# World Pear Situation: <br> Driven by Growing Output in China <br> Global Production Continues to Increase 

## SUMMARY

Combined pear production in major producing countries in $2002 / 03$ is estimated to increase for the seventh consecutive season and reach a record 14.2 million tons. A large crop in China accounts for much of the increase in world pear production this season. Bigger pear crops are also estimated in some other top producers, such as Italy, Turkey, and South Africa. On the other hand, U.S. pear production will decrease this season and could be the smallest harvest since 1996/97.

World pear exports in $2002 / 03$ are estimated at 1.6 million tons, a record. In the Northern Hemisphere, more exports are anticipated from China and from some countries of the EU. Increased supplies of good-quality fruits and devalued currencies vis-à-vis the U.S. dollar will drive shipments up this season from the two largest exporters in the Southern Hemisphere, Argentina and Chile. U.S. pear exports in 2002/03, conversely, will likely decline for the first time in three seasons.

## PRODUCTION

China's pear industry, the world's largest, is a major force behind expected 2002/03 world record output

China's pear production in 2002/03 is expected to remain at last year's large level of 8.8 million tons, the result of increasing plantings of non-traditional varieties. Moreover, land that was devoted to grains is now being switched to pear production. The trend is part of China's government's efforts to improve quality, food safety, and production techniques in the domestic fruit industries. The Chinese policies are basically aimed at improving the economic situation of farmers, as well as increasing the supply of fruits during China's off-season. As a result, pear production volume and quality keep improving in China.

For many years, China's pear industry has struggled with low prices, as have most other fruit industries in the country. The decreasing value of China's pear crop, combined with little government financial support, has kept incomes very low and created financial stress among Chinese pear farmers. To improve this situation, the government of China is seeking adjustments in the fruit industry, including improvement in fruit quality and more diversification of varieties planted. As researchers develop grafted and crossbred varieties, and introduce imported seedlings or cuttings, China's variety of pears continues to expand. In addition to boosting more diversification and increasing the supply of domestic fruits during the year, China also intends to enhance demand for Chinese apples in world markets and produce fruits with alternative uses among the processing industries.

## A larger pear crop in Italy boosted larger production in the EU

Combined pear production in countries of the European Union (EU) is expected to increase to nearly 2.3 million tons in 2002/03. Production in Italy, the top producer in the EU, is now estimated at 900,000 tons, 8 percent above last season's crop. However, a large portion of the harvest is likely to be of lower quality fruit, mainly due to damage caused by hail in the spring.

In Italy, lower quality fruits are generally directed to the processing sector, with the remaining volume going to the domestic fresh market. This season, Italian consumption of fresh pears is expected to increase, as larger supplies of low-quality inexpensive fruits become available. Italian fruit consumption is generally driven by supplies and prevailing prices. Given the wide range of fruit available in Italy, consumption of certain fruits responds quickly to price changes.

## U.S. pear crop in 2002/03 could be the smallest in 7 seasons

U.S. pear production, in contrast, will be mostly hampered by a decreasing trend in acreage of Bartlett pears. Estimated at 830,000 tons in 2002/03, U.S. pear production could be the smallest since 1996/97, when production totaled barely 745,000 tons. The reduced acreage of Bartlett varieties responds mainly to the financial problems the U.S. processing industries, mostly from the west coast, have been facing in recent years. Continuing low prices in the domestic market as well as ample supplies of lowered-priced imported canned fruit have been hampering the profits of U.S. canneries. On the other hand, these problems have prompted more diversion of

Bartlett pears into the fresh market, which has helped U.S. pear sales domestically and, somewhat, abroad. Still, Bartlett varieties, which are used mostly for canning, account for more than half of the pears produced in the United States.

# The Pacific Northwest and California Accounts for Nearly All of the Pears Produce in the United States

## In the Southern Hemisphere, pear crops are also up

Combined pear production in selected countries of the Southern Hemisphere is expected to increase about 4 percent to 1.3 million tons. Encouraged by lower costs of production, farmers in Argentina and Chile are expanding pear acreage, and, as such, fruit output. Argentina and Chile account for more than 60 percent of the pears produced in the Southern Hemisphere and over 70 percent of its exports.

In Argentina, pear production costs are reported down by as much as 50 percent. Reduced costs of production are in part due to the continued devaluation of the Argentine peso, which has virtually stopped imports of production inputs, such as herbicides, fertilizers, and machinery. Imported inputs have been substituted by lowered-price domestic ones and by increased use of cheap local labor, which accounts for a large share of Argentina's production costs. However, many Argentine fruit growers continue to be heavily in debt. Since the debt situation for many farmers is serious, the government of Argentina decided to convert all dollar-denominated debt into pesos. This policy could slow down the acreage expansion trend, since credit in Argentina is expected to remain extremely limited for farm produc tion.

