part II of the Innovation Data Form (Figure 2.2). These data were obtained for a subsample of innovations. (Firm size information was obtained for another 314 innovations.) The size of the subsample was limited by the following causes:

- o inability to locate the innovating company or individuals,
- o refusal by a company to participate in the survey, or
- o failure to substantially complete the questionnaire.

*Excludes 45 NSF innovations.

GELLMAN RESEARCH ASSOCIATES, INC.

PART II: DETAILED INNOVATION HISTORY

A. History of Product (or Process) Development

1. Identify and date key elements in the preproduction stage:

Key Element	Date	Not Known	Not Applicable	No Response	Question Omitted
(a) performance criteria	_____	_____	_____	_____	_____
(b) preliminary engineering designs finalized	_____	_____	_____	_____	_____
(c) prototype/pilot-project/bench model	_____	_____	_____	_____	_____

2. Identify and date key elements in the production and marketing of the innovation:

Key Element	Date	Not Known	Not Applicable	No Response	Question Omitted
(a) first production	_____	_____	_____	_____	_____
(b) meet government regulation	_____	_____	_____	_____	_____
(c) first order/contract/delivery	_____	_____	_____	_____	_____
(d) modifications after first delivery (required by customer)	_____	_____	_____	_____	_____
(e) start-up sales promotion	_____	_____	_____	_____	_____
(f) first retail sales	_____	_____	_____	_____	_____

B. Technology

3. Was any part of the technology underlying the innovation:

- (a) developed by R&D activity within the organization?
 Yes _____ Not Known _____ No Response _____
 No _____ Not Applicable _____ Question Omitted _____
- (b) acquired through merger or acquisition of a going concern?
 Yes _____ Not Known _____ No Response _____
 No _____ Not Applicable _____ Question Omitted _____
- (c) developed abroad?
 Yes _____ Not Known _____ No Response _____
 No _____ Not Applicable _____ Question Omitted _____
- (d) acquired by license?
 Yes _____ Not Known _____ No Response _____
 No _____ Not Applicable _____ Question Omitted _____
- (e) patented (by this organization or another)?
 Yes _____ Not Known _____ No Response _____
 No _____ Not Applicable _____ Question Omitted _____
- (f) Was the technology acquired in any other way not mentioned above?
 Yes _____ Not Known _____ No Response _____
 No _____ Not Applicable _____ Question Omitted _____

If yes, please specify: _____

C. Governmental Role

4. (a) Were public funds, contracts, grants, etc., used to assist the innovating enterprise?
 Yes _____ No _____ Not Known _____ No Response _____
 Question Omitted _____
- (b) If yes, which specific activities related to innovation did public funds support?
 Other (specify) _____
- | | | | |
|--------------------------------|-------|------------------|-------|
| Basic Research | _____ | Other (specify) | _____ |
| Applied Research | _____ | | |
| Development | _____ | Not Known | _____ |
| Engineering | _____ | Not Applicable | _____ |
| Production-Oriented Activities | _____ | No Response | _____ |
| Marketing and Distribution | _____ | Question Omitted | _____ |

D. The Innovating Organization

5. Describe the type of organization you are (e.g., retail, industrial, wholesale, farm, research institution, university): _____
-
6. What is the present size of the organization (no. of employees)?
- | | | | |
|----------------|-------|------------------|-------|
| Not Known | _____ | No Response | _____ |
| Not Applicable | _____ | Question Omitted | _____ |
| 0 | _____ | 100-249 | _____ |
| 1-9 | _____ | 250-499 | _____ |
| 10-19 | _____ | 500-999 | _____ |
| 20-99 | _____ | 1000+ | _____ |

6. If only a rough approximation is possible:

(cont.)

_____	0	_____	500-999
_____	20-99	_____	1000+
_____	100-499	_____	
_____	Not Known	_____	No Response
_____	Not Applicable	_____	Question Omitted

7. (a) When the innovation was introduced, was the size of the organization very different?

