

# Fact Sheet

NPDES Permit Number: ID-002696-4

Date:

**Public Notice Expiration Date:** 

**Contact:** Kelly Huynh (206)553-8414 or

1-800-424-4372 (within Region 10 only)

huynh.kelly@epa.gov

The U.S. Environmental Protection Agency (EPA) Plans to Issue a Wastewater Discharge Permit for:

Simplot Meat Products Incorporated 616 West Railroad Street Nampa, Idaho 83653

and

The State of Idaho Proposes to Certify the Permit

## **EPA Proposes NPDES Permit Issuance.**

EPA proposes to issue a National Pollutant Discharge Elimination System (NPDES) permit for Simplot Meat Products Incorporated. The draft permit sets conditions on the discharge--or release--of pollutants from the facility to Indian Creek.

### This fact sheet includes:

- information on public comment, public hearing, and appeal procedures
- a description of the current discharge
- a listing of proposed effluent limitations and other conditions
- a map and description of the discharge location
- detailed background information supporting the conditions in the permit

# The State of Idaho Proposes Certification.

The Idaho Division of Environmental Quality (IDEQ) proposes to certify the NPDES permit for Simplot Meat Products Incorporated, under section 401 of the Clean Water Act. The State provided preliminary comments prior to the public notice which are incorporated into the draft permit.

## **EPA Invites Comments on the Draft Permit.**

Persons wishing to comment on or request a public hearing for the draft permit may do so in writing by the expiration date of the public notice. A request for public hearing must state the nature of the issues to be raised as well as the requester's name, address and telephone number. All comments and requests for public hearings must be in writing and submitted to EPA as described in the public comments section of the attached public notice.

Persons wishing to comment on State certification should submit written comments by the public notice expiration date to the State of Idaho Division of Environmental Quality, 1445 North Orchard, Boise, Idaho 83706-2239.

If no substantive comments are received, the tentative conditions in the draft permit will become final, and the permit will become effective upon issuance. If substantive comments are received before the expiration of the public notice, EPA will address the comments and EPA's regional Office of Water Director will make a final decision regarding permit issuance along with a response to comments. If comments are received, the permit will become effective 30 days after the issuance date, unless a request for an evidentiary hearing is submitted within 30 days.

# Documents are Available for Review.

The draft NPDES permit and related documents can be reviewed at EPA's regional office in Seattle between 8:30 a.m. and 4:00 p.m., Monday through Friday. To request copies and other information, contact the NPDES Permits Unit at:

United States Environmental Protection Agency Region 10 1200 Sixth Avenue, OW-130 Seattle, Washington 98101 (206) 553-8414 or 1 (800) 424-4372 (within Region 10 only)

The fact sheet and draft permit are also available at:

EPA Idaho Operations Office 1435 North Orchard Street Boise, Idaho 83706 (208) 378-5746

Idaho Division of Environmental Quality 1445 North Orchard Boise, Idaho 83706-2239 (208) 373-0550 The draft permit and fact sheet can also be found by visiting the Region 10 web site at www.epa.gov/r10earth/offices/water/npdes.htm.

For technical questions regarding the permit or fact sheet, contact Kelly Huynh at the phone numbers or e-mail address at the top of this fact sheet. Those with impaired hearing or speech may contact a TDD operator at 1-800-833-6384 (ask to be connected to Kelly Huynh). Additional services can be made available to persons with disabilities by contacting Kelly Huynh.

