National Drug Threat Survey

2003 Report

The image shows the front of a white envelope for the National Drug Threat Survey 2003. On the left side, there is a circular logo of the U.S. Department of Justice. The text on the envelope reads: "National Drug Threat Survey 2003", "U.S. Department of Justice", "National Drug Intelligence Center", "319 Washington Street, 5th Floor", "Johnstown, PA 15901-1622", "Phone: (800) 624-4958", and "Fax: (814) 532-4690". To the right of the text is a small circular logo of the NDIC. Below the text is a large rectangular box for a return address, followed by a zip code box with four empty slots. At the bottom, there are fields for "Name", "MI", "Last Name", and "Zip". A note at the bottom left says "Please note any changes from label:".

National Drug Threat Survey 2003 Report

Overview

The National Drug Intelligence Center (NDIC) collects drug-related information from state and local law enforcement agencies throughout the country via its annual National Drug Threat Survey (NDTS). The NDTS is vital to the preparation of NDIC's National Drug Threat Assessment, state and regional drug threat assessments, and other strategic drug intelligence reports. In 2003 the NDTS was disseminated to a statistically representative sample of state and local law enforcement agencies at the national, regional, and state levels. A detailed description of NDTS 2003 methodology can be found in Appendix B.

NDTS 2003 recipients were asked to identify the drug that poses the greatest threat, most contributes to violent crime, and most contributes to property crime in their areas. Survey recipients also were asked to rate the overall level of availability (rated on a scale of low, moderate, high, or not available) for powdered cocaine, crack cocaine, heroin, methamphetamine, marijuana, MDMA (ecstasy), and other dangerous drugs

(ODDs) in their areas. Several survey questions were designed to elicit information regarding the level of involvement of street gangs and outlaw motorcycle gangs (OMGs) in the distribution of drugs in general and of specific drugs. Other survey questions asked respondents to indicate whether or not cocaine was converted to crack in their areas, the level of methamphetamine production (rated on a scale of low, moderate, high, or not produced), and types of cannabis cultivation in their areas. Recipients also were asked to indicate which precursor chemicals, solvents, and reagent chemicals were diverted in their areas for use in the production of illicit drugs and which pharmaceuticals were commonly diverted or illicitly used in their areas.

This report provides data tables and discussion of NDTS 2003 agency responses at the national and regional levels. Data tables for NDTS 2003 state-level data also are provided. (See Appendix A.)

Greatest Drug Threat and Drug-Related Crime

NDTS 2003 respondents were asked to identify the drug that poses the greatest threat, most contributes to violent crime, and most contributes to property crime in their areas.

Nationally, 37.0 percent of state and local law enforcement agencies identified cocaine (either powdered or crack) as their greatest drug

threat followed by methamphetamine (36.2%), marijuana (13.1%), heroin (8.7%), and MDMA (0.9%); however, there are sharp regional differences. According to NDTS data, cocaine is the predominant drug threat for regions in the eastern half of the country, and methamphetamine is the predominant drug threat for regions in the

western half. A higher percentage of state and local law enforcement agencies in the Northeast/Mid-Atlantic (11%), Southwest (10.6%), and Great Lakes (9.2%) regions identified powdered cocaine as their greatest drug threat than agencies in the West Central (3.2%), Southeast (2.8%), and Pacific (1.6%) regions.¹ Crack cocaine was identified as the greatest drug threat by more state and local law enforcement agencies in the Southeast (59.1%), Great Lakes (30.4%), and Northeast/Mid-Atlantic regions (28.1%) than agencies in the Southwest (20.2%), West Central (9.0%), and Pacific (3.7%) regions. Methamphetamine was most often identified as the greatest drug threat by agencies in the Pacific (90.9%), West Central (80.2%), and Southwest (51.6%) regions, while a smaller proportion of agencies in the Great Lakes (29.4%), Southeast (28.0%), and Northeast/Mid-Atlantic (2.7%) regions reported methamphetamine as their greatest drug threat. A higher percentage of state and local agencies in the Northeast/Mid-Atlantic (23.0%) and Great Lakes (19.7%) regions identified marijuana as their greatest drug threat than did agencies in any other region; the lowest percentage (2.1%) of such agencies was in the Pacific region. Heroin was identified as the greatest drug threat by 28.5 percent of state and local law enforcement agencies in the Northeast/Mid-Atlantic region—the highest percentage of any region—compared to less than 1.0 percent in the Pacific, Southeast, and West Central regions. (See Figures 1, 2, and 3, Tables 1 and A1.)

According to NDTs 2003 data, cocaine (either powdered or crack) and methamphetamine are the drugs that most contribute to violent crime. Cocaine (either powdered or crack) was identified by 50.1 percent of state and local law enforcement agencies as the drug that most contributes to violent crime, and methamphetamine was identified by 31.6 percent of such agencies. A relatively small percentage of state and local law enforcement agencies identified marijuana (4.6%), heroin (4.6%), and MDMA (0.2%) as the

drugs that most contribute to violent crime. Powdered cocaine was most often indicated in the Southwest (13.8%) and Northeast/Mid-Atlantic (13.6%) regions as the drug that most contributes to violent crime. Most agencies in the Southeast region (70.7%) identified crack cocaine as the drug that most contributes to violent crime, higher than the percentages reported by agencies in any other region. Most agencies in the Pacific (86.3%) and West Central (72.6%) regions identified methamphetamine as the drug that contributes most to violent crime in their areas. (See Tables 2 and A2.)

Cocaine and methamphetamine are frequently identified as the drugs that most contribute to property crime. Nationally, 42.0 percent of state and local law enforcement agencies identified cocaine, particularly crack, as the drug that most contributes to property crime in their areas followed by methamphetamine (29.8%), marijuana (11.8%), heroin (10.9%), and MDMA (0.1%). Regionally, cocaine was most often reported by agencies in the Southeast region (73.2%) as the drug that most contributes to property crime followed by the Great Lakes (44.2%), Northeast/Mid-Atlantic (39.4%), Southwest (38.8%), West Central (16.6%), and Pacific (5.0%) regions. The highest proportion of state and local law enforcement agencies that reported methamphetamine as the drug that most contributes to property crime was in the Pacific region (80.2%) followed by the West Central (73.3%), Southwest (47.3%), Great Lakes (23.0%), Southeast (17.2%), and Northeast/Mid-Atlantic (1.2%) regions. (See Tables 3 and A3.)

1. NDTs data do not imply that there is only one drug threat per region. A percentage given for a region represents the estimated proportion of state and local law enforcement agencies in that region that identified a particular drug as their greatest threat.