_____	Yes	_____	Not Known	_____	No Response
_____	No	_____	Not Applicable	_____	Question Omitted

(b) If yes, how many employees did it have?

_____	0	_____	100-249
_____	1-9	_____	250-499
_____	10-19	_____	500-999
_____	20-99	_____	1000+

If only a rough approximation is possible:

_____	0	_____	500-999
_____	20-99	_____	1000+
_____	100-499	_____	
_____	Not Known	_____	No Response
_____	Not Applicable	_____	Question Omitted

8. Describe the organization's present form of ownership.

_____	Closely held corporation, partnership or sole proprietorship	_____	No Response
_____	Publicly held corporation (shares traded on exchange)	_____	Question Omitted
_____	Government-owned or controlled	_____	
_____	Not Known	_____	No Response
_____	Not Applicable	_____	Question Omitted

9. (a) Was the form of ownership different when the innovation was introduced?

Yes _____ No Response
 No _____ Not Applicable Question Omitted

(b) If yes, describe the previous form of ownership:

_____ Closely held
 _____ Publicly held
 _____ Government-owned or controlled

_____ Not Known No Response
 _____ Not Applicable Question Omitted

10. (a) At the time of market introduction, was the innovative product the firm's only product?

Yes _____ Not Known No Response
 No _____ Not Applicable Question Omitted

(b) Is the innovative product now the firm's only product?

Yes _____ Not Known No Response
 No _____ Not Applicable Question Omitted

(c) Was the innovative product the first product in what later became a broad line?

Yes _____ Not Known No Response
 No _____ Not Applicable Question Omitted

E. Market Information

11. What product(s)/types of product(s) do you sell (in general)?

_____ Not Known No Response
 _____ Not Applicable Question Omitted

12. To whom do you sell this product: To what types of organizations? (producers, distributors, consumers, government organizations, or users internal to your organization).

____ Not Known _____ No Response
____ Not Applicable _____ Question Omitted

13. Was the innovative product introduced into a market not previously served by the innovating organization?

____ Yes _____ Not Known _____ No Response
____ No _____ Not Applicable _____ Question Omitted

14. (a) Was the innovative product sold abroad before it was introduced in the U.S.?

____ Yes _____ Not Known _____ No Response
____ No _____ Not Applicable _____ Question Omitted

(b) If yes, was it sold abroad by you or by another company? _____

15. Has the product been sold abroad since it was introduced in the U.S.?

____ Yes _____ Not Known _____ No Response
____ No _____ Not Applicable _____ Question Omitted

Section F

16. Further comments:

17. Sources of information (please list the key sources of information provided in the survey). Where possible, associate the source with the item number on the form:

25 Part II Completion Date: _____

Signature: _____

The distribution of innovations for the industries represented in the subsample is shown in Table 2.3. It should be noted that Table 2.3 includes the 45 NSF innovations.

Summaries of the survey data for the 206 questionnaires are presented in Appendix A. Similar data on the 45 post-1969 NSF innovations are given in Appendix B. The summaries profile the responses to the survey questions. In referring to these data, it should be noted that the distributions of time series data are given both with respect to the year in which an event (e.g., prototype developed) occurred and with respect to the elapsed time between the event and the introduction of the innovation to the market.

In testing a hypothesis, the maximum amount of data available for that test was used. Thus, the sample for testing hypotheses on the effect of concentration included all innovations for which firm size was available. Other questions could only be examined with respect to those innovations for which Part II of the Data Form was complete.

III. Collection of Industry Data

While the telephone survey provided valuable information for individual innovations and firms, it was necessary to obtain additional industry-specific data on the number of establishments, employment, concentration, and capital intensity. These data were needed to develop statistical tests on the relationship between innovation behavior and three industry characteristics: concentration, capital intensity and growth.

* Includes 45 post-1969 innovations from NSF study.

