

Our Mission

The Technology Commercialization Office (TCO) develops new ways to use emerging Laboratory technologies to stimulate new, high-tech, business startups, create job opportunities, and attract business and capital to the region while serving the nation as a whole.

The Laboratory actively encourages LANL staff members to undertake technology commercialization and supports entrepreneurial activities. We value people who extend their vision beyond the Laboratory walls to create successful partnerships with industry or establish regional technology businesses. These activities will ultimately yield a vital Northern New Mexico business community capable of effectively serving the Laboratory's needs.

TCO Services

TCO provides a broad range of services to help LANL staff members and fledgling entrepreneurs who wish to commercialize their technology or perhaps start a business based on a Laboratory technology. We also work within the Laboratory to identify, evaluate, and prioritize technologies with commercialization potential.

Our staff of technology commercialization executives, MBA interns and business development consultants help LANL technical staff or aspiring entrepreneurs evaluate and implement the different paths to commercialization. Specific services include the following:

- One-on-one business consulting
- Entrepreneurial and commercialization training seminars
- Market assessment services
- Business plan development assistance
- Introductions to management or technical talent
- Access to financing

TCO staff can help Laboratory research and development staff identify potential collaborators, licensees, or investors.