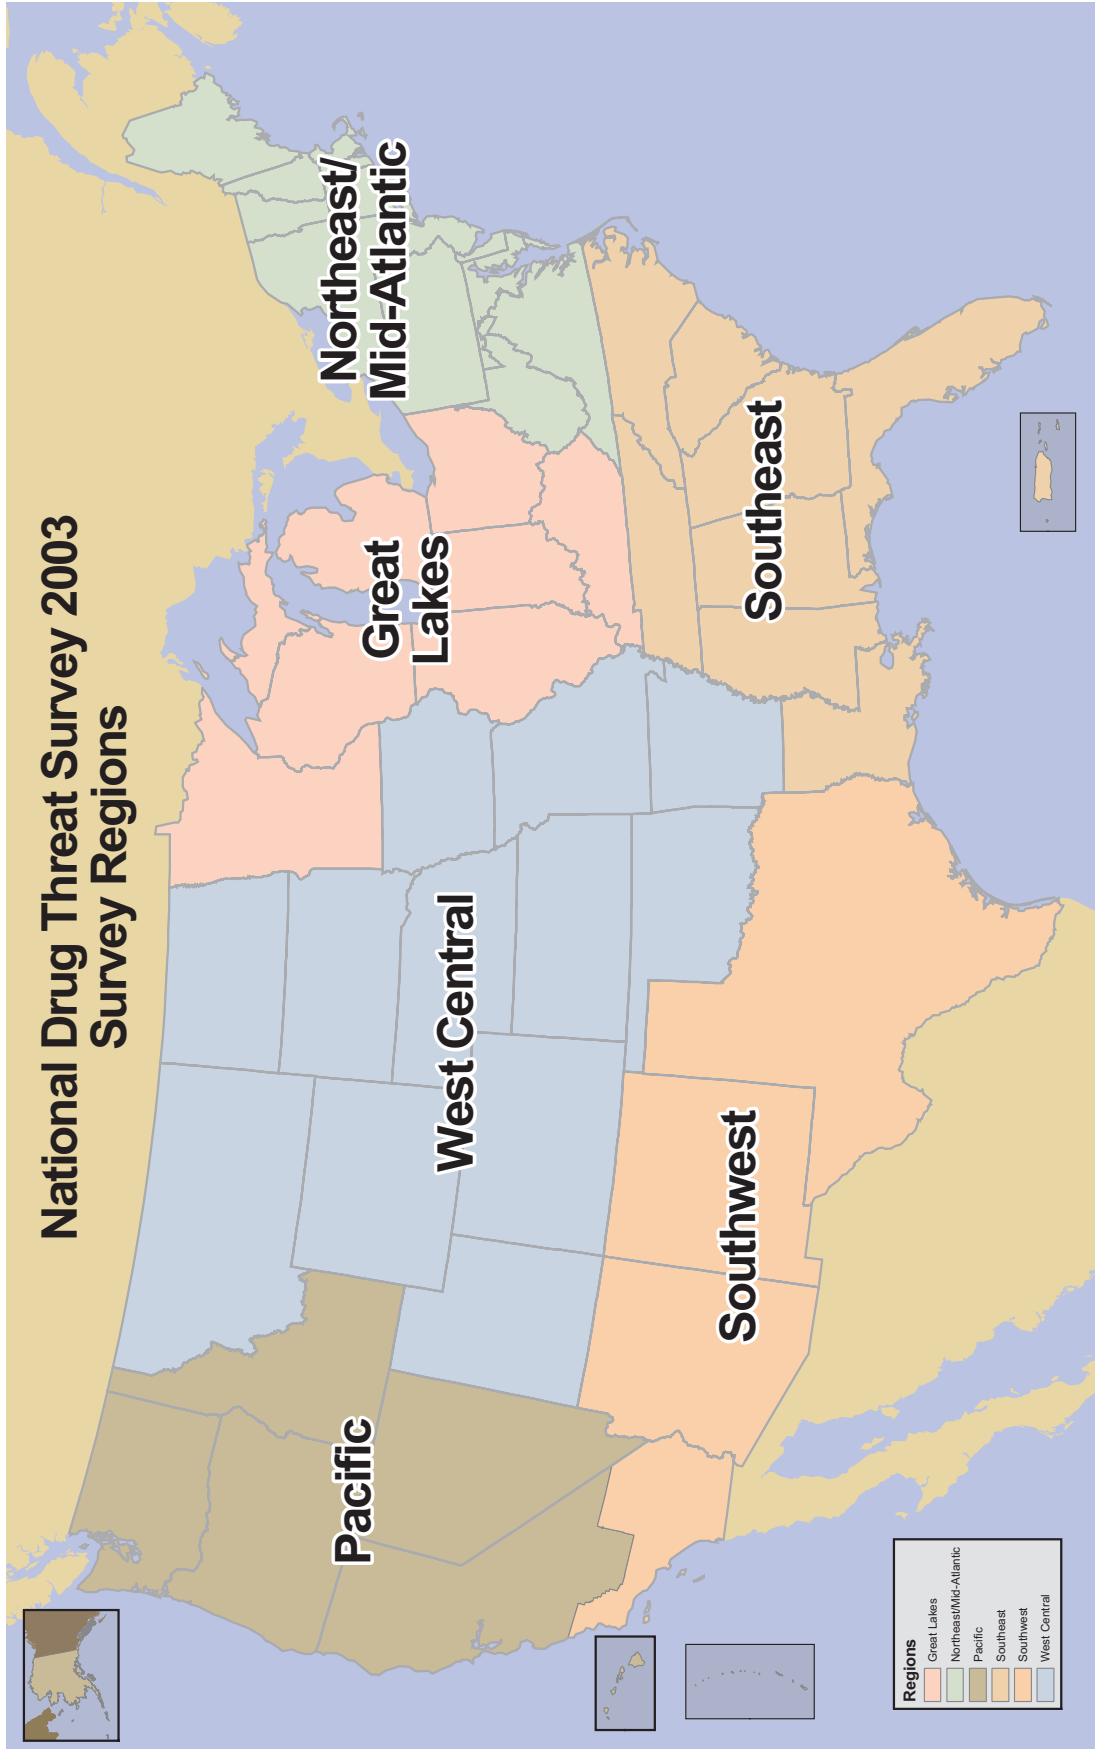

Figure 1.