A larger pear crop is also anticipated in Chile, the result of more planted acres coming into production. Chilean pear producers are having lower production costs and are continuing to diversify their orchards by planting different and more popular varieties. To date, there are more than 36 pear varieties grown in Chile. The Packham's Triumph variety, grown mainly for the fresh market, accounts for about 45 percent of Chile's annual pear crop. The Beurre Bosc variety makes up about 25 percent of Chile's pear production and exports.

## Increased producing acreage to boost pear production in South Africa

Continue expansion in South Africa's pear acreage will in part boost pear production in 2002/03. Improved management, increased harvested area, and favorable weather, will further advance pear production in South Africa this season. Similar to the ongoing situation with the domestic apple industry, export sales of South Africa's pears are facing fierce competition in global markets; especially from heavily subsidized competitors' industries. Pear growers in South Africa have requested government assistance to address their difficult situation.

TRADE
China's pear exports expanding as fruit quality and marketing technology improve

China's pear exports are expected to reach a record 200,000 tons in 2002/03, after jumping significantly in 2000/01 and 2001/02. Pear shipments from China have been largely boosted by improved fruit quality, the result of increased investments in controlled storage facilitates. These investments are financed by domestic, as well as foreign fruit processing and trading companies. The technology is allowing Chinese traders to store and maintain fruit quality for longer periods, improving pear export sale opportunities. As shipments expand, exports are becoming increasingly important to Chinese pear growers. Russia and Southeast Asia are the main destinations for most of China's pear exports, which are displacing some fruit shipments from other world suppliers.

## China's Share of Global Pear Exports Is Expanding Rapidly

Marketing Year 1995/96

Marketing Year 2002/03 F

Source: USDA Agricultural Attache Reports and the U.S. Department of Commerce, Bureau of the Census
U.S. pear shipments likely down in 2002/03; Cuba could become bright spot for U.S. fruit exporters
U.S. exports of pears in 2002/03 are expected at 150,000 tons, the lowest volume in 3 seasons. Reduced supplies of exportable fruits and related higher prices will likely contribute to reduced U.S. pear shipments this season to important markets, including Mexico and Canada, the U.S. top customers. As of February 28, 2003, U.S. pear shipments to Mexico were down 4 percent, while exports to Canada were behind 18 percent.

Nevertheless, U.S. pears are likely to benefit from the growing potential in the Cuban market. In December 2002, a shipment of U.S. pears, valued at nearly $\$ 30,000$, arrived in Cuba, making the first shipment to the island in more than 40 years. With no local pear production, Cuba could
likely become an important customer for high-quality pears produced in the United States. However, to advance export sales, the Cuban government would have to develop policies aimed at strengthening the domestic economy. Refrigeration and distribution facilities would also need to be developed in Cuba for potential expanded U.S. pear sales.

## Russia, Mexico, the United States, and Canada are the Single Largest Pear Importers; Import Demand in Mexico Has Increased Dramatically

Argentina and Chile; forces behind larger shipments from Southern Hemisphere countries in 2002/03

Argentina, the world's single largest pear exporter, is expected to increase export sales in 2002/03 to 270,000 tons, slightly above last season's shipments. Despite a governmentimplemented 5-percent export tax, Argentina's pear exports in 2002/03 are expected to continue strong, as a larger crop of good quality fruit and a devalued Argentine peso will likely make Argentina's pears more appealing in world markets. The EU is expected to continue to be the top destination for Argentine pear exports in 2002/03. Demand from other important customers, including Brazil, the single-largest destination, the United States, and Russia are also predicted to increase. Bartlett (known in Argentina as Williams) is the top variety exported, accounting for about 40 percent of Argentine annual pear shipments. APHIS maintains an export clearance program for pears destined to the United States, in cooperation with the Argentine government. Quality problems and plant health issues continue to be the major constraints for increased Argentine pear export sales.

Chile's pear exports in 2002/03 are expected to increase to nearly 130,000 tons. Strong demand in countries of the EU is expected to continue, due to lower stocks at the end of the European season. Increased demand in Latin America is also anticipated, mainly for lowered-quality pears. Exports to the United States are expected to increase as well, because of tight U.S. pear supplies this season. According to Chilean industry representatives, even though the Fresh Produce Exporter Association has been operating for only two years, the group is already showing signs of export effectiveness. Chile continues its promotional campaign in the United States, Japan, and the EU. In the United States, written media, TV, and radio are used for the promotions of Chilean fruit.