## LIST OF ACRONYMS

BAT - best available technology economically achievable

BCT - best conventional pollutant control technology

BPT - best practicable control technology currently available

CFR - Code of Federal Regulations

cfs - cubic feet per second

CWA - Clean Water Act

DMRs - Discharge Monitoring Reports

EPA - Environmental Protection Agency

IDEQ - Idaho Division of Environmental Quality

MDL - maximum daily limit

mgd - million gallons per day

NMFS - National Marine Fisheries Service

NPDES - National Pollutant Discharge Elimination System

TSD - EPA's Technical Support Document for Water Quality-based Toxics Control

USFWS - United States Fish and Wildlife Service

USGS - United States Geological Survey

WLA - wasteload allocation

#### **BACKGROUND INFORMATION**

#### I. APPLICANT

Simplot Meat Products Incorporated NPDES Permit No: ID-002696-4

616 West Railroad Street Nampa, Idaho 83653

Contact: Joe Tost, Environmental Maintenance Manager

## II. FACILITY ACTIVITY

Simplot Meat Products Incorporated (hereafter "Simplot") is a slaughterhouse and meat packing facility employing approximately 240 people (standard industrial classification code 2011). The facility utilizes approximately 325 head of cattle per day and operates six days a week. Simplot uses well water for the three compressors, that are used to reduce the temperature of the meat prior to and during packaging and shipment. The non-contact cooling water does not come into direct contact with any raw material, intermediate product, waste product (other than heat) or finished product. The discharge of sewage, process waste, and wash down water is permitted by the City of Nampa and is not covered under this NPDES permit (See NPDES permit ID-002206-3). The discharged water does not contain any waste product (other than heat). See Appendix A for a map of the facility, and outfall location.

# III. RECEIVING WATER

Simplot discharges through outfall 001 (latitude 43° 40' 11", and longitude 116° 44' 0") to Indian Creek which is a tributary of the Boise River. This portion of Indian Creek is protected by the State of Idaho (IDAPA 16.01.02.140.01.y) for the following uses: agricultural water supply, cold water biota, salmonid spawning, primary contact recreation and secondary contact recreation. Indian Creek has been listed under Section 303(d) of the Clean Water Act as not attaining or not expected to meet the state water quality standards for sediment and nutrients. Where the receiving water quality does not meet water quality standards after the imposition of technology-based effluent limitations, Section 303(d) of the Clean Water Act requires the state to develop a Total Maximum Daily Load (TMDL) plan to ensure that these waters will come into compliance. A TMDL is a determination of the amount of pollutant or property of a pollutant, from point, nonpoint, and natural background sources, including a margin of safety, that may be discharged to a water body without causing the water body to exceed the water quality criterion for that pollutant.

## IV. EFFLUENT LIMITATIONS

# A. Background

EPA followed the Clean Water Act, State and federal regulations, and EPA's 1991 *Technical Support Document for Water Quality-Based Toxics Control* to develop the draft effluent limits. In general, the Clean Water Act requires that the effluent limit for a particular pollutant be the more stringent of either the technology-based or water quality-based limit.

EPA sets technology-based limits based on the effluent quality that is achievable using readily available technology. EPA develops these limits based either on federally-promulgated effluent guidelines or, where such guidelines have not been promulgated for an industry, based on best professional judgement.

The Agency evaluates the technology-based limits to determine whether they are adequate to ensure that water quality standards are met in the receiving water. If the limits are not adequate, EPA must develop additional water quality-based limits. These limits are designed to prevent exceedences of the Idaho water quality standards in Indian Creek.

The draft permit limitations are based solely on Idaho's water quality standards because effluent guidelines have not been established for non-contact cooling water facilities. Appendix B provides the basis for the development of the following effluent limits.

# **B.** Effluent Limits

- 1. The permittee shall comply with a maximum daily flow limit of 0.11 million gallons per day (mgd).
- 2. Five years from the effective date of the permit, the permittee shall comply with a maximum daily average temperature limit of 13°C and an average monthly limit of 9°C from October 15 through March 15. The permittee shall comply with a maximum instantaneous temperature limit of 22°C and a maximum daily average of 19°C from March 16 through October 14, five years from the effective date of the permit.
- 3. The pH of the effluent shall be within the range of 6.5 standard units to 9.5 standard units.
- 4. Surface waters shall be free from toxic substances in concentrations that impair designated beneficial uses.