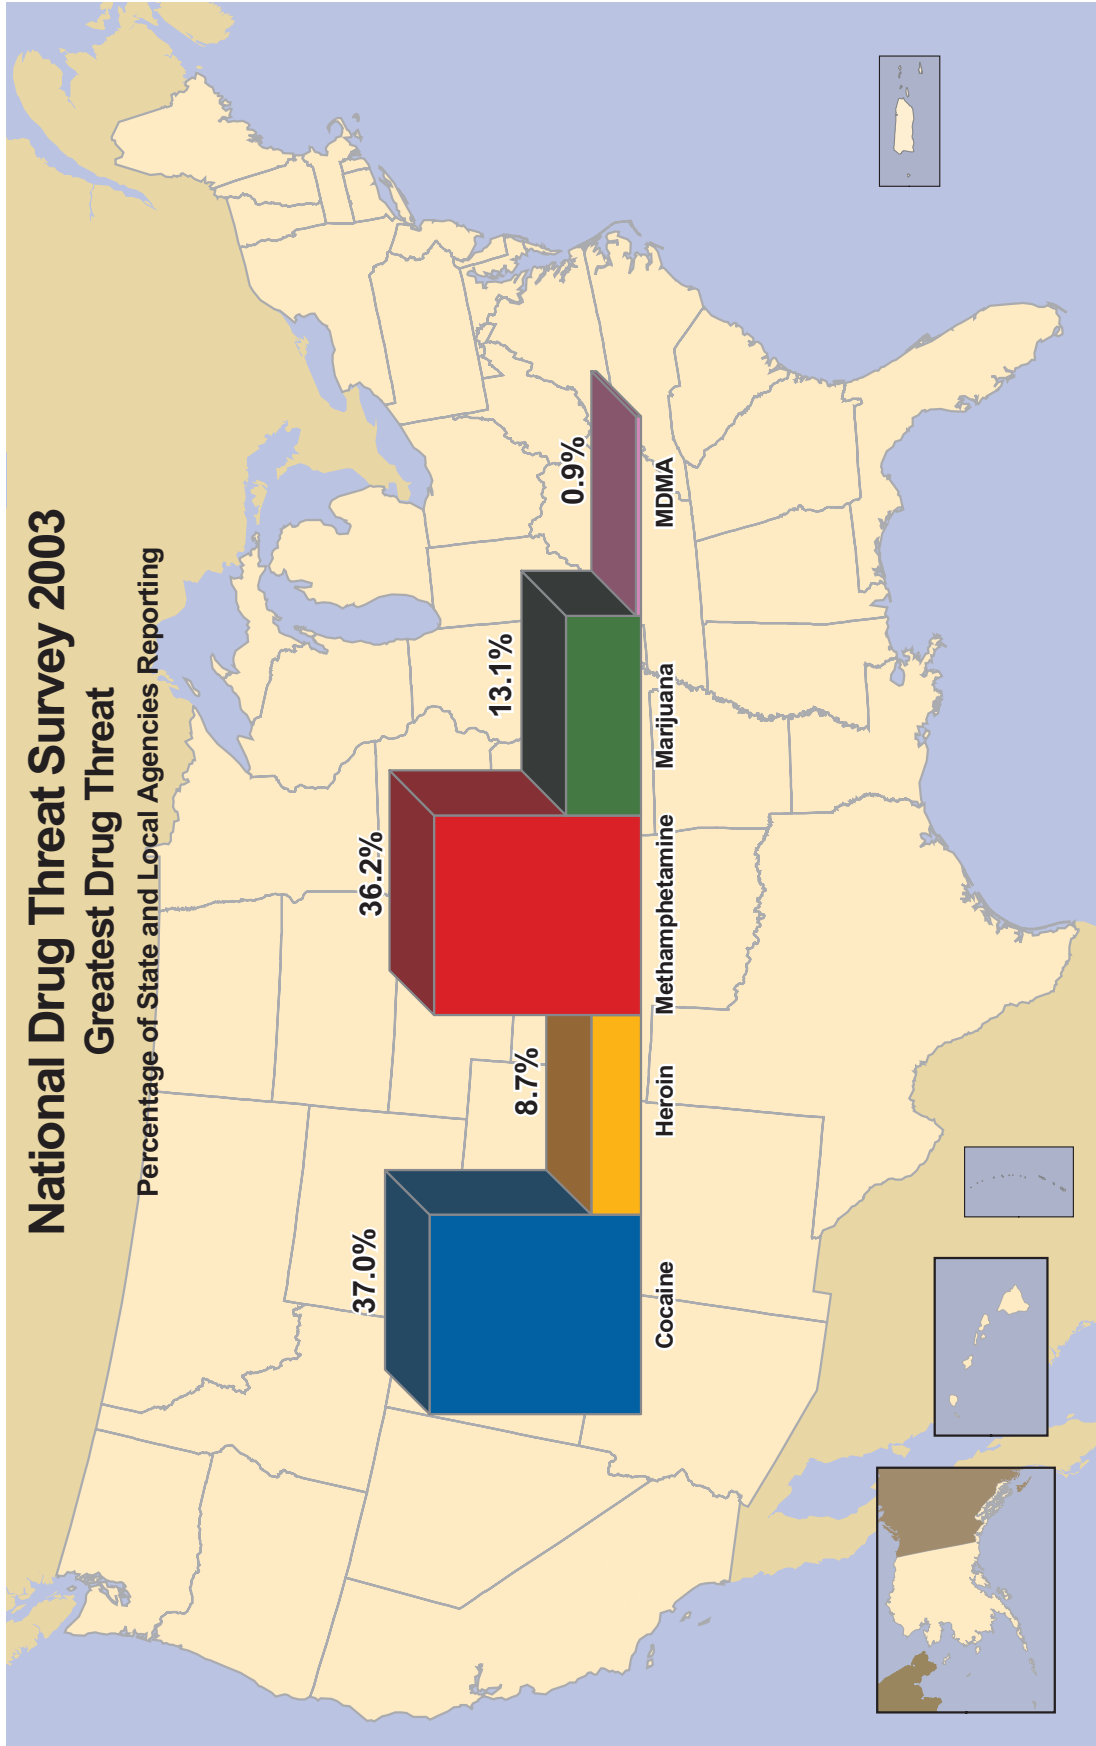

Figure 2.

