Occupational Health Guideline for Butyl Acetate

INTRODUCTION

This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION

- Formula: CH₃COO(CH₂)₃CH₃
- Synonyms: n-Butyl acetate; butyl ethanoate; acetic acid butyl ester
- Appearance and odor: Colorless liquid with a fruity odor.

PERMISSIBLE EXPOSURE LIMIT (PEL)

The current OSHA standard for butyl acetate is 150 parts of butyl acetate per million parts of air (ppm) averaged over an eight-hour work shift. This may also be expressed as 710 milligrams of butyl acetate per cubic meter of air (mg/m³).

HEALTH HAZARD INFORMATION

Routes of exposure

Butyl acetate can affect the body if it is inhaled, comes in contact with the eyes or skin, or is swallowed.

- Effects of overexposure
- I. Short-term Exposure: Overexposure to butyl acetate may cause irritation of the eyes, nose, and throat. Severe overexposure may cause weakness, drowsiness, and unconsciousness.
- 2. Long-term Exposure: Prolonged overexposure may produce irritation of the skin.
- 3. Reporting Signs and Symptoms: A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to butyl acetate.

Recommended medical surveillance

The following medical procedures should be made available to each employee who is exposed to butyl acetate at potentially hazardous levels:

- 1. Initial Medical Screening: Employees should be screened for history of certain medical conditions (listed below) which might place the employee at increased risk from butyl acetate exposure.
- —Skin disease: Butyl acetate is a mild defatting agent and can cause dermatitis on prolonged exposure. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent.
- —Kidney disease: Although butyl acetate is not known as a kidney toxin in humans, the importance of this organ in the elimination of toxic substances justifies special consideration in those with possible impairment of renal function.
- —Chronic respiratory disease: In persons with impaired pulmonary function, especially those with obstructive airway diseases, the breathing of butyl acetate might cause exacerbation of symptoms due to its irritant properties.
- —Liver disease: Although butyl acetate is not known as a liver toxin in humans, the importance of this organ in the biotransformation and detoxification of foreign substances should be considered before exposing persons with impaired liver function.
- 2. Periodic Medical Examination: Any employee developing the above-listed conditions should be referred for further medical examination.

Summary of toxicology

The principal effect of overexposure to butyl acetate is irritation of the eyes and nose, which occurs at 200 to 300 ppm and is marked at concentrations over 3000 ppm. Butyl acetate splashed in the eye causes marked irritation, but recovery is rapid. Anesthetic effects have been observed in animals at very high concentrations. Levels of 400 to 600 ppm in exposures of 2 to 3 hours' duration did not cause anesthetic effects in man. No chronic systemic effects have been reported in humans.

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance with all requirements of OSHA regulations.

Public Health Service Centers for Disease Control National Institute for Occupational Safety and Health

U.S. DEPARTMENT OF LABOR

Occupational Safety and Health Administration

CHEMICAL AND PHYSICAL PROPERTIES

Physical data

- 1. Molecular weight: 116
- 2. Boiling point (760 mm Hg): 126 C (260 F)
- 3. Specific gravity (water = 1): 0.88
- 4. Vapor density (air = 1 at boiling point of butyl acetate): 4.0
 - 5. Melting point: -74 C (-101 F)
 - 6. Vapor pressure at 20 C (68 F): 10 mm Hg
- 7. Solubility in water, g/100 g water at 20 C (68 F): 0.68
 - 8. Evaporation rate (butyl acetate = 1): 1.0

Reactivity

- 1. Conditions contributing to instability: Heat
- 2. Incompatibilities: Contact with nitrates, strong oxidizers, strong alkalies, and strong acids may cause fires and explosions.
- 3. Hazardous decomposition products: Toxic gases and vapors (such as carbon monoxide) may be released in a fire involving butyl acetate.
- 4. Special precautions: Butyl acetate will dissolve many plastics and resins.

Flammability

- 1. Flash point: 22 C (72 F) (closed cup)
- 2. Autoignition temperature: 425 C (797 F)
- 3. Flammable limits in air, % by volume: Lower: 1.7;
- 4. Extinguishant: Dry chemical, carbon dioxide, foam

Warning properties

- 1. Odor Threshold: Summer and May report odor thresholds for butyl acetate of 7 ppm and 20 ppm, respectively.
- 2. Eye Irritation Level: Grant reports that the vapor of butyl acetate "causes irritation of the eyes and nose, first noticeable to human beings at a concentration of 300 ppm in air, and objectionable at 3300 ppm; higher concentrations cause tearing and hyperemia of the conjunctiva."
- 3. Evaluation of Warning Properties: Butyl acetate can be detected below the TLV through its odor, and at a concentration of only twice the TLV through its irritant effects. For the purposes of this guideline, therefore, butyl acetate is considered to have good warning properties.

MONITORING AND MEASUREMENT PROCEDURES

• General

Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee's breathing zone (air that would most nearly represent that inhaled by the employee).

Method

Sampling and analyses may be performed by collection of butyl acetate vapors using an adsorption tube with subsequent desorption with carbon disulfide and gas chromatographic analysis. Also, detector tubes certified by NIOSH under 42 CFR Part 84 or other direct-reading devices calibrated to measure butyl acetate may be used. An analytical method for butyl acetate is in the NIOSH Manual of Analytical Methods, 2nd Ed., Vol. 2, 1977, available from the Government Printing Office, Washington, D.C. 20402 (GPO No. 017-033-00260-6).

