

**NHANES 1999-2000 Data Release**  
Prescription Medication Subsection (RXQ\_RX)  
of Dietary Supplements and Prescription Medication Section (DSQ)  
Sample Person Questionnaire

## **1 Component Description**

The Dietary Supplements and Prescription Medication Section (DSQ) of the Sample Person (SP) Questionnaire collects information on 1) dietary supplement and minerals, 2) nonprescription antacids, 3) pain relievers, and 4) prescription medications.

The Prescription Medication subsection provides personal interview data on use of prescription medications during a one-month period prior to the survey date. The NHANES 1999-2000 prescription medication questions are similar to the NHANES III, 1988-1994 questions.

## **2 Eligible Sample and Exclusion Criteria**

All survey participants are eligible for the prescription medication questions. Participants over 16 years of age answer for themselves; proxy respondents answer for participants 16 years of age or younger and for individuals who could not self-report.

## **3 Data Collection Methods**

During the household interview survey participants are asked if they have taken a medication in the past month for which they needed a prescription. Those who answer “yes” are asked to show the interviewer the medication containers of all the products to. For each medication reported, the interviewer enters the product’s complete name from the container into a computer. If no container is available, the interviewer asks the participant to verbally report the name of the medication.

When the interviewer enters the medication name into the computer, the name is automatically matched to a prescription drug database on the computer to identify an exact match or similar text matches (refer below for details on the prescription medication database). The interviewer then selects the best match from a list of possible matches. The original entry of the interviewer and the product selected from the computer list are saved under separate variables for quality control purposes. If an exact match of the medication cannot be found, the interviewer is instructed to select “drug not found on list” from the list. Interviewers can record up to 20 prescription medications.

Participants are also asked how long they had been taking the medication and the main reason for use.

The NHANES 1999-2000 prescription medication questions can be accessed in the Dietary Supplements and Prescription Medications Section of the Sample Person Questionnaire at the following website: <http://www.cdc.gov/nchs/data/nhanes/spq-ds.pdf>.

## **Prescription Medication Questions Included in this Data Release**

- Was any prescription medication taken in the past month
- Medication name
- Was medication container seen by interviewer
- How long was medication taken
- Number of prescription medications taken
- Number of canisters of Beta-agonists used in the past month

## **Prescription Medication Database**

NCHS used the Master Drug Database (MDDB<sup>®</sup>), a proprietary database of Facts and Comparison (Indianapolis, Indiana), to assist in data collection. MDDB is a comprehensive database of all prescription and some nonprescription drug products available in the U.S. drug market. For NHANES, the MDDB files were modified and uploaded to a laptop computer and incorporated into a search engine for use by interviewers in the field. The computer file is updated at the beginning of each survey year to incorporate changes to the MDDB and include products approved and available to the U.S. public in the prior year. During 1999 and 2000, the modified MDDB file on the computer contained ~15,000 prescription and some over-the-counter drug products.

## **4 Staff**

A trained survey interviewer administered the survey participant questionnaire.

## **5 Quality Control Procedures**

Data were routinely examined for discrepancies and erroneous entries. The medication name entered by the interviewer was compared to the medication name selected from the database. About 92% of all reported medications were matched during the interview to a drug product in the database. Review of these matches found that the interviewer selected the wrong drug product (e.g., Triam/hctz entered, Triamterene selected) in less than 1% of the cases. Editing of the remaining 8% of reported medications, which were not matched to the products in the drug database, was performed after data collection at NCHS.

## **6 Data Preparation: Editing and Derived Variables**

### **General editing of data:**

If changes were made to the original data, a derived variable was created. The derived variable is essentially the final version of the variable after editing and recoding was performed. The derived variable includes the letter “D” in the third position of the variable name in place of the letter “Q” for the questionnaire item that is customarily used in NHANES data release files. The survey questionnaire codebooks include the names and description of the derived variables.

### **Prescription medications incorrectly reported in subsections of questionnaire:**

Prescription antacids that were incorrectly reported in the nonprescription antacid section of the questionnaire were removed from the antacid file and added to the prescription medication file. Prescription medications that were incorrectly reported in the dietary supplement section were removed from that file and added to the prescription medication file.