The measure of concentration used was the 4-firm concentration ratio by value of shipments in the 1972 Census of Manufactures⁵ for 4-digit SIC industry groups.

Capital intensity was defined as gross stocks per employee, where gross stocks represent capital assets on hand adjusted for discards of worn-out assets. Data on gross stocks were obtained from the capital stock data base compiled by the Bureau of Labor Statistics in the U.S. Department of Labor. These data are available, with few exceptions, only the 3-digit SIC level; correspondingly, 3-digit employment data were used to calculate capital intensity.

A Growth Rate for each 4-digit industry was defined as:

$$\text{Annual Growth Rate} = \frac{(\text{1976 Employment}) - (\text{1967 Employment})}{9.0 \times (\text{1967 Employment})}$$

In industries where 1967 employment data were unavailable, 1972 employment was used instead, and the comparable estimate is:

$$\text{Annual Growth Rate} = \frac{(\text{1976 Employment}) - (\text{1972 Employment})}{4.0 \times (\text{1972 Employment})}$$

The data on establishments, employment, concentration, capital intensity, and growth are given in Appendix C. Data on establishment employment by size of owning company are given in Appendix E.

⁵U.S. Department of Commerce, Bureau of the Census, 1972 Census of Manufacture, Vol. 1, Subject and Special Statistics, Table 4. Washington, DC: GPO, 1976.

Chapter 3
DATA ANALYSIS

I. Introduction

The industries generating the innovations reported in the survey are not homogeneous. They vary with respect to growth, firm size, concentration, capital intensity, the age of their technological base, and the characteristics of their markets. These variables were used to partition the sample into subsamples for further analysis.

Of the 121 industries represented in the survey, 70 industries showed an increase in the number of establishments from 1967 to 1972, 22 showed a decline in the number of establishments and 29 did not have data available on the number of establishments for 1967.

Four industry groupings denoted by P1, P2, P3, and P4, were defined as follows:

- o P1--Establishments increased or data not available for 1967
Employment increased
- o P2--Establishments increased or data not available for 1967
Employment decreased
- o P3--Establishments decreased
Employment increased
- o P4--Establishments decreased
Employment decreased

Table 3.1 shows the number of industries and the distribution of innovations by firm size within P1, P2, P3, and P4. Tables 3.2 and 3.3 show the distribution of innovations and employment in P1, P2, P3, and P4 with respect to concentration ratio and firm size.

Tables 3.4 through 3.7 compare the distribution of innovations with the distribution of employment with respect to concentration ratio for small and large firms in subsamples P1 and P2. In testing for a concentration ratio (CR) effect, the null hypothesis is that there is no effect and that innovation is directly proportional to employment.

II. Findings

1.a Within P1, the frequency of innovation by small firms in very diffuse industries ($0 < CR < 0.2$) is well below the average rate per employee for all small firms in P1, and the frequency of innovation in slightly and moderately concentrated industries ($0.2 < CR < 0.6$) is greatly in excess of the average rate per employee.

1.b Within P2, small firms in very diffuse industries ($0 < CR < 0.2$) and in moderately concentrated industries ($0.4 < CR < 0.6$) innovate less than the average rate per employee for all small firms in P2. Firms with concentration ratios in the interval $0.2 < CR < 0.4$ tend to innovate above the average rate per employee.

2.a Within P1, large firms tend to innovate above the average rate (per employee for all large firms in P1) with slight and moderate concentration ($0.2 < CR < 0.6$) and below the average rate in the upper range of $0.6 < CR < 1.0$.

D.F.* = 3

Sig. Level: 1%

*The intervals 0.6 < CR ≤ 0.8 and 0.8 < CR ≤ 1.0 were combined for the χ^2 test.

2.b Within P2, the innovation performance of large firms is similar to that noted in P1 but shifted toward the lower concentration ratios. The frequency of innovation is above average at the low end ($0 \leq CR \leq 0.4$) and below average for moderate concentration ($0.4 < CR \leq 0.6$).