# V. MONITORING REQUIREMENTS

# A. Effluent Monitoring

Section 308 of the Clean Water Act and the federal regulations at 40 CFR 122.44(i) require that permits include monitoring to determine compliance with effluent limitations. Monitoring may also be required to gather data for future effluent limitations or to monitor effluent impacts on receiving water quality. Simplot is responsible for conducting the monitoring and for reporting the results to EPA on quarterly Discharge Monitoring Reports (DMRs).

Table V-1 presents the proposed monitoring requirements based on the minimum sampling necessary to adequately monitor the facilities performance. Monitoring shall occur prior to discharge to Indian Creek.

Table V	V-1: Simplot Monitoring Requirements		
Parameter	Monitoring Frequency	Method	
Flow, mgd	Continuous	Recorder	
pH, standard units	5/week	Grab	
Temperature, °C	Continuous	Recorder	

# **B.** Quality Assurance Plan

It is important that data collected to evaluate compliance with the permit limits or to evaluate the effects of the discharge on the receiving water be accurate. To ensure accuracy, the draft permit requires Simplot to develop and implement Quality Assurance Plan within 120 days of effective date of the permit. The Quality Assurance Plan consists of standard operating procedures permittees must follow for collecting, handling, storing and shipping samples, laboratory analysis, and data reporting.

#### VI. OTHER PERMIT CONDITIONS

#### A. Additional Permit Provisions

In addition to facility-specific requirements, sections II, III, and IV of the draft permit contains "boilerplate" requirements. Boilerplate is standard regulatory language that applies to all permittees and must be included in NPDES permits. Because boilerplate requirements are based on regulations, they cannot be challenged in the context of an NPDES permit action. The boilerplate covers

requirements such as monitoring, recording, and reporting requirements, compliance responsibilities, and general requirements.

#### **B.** New Treatment Processes

Section III.J of the draft permit requires that the permittee give the Director and IDEQ notice of any planned alterations or additions to the permitted facility. Notice would therefore be required for the addition of a cooling tower or other treatment device for temperature. Section IV.M of the draft permit explains that the permit is subject to modification, revocation, or reissuance at the request of any interested party, or upon EPA initiative, if new information becomes available that justifies different permit conditions. New information would include an increase in pollutants identified in the permit application or additional pollutants that were not present in the waste stream when the latest permit application was submitted.

# VII. OTHER LEGAL REQUIREMENTS

# A. Endangered Species Act

The Endangered Species Act requires federal agencies to consult with the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS) if their actions could beneficially or adversely affect any threatened or endangered species.

EPA requested lists of threatened and endangered species from the NMFS and the USFWS in letters dated February 17, 1999. In a letter dated March 3, 1999, the USFWS identified the Gray Wolf (*Canis lupus*) and Peregrine Falcon (*Falco peregrinus anatum*) as endangered. In a letter dated March 10, 1999, the NMFS stated that there are currently no threatened or endangered species under its jurisdiction in Indian Creek.

EPA has determined that the draft permit will have *no effect* on the gray wolf. Hunting and habitat destruction are the primary causes of the gray wolf's decline. Issuance of the NPDES permit will not result in habitat destruction, nor will it result in changes in population that could result in increased habitat destruction. Furthermore, issuance of this draft permit will not impact the food sources of the gray wolf.

#### **B.** State Certification

Section 401 of the Clean Water Act requires EPA to seek certification from the State that the permit is adequate to meet State water quality standards before issuing a final permit. The regulations allow for the State to stipulate more

stringent conditions in the permit, if the certification cites the Clean Water Act or State law references upon which that condition is based. In addition, the regulations require a certification to include statements of the extent to which each condition of the permit can be made less stringent without violating the requirements of State law. The draft permit has been sent to the State to begin the final certification process.