Any prescription dietary supplements and vitamin that was incorrectly reported in the prescription medication section was removed from the prescription medication section and moved to the dietary supplement section. These products are not included in any counts of prescription medications. Products reported in the prescription medication section that were only available as over-the-counter products during 1999-2000 were removed from the prescription medication file.

The variables that record overall prescription drug use (RXD030) and number of prescription drugs taken (RXD295) were adjusted for products moved into or out of the prescription medication file.

### **Specific variable editing:**

#### RXD030: Have you taken or used any prescription medicines in the past month?

This variable was the lead-in question to the series of questions on prescription medication use. It accounts for all prescription medications except prescription dietary supplements and minerals that are included in the dietary supplements and mineral file (DSQ). A small number of persons refused to answer this question (coded 7) or did not know whether they used a prescription medication in the past month (coded 9). This variable was edited and takes into account prescription medications reported in this section as well as prescription medications moved from the supplements or nonprescription antacid sections of the questionnaire.

#### RXD295: The number of prescription medicines reported

This variable was computed at NCHS and represents the total number of different prescription medications reported by the respondent. The count has been adjusted for all prescription medications moved into and those moved out of the prescription medication section. However, the count is not a comprehensive count of all prescription medications used by a participant because prescription vitamins are part of the

supplements section and prescription analgesics that were taken chronically are part of the pain reliever section. There were also participants who reported the use of prescription medication in the past month (RXD030=1) but did not know the name of the medication (RXD240B=99999) or refused to report the name of the medication (RXD240B=77777). Each product reported as refused or don't know is still included in the total count of prescription medications used under RXD295.

RXD260: For how long have you been taking this medicine?

This variable was created from a two-part (number and unit) question and indicates how long the respondent reported taking each prescription medication. Responses were recorded in days, weeks, months, and years. To facilitate analysis, all answers were converted to days using conversion factors of 7 days per week, 30.4 days per month, and 365 days per year. There were persons who reported the use of a prescription medication but did not know how long they had been using the medication. RXD260 is coded as 999999 (don't know) for these persons. There were also persons who reported the use of a prescription medication but did not report the length of use. RXD260 is missing for these persons.

**Creation of additional data release variables:**

RXD240B: Standard generic ingredient name

As in NHANES III, all reported medication names were converted to their standard generic ingredient name for data release. For multi-ingredient products, the ingredients are listed in alphabetical order (i.e., Acetaminophen; Codeine).

There were participants who reported the use of a prescription medication but did not know the name of the medication or refused to report the name of the medication. These entries were coded as 99999, don't know and 77777, refused, respectively. There were also medications reported with insufficient detail to accurately identify the exact product but there was some information about the drug. These products have been released with the reported name followed by "-unspecified" (e.g., cardiac drug-unspecified, estrogen-unspecified). The names of a limited number of reported medications could not be identified by NCHS as a known prescription product. These entries are counted as prescription medications, since there is no evidence that they are not, and have been coded as 55555, unknown drug.

NHCODE: Standard generic ingredient code

To assist in data analysis, NCHS assigned a 5-digit generic ingredient drug code to each generic ingredient name. Codes were assigned based on the alphabetical listing of generic ingredient names starting with 00100. Unspecified products were assigned codes of 70000 and greater. Refer to Appendix 2 for a list of standard generic ingredient names and their associated generic codes. NHCODE is missing for unknown (55555), refused (77777), or don't know (99999) RXD240B entries.

## FDACODE1--FDACODE6:

Similar to NHANES III, therapeutic drug class codes were assigned based on FDA's National Drug Code Directory. Specifically, FDA/NDC's Formulation Data File and Drug Class Data File (<http://www.fda.gov/cder/ndc/index.htm>) were used to assign up to a maximum of six drug class codes for each generic ingredient name.