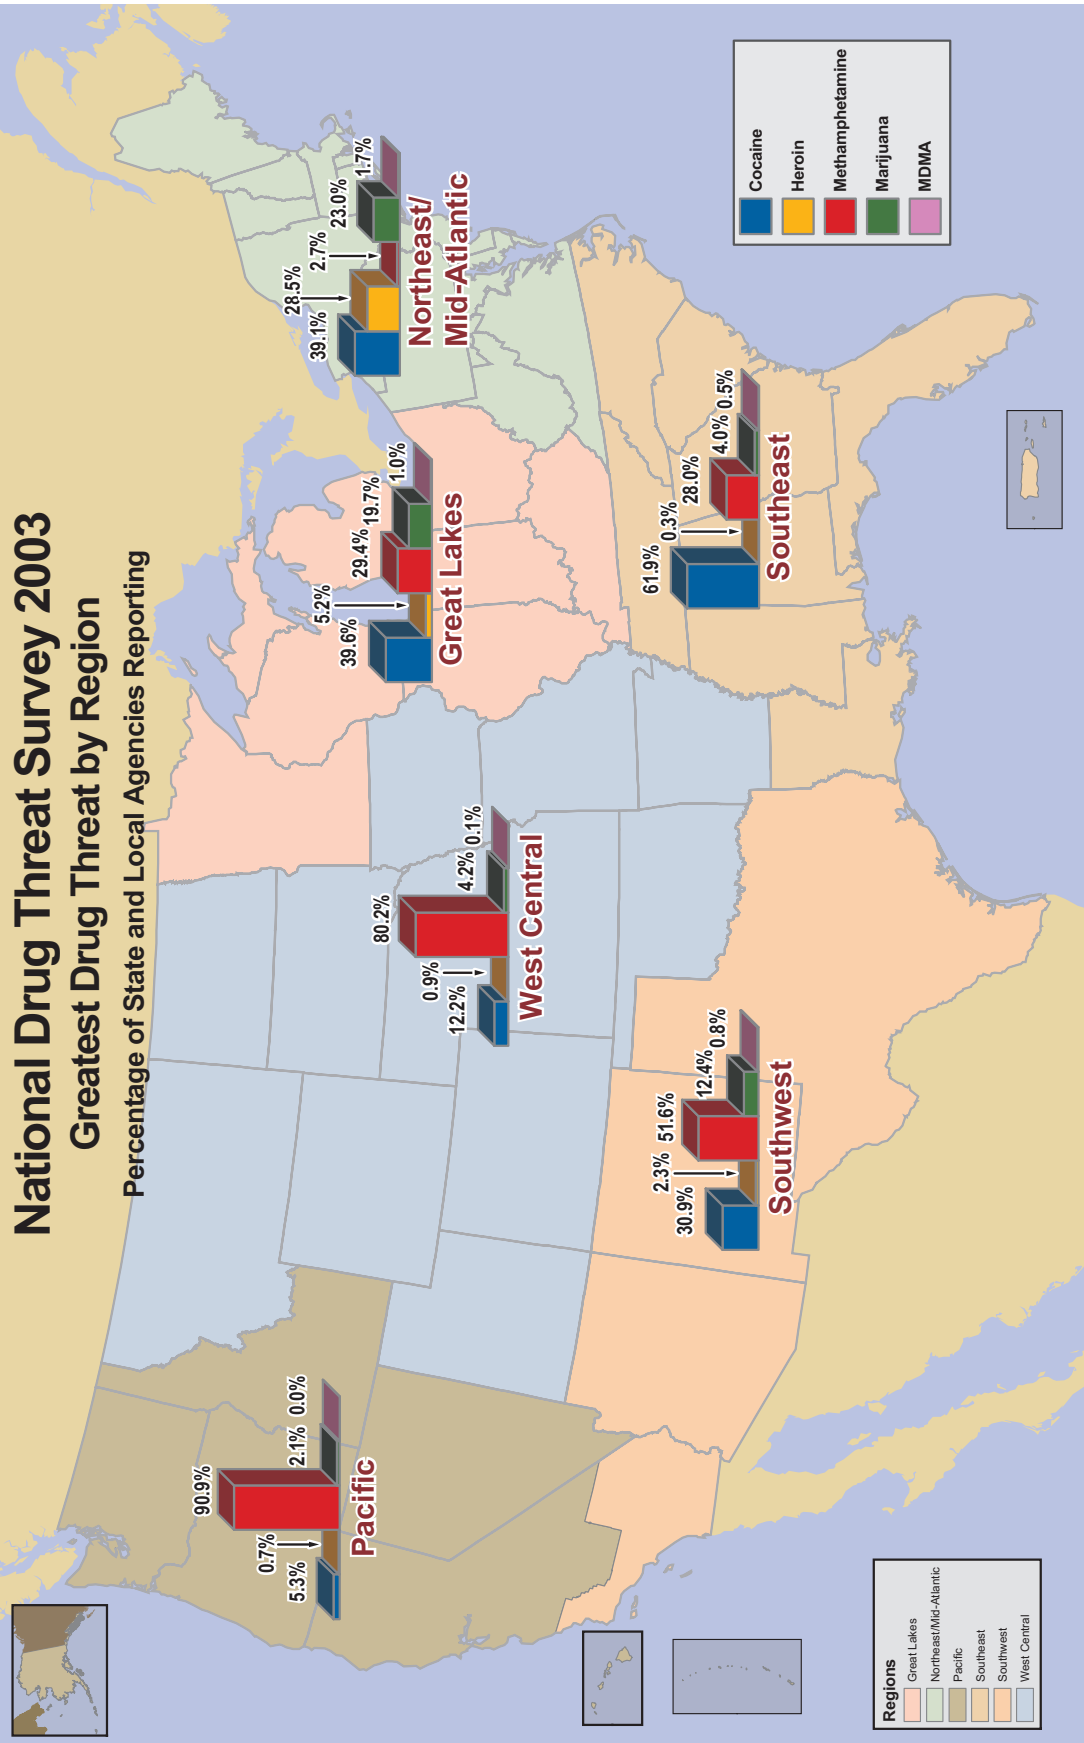

Figure 3.

Drug Availability

NDTS 2003 recipients were asked to rate the overall level of availability (on a scale of low, moderate, high, or not available) of powdered cocaine, crack cocaine, heroin, methamphetamine, marijuana, MDMA, club drugs, hallucinogens, analogs, and illegally diverted prescription pharmaceuticals in their areas.

Nationally, state and local law enforcement agencies report that marijuana, cocaine, and methamphetamine are the most available illicit drugs of abuse. NDTS data indicate that 81.7 percent of state and local agencies reported high or moderate availability of powdered cocaine in their areas, while 16.4 percent of the agencies reported low availability. Only 0.5 percent of agencies nationwide reported that powdered cocaine was not available in their areas. The highest proportion of state and local agencies that reported high or moderate availability of powdered cocaine was in the Northeast/Mid-Atlantic region (88.4%), and the lowest proportion of agencies was in the Pacific region (63.5%). (See Figure 4, Tables 4 and A4.)

NDTS 2003 data show that 75.0 percent of state and local agencies reported high or moderate availability of crack cocaine in their areas, 21.9 percent reported low availability, and 1.7 percent reported that crack is not available in their areas. Regionally, the highest percentage of agencies that reported high or moderate crack availability was in the Southeast region (95.1%), and the lowest percentage of such agencies was in the Pacific region (46.9%). (See Figure 4, Tables 4 and A5.)

Heroin availability was reported as high or moderate by 38.0 percent of state and local law enforcement agencies, while over half (50.5%) reported low availability of the drug. Regionally, a higher proportion of state and local law enforcement agencies in the Northeast/Mid-Atlantic region (68.1%) reported high or moderate heroin availability than did agencies in any other region. The lowest percentage of such agencies was in the Southeast region (16.4%). (See Figure 4, Tables 4 and A6.)