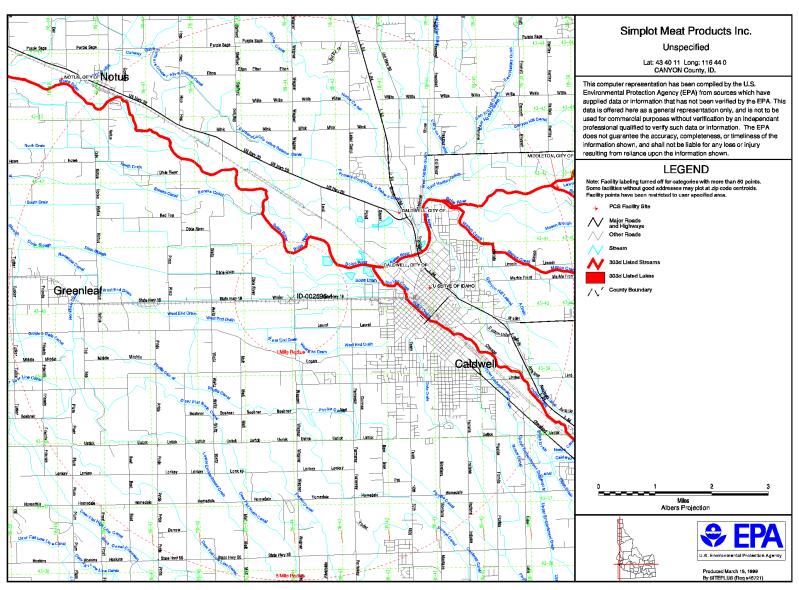

# C. Permit Expiration

This permit will expire five years from the effective date.

# APPENDIX A - SIMPLOT INC. FACILITY MAP

#### APPENDIX B - BASIS FOR EFFLUENT LIMITATIONS

# I. Statutory and Regulatory Basis for Limits

Sections 101, 301(b), 304, 308, 401, 402, and 405 of the Clean Water Act (CWA) provide the basis for the effluent limitations and other conditions in the draft permit. The EPA evaluates the discharge(s) with respect to these sections of the CWA and the relevant NPDES regulations to determine which conditions to include in the draft permit.

In general, EPA first determines which technology-based limits must be incorporated into the permit. EPA then evaluates the effluent quality expected to result from these controls, to see if it could result in any exceedences of the water quality standards in the receiving water. If exceedences could occur, EPA must include water quality-based limits in the permit. The draft permit limits reflect whichever requirements (technology-based or water quality-based) are more stringent. The technology-based and water quality-based evaluations are described below.

# II. Technology-based Evaluation

Section 301(b)(2) of the CWA requires technology-based controls on effluents. This section of the CWA requires that, by March 31, 1989, all permits contain effluent limitations which: (1) control toxic pollutants and nonconventional pollutants through the use of "best available technology economically achievable" (BAT), and (2) represent "best conventional pollutant control technology" (BCT) for conventional pollutants. In no case may BCT or BAT be less stringent than "best practicable control technology currently available" (BPT), which is a minimum level of control required by section 301(b)(1)(A) the CWA. Technology-based limitations are set by regulation or developed on a case-by-case basis (40 CFR 125.3). Effluent guidelines for technology-based limitations are not available for non-contact cooling water discharges.

# III. Water Quality-based Evaluation

EPA evaluated the discharge to determine compliance with Section 301(b)(1)(C) of the CWA. This section requires the establishment of limitations in permits necessary to meet water quality standards by July 1, 1977.

The regulations at 40 CFR 122.44(d) implement section 301(b)(1)(C) of the CWA. These regulations require that NPDES permits include limits for all pollutants or parameters which "are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality." The limits must be stringent enough to ensure that water quality standards are met, and must be consistent with any available wasteload

allocation. The draft permit includes water quality-based limits and conditions for temperature; pH; and toxic substances.

In determining whether water quality-based limits are needed and developing those limits when necessary, EPA generally uses the approach outlined below:

- 1. Determine the appropriate water quality criterion
- 2. Determine whether there is "reasonable potential" to exceed the criterion
- 3. If there is "reasonable potential", develop a wasteload allocation
- 4. Develop effluent limitation(s) based on WLA

The following sections provide a detailed discussion of each step.