As stated on FDA's website, "The major drug class is a general therapeutic or pharmacological classification scheme for drug products reported to the FDA under the provisions of the Drug Listing Act. The classification scheme used was based on the AMA DRUG EVALUATIONS SUBSCRIPTION and generally follows the organization of material in that publication. The drug class for each product was determined by the labeled indication. The major (ending with "00") and minor drug class codes and their definitions are listed in FDA's NDC directory (<http://www.fda.gov/cder/ndc/tbldclas.txt>). NCHS used this classification system because the files are nonproprietary and can be released to the public.

If a product has more than one drug class code the codes were recorded in numerical order, with a maximum of 6 codes, and were not recorded based on primary, secondary, or tertiary drug action or response. There were some products that were not identified in the FDA/NDC Directory and therefore, do not have an FDA/NDC drug class code. NCHS assigned a code of 99999 to these products. Some products were assigned codes by NCHS (e.g., Latanoprost=1566; Cerivastatin Sodium=0912; Allergy Pills-Unspecified=1900). "Unspecified" drugs were assigned to a drug class code if there was enough information to identify a drug class. "Unknown" drugs were not assigned a drug class code. See Appendix 1 for a listing of the drug class codes and descriptions.

A small number of medications matched to more than 6 FDA/NDC drug class codes (n=10, listed below). For these products NCHS made a decision about which 6 codes to retain.

ASPIRIN; BUTALBITAL; CAFFEINE  
EPINEPHRINE HYDROCHLORIDE  
ERYTHROMYCIN  
HEPARIN SODIUM  
HYDROCORTISONE  
HYDROXYZINE HYDROCHLORIDE  
METHOTREXATE SODIUM  
METRONIDAZOLE  
SODIUM CHLORIDE  
TRIAMCINOLONE ACETONIDE

Note that the FDA/NDC Directory files are updated several times during the year. The files used for the NHANES prescription medication data release file were from July 2002. Current FDA/NDC files can be accessed at the following website:

## 7 Data File Structure

The prescription medication file is a product level file. Therefore, participants who reported the use of multiple prescription medications will have multiple records, that is, a record for each product. The following variables are part of this data release.

SEQN	Respondent ID number
RXD030	Taken prescription medicine, past month (yes/no)
RXD240B	Standard generic ingredient name (Appendix 2)
NHCODE	Standard generic ingredient code (Appendix 2)
RXQ250	Medicine container seen by interviewer (yes/no)
RXD260	Number of days taken medicine
FDACODE1-6	FDA/NDC drug class codes 1-6 (Appendix 1)
RXD295	Number of prescription medicine taken
RXQ280	Number of Beta-agonist canisters, past month

## 8 Analytic Notes

RXD295 provides a count of all prescription products reported in the prescription medication section of the survey participant questionnaire. This count includes products reported as “refused” or “don’t know” by participants who reported they had taken a prescription medication but did not know the name of the medication or refused to report the name of the medication. Prescription supplements, vitamins, and minerals reported in the Supplements Section of the questionnaire and prescription analgesics used chronically that were reported in the Pain Medication Section are not counted. Therefore, this variable does not provide a comprehensive count of all prescription products used by the survey participants

In some cases it may appear as though respondents reported the same prescription more than once. That is, the same generic ingredient name and product code may be listed more than once. There are a number of reasons for these duplications. Respondents may have reported different brand name medications which had the same generic ingredient name (e.g., “Adalat” vs. “Procardia”), or the medications may have been different forms of the same product. Since descriptive information on the form, strength, and dosage was not collected, it could not be determined if this was the reason for the duplications. If different product names were reported that had the same generic name, they were retained in the file. However, if the exact same product name was reported, with the same length of use and the same reason for use, these records were assumed to be duplicates and only one record was retained in the file.

During the data editing process, outlier values were examined. When there was insufficient information to conclude that values were invalid, they were left in the data set. Analysts should examine the distribution of the data and consider whether or not it is appropriate to include or exclude extreme values in a given analysis.

All generic ingredient names reported in the prescription medication file were reviewed by NCHS' Disclosure Review Board. Certain medications were found to be a potential disclosure risk. These drugs were recoded to 55555, unknown drug.