According to NDTS 2003 data, nearly two-thirds (64.6%) of state and local law enforcement agencies reported that the availability of methamphetamine was high or moderate in their areas. Low methamphetamine availability was reported by 28.8 percent of such agencies, and only 4.5 percent of agencies reported that methamphetamine was not available in their areas. Regionally, the highest percentage of agencies that reported high or moderate methamphetamine availability was in the Pacific region (97.8%) followed by the West Central (95.6%), Southwest (86.2%), Southeast (76.5%), Great Lakes (58.9%), and Northeast/Mid-Atlantic (24.1%) regions. (See Figure 4, Tables 4 and A7.)

NDTS 2003 data indicate that marijuana availability is very high in every region. According to NDTS 2003 data, 98.2 percent of state and local agencies rated the availability of marijuana as high or moderate in their areas. Only 0.7 percent of agencies reported low marijuana availability, and 0.2 percent reported that marijuana was not available in their areas. Regionally, the proportion of agencies reporting high or moderate marijuana availability ranges from a low of 97.2 percent in the Northeast/Mid-Atlantic region to a high of 99.0 percent in the Great Lakes region. (See Figure 4, Tables 4 and A8.)

NDTS 2003 data indicate that 54.1 percent of state and local law enforcement agencies reported high or moderate availability of MDMA in their areas. Regionally, a greater proportion of agencies in the Northeast/Mid-Atlantic (63.0%) and Southeast (59.8%) regions reported high or moderate availability than did those in the Pacific (50.7%), Southwest (50.7%), Great Lakes (49.5%), and West Central (42.2%) regions. (See Figure 4, Tables 5 and A9.)

The availability of the club drugs GHB, ketamine, and Rohypnol appears to be somewhat limited, according to NDTS 2003 data. GHB availability was rated as high or moderate by only 20.7 percent of agencies followed by ketamine