# A. Water Quality Criteria

The first step in developing water quality-based limits is to determine the applicable water quality criteria. The state of Idaho's water quality standards are found at IDAPA 16 Title 1, Chapter 2.

The applicable criteria are determined based on the beneficial uses of the receiving water. The beneficial uses for Indian Creek in Idaho are: agricultural water supply, cold water biota, salmonid spawning, primary contact recreation and secondary contact recreation.

For any given pollutant, different uses may have different criteria. To protect all beneficial uses, the permit limits are based on the most stringent of the water quality criteria applicable to those uses.

## 1. Temperature

The most stringent of Idaho's temperature criteria applicable to Indian Creek is for protection of salmonid spawning (found at IDAPA 16.01.02.250.02.d). This criterion specifies a maximum temperature of 13°C (55°F) at any time, with a maximum temperature of 9°C (48°F) as a daily average during the spawning and incubation period for the particular species inhabiting the Indian Creek. Fish sampling was conducted by the United States Geological Survey (USGS) in the Boise River in October of 1996 and August of 1997 and found that mountain whitefish were available in the portion of the Boise River that Simplot indirectly discharges to. Therefore, according to IDAPA 16.01.02.250.02.d, the river should be protected for salmonid spawning from October 15 to March 15th. From March 16 to October 14, Indian Creek is protected for the next most stringent beneficial use, cold water biota criteria (found at IDAPA

16.01.02.250.02.c). The cold water biota regulation limits water temperature to 22°C (72°F) at any time, with a maximum daily average of 19°C (66°F). Available information indicates that the discharge temperature in winter and summer is greater than the State's water quality criteria therefore, a reasonable potential analysis is not necessary and limits are required in the permit.

A 95th percentile value of the ambient temperature data from 1971 through 1979 at station 1119USBRB01016 (Indian Creek at Carcher Road, Nampa) was considered. Because the ambient temperature value (21°C) is greater than the criteria for salmonid spawning and cold water biota, mixing is not available.

# 2. pH

The most stringent Idaho standard applicable to Indian Creek is for protection of aquatic life (found at IDAPA 16.01.02.250.02.a) This standard requires that effluent pH be within the range of 6.5 to 9.5 pH units.

## 3. Toxic substances

Idaho water quality regulation IDAPA 16.01.02.200.02 requires that surface waters of the state be free from toxic substances in concentrations that impair designated beneficial uses. The substances do not include suspended sediment produced as a result of nonpoint source activities. This narrative requirement has been included in the draft permit.

# B. Wasteload Allocation and Effluent Limit Development

Once the need for a permit limit is established, the first step in developing the limit is developing a wasteload allocation (WLA) for the pollutant. A WLA is the concentration (or loading) of a pollutant that a facility may discharge without causing or contributing to an exceedence of water quality standards in the receiving water. The WLAs for pH and temperature were established "end of pipe."

## 1. "End of Pipe" WLA

End of pipe limits are established when dilution is unavailable, either because the receiving water exceeds the criteria or because the State has decided not to authorize a mixing zone for a particular pollutant. When there is no dilution, the criterion becomes the WLA.

# C. Antidegradation

In addition to water quality-based limitations for pollutants that could cause or contribute to exceedences of standards, EPA must consider the State's antidegradation policy (found at IDAPA 16.01.02.051). The antidegradation policy represents a three tiered approach to maintain and protect various levels of water quality and uses. Tier 1 protects the existing uses of the water body when existing quality just meets the standard, Tier 2 protects waters that whose existing quality is better than that required to meet the standard and prevents water quality from being degraded below the standard, and Tier 3 applies to Outstanding National Resource Waters where the ordinary use classifications and supporting criteria may not be sufficient or appropriate. The draft permit for discharge to Indian Creek (Tier 1) is consistent with the State's antidegradation policy.