3. Small and large firms exhibit substantially the same distributions of innovations with respect to concentration ratio in both P1 and P2 (Table 3.8). The interval $0.2 < CR \leq 0.6$ in P1 and the interval $0 \leq CR \leq 0.4$ in P2 are the major producers of innovations.

4. The number of innovations per million employees in industries with growing employment differs significantly from that in industries with declining employment. For small firms the rates are respectively 145 and 187 innovations per million employees. The corresponding rates for large firms are 73 and 56 innovations per million employees. The average rate taken over all small firms is 162 innovations per million. For large firms the rate is 66 per million.

5. Small firms produce significantly more innovations than large firms per employee. See Tables 3.9 and 3.10. Overall, small firms produce 2.5 times as many innovations per employee as large firms.

6. The distributions of innovations by small and large firms were compared with respect to the following time variables measured from the year of market introduction:

T_{CRIT} - Year performance criteria established

T_{ENG} - Year preliminary design finalized

T_{PROTO} - Year prototype developed

T_{PROD} - Year of first production

NUMBER OF ESTABLISHMENTS INCREASED
AND EMPLOYMENT DECREASED (P2)

	<u>Innovations</u>	<u>Industry Employment (1000)</u>
Small Firms	89	378
Large Firms	109	1869

$\chi^2 = 112$
D.F. = 1
Sig. Level: 1%

The distributions of these variables are given in Table 3.11.

Analysis of these distributions indicates that small firms tend to bring their innovations to market sooner than large firms.

The mean time from the establishment of performance criteria to market introduction is 2.22 years for small firms and 3.05 years for large firms.

Table 3.12 shows that, on average, small firms take less time to carry out each of the several activities on the path from the establishment of performance criteria to market introduction.

7. Table 3.13 shows a frequency distribution with respect to concentration ratio of innovations introduced by large firms. In the concentration ratio range $0 \leq CR \leq 0.4$, 20 percent of the innovations were acquired from outside the firm. In the interval $0.6 < CR \leq 1.0$, 34 percent were acquired from outside. This difference is significant at the 10 percent level and tends to support the hypothesis that a greater proportion of the innovations introduced by large firms in concentrated industries is acquired from outside the firm than is the case for large firms operating in less concentrated industries.

The corresponding hypothesis for small firms is not supported by the data. In the interval $0 \leq CR \leq 0.4$, 23 percent (8 of 35) of the innovations were acquired from outside small firms. In the interval $0.06 < CR \leq 1.0$, 17 percent (1 of 6) were acquired from outside.

8. Table 3.14 shows the distributions of innovations for small firms with respect to a measure of industry capital intensity (capital stocks per employee) and a measure of industry growth (annual employment growth rate).

Table 3.15 shows the distribution of employees among small firms in industries generating innovations reported in the survey, with respect to industry capital stocks per employee and industry employment growth rate.

Tables 3.14 and 3.15 are the basis for testing the hypothesis that the frequency of small firm innovation is independent of industry capital intensity. Table 3.16 compares the distribution of innovations in small firms in industries for which total employment increased with the distribution of small firm employees in the same industries. Table 3.17 does the same for industries with decreasing total employment. The data indicate that the frequency of innovation by small firms is not affected by industry capital intensity.

Tables 3.18 and 3.19 show a different pattern for large firms. The frequency of innovation by large firms appears to be related to the capital intensiveness of its industry. Large firms in the more capital-intensive industries tend to be significantly less innovative than large firms in less capital-intensive industries.

Other Findings

9. Table 3.20 indicates that large firms receive more frequent public funding for innovation-related purposes than do small firms. It also shows that small and large firms apply public funds to the same purposes with substantially the same frequencies.

10. Table 3.21 indicates that most small firms reporting innovations were closely held (78 percent) at the time the innovation was introduced and that 17 percent of the small firms changed their form of ownership following introduction of an innovation.