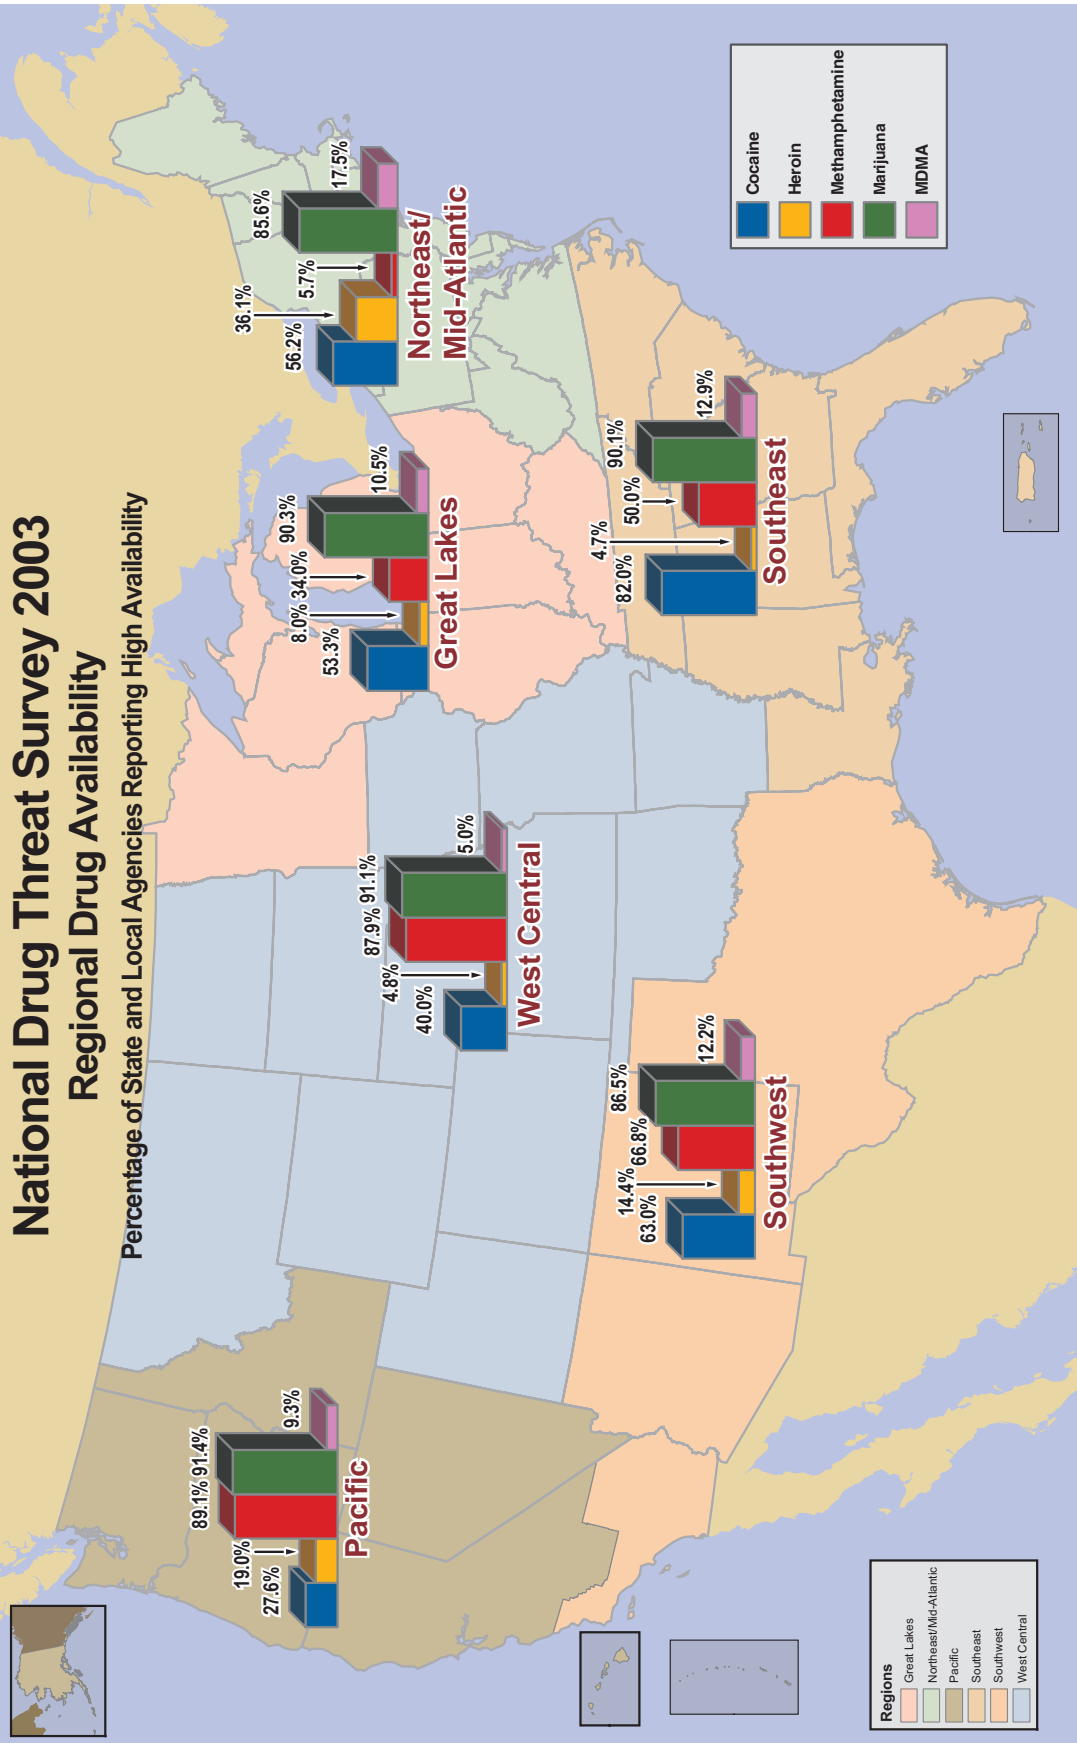

Figure 4.

(13.6%) and Rohypnol (10.1%). Of these club drugs, 23.9 percent of state and local agencies reported that Rohypnol was not available in their areas, while lower percentages of such agencies reported that ketamine (20.8%) and GHB (15.8%) were not available in their areas. Most survey respondents rated the availability of these drugs as low in their areas. NDTs 2003 data indicate that 61.5 percent of state and local law enforcement agencies reported low availability of Rohypnol followed by ketamine (61.1%) and GHB (59.0%). (See Tables 5 and A10–A12.)

NDTS 2003 data indicate limited availability of the hallucinogens LSD, PCP, and psilocybin. Nationally, only 23.4 percent of state and local law enforcement agencies reported high or moderate availability of psilocybin followed by LSD

(18.9%) and PCP (9.6%). Most state and local law enforcement agencies rated the availability of LSD (66.0%), PCP (62.1%), and psilocybin (58.9%) as low in their areas. Moreover, a relatively high percentage of agencies reported that PCP (23.6%), psilocybin (14.1%), and LSD (11.9%) were not available in their areas. (See Tables 6 and A14–A16.)

NDTS 2003 data indicate that diverted pharmaceuticals are widely available throughout the country. Nationally, 72.3 percent of state and local law enforcement agencies reported high or moderate availability of prescription pharmaceuticals in their areas, 21.7 percent reported low availability, while 2.8 percent reported that prescription pharmaceuticals were not available in their areas. (See Tables 6, A19, and A20.)

Gang Involvement in Drug Distribution

Several survey questions were designed to elicit information regarding the level of street gang and OMG involvement (rated on a scale of low, moderate, high, or none) in the distribution of drugs.

Nationally, 25.9 percent of state and local law enforcement agencies reported that street gang involvement in drug distribution in general was moderate or high in their areas. The percentage of agencies reporting moderate or high street gang involvement in drug distribution was highest in the Southwest (39.0%) and Pacific (36.8%) regions and was lowest in the Northeast/Mid-Atlantic region (17.9%). For distribution of specific drug types, street gangs appear to be most involved in the distribution of marijuana, cocaine (both powdered and crack), and methamphetamine. The percentage of agencies that indicated high or moderate street gang involvement in distribution of specific drugs was highest for marijuana (32.9%), crack cocaine (29.1%), powdered cocaine (24.8%), and methamphetamine (17.1%) followed by heroin (11.6%), ODDs (9.0%), MDMA (8.5%), and pharmaceuticals (7.0%). (See Tables 7, 8, and A21–A29.)

NDTS 2003 data indicate that, nationally, 11.5 percent of state and local law enforcement agencies reported moderate or high OMG involvement in drug distribution in their areas. The highest percentage of such agencies was in the Pacific region (21.6%) followed by the Great Lakes (13.7%), Southwest (12.6%), Northeast/Mid-Atlantic (10.0%), West Central (9.2%), and Southeast (8.3%) regions. The proportion of agencies that indicated high or moderate OMG involvement in distribution of specific drugs was highest for methamphetamine (17.0%) followed by marijuana (14.1%), powdered cocaine (9.0%), pharmaceuticals (5.0%), heroin (4.8%), ODDs (4.8%), crack cocaine (4.5%), and MDMA (3.3%). (See Tables 9, 10, and A30–A38.)

Drug Production

The NDTs 2003 included several questions related to the production of specific drugs. Survey recipients were asked to indicate whether or not powdered cocaine was converted to crack cocaine, the methods of cannabis cultivation, and the level of methamphetamine production (rated on a scale of low, moderate, high, or not produced) in their areas.

Most agencies (68.0%) indicated that powdered cocaine was converted to crack in their areas. Regionally, more agencies in the Southeast region (88.0%) reported crack conversion in their areas, while the lowest percentages of such agencies were in the West Central (52.4%) and Pacific (47.8%) regions. (See Tables 11 and A39.)

NDTS 2003 data indicate that domestic cannabis cultivation is widespread. Both indoor and outdoor cannabis cultivation was reported by nearly equal percentages of agencies—73.1 percent reported indoor cannabis cultivation in their areas, and 74.0 percent reported outdoor cannabis cultivation. A significantly smaller proportion (39.7%) of state and local law enforcement agencies reported hydroponic cannabis cultivation in their areas, and 9.7 percent indicated that

cannabis is not cultivated in their areas. The highest proportion of agencies that reported indoor (89.7%) and hydroponic (55.4%) cannabis cultivation was in the Pacific region, while the highest percentage of agencies reporting outdoor cultivation (82.3%) was in the Southeast region. (See Tables 12 and A40.)

According to NDTs data, nearly half (48.8%) of state and local law enforcement agencies rated the level of methamphetamine production in their areas as either high or moderate. NDTs 2003 data further indicate that 27.2 percent of state and local law enforcement agencies rated the level of methamphetamine production in their areas as low, while only 23.2 percent reported that methamphetamine was not produced in their areas. The highest percentage of state and local law enforcement agencies that reported moderate or high methamphetamine production levels was in the West Central region (81.2%) followed by the Pacific (76.5%), Southwest (71.2%), Southeast (61.5%), Great Lakes (43.4%), and Northeast/Mid-Atlantic (7.2%) regions. (See Tables 13 and A41.)

Chemical Diversion

NDTS 2003 recipients were asked to identify the chemicals commonly diverted in their areas for use in the production of illicit drugs.