RESPIRATORS

- Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.
- In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

PERSONAL PROTECTIVE EQUIPMENT

- Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent repeated or prolonged skin contact with liquid butyl acetate.
- Clothing wet with liquid butyl acetate should be placed in closed containers for storage until it can be discarded or until provision is made for the removal of butyl acetate from the clothing. If the clothing is to be laundered or otherwise cleaned to remove the butyl acetate, the person performing the operation should be informed of butyl acetate's hazardous properties.
- Any clothing which becomes wet with liquid butyl acetate should be removed immediately and not reworn until the butyl acetate is removed from the clothing.
- Employees should be provided with and required to use splash-proof safety goggles where liquid butyl acetate may contact the eyes.

SANITATION

• Skin that becomes wet with liquid butyl acetate should be promptly washed or showered with soap or mild detergent and water to remove any butyl acetate.

COMMON OPERATIONS AND CONTROLS

The following list includes some common operations in which exposure to butyl acetate may occur and control methods which may be effective in each case:

Operation

Use during application of nitrocellulose by spraying, brushing, or dipping

Use during application of surface coatings other than nitrocellulose lacquers, including paper coatings, leather coatings, and airplane dope ename!

Liberation during manufacture of nitrocellulose lacquers

Liberation during production of lacquer thinner

Liberation during use as a solvent for oils, pitch, camphor, ethyl cellulose acetate, and chlorinated rubber

Liberation during use as a solvent in production of artificial leather

Liberation during use of protective coatings in automobile industry

Liberation during use as a solvent for vinyl, polystyrene, and methacrylate plastics

Liberation during manufacture of safety glass; during production of flavorings and perfumes; during manufacture of cosmetics, adhesives, shoe polishes, and stain removers

Controls

Local exhaust ventilation; general dilution ventilation; personal protective equipment

Local exhaust ventilation; general dilution ventilation; personal protective equipment

Local exhaust ventilation

General dilution ventilation

General dilution ventilation

General dilution ventilation

Local exhaust ventilation

Local exhaust ventilation

Local exhaust ventilation

EMERGENCY FIRST AID PROCEDURES

In the event of an emergency, institute first aid procedures and send for first aid or medical assistance.

Eye Exposure

If butyl acetate gets into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. Get medical attention as soon as possible. Contact lenses should not be worn when working with this chemical.

• Skin Exposure

If butyl acetate gets on the skin, promptly flush the contaminated skin with water. If butyl acetate soaks through the clothing, remove the clothing immediately and flush the skin with water. If there is skin irritation, get medical attention.

• Breathing

If a person breathes in large amounts of butyl acetate, move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. Keep the affected person warm and at rest. Get medical attention as soon as possible.

Swallowing

When butyl acetate has been swallowed, get medical attention immediately. If medical attention is not immediately available, get the afflicted person to vomit by having him touch the back of his throat with his finger or by giving him syrup of ipecac as directed on the package. This non-prescription drug is available at most drug stores and drug counters and should be kept with emergency medical supplies in the workplace. Do not make an unconscious person vomit.

• Rescue

Move the affected person from the hazardous exposure. If the exposed person has been overcome, notify someone else and put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility's emergency rescue procedures and know the locations of rescue equipment before the need arises.

SPILL, LEAK, AND DISPOSAL PROCEDURES

- Persons not wearing protective equipment and clothing should be restricted from areas of spills or leaks until cleanup has been completed.
- If butyl acetate is spilled or leaked, the following steps should be taken:
- 1. Remove all ignition sources.
- 2. Ventilate area of spill or leak.
- 3. For small quantities, absorb on paper towels. Evaporate in a safe place (such as a fume hood). Allow sufficient time for evaporating vapors to completely clear the hood ductwork. Burn the paper in a suitable location away from combustible materials. Large quantities can be collected and atomized in a suitable combustion chamber. Butyl acetate should not be allowed to

enter a confined space, such as a sewer, because of the possibility of an explosion.

• Waste disposal methods:

Butyl acetate may be disposed of:

- 1. By absorbing it in vermiculite, dry sand, earth or a similar material and disposing in a secured sanitary landfill.
- 2. By atomizing in a suitable combustion chamber.

RESPIRATORY PROTECTION FOR BUTYL ACETATE

Condition	Minimum Respiratory Protection* Required Above 150 ppm
Vapor Concentration	
1000 ppm or less	A chemical cartridge respirator with a full facepiece and an organic vapor cartridge(s).
5000 ppm or less	A gas mask with a chin-style organic vapor canister.
7500 ppm or less	A gas mask with a chin-style or a front- or back-mounted organic vapor canister.
	Any supplied-air respirator with a full facepiece, helmet, or hood.
	Any self-contained breathing apparatus with a full facepiece.
10,000 ppm or less	A Type C supplied-air respirator with a full facepiece operated in pressure- demand or other positive pressure mode or with a full facepiece, helmet, or hood operated in continuous-flow mode.
Greater than 10,000 ppm or entry and escape from unknown concentrations	Self-contained breathing apparatus with a full facepiece operated in pressure- demand or other positive pressure mode.
	A combination respirator which includes a Type C supplied-air respirator with a full facepiece operated in pressure-demand or other positive pressure or continuous-flow mode and an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive pressure mode.
Fire Fighting	Self-contained breathing apparatus with a full facepiece operated in pressure- demand or other positive pressure mode.
Escape	Any gas mask providing protection against organic vapors.
	Any escape self-contained breathing apparatus.

^{*}Only NIOSH-approved or MSHA-approved equipment should be used.