11. Table 3.22 shows that at the time of market introduction, an innovation is more likely to be a firm's only product if the firm is small than if a firm is large. It also shows that the innovations of small firms are more likely to initiate a broad line of new products. Table 3.23 shows that the percentage of small firm innovations introduced into consumer markets and government markets is greater than that of large firms and that a greater percentage of large firm innovations are for internal users.

12. Table 3.24 indicates that a greater percentage of small firms tend to also sell their product abroad after introduction.

Appendix D

INNOVATING INDUSTRIES

INNOVATING INDUSTRIES IN P1:
ESTABLISHMENTS INCREASED - EMPLOYMENT INCREASED

SIC #	Description
2499	Wood Products, NEC
2641	Paper Coating and Glazing
2819	Industrial Inorganic Chemicals, NEC
2821	Plastic Materials, Synthetic Resins, and Non-Vulcanized Elastomers
2824	Synthetic Organic Fibers, Except Cellulosic
2833	Medicinal Chemicals and Botanical Products
2843	Surface Active Agents, Finishing Agents, Sulfonated Oils and Assistants
2869	Industrial Organic Chemicals, NEC
2879	Pesticides and Agricultural Chemicals, NEC
3011	Tires and Inner Tubes
3079	Miscellaneous Plastics Products
3229	Pressed and Blown Glass and Glassware, NEC
3299	Non-Metallic Mineral Products, NEC
3399	Primary Metal Products, NEC
3411	Metal Cans
3425	Hand Saws and Saw Blades
3432	Plumbing Fixture Fittings and Trim (Brass Goods)
3443	Fabricated Plate Work (Boiler Shops)
3471	Electroplating, Plating, Polishing, Anodizing and Coloring
3479	Coating, Engraving, and Allied Services, NEC
3494	Valves and Pipe Fittings, Except Plumbers' Brass Goods
3496	Miscellaneous Fabricated Wire Products
3499	Fabricated Metal Products, NEC
3523	Farm Machinery and Equipment
3531	Construction Machinery and Equipment
3532	Mining Machinery and Equipment Except Oil Field Machinery and Equipment
3535	Conveyors and Conveying Equipment
3549	Metalworking Machinery, NEC
3551	Food Products Machinery
3559	Special Industry Machinery, NEC
3568	Mechanical Power Transmission Equipment
3573	Electronic Computing Equipment
3576	Scales and Balances, Except Laboratory
3579	Office Machines, NEC
3586	Measuring and Dispensing Pumps
3592	Carburetors, Pistons, Piston Rings, and Valves
3623	Welding Apparatus, Electric
3624	Carbon and Graphite Products
3629	Electrical Industrial Apparatus, NEC
3643	Current-Carrying Wiring Devices
3674	Semiconductors and Related Devices

SIC #	Description
3693	Radiographic X-Ray, Fluoroscopic X-Ray, Therapeutic X-Ray, and Other X-Ray Apparatus and Tubes; Electromedical and Electrotherapeutic Apparatus
3694	Electrical Equipment for Internal Combustion Engines
3699	Electrical Machinery, Equipment, and Supplies, NEC
3711	Motor Vehicles and Passenger Car Bodies
3714	Motor Vehicle Parts and Accessories
3731	Ship Building and Repairing
3751	Motorcycles, Bicycles, and Parts
3822	Automatic Controls for Regulating Residential and Commercial Environments and Appliances
3824	Totalizing Fluid Meters and Counting Devices
3825	Instruments for Measuring and Testing of Electricity and Electrical Signals
3829	Measuring and Controlling Devices, Not Elsewhere Classified
3832	Optical Instruments and Lenses
3841	Surgical and Medical Instruments and Apparatus
3843	Dental Equipment and Supplies
3851	Ophthalmic Goods
3861	Photographic Equipment and Supplies