Nationally, ephedrine (55.1%) and pseudoephedrine (49.0%) were the precursor chemicals most often identified by state and local law enforcement agencies. Agencies in the West Central region were most likely to report the diversion of ephedrine (83.1%) and pseudoephedrine (85.7%) in their areas followed by agencies in the Pacific region, with 77.6 percent reporting ephedrine and 68.2 percent reporting pseudoephedrine diversion. Acetone (48.1%) and anhydrous

ammonia (44.6%) were the most commonly diverted reagents and solvents identified by state and local law enforcement agencies, according to NDTs 2003 data. Agencies in the Pacific (78.6%) and West Central (78.3%) regions were most likely to report the diversion of acetone in their areas, while agencies in the Northeast/Mid-Atlantic region (14.8%) were least likely to report acetone diversion. Anhydrous ammonia diversion was reported most often by agencies in the West Central region (76.5%) and least often by agencies in the Northeast/Mid-Atlantic region (7.8%). (See Tables 14, A42 and A43.)

Pharmaceutical Diversion/Illicit Use

NDTS 2003 recipients were asked to identify the pharmaceuticals commonly diverted or illicitly used in their areas.

Nationally, OxyContin (67.0%) was the pharmaceutical narcotic most often identified by state and local agencies as a commonly diverted or illicitly used pharmaceutical in their areas. Other narcotics identified by more than half of the state and local law enforcement agencies were Vicodin (62.8%), oxycodone (58.4%), hydrocodone (55.6%), Percocet (52.2%), and codeine (50.4%). Regionally, OxyContin was reported as a commonly diverted or illicitly used pharmaceutical by a higher percentage of state and local law enforcement agencies in the Southeast (83.9%) and Northeast/Mid-Atlantic (75.0%) regions than in the Great Lakes (65.4%), West Central (61.8%), Pacific (56.9%), and Southwest (28.6%) regions.

According to NDTS 2003 data, Valium (72.8%) and Xanax (65.7%) were identified by agencies as commonly diverted or illicitly used pharmaceutical depressants in their areas more

frequently than any other pharmaceutical depressants. Regionally, the highest proportion of agencies that reported Valium as a commonly diverted or illicitly used pharmaceutical was in the Southeast region (83.3%), and the lowest proportion of such agencies was in the Northeast/Mid-Atlantic region (64.5%). The highest percentage of agencies that reported Xanax as a commonly diverted or illicitly used depressant was in the Southeast region (86.7%), and the lowest percentage of such agencies was in the Southwest region (41.5%).

State and local law enforcement agencies nationwide most frequently identified Ritalin (51.1%) as a commonly diverted or illicitly used pharmaceutical stimulant in their areas. Regionally, a higher percentage of agencies in the Great Lakes (57.9%) and West Central (57.3%) regions reported that Ritalin was a commonly diverted or illicitly used pharmaceutical stimulant followed by the Northeast/Mid-Atlantic (49.9%), Southeast (48.4%), Southwest (41.4%), and Pacific (41.1%) regions. (See Tables 15, A44, and A45.)

Summary

NDTS 2003 data collected from a representative sample of state and local law enforcement agencies provide insight into the availability, production, distribution, and overall threat posed by the trafficking and abuse of cocaine (powdered and crack), methamphetamine, heroin, marijuana, MDMA, ODDs, and pharmaceuticals. The valuable data presented in this report reflect the state, regional, and national responses to numerous questions posed to state and local law enforcement agencies. These data are analyzed and incorporated into strategic drug intelligence reports.

Appendix B:

National Drug Threat Survey 2003 Methodology

The National Drug Intelligence Center (NDIC) *National Drug Threat Survey 2003* (NDTS 2003) was administered to a probability-based sample of state and local law enforcement agencies. The sample was designed to provide representative data at national, regional, and state levels for use in the National Drug Threat Assessment 2004. The previous NDTS 2002 sample was designed to provide representative data at the national and regional levels only. The availability of state-level representative data not only increases the precision of the data used in this year's National Drug Threat Assessment but also expands the application of NDTS 2003 results to NDIC's state and regional threat assessments.

Survey Instrument

The NDTs 2003 questionnaire (OMB Number 1105-0071) was designed by NDIC. A thorough review of data and response patterns from previous versions of the NDTs was conducted to improve the accuracy of information obtained from respondents. Responding law enforcement agencies were asked to identify the drug that poses the greatest threat, that most contributes to violent crime, and that most contributes to property crime in their areas. Agencies also were asked to rate the overall level of availability (on a scale of low, moderate, or high) of powdered cocaine, crack cocaine, heroin, methamphetamine, marijuana, MDMA (ecstasy), and other dangerous drugs in their areas. The survey included an item designed to solicit information on the level of involvement of street gangs and outlaw motorcycle gangs in the distribution of drugs in general and of specific drugs. Other items in the questionnaire asked respondents to indicate the types of heroin available, predominant type of heroin, presence of crack cocaine conversion sites, presence of MDMA production laboratories, level of methamphetamine production, and nature of cannabis cultivation in their areas. Respondents also were asked to indicate which chemicals are diverted in or from their areas for the production of illicit drugs and which pharmaceuticals are commonly diverted or illicitly used in their areas.

Sample Design

The *2000 Census of State and Local Law Enforcement Agencies* conducted by the U.S. Bureau of Justice Statistics was the basis for determining a sample frame from which to select law enforcement agencies to be surveyed for the NDTs 2003. After careful review of the more than 17,000 law enforcement agencies in the *2000 Census of State and Local Law Enforcement Agencies*, a final sample frame of 7,930 state and local law enforcement agencies with drug law enforcement responsibilities was created. Municipal police departments from every state, including regional and county police departments with 10 or more sworn full time equivalent (FTE) employees, were retained for the sampling frame. County sheriff's offices with 10 or more sworn FTE employees were also retained for the sampling frame except those in six states where county sheriff's offices do not have drug law enforcement responsibilities. In the rest of the country, sheriff's offices were excluded if they did not indicate on the *2000 Census of State and Local Law Enforcement Agencies* that they enforce drug laws. Campus police departments, constables, and special police agencies were excluded since most of these agencies, too, have limited or no drug investigation responsibilities. Tribal police departments, whose jurisdictions fall under federal authority, also were eliminated. State drug investigative agencies not in the *2000 Census of State and Local Law Enforcement Agencies* were added to the sampling universe.

The sample frame of 7,930 state and local law enforcement agencies was stratified (see Table B1 on page 105) to include the following specific groups of state and local law enforcement agencies to ensure a thorough analysis of the domestic drug situation:

- ▶ Municipal police departments and county sheriff's offices with 75 or more sworn FTE employees as reported in the *2000 Census of State and Local Law Enforcement Agencies* were selected with certainty (stratum 97).
- ▶ State police and state-level investigative agencies were selected with certainty to provide information on the drug threat situation from a state perspective. State police agencies were obtained from the *2000 Census of State and Local Law Enforcement Agencies*. Additional state-level investigative agencies were derived from previous NDTs sampling plans. Typically included for each state were the state police and lead drug enforcement agency, although this pattern varied in some states (stratum 98).

