

## **OTHER VACCINES**

In addition to the routine childhood vaccinations covered in this booklet, there are other vaccines that children *may* need under special circumstances.

**Influenza (flu) vaccine** is recommended for children who have certain chronic diseases, including asthma; who have been hospitalized because of certain chronic diseases; or who are receiving long-term aspirin therapy.

**Rabies vaccine** may be recommended for children thought to have been exposed to rabies.

Children traveling to other countries may need other vaccines, depending on the countries being visited. These vaccines can include **Japanese encephalitis, meningococcal, typhoid,** and **yellow fever.**

Your doctor, nurse, or clinic staff can advise you about use of these vaccines.