INNOVATING INDUSTRIES IN P2:
ESTABLISHMENTS INCREASED - EMPLOYMENT DECREASED

SIC #	Description
2295	Coated Fabrics, Not Rubberized
2822	Synthetic Rubber (Vulcanized Elastomers)
2891	Adhesives and Sealants
2892	Explosives
2899	Chemicals and Chemical Preparations, NEC
3255	Clay Refractories
3264	Porcelain Electrical Supplies
3281	Cut Stone and Stone Products
3291	Abrasive Products
3293	Gaskets, Packing, and Sealing Devices
3312	Blast Furnaces, Steel Works, and Rolling Mills
3313	Electrometallurgical Products
3351	Rolling, Drawing, and Extruding of Copper
3452	Bolts, Nuts, Screws, Rivets and Washers
3463	Nonferrous Forgings
3537	Industrial Trucks, Tractors, Trailers, and Stackers
3542	Machine Tools, Metal Forming Types
3545	Machine Tool Accessories and Measuring Devices
3546	Power Driven Hand Tools
3552	Textile Machinery
3555	Printing Trades Machinery and Equipment
3562	Ball and Roller Bearings
3563	Air and Gas Compressors
3567	Industrial Process Furnaces and Ovens
3569	General Industrial Machinery and Equipment, NEC
3585	Air Conditioning and Warm Air Heating Equipment and Commercial and Industrial Refrigeration Equipment
3612	Power, Distribution, and Specialty Transformers
3613	Switchgear and Switchboard Apparatus
3621	Motor and Generators
3641	Electric Lamps
3648	Lighting Equipment, NEC
3651	Radio and Television Receiving Sets, Except Communication Types
3661	Telephone and Telegraph Apparatus
3662	Radio and Television Transmitting, Signaling, and Detection Equipment and Apparatus
3671	Radio and Television Receiving Type Electron Tubes, Except Cathode Ray
3676	Resistors, for Electronic Applications
3677	Electronic Coils, Transformers, and Other Inductors
3679	Electronic Components, NEC
3715	Truck Trailers

<u>SIC #</u>	<u>Description</u>
3728	Aircraft Parts and Auxiliary Equipment, NEC
3811	Engineering, Laboratory, Scientific, and Research Instruments and Associated Equipment
3823	Industrial Instruments for Measurement, Display, and Control of Process Variables; and Related Products

INNOVATING INDUSTRIES IN P3:
ESTABLISHMENTS DECREASED - EMPLOYMENT INCREASED

<u>SIC #</u>	<u>Description</u>
2221	Broad Woven Fabric Mills, Man-Made Fiber and Silk
2395	Pleating, Decorative and Novelty Stitching, and Tucking for the Trade
3561	Pumps and Pumping Equipment
3636	Sewing Machines
3673	Transmitting, Industrial, and Special Purpose Electron Tubes
3691	Storage Batteries

INNOVATING INDUSTRIES IN P4:
ESTABLISHMENTS DECREASED - EMPLOYMENT DECREASED

<u>SIC #</u>	<u>Description</u>
2052	Bread and Other Bakery Products, Except Cookies and Crackers
2515	Mattresses and Bedsprings
2661	Building Paper and Building Board Mills
2841	Soap and Other Detergents, Except Specialty Cleaners
2851	Paints, Varnishes, Lacquers, Enamels, and Allied Products
2911	Petroleum Refining
3297	Nonclay Refractories
3321	Gray Iron Foundries
3433	Heating Equipment, Except Electric and Warm Air Furnaces
3497	Metal Foil and Leaf
3541	Machine Tools, Metal Cutting Types
3554	Paper Industries Machinery
3574	Calculating and Accounting Machines, Except Electronic Computing Equipment
3692	Primary Batteries, Dry and Wet
3873	Watches, Clocks, Clockwork Operated Devices, and Parts
3955	Carbon Paper and Inked Ribbons