- Investigative agencies in three U.S. territories—Guam, the Northern Mariana Islands, and Puerto Rico—were also selected with certainty (stratum 99).

To ensure that state-level representative statements could be made about results obtained from the NDTs 2003, local law enforcement agencies were coded according to the 50 states and District of Columbia. Municipal police departments and county sheriff's offices with sworn FTE employees of 10 or more but fewer than 75, and meeting all the criteria discussed above, were included in these strata. The states were used as the noncertainty strata, and a Neyman allocation was used to allocate the noncertainty sample to the state strata.² All eligible law enforcement agencies in the District of Columbia and Hawaii met the criteria for inclusion with certainty and were included in stratum 97. The state of California was split: law enforcement agencies within the Southern and Central U.S. Attorney Districts were included in Southern California, and those in the Eastern and Northern Districts were included in Northern California. The noncertainty agencies in Southern California were included in stratum 91, and similar agencies for Northern California were included in stratum 92.

The actual sample, representing the sampling universe of 7,930 state and local law enforcement agencies, consisted of 3,497 agencies in 53 strata, 3 of which were certainty strata.

Data Collection

NDIC verified the point of contact and mailing address for each law enforcement agency in the sample and mailed the surveys, which were accompanied by a cover letter from NDIC Director Michael T. Horn and a postage-paid return envelope. NDIC Field Program Specialists located throughout the country were responsible for follow-up contacts with sample agencies that were mailed a survey.

Of the 3,497 state and local law enforcement agencies in the actual sample, 251 had received the survey earlier in 2003 under a joint effort by NDIC and the High Intensity Drug Trafficking Area (HIDTA) program that was designed to assist the HIDTAs in preparing their annual threat assessments. Copies of surveys completed by sample agencies under the joint NDIC-HIDTA effort were forwarded to NDIC. Lists of agencies that did not respond were given to Field Program Specialists for follow-up contact, and a second NDTs 2003 survey was either mailed or personally delivered to the nonresponding agency.

NDIC provided daily reports to help Field Program Specialists target nonresponding agencies, which were contacted by telephone, by letter, and in person. All responses were entered in the NDTs database designed and developed by NDIC.

Sample Adjustments

During survey processing, NDIC identified nine ineligible agencies. Included in this group were five agencies that no longer performed drug enforcement activities, three agencies that no longer existed, and one agency that had merged with another law enforcement agency. Three of these agencies were state noncertainty cases (one each in stratum 24, stratum 29, and stratum 91), three were certainties due to size (stratum 97), and three were state agency certainties (stratum 98).

The nine ineligible agencies were deleted from the original actual sample of 3,497 that resulted in an adjusted sample of 3,488 agencies in 53 strata, three of which were certainty strata. The sample represents 7,921 agencies. A summary of the adjusted sample design is presented in Table B1, page B-6.

2. For more details on Neyman allocation, see W.G. Cochran, "Stratified Random Sampling," Chapter 5, in *Sampling Techniques*, 3d ed. New York: John Wiley and Sons, 1977.

To compensate for the deletion of the three ineligible records in noncertainty strata (stratum 24, stratum 29, and stratum 91) from the sample, a poststratification factor was calculated for the affected strata to correct the base weights for those strata. For all other strata, the poststratification factor is 1.0. The poststratification factors for all strata also are shown in Table B1.

Nonresponse Adjustment Factor

Of the 3,488 agencies in the adjusted sample, 3,354 agencies responded to the NDTS 2003 for an overall response rate of 96.2 percent. Table B2 on page B-8 summarizes the response rates by state. A nonresponse adjustment factor was applied to account for those agencies that did not respond to the survey.

The nonresponse adjustment factor for each stratum j is calculated as

$$\left(\begin{array}{l} \text{nonresponse} \\ \text{adjustment} \\ \text{factor } j \end{array} \right) = \frac{\sum_{\text{responding agencies}_{j,k}} \left(\begin{array}{l} \text{base} \\ \text{weight} \end{array} \right) \times \left(\begin{array}{l} \text{poststratification} \\ \text{factor} \end{array} \right) + \sum_{\text{nonresponding agencies}_{j,k}} \left(\begin{array}{l} \text{base} \\ \text{weight} \end{array} \right) \times \left(\begin{array}{l} \text{poststratification} \\ \text{factor} \end{array} \right)}{\sum_{\text{responding agencies}_{j,k}} \left(\begin{array}{l} \text{base} \\ \text{weight} \end{array} \right) \times \left(\begin{array}{l} \text{poststratification} \\ \text{factor} \end{array} \right)}$$

where k represents either the k^{th} responding or the k^{th} nonresponding agency in stratum j .

The final weight for each responding agency is calculated as

$$\left(\begin{array}{l} \text{final} \\ \text{weight} \end{array} \right) = \left(\begin{array}{l} \text{base} \\ \text{weight} \end{array} \right) \times \left(\begin{array}{l} \text{poststratification} \\ \text{factor} \end{array} \right) \times \left(\begin{array}{l} \text{nonresponse} \\ \text{adjustment} \\ \text{factor} \end{array} \right)$$

Estimation Techniques

The final weight for each respondent was used to derive national, regional, and state level estimates for all survey items. The final adjusted score was summed for each response category (for example, high, moderate, and low) for each item, and the proportion of the final scores provided the national, regional, or state level estimate for that item. Some respondents did not answer all survey items. The item nonresponse rate ranged from 0.8 to 20.3 percent.

Nonsampling Error

Nonsampling error may affect NDTS 2003 data. Possible nonsampling errors include the following:

- ▶ Inability to obtain information about all agencies in the sample
- ▶ Varied interpretation of response categories (for example, high, moderate, and low are defined differently by respondents)
- ▶ Inability or unwillingness of respondents to provide correct information
- ▶ Errors made in collection, coding, or processing of data
- ▶ Failure to represent all agencies within the sample (undercoverage)

Nonsampling error can increase the total error over the error resulting from sampling. Random non-sampling errors can increase the variability of data, while systemic nonsampling errors that are consistent in one direction can introduce bias into the results of a sample survey. NDIC used data collection, coding, and processing procedures designed to limit the effects of random nonsampling error on the NDTS 2003 data. No systemic nonsampling errors were identified.

Table B1. NDTs 2003 Sample Design (3,354 of 3,488 agencies responding)

	Stratum	Sample Count	Total	Original Base Weight	Post-stratification Factor	Nonresponse Adjustment Factor	Final Weight
